Helping You Make Informed Decisions

2008 Capital Spending Report:

U.S. CAPITAL SPENDING PATTERNS— 1999-2006

Data in this report are from the Census Bureau's Annual Capital Expenditures Survey (ACES), which collects information on expenditures for new and used structures and equipment by all U.S. nonfarm businesses. (See endnote.)

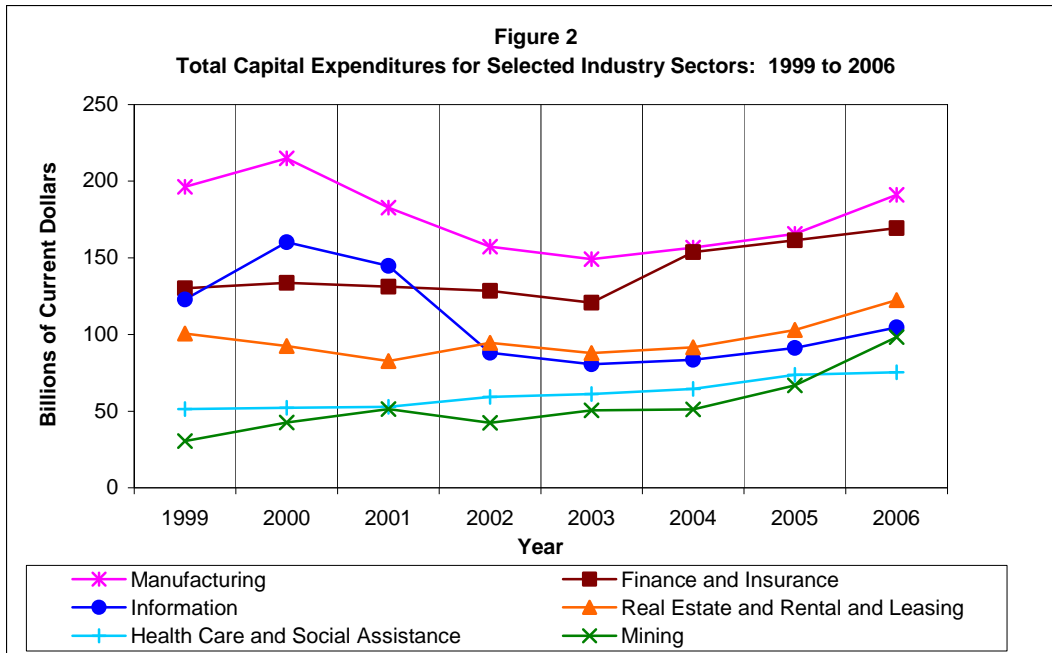

General Highlights:

- In 2006, total spending on new and used structures and equipment (*i.e.*, capital spending) by all U.S. nonfarm businesses (\$1.309 trillion) increased for the third consecutive year.¹ In both absolute and percentage terms, the increase in 2006 (\$164.6 billion; 14.3 percent) was larger than in either of the two previous years. (Figure 1, Table 1a)

¹ Estimates in this report are not adjusted for inflation. This may affect the utility of year-to-year or longer-term comparisons of spending levels, especially when inflation rates are volatile and vary across industries and asset categories. However, with some exceptions (*e.g.*, declines in information technology equipment prices, which may have a negative effect on investment totals in industries that invest heavily in IT equipment) comparisons of shares of overall investment going to this or that industry are less affected by inflation. This report looks closely at industry investment shares over time to see which are growing (shrinking) and, in theory, where firms and capital markets perceive the greatest economic opportunity. Estimates for 2006 are subject to revision.

- Between 1999 and 2006, the period covered by this report, capital spending by U.S. nonfarm businesses varied cyclically. Total spending reached \$1.161 trillion in 2000, then fell each year to a low of \$975 billion in 2003, before recovering in 2004, 2005, and 2006. In 2006, for the first time in the eight-year period, total spending surpassed the level attained in 2000. (Figure 1, Table 1a)
- Sectors registering the largest absolute increases in investment spending between 1999 and 2006 were mining (up \$67.7 billion or 221.5 percent) and finance and insurance (up \$39.3 billion or 30.2 percent). (Figure 2, Table 2a)

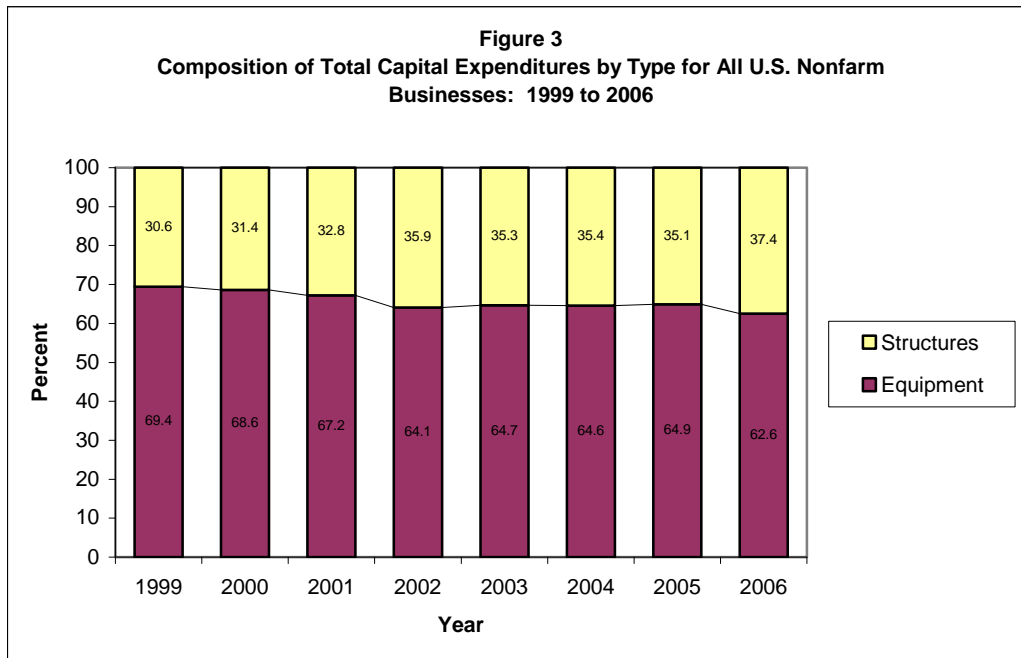

- Sectors experiencing the largest absolute declines in investment spending over the 1999-2006 period were information (down \$18.2 billion or 14.8 percent) and manufacturing (down \$5.4 billion or 2.7 percent). (Figure 2, Table 2a)
- Capital spending is heavily concentrated in a few industry sectors. In 2006, four of the 19 industry sectors accounted for 48.3 percent of all structures and equipment spending by U.S. *employer* businesses²—manufacturing (15.7 percent), finance and insurance (13.9 percent), real estate and rental and leasing (10.1 percent), and information (8.6 percent). (Table 3a)

² The ACES survey collects industry detail only for companies with employees. On average over the period 1999-2006, these companies accounted for about 93 percent of total annual structures and equipment spending by U.S. businesses. *Unless otherwise stated, all estimates in this report are for employer businesses.*

Changes in the Composition of Investment by Type of Investment—Structures and Equipment, 1999-2006

- Between 1999 and 2006, total annual spending on new and used structures by all U.S. nonfarm businesses increased from \$320.1 billion to \$490.3 billion (\$170.2 billion or 53.2 percent). The spending increase in 2006 alone was \$88.7 billion. (Table 1a)
- Between 1999 and 2006, total annual spending on new and used equipment by all U.S. nonfarm businesses increased from \$726.9 billion to \$819.1 billion (\$92.2 billion or 12.7 percent). The spending increase in 2006 (\$76.0 billion) amounts to more than 80 percent of the total increase for the eight-year period. (Table 1a)
- The percentage of investment spending on structures by all U.S. nonfarm businesses increased from 30.6 percent in 1999 to 37.4 percent in 2006. (Figure 3, Table 1a)

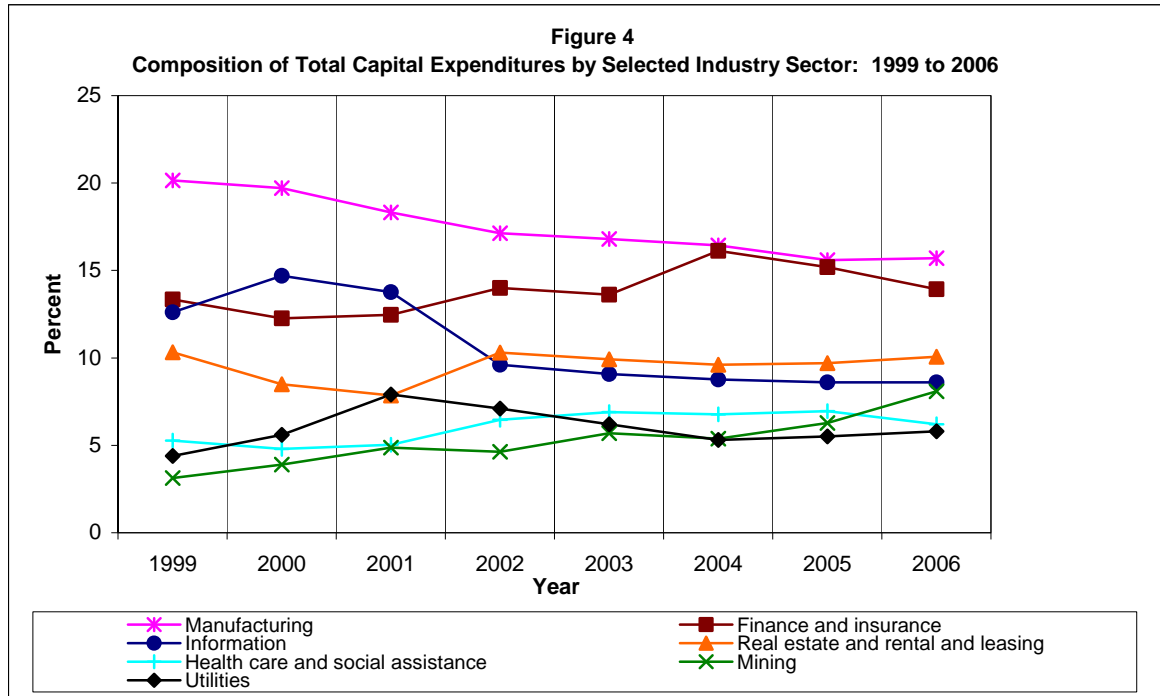

- The renewed shift toward structures in 2006 coincides with an increase in the share of total capital spending accounted for by mining, a sector that typically invests more heavily in structures than equipment. (Tables 4a and 4c)

Changes in the Composition of Investment by Industry Sector

- Sectors experiencing the largest increases in their shares of total capital spending between 1999 and 2006 included mining (up 5.0 percentage points) and utilities (up 1.4 percentage points). (Figure 4, Table 3a)

- Sectors experiencing the largest declines in their shares of total capital spending over the period included manufacturing (down 4.5 percentage points) and information (down 4.0 percentage points). (Figure 4, Table 3a)

Sector-level Highlights:

- **Mining:** Investment spending by employer firms in the mining sector hovered between \$42.5 billion and \$51.3 billion during 2000-2004, but increased to \$66.7 billion in 2005 and \$98.3 billion in 2006. In 2006, spending growth in mining in both absolute and percentage terms (\$31.6 billion; 47.3 percent) exceeded spending growth in all other sectors. Mining, which accounted for only 6.3 percent of total investment spending by employer firms in 2005, accounted for 20.5 percent of the growth in investment spending by these firms between 2005 and 2006. In 2006, the mining share of total investment stood at 8.1 percent. (Table 2a, Table 3a)
- **Manufacturing:** In 2006, investment spending in the manufacturing sector increased by \$25.4 billion, reaching its highest level (\$191.0 billion) since 2001. In addition, for the first time in the 1999-2006 period, the sector's share of total spending (15.7 percent) did not decline, but held steady at the previous-year level.³ (Table 2a, Table 3a)
- **Finance and Insurance:** In 2006, investment spending in the finance and insurance sector reached \$169.4 billion, surpassing the previous (2005) high for the 1999-2006

³ The 0.1 percentage point difference between the 2005 and 2006 estimates of the manufacturing share of total investment spending is not statistically significant.

period. However, the rate of increase lagged that for the economy at large, and the sector's share of total investment spending declined to 13.9 percent (from 15.2 percent in 2005). (Table 2a, Table 3a)

- **Information:** In 2006, investment spending in the information sector increased by \$13.2 billion, reaching its highest level (\$104.6 billion) since 2001; the sector's share of total spending (8.6 percent) held steady at the 2005 level. (Table 2a, Table 3a)
- **Health care:** Investment spending in the health care and social assistance sector increased from \$51.3 billion in 1999 to \$75.4 billion in 2006. However, the increase in 2006 (\$1.6 billion) was below the sector's average annual increase for the 1999-2006 period (\$3.4 billion), and the sector's share of total spending declined to 6.2 percent (from 6.9 percent in 2005). (Table 2a, Table 3a)

ENDNOTE

Initiated in 1993, ACES originally covered 97 industries organized for statistical purposes under the then-operative Standard Industrial Classification code. The survey was expanded in 1999 to 135 industries classified under a new North American Industry Classification System (NAICS). ACES data are published in annual reports about 12 months after the close of each reference year; the most recent report, published in January 2008, covers the reference year 2006 (<http://www.census.gov/csd/ace/>).

This 2008 *Capital Spending Report* continues the Census Bureau's effort to present annual ACES data longitudinally, beginning in 1999, the year when the data were first collected under the NAICS. This 2008 report carries the series through 2006, the reference year for the most recent ACES report. Readers are cautioned that while the *Report* marshals annual ACES data longitudinally, the series is not always internally consistent. This can be attributed to several factors, including changes in the NAICS (e.g., the 1997 NAICS updated to the 2002 NAICS), and changes over time in company organization and classification.

Investment estimates from the ACES that appear in this report are not directly comparable to investment data from other sources. Variations in survey concepts, coverage, definitions, data collection techniques, estimation methodologies, and sample designs may contribute to differences among estimates.

NOTE ON THE DATA

The estimates in this report are based on sample surveys and are subject to sampling and nonsampling errors. Sampling error occurs because only a subset of the entire population is measured. Nonsampling error encompasses all other factors that contribute to the total error of a sample survey and may also occur in censuses.

Sampling Variability

The standard error is a measure of the variability among the estimates from all possible samples that could have been selected using the same sampling methodology used for the ACES. The relative standard error (expressed as a percentage) is the standard error of the estimate divided by the estimate. This report provides relative standard errors for estimates presented in dollar value format and standard errors for estimates presented in percentage format. Note that both the relative standard errors and the standard errors are estimates derived from the sample and are also subject to error.

The relative sampling errors and standard errors presented in this report may be used to derive interval estimates with prescribed levels of confidence that the interval includes the average results of all samples. An interval defined by 1.6 standard errors below and above the estimate will contain the true value approximately 90 percent of the time.

To compute a 90-percent confidence interval for an estimate that has a relative standard error, multiply the estimate by its relative standard error and then by 1.6. Add and subtract the resulting amount from the estimate to obtain the upper and lower bounds of the interval. For example, the estimate for Total Capital Expenditures for All Companies in 2006 shown in Table 1a is \$1,309,426 and the corresponding estimated relative standard error shown in Table 1b is 1.1 percent (0.011). Multiplying \$1,309,426 by 0.011 and then by 1.6 gives \$23,046, and the 90-percent confidence interval is \$1,309,426 +/- \$23,046, or \$1,286,380 to \$1,332,427.

To compute a 90-percent confidence interval for an estimate that has a standard error, multiply the standard error by 1.6. Add and subtract the resulting amount from the estimate to obtain the upper and lower bounds of the interval. For example, the estimate for Percent Change from 1999 to 2006 for Total Expenditures for Companies with Employees shown in Table 2a is 24.8 percent and the corresponding estimated standard error shown in Table 2b is 1.5. Multiplying 1.5 by 1.6 gives 2.4 percent, and the 90-percent confidence interval is 24.8 percent +/- 2.4 percent, or 22.4 percent to 27.2 percent.

Nonsampling Error

All surveys and censuses are subject to nonsampling errors. Nonsampling errors can be attributed to many sources: inability to obtain information about all companies in the sample; inability or unwillingness on the part of respondents to provide correct information; response errors; definition difficulties; differences in the interpretation of questions; mistakes in recording or coding the data; and other errors of collection, response, coverage, and estimation for nonresponse. Although no direct measures of these sources of nonsampling error are available, precautionary steps were taken in all phases of the collection, processing and tabulation of the data in an effort to minimize their influence.

A complete description of the ACES survey design can be found at <http://www.census.gov/csd/ace/pubs.html>.
