

# Sibliometric Analysis for the U.S. Environmental Protection Agency/Office of Research and Development's Science and Technology for Sustainability (STS) Research Program

This is a bibliometric analysis of the papers prepared by intramural and extramural researchers of the U.S. Environmental Protection Agency (EPA) of the Science and Technology for Sustainability (STS) Research Program. For this analysis, 662 papers were reviewed, and they were published from 1996 to 2006. These publications were cited 12,887 times in the journals covered by Thomson's Web of Science<sup>1</sup> and Scopus<sup>2</sup>. Of these 662 publications, 546 (82%) have been cited at least once in a journal.

Searches of Thomson Scientific's Web of Science and Scopus were conducted to obtain times cited data for the STS journal publications. The analysis was completed using Thomson's Essential Science Indicators (ESI) and Journal Citation Reports (JCR) as benchmarks. ESI provides access to a unique and comprehensive compilation of essential science performance statistics and science trends data derived from Thomson's databases. For this analysis, the ESI highly cited papers thresholds as well as the hot papers thresholds were used to assess the influence and impact of the STS papers. *JCR* is a recognized authority for evaluating journals. It presents quantifiable statistical data that provide a systematic, objective way to evaluate the world's leading journals and their impact and influence in the global research community. The two key measures used in this analysis to assess the journals in which the EPA STS papers are published are the Impact Factor and Immediacy Index. The Impact Factor is a measure of the frequency with which the "average article" in a journal has been cited in a particular year. The Impact Factor helps evaluate a journal's relative importance, especially when compared to other journals in the same field. The Immediacy Index is a measure of how quickly the "average article" in a journal is cited. This index indicates how often articles published in a journal are cited within the same year and it is useful in comparing how quickly journals are cited.

The report includes a summary of the results of the analysis, an analysis of the 662 STS research papers analyzed by ESI field (e.g., chemistry, environment/ecology, engineering), an analysis of the journals in which the STS papers were published, a table of the highly cited researchers in the STS Research Program, and a list of the patents and patent applications resulting from the program.

<sup>1</sup> Thomson Scientific's Web of Science provides access to current and retrospective multidisciplinary information from approximately 8,830 of the most prestigious, high impact research journals in the world. Web of Science also provides cited reference searching.

<sup>2</sup> Scopus is a large abstract and citation database of research literature and quality Web sources designed to support the literature research process. Scopus offers access to 15,000 titles from 4,000 different publishers, more than 12,850 academic journals (including coverage of 535 Open Access journals, 750 conference proceedings, and 600 trade publications), 27 million abstracts, 245 million references, 200 million scientific Web pages, and 13 million patent records.

# SUMMARY OF RESULTS

- 1. More than one-quarter of the STS publications are highly cited papers. A review of the citations indicates that 187 (28.2%) of the STS papers qualify as highly cited when using the *ESI* criteria for the top 10% of highly cited publications. This is 2.8 times the number expected. Thirty-two (4.8%) of the STS papers qualify as highly cited when using the *ESI* criteria for the top 1%, which is 4.8 times the number expected. Six (0.91%) of these papers qualify as very highly cited when using the criteria for the top 0.1%, which is 9.1 times the number anticipated. One paper (0.15%) actually meets the 0.01% threshold for the most highly cited papers, which is 15 times the 0.066 number expected.
- 2. The STS papers are more highly cited than the average paper. Using the *ESI* average citation rates for papers published by field as the benchmark, in 11 of the 17 fields in which the EPA STS papers were published, the ratio of actual to expected cites is greater than 1, indicating that the STS papers are more highly cited than the average papers in those fields. For all 17 fields combined, the ratio of total number of cites to the total number of expected cites (12,887 to 5,134) is 2.5, indicating that the STS papers are more highly cited than the average paper.
- **3. One-third of the STS papers are published in high impact journals**. Two hundred twentyseven (227) of the 662 papers were published in the top 10% of journals ranked by *JCR* Impact Factor, representing 34.3% of EPA's STS papers. This number is 3.4 times higher than expected. Two hundred thirty-nine (239) of the 661 papers appear in the top 10% of journals ranked by *JCR* Immediacy Index, representing 36.1% of EPA's STS papers. This number is 3.6 times higher than expected.
- **4.** Eight of the STS papers qualify as hot papers. Using the hot paper thresholds established by *ESI* as a benchmark, 8 hot papers, representing 1.2% of the STS papers, were identified in the analysis. Hot papers are papers that were highly cited shortly after they were published. The number of STS hot papers is 12 times higher than the 0.66 hot papers expected.
- **5.** The authors of the STS papers cite themselves much less than the average author. Four hundred seventy-seven (477) of the 12,887 cites are author self-cites. This 3.7% author self-citation rate is well below the accepted range of 10-30% author self-citation rate.
- 6. Eight of the authors of the STS papers are included in *ISIHighlyCited.com*, which is a database of the world's most influential researchers who have made key contributions to science and technology during the period from 1981 to 1999.
- 7. There were 25 patents issued and 9 patent applications filed by investigators from 1996 to 2006 for research that was conducted under EPA's STS research program. Seventeen (68%) of the 25 patents have been referenced by 114 other patents.

### Highly Cited STS Publications

All of the journals covered by ESI are assigned a field, and to compensate for varying citation rates across scientific fields, different thresholds are applied to each field. Thresholds are set to select highly cited papers to be listed in *ESI*. Different thresholds are set for both field and year of publication. Setting different thresholds for each year allows comparable representation for older and younger papers for each field.

The 662 STS research papers reviewed for this analysis were published in journals that were assigned to 17 of the 22 *ESI* fields. The distribution of the papers among these 17 fields and the number of citations by field are presented in Table 1.

| No. of<br>Citations | <i>ESI</i> Field             | No. of EPA<br>STS Papers | Average<br>Cites/Paper |

#### Table 1. STS Papers by ESI Fields

There are 187 (28.2% of the papers analyzed) highly cited EPA STS papers in 9 of the 17 fields— Chemistry, Engineering, Multidisciplinary, Environment/Ecology, Materials Science, Computer Science, Biology & Biochemistry, Economics & Business, and Plant & Animal Science—when using the *ESI* criteria for the **top 10% of papers**. Table 2 shows the number of EPA papers in those 9 fields that meet the **top 10% threshold in** *ESI*.

| Citations        | <i>ESI</i> Field       | No. of<br>Papers | Average<br>Cites/Paper | % of EPA<br>Papers in<br>Field |

| 40               | Economics & Business   | 2                | 20.00                  | 50.00%                         |
| 17               | Plant & Animal Science | 1                | 17.00                  | 50.00%                         |
| Total =<br>9,526 |                        | Total =<br>187   | 50.94                  | 28.25%                         |

 Table 2. Number of Highly Cited STS Papers by Field (top 10%)

Thirty-two (4.8%) of the papers analyzed qualify as highly cited when using the *ESI* criteria for the **top** 1% of papers. These papers cover six fields—Chemistry, Engineering, Multidisciplinary, Environment/Ecology, Materials Science, and Plant & Animal Science. Table 3 shows the 32 papers by field that meet the **top 1% threshold in** *ESI*. The citations for these 32 papers are provided in Tables 4 through 9. There were 6 (0.91%) very highly cited STS papers in the fields of Chemistry, Engineering, and Multidisciplinary. These papers, which meet the **top 0.1% threshold in** *ESI*, are listed in Table 10. One of the STS papers actually meets the **top 0.01% threshold in** *ESI*, which represents 0.15% of the papers. The citation for this paper is provided in Table 11.

| Citations | <i>ESI</i> Field | No. of<br>Papers | Average<br>Cites/Paper | % of EPA<br>Papers in<br>Field |
|-----------|------------------|------------------|------------------------|--------------------------------|
| 3,482     | Chemistry        | 20               | 174.10                 | 5.21%                          |
| 457       | Engineering      | 7                | 65.28                  | 7.45%                          |

# **Ratio of Actual Cites to Expected Citation Rates**

The expected citation rate is the average number of cites that a paper published in the same journal in the same year and of the same document type (article, review, editorial, etc.) has received from the year of publication to the present. Using the *ESI* average citation rates for papers published by field as the benchmark, in 11 of the 17 fields in which the EPA STS papers were published, the ratio of actual to expected cites is greater than 1, indicating that the STS papers are more highly cited than the

average papers in those fields (see Table 12). For all 17 fields combined, the ratio of total number of cites to the total number of expected cites (12,887 to 5,134) is 2.51, indicating that the STS papers are more highly cited than the average paper.

| <i>ESI</i> Field             | Total<br>Cites | Expected Cite<br>Rate | Ratio |
|------------------------------|----------------|-----------------------|-------|
| Agricultural Sciences        | 16             | 10.40                 | 1.54  |

Table 12. Ratio of Actual Cites to Expected Cites for STS Papers by Field

# JCR Benchmarks

*Impact Factor*. The *JCR* Impact Factor is a well known metric in citation analysis. It is a measure of the frequency with which the "average article" in a journal has been cited in a particular year. The Impact Factor helps evaluate a journal's relative importance, especially when compared to others in the same field. The Impact Factor is calculated by dividing the number of citations in the current year to articles published in the 2 previous years by the total number of articles published in the 2 previous years.

Table 13 indicates the number of STS papers published in the top 10% of journals, based on the *JCR* Impact Factor. Two hundred twenty-seven (227) of 662 papers were published in the top 10% of journals, representing 34.3% of EPA's STS papers. This indicates that more than one-third of the STS papers are published in the highest quality journals as determined by the *JCR* Impact Factor, which is 3.4 times higher than the expected percentage.

| EPA STS<br>Papers in<br>that Journal | Journal                                  | Impact<br>Factor<br>(IF) | <i>JCR</i> IF<br>Rank |
|--------------------------------------|--|--------------------------|-----------------------|

| Total = 227                          |   |                          |                       |

*Immediacy Index*. The *JCR* Immediacy Index is a measure of how quickly the *average article* in a journal is cited. It indicates how often articles published in a journal are cited within the year they are published. The Immediacy Index is calculated by dividing the number of citations to articles published in a given year by the number of articles published in that year.

Table 14 indicates the number of STS papers published in the top 10% of journals, based on the *JCR* Immediacy Index. Two hundred thirty-nine (239) of the 662 papers appear in the top 10% of journals, representing 36.1% of the STS papers. This indicates that one-third of the STS papers are published in the highest quality journals as determined by the *JCR* Immediacy Index, which is 3.6 times higher than the expected percentage.

# Hot Papers

*ESI* establishes citation thresholds for hot papers, which are selected from the highly cited papers in different fields, but the time frame for citing and cited papers is much shorter—papers must be cited within 2 years of publication and the citations must occur in a 2-month time period. Papers are assigned to 2-month periods and thresholds are set for each period and field to select 0.1% of papers. There were no hot papers identified for the current 2-month period (i.e., September-October 2006), but there were a number of hot papers identified from previous periods.

Using the hot paper thresholds established by *ESI* as a benchmark, 8 hot papers, representing 1.2% of the STS papers, were identified in three fields—Chemistry, Engineering, and Plant & Animal Science. The number of STS hot papers is 12 times higher than expected. The hot papers are listed in Table 15.

### Table 15. Hot Papers Identified Using ESI Thresholds

# **Author Self-Citation**

Self-citations are journal article references to articles from that same author (i.e., the first author). Because higher author self-citation rates can inflate the number of citations, the author self-citation rate was calculated for the STS papers. Of the 12,887 total cites, 477 are author self-cites—a 3.7% author

self-citation rate. Garfield and Sher<sup>3</sup> found that authors working in research-based disciplines tend to cite themselves on the average of 20% of the time. MacRoberts and MacRoberts<sup>4</sup> claim that approximately 10% to 30% of all the citations listed fall into the category of author self-citation. Kovacic and Misak<sup>5</sup> recently reported a 20% author self-citation rate for medical literature. Therefore, the 3.7% self-cite rate for the STS papers is well below the range for author self-citation.

#### **Highly Cited Researchers**

A search of Thomson's *ISIHighlyCited.com* revealed that 8 (0.9%) of the 931 authors of the STS papers are highly cited researchers. *ISIHighlyCited.com* is a database of the world's most influential researchers who have made key contributions to science and technology during the period from 1981 to 1999. The highly cited researchers identified during this analysis of the STS publications are presented in Table 16.

| Highly Cited<br>Researcher  | Affiliation                        | <i>ESI</i> Field    |
|-----------------------------|------------------------------------|---------------------|
| Abraham, Michael H.         | University College London          | Chemistry           |
| Calabrese, Joe C.           | E.I. Dupont de Nemours Co.         | Chemistry           |

## Patents

There were 25 patents issued to and 9 patent applications filed by investigators from 1996 to 2006 for research that was conducted under EPA's STS research program. Seventeen (68%) of the 25 patents have been referenced by 114 other patents. These patents and patent applications, along with the patents that reference them, are listed in Table 17.
