

# Verification via Optical Flow

Dustin Lennon, Caren Marzban, and **Scott Sandgathe**

Department of Statistics and Applied Physics Lab.

University of Washington

## History

In the past, in this workshop: MVT.

Last year: Optical Flow (OF) for verification.

OF = method for mapping one image (observed field) to another image (forecast field).

Used in machine vision, robotics, image enhancement, moving-target indication, passive navigation, surveillance.

Nowcasting: Bowler, Pierce, and Seed (Jour. Hydrology, 2004)

Verification: Keil and Craig (MWR 2007).

## The Math

$$\begin{aligned} I(x + dx, y + dy, t + dt) \\ = I(x, y, t) + \frac{\partial I}{\partial x} dx + \frac{\partial I}{\partial y} dy + \frac{\partial I}{\partial t} dt + \dots \end{aligned}$$

Suppose

$(x, y) \rightarrow (x + dx, y + dy), dt$  later.

$$I(x + dx, y + dy, t + dt) = I(x, y, t)$$

Then 
$$\frac{\partial I}{\partial x} u + \frac{\partial I}{\partial y} v = -\frac{\partial I}{\partial t}$$

where 
$$u = \frac{\partial x}{\partial t} \quad v = \frac{\partial y}{\partial t}$$

$(u, v) =$  optical flow vector field = unknown.

Comparison of lumpy fields (reflectivity.) is difficult.

Observation

arw2

arw4

nmm4

Comparison of smooth fields (slp) is no less difficult!

Instead of two hard-to-compare images, OF delivers this:

Confirm that it makes sense:

**(A) Shift = 2.83**

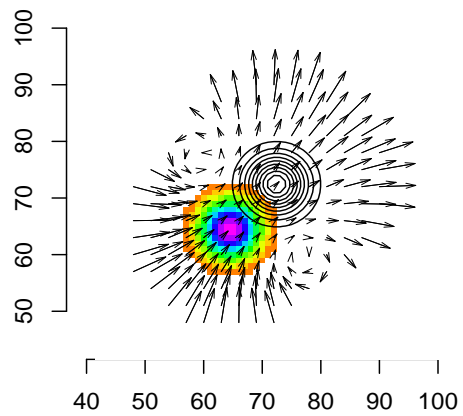

**(B) Shift = 5.66**

**(C) Shift = 8.49**

**(D) Shift = 11.31**

**(E) Shift = 14.14**

**(F) Shift = 16.97**

# Joint histograms as summary measures:

**(A) Shift = 2.83**

**(B) Shift = 5.66**

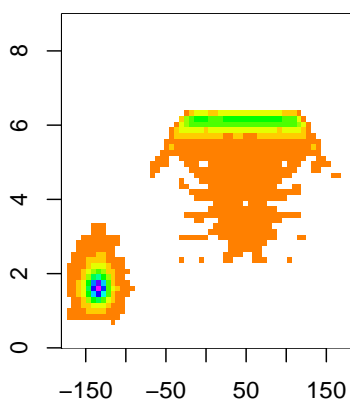

**(C) Shift = 8.49**

**(D) Shift = 11.31**

**(E) Shift = 14.14**

**(F) Shift = 16.97**

## In Summary:

Optical flow  $\rightarrow$  visual tool for diagnostic verification.

Summary measures  $\rightarrow$  diagnostic and automatic verification.

Future  $\rightarrow$  doing statistics on lots of dates.

Problems: Discrete fields (e.g., reflectivity).
