Vehicle and Fuel Cycles: Petroleum-Based Fuels

The GREET (Greenhouse gases, Regulated Emissions, and Energy use in Transportation) Model

- ❑ Includes emissions of greenhouse gases
 - CO₂, CH₄, and N₂O
 - VOC, CO, and NO_x as optional GHGs
- ❑ Estimates emissions of five criteria pollutants
 - Total and urban separately
 - VOC, CO, NO_x, SO_x, and PM₁₀
- ❑ Separates energy use into
 - All energy sources
 - Fossil fuels (petroleum, natural gas, and coal)
 - Petroleum
- ❑ The GREET model and its documents are available at Argonne's GREET website at ***<http://greet.anl.gov>***

Calculation Logic for a Given WTP Production Activity in GREET

Calculations

Calculation Logic for a Given WTP Transportation Activity in GREET

WTP Criteria Pollutant Issues Are Addressed Through an On-Going Project with GM

- ❑ Data for relevant facilities were extracted from EPA's 1999 National Emissions Inventory database
- ❑ Total emissions for a given facility were divided by its throughput to develop emissions factors
- ❑ Distribution curves were developed to fit to the developed emission factors
- ❑ The curves were further adjusted to account for improved future technologies and emission controls

This Study Includes Many Fuel Pathways

CENTER FOR
TRANSPORTATION RESEARCH

CRUDE OIL

- Gasoline
- Diesel fuel
- LPG

NATURAL GAS

- North American
- Non North American

- Compressed natural gas
- Hydrogen (gaseous and liquid)
 - ✓ Central plant
 - ✓ Refueling station
- Fischer-Tropsch diesel
- Methanol
- LPG

BIOETHANOL

- Corn
- Cellulose

- Ethanol
Pure ethanol and E85

ELECTRICITY

- U.S. Mix
- Renewable

- Hydrogen
Gaseous and liquid

Petroleum Refining Is the Key Energy Conversion Step for Gasoline and Diesel

Petroleum Recovery (97%)

Petroleum Transportation
and Storage (99%)

Petroleum Refining to Gasoline (84.5-86%, Depending on
Oxygenates and Reformulation) and Low-S Diesel (87%)

Transportation, Storage, and
Distribution of Gasoline (99.5%)

Gasoline and Diesel at Refueling Stations

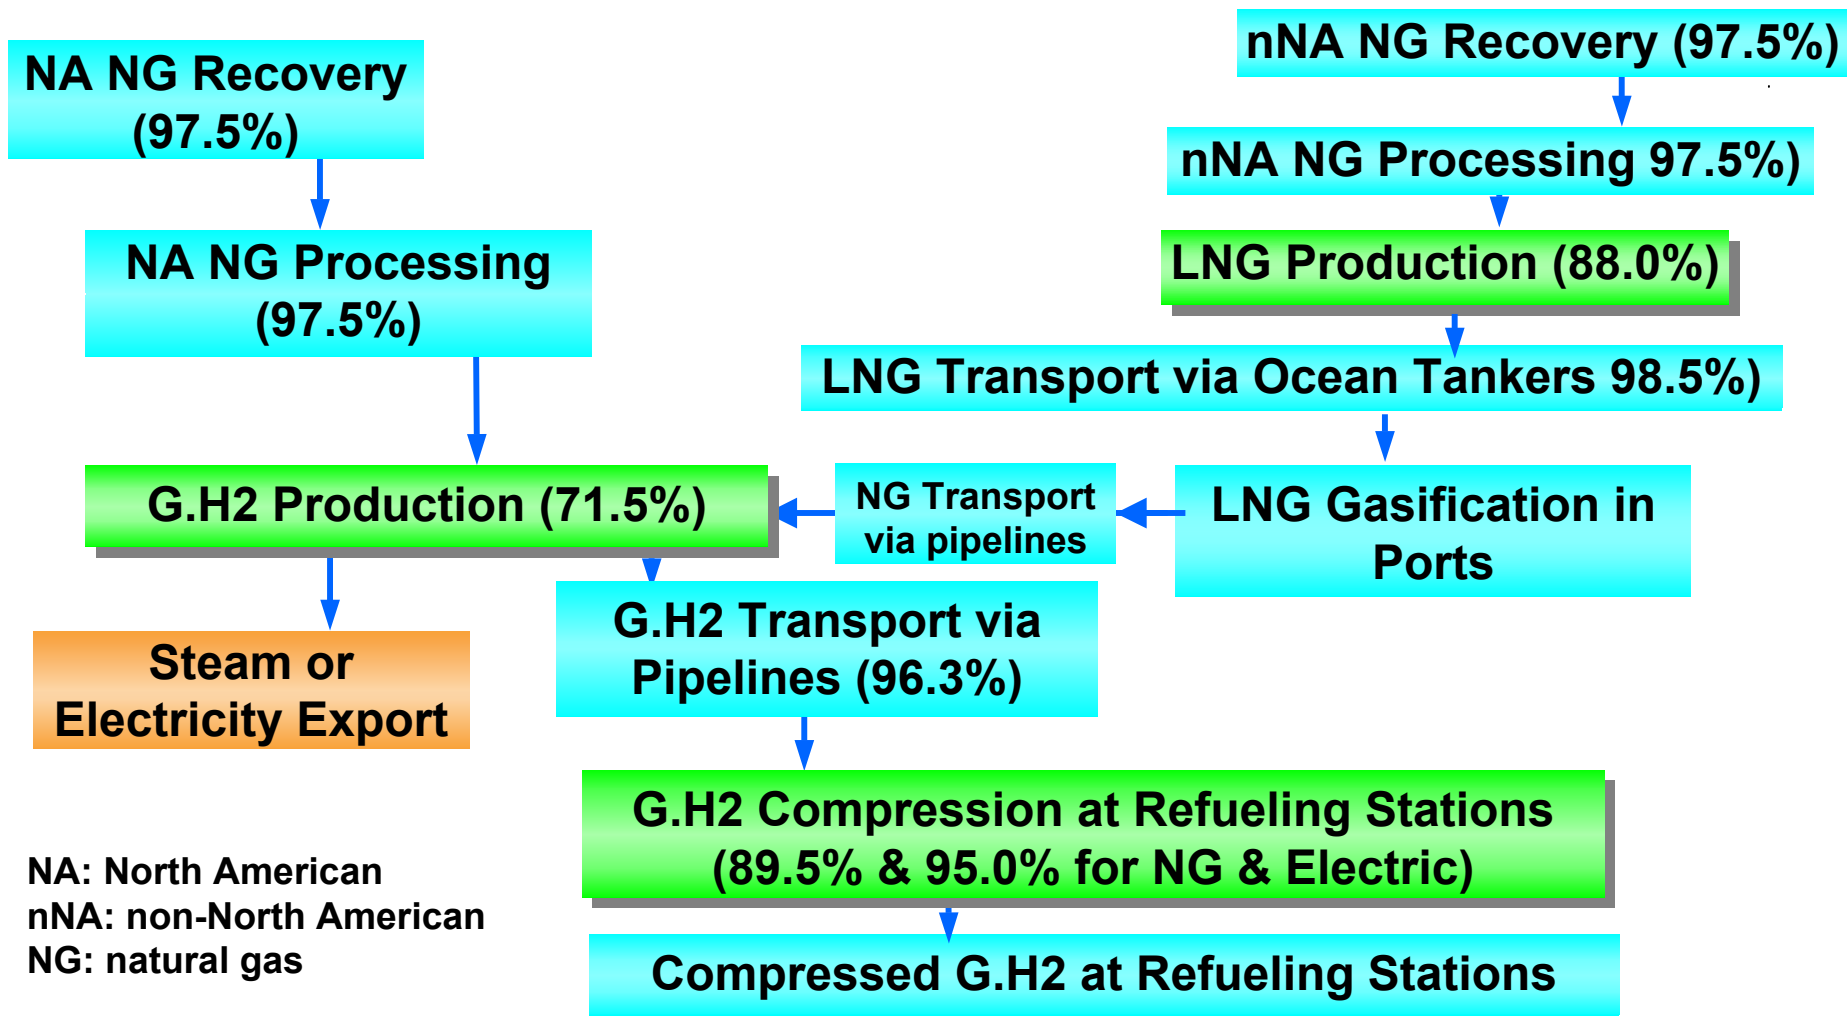

NG to MeOH

Corn

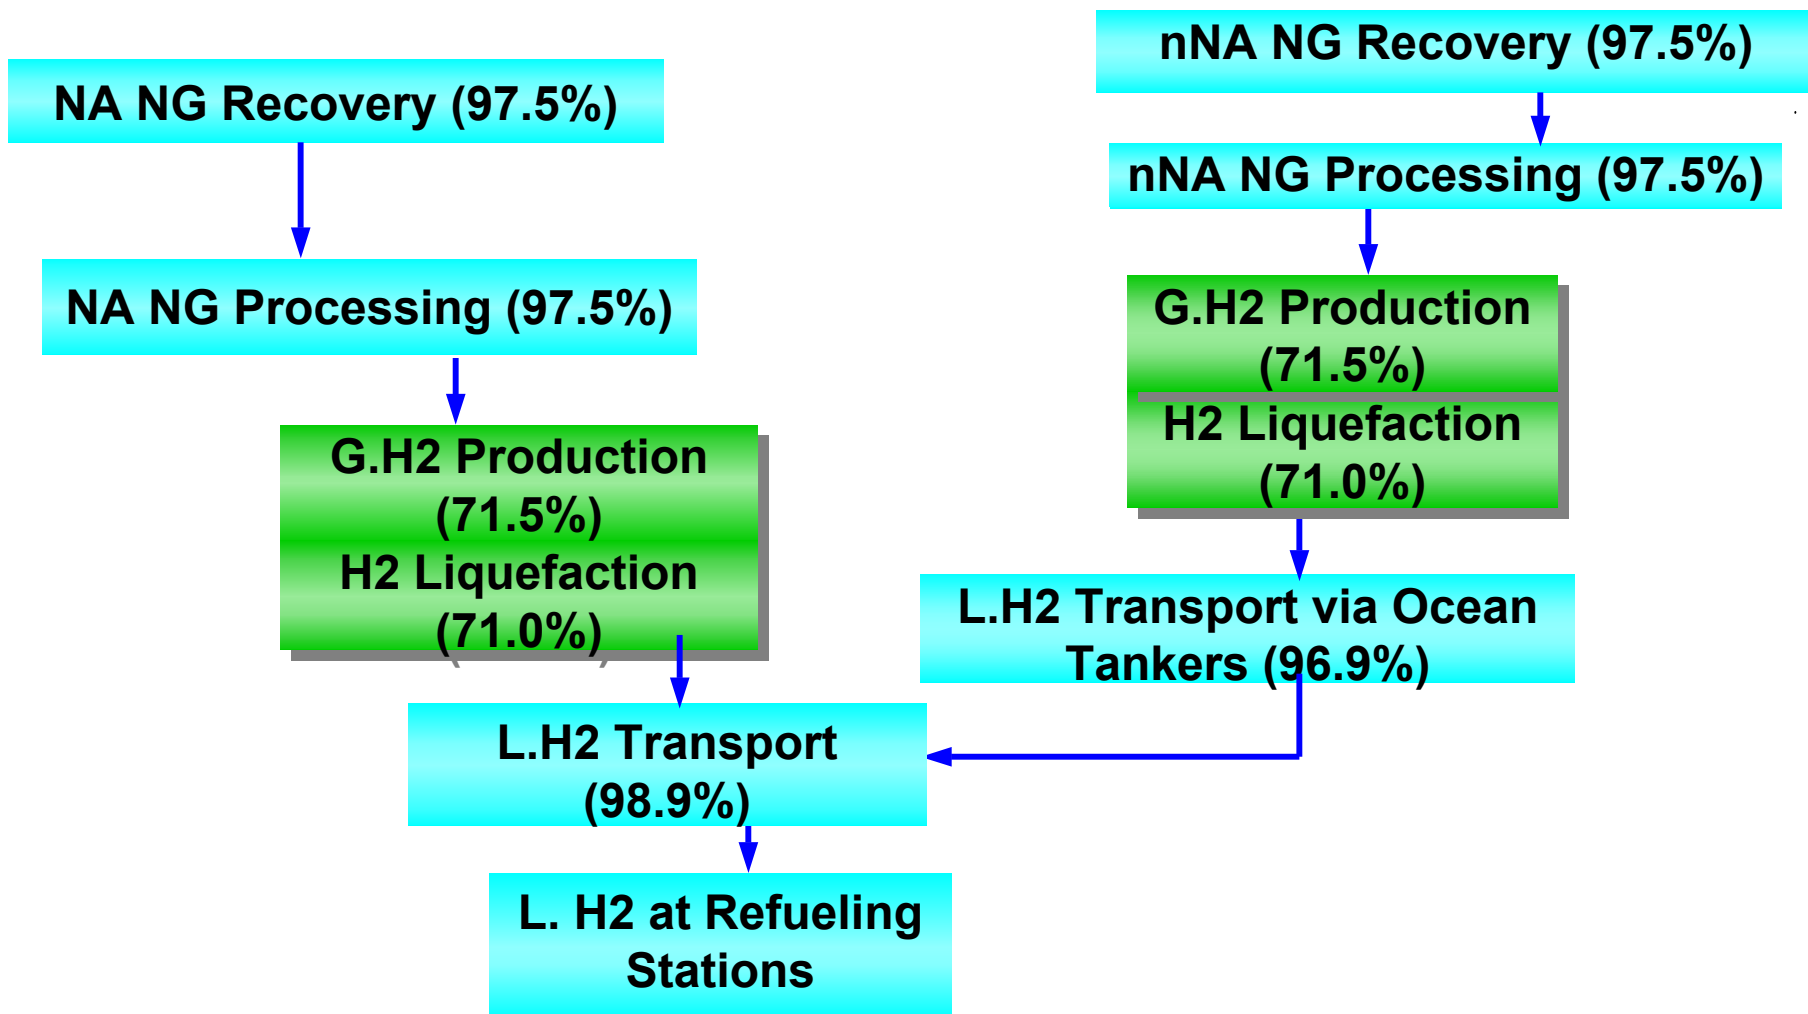

MTBE or EtOH for Gasoline

Production and Compression Are Key Steps for G.H₂ Production

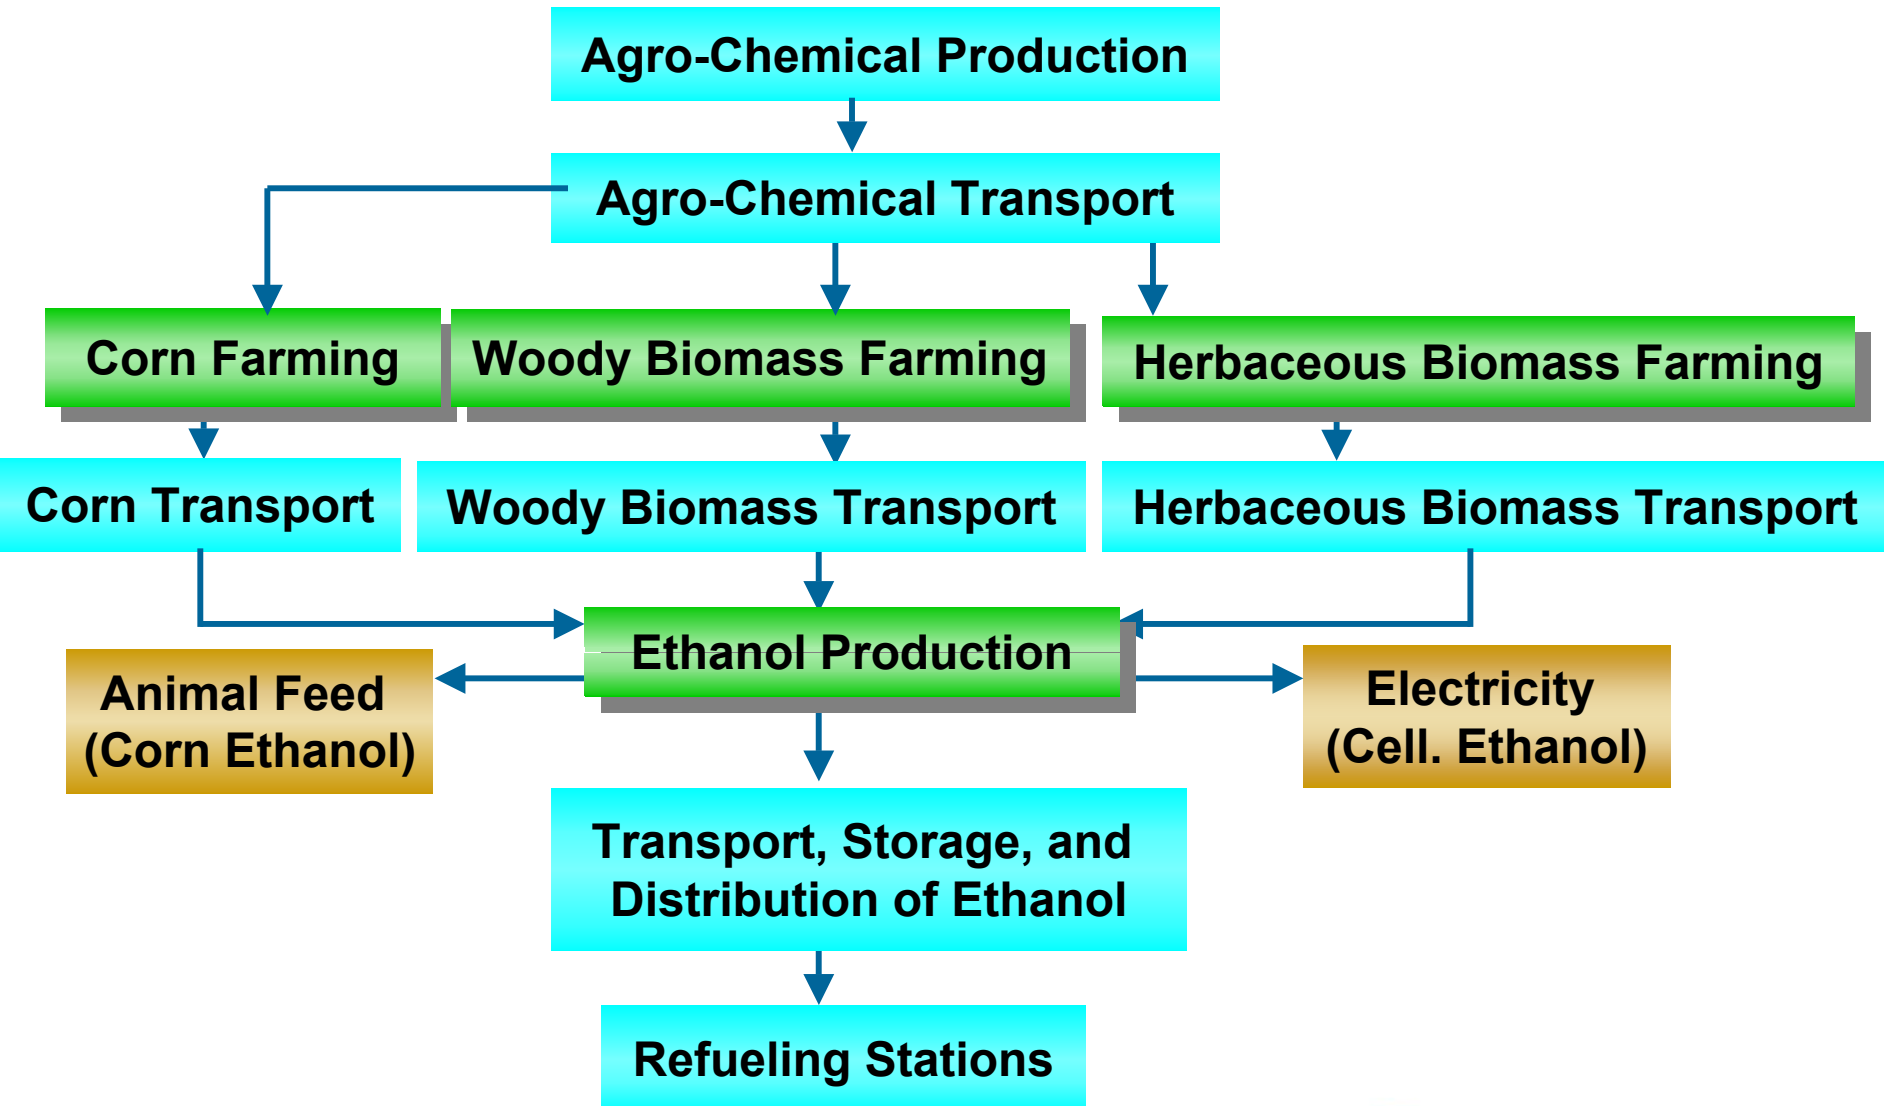

H₂ Liquefaction Has Higher Energy Losses Than H₂ Compression

Resource and Infrastructure Options Result in Many Potential H₂ Pathways

- H₂ is produced from natural gas via steam methane reforming (SMR) now, and in the foreseeable future
- SMR plant emissions need to be taken into account
- Regional or station SMR production
 - Could reduce or avoid expensive distribution infrastructure
 - But production emissions are close to urban areas
- Central SMR CO₂ emissions can be potentially sequestered
- Electrolysis' H₂ energy and emissions depend on electricity sources
- Gasification for H₂ production
 - Coal: CO₂ and criteria pollutant emissions; possible CO₂ sequestration
 - Biomass: criteria pollutant emissions
- Nuclear electrolysis or thermal cracking H₂ - virtually no air emissions

Ethanol WTP Pathways Include Activities from Fertilizer to Ethanol at Stations

WTP Energy Use Significantly Affects Ranking of Total WTW Energy and GHGs

GREET Includes More Than 50 Vehicle/Fuel Systems

Conventional Spark-Ignition Vehicles

- Conventional gasoline, federal reformulated gasoline, California reformulated gasoline
- Compressed natural gas, liquefied natural gas, and liquefied petroleum gas
- Methanol and ethanol

Compression-Ignition Direct-Injection Hybrid Electric Vehicles: Grid-Independent and Connected

- Conventional diesel, low sulfur diesel, dimethyl ether, Fischer-Tropsch diesel, and biodiesel

Spark-Ignition Hybrid Electric Vehicles: Grid-Independent and Connected

- Conventional gasoline, federal reformulated gasoline, California reformulated gasoline, methanol, and ethanol
- Compressed natural gas, liquefied natural gas, and liquefied petroleum gas

Battery-Powered Electric Vehicles

- U.S. generation mix
- California generation mix
- Northeast U.S. generation mix

Compression-Ignition Direct-Injection Vehicles

- Conventional diesel, low sulfur diesel, dimethyl ether, Fischer-Tropsch diesel, and biodiesel

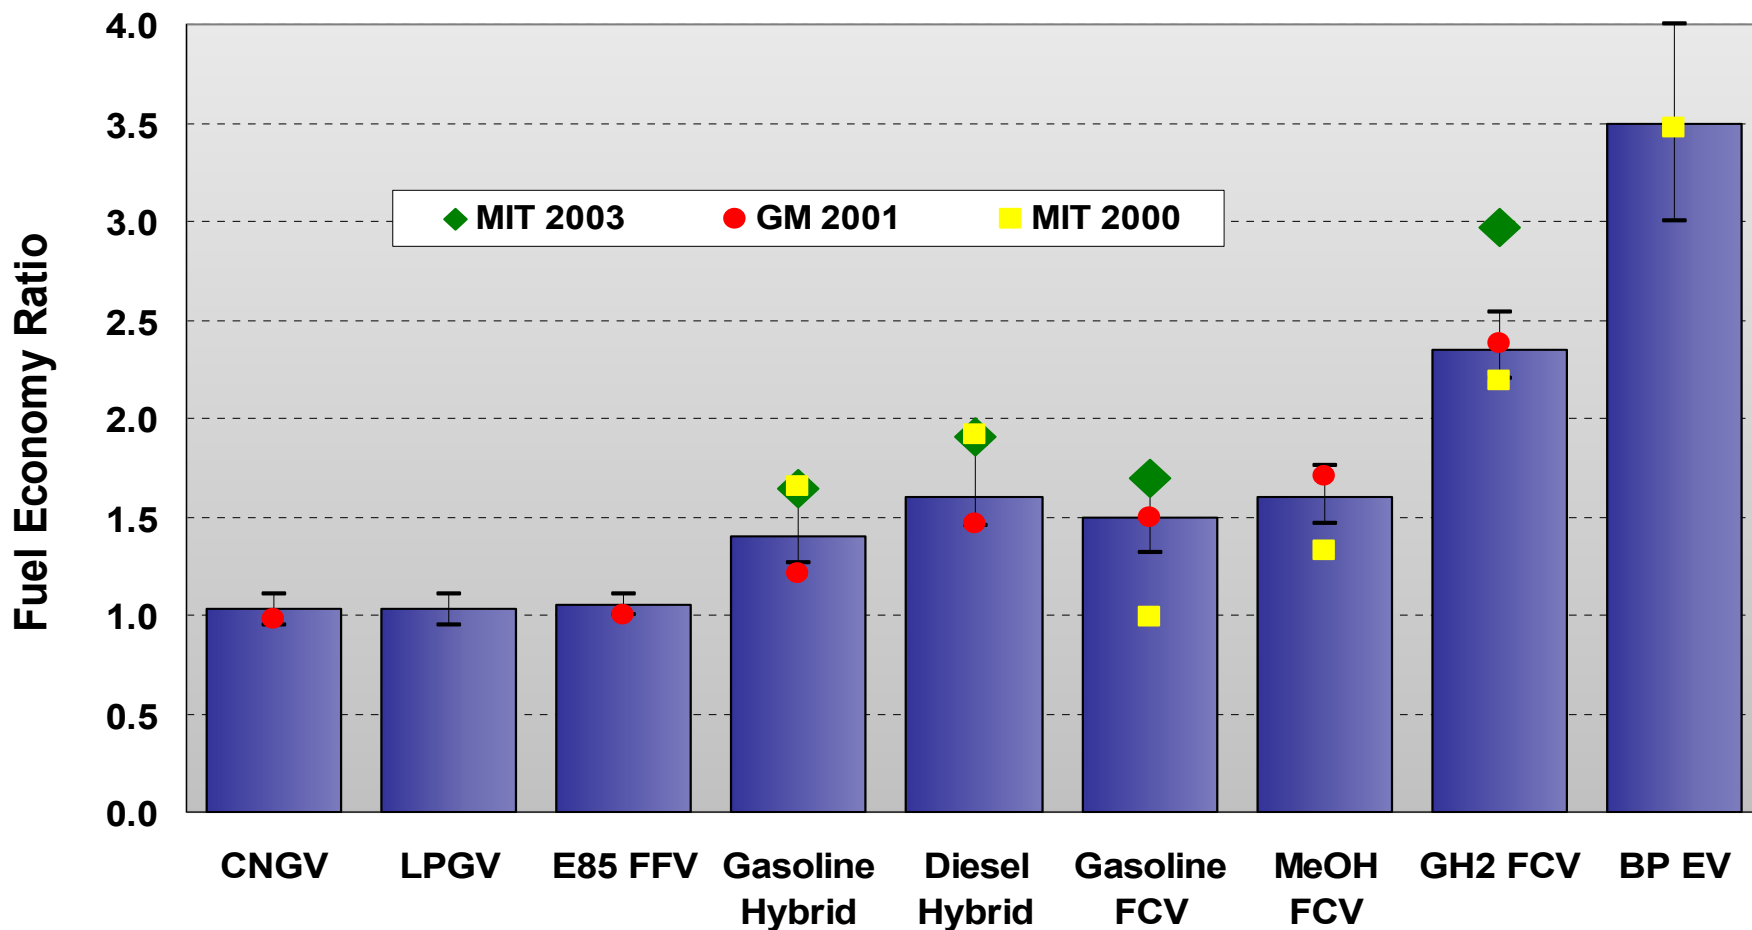

Fuel Cell Vehicles

- Gaseous hydrogen, liquid hydrogen, methanol, federal reformulated gasoline, California reformulated gasoline, low sulfur diesel, ethanol, compressed natural gas, liquefied natural gas, liquefied petroleum gas, and naphtha

Spark-Ignition Direct-Injection Vehicles

- Conventional gasoline, federal reformulated gasoline, and California reformulated gasoline
- Methanol and ethanol

Vehicle Fuel Economy Is One of the Most Important Factors for WTW Results

Fuel economy ratios are relative to improved future gasoline ICE technology

Vehicle/Fuel Technologies for WTW Energy and GHG Emission Results

❑ Crude oil-based technologies

RFG ICE

LS Diesel ICE

Gasoline FCV

LPG ICE

RFG ICE hybrid

LS diesel ICE hybrid

❑ Natural gas-based technologies

FT diesel ICE

FT diesel ICE hybrid

G.H2 FCV

CNG ICE

MeOH FCV

❑ Bioethanol and Electricity

Corn E85 ICE FFV

U.S. average electri.-to-G.H2 FCV

U.S. average electricity battery-powered EV

Cellulosic EtOH FCV

Renewable electricity-to-G.H2 FCV

WTW Total Energy Use of Selected Vehicle/Fuel Systems

WTW Fossil Energy Use of Selected Vehicle/Fuel Systems

WTW GHG Emissions of Selected Vehicle/Fuel Systems

ANL/GM Study Takes the Following Key Assumptions for PTW Emissions

2010 MY Vehicle Emissions Targets

Propulsion System	Assumed Emission Performance
Gasoline ICE	Tier 2 Bin 5
Diesel and CNG ICE	Tier 2 Bin 5, but no evap VOC
Hydrogen ICE	Tier 2 Bin 2, no evap, Bin 5 NOx
Fuel processor fuel cell	Tier 2 Bin 2
Hydrogen fuel cell	Tier 2 Bin 1 (zero emissions)

- Fuel consumption penalties of aftertreatment systems to meet standards were considered in the study
- Bin 5 diesel has not been demonstrated
- MY 2010 vehicle in-use emissions in 2016 were modeled using
 - EPA MOBILE 6.2
 - ARB EMFAC2002 version 3

Vehicle/Fuel Technologies for WTW Criteria Pollutant Emission Results

❑ Crude oil-based technologies

RFG displacement on demand (DOD) SI conventional drive (CD)

RFG DI SI CD

LS Diesel DI CI CD

RFG DOD SI hybrid

LS diesel DI CI hybrid

Gasoline fuel-processor (FP) FCV

❑ Natural gas-based technologies

CNG DOD SI CD

FT diesel DI CI CD

G.H2 SI CD

MeOH FP FCV

G.H2 FCV

L.H2 FCV

❑ Bioethanol and Electricity

Corn E85 DOD SI CD

Cellulosic E85 DOD SI CD

Cellulosic EtOH FP FCV

U.S. average electri.-to-G.H2 FCV

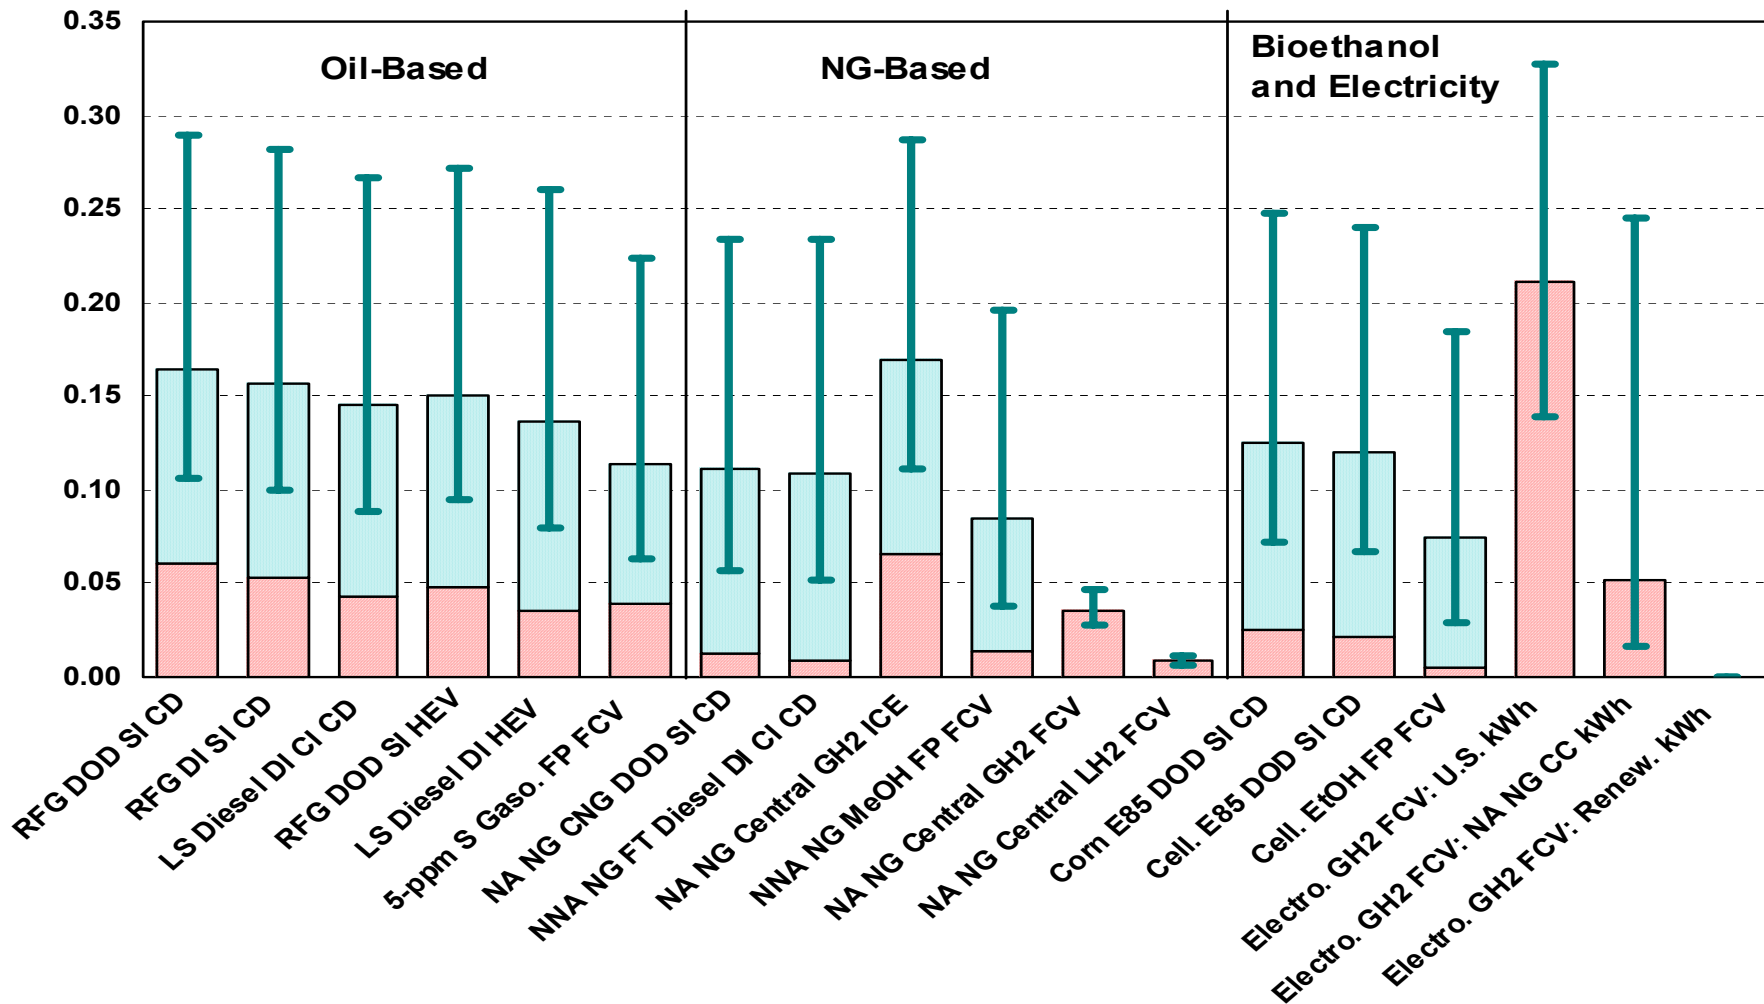

NG CC electri.-to-G.H2 FCV

Renewable electricity-to-G.H2 FCV

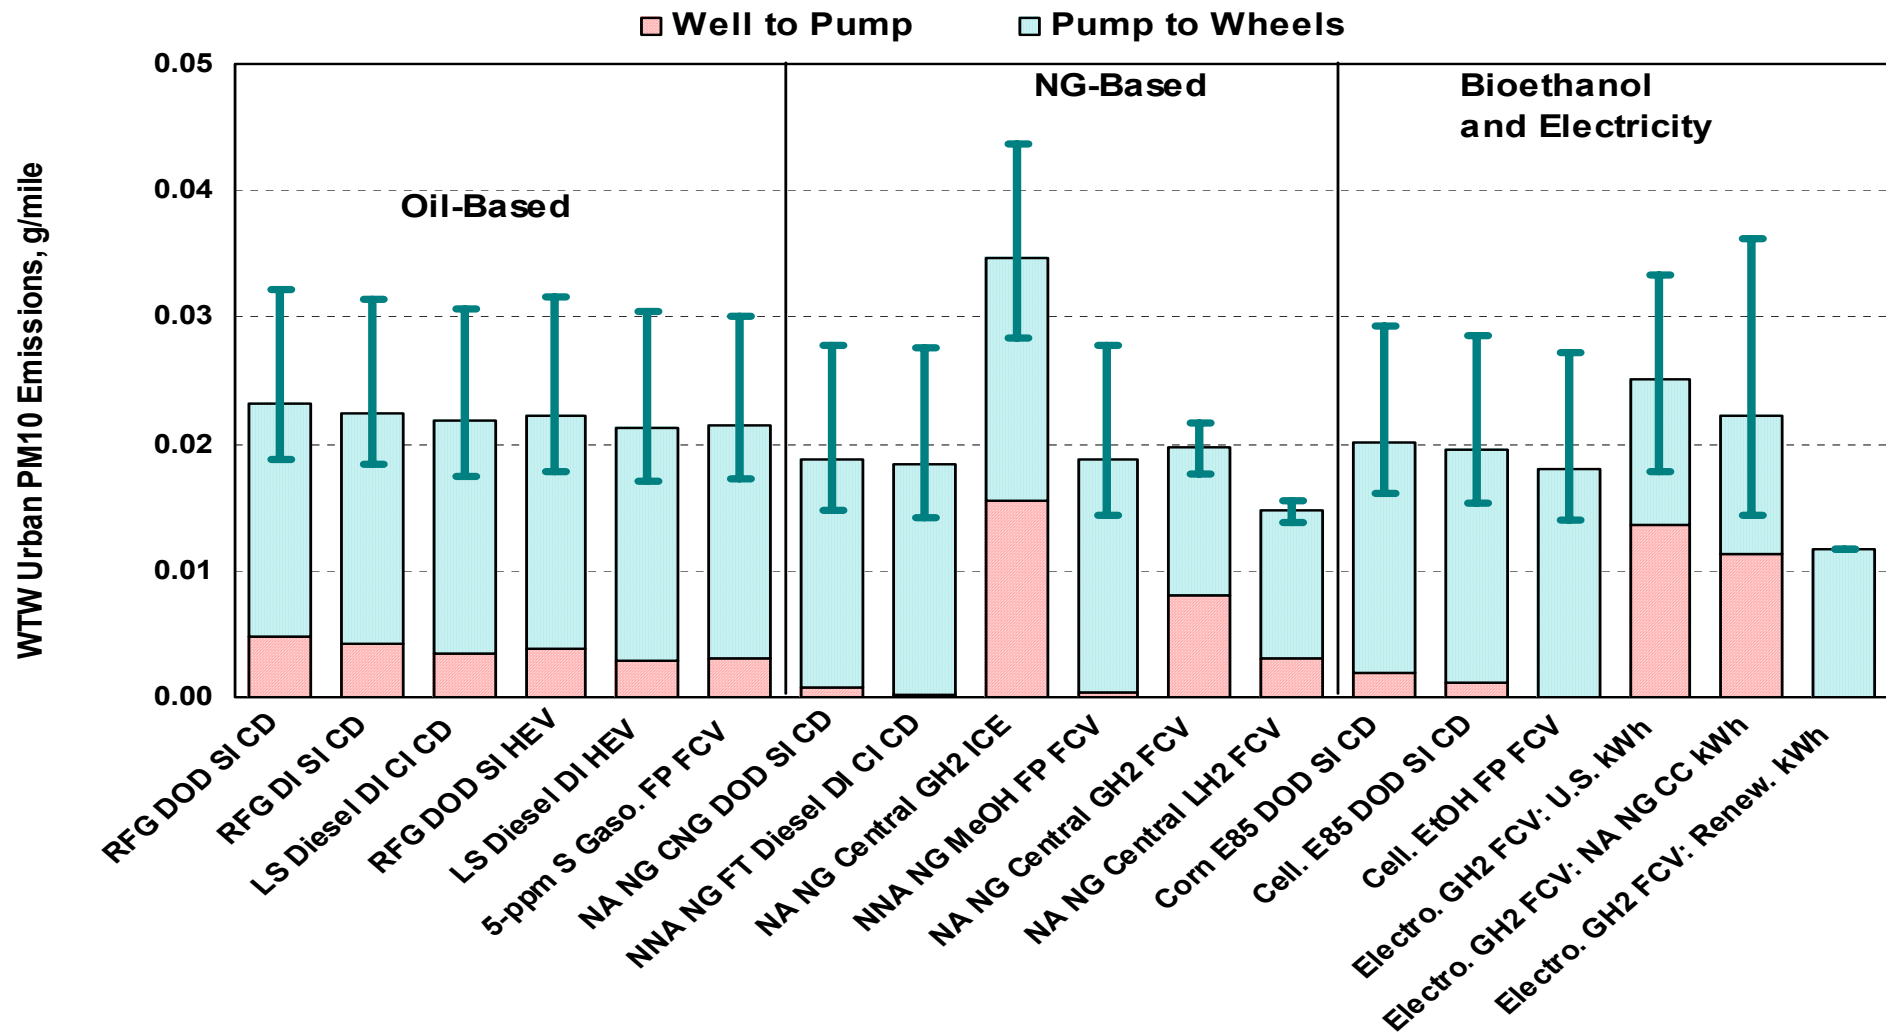

WTW Urban NOx Emissions of Selected Vehicle/Fuel Systems

Well to Pump Pump to Wheels

WTW Urban NOx Emissions, g/mile

WTW Urban PM₁₀ Emissions of Selected Vehicle/Fuel Systems

Conclusions

- ❑ WTW analysis becomes necessary when comparing vehicle technologies powered by different fuels
- ❑ Advanced vehicle/fuel technologies could significantly reduce energy use and GHG emissions
- ❑ For criteria pollutants, as tailpipe emissions continue to decline, WTP emissions could become a significant share of total WTW emissions
- ❑ Fuel pathways need to be carefully examined for achieving intended energy and emission benefits by advanced vehicle/fuel systems
