CHARACTERISTICS OF THE POPULATION BELOW THE POVERTY LEVEL: 1974

This report presents detailed social and economic statistics for the population of the United States below the poverty level in 1974 based on the March 1975 Current Population Survey (CPS). Data are presented by selected characteristics such as race, family status, education, work experience, type and source of income, and residence in poverty areas. Several historical tables detailing a picture of the changing composition of the population below and above the poverty level since 1959, the first year for which such data are available, are also presented.

In this text, the terms "poverty," "low-income," and "poor" are used interchangeably. The poverty threshold for a nonfarm family of four persons was \$5,038 in 1974, about 11 percent higher than the comparable 1973 cutoff of \$4,540. The poverty thresholds are updated every year to reflect changes in the annual average Consumer Price Index (CPI). See page 143 for a detailed explanation of the poverty level.

Highlights

- Reflecting the downturn in the economy and the substantial inflation, the number of low-income persons increased by 1.3 million or 5.6 percent between 1973

and 1974 (table A). There were 24.3 million persons below the poverty level in 1974 comprising 12 percent of the U.S. population (table 1).

White persons below the poverty level increased by 1.1 million or 8 percent between 1973 and 1974 whereas the change in the number of low-income blacks was not statistically significant. About 9 percent of white persons and 31 percent of black persons were below the poverty level in 1974 (figure 2).

There were about 2.6 million persons of Spanish origin below the low-income level in 1974. The apparent increase in the number of poor persons of Spanish origin between 1973 and 1974 was not statistically significant due to the large sampling variability for this group (table A). About 23 percent of the Spanish origin population was below the poverty level in 1974 (figure 2).

The apparent increase in the number of low-income blacks was 79,000. However, the 95 percent confidence interval around this estimated increase ranged from -281,000 to +439,000.

FIGURE 2. Poverty Rates for Persons of Spanish Origin and Blacks are Higher than those for Whites

- The survey indicated that between 1973 and 1974 there was a 7 percent increase in the number of poor persons under 65 years of age, while the number of such persons 65 years and over did not change significantly. This was the first time since 1970, when substantial increases in Social Security benefits were enacted, that the number of aged poor did not decline. Social Security benefits increased at about the same rate as the Consumer Price Index during 1974. The poverty rate for aged persons was about 16 percent in 1974 compared to 11 percent for those under 65 years (table 7).

- Of the 24.3 million persons below the poverty level in 1974, about 19.4 million were family members, while the remainder were unrelated individuals (persons living alone or with nonrelatives). In 1974, there were 5.1 million families and 4.8 million unrelated individuals below the low-income level (table B). Both of these figures represented increases from the 1973 levels.² Increases in the number of low-income families were observed regardless of the sex of the family head. The number of poor families with a male head increased from 2.6 million in 1973 to 2.8 million in 1974 and those with a female head increased from 2.2 to 2.4 million during the same period. The poverty rate in 1974 was 33 percent for families headed by women compared to 6 percent for those headed by men (table 1).

²The increase for unrelated individuals was statistically significant at the 93 percent confidence level.

- Although a considerable increase (13 percent) in the number of low-income nonaged white persons in families with a male head was observed over the past year, the majority of the poor in 1974 were still either black, of Spanish origin, elderly or in families headed by women. These groups together comprised 66 percent of the low-income population while they represented 27 percent of those above the poverty level.

- In 1973, there were 9.5 million related children under 18 years in families with incomes below the poverty level. Between 1973 and 1974 this figure increased by 8 percent to 10.2 million. The poverty rate for children during this period increased from 14.2 percent in 1973 to 15.5 percent in 1974 (table 1).

- Between 1973 and 1974, the number of low-income families in which the head worked at some time during the year increased from 2.5 to 2.7 million. In 1974, the poverty rate for families headed by a worker was 6 percent compared to 25 percent for those headed by a nonworker (table D).

These are some of the highlights obtained from the Consumer Income Supplement conducted in March 1975 in connection with the Bureau's monthly Current Population Survey (CPS). The information was collected from a sample of persons representing: (1) the civilian noninstitutional population; and (2) members of the Armed Forces living off post or with their families on post in the United States. Unrelated individuals under 14 years of age are also excluded from this report.

The poverty definition used in this report is based on an index developed at the Social Security Administration (SSA) in 1964, and revised by a Federal Inter-agency Committee in 1969. A directive from the Bureau of the Budget (described in the September 1969 Statistical Reporter) established the Census Bureau statistics on poverty as the standard data series to be used by all Federal agencies.

The poverty concept is a statistical yardstick based on the Department of Agriculture's 1961 Economy food plan and reflects the different consumption requirements of families in relation to their size and composition, sex and age of the family head, and farm-nonfarm residence. A food-to-income ratio of one-third for families of three or more, based on the Department of Agriculture's 1955 Survey of Food Consumption, was used to derive the poverty thresholds from the economy food plan.³

³See page 143 for further details.

NA Not available.

Note: Persons of Spanish origin may be of any race, but the vast majority are white.

When analyzing CPS data on the low-income population, it is important to keep in mind that these data are based on a sample survey (47,000 households) and are therefore subject to sampling variability. An explanation of sampling variability is found on page 153 and text tables A, B, and C show examples of standard errors. As in all field surveys of income, the data are also subject to errors of response and nonreporting. For ex-

ample, for many different reasons there is a tendency in household surveys for respondents to underreport their income. Underreporting is especially pronounced for income sources that are not derived from earnings, such as Social Security, public assistance, interest, dividends, net income from rentals, etc. More details on the limitations of the income data are given on page 141. In addition, the reader is reminded that nonmoney income is

not considered in calculating the poverty thresholds or in the income concept used to determine poverty status. Recently, however, receipts from nonmoney transfers such as food stamps have become an increasingly important element in the income of low-income persons.⁴ For example, data from the April 1975 CPS indicate that about 40 percent of all poor families participated in the food stamp program.⁵

Changes in the Poverty Population by Race and Spanish Origin

As shown in figure 1, the overall poverty population was reduced from 39.5 million in 1969 to 24.3 million in 1974. A sharp decrease was observed during the 1964-69 period when the number of low-income persons declined by about 12 million. During the next

⁴ Statistical Abstract of the United States 1975, Table 664.

⁵ Coder, John F., "Characteristics of Households Purchasing Food Stamps in 1974," American Statistical Association, Proceedings of the Social Statistics Section, 1975.

5-year period (1969-74), the number of poor has fluctuated so that in 1974 the figure was not significantly different from the 1969 level. However, as the total population has increased since 1969, the proportion of persons below the poverty level was somewhat lower in 1974 than in 1969 (11.6 percent compared to 12.1 percent).

Figure 3 shows a decrease in both the number of white and black persons below the poverty level between 1966 and 1969.⁶ The rate of decline was sharper for blacks than for whites during this period (20 percent compared to 14 percent). There has been no discernible trend for either race for the 1969-74 period. The number of low-income whites fluctuated with the result that the 1974 figure of 16.3 million was not significantly different from the 1969 figure of 16.7 million. A definite statement on the trend for low-income blacks since 1969 cannot be made because of the relatively large sampling variability for this group (see

⁶ 1966 is the first year that data for blacks are available.

Table D. Poverty Status in 1974 and 1973 of Families by Work Experience and Race of Head

¹Totals include members of the Armed Forces, not shown separately.

table C). Low-income blacks comprise about 3.6 percent of the entire population and consequently small changes over time are difficult to measure from sample survey results.

The survey indicates that there were 2.6 million persons of Spanish origin below the poverty level in 1974 and 2.4 million in 1972 (the earliest year for which comparable data are available). However, because of the small sample size for this group, it is not possible to determine with sufficient confidence whether there is a difference between the two figures.

FIGURE 3. Persons Below the Poverty Level by Race : 1966 to 1974

The Working Poor

As part of the overall reduction in the number of families below the poverty level between 1959 and 1973, the number of such families in which the family head worked at some time during the year declined from 5.6 million to 2.5 million and the poverty rate for these families was reduced from 14.6 percent to 5.5 percent (table 4). However, during the 1973-74 period, an increase was noted in both the number of such low-income families and in their rate (table D).

The increased poverty rate among families with heads who worked at some time during 1974 can be accounted for in part by a decline in the proportion of such families who were headed by a year-round full-time worker. However, for families headed by a year-round

full-time worker, the poverty rate increased somewhat between 1973 and 1974. This increase was noted only among white families. In contrast, there was a decrease in the rate for comparable black families. Of the low-income white families headed by a year-round full-time worker, about one-fourth had total incomes which fell in the "Under \$1,000 or Loss" category in 1974 compared to one-fifth in 1973. The corresponding figures for black families were considerably lower and did not show any evidence of change between 1973 and 1974.

The increased incidence of losses between 1973 and 1974 among white families is reflected in the poverty data. Caution, however, must be used in interpreting poverty data that include losses. Since a loss is a negative income amount, it will reduce the family's total income, but this lower family income could be misleading in terms of the available purchasing power. Families are classified as being above or below the poverty line based on the total money income received by all family members during the calendar year. Of the low-income families that received self-employment income, about four-fifths also received income of another type. A loss in self-employment income could offset the income from other sources and result in the classification of the family as "poor," even though the income from other sources was greater than the appropriate poverty threshold. In addition, for many self-employed persons, gains and losses are sometimes offset when the time span considered is a longer period than the single calendar year that is used to determine poverty status. It is not unusual, for example, for a farmer to report a loss one year and then recoup the next year. Although a family may suffer considerable hardship because of losses, the available data are insufficient to accurately determine the economic well-being of such families.

Among the other factors relating to the poverty status of workers in 1974, the increased unemployment rates for both blacks and whites are frequently mentioned. As noted by Robert Stein,⁷ however, there is generally a lack of overlap between the unemployed and the poor. Several factors are important in explaining this lack of overlap. First, the unemployment data relate to one week out of each month whereas the poverty statistics are based on money income received during the entire calendar year. The difference in the length of the time period that is used to compute the unemployment and the poverty rates is important to note because the data indicate that there are high turnover rates among the unemployed; i.e., most of those who are unemployed at some time during the year are employed for part of the year. In addition, even when unemployed, the majority of jobless workers receive some

⁷"Relationship Between Poverty Measures and Unemployment Measures at the National Level," working paper by Robert Stein (BLS), prepared for Poverty Study Task Force.

income from unemployment compensation. It should also be noted that since income from all family members is included in the income concept used to determine poverty status, it is quite possible for a family in which the head was unemployed for part of the year to have an annual income above the poverty level. Furthermore, in 1974, the wages of many of the workers that were laid off were relatively high for the part of the year in which they worked.

Low-Income Families With Female Heads

Although an increase was noted in the number of low-income families in which the head worked at some time during 1974, the poverty rate for these families (6 percent) was still far lower than for the groups that are usually not associated with the work force, i.e., families headed by women and the elderly. About three-fifths of all low-income female heads of families did not work at all during 1974, and of the female heads that did work, about 45 percent worked less than half the year (table 27).

Changes over time. Each year from 1970 to 1973,⁸ it has been reported that families headed by women have become an increasing proportion of all poor families so that by 1973, 45 percent of all poor families were headed by a female compared to 37 percent in 1970 (table E). The increase in this proportion from 1970 to 1973 resulted from a decrease in the number of poor families headed by men along with an increase in the corresponding number of families headed by women. Between 1973 and 1974, however, low-income families headed by a male increased along with their female counterparts and as a result the proportion of all low-income families which were headed by women did not change significantly during this period.

It should be noted, however, that although the number of low-income female headed families has risen between 1970 and 1974, their poverty rate has not

⁸The apparent increase between 1969 and 1970 in the proportion of low-income families with a female head was not statistically significant.

Table E. Families Below the Poverty Level by Sex and Race of Head: 1969 to 1974

Poverty rate.....	52.8	52.7	53.3	53.5	54.3	53.3

Note: Comparable data for the years 1959 to 1968 can be found in table 1.

changed significantly during this period. This reflects, in part, the increase in the proportion of female headed families in the total population (11.5 percent in 1970 to 13.0 percent in 1974).

Since 1969, there have been some changes in the demographic characteristics of low-income families with a female head. In 1974 these families were more likely to be black, younger, and have fewer children under 18 present than their counterparts of 5 years ago. In 1969, about 40 percent of all poor families headed by women were black. By 1974, this figure had risen to 44 percent. The median age for low-income female headed families declined from 39.2 years in 1969 to 34.3 years in 1974, and the mean number of children under 18 years present declined from 2.8 in 1969 to 2.5 in 1974 (table 4). This decline in the number of children per family is in line with the decrease in family size which has been observed for the Nation as a whole primarily as a result of the declining birth rate of the past decade.

On the other hand, there were no significant changes in the work experience characteristics of female headed families below the poverty level between 1969 and 1974. The proportion of these families that were headed by workers was about two-fifths in both 1969 and 1974. Service workers represented the predominant occupation category in both years (table 4).

Type of income in 1974. Black families headed by women were more likely to receive public assistance than corresponding white families, regardless of poverty status. The figures for the poor in 1974 were 73 percent for blacks compared to 55 percent for whites (table 38). White female headed families, however, were more likely to depend on unearned income from sources other than government transfer programs (for example, dividends, interest, alimony, or private pensions) than their black counterparts. In addition, the mean income amount received from these sources in 1974 was considerably higher for white than for black families (table 38). This could, in part, explain why the poverty rate for

Table F. Persons 65 Years and Over by Poverty Status and Sex: 1970 to 1974

families with a female head who did not work at all during 1974 was lower for whites than for blacks (38 percent compared to 72 percent) (table 27).

The Elderly Poor

Changes over time. The decline in the number of low-income elderly (persons 65 years and over) was pronounced during the 1970 to 1973 period when substantial increases in Social Security benefits were enacted (table F). The proportion of the poverty population represented by the aged was therefore reduced from 19 percent in 1970 to 15 percent in 1973. The poverty rate for this group declined from about one in four to one in six during this period. Between 1973 and 1974, when Social Security benefits increased at about the same rate as the Consumer Price Index, neither the number of poor persons 65 years and over nor their rate showed a statistically significant change.

Family status of the elderly. The majority (62 percent) of low-income aged persons in 1974 were either living alone or with nonrelatives (i.e., they were unrelated individuals). The reverse was true for the total elderly population where about 69 percent were family members (table G). The elderly who were family members had far lower poverty rates than those who were unrelated individuals (9 percent and 32 percent, respectively). Low-income aged family members were distributed about equally by sex, whereas, among low-income unrelated individuals, women outnumbered men by about 4 to 1.

Most elderly male family members in poverty were family heads while about three-fifths of the elderly female family members were wives. Only about 5 percent of all low-income aged family members were considered "other relatives" (i.e., they were neither family heads nor wives) of a younger family head. The comparable figure for the total elderly population was 10 percent.

Table G. Persons 65 Years and Over by Family Status and Poverty Status in 1974

(Numbers in thousands. Persons as of March 1975)

¹Detail does not add to total because some families have more than one of the types of income specified.

²Unemployment and workmen's compensation, government employee pensions, veterans' payments.

³Private pensions, annuities, regular contributions from persons outside the household, etc.

Type of income. Unrelated individuals 65 years and over were more likely to have received Social Security than any other type of income. This was true regardless of poverty status or race (table H). Among low-income white aged unrelated individuals, the next largest category was income from sources other than earnings and government transfer payments (i.e., property income, pensions, and contributions from persons residing outside the household). For comparable blacks, the second largest category was supplemental security income and other types of public assistance. Only about 9 percent of all low-income unrelated individuals

65 years and over received income from earnings in 1974. The figure was about four times higher for the aged who were family heads.

RELATED MATERIALS

Current Population Survey

Current Population Survey Reports. A detailed explanation of the low-income concept appears in *Current Population Reports, Series P-23, No. 28, "Revision in Poverty Statistics, 1959 to 1968."*

A detailed description of the original poverty index developed by the Social Security Administration appears in the following articles by Mollie Orshansky published in the Social Security Bulletin: "Counting the Poor: Another Look at the Poverty Profile," January 1965, and in "Who's Who Among the Poor: A Demographic View of Poverty," July 1965.

Data on poverty based on the original poverty definition appear in Current Population Reports, Series P-60, No. 54, "The Extent of Poverty in the United States: 1959 to 1966." Comprehensive data and analysis of poor persons and families based on the revised definition of poverty appear in Series P-60, No. 68, "Poverty in the United States, 1959 to 1968;" P-60, No. 76; "24 MILLION AMERICANS, Poverty in the United States: 1969;" P-60, No. 81, "Characteristics of the Low-Income Population: 1970;" P-60, No. 86, "Characteristics of the Low-Income Population: 1971;" P-60, No. 91, "Characteristics of the Low-Income Population: 1972;" P-60, No. 95, "Supplementary Report on the Low-Income Population: 1966 to 1972" and P-60, No. 98, "Characteristics of the Low-Income Population: 1973." Data based on the Current Population Survey showing the distribution of families and persons, by income levels, appear in the other P-60 reports, the latest of which is P-60, No. 101, "Money Income in 1974 of Families and Persons in the United States."

Advance data on the low-income population in 1974 cross-classified by selected characteristics appear in Current Population Reports, Series P-60, No. 99, "Money Income and Poverty Status of Families and Persons in the United States: 1974."

Data on the employment status of persons in poverty areas appear in Employment and Earnings, Volume 22, No. 4, October 1975.

A summary of the changes in the composition of the low-income population since 1959 and the limitations of the data used to quantify poverty are presented in "Trends and Composition of the Low-Income Population," by Renee Miller and Arno Winard, Proceedings of the Social Statistics Section, American Statistical Association, 1974.

An analysis of the characteristics of food stamp households appears in "Characteristics of Households Purchasing Food Stamps in 1974" by John Coder, Proceedings of the Social Statistics Section, American Statistical Association, 1975.

Office of Economic Opportunity Tabulations. The data in Tables 6, 10-15, 35, 39, 42, 45, and 46 of this report were extracted from a series of tabulations prepared for and previously distributed by the Office of Economic Opportunity (OEO). These tabulations

contain more detailed cross-classifications by age and other characteristics than are shown in the tables presented in this report. The complete contents of the OEO tables are outlined in appendix B.

Decennial Census

Poverty data collected in the 1970 Census of Population appear in a number of published reports. Selected characteristics of persons, families, and unrelated individuals below the poverty level, for the United States, each of the States, counties, standard metropolitan statistical areas, urbanized areas, and urban places are presented in 1970 Census of Population, Vol. 1, Characteristics of the Population, chapter C, "General Social and Economic Characteristics." Statistics on poverty status in 1969 of persons and families by detailed characteristics, including cross-classifications by race, age, weeks worked, education, type of family, etc., are presented in 1970 Census of Population, Vol. 1, Characteristics of the Population, chapter D, "Detailed Characteristics," for some or all of the following areas: United States, each of the States, and standard metropolitan statistical areas of 250,000 inhabitants or more. Further information is contained in Data Access Description No. 29, Collection, Evaluation, and Processing Series CEP-7, "Low-Income Data from the 1970 census."

Cross-classifications of poverty status in 1969 for persons and families by detailed social, economic, and housing characteristics are presented in 1970 Census of Population, Volume II Report PC(2)-9A, "Low-Income Population." Tables are generally for the United States, although some are repeated for regions and metropolitan-nonmetropolitan residence. Data on the social, economic, and housing characteristics of the low-income population residing in poverty areas in the 50 largest cities can be found in 1970 Census of Population, Volume II Report PC(2)-9B, "Low-Income Areas in Large Cities," "Supplementary Report PC(S1)-56, "Selected Characteristics of the Population in Low-Income Areas of Large Cities," and Supplementary Reports PC(S1)-65 to PC(S1)-103, "Low-Income Neighborhoods in Large Cities: 1970." Selected data on the poverty status in 1969 and 1959 of persons and families for the United States, each of the States, counties, standard metropolitan statistical areas (SMSA's), and central cities of large SMSA's appear in 1970 Census of Population, Supplementary Report, PC(S1)-105, "Poverty Status in 1969 and 1959 of Persons and Families, for States, SMSA's, Central Cities, and Counties: 1970 and 1960."

Statistics on income in 1969 collected in the Current Population Survey of March 1970 differ from data for that year from the 1970 census despite the fact that the same basic concept was used in both instances. In the first place, the survey data exclude the institutional

population and most members of the Armed Forces living on post. These two groups were included in the census. Secondly, college students are generally enumerated at their own homes in the Current Population Survey and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals. Thirdly, the small group of Current Population Survey interviewers was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 60 percent of the households were self-enumerated in the 1970 census. Moreover, income data in the Current Population Survey are based on responses to separate questions on eight types of income, as well as responses to additional yes-no circles within 3 of these questions, whereas in the census only six questions were used.

In general, the number of persons and families below the poverty level reported in the census is higher than that reported in the Current Population Survey. The number of poor persons in the 1970 census was 27.1 million compared to 24.1 million derived from the March 1970 Current Population Survey. The comparable figures for low-income families were 5.5 million and 5.0 million, respectively.

For a more detailed discussion of the overall income differences between the 1970 census and the Current Population Survey, see "Preliminary Evaluation of 1969 Money Income Data Collected in the 1970 Census of Population and Housing" by Mitsuo Ono, American Statistical Association Proceedings of the Social Statistics Section, 1972.

- Represents zero. B Base less than 75,000.

¹Includes a small number of family heads and spouses 14 and 15 years old.

²The data on persons by race in tables 6, 10-15, 45 and 46 differ from those in other tables of this report where persons are classified by race of the family head.

³For an explanation of the use of standard errors, see section entitled "Source and Reliability of the Estimates."

APPENDICES

APPENDIX A

DEFINITIONS AND EXPLANATIONS

Population coverage. This report excludes inmates of institutions and unrelated individuals under 14 years old. It includes only those approximately 1.0 million members of the Armed Forces living off post or with their families on post.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey is the same as that used in the 1960 and 1970 censuses and in the Current Population Surveys since 1960, but differs from that used in earlier surveys and censuses. According to the current definitions, the farm population consists of all persons living in rural territory on places of less than 10 acres yielding agricultural products which sold for \$250 or more in the previous year, or on places of 10 acres or more yielding agricultural products which sold for \$50 or more in the previous year. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming are not classified as farm population.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

The 1974 and the revised 1969 and 1971 to 1973 figures shown in this report for SMSA's are based on the SMSA's as defined on the basis of the 1970 census; those shown for earlier years refer to SMSA's defined on the basis of the 1960 census. As a result of these changes, the proportion of low-income families in 1969 living in metropolitan areas increased from about 49

percent to 52 percent. The comparable figures for families above the low-income level were 66 percent and 70 percent, respectively.

Central cities. The population inside SMSA's is further classified as "inside central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.
2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:
 - a. The additional city or cities have at least 250,000 inhabitants.
 - b. The additional city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Geographic regions. The four major regions of the United States for which data are presented in this report represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

North and West: Northeast, North Central, and West regions combined.

Poverty Areas. For this report poverty areas in metropolitan areas are defined in terms of census tracts and in nonmetropolitan areas in terms of minor civil divisions (townships, districts, etc.) in which 20 percent or more of the population was below the low-income level in 1969. This method of defining poverty areas differs from the definitions used in past Current Population Reports.

The 1970 census definition was developed in order to provide a statistical index based on income only and to utilize the small area data on poverty status which were available in 1970 for the first time in a decennial census. Research was conducted by the Bureau's staff to find a definition that would delineate poverty areas for a given year which would be similar in size and location to those delineated by the 1960 poverty area definition, which consisted of an unweighted combination of five poverty-related socioeconomic characteristics. For this purpose, the Bureau utilized a special tabulation of 1960 census data for census tracts in a sample of large metropolitan areas. Poverty areas defined by the 1960 low-income area definition were compared to those defined by aggregating all census tracts with poverty rates above selected cutoff values. Based on this research, it was determined that areas consisting of census tracts with poverty rates of 20 percent or more most closely approximated those defined by the 1960 method. For further details, see 1970 Census of Population Report PC(2)-9B, "Low-Income Areas in Large Cities," and Supplementary Reports PC(S1)-65 to PC(S1)-103, "Low-Income Neighborhoods in Large Cities: 1970."

Federal regions. The ten standard Federal administrative regions for which data are presented in this report represent groups of States, as follows:

Region I, Boston: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.

Region II, New York: New Jersey, New York.

Region III, Philadelphia: Delaware, District of Columbia, Maryland, Pennsylvania, Virginia, West Virginia.

Region IV, Atlanta: Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee.

Region V, Chicago: Illinois, Indiana, Michigan, Minnesota, Ohio, Wisconsin.

Region VI, Dallas-Fort Worth: Arkansas, Louisiana, New Mexico, Oklahoma, Texas.

Region VII, Kansas City: Iowa, Kansas, Missouri, Nebraska.

Region VIII, Denver: Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming.

Region IX, San Francisco: Arizona, California, Hawaii, Nevada.

Region X, Seattle: Alaska, Idaho, Oregon, Washington.

Mobility status. The population of the United States has been classified according to mobility status on the basis of a comparison between the place of residence of each person at the survey date and the place of residence 5 years earlier.

1. **Nonmovers.** This group consists of persons who were living in the same house at the end of the period as at the beginning of the period.

2. **Movers.** This group consists of all persons who were living in a different house in the United States at the end of the period than at the beginning of the period.

3. **Persons abroad.** This group consists of persons, either citizens or aliens, whose place of residence was outside the United States at the beginning of the period, that is, in an outlying area under the jurisdiction of the United States or in a foreign country.

Income. For each person 14 years old and over in the sample, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) Money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) supplemental security income; (6) public assistance or welfare payments; (7) interest (on savings or bonds); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and workmen's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

When an indefinite amount was reported by the respondent, a specific value was assigned during processing wherever possible. If the indefinite amount was reported in terms of a range, the midpoint of the range was assigned, e.g., \$10,000 to \$15,000 was coded as \$12,500. Open-ended amounts were converted to specific amounts.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on income collected in the CPS are limited to money income received before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Money income is the sum of the amounts received from earnings; Social Security and public assistance payments; dividends, interest, and rent; unemployment and workmen's compensation; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that many families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc.¹ These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Overall, income earned from wages or salary is much better reported than other sources of income and is nearly equal to independent estimates of aggregate income. By contrast, recent CPS income data on Social Security and public assistance payments to beneficiaries have averaged approximately 89 percent and 75 percent of independent estimates, respectively.

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods

and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. The value of salable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government crop loans, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were not considered in determining net income; however, replies based on income tax returns or other official records do reflect inventory changes.

Social Security includes Social Security pensions and survivor's benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government. "Medicare" reimbursements are not included.

Dividends, interest (on savings or bonds), income from estates or trusts, net rental income or net royalties include dividends from stockholdings or membership in associations, interest on savings or bonds, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Public assistance or welfare payments include public assistance payments such as aid to families with dependent children, general assistance, and supplemental security income. Separate payments received for hospital or other medical care (vendor payments) are excluded from this item.

Unemployment compensation, government employee pensions, or veterans' payments include: (1) Unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors; (3)

¹ Estimates of Federally funded non-money transfer income programs benefiting persons below the low-income level are published in the *Statistical Abstract*, 1975, table 664. "Federal Outlays Benefiting Low-Income Persons: 1964 to 1974." It should be noted that federal outlays for in-kind benefits, which in table 664 include "Medicaid" and "Medicare" in addition to "Income security in kind", cannot be equated to increases in consumer income because they do not necessarily release equivalent amounts of funds for either consumption or savings.

money paid periodically by the Veterans' Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; also includes (4) workmen's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private pensions, annuities, alimony, regular contributions from persons not living in the household, and other periodic income include the following types of income: (1) Private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company; (2) periodic receipts from annuities or insurance; (3) alimony and child support; (4) contributions received periodically from persons not living in the household; and (5) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) Money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings—the algebraic sum of money wages or salary and net income from farm and nonfarm self-employment; and

Income other than earnings—the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. The algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings represents total money income. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under \$1,000) those that were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, unrelated individuals who had recently left

families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families and unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of families or unrelated individuals (as appropriate) in that group.

Income per family member. The income per family member is the average amount of income available to every man, woman, and child in a family. Income per family member is derived by dividing the total family income of a group by the number of family members in the same group.

Comparability of Current Population Survey income data with other data from Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics) of the Department of Commerce. The lack of correspondence stems from the following differences in definition and coverage:

Income definition. The personal income series includes, among other items, the following types of nonmoney income which are not included in the census definition: Wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarter, income received from roomers and boarders residing in households, and employee contributions for social insurance which are not included in the personal income series. These items, however, represent a much smaller income total than the non-money items included in personal income.

Source of data. The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employers' wage reports under the Social Security programs,

and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households. As discussed in the section "Source and reliability of the estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 89 percent of the comparable aggregate total money income, 97 percent of the comparable aggregate money wage or salary income, 89 percent of the comparable aggregate money Social Security income, and 75 percent of the comparable aggregate money public assistance income included in the personal income series prepared by the BEA. Comparable estimates are not available for the low-income population.

Poverty (low-income) definition. Poverty statistics presented in this report are based on a definition developed by the Social Security Administration in 1964 and revised by a Federal Interagency Committee in 1969.

Statistics presented in Census Bureau reports prior to publication of Current Population Reports, Series P-60, No. 68, "Poverty in the United States, 1959 to 1968," were based on the poverty index developed by the Social Security Administration (SSA) in 1964. This index provided a range of income cutoffs adjusted by such factors as family size, sex of the family head, number of children under 18 years old, and farm-nonfarm residence. At the core of this definition of poverty was a nutritionally adequate food plan ("economy" plan) designed by the Department of Agriculture for "emergency or temporary use when funds are low." It was determined from the Department of Agriculture's 1955 survey of food consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. Annual revisions of these SSA poverty cutoffs were based on price changes of the items in the economy food budget.

As a result of deliberations of a Federal Interagency Committee in 1969, the following two modifications to the original SSA definition of poverty were recommended: (1) that the SSA thresholds for nonfarm families be retained for the base year 1963, but that annual adjustments in the levels be based on changes in the Consumer Price Index (CPI) rather than on changes in the cost of food included in the economy food plan; and (2) that the farm thresholds be raised from 70 to 85 percent of the corresponding nonfarm levels. The

combined impact of these two modifications resulted in an increase of 360,000 poor families and 1.6 million poor persons in 1967. The reasons for making these changes are outlined below.

Change in cost of living adjustment. Annual revisions of the SSA poverty thresholds were based only on the average per capita cost of the foods in the economy food budget. This method of updating these cutoffs did not fully reflect increases in the overall cost of living during the 1960's. The pace at which the general cost of living advanced in the 1960's was not uniformly matched by increases in the price of goods in the economy food plan. Thus, general price changes since 1959 were not paralleled by comparable changes in the poverty thresholds. The differences between changes in the cost of the economy food budget and the overall cost of living led to the adoption of the CPI as the basis for annual revisions in the income cutoffs.

Table A-1 shows the changes in the CPI between 1959 and 1974 and the corresponding average thresholds for a nonfarm family of four.

Table A-1. Changes Between 1959 and 1974 in the Consumer Price Index and the Average Low-Income Threshold for a Nonfarm Family of Four

Year	Consumer Price Index (1963=100)	Average threshold for a nonfarm family of four persons
1974.....	161.1	\$5,038
1973.....	145.1	4,540
1972.....	136.6	4,275
1971.....	132.3	4,137
1970.....	126.8	3,968
1969.....	119.7	3,743
1968.....	113.6	3,553
1967.....	109.1	3,410
1966.....	106.0	3,317
1965.....	103.1	3,223
1964.....	101.3	3,169
1963.....	100.0	3,128
1962.....	98.8	3,089
1961.....	97.7	3,054
1960.....	96.7	3,022
1959.....	95.2	2,973

Change in the farm-nonfarm relationship. Under the old definition, the poverty thresholds for farm families were adjusted for the average value of food consumed by these families which they had grown themselves.

Based on a 1961 study of household consumption which indicated that the value of food produced by farm families for home use amounted to about 30 percent of their total food budget, the poverty cutoffs for farm families were established at 70 percent of the nonfarm levels.

Up to the present time, no entirely satisfactory means of determining the income required for equivalent levels of living for farm and nonfarm families has been provided by studies on this subject. Further research is needed to analyze the differences in the costs between farm and nonfarm families. Although it is not yet possible to quantify exactly all the factors contributing to cost of living differences between farm and nonfarm families, research already completed suggests that the differences are not as great as provided for by the 70 percent differential. After weighing the available evidence, the Review Committee agreed that narrowing the farm-nonfarm differential to 85 percent more nearly reflects the overall cost of living differences between farm and nonfarm families than the previously used differential.

Alternate level. Because the poverty definition currently in use by the Federal Government does not meet all the needs of the analysts of the data, a variation was introduced at the same time that modifications were made to the SSA poverty index and set at 125 percent of the official government standard. This alternate cutoff is obtained by multiplying the income cutoffs at the low-income level by 1.25. Thus, the income cutoff for a nonfarm family of four at 125 percent of the low-income level is \$6,298. Tables 2, and 46-48 present selected data for persons, families, and unrelated individuals below 125 percent of the low-income level. Also, all the data presented in detailed tables 7, 20, 21, 23, 25-29, 40, 41 and 44 of this report have been tabulated for this additional level and are available upon request for the years 1959 through 1974. Requests for these unpublished data, giving a specific description of the figures desired, may be made in writing to the Chief, Population Division, Bureau of the Census, Washington, D.C. 20233.

Weighted average thresholds at the low-income level. The low-income cutoffs used by the Bureau of the Census to determine the low-income status of families and unrelated individuals consist of a set of 124 thresholds arranged in a four-dimensional matrix consisting of family size (from one person, i.e., unrelated individuals, to seven or more person families) cross-classified by presence and number of family members under 18 years old (from no children present to six or more children present); sex of head, and farm-nonfarm residence (Table A-2). Unrelated individuals and two-person families are further differentiated by age of head (under 65 years and 65 years and over). The total family income of each family in the sample is tested against the appropriate dollar threshold to determine the low-

income status of that family. If the family's total income is less than its corresponding cutoff, the family is classified as below the low-income level. The average thresholds shown in table A-3 were weighted by the presence and number of children. For example, for a given size of family, sex of head, and residence category, the weighted average threshold for that group is obtained by multiplying the threshold for each presence and number of children category within the given family size by the number of families in that category. These products are then aggregated across the entire range of presence and number of children categories, and the total aggregate is divided by the total number of families in the group to yield the weighted average threshold at the low-income level for that size family.

Because family composition varies by farm-nonfarm residence, the weighted average thresholds at the low-income level for farm families, as shown in table A-3, will not be exactly 85 percent of the nonfarm levels. Moreover, since family composition does not remain constant from year to year, the weighted average thresholds for 1974 will not reflect, identically, the change in the CPI between 1974 and earlier years.

Since the basic thresholds used to determine the low-income status of families and unrelated individuals are applied to all families and unrelated individuals, the weighted low-income thresholds are derived using all families and unrelated individuals rather than just those families and unrelated individuals classified as below the low-income level. To obtain the weighted low-income thresholds for families and unrelated individuals below 125 percent of the low-income level, the weighted thresholds shown in table A-3 may be multiplied directly by 1.25.

Income deficit. Income deficit is the difference between the total income of families and unrelated individuals below the low-income level, and their respective income thresholds. In computing the income deficit, families reporting a net income loss are assigned zero dollars and for such cases the deficit is equal to the low-income threshold. This measure provides an estimate of the amount which would be required to raise the incomes of all low-income families and unrelated individuals to their respective low-income thresholds. The income deficit is thus a measure of the degree of impoverishment of a family or unrelated individual. However, caution must be exercised in comparing the average deficit of families of different racial groups. Since the low-income thresholds used in this report are based on family size and composition, apparent differences in the average income deficits of racial groups may, to some extent, be a function of the differences in these characteristics. It must also be remembered that the thresholds in this report vary according to the sex of the family head. Thus, differences in the average deficit between families with a male or female head may be in part attributable to both differences in thresholds and to differences in family size and composition.

Table A-2. Income Thresholds at the Poverty Level in 1974 by Sex of Head, Size of Family,
and Number of Related Children Under 18 Years Old, by Farm-Nonfarm Residence

Size of family unit	Number of related children under 18 years old						
	None	1	2	3	4	5	6 or more

¹For one person (i.e. unrelated individual), sex of the individual.

Median income deficit. The median income deficit is the amount which divides the distribution into two equal groups, one having an income deficit above the median and the other having an income deficit below the median.

Mean income deficit. The mean income deficit is the amount obtained by dividing the total income deficit of a group below the low-income level by the number of families or unrelated individuals (as appropriate) in that group.

Deficit per family member. The deficit per family member is the average amount of money necessary to raise every man, woman, and child in a family out of poverty. The deficit per family member is derived by dividing the total family income deficit of a group by the number of family members in the same group.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, a lodger and his wife not related to the head of the household or an unrelated servant and his wife are considered as additional families, and not a part of the household head's family.

Head of family. One person in each family was designated as the head. Women are not classified as heads if their husbands are resident members of the family at the time of the survey. In other cases, the head is usually the person regarded as the head by members of the family. Married couples related to the head of a family are included in the head's family and are not classified as separate families.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the head of the household or his wife. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Marital status. The marital status classification refers to the status at the time of enumeration. "Separated" is regarded as a subdivision of the category "married" and includes persons with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord.

Size of family. The term "size of family" refers to the number of persons who are living together and are related to each other by blood, marriage, or adoption.

Unrelated individual. The term "unrelated individual," as used in this report, refers to persons 14 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household by himself, or he may be part of a household including one or more other families or unrelated individuals, or he may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her and a lodger not related to the head of the household or to anyone else in the household are examples of unrelated individuals.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. "Related"

children in a family include own children and all other children in the household who are related to the family head by blood marriage, or adoption.

Number of earners. This number includes all persons in the family with \$1 or more in wages and salaries, or \$1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro.

Spanish origin. To reduce the sampling variability and thereby increase the reliability of the data for persons of Spanish origin, the number of "Spanish households" in the March 1975 CPS was doubled compared to earlier years. This was accomplished by interviewing in March 1975, in addition to the "regular" sample, the households from the November 1974 sample containing at least one person of Spanish origin. Because of changes in sample design, question wording, and allocation procedures to assign origin to persons under 14 years of age, the overall count of persons of Spanish origin in the March 1973 to 1975 CPS is not strictly comparable with data for earlier years. Comparability of Spanish origin data from the March 1973 CPS with those for earlier years is discussed in Current Population Reports, Series P-20, No. 264, "Persons of Spanish Origin in the United States: March 1973."

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For

example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status in this report relate to family heads and unrelated individuals 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians 14 years old and over who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation, industry, and class of worker. Persons are classified according to the civilian job held longest during the year. Persons who held two jobs or more were reported in the job at which they worked the greatest number of weeks.

The occupation and industry groupings included in this report were based on the classification system used in the 1970 census, as were the data included in Current Population Reports, Series P-60, Nos. 81, 86, 91 and 98. A detailed comparison of the 1970 classification systems to those used during the 1960's may be found in the Bureau of the Census Technical Paper 26, 1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements.

In addition to the change in occupational titles between the March 1972 and the March 1971 surveys which did not affect the comparability of the data, a supplemental question, "What were your most important activities or duties?" was added which provided additional information for classifying persons by occupation. In general, the major impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "craft and kindred workers").

Class of worker refers to the subdivision of workers into three groups: Wage and salary workers, self-employed workers, and unpaid family workers. The first group refers to persons working for wages, salaries, commissions, tips, pay "in kind", or at piece rate for private employer or for any government unit. The second group refers to persons working in their own business, profession, or trade, for profit or fees. The third group refers to persons working without pay in a business operated by a member of the household to whom they are related by blood or marriage.

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks during the preceding calendar year in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year if he worked at civilian jobs which

provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Main reason for working part year. For persons who worked 1 to 49 weeks during the year, the main reason for working part year is based on the response to the question "What were you doing most of the remaining weeks?"

Main reason for not working. For persons who reported that they did not work at a civilian job for pay or profit or on a family-operated farm or business during the year, the main reason for not working is derived from the response to the question "What were you doing most of last year?"

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. An estimate of the size of the base (number of persons and families, etc.) of each percent is shown in most of the tables of this report. The 1971 to 1974, and revised 1970 and 1969 base figures shown in this report were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census. The base figures for the years 1961 to 1969 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census.

The major effects resulting from the introduction of population controls and estimation procedures based on the 1970 census were to raise the number of families from 51.2 million to 51.6 million in the March 1970 CPS and to lower the number of related children under 18 from 69.8 to 68.7 million. However, the number of poor families and the number of related children below the low-income level remained about the same—5 million and about 9.5 million, respectively.

LIMITATIONS OF THE POVERTY CONCEPT

In analyzing data on the low-income population, the following limitations should be noted. The low-income concept has been developed in order to identify, in dollar terms, a minimum level of income adequacy for families of different types in keeping with American consumption patterns. Based on an analysis of the percent of income devoted to food expenditures, an estimate was developed of the minimum cost at which an American family, making average choices, can be provided with a diet meeting recommended nutritional goals. Consequently, it is an overall statistical yardstick which reflects the different consumption requirements of families of different size, taking into account family composition and farm-nonfarm residence. Insofar as individual circumstances or consumption patterns differ, the dollar value of the low-income threshold for a given family size may not represent the money income required by an individual family to maintain a level of economic well being equivalent to other families with similar incomes. For a discussion of the limitations of money income as a measure of economic status, see "Trends and Composition of the Low-Income Population," by Renée Miller and Arno Winard, Proceedings of the Social Statistics Section, American Statistical Association, 1974.

The original intent of the poverty definition was not for administrative use in any specific program; it was to be a statistical yardstick. The problem arises when this concept, in the absence of any other measure, is used to determine eligibility in programs to aid the poor. In April 1973, the Interagency Committee on Income Distribution and Poverty was requested by the Statistical Policy Division of the Office of Management and Budget to conduct a thorough review of the statistics on income and poverty. Three subcommittees, one focusing on updating the poverty threshold, another on measuring cash income, and the third on measuring noncash income, met throughout the summer of 1973 and came up with a number of recommendations. One of the conclusions reached by the Subcommittee on Updating the Poverty Threshold was that the development of separate measures for eligibility in programs should receive high priority. For a summary of the research recommendations of the Interagency Committee see "Review of Poverty and Income Distribution Statistics" by Bette S. Mahoney, Statistical Reporter, Statistical Policy Division, Office of Management and Budget, January 1974.

A further review of the poverty definition is now underway. The Education Amendments of 1974 require the Assistant Secretary of Education, Department of Health, Education and Welfare, to supervise a "thorough study of the manner in which the relative measure of

poverty for use in the financial assistance program authorized by Title I of the Elementary and Secondary Education Act of 1965 may be more accurately and currently developed." At the end of 1974 an interagency Poverty Study Task Force was established under the leadership of HEW which has undertaken an intensive review of the present definition of poverty and of the implications of various alternatives. A final report is to be submitted to the Congress by the end of calendar year 1975. Inquiries concerning the work of the Poverty Study Task Force should be addressed to Ms. Bette Mahoney, Office of the Assistant Secretary for Planning and Evaluation, HEW.

COMPARABILITY OF ESTIMATES FROM MARCH 1975 CPS WITH ESTIMATES FOR PREVIOUS YEARS

The data for 1971 to 1974 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances, data from the March 1970 and 1971 CPS's were revised to take account of 1970 census-based population controls, thus providing some measure of the impact of the changes (see Table 3, Current Population Reports, Series P-60, No. 91). Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings such as the total number of persons or families either overall, within some particular income interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, "Employment and Earnings," Vol. 18, No. 8, February 1972.

The figures shown in this report for metropolitan areas (SMSA's) are based on the SMSA's as defined on the basis of the 1970 census; those published in earlier years referred to SMSA's as defined on the basis of the 1960 census. There are significant differences in the population classified as metropolitan from each of these definitions. For the 1970 definition of SMSA's, see 1970 Census of Population, United States Summary, PC(1)-A1, "Number of Inhabitants."

Another change in the Current Population Survey, which affects occupational data only is the inclusion of a supplemental question, "What were your most important activities or duties?" which provided additional information for classifying persons by occupation. In general, the impact of this supplemental question was to reclassify some persons from the "managers" classification into other types of occupations (primarily into the major occupation group of "craft and kindred workers").

NONRESPONSES AND ALLOCATIONS

In the March 1975 CPS, no information was recorded for approximately 5 percent of the 47,000 households because no interview could be obtained during the week in which the enumeration was conducted. In order to account for these households, the weights assigned to other sample households of similar characteristics residing in the same sample areas were increased accordingly. In addition, complete income information was not reported for about 22 percent of all families and 16 percent of all unrelated individuals. Overall, about 16 percent of all persons 14 years old and over in households that were interviewed did not report complete income information.

Although nonresponse rates for families by low-income status are not available, it is known that families in the lower income intervals tend to have lower nonresponse rates than those in the middle and upper income intervals. This is due in part to the fact that lower income families have less complicated financial arrangements than those in other income groups. For a more detailed discussion of this topic see paper by Mitsuo Ono and Herman P. Miller, "Income Non-responses in the Current Population Survey" published in Proceedings of the Social Statistics Section, American Statistical Association, 1969.

For more detailed information on the characteristics of nonrespondents, see "Characteristics of Income Nonrespondents in the Current Population Survey," by Emmett Spiers, John Coder, and Mitsuo Ono, American Statistical Association Proceedings of the Social Statistics Section, 1971.

In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics. Beginning with the March 1962 survey, when a respondent did not answer one or more of the income items, all of his income data were imputed.

Beginning with the March 1966 survey, however, in the event a respondent did not answer one or more of the income questions, the missing income data for this person were imputed for only those income items which were not answered. Each of the earnings items was handled individually, whereas income items other than earnings were handled as a group. Characteristics used in this imputation are age, family status, race, residence, weeks worked, and major occupation group. The income amount assigned to a nonrespondent is that observed for another person with similar demographic and economic characteristics who did respond and who has been selected systematically in the order in which individual records are processed.

In the tabulation of income from surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distribution as those who do provide such information. Using income data for 1958, a comparison was made of the income distributions obtained before and after the assignment of income to nonrespondents on the basis of known demographic and economic characteristics. This comparison indicated that the procedure for making individual assignments of income to nonrespondents resulted in slightly higher estimates of the proportion of families and individuals in the upper income classes than those obtained from the distributions based solely on those reporting on income. (See Current Population Reports, Series P-60, No.33, tables F and G.)

Beginning with the 1967 CPS, the Bureau of the Census introduced improved income edit and allocation procedures. The main feature of the new procedures is a more refined method for imputing missing income data which expands the use of information already known about that person. Among the major improvements made affecting the income data are the following: (1) an expanded set of social and economic characteristics within which the imputations are made; in addition to age, race, occupation, and weeks worked; the new procedures include sex and type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missing earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings.

However, because of coding errors in the processing of the 1968 CPS data, in that year alone it was not possible to apply all the aforementioned improvements to the editing and allocation procedures. Since these errors produced an under-estimate of income, they had the effect of over-stating the number of poor.

In addition, it was discovered that the computer procedures for editing certain incorrect income codes caused an upward bias in the income data for some respondents and therefore would tend to produce an underestimate of the number of poor. It is estimated that the net impact of these errors had the effect of overestimating the number of poor families by about 120 thousand. Due to these errors affecting the income data for 1967, data for that year are not strictly comparable with those shown for 1966, and 1968 to 1974.

Comparison of 1966 poverty data according to original and revised editing and allocation procedures. In order to evaluate the impact of the new procedures, the poverty data from the March 1967 CPS were rerun, thus providing a bridge for the 1966 income year showing the results of both the earlier and the new procedures. Both series of data are shown in table 1 of Current Population Reports, Series P-60, No. 98. The general impact of the new allocation procedure was to shift the income distribution slightly upward, thus decreasing by 416,000 the number of poor families. A more detailed description of the new computer editing and allocation procedures may be found in Current Population Reports, Series P-60, No. 59, "Income in 1967 of Families in the United States," pages 17 to 19.

QUESTIONNAIRE AND PROCEDURAL CHANGES

Modifications in collecting income data in the March-April 1969 CPS. Several modifications were introduced in the collection of income data in the March and April CPS supplements. These include (1) extension of the interview period of the six rotation groups for which income questions were asked in March and the use of followup forms in these six groups to accommodate household respondents who needed more time to obtain the required income information (it is estimated that some members of approximately 4,400 households, or 9 percent of the total relevant households, made use of these followup forms); (2) modification of the design and content of the questionnaire to allow for more detailed questioning of certain income items; thus, boxes for gross receipts, business expenses, and net income have been added to the self-employment income questions to help the interviewer and respondent determine net income, and "yes-no" circles were added to the questions on income other than earnings in order to ascertain whether the respondent received or did not receive income; (3) field office editing procedures were extended to a 100 percent income edit of the CPS

schedules; (4) training instructions were strengthened by including more detailed explanations and more examples; and (5) the interview group training session was shifted from February to March.

Modifications in collecting income data in the March 1970 Current Population Survey. The Bureau introduced modifications in the collection of income data for the March 1970 CPS supplement. These were: (1) An advance letter informing households about the collection of income data was mailed to all households except those in the first and fifth months. The latter households received special letters which explained the need for collecting both CPS and census data; (2) information on work experience and income was collected simultaneously for the full sample (in previous years, work experience information was collected separately from income data); (3) the interview period was extended one week for three-fourths of the sample (using followup calls and separate questionnaires). In addition, modified procedures which were incorporated in the March 1969 CPS supplement were also implemented in the March 1970 CPS. Overall, data indicate that the use of these procedures has resulted in some improvement in the collection of income data. The family income nonresponse rate has not only dropped by 5 percentage points (from 19 to 14 percent) but also it appears that the proportion of aggregate income amounts collected in the March 1970 CPS relative to benchmark totals has increased slightly in the March 1970 CPS supplement as compared with the proportion collected in the March 1969 CPS supplement.

Modification in collecting income data in the March 1971 Current Population Survey. The Bureau continued to use the improved procedures which were incorporated in the March 1970 CPS. Procedural changes that were instituted in the March 1971 CPS, among others, were:

1. The interview period was extended one week for all households in the sample (using follow-up calls and separate questionnaires). In the previous year's survey, the interview period was extended for only three-fourths of the sample.
2. Income from net royalties was included in the question covering estates, trusts, or dividends, interest on savings accounts or bonds, and net rental income. In previous surveys, income from net royalties was included in the question covering private pensions, annuities, alimony, regular contributions from persons not living in this household, and anything else.
3. An additional regional office follow-up was made by telephone to obtain income amounts for all follow-up cases containing one or more persons who were not interviewed during the original follow-up period, except for refusal.

Modifications in collecting income data in the March 1975 Current Population Survey. Several modifications in the design and content of the questionnaire were introduced in the March 1975 CPS to allow for more detailed questioning of certain income items. These changes were:

1. In the March 1974 CPS, income from aid to families with dependent children, old age assistance, and aid to the blind or totally disabled were asked in one combined question on welfare payments. Beginning in January 1974, the programs for old age assistance and aid to the blind or totally disabled were replaced by the Supplemental Security program. Therefore, in March 1975 a separate question was asked for the receipt of supplemental security income. Income from aid to families with dependent children or any other assistance was asked under the general category of public assistance or welfare payments.

2. In the March 1974 CPS, income from interest, net rental income or income from estates, trusts, or dividends was asked in one question. In the 1975 CPS these income types were asked as two questions with income received from interest on savings accounts or bonds included in one question and income from estates, trusts, or dividends in the other.

3. In the March 1974 CPS, income received from private pensions was asked along with alimony and certain other income items while income from government employee pensions was asked along with veterans' payments, unemployment compensation and workmen's compensation. In the March 1975 CPS, income received from both private and government employee pensions (including military retirement) were extracted from their previous categories and asked as one combined question.

In order to expedite processing of the March 1975 CPS data, it was decided to tabulate the income data according to the same income groupings used from the March 1974 CPS data. The new information on supplemental security income was tabulated along with public assistance since it replaced old age assistance and aid to the blind or totally disabled. It is planned to incorporate the detailed income categories into the published income tabulations for the March 1976 CPS.

OTHER LIMITATIONS OF THE DATA

Although every effort is made to reduce the errors of underreporting, nonreporting or misreporting of income data in the Current Population Survey, they still occur because of various reasons. Some of these are (1) overlooking income received, especially small amounts of income types not regularly received, e.g., contri-

butions from nonhousehold members, (2) reluctance to reveal certain types of income, e.g., public assistance (3) rounding estimates, (4) misunderstanding the question, (5) lack of information, especially covering family members not present at the time of interview, (6) interviewers' errors, (7) processing errors, etc. For more details on this topic of income underreporting in censuses and surveys, see (1) Income Distribution in the United States (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966, (2) The Structure of Income, by Irving B. Kravis, University of Pennsylvania, 1962; and (3) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates of annual income for a particular year are based on data obtained in March of the following year in the Current Population Survey (CPS) of the Bureau of the Census. For example, income data for the year 1974 were obtained in the CPS in March 1975.

The 1975 sample is spread over 461 areas comprising 923 counties and independent cities with coverage in each of the 50 States and the District of Columbia. As of July 1971, approximately 47,000 occupied households are eligible for interview each month. Of this number, 2,000 occupied units, on the average, are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason. In addition to the 47,000, there are also about 8,000 sample units in an average month which are visited but are found to be vacant or otherwise not to be interviewed.

From January 1967 through July 1972 the sample was spread over 449 areas. From January 1967 through June 1971 approximately 50,000 occupied housing units were eligible for interview each month.

For data collected in years prior to 1967, the sample was spread over fewer areas with fewer interviewed households. Prior to the March 1966 survey, income data were collected from only 75 percent of the households included in the CPS. See Current Population Reports, series P-23, No. 22, "Concepts and Methods Used in Manpower Statistics from the Current Population Survey", June 1967, pp. 7-10, for more information about the sample design.

The estimating procedure used for the March 1970 through March 1975 data involved the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States

by age, race, and sex. These independent estimates were based on statistics from the 1970 population; statistics of births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. To these totals were added the population in the Armed Forces living off post or with their families on post. A further adjustment was made so that the husband and wife of a household got the same weight while at the same time leaving unchanged the estimates for certain basic labor force categories.

Report No. 81 in this series showed somewhat different figures for 1970 since the data in that report were inflated to independent estimates of the population based on 1960 census data. For data collected in the Current Population Surveys in the years 1960 through 1969, the independent estimates used were based on statistics from the 1960 Census of Population.

To show comparable poverty data for 1969 and 1959 by detailed type of residence, it was necessary to use data from the 1960 census for 1959 estimates rather than from the 1960 CPS. In table 3, 1959 data based on 1960 census data are identified as such; other tables for 1959 are based on 1960 CPS data. The type of residence classification used in the 1960 CPS was based on data from the 1950 census. Therefore, to achieve comparability with March 1970 CPS data, special tabulations of poverty data from the 53,000 households in the 1-in-1,000 sample of 1960 census data were prepared. The 1974, 1973, 1972, 1971, and revised 1969 data² by residence are based on the 1970 census residence definition; therefore, they are not strictly comparable to data for earlier years which are based on 1960 census metropolitan area definitions.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions and enumerators. As in any survey work, the results are subject to errors of response and of reporting, as well as being subject to sampling variability.

Errors in reporting. In most cases, the schedule entries for income are based on memory rather than on records, and, in the majority of cases, on the memory or knowledge of one person, usually the wife of the family head. The memory factor in data derived from field surveys of income produces underestimates because the tendency is to forget minor or irregular sources of income. These errors of reporting are due to misrepre-

sentation or to misunderstanding of the scope of the income concept. See the section on "Other Limitations of the Data" for further details.

Standard errors. The reliability of an estimate is described in terms of standard errors which are primarily measures of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. As calculated for this report, the standard error also partially measures the effect of certain response and enumeration errors but does not measure, as such, any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that the difference would be less than 1.6 times the standard error, and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better. Most are significant at a level of more than 2.0 standard errors. Thus, for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables A-4 through A-11 are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. In addition where two or more items have nearly the same standard errors, one table is used to represent them. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item. Standard errors for values within the ranges of the tables may be approximated by interpolation.

Description of which standard error table to use. Tables A-4 and A-5 contain the standard errors of estimates of the number of total persons and persons below the poverty level, the number of total persons and persons below the poverty level who are 65 years and over, and the number of families and unrelated individuals regardless of poverty status for the years 1966 through 1974. The last column of tables A-4 and A-5 pertaining to families should also be used for items which can typically appear only once in a given family, e.g., "number of male heads of families."

²For more details, see the section on "Comparability of Estimates from March 1975 CPS With Estimates for Previous Years."

Table A-4. Standard Errors of Estimated Numbers for 1966-1974

Total or White

(68 chances out of 100. In thousands)

Size of estimate	Standard error for persons ¹				Standard error for families and unrelated individuals ²
	All income levels		Below poverty level		
	Total	65 years and over	Total	65 years and over	
100.....	12	12	25	25	10
250.....	20	19	39	39	16
500.....	28	27	55	55	23
1,000.....	39	38	78	76	32
2,500.....	62	58	123	116	51
5,000.....	87	76	173	152	72
10,000.....	121	89	242	178	99
25,000.....	184	(X)	367	(X)	147

Note: To estimate standard errors for persons in the 10 Federal Regions at all income levels divide these standard errors by 2.0.

X Not applicable.

Table A-6 contains the standard errors of the estimated number of persons below the poverty level in the 10 Federal Regions in the United States.

Tables A-7 through A-11 contain standard errors of estimated percentages of persons below the poverty level and total persons for the United States and the 10 Federal Regions and of families and unrelated individuals regardless of poverty status for the United States.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the table indicated by the numerator. The guidelines used to decide whether tables A-4, A-5 or A-6 are appropriate for a particular item should also be used for deciding which of tables A-7 through A-11 is correct.

Methods for finding standard errors of estimated numbers and percentages. Tables A-4, A-5, and A-6 show standard errors for estimated numbers. Linear interpolation in these tables may be used to obtain standard errors for intermediate values not shown, or the following formula, (F.1), from which the standard errors were derived, may be used directly to compute the standard error; direct computation will give more accurate results than linear interpolation:

$$\sigma_x = \sqrt{ax^2 + bx} \quad (F.1)$$

In this formula, x is the size of the estimate and a and b are parameters used to calculate standard errors for the particular type of characteristic that x represents. The parameters for persons, families, and unrelated individuals in the United States can be obtained from table A-12 and the parameters for persons below the poverty level in the 10 Federal Regions are in table A-13. The standard errors displayed in selected tables of the estimates were calculated using formula (F.1).

Tables A-7 through A-11 contain standard errors of estimated percentages. Linear interpolation in these tables may be used to obtain standard errors for intermediate values of x and p, or the following

formula, (F.2), from which the standard errors were derived, may be used directly to compute the standard errors; direct computation will give more accurate results than interpolation.

$$\sigma_{x,p} = \sqrt{\frac{b}{x} \cdot p \cdot (100-p)} \quad (F.2)$$

Here x is the size of the subclass of the population which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table A-12 or A-13 associated with the particular type of characteristic in the numerator of the percentage.

Note when using small estimates. Percentage distributions are shown in this report only when the base of the percentage is greater than 75,000. Because of the large standard errors involved, there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated totals are shown, however, even though the relative standard errors of these totals are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Illustration of the use of tables of standard errors. Table B of this report shows that in 1974 there were 1,607,000 male unrelated individuals below the poverty level. Table A-4 shows the standard error of an estimate of this size to be approximately 40,000³. The

³ Formula (F.1) gives a standard error of 41,000 as shown in table B.

chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 40,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 80,000 (twice the standard error).

Table 8 of this report shows that of these 1,607,000 total male unrelated individuals below the poverty level, 1,200,000 or 74.7 percent were white male unrelated individuals below the poverty level. Table A-9 shows the standard error of 74.7 percent on a base of 1,607,000 to be approximately 1.2 percent⁴. Consequently, chances are 68 out of 100 that the estimated 74.7 percent would be within 1.2 percentage points of a complete census figure, and chances are 95 out of 100 that the estimate would be within 2.4 percentage points of a complete census figure, i.e., this 95 percent confidence interval would be from 72.3 to 77.1 percent.

Standard Error of a Difference. The formula for approximate standard errors of the difference between two estimates is given by (F.3):

$$\sigma_{\Delta} = \sqrt{\sigma_1^2 + \sigma_2^2 - 2\rho\sigma_1\sigma_2} \quad (F.3)$$

where σ_1 and σ_2 are the standard errors presented in Tables A-4 through A-11. The correlation coefficient ρ can be determined from table A-14, for year-to-year

⁴ Formula (F.2) gives a standard error of 1.1 percent.

Table A-7. Standard Errors of Estimated Percentages of Persons Below the Poverty Level: 1966-1974

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50

10,000.....	0.14	0.2	0.3	0.4	0.5
25,000.....	0.09	0.14	0.2	0.3	0.3
50,000.....	0.06	0.10	0.14	0.2	0.2

Note: To estimate standard errors for CPS data for 1959-1964, multiply these standard errors by 1.4 and for 1965 data multiply by 1.2; for the 1960 1-in-1000 sample data, multiply by 0.6; for CPS Spanish Origin, multiply by 1.16.

comparisons for poverty estimates and proportions; for other comparisons assume that ρ equals zero. Making this assumption will result in accurate estimates of standard errors for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overstate the true standard error.

One method of determining intermediate values not shown in the standard error tables is to use linear interpolation. An alternative method of computing standard errors of differences between estimated numbers requires using the following formulas for σ_1 and σ_2 in formula (F.3):

$$\sigma_1 = \sqrt{a_1 x_1^2 + b_1 x_1}$$

and

$$\sigma_2 = \sqrt{a_2 x_2^2 + b_2 x_2}$$

(F.4)

Here x_1 and x_2 are the size of the estimates and a_1, b_1, a_2 and b_2 are the parameters for the characteristics and population in question. The standard errors of the differences displayed in selected text tables were calculated using the parameters and correlation coefficients in tables A-12 and A-14.

An alternative method of computing standard errors of differences between estimated percents requires using the following formulas for σ_1 and σ_2 in formula (F.3):

$$\sigma_1 = \sqrt{\frac{b_1}{x_1} \cdot p_1 \cdot (100 - p_1)}$$

(F.5)

and

$$\sigma_2 = \sqrt{\frac{b_2}{x_2} \cdot p_2 \cdot (100 - p_2)}$$

Here x_1 and x_2 are the bases of the percents, b_1 and b_2 are the parameters for the characteristics and population in question, and p_1 and p_2 are the percents being compared ($0 \leq p_1, p_2 \leq 100$).

Illustration of the computation of the standard error of a difference in estimates. Table B of this report shows that in 1974 there were 1,607,000 male unrelated individuals below the poverty level and 3,212,000 female unrelated individuals below the poverty level. The apparent difference is 1,605,000. The standard error of 1,607,000 total male unrelated individuals below the poverty level for 1974 is about 40,000 as shown above. Table A-4 shows the standard error of an

Table A-10. Standard Errors of Estimated Percentage of Persons Below the Poverty Level in Federal Regions I to VII, and IX

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
100.....	5.4	7.6	11.9	16.3	23.6	27.2
250.....	3.4	4.8	7.5	10.3	14.9	17.2
500.....	2.4	3.4	5.3	7.3	10.5	12.2
1,000.....	1.7	2.4	3.8	5.2	7.5	8.6
2,500.....	1.1	1.5	2.4	3.3	4.7	5.4
5,000.....	0.76	1.10	1.70	2.30	3.30	3.80
10,000.....	0.54	0.76	1.20	1.60	2.40	2.70
25,000.....	0.34	0.48	0.75	1.00	1.50	1.70
50,000.....	0.24	0.34	0.53	0.73	1.10	1.20

Note: For Regions I and II, multiply standard errors by 0.70; for Regions III, IV, and IX, multiply standard errors by 0.85; for Region V, multiply standard errors by 0.80; for Region VI, multiply standard errors by 0.95; and for Region VII, multiply standard errors by 1.00.

estimate of 3,212,000 to be approximately 57,000. The standard error of the estimated difference of 1,605,000 is about

$$70,000 = \sqrt{(40,000)^2 + (57,000)^2} \quad ^5$$

This means the chances are 68 out of 100 that the estimated difference based on the samples would differ from the difference derived using complete census figures by less than 70,000. The 68 percent confidence interval around the 1,605,000 difference is from 1,535,000 to 1,675,000, i.e., $1,605,000 \pm 70,000$. A conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 1,465,000 to 1,745,000. We can conclude with 95 percent confidence that the number of male unrelated individuals below the poverty level in 1974 is actually smaller than the number of female unrelated individuals below the low-income level in 1974, i.e., the difference is not zero.

⁵ Formulas (F.3) and (F.4) give a standard error of about 71,000 with $\rho = 0.0$.

Illustration of the computation of the standard error of a difference in percentages. Table 1 of this report shows that the 1973 poverty rate for children under 18 was 14.2 percent while, in 1974, this figure was 15.5 percent. Formulas (F.3) and (F.5), with $\rho = .4$ from table A-14, gives a standard error of the differences of 1.3 percent to be about .4 percent:

$$.4 = \sqrt{(.349)^2 + (.335)^2 - 2(.4)(.349)(.335)}$$

The 95 percent confidence interval around the 1.3 percent difference is from 0.5 percent to 2.1 percent and we can conclude with 95 percent confidence that the poverty rate for children in 1974 was actually higher than the poverty rate for children in 1973.

Ratios. A ratio of two numbers can be expressed as a mean for the purposes of computing an approximate standard error. In the case where either the numerator or denominator of the ratio is income, the formula for the standard error of the arithmetic mean (F.6) should be used. In the case where the ratio has persons in the numerator and families in the denominator, formula (F.7) with the appropriate ρ will give a preferable result to that of formula (F.6).

Table A-11. Standard Errors of Estimated Percentages of Persons Below the Poverty Level in Federal Regions VIII and X

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
100.....	8.0	11.2	17.5	24.1	34.8	40.2

Note: For years prior to 1966, a standard error estimate computed with these parameters must be adjusted. For 1959 to 1964, multiply the standard error by 1.4 and for 1965 data, multiply by 1.2.

Table A-13. Parameters for Persons Below the Poverty Level in the 10 Federal Regions

Region	I	II	III	IV	V
Parameter	(Boston)	(New York)	(Philadelphia)	(Atlanta)	(Chicago)
a.....	.034561	.014617	.017573	.006710	.009527
b.....	14,168.9666	15,586.1130	22,296.1091	21,322.6729	18,109.1707
Region	VI	VII	VIII	IX	X
Parameter	(Dallas-Ft. Worth)	(Kansas City)	(Denver)	(San Francisco)	(Seattle)
a.....	.014312	.044507	.192584	.019675	.131217
b.....	27,624.8572	29,607.5149	64,494.4888	21,407.5747	41,684.0103

Note: To estimate standard errors for all persons in the 10 Federal Regions divide the parameters by 4 and use the appropriate formulas given in the text.

Computation of the standard error of an arithmetic mean. To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}} = \sqrt{b \left[\frac{\sum_{i=1}^c P_i x_i^2}{n} - \frac{\bar{x}^2}{n} \right]} \quad (F.6)$$

In this formula, n is the weighted total number of cases in all c classes, P_i are the percentages of total cases in the i classes, x_i are the midpoints of the i classes (or discrete values of the i classes).⁶

The mean value, \bar{x} , is defined by $\sum_{i=1}^c P_i x_i$

The parameter b is the parameter from Table A-12 or A-13 corresponding to the characteristic of interest.

Standard error of a ratio. Certain mean values, for persons in families, listed in the tables of this report were not calculated using the formula for \bar{x} given above. Rather, they were calculated as the ratio of two numbers. For example, the mean number of children per family with children is calculated as

$$\frac{x}{y} = \frac{\text{total number of children in families}}{\text{total number of families with children}}$$

Standard errors for these means may be approximated as shown below from the standard error tables or by using formula (F.1) and the parameters from Table A-12. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristic in every family of the class; as for example, the mean number of children per family with children. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma_{\frac{x}{y}} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho \left(\frac{\sigma_x}{x}\right) \left(\frac{\sigma_y}{y}\right) \right]} \quad (F.7)$$

⁶ If the open-ended interval for income tables is "under \$1,000" use \$761; "\$2,500 or more" use \$2,750; "\$8,000 or more" use \$8,500.

The standard error of the estimated number of families, σ_y , and the standard error of the estimated number of persons with the characteristic, σ_x , may be obtained from Tables A-4 or A-5. Alternatively, formula (F.1) and Table A-12 may be used. In formula (F.7), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above example, and for other ratios of this kind, use 0.7 as an estimate of ρ . This procedure can also be used to compute the standard error on the estimate of mean family size where

$$\frac{x}{y} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

and ρ is again estimated to be approximately 0.7.

Case 2: The number of persons having the characteristic in a given family may be 0, 1, 2, 3, or more; for example, the mean number of children per family. For ratios of this kind the standard error is approximated by formula (F.7) but ρ is assumed to be zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Sampling variability of a median. The sampling variability of an estimated median depends upon the form as well as on the size of the distribution from which the median is determined. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate confidence limits of a median based on sample data:

1. Determine, using the standard error tables or formula (F.2), the standard error of a 50 percent characteristic, using the appropriate base.
2. Add to and subtract from 50 percent the standard error determined in step (1).
3. Using the distribution of the characteristic, read off the confidence interval corresponding to the two points established in step (2).

A two standard error confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

Illustration of the computation of a confidence interval for a median. Using estimates from Table 4, it can be shown that the median age for heads of poor, female-headed families was 34.3 years in 1974. The size, or base, of the distribution from which this median was determined is 2,351,000.

1. Table A-7 shows that the standard error of an estimate of 50 percent on a base of 2,351,000 is about 2.6 percent.
2. To obtain a two standard error confidence interval on the estimated median, initially add to and subtract from 50 percent twice the standard error found in step (1). This yields percentage limits of 44.8 and 55.2.
3. From Table 4 it can be seen that 19.0 percent of all female headed families below the poverty level were headed by a woman

under 25 years of age. There were 33.4 percent having a female head between 25 and 34 years of age. By linear interpolation the lower limit of the confidence interval is about:

$$25 + (34-25+1) \left[\frac{44.8 - 19.0}{33.4} \right] = 32.7$$

Similarly, the upper limit may be found by linear interpolation to be about:

$$35 + (44-35+1) \left[\frac{55.2 - 52.3}{22.5} \right] = 36.3$$

Thus, an approximate 95 percent confidence interval is from 32.7 to 36.3.

Table A-14. Year-to-Year Correlation Coefficients for Poverty Estimates

(Numbers and proportions)

Characteristic	1973-1974 ¹		1971-1972		1970-1971	
	Persons	Families	Persons	Families	Persons	Families
Total.....	0.40	0.35	0.15	0.14	0.31	0.28

¹These correlation coefficients are also applicable to 1972-1973, 1969-1970 and earlier years.

APPENDIX B

OEO TABULATION SPECIFICATIONS

The data in tables 6, 10 to 15, 35, 39, 42, 45 and 46 of this report were extracted from a series of tabulations prepared for and previously distributed by the Office of Economic Opportunity (OEO). These tabulations contain more detailed cross-classifications by age and other characteristics than are shown in the tables presented in this report. Financial support for the preparation of the OEO tabulations was provided by the Office of the Assistant Secretary for Planning and Evaluation, Department of Health, Education, and Welfare. Requests for further information about these tabulations as well as limited requests for copies should be made in writing to Chief, Population Division, Bureau of the Census, Washington, D.C. 20233. Outlines of the contents of the complete OEO tabulations are shown on the following pages.

OEO Table 1. AGE OF PERSON AND FAMILY RELATIONSHIP BY AGE AND SEX OF HEAD

Age of person and relationship to head	Total	In families								Unrelated individuals	
		Total	Age of head (years)								
			14 to 21	22 to 34	35 to 44	45 to 54	55 to 59	60 to 64	65 and over
