

GERMANY

By Harold R. Newman

The German economy was the world's third largest, after the United States and Japan, and accounted for about one-third of Europe's gross domestic product (GDP). In 2002, the rate of economic growth was slow. The growth rate of real GDP was about 0.5% compared with 1.5% in 2001. Sluggish global demand has been particularly damaging to Germany, which depends heavily on exports for its economic growth. The German economy faced other serious issues that included high unemployment, high outstanding Government debt, increasing share of Government revenues going for debt service payment, high tax rates, continuing transfer payments to eastern Germany, and growing social security costs (U.S. Embassy, Berlin, Germany, 2003).

Government Policies and Programs

The Government's declared primary objective continued to be seeking ways to stimulate economic growth and employment and to get a grip on rising Government debt. To this end, the Government was pursuing a combination of budget consolidation, growth incentives, and structural reform. Although the Government intervenes in the economy through the provision of subsidies to selected sectors and the ownership of some segments of the economy, competition and free enterprise are promoted as significant segments of Government policy.

Environmental Issues

The environment in Germany is the responsibility of the Federal Ministry for the Environment, Water Conservation and Nuclear Safety. Falling within its purview is the Federal Environment Agency in Berlin, the Federal Office for Nature Conservation in Bonn, and the Federal Office for Radiation Protection in Salzgitter.

Environmental concerns that relate to mining are addressed under the Federal mining law and its provisions for environmental impact assessments that must be completed before mining can start. The objective of the assessment is to identify and evaluate all environmental consequences of a planned project by taking into account various design options. The environmental evaluation process in Germany presents a risk for the company involved because project approval is not guaranteed even after completion of the assessment, which usually involves considerable time and resources.

In 2000, the German Government introduced the Summer Smog Program to reduce the levels of ground-level ozone. The program included 17 measures to reduce ozone precursor substances, such as nitrous oxide and volatile organic compounds. By 2010, the Government expects to reduce emissions by 40%. This program is in line with the

European Union's (EU) National Emission Ceilings for Certain Pollutants (NEC Directive), which came into force in November 2001. The NEC Directive is the EU's strategy to combat acidification of soil and water and the presence of ozone smog at low altitudes (troposphere) by setting national emission ceilings for ammonia, nitrogen oxide, sulfur dioxide, and volatile organic compounds. Germany has become a pioneer in reducing greenhouse gas emissions and in making alternative fuel sources viable. As a result, Germany has become the world's leader in wind energy with an estimated 39% of the world's installed wind energy capacity (U.S. Energy Information Administration, 2003b§¹).

Production

Production in the mining and metals industries depended on a variety of factors that included the availability of materials and supply and demand. The easing of the worldwide recession was a positive factor for those industries that depended on exporting their products. The importance of certain sectors of the German mining industry has decreased steadily during the past decade. Employment in mining decreased to 52,000 in 2000 from 130,000 in 1990. The underground mining sector has shrunk significantly in recent years (Mining Journal, 2002a). Notwithstanding the general contraction of the industry, the production levels of certain minerals remain important domestically and on a worldwide scale (table 1). The high costs of production in Germany compared with those of competing foreign producers and the problems caused by trying to balance production between the reunified former German Democratic Republic (GDR) and former Federal Republic of Germany (FRG) helped constrain production. Germany was among the world's leading and most technologically advanced producers of ammonia, cement, chemicals, coal, electronics, iron, machinery, steel, and vehicles. Germany has remained a world leader in the mining equipment manufacturing sector. Selected indices of production are listed in table 2.

Trade

Germany was one of the world's major trading nations. About one-third of its GDP depended on exports, and, on average, one job in four depended on trade. Trade between Germany and the United States was worth more than \$90 billion in 2002; Germany was the United States' leading European trading partner. Outside the EU, the United States and Japan were Germany's major trading partners (U.S. Census Bureau, 2003).

¹References that include a section mark (§) are found in the Internet References Cited section.

As a major mineral-processing nation, Germany relied mainly on imports to feed the metals-processing industry, which transformed raw materials into products that supplied the manufacturing industry and provided the bulk of the country's exported materials. The nonferrous metallurgical industry provided its raw materials by imports and recycling. Supply of precious metals originated from domestic nonferrous refineries, domestic supply of scrap, and imports of wrought metal and scrap.

Structure of the Mineral Industry

The structure of the industry in Germany and the principal companies that operated in the production and processing of metals and minerals are listed in table 3. Most of the producing and processing facilities still in operation were small compared with those in the former FRG except for lignite and potash, which were very large operations. The restructuring and privatization of the facilities in the former GDR continued in 2002. Treuhandanstalt (Interest Management Association), which was the state holding company, retained control of a few companies until they were sold or closed.

Commodity Review

Metals

Aluminum.—In 2002, Germany's primary aluminum industry was the largest in the EU, although it was considered to be medium sized when compared with other world producers. VAW Aluminium AG (a subsidiary of E.ON AG) accounted for more than 75% of the country's primary aluminum production. VAW's wholly owned aluminum smelters in Germany and its participating interests in smelters abroad ensured the supply of input metal for the company's downstream fabricating operations.

Norsk Hydro, which was a Norwegian energy, metals, and agricultural group, entered into an agreement to acquire all shares of VAW. If approved by the European Commission, then the buyout would make Norsk the world's third leading light metal producer after Alcoa Inc. of Canada and Alcan Inc. of the United States. Norsk's aluminum activity annual sales after the acquisition was expected to be about €10 billion (\$12 billion), and the merged company would employ about 30,000 people (Alunet, 2002§).

Copper.—Norddeutsche Affinerie AG (NA) operated the custom smelter and refinery at Hamburg and was the world's fifth leading custom copper smelter with a production capacity of about 500,000 metric tons per year (t/yr) of copper cathode, 320,000 t/yr of copper rod, and 176,000 t/yr of copper billets and cake. NA was Europe's leading copper smelter (Metal Bulletin, 2002b).

NA was hoping to expand overseas with its new technology for the recovery of copper from scrap, which was developed at its subsidiary Hüttenwerke Kayser AG. The technology was basically an improved version of Mt. Isa technology and involved an investment of about €11 million (\$13.4 million).

The system combines two processing steps in which materials with an average copper content of 30% are treated and produce an intermediate material of 95% purity. Three shaft furnaces and two converters would be replaced with one new aggregate system. The new system improves in particular the recovery of complex materials (Metal Bulletin, 2002a).

Steel.—Europe's steel industry may look uneven to some observers, but it is the most consolidated in the world. European steel producers included the Usinor Group [24-million-metric-ton-per-year (Mt/yr) capacity], the Corus Group (22.9-Mt/yr capacity), the Arbed Group (22.4-Mt/yr capacity), the Thyssen Krupp Group (18.9-Mt/yr capacity), and the Riva Group (14-Mt/yr capacity) and accounted for more than 100 Mt/yr of raw steel capacity, which was about one-half of the EU total.

Germany's number two steelmaker was Salzgitter AG, which was the leading seamless tube and pipe producer in Western Europe. It continued to reap dividends from its purchase of Mannesmannröhren Werk (MRW) in 2001. Among the top international steelmakers in 2002, Salzgitter went to 16th from 37th. Salzgitter's crude steel production rose to 8.2 Mt/yr compared with 5.1 Mt/yr in 2001. Mannesmann's tubes unit helped Salzgitter to compensate for the slump in steel sales that it shared with most other mills (Metal Bulletin, 2002c).

Zinc.—MIM Holdings Ltd. of Australia stated that it no longer regarded its zinc smelting operations in Duisburg, Germany, and Avonmouth, United Kingdom, as part of its core business. MIM announced that subject to regulatory approvals, it would sell the MIM Huttewerke Duisburg GmbH (MHD) lead-zinc smelting and refining complex to Sudamin Investments GmbH. The MHD operations produced 90,000 metric tons (t) of zinc in the 2001-02 financial year; this output represented more than one-third of Germany's zinc production. According to MIM, Sudamin planned to restructure MHD with a view of converting the whole operation to recycled sources of feed. Sudamin would continue to process concentrates from MIM's McArthur River Mine in Australia and to supply crude lead produced at MHD to MIM's lead refinery at Northfleet in the United Kingdom (Mining Journal, 2002b).

Xstrata plc announced it had completed its acquisition of the Nordenham zinc smelter from Metaleurop SA. Consideration was reported to be \$100 million; this included \$13 million for zinc-related inventories (Mining Journal, 2003).

Industrial Minerals

Bentonite.—In terms of overseas developments, Süd-Chemie AG was the leading bentonite producer in Europe. The company controlled or had minority interests in companies in France, Indonesia, Mexico, the Republic of Korea, Turkey, and the United States. Süd-Chemie's main business was in Gammelsdorf, Bavaria, where it produced acid-activated bentonite, calcium, and sodium products (Süd-Chemie AG, 2002§).

Cement.—The privatization process launched by Treuhandstalt 11 years ago in East Germany has resulted in

a more-fragmented industry and a more-diversified range of companies than in other European countries. In 2002, seven cement producers and three or four importers competed in a market that collapsed by one-third within 5 years. The main reason for the depressed state of the cement market was a 7-year-long recession in the German construction sector (Bulk Materials International, 2002).

Clays.—Between 140 and 160 small- to medium-sized clay mines were in operation in 2000 in Germany. About one-half of the high-quality refractory and ceramic clays produced were from the Rhineland-Palatinate area. Production in Bavaria was concentrated in the Oberfalz area.

Germany was one of the leading producers of kaolin in Western Europe. Most of the German kaolin was mined in Bavaria, and Amberger Kaolinwerke GmbH was the leading producer with mines in Hirschau (Quarzwerke, 2002§).

Graphite.—Graphitwerk Kropfmühl AG was the only company that mined and processed natural graphite in Germany. The company operated a mine and plant at Kropfmühl, Passau, and a plant at Werk Wedel, Holstein. The amount of production has been decreasing in recent years owing to declining reserves. About one-half of the company's production went into the European refractory industry.

Gypsum.—Germany was a major European producer of crude gypsum. Most of the production was from the Lower Saxony area.

Potash.—After closings and restructuring, K+S Kali GmbH operated six mines in four potash districts and had a potassium chloride production capacity of 4 Mt/yr; its product grades were 2 Mt/yr of standard grade and 2 Mt/yr of granular grade. Germany was the third leading potash producer in the world after Canada and Russia and met about 13% of worldwide potash needs (K+S Kali GmbH, 2003§).

Mineral Fuels

Germany has relatively insignificant domestic energy sources and must rely on imports to meet its energy needs. In 2002, the most important energy source in Germany's consumption of primary energy was petroleum with a 41% share of total consumption followed by natural gas (23%) and coal (23%). About 11% of electrical generation was supplied by 19 nuclear plants. About 30% of Germany's energy requirements was satisfied from domestic sources; the remaining 70% was imported. By 2020, the share of imports was expected to rise to 80%; oil was still expected to remain the primary energy source. The Government signed an agreement with the utility companies to phase out nuclear power generation by 2021 (U.S. Energy Information Administration, 2003a§).

As domestic production declines, Germany will emerge as a significant coal importer. Gross imports of hard coal, coke, and briquettes have more than doubled since unification in 1995. Germany's largest suppliers included Australia, Canada, Columbia, Poland, and South Africa. German hard coal

imports were expected to increase during the next 20 years as nuclear power is phased out and domestic production declines (Alexander's Gas & Oil Connections, 2003a§).

Coal, Anthracite and Bituminous.—Coal production was located primarily in the Ruhr and Saar regions. The gradual phase-out of subsidies that have supported Western Europe's coal industry for so long continued. Beginning in 2003, subsidies will be reduced to below their 2001 levels. This was in line with EU policy to eliminate subsidies to industries. Because coal was Germany's only major domestic fuel source, the Government was considering maintaining anthracite and bituminous coal production capacity critical to the country's energy security. The coal industry was also a major employer (Mining Magazine, 2002a).

Lignite.—Lignite coal production was mainly in the Rheinisch area to the west of Cologne and the Lusatian area near Dresden. Lignite mining was under less economic pressure than hard coal mining.

Germany was the world's largest lignite producer. Lignite-fired powerplants became the second largest supplier of electricity after nuclear energy, which accounted for 33% of the total. Lignite raised their share to 27% (Mining Magazine, 2002b).

Renewable Energy.—The wind power sector has continued its strong expansion. Capacity grew by more than one-third in 2002 after more than 2,000 new turbines were installed in a country that is already a world leader in the field. Capacity rose by 37% to 12 gigawatts (GW), and the number of turbines installed rose by 20% to 13,800. As a result, wind power accounted for 4.7% of total energy consumption in 2002 compared with 3% in 2001, and topped the contribution from hydroelectric generation for the first time (Alexander's Gas & Oil Connections, 2003b§).

The Government approved a project to build the second wind-propelled electricity power station in the German North Sea. The project will be located 35 kilometers (km) west of Sylt outside the 12-sea-mile zone and will have a generating capacity of 300 megawatts (MW). The Government was expecting to build wind plants that would account for 500 MW of capacity by 2006 (Alexander's Gas & Oil Connections, 2003c§).

Uranium.—The ongoing cleanup of the former Soviet uranium mining operations in the former GDR was viewed as Europe's biggest mine rehabilitation project. When the Wismut Mines were in production, the only goal was to maximize uranium output. This resulted in an environmental problem of monumental proportions. At various sites, 48 waste rock piles contained about 311 million cubic meters of waste material and covered a surface area of about 15 square kilometers (km²). In addition, 14 tailings ponds contained 160 million cubic meters of residues from uranium-ore-processing plants and covered a surface area of 7 km². The German Government was expected to spend more than \$9 billion on this rehabilitation project during the next 10 to 15 years (Engineering and Mining Journal, 1999). Continuing remediation work in 2002 focused

on decommissioning facilities and immobilizing contaminated material in a manner that would limit long-term hazards to humans and the environment.

Infrastructure

Germany had about 640,000 km of highways and roads that ranged from the high-speed autobahn system to undeveloped gravel-and-packed-dirt country roads. Of this total, paved highway totaled more than 500,000 km, and unpaved roads, an estimated 135,000 km. The railroad system included 45,468 km of track, about 90% of which was Government owned. Of this total, 44,769 km was 1.435-meter(m) standard-gauge track, and 699 km was 1.000-m gauge track. Germany had 600 airports. Pipelines included a 97,564-km line for natural gas, a 3,964-km line for refined products, and a 3,644-km line for crude petroleum. Inland waterways and canals totaled 7,541 km and had 31 major ports; the Kiel Canal served as an important connection between the Baltic and the North Seas, and the Rhine-Main-Danube Canal served as a connection between the North and the Black Seas. The major maritime ports were, in descending order of tonnage, Hamburg, Rostock, Bremerhaven, Bremen, and Wilhelmshaven and accounted for about 70% of total merchandise traffic (U.S. Central Intelligence Agency, 2002§).

Outlook

Germany's economy, with a growth rate of close to zero and an unemployment rate hovering around 10.5%, grew more slowly during 2002 compared with 2001 and may be on the verge of stagnation. This could be offset if the economic growth in Germany's international trading partners increases. Industrial production is expected to remain around current levels. Exported growth has diminished as the global economy has lost momentum (U.S. Commercial Service Germany, 2002§).

To be more efficient, industries, which include mineral-resource industries, may have to be restructured, which may result in increased unemployment that, in turn, would cut into the available resources of the Federal Government in the form of payments for unemployment compensation, retraining, and other social costs. This situation is expected to continue in the short term.

GERMANY: PRODUCTION OF MINERAL COMMODITIES^{1,2}

(Metric tons unless otherwise specified)

Commodity		1998	1999	2000	2001	2002 ^c
MINERAL FUELS AND RELATED MATERIALS--Continued						
Coke:						
Of anthracite and bituminous coal	thousand tons	10,277	8,568	9,115	7,289	7,226 ³
Of lignite ^c	do.	175	175	175	173 ^r	154 ³
Fuel briquets:						
Of anthracite and bituminous coal	do.	185	174	146 ^r	140 ^{r,e}	124 ³
Of lignite, including dust and dried	do.	2,345	2,072	1,819 ^r	1,740 ^r	1,365 ³
Gas: ^c						
Manufactured:						
Blast furnace	million cubic meters	4,500	4,000	4,000	4,000	3,000
Coke oven	do.	2,500	2,000	2,000	2,000	1,000
Total	do.	7,000	6,000	6,000	6,000	4,000
Natural:						
Gross	do.	22,000	23,000	22,000	22,000	22,000
Marketed	do.	19,900 ³	21,200 ³	21,720 ^{r,3}	21,698 ^{r,3}	21,529 ³
Peat:						
Agricultural use	thousand cubic meters	9,561	9,473	9,648	9,722 ^r	9,788 ³
Fuel use ^c	do.	175,000 ³	175,000	160,000	-- ^r	-- ³
Petroleum:						
Crude	thousand 42-gallon barrels	21,146	19,728	22,658	23,603	27,758 ³
Refinery products:						
Liquefied petroleum gas	do.	29,255	31,888	32,688	35,032 ^r	34,289 ³
Gasoline, including aviation	do.	223,465	228,038	229,101	293,378 ^r	308,252 ³
Naphtha	do.	81,379	82,648	82,085	82,548 ^r	83,229 ³
Mineral jelly and wax	do.	1,527	1,472	1,575 ^r	1,554 ^r	1,645 ³
Kerosene and jet fuel	do.	211,676	233,046 ^r	234,461 ^r	227,153 ^r	246,822 ³
Distillate fuel oil	do.	265,555	343,167	345,637	349,853 ^r	351,114 ³
Refinery gas	do.	3,227	2,706	3,269	3,276 ^r	3,505 ³
Lubricants	do.	10,787	11,298	10,556	10,675 ^r	10,737 ³
Nonlubricating oils	do.	7,867	8,197	8,100	7,197 ^r	7,348 ³
Residual fuel oil	do.	14,626	17,399 ^r	15,756 ^r	16,257 ^r	12,847 ³
Bitumen and other residues	do.	16,968	22,228	22,592	19,450 ^r	21,252 ³
Bituminous mixtures	do.	1,211	1,199	1,210 ^r	1,100	1,209 ³
Petroleum coke	do.	7,539	10,428	5,819	9,328 ^r	9,031 ³
Unspecified	do.	18,242	16,254	11,977	9,919 ^r	10,920 ³
Total	do.	893,324	1,009,968 ^r	1,004,826 ^r	1,066,720 ^r	1,102,200 ³

^cEstimated; estimated data are rounded to no more than three significant digits; may not add to total shown. ^rRevised. -- Zero.

¹Table includes data available through November 2003.

²Data are from a combined Germany.

³Reported figure.

⁴Includes speigeleisen, unspecified crude iron, and blast furnace ferromanganese with 2% or more carbon.

TABLE 3
GERMANY: STRUCTURE OF THE MINERAL INDUSTRY IN 2002

(Thousand metric tons unless otherwise specified)

Commodity		Major operating companies and major equity owners	Location of main facilities	Annual capacity
Alumina		VAW Aluminium AG (E.ON AG)	Plant at Schwandorf (special aluminas)	430
Do.		Aluminium Oxid Stade GmbH (VAW Aluminium AG, 50%, and Dadco Alumina and Chemicals Ltd., 50%)	Plant at Stade	750
Do.		Martinswerke GmbH (Alusuisse, 100%)	Plant at Bergheim (fused alumina)	350
Aluminum		VAW Aluminium AG (E.ON AG)	Smelters at Innwerke at Töging, Elbwerke at Stade, Rheinwerke at Neuss, Lippenwerke at Lünen (secondary)	300
Do.		Aluminium Essen GmbH	Smelter at Essen-Borbeck	95
Do.		Hamburger Aluminium-Werke GmbH (VAW Aluminium AG, 33%)	Smelter at Hamburg	120
Arsenic, metal	tons	Metaleurop Handel GmbH	Plant at Langelsheim	5
Cement		38 companies, the major ones are:	64 mills (grinding) including:	59,000
Do.		Heidelberger Zement AG	Plants at Blaubeuren-Schelkingen, Leimen, Hassmersheim, Burglengenfeld, Kiefersselden, and others	(9,200)
Do.		Dyckerhoff AG	Plants at Amoneburg, Golheim, Neuwied, Neubeckum, and others	(7,250)
Do.		E. Schwenk, Zementwerke KG	Plants at Allmendingen, Karlstadt, and Mergelstetten	(6,000)
Do.		Anneliese Zementwerke AG	Plants at Ennigerloh-Nord, Ennigerloh-Süd, Geske, and Paderborn	(3,500)
Do.		Zementwerke Deunan GmbH	Plant at Deuna	(3,000)
Chalk		Kreidewerke Rugen GmbH	Quarries on Rugen Island	500
Coal, anthracite and bituminous		Three companies:	About 27 mines, including:	72,500
Do.		Ruhrkohle AG	14 mines in Ruhr region	(40,000)
Do.		Saarbergwerke AG	5 mines in Saar basin	(14,000)
Do.		Preussag Anthrazit GmbH	Mine at Ibbenbüren	(2,500)
Copper		Norddeutsche Affinerie AG (Dresdner Bank AG, 20%, and Degussa AG, 10%)	Smelter and refinery, both at Hamburg	500
Do.		Hüttenwerke Kayser AG	Refinery at Lünen	120
Graphite	tons	Graphitwerk Kropfmühl AG	Mine and plant at Kropfmühl, Passau	20,000
Do.	do.	do.	Plant at Wedel, Holstein	8,000
Gypsum		Gipswerke Dr. Karl Würth GmbH	Mine and plant at Stadtoldendorf, Lower Saxony	150
Do.		Gyproc GmbH Banstoff Production & Co. KG	Mines and plant in Lower Saxony	110
Kaolin		Kemmlitzer Kaolinwerke GmbH	Mines at Gröppendorf, Oschatz, and Sachsen	100
Do.		Do.	Plant at Sachsen	100
Limestone		Harz Kalk GmbH	Quarries at Bad Kösen, Rubelaand, and Kaltes Tal	6,000
Lead		Metaleurop Weser Blei GmbH	Smelter and refinery at Nordenham	120
Do.		MIM Huttenwerke Duisberg GmbH (MIM Holdings Ltd., 100%)	QSL smelter at Stolberg	75
Do.		do.	Refinery at Duisberg	120
Do.		Norddeutsche Affinerie AG	Refinery at Hamburg	50
Lignite		Rheinische Braunkohlenwerke AG (RWE Rheinbraun)	Surface mines in Rhenish mining area: Garzweiler, Bergheim, Inden, and Hambach	105,000
Do.		Lausitzer Braunkohle AG (LAUBAG)	Surface mines in Lausatian mining area: Jänschwalde/Cottbus-Nord, Welzow-Süd, and Nochten/Reichswalde	50,000
Natural gas	million cubic meters	Brigitta Erdgas und Erdöl GmbH and Elwerath Erdgas-Erdöl GmbH	Plants at Clenze and Grossenkmeten	9,500
Do.	do.	Mobil Erdgas-Erdöl GmbH	Plants at Scholen	4,000
Do.	do.	Other companies	Plants at Duste, Rutenbrock, and others	2,000

TABLE 3--Continued
GERMANY: STRUCTURE OF THE MINERAL INDUSTRY IN 2002

(Thousand metric tons unless otherwise specified)

Commodity	Major operating companies and major equity owners	Location of main facilities	Annual capacity
Petroleum:			
Crude	thousand 42-gallon barrels	The largest companies were:	6 areas with about 85 oilfields, including:
Do.	do.	Elwerath Erdgas-Erdöl GmbH	West of Ems River
Do.	do.	Wintershall AG	Weser-Ems Rivers
Do.	do.	Deutsche Texaco AG	Elbe-Weser Rivers
Refined	do.	About 25 companies, of which the largest were:	20 refineries, including:
Do.	do.	Deutsche Shell AG	Refineries at Godorf, Hamburg, and Grasbrook
Do.	do.	Esso AG	Refineries at Karlsruhe and Ingolstadt
Do.	do.	Ruhr Oel AG	Refinery at Gelsenkirchen
Do.	do.	Erdoel Raffinerie Neustadt GmbH	Refinery at Neustadt-Donau
Potash, K ₂ O content		K+S Kali GmbH	Mines at Bergmannsseggen-Hugo, Niedersachsen-Riedel, Salzdettfurth, Sigmundshall, Hattorf, Neuhof-Ellers, and Wintershall
Do.		MDK (Mitteldeutsche Kali und Sondershausen)	10 mines mostly in the State of Thüringen
Salt (rock)		K+S Kali GmbH	Mines at Bad Friedrichshall-Kochendorf, Braunschweig-Lüneburg, Heilbronn, Riedel, Stetten, and Wesel (Borth)
Steel		Major companies including:	About 25 plants, including:
Do.		Thyssen Krupp Stahl AG	Plants mostly in the Westphalia Region
Do.		Salzgitter AG	Plants at Peine and Salzgitter
Do.		Klöckner-Werke AG	Plants at Bremen and Osnabruck
Zinc		Ruhr-Zink GmbH (Metallgesellschaft AG, 100%)	Refinery at Datteln
Do.		MIM Huttenwerke Duisberg GmbH (MIM Holdings Ltd., 100%)	Imperial smelter and fire refinery at Duisburg
Do.		Xstrata plc	Refinery at Nordenham
