## FCC RELEASES SUPPLEMENTAL TELEPHONE PENETRATION REPORT

Washington, D.C. – The Federal Communications Commission (FCC) today released a report presenting data on telephone penetration levels on a state-by-state basis for various income categories. The report presents penetration statistics based on individual household data from the Current Population Survey (CPS) conducted by the Census Bureau in March 2002.

This report, which is updated annually, provides more detailed information on telephone penetration to complement the information available in *Telephone Subscribership in the United States*, which is published three times a year. This report is designed to track the effects of federal and state Lifeline and Linkup support mechanisms that defray the cost of telephone service for low-income consumers.

### Report Highlights

- In March 2002, penetration among low-income households nationwide was 89.1%. This contrasts with an overall nationwide penetration rate of 95.5% in March 2002.
- Since 1985, when the FCC first established Lifeline to help low-income households afford the monthly cost of telephone service, penetration rates among the lowest income households (under \$10,000 annual income in 1984 dollars) have grown steadily from 80.0% to 89.1%.
- States that have taken full or nearly full advantage of federal universal service support for telephone service for low-income consumers saw an average growth in penetration for low-income households of over 4% from March 1997 to March 2002. In contrast, states that did not provide any lifeline support beyond the basic federal support saw an average growth in telephone penetration rates for low-income households between March 1997 and March 2002 of less than 1%.
- Penetration rates among low-income households ranged from a high of 96.5% in Maine to a low of 79.4% in Mississippi in March 2002.

This report is available in the FCC's Reference Information Center, Courtyard Level, 445 12th Street SW, Washington, DC 20554. Call Qualex International at (202) 863-2893 to purchase a copy. This report also can be downloaded from the FCC-State Link Internet site at <<http://www.fcc.gov/wcb/iatd/stats.html>>.

# Telephone Penetration by Income by State

## Executive Summary

This report presents data on telephone penetration levels on a state-by-state basis for various income categories. The report, which covers data through March 2002, is designed to help assess the effects of federal and state support mechanisms that defray the cost of telephone service for low-income consumers.

This report, which is updated annually,<sup>1</sup> is part of a series of supplemental reports on telephone penetration that is designed to complement the information available in *Telephone Subscribership in the United States*.<sup>2</sup> Like the subscribership report, this report is based on data from the Current Population Survey (CPS), which is conducted by the United States Commerce Department's Bureau of the Census (Census Bureau).

## Statistical Findings

- In March 2002, penetration among low-income households nationwide was 89.1%. This contrasts with an overall nationwide penetration rate of 95.5% in March 2002.
- Since 1985, when the Federal Communications Commission (Commission) first established Lifeline to help low-income households afford the monthly cost of telephone service, penetration rates among the lowest income households (under \$10,000 annual income in 1984 dollars) have grown steadily from 80.0% to 89.1%.
- States that have taken full or nearly full advantage of federal universal service support for telephone service for low-income consumers saw an average growth in penetration for low-income households of over 4% from March 1997 to March 2002. In contrast, states that did not provide any lifeline support beyond the basic federal support saw an average growth in telephone penetration rates for low-income households between March 1997 and March 2002 of less than 1%.
- Penetration rates among low-income households ranged from a high of 96.5% in Maine to a low of 79.4% in Mississippi in March 2002.

## Background

Under contract with the Commission, the Census Bureau includes in the CPS questions about telephone availability in United States households and provides the Commission with summary tables on telephone penetration rates. Those tables are used in our subscribership reports. The Census Bureau subsequently provides the Commission with the raw CPS data files

---

1 The last version of this report was released April 23, 2002.

2 *Telephone Subscribership in the United States* is published three times a year. The last report was released April 10, 2003.

containing all of the responses to all of the questions on the CPS questionnaires. This report analyzes the more detailed information in the raw CPS data, to better understand telephone penetration and the effect of our policy decisions.<sup>3</sup>

The number and percentage of households that have telephone service is the most fundamental measure of the success of our universal service policies. Continuing analysis of telephone penetration statistics allows us to examine the effects of Commission policies on households' decisions to maintain, acquire, or discontinue telephone service.

The most widely used measure of telephone subscribership is the percentage of households with telephone service, sometimes called a measure of telephone penetration. Prior to the 1980s, precise measurements of telephone subscribership received little attention. Traditionally, telephone penetration was measured by dividing the number of residential telephone lines by the number of households. Measures of penetration based on the number of residential lines, however, became subject to a large margin of error as more and more households added second telephone lines and more consumers acquired second homes. By 1980, the traditional measure of penetration (residential lines divided by the number of households) reached 96%, while the number of households reporting that they had telephones in the 1980 census was 92.9%.

Recognizing the need for more precise periodic measurements of subscribership, the Commission requested that the Census Bureau include questions on telephone availability as part of the CPS, in order to monitor demographic trends between the decennial censuses. This survey is a staggered panel survey in which the people residing at particular addresses are included in the survey for four consecutive months in one year and the same four corresponding months in the following year. Use of the CPS has several advantages: it is conducted every month by an independent and expert agency, the sample is large, and the questions are consistent. Thus, changes in the results can be compared over time with a reasonable degree of confidence.

The specific question asked in the CPS is: "Is there a telephone in this house/apartment?"<sup>4</sup> If the answer to this question is "yes," the household is counted as having a telephone in the housing unit. Although the survey is conducted every month, not all questions are asked every month. The telephone question is asked once every four months, in the month that a household is first included in the sample and in the month that the household re-enters the sample a year later. Since the sample is staggered, the reported information for any given month actually reflects responses over the preceding four months. Aggregated summaries of the responses are reported to the Commission, based on the surveys conducted through March, July, and November of each year. These summaries form the basis of our subscribership reports.

---

3 Due to the lag in making the raw data available, the data summarized in this report are through March 2002, while the more aggregated data described in our April 2003 *Telephone Subscribership in the United States* are through November 2002.

4 The question is intended to be neutral as to whether the household has wireline or wireless phones.

Once a year, in March, the CPS supplements its survey with additional questions, which seek detailed information about income<sup>5</sup>, and augments its sample with about 2,500 additional Hispanic households. Starting in 2001, the sample was further augmented with about 19,000 additional households with children.<sup>6</sup> The responses from these additional households are not included in the summary tables used in the subscribership reports. Thus, in some cases, there may be small discrepancies between the percentages in the subscribership report and those presented in this report.

The more detailed information from the March surveys makes it possible to adjust the income categories for inflation, and therefore make the purchasing power within each category stable over time. The relative levels of the March Consumer Price Index for all items (as reported in Table 7.4 of the *Universal Service Monitoring Report*) were used to make the inflation adjustment. Thus, for example, \$10,000 in March 1984 dollars had the same purchasing power as \$17,427 in March 2002 dollars. The precise current dollar values in each year are reported at the end of Table 4.

Data are presented here for the following income categories (expressed in March 1984 dollars): \$9,999 or less; \$10,000 - \$19,999; \$20,000 - \$29,999; \$30,000 - \$39,999; and \$40,000 or more. These categories were chosen because they are of approximately equal size, both in terms of income ranges and the number of households in each category. The current report uses only five categories because the small sample sizes caused by a larger number of categories would result in unreliably large sampling variability for some states. The upper limit of the lowest category is also approximately equal to the federal poverty line for a family of four.

The Commission's Lifeline support mechanism was instituted in 1985 to help low-income households afford the monthly cost of telephone service. Under the federal Lifeline support mechanism, local telephone companies offer reduced rates to qualifying households and currently receive reimbursement from the universal service support mechanism. Initially, the program was available only in those states that chose to participate by providing matching assistance.

Effective in 1998, the federal Lifeline support mechanism was revised so that a basic level of assistance would be provided in all states.<sup>7</sup> Additional federal support is also provided

---

5 In the July and November surveys, only broad income categories are reported. (These are the categories that appear in the subscribership reports.)

6 In the last edition of this report, the additional households with children were not included in the data for 2001. The data for that year have been revised in this report to include those households. In addition, the weights for all households, used to estimate the population from the sample, were revised for 2001 to reflect the results of the 2000 decennial Census.

7 The basic federal Lifeline support level is the subscriber line charge plus \$1.75 per line per month. Eligible subscribers living on tribal lands may receive up to \$25 additional Lifeline support as needed to bring their monthly rate down to \$1.

wherever a state chooses to provide matching assistance, at a rate of \$1 in federal support for each \$2 of state matching support, up to a maximum of \$1.75 federal support (corresponding to \$3.50 of state matching support). States may provide further support without further matching federal assistance.

## **Results and Statistical Analysis**

Chart 1 summarizes the telephone penetration rates over time for each income category for the entire United States. (The data are included in Table 4.) Between 1984 and 2002, there was a statistically significant increase in the penetration rate for all households. There also were statistically significant increases in penetration rates in the three lowest income categories over this time period, with the largest increase being in the lowest income category.<sup>8</sup> For the two highest income categories there was no significant change in penetration between 1984 and 2002. Not all of the increases in the national telephone penetration rate can be attributed to increases in real income, because real income increases are reflected in the movement of households between categories. Thus, penetration changes within each income category represent changes holding real income constant.

To help evaluate the effect of the federal Lifeline support mechanism, Table 1 focuses on changes in telephone penetration rates from just before the program was established to just before it was substantially expanded in 1998, by comparing penetration rates for states with and without state Lifeline programs prior to 1998.<sup>9</sup> Briefly, penetration rate increases were greater, on average, in states with Lifeline programs than in states without Lifeline programs.<sup>10</sup> The effect is especially apparent for low-income households,<sup>11</sup> which are the households primarily affected by the federal and state Lifeline programs. Between March 1984 and March 1997, the increase in the average penetration rate in states with Lifeline programs was 6.5% for low-income households. During this period, the increase in subscribership among low-income households in those states that adopted Lifeline programs was double that of states that did not adopt such programs, although there may have been other factors besides Lifeline that contributed to this result.

---

8 See footnote 14 for the critical values for these significance tests.

9 The expanded program was adopted in 1997 and took effect on January 1, 1998. States with Lifeline programs prior to 1998 are identified in Table 3 by showing the year that Lifeline began was before 1998. Prior to the expansion, states participating in the federal Lifeline program were required to match the federal support with their own state support.

10 The averages for the groups of states were computed as weighted averages of the states in the groups, using the total number of households in each state as weights. This was calculated as the total number of households with telephone service in each group of states divided by the total number of households in that group.

11 Low-income households are those with incomes under \$10,000 (expressed in 1984 dollars).

Information on all households is also included in Table 1. Overall penetration rates are more generally available and more commonly cited as measures of penetration than are rates only for low-income households. Penetration rate increases were again greater, on average, in states that established Lifeline programs. The increase for states with Lifeline programs was statistically significant,<sup>12</sup> but the increase for states without state Lifeline programs was not. States that adopted Lifeline programs before 1998 generally had lower penetration rates in 1984 than those that did not adopt such programs. By 1997, the difference in the penetration rates for the two groups diminished significantly.

Table 2 focuses on the change in penetration rates between March 1997 (before the expansion of the federal Lifeline program) and March 2002. The states are divided into four groups:

- “Full Assistance” states providing sufficient support to get the maximum federal matching support. The total state support in these states was \$3.50 or more;<sup>13</sup>
- “Nearly Full Assistance” states providing slightly less support than that required to get the maximum federal matching support. In most cases, \$3.50 support was provided to most but not all lifeline customers. The total state support in these states averaged over \$3.00 per lifeline customer but less than \$3.50;
- “Intermediate Assistance” states providing some support, but less than enough to qualify for the maximum federal matching support. The monthly level of state support in such states was more than \$0 but less than \$3.00;
- “Basic Assistance” states providing no state support, and receiving just the basic federal support.

On average, for low-income households in those states where the maximum federal support is provided, telephone penetration increased significantly, by 4.1%, between March 1997 and March 2002. In this group of states there was a smaller, but also statistically significant, increase in the overall penetration rate for all households. For states with nearly full assistance, there was an increase of 4.2% in the low-income penetration rate and a smaller but significant change in overall penetration. For states with intermediate assistance, there was an increase of 2.3% in the low-income penetration rate and a smaller but significant change in overall penetration. For states with just the basic federal support, the average increases in penetration for low-income households and for all households were less than 1% and not statistically significant.

Data on individual states are provided in Table 3. The support amounts shown in Table 3 are the average state support for all lifeline subscribers in March 2002.

---

12 See the last paragraph (on page 6) for a discussion of the determination of the statistical significance of a change over time. The critical value is dependent on the sizes of the samples from which the change is computed.

13 Any state support over \$3.50 is not matched by further federal support.

Table 4 shows the penetration rates for each income category for each state for each year. These are calculated as the ratio of the estimated number of households with telephone service, shown in Table 5, to the estimated total number of households, shown in Table 6. Table 7 shows the sample sizes on which these estimates are based.

The CPS data are based on a nationwide sample of about 50,000 households. Because a sample is used, the estimates are subject to sampling error. For the nationwide totals, changes in telephone penetration rates between reports of nonconsecutive years of less than 0.4% may be due to sampling error and should not be regarded as statistically significant. As explained below, when comparing the same or corresponding month in two consecutive years, changes of less than or equal to 0.3% are not statistically significant. For individual states or other subgroups of the U.S. population, the amount of sampling variability is much greater.

Table 8 presents critical values for determining whether changes in penetration rates for the state totals in nonconsecutive years are statistically significant (at the 95% confidence level). Because there is an overlap of half of the sample from year to year, but no overlap in the sample between surveys in nonconsecutive years, annual changes are less subject to variations in sampling error. Consequently, the critical values should be multiplied by 0.8 when making a comparison for the same or corresponding month in two consecutive years. For individual income categories, the critical values are larger because the sample sizes are smaller. The sampling variability is inversely related to the square root of the sample size. The critical values for individual income categories can therefore be estimated by taking the critical value for the state total and multiplying it by the square root of the ratio of the sample size for the state total to the sample size for the income category. In most cases, the critical value for an individual income category will be between two and three times the critical value for the state total.<sup>14</sup> In some cases, these critical values are very large because the sample sizes are very small for these subcategories, thereby rendering the estimated penetration rates unreliable.

---

14 For example, using this methodology to calculate critical values for comparing the 1984 and 2002 values for the United States total, the critical values are 0.8% for the \$10,000 - \$19,999 category and the \$40,000 or more category, 0.9% for the \$9,999 or less category and the \$20,000 - \$29,999 category, and 1.1% for the \$30,000 - \$39,999 category. These compare with 0.4% for all households.

## Customer Response

Publication: Telephone Penetration by Income by State (Data Through March 2002)

You can help us provide the best possible information to the public by completing this form and returning it to the Industry Analysis and Technology Division of the FCC's Wireline Competition Bureau.

1. Please check the category that best describes you:
- press
  - current telecommunications carrier
  - potential telecommunications carrier
  - business customer evaluating vendors/service options
  - consultant, law firm, lobbyist
  - other business customer
  - academic/student
  - residential customer
  - FCC employee
  - other federal government employee
  - state or local government employee
  - Other (please specify)

2. Please rate the report:
- |                      | Excellent             | Good                  | Satisfactory          | Poor                  | No opinion            |
|----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
| Data accuracy        | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Data presentation    | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Timeliness of data   | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Completeness of data | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Text clarity         | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Completeness of text | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

3. Overall, how do you rate this report?
- |  | Excellent             | Good                  | Satisfactory          | Poor                  | No opinion            |
|--|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
|  | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
