# TELEPHONE PENETRATION BY INCOME BY STATE 

(Data Through 1999)

ALEXANDER BELINFANTE<br>Industry Analysis Division<br>Common Carrier Bureau<br>Federal Communications Commission

Released: March 2000

This report presents data on telephone penetration levels by state for various income categories. It is designed to help evaluate the degree of success of making telephone service available to low-income households in each state. This report is updated annually. It is part of a series of supplemental reports on telephone penetration that are designed to complement the information available in "Telephone Subscribership in the United States" (subscribership report), which is published three times a year. Like the subscribership report, this report is based on data from the Current Population Survey (CPS), conducted by the Bureau of the Census (Census). Under contract with the Commission, the Census includes in the CPS questions about telephone availability in United States households and provides the Commission with summary tables on telephone penetration rates, which are used in the subscribership reports. The Census later provides the Commission with the raw CPS data files containing all of the responses to all of the questions on the CPS questionnaires. This report is designed to make available more detailed information that can be gleaned from the raw data.

The number and percentage of households that have telephone service represent the most basic measures of the extent of universal service. Continuing analysis of telephone penetration statistics allows us to examine the effects of Commission actions on households' decisions to maintain, acquire, or drop telephone service.

The most widely used measure of telephone availability is the percentage of households with telephone service -- sometimes called a measure of telephone subscribership "penetration." Prior to the 1980s, precise measurements of telephone subscribership received little attention. Traditionally, telephone penetration was measured by dividing the number of residential telephone lines by the number of households. Measures of penetration based on the number of residential lines, however, became subject to a large margin of error as more households added second telephone lines and more consumers acquired second homes. By 1980, the traditional penetration measure (residential lines divided by the number of households) reached $96 \%$, while the number of households reporting that they had telephones in the 1980 census was $92.9 \%$.

Recognizing the need for precise periodic measurements of subscribership, the Commission requested that Census include questions on telephones as part of the CPS, which monitors demographic trends between the decennial censuses. This survey is a staggered panel survey in which the people residing at particular addresses are included for four consecutive months in one year and the same four months in the following year. Use of the CPS has several advantages: it is conducted every month by an independent and expert agency, the sample is large, and the questions are consistent. Thus, changes in the results can be compared over time with a reasonable degree of confidence.

The specific question asked in the CPS is: "Is there a telephone in this house/apartment?" If the answer to this question is "yes," the household is counted as having a telephone in the housing unit. Although the survey is conducted every month, not all questions are asked every month. The telephone question is asked once every four months, in the month that a household is first included in the sample and in the month that the household re-enters the sample a year later. Since the
sample is staggered, the reported information for any given month actually reflects responses over the preceding four months. Aggregated summaries of the responses are reported to the Commission, based on the surveys conducted through March, July, and November of each year. These form the basis of our subscribership reports.

Once a year, in March, the CPS augments its sample with about 2,500 additional Hispanic households, and supplements its survey with additional questions, which seek detailed information about income. The responses from the additional Hispanic households are not included in the summary tables used in the subscribership reports. Thus, in some cases, there may be small discrepancies between the percentages in the subscribership report and those presented in this report. In the July and November surveys, only broad income categories are reported. (These are the categories that appear in the subscribership reports.)

The more detailed information from the March surveys makes it possible to adjust the income categories for inflation. The relative levels of the March Consumer Price Index for all items (as reported in Table 7.4 of the Monitoring Report) were used to make the inflation adjustment. Thus, for example, $\$ 10,000$ in March 1984 dollars had the same purchasing power as $\$ 16,082$ in March 1999 dollars. The precise current dollar values in each year are reported at the end of Table 2.

Data are presented here for the following income categories (expressed in March 1984 dollars): \$9,999 or less; \$10,000-\$19,999; \$20,000-\$29,999; \$30,000-\$39,999; and \$40,000 or more. These categories were chosen because they are of approximately equal size, both in terms of income ranges and the number of households in each category. The current report uses only five categories because the small sample sizes caused by a larger number of categories would result in unreliably large sampling variability for some states.

Chart 1 shows the telephone penetration rates over time for each income category for the total United States. (The data are included in Table 2.) As can be seen from the chart, most income categories have experienced increases in penetration over time, with the largest increases being in the lowest income categories. The changes between 1984 and 1999 are statistically significant for the two lowest income categories and for all households, but not for the three highest income categories. ${ }^{1}$ Not all of the increases in the national total penetration rate can be explained by increases in real income, because real income increases are reflected in the movement of households between categories. Thus, penetration changes within each income category represent changes holding real income constant.

1 See footnote 8 for the critical values for these significance tests.

TELEPHONE PENETRATION BY INCOME
ANNUAL HOUSEHOLD INCOME IN 1984 DOLLARS

To help evaluate the effect of the Federal Communications Commission's (Commission) lifeline program on telephone penetration, our previous reports compared penetration rates for states with and without lifeline programs. ${ }^{2}$ Briefly, penetration increases were greater, on average, in states with lifeline programs than in states without lifeline programs. ${ }^{3}$ This conclusion applied both for all households and for low-income households alone. Also, between March 1984 and March 1998, the increase in the average penetration rate for states with lifeline programs was statistically significant, ${ }^{4}$ while the increase for states without programs was not statistically significant. Again, this was true for all households, as well as those with incomes under $\$ 10,000$ (expressed in 1984 dollars), that would be the households primarily affected by the lifeline program. In 1998, the lifeline program was expanded to all states. Therefore, it is no longer meaningful to compare states with and without a program. The historical experience is summarized in the following table of penetration rates:

ALL HOUSEHOLDS

|  | March 1984 | March 1998 | Change |  |
| :---: | :---: | :---: | :---: | :---: |
| States with Lifeline Programs | 91.5\% | 94.1\% | 2.6\% | * |
| States without Lifeline Programs | 93.3\% | 94.3\% | 0.9\% |  |
| Total United States | 91.8\% | 94.1\% | 2.3\% | * |
| HOUSEHOLDS WITH INCOMES UNDER \$10,000 \# |  |  |  |  |
| States with Lifeline Programs | 79.3\% | 85.6\% | 6.3\% | * |
| States without Lifeline Programs | 83.6\% | 86.1\% | 2.5\% |  |
| Total United States | 80.1\% | 85.7\% | 5.6\% | * |
| Change is statistically significant at the $95 \%$ confidence level. |  |  |  |  |
| \# Income expressed in March 1984 dollars. \$10,000 in March 1984 dollars is equivalent to $\$ 15,809$ in March 1998 dollars. |  |  |  |  |

2 See Telephone Penetration by Income by State (Data through 1998), Federal Communications Commission, February 1999. Table 1 of that report identifies those states with and without lifeline programs and contains data on a state-by-state basis.

3 The averages for the two groups of states were computed as weighted averages of the states in the groups, using the total number of households in each state as weights.

4 See the last paragraph below for a discussion of the determination of the statistical significance of a change over time. The critical value is dependent on the sizes of the samples from which the change is computed.

In this report we move beyond Lifeline issues and turn our attention to another policy that might affect telephone subscribership. Many households that do not currently have service are ones that formerly had service but were disconnected for non-payment. Through December 1998, eighteen states had implemented a policy where local telephone companies are prohibited from disconnecting their consumers from the local telephone network as long as the consumers pay the local portion of their telephone bills. Such a policy is called a "do not disconnect" (DND) policy. Local telephone companies have traditionally billed their customers for local service as well as for long distance service provided by AT\&T or other companies. Most local telephone companies continue to act as billing agents for long distance carriers, and many local telephone companies bill for other services too, including enhanced services and pay-per-call services (900 and 976 numbers). Local telephone companies make excellent billing and collection agents for three reasons: they send their customers a bill every month, their operating systems have been designed to collect for others, and the demand for local telephone service is very strong.

If a local telephone company is unimpeded by a state DND policy, it can present its customer with an ultimatum: either pay the phone bill in its entirety (local charges plus long distance and other types of charges), or be disconnected from the network entirely. The consumer may not be given the option of paying just the local charges, which would allow the consumer to remain connected to the local network. If the local telephone company allowed the consumer to remain connected to the local network, but blocked the consumer from making toll calls, the consumer would still be able to make local and emergency calls, and receive long distance calls. Some consumers cannot pay their entire phone bill and they become disconnected from the network, even though they could pay their local telephone charges. ${ }^{5}$

In states with a DND policy, consumers that pay the local portion of their bill ${ }^{6}$ cannot be disconnected from the local telephone network. The long distance or other companies with unpaid charges can, of course, discontinue their services to those customers who don't remit payment. Typically the customer will enter an arrangement, such as toll blocking, to prevent further use of the services unpaid for, until they are paid.

5 Some states have a "soft dialtone", which is a dialtone that allows people with disconnected phone service to call 911, and to call the local telephone company so that service can be reestablished.

6 In some states with a do not disconnect policy, the local telephone company has discretion on how to apply any funds that the consumer remits, unless the consumer specifies which portion of the bill is being paid. In such states, the local telephone company may decide to prorate any payment evenly across all charges. Upon finding that the local telephone charges were not paid in full, the local telephone company may then lawfully decide to disconnect that consumer, even though the consumer has sent the local telephone company sufficient money to cover the local charges on the bill.

An earlier analysis of DND policies showed that the length of time the DND policy has been in effect affects the penetration rate. ${ }^{7}$ Table 1 compares penetration rates of states without DND policies as of December 1998 with states that had them for less than five years and states that had them for more than five years. It shows that penetration increases between March 1984 and March 1999 have been greater for states that have had DND policies in effect for more than five years than for either of the other two groups. However, it also shows that the penetration increases have been smaller for states that have had DND policies for less than five years than for states with no DND policy. These findings indicate that a DND policy might not have a noticeable beneficial effect on penetration until it has been in effect for several years. We solicit comments on these preliminary findings.

Table 2 shows the penetration rates for each income category for each state for each year. These are calculated as the ratio of the estimated number of households with telephone service, shown in Table 3, to the estimated total number of households, shown in Table 4. Table 5 shows the sample sizes on which these estimates are based.

The CPS data are based on a nationwide sample of about 50,000 households. Because a sample is used, the estimates are subject to sampling error. For the nationwide totals, changes in telephone penetration between reports of nonconsecutive years of less than or equal to $0.5 \%$ may be due to sampling error and cannot be regarded as statistically significant. As explained below, when comparing the same month in two consecutive years, changes of less than or equal to $0.4 \%$ are not statistically significant. For individual states or other subgroups of the U.S. population, the amount of sampling variability is much greater.

Table 6 presents critical values for determining whether changes in penetration for the state totals in nonconsecutive years are statistically significant (at the $95 \%$ confidence level). Because there is an overlap of half of the sample from year to year, but no overlap in the sample between surveys in nonconsecutive years, annual changes are less subject to variations in sampling error. Consequently, the critical values should be multiplied by 0.8 when making a comparison for the same month in two consecutive years. For individual income categories, the critical values are larger because the sample sizes are smaller. The sampling variability is inversely related to the square root of the sample size. The critical values for individual income categories can therefore be estimated by taking the critical value for the state total and multiplying it by the square root of the ratio of the sample size for the state total to the sample size for the income category. In most cases the critical value for an individual income category will be between two and three times the critical

7 See Monitoring Report, CC Docket No. 98-202, December 1999, section 6.
value for the state total. ${ }^{8}$ In some cases these critical values are very large because the sample sizes are very small for these subcategories, thereby rendering the estimated penetration rates unreliable.

8 For example, using this methodology to calculate critical values for comparing the 1984 and 1999 values for the United States total, the critical values are $1.1 \%$ for the $\$ 10,000$ $\$ 19,999$ category, $1.2 \%$ for the $\$ 9,999$ or less category, the $\$ 20,000-\$ 29,999$ category and the $\$ 40,000$ or more category, and $1.5 \%$ for the $\$ 30,000-\$ 39,999$ category. These compare with $0.5 \%$ for all households.
