

Consumer Income

Series P-60, No. 55
August 5, 1968**FAMILY INCOME ADVANCES, POVERTY REDUCED IN 1967****(Preliminary data from March 1968 sample survey)**

Family income continued its upward trend in 1967. The estimated median income of families in the United States reached \$8,000 for the first time, up by 6 1/2 percent from \$7,500 the previous year.¹ With prices also rising between 1966 and 1967,² the gain in real purchasing power averaged about 4 percent, in line with the trend of recent years. Even after allowance for changes in consumer prices, family income has risen by 3 1/2 to 4 percent in each of the last 4 years.

An estimated 5.3 million families, or 10 1/2 percent of the 49.8 million families in the Nation had incomes below the poverty line in 1967. This was 600,000 fewer poor families than in 1966. The decade of the 1960's has witnessed a sizable reduction in the proportion of families living in poverty. The ratio of poor families to all families has been reduced on the average by about one percentage point per year since 1960.

The total number of poor persons in 1967 was estimated at 25.9 million, down by 2.9 million from the 1966 level of 28.8 million. There were an estimated 10 1/2 million children under 18 years of age living in poor families in 1967. They

accounted for two-fifths of all poor persons. About 4 million of these poor children were growing up in families headed by a woman and 6 1/2 million were living in families with a man as head.

Over the past 2 years, the median income of nonwhite as well as white families rose considerably. The ratios of nonwhite to white median incomes were about the same in the last 2 years but significantly higher than the average for the preceding 10 years. The estimated ratio was 62 percent in 1967 and 60 percent in 1966, as contrasted to about 53 percent during the 1955-1965 period.

For Negro families separately (which constitute 91 percent of all nonwhite families) the ratio of median income to white income was 59 percent in 1967. However, even in 1967, one-half of all Negro families received less than \$5,000 in money income from all sources. In the South, the ratio of Negro to white median income was only 54 percent in 1967, whereas in the other three regions the ratio averaged about 73 percent.

The lower income of nonwhite families relative to that of white families is attributable in part to the relatively large proportion of nonwhite families headed by women. If nonwhite families had the same proportions of families headed by men and women as white families, the median income of nonwhite families as a percent of that of white families would have been 69 percent instead of the actual 62 percent. In 1967, about one-fourth of all nonwhite families were headed by women as compared with less than 10 percent of the white families. The median income of nonwhite families

¹The 1966 and 1967 statistics cited in this report are based on an improved methodology for processing the income data; see explanation on page 2. The figures were obtained from preliminary tabulations of the March 1967 and March 1968 Current Population Survey supplements, and may be revised when final tabulations become available later this year.

BUREAU OF THE CENSUS, A. Ross Eckert, Director

headed by women was approximately two-fifths of the overall U.S. median, whereas the median income of nonwhite families headed by men was about three-fourths that of the average for all families. The incidence of poverty among nonwhite families headed by women was 54 percent, as compared with 22 percent for nonwhite families headed by men, 25 percent for white families headed by women, and 7 percent for those with male heads.

There were about one million fewer nonwhites below the poverty line in 1967 than in 1966. This sharp reduction in the number of poor, and the reduction of similar magnitude in the previous year, were the largest declines on record for the nonwhite population since 1959, the earliest year for which comparable data are available. However, nonwhites continued to be over-represented among the poor in 1967. They constituted 32 percent of the poor, although they comprised only 12 percent of the total population.

The 1967 income statistics presented in this report were obtained from the Census Bureau's Current Population Survey of March 1968. The information was collected from a sample of 52,500 households, representing the civilian noninstitutional population and members of the Armed Forces living off post or with their families on post in the United States. The income data presented in this report relate to money income only, prior to deductions for taxes. Detailed definitions of the terms and concepts used in this report can be found in Current Population Reports, Series P-60, Nos. 53 and 54. Since the estimates in this report are based on a sample survey, they are subject to sampling variability. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting. More detailed data on income and poverty for 1967 will appear in forthcoming reports in this series.

Families and unrelated individuals were classified as being above or below the poverty level using the poverty index developed by the Social Security Administration. This index takes into account such factors as family size, number of children, and farm-nonfarm residence, as well as the amount of money income. The poverty level is based on an "economy" food plan designed by the Department of Agriculture for "emergency or temporary use when funds are low." Assuming that a family should not have to spend more than a third of its income for food, the cost of food included in the economy plan was used to determine the minimum total income requirements for a given type of family. A household is statistically classified as poor if its total money income falls below levels calculated by the Social Security Administration. As applied to 1967 and 1966 incomes, the

poverty threshold for a nonfarm family of four was \$3,335. For nonfarm residents it ranged from \$1,560 for a woman 65 years or older living alone to \$5,440 for a family of seven or more persons.³

The poverty thresholds used for the current poverty statistics shown in this report were based on essentially the same concepts as have been used since the beginning of this series (1959). Annual changes in specific levels have reflected changes in prices of the foods included in the economy food plan. Other changes in the method for determining the poverty thresholds are now under consideration including the incorporation of more recent information on food consumption patterns of low income families, a different method of adjusting to price changes, and similar aspects of the poverty definition.

The 1967 income statistics are based on a revised procedure for imputing income to non-respondents to the income questions. In surveys prior to 1962, the distributions by income levels had been based only on those cases which reported complete income information. The assumption implicit in this method was that persons who do not provide income information have the same income distributions as those who do provide such information. Beginning with March 1962, in the event a respondent did not respond to one or more of the income items, the missing income data for this person were imputed, based on reported income values of persons with similar demographic and economic characteristics.

The use of more advanced electronic equipment has enabled the Bureau of the Census to introduce improved income edit and allocation procedures for the March 1968 CPS data. The main feature of the new procedures was a more refined method for imputing missing income data which expands the use of information already known about that person. In order to evaluate the impact of the new procedures, the income data from the March 1967 CPS were rerun, thus providing a bridge for the 1966 income year showing the results of both the earlier and the new procedures. Among the major improvements made affecting the income data are the following: (1) an expanded set of social and economic characteristics within which the imputations are made; in addition to age, color, occupation, and weeks worked, the new procedures include sex and

³For a detailed description of this index, see Mollie Orshansky: "Counting the Poor: Another Look at the Poverty Profile," Social Security Bulletin, January 1965; "Who's Who Among the Poor: A Demographic View of Poverty," Social Security Bulletin, July 1965.

type of family member as major variables within which the missing income items are imputed; (2) the elimination of inconsistent reporting which resulted in having workers with no earnings and earners with no weeks worked; and (3) the new imputation procedure assigns missing earnings entries first and then utilizes the earnings information to assign missing sources of income other than earnings.

A comparison of the income and poverty data for 1966 before and after introduction of the

improvements in statistical procedures is presented in table A. The median family income under the revised methodology was about \$80 higher than originally published, with a corresponding upward shift in the income distributions. The major impact of the improvements was to raise the number of multi-earner families by slightly over one million and to reduce the number of one- and no-earner families. A more detailed explanation of the revised methodology and its impact on the income and poverty data will appear in the forthcoming reports on these subjects.
