Employee Benefits in Industry: A Pilot Survey

U.S. Department of Labor Bureau of Labor Statistics July 1980

Report 615

U.S. Department of Labor Ray Marshall, Secretary Bureau of Labor Statistics Janet L. Norwood, Commissioner July 1980

Unless specifically identified as copyright, material in this publication is in the public domain and may, with the appropriate credit, be reproduced without permission.

Preface

This publication reports on a pilot survey conducted by the Bureau of Labor Statistics, of the incidence and characteristics of private sector employee benefit plans in 1979. The pilot survey was conducted for the Office of Personnel Management (OPM) which will use the data to develop the dollar cost for providing Federal employees with a level of benefits found in private industry.

The pilot survey was designed to represent 21 million employees in establishments covered by the Bureau's annual survey of Professional, Administrative, Technical, and Clerical Pay—presently used in the pay comparability process for Federal white-collar employees. The test collected information on employee work schedules and developed detailed data on the characteristics (excluding employer cost) of 11 private-sector employee benefits selected for study by OPM: Paid lunch and rest

periods; paid holidays, vacations, personal leave, and sick leave; life, accident and sickness, health, and long-term disability insurance; and private pension plans. A description of the scope of the survey, statistical procedures, and definitions of terms used are in the appendix.

The Bureau will review the test results to determine the adequacy of the sample size and design, as well as to improve its collection techniques and procedures. The Bureau will also explore with OPM methods for adding benefits not covered in the initial test to future surveys.

This report was prepared in the Office of Wages and Industrial Relations by the staffs of the Division of General Compensation Structures and the Division of Occupational Wage Structures.

Employee benefits in industry: A pilot survey

Most full-time employees in medium and large private-sector establishments work a 5-day, 40-hour week and receive paid holidays and vacations as well as fully employer financed life and health insurance, income continuation during disability, and pension plans. The detailed characteristics of these and other types of employee benefits were collected in the 1979 pilot survey and are presented in this report (table 1).

Work schedules. Weekly work schedules of 5 days, 40 hours applied to 82 percent of the employees covered by the survey (table 2). Eighteen percent of the professional-administrative employees, 27 percent of the technical-clerical employees, and only 7 percent of the production workers were on schedules of less than 40 hours. A 5-day week was also predominant among all three occupational groups. Only about 1 percent of the workers were scheduled to work fewer than 5 days; 3 percent were usually scheduled for more than 5 days.

Paid lunch and rest periods. About 13 percent of the employees covered by the survey received paid lunch periods, while more than 75 percent were provided paid rest time, e.g., coffee breaks and cleanup time (tables 3 and 4). Both benefits were more common among production employees than among the two other occupational groups. The incidence of these benefits was lowest among professional-administrative employees (less than 5 percent received paid lunch periods and 60 percent paid rest time). The professional-administrative group were most likely to be covered by informal plans, which were not included in the survey.

Among those receiving paid rest periods, production employees typically received 20 or 30 minutes a day, while professional-administrative and technical-clerical employees generally were eligible for 30 minutes of paid rest time daily. Most commonly, paid rest was provided as two daily breaks of 10 to 15 minutes each. Production employees who were covered by paid lunch plans usually received 20 to 30 minutes a day.

Paid vacations. As many as 25 days of vacation were commonly provided, annually to full-time employees after 25 years of service (table 5). Typical vacation plans called for 5 days with less than 1 year of service;

10 days after 1 year; 15 days after 10 years; and 20 days after 15 years of service. Plans covering professional-administrative and technical-clerical employees were generally more liberal than those covering production employees, especially during early years of service. Nearly half of the professional-administrative employees, for example, became eligible for at least 15 days of vacation after 5 years of service, compared with three-tenths of the production employees.

Nearly all workers received their regular pay during vacations. Less than 1 percent received payments in excess of regular pay, e.g., 5 weeks' pay for 4 weeks of vacation time. About one-tenth of the employees received vacation payments which were calculated as a percentage of their earnings during the previous year. This type of payment was most common among production employees.

Excluded from the vacation provisions studied were extended plans, such as those found in the steel, aluminum, and can industries; and anniversary-year bonus plans. In cases where personal leave could not be reported separately, it was included in the vacation plans.

Paid holidays. Virtually all employees were provided paid holidays. The number of holidays provided was generally the same among the three occupational groups, with full-time employees typically receiving 9 to 11 days per year (table 6). Extended holiday plans, such as the Christmas-New Year's Day period provided in the auto industry, floating holidays, and "personal holidays," such as employee birthdays, were included in the holiday plans reported.

Personal leave. Personal leave, which allows employees to be absent from work with pay for a variety of reasons not covered by other specific leave plans, was provided to about 19 percent of the employees. The proportion of professional-administrative and technical-clerical employees (about 30 percent) receiving personal leave was far greater than that for production employees (about 11 percent). Most commonly, employees provided personal leave were eligible for 2 to 5 days per year (table 7). A small proportion of employees, primarily professional-administrative, were provided as much personal leave as

they needed with no maximum number of days specified.

Sick leave plans. Formal sick leave plans covered 80 percent of the professional-administrative employees, 83 percent of the technical-clerical employees, and 37 percent of the production employees. The latter, however, were more frequently covered under accident and sickness insurance plans than sick leave.

Benefits differed significantly among the various sick leave plans, ranging from those providing 2 or 3 days of leave per year, to others providing 6 months or more of benefits (table 8). Most plans provided the employee with full pay for at least a portion of the time while on sick leave. In addition, about one-tenth of the workers were in plans which contained provisions for paying part of the employee's regular salary after the full-pay provisions were exhausted. More than nine-tenths of the workers covered by sick leave plans received benefits beginning on the first day of illness or disability. For those who reported a waiting period before benefits began, this period was typically 1 to 3 days.

The most commonly reported full-pay provisions—accounting for about one-third to two-fifths of all employees (depending on length of service)—were 5 to 30 days of sick leave annually. Sick leave plans covering professional-administrative and technical-clerical employees generally were more liberal than those covering production employees. For example, 14 percent of the professional-administrative employees were eligible for 120 days or more of sick leave at full pay after 20 years of service, while only about 2 percent of the production employees were covered by similar provisions.

Accident and sickness insurance. Accident and sickness insurance would provide two-thirds of the employees with income during absence from work due to disability, sometimes in coordination with sick leave payments. (Although professional-administrative and technical-clerical employees were not covered by accident and sickness insurance as frequently as production employees, they were covered to a greater extent by sick leave.)

Payments from accident and sickness insurance during short-term disability are either a proportion of earnings or a scheduled dollar amount (table 9). Fifty-five percent of production employee participants were in plans that based benefits on earnings, paying either a proportion of earnings or a flat dollar amount that varied by earnings. For the other employee groups, the proportion of participants in earnings-based plans was nearly nine-tenths.

Just over one-half of all participants would receive benefits for up to 26 weeks, and about one-fifth for up to 52 weeks. Professional-administrative and technicalclerical employees were more likely than production employees to be covered for 52 weeks. Somewhat more than four-fifths of participants were in plans paid for entirely by the employer.

Long-term disability insurance. Long-term disability insurance (LTD) benefits replace some of the income employees lose when they are unable to work because of disability. Generally, it takes over after sick leave and accident and sickness insurance are exhausted. In 1979, nearly one-half of all employees were participants in an employer-sponsored LTD plan.

More than 3 out of 4 participants in LTD plans could receive a benefit equal to between 50 and 60 percent of usual earnings (table 10).

For 7 out of 10 participants, benefits were limited either by direct plan maximums or by maximums integrated with other income received during disability, such as family social security payments and rehabilitative employment income.

Nearly 4 out of 5 participants were in plans funded entirely by the employer. Production employees were more likely than the others to be in such plans.

Health insurance. Health insurance plans that were at least partially financed by the employer covered 97 percent of the workers in the survey. Nearly all participants were insured for hospital room and board, surgery, X-rays, and physicians' hospital visits. One-half had some form of dental insurance and almost one-fifth had vision care insurance (table 11).

Insurance up to the hospital's usual rate for a semiprivate room was provided to 90 percent of the participants with basic hospital room and board coverage (table 12). The remainder of the participants were in plans which provided up to a specified dollar amount for each day spent in the hospital. Seventy-two percent of the participants could receive hospital room and board payments for a specific number of days, most commonly 365 days per hospital confinement. For 23 percent, hospital expenses were reimbursed up to a dollar limit per hospital confinement, and 5 percent had unlimited coverage. Sixty percent of the participants with basic surgical benefits were in plans that covered "usual and customary" charges for operations; the rest were in plans that covered up to a specified amount, depending on the surgical procedure (table 13).

Eighty-seven percent of the participants with major medical benefits were required to pay no more than \$100 in covered expenses before major medical protection went into effect (table 14). Just over one-half had to pay \$100, and about one-fourth, \$50. Nearly all employees had to satisfy this requirement yearly. Once the deductible requirement was satisfied, 9 out of 10 participants in major medical plans were insured to 80 percent of expenses (coinsurance) but had to pay the remaining 20 percent (table 15). Fifty-three percent of the professional-administrative and 56 percent of the

technical-clerical participants, but only 39 percent of the production participants, had coinsurance that increased from the initial proportion to 100 percent after a specified level of expenses was incurred during a year, thus limiting the employee's potential out-of-pocket costs.

Commercially insured plans predominated in all the health benefit areas with the heaviest concentration being in major medical plans (table 16). Blue Cross-Blue Shield was an important funding medium for basic benefits, but was a less important funding medium for major medical benefits. Eleven percent of the participants were covered by self-insured benefits, and only about 2 percent were enrolled in a prepaid health plan. No noticeable differences were found in funding media by type of employee covered.

Seventy-three percent of all participants had their individual health benefits financed entirely by the employer. The proportion varied by occupational group, from 79 percent of the production employees to 61 percent of the technical-clerical employees.

Pension plans. Eighty-seven percent of the employees participated in pension plans with either specified retirement benefits or with unspecified benefits based on employer contributions. The survey did not cover other plans that could provide retirement income, such as profit sharing, stock purchase, and savings plans. The rate of participation in pension plans was 96 percent among professional-administrative employees, about 10 percentage points greater than the other groups.

Two out of three participants were in plans that provide retirement income based on either career or final years' earnings. While 9 out of 10 professional-administrative and technical-clerical employee participants were in such plans, production employee participants were roughly evenly divided between these plans and those which based benefits on a formula—dollar amounts times years of service (table 17).

Over two-fifths of all participants (44 percent) were covered by plans that required the employee to reach age 63 to 65 before being eligible to retire with im-

mediate full benefits (normal retirement); the majority of these were in plans with no length of service requirements (table 18). Nearly one-fifth (19 percent) were in plans specifying age 61 or 62 for normal retirement, and another one-fifth were in plans specifying age 60 or less.

Eighty-three percent of the professionaladministrative participants were in plans fully paid by the employer, compared to 89 percent of the other employee group participants.

Life insurance. Nearly all the workers were provided life insurance by their employers. The amount of insurance, however, varied by earnings and occupation. Sixty-three percent of all insured workers received life insurance related to earnings (table 19). This included 39 percent who were insured for a multiple of their annual earnings and 24 percent whose coverage was graduated according to an earnings schedule. A flat amount of insurance was provided to most of those whose insurance was not based on their earnings. Four out of five professional-administrative and technical-clerical participants had pay-related insurance, in contrast to only 1 of 2 production participants.

Forty-four percent of the participants covered by a multiple-of-earnings formula were insured for an amount equal to their earnings, and 34 percent were insured for 2 times earnings (table 20). Professional-administrative participants were evenly divided between both levels, but the majority of other participants were most commonly at the lower level.

Three out of five participants with a flat amount of insurance had less than \$10,000 coverage. These were mostly technical-clerical and production employees (table 21). Professional-administrative employees with flat amounts of insurance usually were covered for between \$10,000 and \$20,000.

Additional insurance for accidental death or dismemberment was provided for nearly 3 out of 4 workers covered by life insurance. Eighty percent of the participants were provided life insurance at no cost.

³Major medical benefits cover many categories of expenses, some of which are not covered under basic benefits, and others for which basic coverage limits have been exceeded. These benefits are characterized by deductible and coinsurance provisions.

4Less than 0.5 percent.

Note: Because of rounding, sums of individual items may not equal totals.

¹Includes less than 2 percent in plans in which medical care provision was not determinable.

²A provision was classified as a basic benefit when it covered the initial expenses incurred for a specific medical service. Under these provisions, a plan paid covered expenses in one of several ways: (1) In full, with no limitation; (2) in full for a specified period time, or until a doflar limit was reached; and (3) a cash scheduled allowance benefit that provided up to a dollar amount for a service performed by a hospital or physician.

Appendix: Technical Note

The 1979 Level of Benefits (LOB) Survey was a large scale pilot test of data collection, processing, and estimation procedures for a variety of provisions of employee benefit plans. The tested procedures were developed as a result of 2 years of feasibility studies of collection methods and questionnaire designs. The data from the test will be used to assess the survey sample and for other statistical analysis.

The 1979 LOB survey covers all establishments¹ in the United States, except Alaska and Hawaii, which employed the indicated minimum number of workers in the following industries:

Industry	Minimum employment size
Mining	250
Construction	250
Manufacturing	100-250
Transportation, communication,	
electric, gas, and sanitary services	100-250
Wholesale trade	100
Retail trade	250
Finance, insurance, and real estate	100
Selected services	50-100

The 1979 LOB survey of 1,469 establishments was a subsample of the sample for the 1979 National Survey of Professional, Administrative, Technical, and Clerical Pay. It was a stratified systematically selected probability sample. Strata were formed on the basis of establishment employment and industry.

The data for the survey were collected by personal visit of Bureau field representatives to the sample establishments. To reduce the reporting burden, sampled establishments were asked to provide documents describing their pension plans and plans covering the four insured benefits. These were analyzed by BLS staff in Washington to obtain the required data on plan provisions

Sampled establishments were requested to provide data on work schedules and each of the 11 benefits for

¹ For this survey, an establishment is an economic unit(s) which produces goods or services, a central administrative office, or an auxiliary unit providing support services to a company. In manufacturing industries the establishment is usually a single physical location. In nonmanufacturing industries, all locations of an individual company within a Standard Metropolitan Statistical Area (SMSA) or within a nonmetropolitan county are usually considered an establishment.

full-time employees in the following occupational groups:

Professional-administrative:

Includes occupations that require a foundation of knowledge in the theories, concepts, principles, and practices of a broad field of science, learning, administration, or management acquired through a college-level education or the equivalent in progressively responsible experience. Above entry levels, the exercise of a high degree of creativity, originality, analytical ability, and independent judgment to solve varied and complex problems in the field of work is characteristic.

Technical-clerical:

Includes office and sales clerical, technical support, protective services and other such occupations that do not require full knowledge of a professional or administrative field of work or the application of a high level of creativity, originality, analytical ability, or independent judgment. Job performance skills are typically acquired through on-the-job experience and/or specific training which is less than that usually represented by a baccalaureate degree. These skills include the application of a practical knowledge of established procedures, practices, precedents, and guidelines.

Production:

Includes skilled, semiskilled, and unskilled trades; craft and production occupations; manual labor occupations; custodial occupations; and operatives.

Excluded from the survey were executive management employees, defined as those whose decisions have direct and substantial effects on an organization's policymaking, part-time employees, temporary employees, seasonal employees and travelling operating employees such as airline flight crews and long distance truckdrivers

Each of the 36 combinations of benefit and occupational group (e.g., health insurance for production employees) was treated as an individual survey and separate estimates developed for each.

Following is the composite establishment response to the survey:

Number of establishments:

In sample	1,469
Out of business and out of scope	
Refusing to respond	170
Responding fully or partially	

There were two procedures used to adjust for missing data from partial schedules and total refusals. First, im-

putations for the number of plan participants were made for 63 plans for which the number of participants was not reported. Then an adjustment for nonresponse was made using a weight adjustment technique based on sample unit employment.

The survey design used an unbiased estimator (the Horvitz-Thompson) which assigns the inverse of each sample unit's probability of selection as a weight to the unit's data. The estimator was modified to account for a weight adjustment factor developed during nonresponse adjustment.

The statistics in this report are estimates derived from a sample survey. There are two types of errors possible in estimates based on a sample survey—sampling and nonsampling. The "accuracy" of a survey result is determined by the joint effects of sampling and nonsampling errors.

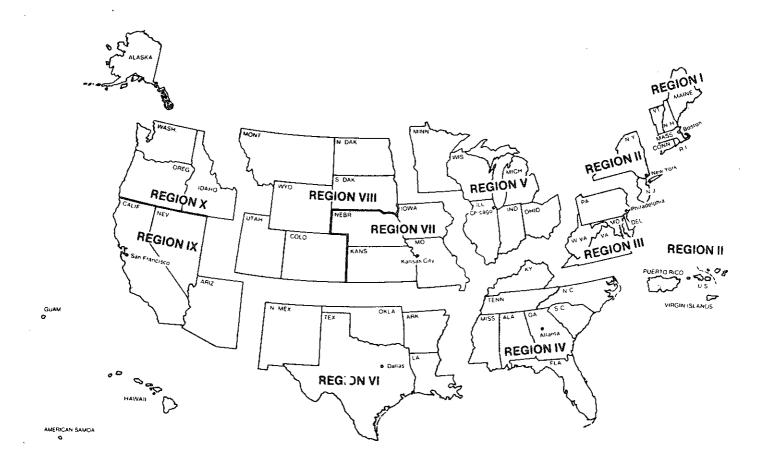

Sampling errors occur because observations are made for only a sample, not the entire population. Since this survey was based on a probability sample, estimates of sampling error can be produced directly from the data. Since this initial survey was a test, some time will be required before reliable estimates of sampling error can be produced.

Nonsampling errors can be attributed to many sources such as reporting errors, data recording and processing errors, and errors that result because not all units surveyed provide all the data requested. A potential for nonsampling error is known to exist due to difficulties in collecting data on employees enrolled in more than one plan in a benefit area. Through the use of computer generated edits of the data and professional review of both individual and summarized data, efforts were made to minimize the nonsampling errors in recording, coding and processing. Improved collection techniques and procedures are being implemented for future surveys.

Adjustments made for missing data are another source for potential nonsampling error. To the extent that the characteristics of the nonrespondents are not the same as those of the respondents, nonsampling error is introduced in the estimates. The magnitude of these and other nonsampling errors is currently undetermined.

A more detailed description of survey methods may be obtained from the Bureau of Labor Statistics, Office of Wages and Industrial Relations.
