THE EMPLOYMENT SITUATION: NOVEMBER 2006

Nonfarm payroll employment rose by 132,000 in November, and the unemployment rate was essentially unchanged at 4.5 percent, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Job gains continued in several service-providing industries, including professional and business services, food services, and health care. Employment declined in construction and manufacturing.

Unemployment (Household Survey Data)

Both the number of unemployed persons (6.8 million) and the unemployment rate (4.5 percent) were about unchanged in November. Over the year, these measures have declined from 7.6 million and 5.0 percent, respectively.

In November, unemployment rates for all major worker groups—adult men (3.9 percent), adult women (4.0 percent), teenagers (15.1 percent), whites (3.9 percent), blacks (8.6 percent), and Hispanics (4.9 percent)—showed little or no change over the month. The unemployment rate for Asians was 3.2 percent, not seasonally adjusted. (See tables A-1, A-2, and A-3.)

Total Employment and the Labor Force (Household Survey Data)

In November, total employment, at 145.6 million, was essentially unchanged, and the employment-population ratio remained at 63.3 percent. The civilian labor force rose by 383,000 to 152.4 million; the labor force participation rate, at 66.3 percent, was about the same as in October. (See table A-1.)

³ Data relate to private production or nonsupervisory workers.

p = preliminary.

Persons Not in the Labor Force (Household Survey Data)

About 1.4 million persons (not seasonally adjusted) were marginally attached to the labor force in November, about unchanged from a year earlier. These individuals wanted and were available for work and had looked for a job sometime in the prior 12 months. They were not counted as unemployed because they had not searched for work in the 4 weeks preceding the survey. Among the marginally attached, there were 349,000 discouraged workers in November, little changed from a year earlier. Discouraged workers were not currently looking for work specifically because they believed no jobs were available for them. The other 1.0 million marginally attached had not searched for work in the 4 weeks preceding the survey for reasons such as school attendance or family responsibilities. (See table A-13.)

Industry Payroll Employment (Establishment Survey Data)

Total nonfarm payroll employment rose by 132,000 in November to 136.0 million. This followed increases of 203,000 in September and 79,000 in October (as revised). Thus far this year, payroll employment has grown by an average of 149,000 per month. In November, employment rose in several service-providing industries and in mining; employment declined in construction and continued to trend downward in manufacturing. (See table B-1.)

Professional and business services employment increased by 43,000 in November and has risen by 426,000 over the year. Job growth has occurred in a number of industries, including architectural and engineering services, management consulting, and computer systems design. Employment in temporary help services was flat over the month and has changed little since January.

Health care employment rose by 28,000 in November. Hospitals and doctors' offices each added 6,000 jobs. Over the year, health care employment has increased by 309,000.

In leisure and hospitality, employment growth continued in food services and drinking places. This industry added 34,000 jobs in November, raising total job gains over the last 12 months to 295,000.

Employment in wholesale trade continued to trend up in November. Employment in this industry has risen by 288,000 since its most recent low in August 2003. Within retail trade, employment grew over the month in clothing and accessory stores; health and personal care stores; sporting goods, hobby, book, and music stores; and nonstore retailers (which include catalog and internet retailers). General merchandise stores continued to lose jobs (-12,000 after seasonal adjustment); since August 2005, employment in this industry has decreased by 107,000.

In the goods-producing sector, mining employment grew by 4,000 in November with gains in support activities for oil and gas. Employment in mining has grown by 136,000 since its most recent low in April 2003.

Construction employment declined by 29,000 in November, following a loss of similar size in October. The November decline was spread across all component industries. Since peaking in February of this year, employment in residential specialty trades was down by 109,000. Employment in nonresidential specialty trades edged down in November, after trending up during the first 10 months of the year.

Manufacturing employment continued to trend down (-15,000) in November. Motor vehicles and parts lost 7,000 jobs. Employment continued to fall in two construction-related industries: wood products (-6,000) and furniture and related products (-5,000). Computer and electronic products manufacturing added 5,000 jobs over the month.

Weekly Hours (Establishment Survey Data)

The average workweek for production and nonsupervisory workers on private nonfarm payrolls was unchanged at 33.9 hours in November. The manufacturing workweek and factory overtime both fell by 0.1 hour to 41.1 and 4.2 hours, respectively. (See table B-2.)

The index of aggregate weekly hours of production and nonsupervisory workers on private nonfarm payrolls increased by 0.1 percent in November to 105.6 (2002=100). The manufacturing index fell by 0.4 percent to 95.5. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of production and nonsupervisory workers on private nonfarm payrolls rose by 3 cents, or 0.2 percent, in November to \$16.94. Average weekly earnings also rose by 0.2 percent in November to \$574.27. Over the year, average hourly earnings increased by 4.1 percent, and average weekly earnings increased by 4.4 percent. (See table B-3.)

The Employment Situation for December 2006 is scheduled to be released on Friday, January 5, 2007, at 8:30 A.M. (EST). Release dates for the balance of 2007 are as follows:

 Dec. 7

 April 6
 July 6
 Oct. 5

November 2006 Household Survey Reference Week

The November 2006 reference week for the household survey was the week of November 5th, a week earlier than the usual reference period, which is the week that includes the 12th day of the month. This is the first time there has been a change in the November reference week. The change was made, in part, so that the household interviews, which are done during the week following the reference period, would not be conducted during the Thanksgiving holiday. The Census Bureau, which collects the household survey data for BLS, requested this change to improve survey operations.

The establishment survey reference period and data collection operations were not modified and were not affected by this change.

Revision of Seasonally Adjusted Household Survey Data

In accordance with usual practice, the Employment Situation release for December, scheduled for January 5, 2007, will incorporate annual revisions in seasonally adjusted unemployment and other labor force series from the household survey. Seasonally adjusted data for the most recent 5 years are subject to revision.

Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with state agencies. The sample includes about 160,000 businesses and government agencies covering approximately 400,000 individual worksites. The active sample includes about one-third of all nonfarm payroll workers. The sample is drawn from a sampling frame of unemployment insurance tax accounts.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys

Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as *employed* if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as *unemployed* if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4-week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The *civilian labor force* is the sum of employed and unemployed persons. Those not classified as employed or unemployed are *not in the labor force*. The *unemployment rate* is the number unemployed as a percent of the labor force. The *labor force participation rate* is the labor force as a percent of the population, and the *employment-population ratio* is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as federal, state, and local government entities. *Employees on nonfarm payrolls* are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. *Hours and earnings* data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-providing sector. Industries are classified on the basis of their principal activity in accordance with the 2002 version of the North American Industry Classification System.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:

- The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes people on unpaid leave among the employed. The establishment survey does not.
- The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
- The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Most seasonally adjusted series are independently adjusted in both the household and establishment surveys. However, the adjusted series for many major estimates, such as total payroll employment, employment in most supersectors, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major age-sex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

For both the household and establishment surveys, a concurrent seasonal adjustment methodology is used in which new seasonal factors are calculated each month, using all relevant data, up to and including the data for the current month. In the household survey, new seasonal factors are used to adjust only the current month's data. In the establishment survey, however, new seasonal factors are used each month to adjust the three most recent monthly estimates. In both surveys, revisions to historical data are made once a year.

Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or *sampling error*, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 430,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90-percent confidence interval on the monthly change would range from -330,000 to 530,000 $(100,000 \pm 430,000)$. These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90-percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90-percent chance) that an employment rise had, in fact, occurred. At an unemployment rate of around 5.5 percent, the 90-percent confidence interval for the monthly change in unemployment is about +/- 280,000, and for the monthly change in the unemployment rate it is about +/- .19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by *nonsampling error*. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth, an estimation procedure with two components is used to account for business births. The first component uses business deaths to impute employment for business births. This is incorporated into the sample-based link relative estimate procedure by simply not reflecting sample units going out of business, but imputing to them the same trend as the other firms in the sample. The second component is an ARIMA time series model designed to estimate the residual net birth/death employment not accounted for by the imputation. The historical time series used to create and test the ARIMA model was derived from the unemployment insurance universe micro-level database, and reflects the actual residual net of births and deaths over the past five years.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from less than 0.05 percent to 0.4 percent.

Additional statistics and other information

More comprehensive statistics are contained in *Employment and Earnings*, published each month by BLS. It is available for \$27.00 per issue or \$53.00 per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household and establishment survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-D of its "Explanatory Notes." For the establishment survey data, the sampling error measures and the actual size of revisions due to benchmark adjustments appear in tables 2-B through 2-F of Employment and Earnings.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone: 1-800-877-8339.

Persons with no previous work experience are included in the unemployed total. NOTE: Beginning in January 2006, data reflect revised population controls used in the household survey.

Table A-12. Alternative measures of labor underutilization

(Percent)

Measure	Not sea	sonally a	djusted	Seasonally adjusted								
	Nov. 2005	Oct. 2006	Nov. 2006	Nov. 2005	July 2006	Aug. 2006	Sept. 2006	Oct. 2006	Nov. 2006			
U-1 Persons unemployed 15 weeks or longer, as a percent of the civilian labor force	1.6	1.3	1.4	1.7	1.5	1.6	1.5	1.4	1.4			
U-2 Job losers and persons who completed temporary jobs, as a percent of the civilian labor force	2.2	1.8	2.0	2.3	2.2	2.2	2.1	2.0	2.1			
U-3 Total unemployed, as a percent of the civilian labor force (official unemployment rate)	4.8	4.1	4.3	5.0	4.8	4.7	4.6	4.4	4.5			
U-4 Total unemployed plus discouraged workers, as a percent of the civilian labor force plus discouraged workers	5.1	4.3	4.5	5.3	5.0	5.0	4.8	4.6	4.7			
U-5 Total unemployed, plus discouraged workers, plus all other marginally attached workers, as a percent of the civilian labor force plus all marginally attached workers	5.7	5.0	5.2	5.9	5.7	5.7	5.4	5.3	5.3			
U-6 Total unemployed, plus all marginally attached workers, plus total employed part time for economic reasons, as a percent of the civilian labor force plus all marginally attached workers	8.4	7.6	7.8	8.7	8.5	8.4	8.0	8.1	8.0			

NOTE: Marginally attached workers are persons who currently are neither working nor looking for work but indicate that they want and are available for a job and have looked for work sometime in the recent past. Discouraged workers, a subset of the marginally attached, have given a job-market related reason for not currently looking for a job. Persons employed part time for economic reasons are those who want and are available for full-time work but

have had to settle for a part-time schedule. For further information, see "BLS introduces new range of alternative unemployment measures," in the October 1995 issue of the *Monthly Labor Review*. Beginning in January 2006, data reflect revised population controls used in the household survey.

Table A-13. Persons not in the labor force and multiple jobholders by sex, not seasonally adjusted

(Numbers in thousands)

Category	To	otal	м	en	Women		
	Nov.	Nov.	Nov.	Nov.	Nov.	Nov.	
	2005	2006	2005	2006	2005	2006	
NOT IN THE LABOR FORCE							
Total not in the labor force Persons who currently want a job Searched for work and available to work now ¹ Reason not currently looking: Discouragement over job prospects ² Reasons other than discouragement ³	76,964	77,315	29,449	29,491	47,516	47,824	
	4,466	4,476	1,963	2,017	2,503	2,458	
	1,415	1,366	724	716	691	649	
	404	349	217	202	186	147	
	1,011	1,016	507	515	504	502	
MULTIPLE JOBHOLDERS							
Total multiple jobholders ⁴	7,586	7,863	3,854	3,808	3,732	4,055	
	5.3	5.4	5.0	4.9	5.6	6.0	
Primary job full time, secondary job part time	4,059	4,165	2,220	2,311	1,839	1,854	
	1,687	1,780	549	484	1,137	1,296	
	278	297	199	198	79	99	
	1,523	1,584	865	798	659	786	

¹ Data refer to persons who have searched for work during the prior 12 months and were available to take a job during the reference week.

² Includes thinks no work available, could not find work, lacks schooling or training,

employer thinks too young or old, and other types of discrimination.

³ Includes those who did not actively look for work in the prior 4 weeks for such

reasons as school or family responsibilities, ill health, and transportation problems, as well

as a small number for which reason for nonparticipation was not determined.

⁴ Includes persons who work part time on their primary job and full time on their secondary job(s), not shown separately.

NOTE: Beginning in January 2006, data reflect revised population controls used in the beginning for survey.

household survey.

¹ Data relate to production workers in natural resources and mining and manufacturing, construction workers in construction, and nonsupervisory workers in the service-providing industries. These groups account for approximately four-fifths of the

total employment on private nonfarm payrolls.

² Includes motor vehicles, motor vehicle bodies and trailers, motor vehicle parts.

p = preliminary.

NOTE: The indexes of aggregate weekly hours are calculated by

dividing the current month's estimates of aggregate hours by the corresponding 2002 annual average levels. Aggregate hours estimates are the product of estimates of average weekly hours and production or nonsupervisory worker employment.

 $^{^{\}rm 1}$ See footnote 1, table B-2. $^{\rm 2}$ Includes motor vehicles, motor vehicle bodies and trailers, and motor vehicle parts.

p = preliminary.

¹ See footnote 1, table B-2.

by the corresponding 2002 annual average levels. Aggregate payroll estimates are the product of estimates of average hourly earnings, average weekly hours, and production or nonsupervisory worker employment.

p = preliminary.

NOTE: The indexes of aggregate weekly payrolls are calculated by dividing the current month's estimates of aggregate payrolls

 $^{^{\}rm 1}$ Based on seasonally adjusted data for 1-, 3-, and 6-month spans and unadjusted data for the 12-month span. $^{\rm p}\!=\!{\rm preliminary}.$

NOTE: Figures are the percent of industries with employment increasing

plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.
