¹ Incidence rates represent the number of injuries per 100 full-time workers and were calculated as: (N/EH) X 200,000 where,

N = number of injuries,
 EH = total hours worked by all employees during the calendar year,
 200,000 = base for 100 equivalent full-time workers (working 40 hours per week, 50 weeks per year).

² High rate industries were those having the 20 highest cases with days away from work incidence rates for injuries at the most detailed or lowest SIC level at which rates are calculated and published. Based on this comparison, the highest rates were reported in manufacturing industries, except SIC's 122, 123, and 141 (mining); SIC's 174, 175, and 176 (construction); SIC's 421 and 451 (transportation and public utilities); SIC 518 (wholesale trade); and SIC 805 (services). Generally, manufacturing industries were calculated at the 4-digit code level and the remaining industries at the 3-digit level based on the Standard Industrial Classification Manual, 1987 Edition.

⁴ Employment is expressed as an annual average and is derived primarily from the BLS-State Current Employment Statistics program.
