

**Gulf of Alaska Rationalization
Preliminary Catch Data and Discussion Paper
Prepared by Council Staff and Northern Economics, Inc.
June 2005**

At its April 2003 meeting, the Council adopted a motion preliminarily defining alternatives for the rationalization of the Gulf of Alaska groundfish fisheries. Since that meeting, the Council has undertaken the process of refining the alternatives for analysis. This paper summarizes provides a preliminary summary of catch data that may aid the Council in continuing that process.

Process for developing the Gulf Rationalization Program

Staff anticipates that the Council will follow its normal process for selecting a preferred rationalization program for submission to the Secretary of Commerce. Typically, that process begins with the Council adopting alternatives for analysis. For most Council actions, these alternatives are specified through elements and options. Staff then drafts regulatory analyses (a Regulatory Impact Review, an Initial Regulatory Flexibility Analysis and either an Environmental Assessment or Environmental Impact Statement) analyzing the impacts of the alternatives (including any elements and options) to inform the Council's decision.

Adequate regulatory analyses must fully analyze all alternatives, comparing and contrasting their impacts. To accomplish that end, the analysis must make clear the implications of each option available to the Council within an alternative, including the interaction of the choice of each option with every other option that the Council might also choose for other provisions. For example, if the Council wishes to consider options for low and high member thresholds for cooperative formation and also options for reducing PSC allocations in some circumstances, the analysis must make clear not only the general impacts of the choices of membership thresholds, but also how the threshold choices under consideration would differently interact with the various choices of PSC reductions under consideration. This example illustrates the analytical issue that arises by retaining options with respect to two decision points in a Council motion. The current Gulf rationalization Council motion, however, contains on the order of one hundred such decision points. The result is that the current motion is analytically intractable. To state the problem simply, the alternatives have too many options for staff to fully explain (or even understand) the implications of the interactions of all of the different options (as required of regulatory analyses).

In selecting options to refine the alternatives to advance for analysis, the Council should also assess the range of alternatives that are created. Each alternative should meet the Council's purpose and need statement, should be feasible, and should be distinguishable from each other alternative. The Council should therefore consider using its selection of options to distinguish the alternatives from each other, but only to the extent that maintains the integrity of each alternative under the problem statement. Since the alternatives as defined to date are distinct, the Council may select the same options for each of the alternatives, if needed to meet the objectives of the purpose and need statement.

Problem Statement

To guide the identification of a rationalization program for the Gulf of Alaska groundfish fisheries, the Council has developed the following purpose and need statement:

The Council is proposing a new management regime that rationalizes groundfish fisheries in the Gulf of Alaska west of 140 degrees longitude and rockfish bycatch east of 140 degrees longitude. A rationalization program includes policies and management measures that may increase the economic efficiency of GOA groundfish fisheries by providing economic incentives to reduce excessive capital investment. These management measures would apply to those species, or groups of species identified by the Council as benefitting from additional economic incentives that may be provided by rationalization. This rationalization program would not modify the hook-and-line sablefish fishery currently prosecuted under the IFQ Program, except for management of associated groundfish bycatch.

The purpose of the proposed action is to create a management program that improves conservation, reduces bycatch, and provides greater economic stability for harvesters, processors, and communities. A rationalization program could allow harvesters and processors to manage their operations in a more economically efficient

manner. Rationalization of GOA fisheries should eliminate the derby-style race for fish by allocating privileges and providing economic incentives to consolidate operations and improve operational efficiencies of remaining operators. Because rationalization programs can have significant impacts on fishing dependent communities, this program should address community impacts and seek to provide economic stability or create economic opportunity in fishery dependent communities.

Rationalizing GOA fisheries may improve stock conservation by creating incentives to eliminate wasteful fishing practices, improve management practices, and provide mechanisms to control and reduce bycatch and gear conflicts. Rationalization programs may also reduce the incentive to fish during unsafe conditions.

Management of GOA groundfish has grown increasingly complicated due to impositions of measures to protect Steller sea lions, increased participation by fishermen displaced from other fisheries such as Alaska salmon fisheries and the requirements to reduce bycatch and address Essential Fish Habitat requirements under the Magnuson-Stevens Act (MSA). These changes in the fisheries are frustrating management of the resource, raising attendant conservation concerns. These events are also having significant, and at times, severe adverse social and economic impacts on harvesters, processors, crew, and communities dependent on GOA fisheries. Some of the attendant problems include:

1. reduced economic viability of the harvesters, processors, and GOA communities,
2. high bycatch,
3. decreased safety,
4. reduced product value and utilization,
5. jeopardy to community stability and their historic reliance on groundfish fishing and processing,
6. limited ability of the fishery harvesters and processors to respond to changes in the ecosystem,
7. limited ability to adapt to MSA requirements to minimize bycatch and protect habitat,
8. limited ability to adapt to changes to other applicable law (i.e., Endangered Species Act).

All of these factors have made achieving the goals of the National Standards in the MSA difficult and encourage reevaluation of the status quo management of the GOA groundfish fisheries. The management tools in the current GOA groundfish FMP do not provide managers with the ability to improve the economic efficiency of the fishery and effectively solve the excess harvesting capacity and resource allocation problems in the GOA groundfish fisheries. The Council has determined that some form of rationalization program is warranted.

Summary of primary species catch history

The information provided by this discussion paper is intended to aid the Council in determining appropriate provisions concerning three aspects of the current elements and options:

Sections 2.2.3.1 and 3.2.3 of the Council motion define “primary species” by gear, which would be allocated to sectors and eligible persons based on the historic catch of the species.¹ Under the rationalization alternatives, these allocations are intended to define the main target fisheries for the different gear-types in the Gulf of Alaska. Table 1 shows the primary species by gear-type, as defined in the motion.

Sections 2.2.2.3 and 3.3.1.1 of the Council motion provide for the set aside (or allocation) of a portion of the TAC for harvest in State managed fisheries. Options would base these allocations to State managed fisheries on historic catch inside 3nm.

Sections 2.2.2.2 and 3.3.1 of the Council motion define eligibility for participation in the rationalization program. Options could limit eligibility to persons that hold either a permanent license or permanent or interim license under the Limited License Program (LLP).

The following set of tables provides participation and catch data for primary species by gear in the Gulf of Alaska aggregated for the years 1995 through 2003, as well as annual catch and participation data for Pacific cod and pollock. The tables are intended to provide background information concerning the three sets of

¹ Other species would be allocated as “secondary species” based on average catch rates for the gear-type, rather than based on individual catch history.

options described above. First, the tables provide background information to the Council that could be used for considering the appropriateness of making allocations of the various primary species to the different gear types as currently proposed in the alternatives. If a gear-type has little catch history for one of its primary species, the allocation to the gear may be insufficient to support directed fishing. If the Council wishes to provide for a directed fishery in these circumstances, some other method of determining an allocation may be appropriate. Second, the tables provide baseline information concerning the distribution of catch between State and Federal waters. This information is intended to aid the Council in its consideration of the option for setting aside a portion of the various TACs for management by the State of Alaska in State waters. Third, the tables provide background information concerning the catch of vessels by license should also prove useful in dealing with the issue of catches by unlicensed vessels and vessels with interim licenses.

The source data for catcher processor (CP) catch are the Weekly Processor Reports. The source data for catcher vessel (CV) catch are ADF&G Fish tickets.

The tables are sorted by management area from west to east—Western Gulf (WG) tables are followed by Central Gulf (CG) tables, with tables for West Yakutat (WY) last. Two tables show catch data for each management area—the first shows total catch and number of vessels, while the second provides catch percentages over all non-confidential catches by all gear and vessel types for that species and management area. The primary species for each gear, as designated by the Council motion, are shown in each table. Pacific cod is designated as a primary species for all four gears; for jig and pot gear Pacific cod is the only designated primary species. In addition to Pacific cod, five other species are primary species for hook and line (HAL) gear, three rockfish species and two flatfish species. There are nine primary species designated for the trawl fisheries. In the catch and participation tables shown below, species are listed, from top to bottom, according to the number of different gears for which they are primary species. Thus the table lists Pacific cod first, followed by the three rockfish species and two flatfish species designated as primary for the hook and line boats, followed by species that are primary only for trawl gear—the three remaining flatfish species, and finally pollock.

Table 1. Proposed Primary Species Allocations by Gear in the Gulf Rationalization Motion

Jig	Hook and Line	Pot		Trawl
Pacific Cod	Pacific Cod	Pacific Cod	Pacific Cod	Deepwater Flatfish
	Northern Rockfish		Northern Rockfish	Flathead Sole
	Pelagic Rockfish		Pelagic Rockfish	Rex Sole
	Pacific Ocean Perch		Pacific Ocean Perch	Shallow-water Flatfish
	Arrowtooth		Arrowtooth	Pollock
	Deepwater Flatfish			

The tables also break out catches in the EEZ and in the parallel fisheries inside 3 miles. For Pacific cod there are additional rows for the State-water fisheries. There is also a row in the West Yakutat table showing catches in the State-managed Prince William Sound pollock fishery.

All of the tables have sets of columns corresponding to the types of licenses on which the vessel operated. Catches of permanent and interim licenses holders were combined due to confidentiality restrictions, but counts of permanent and interim licensed vessels are shown separately. Catches of catcher processors and catcher vessels are also shown in separate columns.

In some cases data cannot be released because fewer than four vessels contributed catches. These entries are shaded black.

All of the tables provide summary columns showing the aggregated catches of licensed and unlicensed vessels combined (i.e., All CPs, All CVs, and All vessels). Numbers provided in these columns reflect only those catches that are not confidential. In other words, in instances in which unlicensed catch is confidential these columns show total non-confidential catch (rather than total catch). Over all three areas, total catch that is considered confidential (and is therefore not accounted for in the table) is approximately 6,000 tons or 0.4 percent of the 1.5 million tons caught in the Gulf in these fisheries during the 9-year period.

Table 2 shows the catch and participation in Western Gulf fisheries by license, vessel, and gear for the years 1995-2003. More than 470,000 MT of primary species by all gears in the WG between 1995-2003, 92 percent of which was either Pacific cod or pollock. Approximately 0.09 percent of the total catch cannot be reported to due confidentiality restrictions. Annual tables for Pacific Cod and Pollock can be seen in the Appendix.

Note: Shaded cells represent catch totals that cannot be released due to confidentiality restrictions. Catch totals in summary columns exclude catches from confidential cells.

Table 5 shows CG catches, but as a percentage of the total catch of that species in the area. While the totals used to calculate the percentage exclude confidential catches, the amount excluded (0.4 percent of the total) is so small that the percentages shown are largely unaffected. Annual tables for Pacific Cod and Pollock can be seen in the Appendix.

Note: Shaded cells represent catch totals that cannot be released due to confidentiality restrictions. Calculation of percentages excludes all confidential numbers.

Table 6 shows the catch and participation in West Yakutat fisheries for the years 1995-2003. Only 52,000 MT of primary species catches were made in West Yakutat during this period, 11 percent of which are confidential, and are not included in the table. Of the 46,000 MT shown, 78 percent are either Pacific cod or pollock. Note also that over 14,000 MT from the State-managed Prince William Sound Pollock fishery are shown. Annual tables for Pacific Cod and Pollock can be seen in the Appendix.

Note: Shaded cells represent catch totals that cannot be released due to confidentiality restrictions. Catch totals in summary columns exclude catches from confidential cells. Also note that catches in the Prince William Sound Pollock fishery are listed as a State-Water Fishery.

Table 7 shows WY catches, but as a percentage of the total catch of that species in the area. The totals used to calculate the percentage exclude confidential catches which as mentioned above constitute over 11 percent of the total. Therefore, in some cases, the amount excluded could result in percentages that are noticeably different than actual percentages. Annual tables for Pacific Cod and Pollock can be seen in the Appendix.

Appendix: Annual Tables for Pacific Cod and Pollock

The tables in this appendix show annual catch and participation for Pacific Cod and Pollock by management area. Annual tables for other species were not created because the limited participation would compromise data confidentiality. The tables are set up in the same way as tables in the main report, except that each section represents the fisheries that took place during one year. There are two sets of tables for each species in each sub-area—the first showing annual catch and participation and the second showing annual catch percentages. Note that because of their length, the Pacific cod tables had to be divided across 2 pages. The order of the tables in the appendix is the same as used in the main report—moving from west to east—Western Gulf, followed by Central Gulf and West Yakutat.
