

## Here's What's New in New Jersey Truck Trends

Data from the Census Bureau's 1997 Vehicle Inventory and Use Survey are now available for New Jersey. This survey produces state and U.S. level statistics on the physical and operational characteristics of the Nation's truck, van, minivan, and sport utility vehicle population.

There were an estimated 1,514,300 private and commercial trucks registered in New Jersey during 1997, up more than 37 percent from the approximately 1,098,500 trucks registered in 1992.

The survey includes these highlights for New Jersey:

The number of minivans registered in New Jersey during 1997 increased 117.8 percent from 1992. In comparison, the number of sport utility vehicles increased 107.3 percent and the number of pickups increased 2.4 percent during this same period.

- Total truck registrations in 1997 included 26.0 percent pickups, 33.3 percent SUVs, and 19.3 percent minivans.
- New Jersey has approximately one SUV for every 16 people and about one pickup for every 20 people. It also has approximately one SUV for every 11 licensed drivers and about one pickup for every 14 licensed drivers.

- Approximately 6.9 percent of all large trucks carried hazardous materials in 1997.
- About 70.3 percent of all trucks were used for personal transportation, while 28.7 percent were operated for business, including for-hire use.
- Approximately 13.8 percent of all trucks were leased from someone else, compared with 4.0 percent in 1992.

The report also includes information on fuel efficiency, annual and lifetime mileage, model year, equipment accessories and other data for each kind of registered truck.

The U.S. Summary will be issued in late 1999, following the release of reports for the 50 states and the District of Columbia. This survey is conducted every five years as part of the Economic Census and data are used by government agencies, business, industry, academia, and the general public.

The estimates from the 1997 Vehicle Inventory and Use Survey are subject to sampling and nonsampling error. Sources of nonsampling error include errors of response, non-reporting and coverage. Measures of sampling variability, presented as relative standard errors, are shown in the tables in the report.
