

What Works Clearinghouse

Early Intervention in Reading^{®1}

Program Description²

Early Intervention in Reading (EIR)[®] is a program designed to provide extra instruction to groups of students at risk of failing to learn to read. The program uses picture books to stress instruction in phonemic awareness, phonics, and contextual analysis, along with repeated reading and writing. In grades K, 1, and 2, the

program is based on whole-class instruction, with additional small group instruction provided to struggling readers. In grades 3 and 4, the program consists of small group instruction for 20 minutes, four days a week. Teachers are trained for nine months using workshops and an Internet-based professional development program.

Research

One study of *EIR[®]* meets What Works Clearinghouse (WWC) evidence standards. That study included 12 teachers and 59 students in first grade from one Midwestern state.³

Based on this one study, the WWC considers the extent of evidence for *EIR[®]* to be small for alphabets and comprehension.

No studies that meet WWC evidence standards with or without reservations examined the effectiveness of *EIR[®]* in the fluency or general reading achievement domains.

Effectiveness

EIR[®] was found to have potentially positive effects on alphabets and comprehension.

	Alphabets	Fluency	Comprehension	General reading achievement
Rating of effectiveness	Potentially positive effects	na	Potentially positive effects	na
Improvement index⁴	Average: +36 percentile points Range: +29 to +42 percentile points	na	+18 percentile points	na

na = not applicable

- EIR[®]* has been adapted into Houghton Mifflin's *Early Success[®]* program. Both programs are available for purchase. This report focuses solely on *EIR[®]*. This report has been updated to include reviews of two studies that have been released since 2005. Of the additional studies, one was not within the scope of the protocol, and one was within the scope of the protocol but did not meet evidence standards. A complete list and disposition of all studies reviewed are provided in the references.
- The descriptive information for this program was obtained from a publicly available source: the program's website (<http://www.earlyinterventioninreading.com>, downloaded October 2008). The WWC requests developers to review the program description sections for accuracy from their perspective. Further verification of the accuracy of the descriptive information for this program is beyond the scope of this review.
- The evidence presented in this report is based on available research. Findings and conclusions may change as new research becomes available.
- These numbers show the average and range of student-level improvement indices for all findings in the study.

Additional program information

Developer and contact

Developed by Dr. Barbara Taylor, *EIR*[®] is distributed by the *Early Intervention in Reading*[®] program. Address: *EIR*[®] Professional Development Program, c/o Ceil Critchley, 11293 Hastings Street NE, Blaine, MN 55449. Email: ccritchley@com-cast.net. Web: www.earlyinterventioninreading.com. Telephone: (763) 785-0701.

Scope of use

EIR[®] was developed in 1989–90. Information is not available on the number or demographics of students, schools, or districts using the program.

Teaching

Instruction involves 15–20 minutes of daily supplemental instruction to the whole class or to groups of five to seven struggling readers. In kindergarten, activities include listening to stories, creative dramatics, and literacy development (concepts of print, rhyme, phonemic segmentation and blending, and letter and sound recognition). In first and second grades, the lessons include repeated reading of familiar stories, coached reading of a new story, phonemic awareness training and systematic phonics instruction, as well as guided sentence writing, vocabulary, and comprehension instruction. The third and fourth grade programs use narrative and informational picture books and focus on

attacking multisyllabic words and fluency, vocabulary, and comprehension strategies. The study reviewed here focused on first grade students. *EIR*[®] has a number of teacher training modules. Modules cover how to use the program, the research and background of the program, routines for the various grade levels, and use of assessments. Other topics include involving parents, training one-on-one coaches, taking running records, and evaluating *EIR*[®] implementation. The training program lasts nine months and consists of two-hour Internet sessions conducted once a month, along with telephone support from an *EIR*[®] trainer. Typically, 45 minutes are spent in a large group session, during which an onsite facilitator leads the group through the Internet program. Then 45 minutes are spent in small groups with teachers sharing videos of their own practices. For the last half hour of the session, an *EIR*[®] trainer meets with the cohort via a conference call to answer questions and highlight appropriate concepts and procedures. Trainers also speak with the teachers by phone between meetings. Onsite technical assistance can be requested by program developers.

Cost

Currently, the *EIR*[®] Internet training program costs \$500 per teacher. One or more site visits by the *EIR*[®] trainer can be arranged at an additional cost. Discounts are available for groups of 10 or more teachers.

Research

Seven studies reviewed by the WWC investigated the effects of *EIR*[®]. One study (Taylor, Frye, Short, & Shearer, 1991) is a randomized controlled trial that meets WWC evidence standards. The remaining six studies do not meet either WWC evidence standards or eligibility screens.

Taylor et al. (1991) conducted a randomized controlled trial of first grade teachers in two schools located in a Midwestern suburban school district. In each first grade classroom, five or six of

the lowest-achieving students participated in the study. In all, 31 students in six classrooms were in the treatment group, and 28 students in six classrooms were in the comparison group.

Extent of evidence

The WWC categorizes the extent of evidence in each domain as small or medium to large (see the [What Works Clearinghouse Extent of Evidence Categorization Scheme](#)). The extent of

Research *(continued)*

evidence takes into account the number of studies and the total sample size across the studies that meet WWC evidence standards with or without reservations.⁵

The WWC considers the extent of evidence for *EIR*[®] to be small for alphabets and comprehension. No studies that meet

WWC evidence standards with or without reservations examined the effectiveness of *EIR*[®] in the fluency or general reading achievement domains.

Effectiveness Findings

The WWC review of interventions for Beginning Reading addresses student outcomes in four domains: alphabets, fluency, comprehension, and general reading achievement. The study included in this report covers two domains: alphabets and comprehension. Within alphabets, results for two constructs, phonological awareness and phonics, are reported. The findings below present the authors' estimates and WWC-calculated estimates of the size and the statistical significance of the effects of *EIR*[®] on students.⁶

Alphabets. The Taylor et al. (1991) study findings for this domain are based on students' performance on two measures of alphabets: (1) segmentation and blending and (2) vowel sounds. When the *EIR*[®] group was compared with the comparison group, the study authors found, and the WWC confirmed, statistically significant positive effects on both measures.

Comprehension. The Taylor et al. (1991) study findings for the comprehension domain are based on the performance of *EIR*[®]

students and comparison students on a standardized reading test (Gates-MacGinitie). The study authors did not find statistically significant effects of *EIR*[®], but the effect was positive and large enough to be considered substantively important according to WWC criteria (that is, an effect size greater than or equal to 0.25).

Rating of effectiveness

The WWC rates the effects of an intervention in a given outcome domain as positive, potentially positive, mixed, no discernible effects, potentially negative, or negative. The rating of effectiveness takes into account four factors: the quality of the research design, the statistical significance of the findings (as calculated by the WWC), the size of the difference between participants in the intervention condition and the comparison condition, and the consistency in findings across studies (see the [WWC Intervention Rating Scheme](#)).

The WWC found *Early Intervention in Reading*[®] to have potentially positive effects in the alphabets and comprehension domains

Improvement index

The WWC computes an improvement index for each individual finding. In addition, within each outcome domain, the WWC computes an average improvement index for each study and an average improvement index across studies (see

[Technical Details of WWC-Conducted Computations](#)). The improvement index represents the difference between the percentile rank of the average student in the intervention condition versus the percentile rank of the average student in the comparison condition. Unlike the rating of effectiveness, the

5. The Extent of Evidence Categorization was developed to tell readers how much evidence was used to determine the intervention rating, focusing on the number and size of studies. Additional factors associated with a related concept—external validity, such as the students' demographics and the types of settings in which studies took place—are not taken into account for the categorization. Information about how the extent of evidence rating was determined for *EIR*[®] is in Appendix A5.
6. The level of statistical significance was reported by the study authors or, where necessary, calculated by the WWC to correct for clustering within classrooms or schools and for multiple comparisons. For an explanation, see the [WWC Tutorial on Mismatch](#). For the formulas the WWC used to calculate the statistical significance, see [Technical Details of WWC-Conducted Computations](#). In the case of Taylor et al. (1991), corrections for clustering and multiple comparisons were needed, so the significance levels may differ from those reported in the original study.

The WWC found *Early Intervention in Reading*[®] to have potentially positive effects in the alphabetics and comprehension domains
(continued)

improvement index is entirely based on the size of the effect, regardless of the statistical significance of the effect, the study design, or the analysis. The improvement index can take on values between -50 and +50, with positive numbers denoting favorable results.

The average improvement index for alphabetics is +36 percentile points for the one study, with a range of +29 to +42 percentile points across findings. The improvement index for comprehension is +18 percentile points in the one study, with only one outcome measured.
