

Appendix B

Per-Mile Fuel-Cycle Energy Use and Emissions

This appendix presents per-mile fuel-cycle energy use (in Btu/mi) and emissions (in g/mi) for all the fuel and vehicle technology options evaluated. The results are presented for vehicle types in the following order: near-term passenger cars, near-term LDT1, near-term LDT2, long-term passenger cars, long-term LDT1, and long-term LDT2.

Per-mile results for each technology are presented separately for each of the three stages of a fuel cycle: feedstock, fuel, and vehicle operations. The feedstock stage includes activities from feedstock recovery to feedstock delivered at fuel production plants. The fuel stage includes activities from feedstock at fuel production plants to fuel at refueling stations. The vehicle operations stage includes activities from fuel at refueling stations to completion of on-board fuel combustion.

Acronyms, initialisms, and abbreviations are defined on pages xv–xviii of Volume 1.
