9

## 10 **DESCRIPTION**

11 Naproxen is a member of the arylacetic acid group of nonsteroidal anti-inflammatory  
12 drugs.

13 The chemical names for naproxen and naproxen sodium are (S)-6-methoxy- $\alpha$ -methyl-2-  
14 naphthaleneacetic acid and (S)-6-methoxy- $\alpha$ -methyl-2-naphthaleneacetic acid, sodium  
15 salt, respectively. Naproxen and naproxen sodium have the following structures,  
16 respectively:

17

18 Naproxen has a molecular weight of 230.26 and a molecular formula of C<sub>14</sub>H<sub>14</sub>O<sub>3</sub>.  
19 Naproxen sodium has a molecular weight of 252.23 and a molecular formula of  
20 C<sub>14</sub>H<sub>13</sub>NaO<sub>3</sub>.

21 Naproxen is an odorless, white to off-white crystalline substance. It is lipid-soluble,  
22 practically insoluble in water at low pH and freely soluble in water at high pH. The  
23 octanol/water partition coefficient of naproxen at pH 7.4 is 1.6 to 1.8. Naproxen sodium  
24 is a white to creamy white, crystalline solid, freely soluble in water at neutral pH.

25 NAPROSYN (naproxen tablets) is available as yellow tablets containing 250 mg of  
26 naproxen, peach tablets containing 375 mg of naproxen and yellow tablets containing 500  
27 mg of naproxen for oral administration. The inactive ingredients are croscarmellose  
28 sodium, iron oxides, povidone and magnesium stearate.

29 EC-NAPROSYN (naproxen delayed-release tablets) is available as enteric-coated white  
30 tablets containing 375 mg of naproxen and 500 mg of naproxen for oral administration.  
31 The inactive ingredients are croscarmellose sodium, povidone and magnesium stearate.  
32 The enteric coating dispersion contains methacrylic acid copolymer, talc, triethyl citrate,  
33 sodium hydroxide and purified water. The dispersion may also contain simethicone  
34 emulsion. The dissolution of this enteric-coated naproxen tablet is pH dependent with  
35 rapid dissolution above pH 6. There is no dissolution below pH 4.

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

36 ANAPROX (naproxen sodium tablets) is available as blue tablets containing 275 mg of  
37 naproxen sodium and ANAPROX DS (naproxen sodium tablets) is available as dark blue  
38 tablets containing 550 mg of naproxen sodium for oral administration. The inactive  
39 ingredients are magnesium stearate, microcrystalline cellulose, povidone and talc. The  
40 coating suspension for the ANAPROX 275 mg tablet may contain hydroxypropyl  
41 methylcellulose 2910, Opaspray K-1-4210A, polyethylene glycol 8000 or Opadry YS-1-  
42 4215. The coating suspension for the ANAPROX DS 550 mg tablet may contain  
43 hydroxypropyl methylcellulose 2910, Opaspray K-1-4227, polyethylene glycol 8000 or  
44 Opadry YS-1-4216.

45 NAPROSYN (naproxen suspension) is available as a light orange-colored opaque oral  
46 suspension containing 125 mg/5 mL of naproxen in a vehicle containing sucrose,  
47 magnesium aluminum silicate, sorbitol solution and sodium chloride (30 mg/5 mL, 1.5  
48 mEq), methylparaben, fumaric acid, FD&C Yellow No. 6, imitation pineapple flavor,  
49 imitation orange flavor and purified water. The pH of the suspension ranges from 2.2 to  
50 3.7.

## 51 **CLINICAL PHARMACOLOGY**

52 *Pharmacodynamics:* Naproxen is a nonsteroidal anti-inflammatory drug (NSAID) with  
53 analgesic and antipyretic properties. The sodium salt of naproxen has been developed as a  
54 more rapidly absorbed formulation of naproxen for use as an analgesic. The mechanism  
55 of action of the naproxen anion, like that of other NSAIDs, is not completely understood  
56 but may be related to prostaglandin synthetase inhibition.

57 *Pharmacokinetics:* Naproxen itself is rapidly and completely absorbed from the  
58 gastrointestinal tract with an in vivo bioavailability of 95%. The different dosage forms  
59 of NAPROSYN are bioequivalent in terms of extent of absorption (AUC) and peak  
60 concentration ( $C_{max}$ ); however, the products do differ in their pattern of absorption. These  
61 differences between naproxen products are related to both the chemical form of naproxen  
62 used and its formulation. Even with the observed differences in pattern of absorption, the  
63 elimination half-life of naproxen is unchanged across products ranging from 12 to 17  
64 hours. Steady-state levels of naproxen are reached in 4 to 5 days, and the degree of  
65 naproxen accumulation is consistent with this half-life. This suggests that the differences  
66 in pattern of release play only a negligible role in the attainment of steady-state plasma  
67 levels.

### 68 *Absorption:*

69 *Immediate Release:* After administration of NAPROSYN tablets, peak plasma levels are  
70 attained in 2 to 4 hours. After oral administration of ANAPROX, peak plasma levels are  
71 attained in 1 to 2 hours. The difference in rates between the two products is due to the  
72 increased aqueous solubility of the sodium salt of naproxen used in ANAPROX. Peak  
73 plasma levels of naproxen given as NAPROSYN Suspension are attained in 1 to 4 hours.

74 *Delayed Release:* EC-NAPROSYN is designed with a pH-sensitive coating to provide a  
75 barrier to disintegration in the acidic environment of the stomach and to lose integrity in

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

76 the more neutral environment of the small intestine. The enteric polymer coating selected  
 77 for EC-NAPROSYN dissolves above pH 6. When EC-NAPROSYN was given to fasted  
 78 subjects, peak plasma levels were attained about 4 to 6 hours following the first dose  
 79 (range: 2 to 12 hours). An in vivo study in man using radiolabeled EC-NAPROSYN  
 80 tablets demonstrated that EC-NAPROSYN dissolves primarily in the small intestine  
 81 rather than the stomach, so the absorption of the drug is delayed until the stomach is  
 82 emptied.

83 When EC-NAPROSYN and NAPROSYN were given to fasted subjects (n=24) in a  
 84 crossover study following 1 week of dosing, differences in time to peak plasma levels  
 85 ( $T_{max}$ ) were observed, but there were no differences in total absorption as measured by  
 86  $C_{max}$  and AUC:

	<b>EC-NAPROSYN*</b> <b>500 mg bid</b>	<b>NAPROSYN*</b> <b>500 mg bid</b>
$C_{max}$ (µg/mL)	94.9 (18%)	97.4 (13%)
$T_{max}$ (hours)	4 (39%)	1.9 (61%)
AUC <sub>0-12 hr</sub> (µg·hr/mL)	845 (20%)	767 (15%)

87 \*Mean value (coefficient of variation)

88 *Antacid Effects:* When EC-NAPROSYN was given as a single dose with antacid (54 mEq  
 89 buffering capacity), the peak plasma levels of naproxen were unchanged, but the time to  
 90 peak was reduced (mean  $T_{max}$  fasted 5.6 hours, mean  $T_{max}$  with antacid 5 hours), although  
 91 not significantly.

92 *Food Effects:* When EC-NAPROSYN was given as a single dose with food, peak plasma  
 93 levels in most subjects were achieved in about 12 hours (range: 4 to 24 hours). Residence  
 94 time in the small intestine until disintegration was independent of food intake. The  
 95 presence of food prolonged the time the tablets remained in the stomach, time to first  
 96 detectable serum naproxen levels, and time to maximal naproxen levels ( $T_{max}$ ), but did  
 97 not affect peak naproxen levels ( $C_{max}$ ).

98 ***Distribution:***

99 Naproxen has a volume of distribution of 0.16 L/kg. At therapeutic levels naproxen is  
 100 greater than 99% albumin-bound. At doses of naproxen greater than 500 mg/day there is  
 101 less than proportional increase in plasma levels due to an increase in clearance caused by  
 102 saturation of plasma protein binding at higher doses (average trough  $C_{ss}$  36.5, 49.2 and  
 103 56.4 mg/L with 500, 1000 and 1500 mg daily doses of naproxen). The naproxen anion  
 104 has been found in the milk of lactating women at a concentrations equivalent to  
 105 approximately 1% of maximum naproxen concentration in plasma (see PRECAUTIONS:  
 106 *Nursing Mothers*).

107 ***Metabolism:***

108 Naproxen is extensively metabolized to 6-O-desmethyl naproxen, and both parent and  
 109 metabolites do not induce metabolizing enzymes.

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

110 *Excretion:*

111 The clearance of naproxen is 0.13 mL/min/kg. Approximately 95% of the naproxen from  
112 any dose is excreted in the urine, primarily as naproxen (less than 1%), 6-O-desmethyl  
113 naproxen (less than 1%) or their conjugates (66% to 92%). The plasma half-life of the  
114 naproxen anion in humans ranges from 12 to 17 hours. The corresponding half-lives of  
115 both naproxen's metabolites and conjugates are shorter than 12 hours, and their rates of  
116 excretion have been found to coincide closely with the rate of naproxen disappearance  
117 from the plasma. In patients with renal failure metabolites may accumulate (see  
118 PRECAUTIONS: *Renal Effects*).

119 *Special Populations:*

120 *Pediatric Patients:* In pediatric patients aged 5 to 16 years with arthritis, plasma naproxen  
121 levels following a 5 mg/kg single dose of naproxen suspension (see DOSAGE AND  
122 ADMINISTRATION) were found to be similar to those found in normal adults following  
123 a 500 mg dose. The terminal half-life appears to be similar in pediatric and adult patients.  
124 Pharmacokinetic studies of naproxen were not performed in pediatric patients younger  
125 than 5 years of age. Pharmacokinetic parameters appear to be similar following  
126 administration of naproxen suspension or tablets in pediatric patients. EC-NAPROSYN  
127 has not been studied in subjects under the age of 18.

128 *Geriatric Patients:* Studies indicate that although total plasma concentration of naproxen  
129 is unchanged, the unbound plasma fraction of naproxen is increased in the elderly,  
130 although the unbound fraction is less than 1% of the total naproxen concentration.  
131 Unbound trough naproxen concentrations in elderly subjects have been reported to range  
132 from 0.12% to 0.19% of total naproxen concentration, compared with 0.05% to 0.075%  
133 in younger subjects. The clinical significance of this finding is unclear, although it is  
134 possible that the increase in free naproxen concentration could be associated with an  
135 increase in the rate of adverse events per a given dosage in some elderly patients.

136 *Race:* Pharmacokinetic differences due to race have not been studied.

137 *Hepatic Insufficiency:* Naproxen pharmacokinetics has not been determined in subjects  
138 with hepatic insufficiency.

139 *Renal Insufficiency:* Naproxen pharmacokinetics has not been determined in subjects  
140 with renal insufficiency. Given that naproxen, its metabolites and conjugates are  
141 primarily excreted by the kidney, the potential exists for naproxen metabolites to  
142 accumulate in the presence of renal insufficiency. Elimination of naproxen is decreased  
143 in patients with severe renal impairment. Naproxen-containing products are not  
144 recommended for use in patients with moderate to severe and severe renal impairment  
145 (creatinine < 30 ml/min) (see PRECAUTIONS: *Renal Effects*).

146 **CLINICAL STUDIES**

147 *General Information:* Naproxen has been studied in patients with rheumatoid arthritis,  
148 osteoarthritis, juvenile arthritis, ankylosing spondylitis, tendonitis and bursitis, and acute  
149 gout. Improvement in patients treated for rheumatoid arthritis was demonstrated by a

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

150 reduction in joint swelling, a reduction in duration of morning stiffness, a reduction in  
151 disease activity as assessed by both the investigator and patient, and by increased  
152 mobility as demonstrated by a reduction in walking time. Generally, response to  
153 naproxen has not been found to be dependent on age, sex, severity or duration of  
154 rheumatoid arthritis.

155 In patients with osteoarthritis, the therapeutic action of naproxen has been shown by a  
156 reduction in joint pain or tenderness, an increase in range of motion in knee joints,  
157 increased mobility as demonstrated by a reduction in walking time, and improvement in  
158 capacity to perform activities of daily living impaired by the disease.

159 In a clinical trial comparing standard formulations of naproxen 375 mg bid (750 mg a  
160 day) vs 750 mg bid (1500 mg/day), 9 patients in the 750 mg group terminated  
161 prematurely because of adverse events. Nineteen patients in the 1500 mg group  
162 terminated prematurely because of adverse events. Most of these adverse events were  
163 gastrointestinal events.

164 In clinical studies in patients with rheumatoid arthritis, osteoarthritis, and juvenile  
165 arthritis, naproxen has been shown to be comparable to aspirin and indomethacin in  
166 controlling the aforementioned measures of disease activity, but the frequency and  
167 severity of the milder gastrointestinal adverse effects (nausea, dyspepsia, heartburn) and  
168 nervous system adverse effects (tinnitus, dizziness, lightheadedness) were less in  
169 naproxen-treated patients than in those treated with aspirin or indomethacin.

170 In patients with ankylosing spondylitis, naproxen has been shown to decrease night pain,  
171 morning stiffness and pain at rest. In double-blind studies the drug was shown to be as  
172 effective as aspirin, but with fewer side effects.

173 In patients with acute gout, a favorable response to naproxen was shown by significant  
174 clearing of inflammatory changes (e.g., decrease in swelling, heat) within 24 to 48 hours,  
175 as well as by relief of pain and tenderness.

176 Naproxen has been studied in patients with mild to moderate pain secondary to  
177 postoperative, orthopedic, postpartum episiotomy and uterine contraction pain and  
178 dysmenorrhea. Onset of pain relief can begin within 1 hour in patients taking naproxen  
179 and within 30 minutes in patients taking naproxen sodium. Analgesic effect was shown  
180 by such measures as reduction of pain intensity scores, increase in pain relief scores,  
181 decrease in numbers of patients requiring additional analgesic medication, and delay in  
182 time to remedication. The analgesic effect has been found to last for up to 12 hours.

183 Naproxen may be used safely in combination with gold salts and/or corticosteroids;  
184 however, in controlled clinical trials, when added to the regimen of patients receiving  
185 corticosteroids, it did not appear to cause greater improvement over that seen with  
186 corticosteroids alone. Whether naproxen has a "steroid-sparing" effect has not been  
187 adequately studied. When added to the regimen of patients receiving gold salts, naproxen  
188 did result in greater improvement. Its use in combination with salicylates is not  
189 recommended because there is evidence that aspirin increases the rate of excretion of

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

190 naproxen and data are inadequate to demonstrate that naproxen and aspirin produce  
191 greater improvement over that achieved with aspirin alone. In addition, as with other  
192 NSAIDs, the combination may result in higher frequency of adverse events than  
193 demonstrated for either product alone.

194 In <sup>51</sup>Cr blood loss and gastroscopy studies with normal volunteers, daily administration of  
195 1000 mg of naproxen as 1000 mg of NAPROSYN (naproxen) or 1100 mg of ANAPROX  
196 (naproxen sodium) has been demonstrated to cause statistically significantly less gastric  
197 bleeding and erosion than 3250 mg of aspirin.

198 Three 6-week, double-blind, multicenter studies with EC-NAPROSYN (naproxen) (375  
199 or 500 mg bid, n=385) and NAPROSYN (375 or 500 mg bid, n=279) were conducted  
200 comparing EC-NAPROSYN with NAPROSYN, including 355 rheumatoid arthritis and  
201 osteoarthritis patients who had a recent history of NSAID-related GI symptoms. These  
202 studies indicated that EC-NAPROSYN and NAPROSYN showed no significant  
203 differences in efficacy or safety and had similar prevalence of minor GI complaints.  
204 Individual patients, however, may find one formulation preferable to the other.

205 Five hundred and fifty-three patients received EC-NAPROSYN during long-term open-  
206 label trials (mean length of treatment was 159 days). The rates for clinically-diagnosed  
207 peptic ulcers and GI bleeds were similar to what has been historically reported for long-  
208 term NSAID use.

209 **Geriatric Patients:** The hepatic and renal tolerability of long-term naproxen  
210 administration was studied in two double blind clinical trials involving 586 patients. Of  
211 the patients studied, 98 patients were age 65 and older and 10 of the 98 patients were age  
212 75 and older. Naproxen was administered at doses of 375 mg twice daily or 750 mg twice  
213 daily for up to 6 months. Transient abnormalities of laboratory tests assessing hepatic and  
214 renal function were noted in some patients, although there were no differences noted in  
215 the occurrence of abnormal values among different age groups.

## 216 **INDIVIDUALIZATION OF DOSAGE**

217 Although NAPROSYN, NAPROSYN Suspension, EC-NAPROSYN, ANAPROX and  
218 ANAPROX DS all circulate in the plasma as naproxen, they have pharmacokinetic  
219 differences that may affect onset of action. Onset of pain relief can begin within 30  
220 minutes in patients taking naproxen sodium and within 1 hour in patients taking  
221 naproxen. Because EC-NAPROSYN dissolves in the small intestine rather than in the  
222 stomach, the absorption of the drug is delayed compared to the other naproxen  
223 formulations (see CLINICAL PHARMACOLOGY).

224 The recommended strategy for initiating therapy is to choose a formulation and a starting  
225 dose likely to be effective for the patient and then adjust the dosage based on observation  
226 of benefit and/or adverse events. A lower dose should be considered in patients with renal  
227 or hepatic impairment or in elderly patients (see PRECAUTIONS).

228 **Analgesia/Dysmenorrhea/Bursitis and Tendinitis:** Because the sodium salt of naproxen  
229 is more rapidly absorbed, ANAPROX/ANAPROX DS is recommended for the

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

230 management of acute painful conditions when prompt onset of pain relief is desired. The  
231 recommended starting dose is 550 mg followed by 550 mg every 12 hours or 275 mg  
232 every 6 to 8 hours, as required. The initial total daily dose should not exceed 1375 mg of  
233 naproxen sodium. Thereafter, the total daily dose should not exceed 1100 mg of naproxen  
234 sodium. NAPROSYN may also be used for treatment of acute pain and dysmenorrhea.  
235 EC-NAPROSYN is not recommended for initial treatment of acute pain because  
236 absorption of naproxen is delayed compared to other naproxen-containing products (see  
237 CLINICAL PHARMACOLOGY and INDICATIONS AND USAGE).

238 **Acute Gout:** The recommended starting dose is 750 mg of NAPROSYN followed by 250  
239 mg every 8 hours until the attack has subsided. ANAPROX may also be used at a starting  
240 dose of 825 mg followed by 275 mg every 8 hours as needed. EC-NAPROSYN is not  
241 recommended because of the delay in absorption (see CLINICAL PHARMACOLOGY).

242 **Osteoarthritis/Rheumatoid Arthritis/Ankylosing Spondylitis:** The recommended dose of  
243 naproxen is NAPROSYN or NAPROSYN Suspension 250 mg, 375 mg or 500 mg taken  
244 twice daily (morning and evening) or EC-NAPROSYN 375 mg or 500 mg taken twice  
245 daily. Naproxen sodium may also be used (see DOSAGE AND ADMINISTRATION).

246 During long-term administration the dose of naproxen may be adjusted up or down  
247 depending on the clinical response of the patient. A lower daily dose may suffice for  
248 long-term administration. In patients who tolerate lower doses well, the dose may be  
249 increased to 1500 mg per day for up to 6 months when a higher level of anti-  
250 inflammatory/analgesic activity is required. When treating patients with naproxen 1500  
251 mg/day (as NAPROSYN or 1650 mg of ANAPROX), the physician should observe  
252 sufficient increased clinical benefit to offset the potential increased risk. The morning and  
253 evening doses do not have to be equal in size and administration of the drug more  
254 frequently than twice daily does not generally make a difference in response (see  
255 CLINICAL PHARMACOLOGY).

256 **Juvenile Arthritis:** The use of NAPROSYN Suspension allows for more flexible dose  
257 titration. In pediatric patients, doses of 5 mg/kg/day produced plasma levels of naproxen  
258 similar to those seen in adults taking 500 mg of naproxen (see CLINICAL  
259 PHARMACOLOGY).

260 The recommended total daily dose is approximately 10 mg/kg given in two divided doses  
261 (ie, 5 mg/kg given twice a day) (see DOSAGE AND ADMINISTRATION).

## 262 **INDICATIONS AND USAGE**

263 Naproxen as NAPROSYN, EC-NAPROSYN, ANAPROX, ANAPROX DS or  
264 NAPROSYN Suspension is indicated:

- 265 • For the relief of the signs and symptoms of rheumatoid arthritis
- 266 • For the relief of the signs and symptoms of osteoarthritis
- 267 • For the relief of the signs and symptoms of ankylosing spondylitis

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

268 • For the relief of the signs and symptoms of juvenile arthritis

269 Naproxen as NAPROSYN Suspension is recommended for juvenile rheumatoid arthritis  
270 in order to obtain the maximum dosage flexibility based on the patient's weight.

271 Naproxen as NAPROSYN, ANAPROX, ANAPROX DS and NAPROSYN Suspension is  
272 also indicated:

273 • For relief of the signs and symptoms of tendinitis

274 • For relief of the signs and symptoms of bursitis

275 • For relief of the signs and symptoms of acute gout

276 • For the management of pain

277 • For the management of primary dysmenorrhea

278 EC-NAPROSYN is not recommended for initial treatment of acute pain because the  
279 absorption of naproxen is delayed compared to absorption from other naproxen-  
280 containing products (see CLINICAL PHARMACOLOGY and DOSAGE AND  
281 ADMINISTRATION).

## 282 **CONTRAINDICATIONS**

283 All naproxen products are contraindicated in patients who have had allergic reactions to  
284 prescription as well as to over-the-counter products containing naproxen. It is also  
285 contraindicated in patients in whom aspirin or other nonsteroidal anti-  
286 inflammatory/analgesic drugs induce the syndrome of asthma, rhinitis, and nasal polyps.  
287 Both types of reactions have the potential of being fatal. Anaphylactoid reactions to  
288 naproxen, whether of the true allergic type or the pharmacologic idiosyncratic (eg, aspirin  
289 hypersensitivity syndrome) type, usually but not always occur in patients with a known  
290 history of such reactions. Therefore, careful questioning of patients for such things as  
291 asthma, nasal polyps, urticaria, and hypotension associated with nonsteroidal anti-  
292 inflammatory drugs before starting therapy is important. In addition, if such symptoms  
293 occur during therapy, treatment should be discontinued (see WARNINGS: *Anaphylactoid*  
294 *Reactions* and PRECAUTIONS: *Preexisting Asthma*).

## 295 **WARNINGS**

296 ***Gastrointestinal (GI) Effects – Risk of GI Ulceration, Bleeding, and Perforation:***

297 Serious gastrointestinal toxicity such as bleeding, ulceration and perforation of the  
298 stomach, small intestine or large intestine, can occur at any time, with or without warning  
299 symptoms, in patients treated with nonsteroidal anti-inflammatory drugs (NSAIDs).  
300 Minor upper gastrointestinal problems, such as dyspepsia, are common and may also  
301 occur at any time during NSAID therapy. Therefore, physicians and patients should  
302 remain alert for ulceration and bleeding, even in the absence of previous GI tract  
303 symptoms (see PRECAUTIONS: *Hematological Effects*). Patients should be informed  
304 about the signs and/or symptoms of serious GI toxicity and the steps to take if they occur.

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

305 The utility of periodic laboratory monitoring has not been demonstrated, nor has it been  
306 adequately assessed. Only 1 in 5 patients who develop a serious upper GI adverse event  
307 on NSAID therapy is symptomatic. It has been demonstrated that upper GI ulcers, gross  
308 bleeding or perforation, caused by NSAIDs, appear to occur in approximately 1% of  
309 patients treated for 3 to 6 months and in about 2% to 4% of patients treated for 1 year.  
310 These trends continue, thus increasing the likelihood of developing a serious GI event at  
311 some time during the course of therapy. However, even short-term therapy is not without  
312 risk.

313 NSAIDs should be prescribed with extreme caution in patients with a prior history of  
314 ulcer disease or gastrointestinal bleeding. Most spontaneous reports of fatal GI events are  
315 in elderly or debilitated patients and therefore special care should be taken in treating this  
316 population. **To minimize the potential risk for an adverse GI event, the lowest**  
317 **effective dose should be used for the shortest possible duration.** For high-risk patients,  
318 alternate therapies that do not involve NSAIDs should be considered.

319 Studies have shown that patients with a *prior history of peptic ulcer disease and/or*  
320 *gastrointestinal bleeding* and who use NSAIDs, have a greater than 10-fold risk for  
321 developing a GI bleed than patients with neither of these risk factors. In addition to a past  
322 history of ulcer disease, pharmacoepidemiological studies have identified several other  
323 co-therapies or co-morbid conditions that may increase the risk for GI bleeding such as:  
324 treatment with oral corticosteroids, treatment with anticoagulants, longer duration of  
325 NSAID therapy, smoking, alcoholism, older age, and poor general health status.

326 **Anaphylactoid Reactions:** As with other NSAIDs, anaphylactoid reactions may occur in  
327 patients without known prior exposure to naproxen. Naproxen should not be given to  
328 patients with the aspirin triad. This symptom complex typically occurs in asthmatic  
329 patients who experience rhinitis with or without nasal polyps, or who exhibit severe,  
330 potentially fatal bronchospasm after taking aspirin or other NSAIDs (see  
331 CONTRAINDICATIONS and PRECAUTIONS: *Preexisting Asthma*). Emergency help  
332 should be sought in cases where an anaphylactoid reaction occurs.

333 **Advanced Renal Disease:** In cases with advanced kidney disease, treatment with  
334 naproxen is not recommended. If NSAID therapy, however, must be initiated, close  
335 monitoring of the patient's kidney function is advisable (see PRECAUTIONS: *Renal*  
336 *Effects*).

337 **Pregnancy:** In late pregnancy, as with other NSAIDs, naproxen should be avoided  
338 because it may cause premature closure of the ductus arteriosus.

### 339 **PRECAUTIONS**

340 **General:** NAPROXEN-CONTAINING PRODUCTS SUCH AS NAPROSYN, EC-  
341 NAPROSYN, ANAPROX, ANAPROX DS, NAPROSYN SUSPENSION, ALEVE®\*,  
342 AND OTHER NAPROXEN PRODUCTS SHOULD NOT BE USED  
343 CONCOMITANTLY SINCE THEY ALL CIRCULATE IN THE PLASMA AS  
344 THE NAPROXEN ANION.

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

345 Naproxen cannot be expected to substitute for corticosteroids or to treat corticosteroid  
346 insufficiency. Abrupt discontinuation of corticosteroids may lead to disease exacerbation.  
347 Patients on prolonged corticosteroid therapy should have their therapy tapered slowly if a  
348 decision is made to discontinue corticosteroids and the patient should be observed closely  
349 for any evidence of adverse effects, including adrenal insufficiency and exacerbation of  
350 symptoms of arthritis.

351 Patients with initial hemoglobin values of 10 g or less who are to receive long-term  
352 therapy should have hemoglobin values determined periodically.

353 The antipyretic and anti-inflammatory activities of the drug may reduce fever and  
354 inflammation, thus diminishing their utility as diagnostic signs in detecting complications  
355 of presumed noninfectious, noninflammatory painful conditions.

356 Because of adverse eye findings in animal studies with drugs of this class, it is  
357 recommended that ophthalmic studies be carried out if any change or disturbance in  
358 vision occurs.

359 **Hepatic Effects:** As with other nonsteroidal anti-inflammatory drugs, borderline  
360 elevations of one or more liver tests may occur in up to 15% of patients. These  
361 abnormalities may progress, may remain essentially unchanged, or may be transient with  
362 continued therapy. The SGPT (ALT) test is probably the most sensitive indicator of liver  
363 dysfunction. Meaningful (3 times the upper limit of normal) elevations of SGPT or  
364 SGOT (AST) occurred in controlled clinical trials in less than 1% of patients. A patient  
365 with symptoms and/or signs suggesting liver dysfunction or in whom an abnormal liver  
366 test has occurred, should be evaluated for evidence of the development of more severe  
367 hepatic reaction while on therapy with naproxen. Severe hepatic reactions, including  
368 jaundice and cases of fatal hepatitis, have been reported with naproxen as with other  
369 nonsteroidal anti-inflammatory drugs. Although such reactions are rare, if abnormal liver  
370 tests persist or worsen, if clinical signs and symptoms consistent with liver disease  
371 develop, or if systemic manifestations occur (e.g., eosinophilia, rash, etc.), naproxen  
372 should be discontinued.

373 **Renal Effects:** Caution should be used when initiating treatment with naproxen in  
374 patients with considerable dehydration. It is advisable to rehydrate patients first and then  
375 start therapy with naproxen. Caution is also recommended in patients with pre-existing  
376 kidney disease (see WARNINGS: *Advanced Renal Disease*).

377 As with other nonsteroidal anti-inflammatory drugs, long-term administration of  
378 naproxen to animals has resulted in renal papillary necrosis and other abnormal renal  
379 pathology. In humans, there have been reports of impaired renal function, renal failure,  
380 acute interstitial nephritis, hematuria, proteinuria, renal papillary necrosis, and  
381 occasionally nephrotic syndrome associated with naproxen-containing products and other  
382 NSAIDs since they have been marketed.

383 A second form of renal toxicity has been seen in patients taking naproxen as well as other  
384 nonsteroidal anti-inflammatory drugs. In patients with prerenal conditions leading to a

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

385 reduction in renal blood flow or blood volume, where the renal prostaglandins have a  
386 supportive role in the maintenance of renal perfusion, caution should be observed since  
387 administration of a nonsteroidal anti-inflammatory drug may cause a dose-dependent  
388 reduction in prostaglandin formation and may precipitate overt renal decompensation or  
389 failure. Patients at greatest risk of this reaction are those with impaired renal function,  
390 hypovolemia, heart failure, liver dysfunction, salt depletion, those taking diuretics and  
391 ACE inhibitors, and the elderly. Discontinuation of nonsteroidal anti-inflammatory  
392 therapy is typically followed by recovery to the pretreatment state.

393 Naproxen and its metabolites are eliminated primarily by the kidneys; therefore, the drug  
394 should be used with caution in such patients and the monitoring of serum creatinine  
395 and/or creatinine clearance is advised. A reduction in daily dosage should be considered  
396 to avoid the possibility of excessive accumulation of naproxen metabolites in these  
397 patients. Naproxen-containing products are not recommended for use in patients with  
398 moderate to severe and severe renal impairment (creatinine < 30 ml/min).

399 Chronic alcoholic liver disease and probably other diseases with decreased or abnormal  
400 plasma proteins (albumin) reduce the total plasma concentration of naproxen, but the  
401 plasma concentration of unbound naproxen is increased. Caution is advised when high  
402 doses are required and some adjustment of dosage may be required in these patients. It is  
403 prudent to use the lowest effective dose.

404 Studies indicate that although total plasma concentration of naproxen is unchanged, the  
405 unbound plasma fraction of naproxen is increased in the elderly. Caution is advised when  
406 high doses are required and some adjustment of dosage may be required in elderly  
407 patients. As with other drugs used in the elderly, it is prudent to use the lowest effective  
408 dose.

409 ***Hematological Effects:*** Anemia is sometimes seen in patients receiving NSAIDs,  
410 including naproxen. This may be due to fluid retention, GI loss, or an incompletely  
411 described effect upon erythropoiesis. Patients on long-term treatment with NSAIDs,  
412 including naproxen, should have their hemoglobin or hematocrit checked if they exhibit  
413 any signs or symptoms of anemia.

414 All drugs which inhibit the biosynthesis of prostaglandins may interfere to some extent  
415 with platelet function and vascular responses to bleeding.

416 NSAIDs inhibit platelet aggregation and have been shown to prolong bleeding time in  
417 some patients. Unlike aspirin, their effect on platelet function is quantitatively less, of  
418 shorter duration, and reversible. Naproxen does not generally affect platelet counts,  
419 prothrombin time (PT), or partial thromboplastin time (PTT). Patients receiving naproxen  
420 who may be adversely affected by alterations in platelet function, such as those with  
421 coagulation disorders or patients receiving anticoagulants, should be carefully monitored.

422 ***Fluid Retention and Edema:*** Peripheral edema has been observed in some patients  
423 receiving naproxen. Since each ANAPROX or ANAPROX DS tablet contains 25 mg or  
424 50 mg of sodium (about 1 mEq per each 250 mg of naproxen), and each teaspoonful of

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

425 NAPROSYN Suspension contains 39 mg (about 1.5 mEq per each 125 mg of naproxen)  
426 of sodium, this should be considered in patients whose overall intake of sodium must be  
427 severely restricted. For these reasons, ANAPROX, ANAPROX DS and NAPROSYN  
428 Suspension should be used with caution in patients with fluid retention, hypertension or  
429 heart failure.

430 **Preexisting Asthma:** Patients with asthma may have aspirin-sensitive asthma. The use of  
431 aspirin in patients with aspirin-sensitive asthma has been associated with severe  
432 bronchospasm, which can be fatal. Since cross reactivity, including bronchospasm,  
433 between aspirin and other nonsteroidal anti-inflammatory drugs has been reported in such  
434 aspirin-sensitive patients, naproxen should not be administered to patients with this form  
435 of aspirin sensitivity and should be used with caution in patients with preexisting asthma.

436 **Information for Patients:** Naproxen, in NAPROSYN, EC-NAPROSYN, ANAPROX,  
437 ANAPROX DS and NAPROSYN Suspension can cause discomfort and, rarely, more  
438 serious side effects, such as gastrointestinal bleeding, which may result in hospitalization  
439 and even fatal outcomes. Although serious GI tract ulcerations and bleeding can occur  
440 without warning symptoms, patients should be alert for the signs and symptoms of  
441 ulcerations and bleeding, and should ask for medical advice when observing any  
442 indicative signs or symptoms. Patients should be apprised of the importance of this  
443 follow-up (see WARNINGS: *Gastrointestinal (GI) Effects-Risk of GI Ulceration,*  
444 *Bleeding, and Perforation*).

445 Patients should promptly report signs or symptoms of gastrointestinal ulceration or  
446 bleeding, skin rash, unexplained weight gain or edema to their physicians.

447 Patients should be informed of the warning signs and symptoms of hepatotoxicity (eg,  
448 nausea, fatigue, lethargy, pruritus, jaundice, right upper quadrant tenderness, and “flu-  
449 like” symptoms). If these occur, patients should be instructed to stop therapy and seek  
450 immediate medical therapy.

451 Patients should also be instructed to seek immediate emergency help in the case of an  
452 anaphylactoid reaction (see WARNINGS).

453 In late pregnancy, naproxen, in NAPROSYN, EC-NAPROSYN, ANAPROX,  
454 ANAPROX DS, and NAPROSYN SUSPENSION, should be avoided because it may  
455 cause premature closure of the ductus arteriosus.

456 Caution should be exercised by patients whose activities require alertness if they  
457 experience drowsiness, dizziness, vertigo or depression during therapy with naproxen.

458 **Laboratory Tests:** Because serious GI tract ulcerations and bleeding can occur without  
459 warning symptoms, physicians should monitor for signs or symptoms of GI bleeding. If  
460 clinical signs and symptoms consistent with liver or renal disease develop, systemic  
461 manifestations occur (eg, eosinophilia, rash, etc.) or if abnormal liver tests persist or  
462 worsen, naproxen should be discontinued.

463 **Drug Interactions:**

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

464 *Aspirin:* Concomitant administration of naproxen and aspirin is not recommended  
465 because naproxen is displaced from its binding sites during the concomitant  
466 administration of aspirin, resulting in lower plasma concentrations and peak plasma  
467 levels.

468 *Methotrexate:* Caution should be used if naproxen is administered concomitantly with  
469 methotrexate. Naproxen, naproxen sodium and other nonsteroidal anti-inflammatory  
470 drugs have been reported to reduce the tubular secretion of methotrexate in an animal  
471 model, possibly increasing the toxicity of methotrexate.

472 *ACE-inhibitors:* Reports suggest that NSAIDs may diminish the antihypertensive effect  
473 of ACE-inhibitors. The use of NSAIDs in patients who are receiving ACE inhibitors may  
474 potentiate renal disease states (see PRECAUTIONS: *Renal Effects*).

475 *Furosemide:* Clinical studies, as well as postmarketing observations, have shown that  
476 NSAIDs can reduce the natriuretic effect of furosemide and thiazides in some patients.  
477 This response has been attributed to inhibition of renal prostaglandin synthesis.

478 *Lithium:* Inhibition of renal lithium clearance leading to increases in plasma lithium  
479 concentrations has also been reported. The mean minimum lithium concentration  
480 increased 15% and the renal clearance was decreased by approximately 20%. These  
481 effects have been attributed to inhibition of renal prostaglandin synthesis by the NSAID.  
482 Thus, when NSAIDs and lithium are administered concurrently, patients should be  
483 observed carefully for signs of lithium toxicity.

484 *Warfarin:* The effects of warfarin and NSAIDs on GI bleeding are synergistic, such that  
485 patients taking both drugs have a risk of serious GI bleeding that is higher than patients  
486 taking either drug alone. No significant interactions have been observed in clinical  
487 studies with naproxen and coumarin-type anticoagulants. However, caution is advised  
488 since interactions have been seen with other nonsteroidal agents of this class. The free  
489 fraction of warfarin may increase substantially in some subjects and naproxen interferes  
490 with platelet function.

491 ***Other Information Concerning Drug Interactions:***

492 Naproxen is highly bound to plasma albumin; it thus has a theoretical potential for  
493 interaction with other albumin-bound drugs such as coumarin-type anticoagulants,  
494 sulphonylureas, hydantoin, other NSAIDs, and aspirin. Patients simultaneously  
495 receiving naproxen and a hydantoin, sulphonamide or sulphonylurea should be observed  
496 for adjustment of dose if required.

497 Naproxen and other nonsteroidal anti-inflammatory drugs can reduce the  
498 antihypertensive effect of propranolol and other beta-blockers.

499 Probenecid given concurrently increases naproxen anion plasma levels and extends its  
500 plasma half-life significantly.

501 Due to the gastric pH elevating effects of H<sub>2</sub>-blockers, sucralfate and intensive antacid  
502 therapy, concomitant administration of EC-NAPROSYN is not recommended.

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

503 ***Drug/Laboratory Test Interactions:*** Naproxen may decrease platelet aggregation and  
504 prolong bleeding time. This effect should be kept in mind when bleeding times are  
505 determined.

506 The administration of naproxen may result in increased urinary values for 17-ketogenic  
507 steroids because of an interaction between the drug and/or its metabolites with m-di-  
508 nitrobenzene used in this assay. Although 17-hydroxy-corticosteroid measurements  
509 (Porter-Silber test) do not appear to be artifactually altered, it is suggested that therapy  
510 with naproxen be temporarily discontinued 72 hours before adrenal function tests are  
511 performed if the Porter-Silber test is to be used.

512 Naproxen may interfere with some urinary assays of 5-hydroxy indoleacetic acid  
513 (5HIAA).

514 ***Carcinogenesis:*** A 2-year study was performed in rats to evaluate the carcinogenic  
515 potential of naproxen at rat doses of 8, 16, and 24 mg/kg/day (50, 100, and 150 mg/m<sup>2</sup>).  
516 The maximum dose used was 0.28 times the systemic exposure to humans at the  
517 recommended dose. No evidence of tumorigenicity was found.

518 ***Pregnancy: Teratogenic Effects:*** Pregnancy Category C. Reproduction studies have been  
519 performed in rats at 20 mg/kg/day (125 mg/m<sup>2</sup>/day, 0.23 times the human systemic  
520 exposure), rabbits at 20 mg/kg/day (220 mg/m<sup>2</sup>/day, 0.27 times the human systemic  
521 exposure), and mice at 170 mg/kg/day (510 mg/m<sup>2</sup>/day, 0.28 times the human systemic  
522 exposure) with no evidence of impaired fertility or harm to the fetus due to the drug.  
523 There are no adequate and well-controlled studies in pregnant women. Because animal  
524 reproduction studies are not always predictive of human response, naproxen should not  
525 be used during pregnancy unless clearly needed.

526 ***Nonteratogenic Effects:*** There is some evidence to suggest that when inhibitors of  
527 prostaglandin synthesis are used to delay preterm labor there is an increased risk of  
528 neonatal complications such as necrotizing enterocolitis, patent ductus arteriosus and  
529 intracranial hemorrhage. Naproxen treatment given in late pregnancy to delay parturition  
530 has been associated with persistent pulmonary hypertension, renal dysfunction and  
531 abnormal prostaglandin E levels in preterm infants. Because of the known effect of drugs  
532 of this class on the human fetal cardiovascular system (closure of ductus arteriosus), use  
533 during third trimester should be avoided.

534 ***Labor and Delivery:*** In rat studies with NSAIDs, as with other drugs known to inhibit  
535 prostaglandin synthesis, an increased incidence of dystocia, delayed parturition, and  
536 decreased pup survival occurred. Naproxen-containing products are not recommended in  
537 labor and delivery because, through its prostaglandin synthesis inhibitory effect,  
538 naproxen may adversely affect fetal circulation and inhibit uterine contractions, thus  
539 increasing the risk of uterine hemorrhage.

540 ***Nursing Mothers:*** The naproxen anion has been found in the milk of lactating women at  
541 a concentrations equivalent to approximately 1% of maximum naproxen concentration in

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

542 plasma. Because of the possible adverse effects of prostaglandin-inhibiting drugs on  
543 neonates, use in nursing mothers should be avoided.

544 ***Pediatric Use:*** Safety and effectiveness in pediatric patients below the age of 2 years  
545 have not been established. Pediatric dosing recommendations for juvenile arthritis are  
546 based on well-controlled studies (see DOSAGE AND ADMINISTRATION). There are  
547 no adequate effectiveness or dose-response data for other pediatric conditions, but the  
548 experience in juvenile arthritis and other use experience have established that single  
549 doses of 2.5 to 5 mg/kg (as naproxen suspension, see DOSAGE AND  
550 ADMINISTRATION), with total daily dose not exceeding 15 mg/kg/day, are well  
551 tolerated in pediatric patients over 2 years of age.

552 ***Geriatric Use:*** Studies indicate that although total plasma concentration of naproxen is  
553 unchanged, the unbound plasma fraction of naproxen is increased in the elderly. Caution  
554 is advised when high doses are required and some adjustment of dosage may be required  
555 in elderly patients. As with other drugs used in the elderly, it is prudent to use the lowest  
556 effective dose.

557 Experience indicates that geriatric patients may be particularly sensitive to certain  
558 adverse effects of nonsteroidal anti-inflammatory drugs. While age does not appear to be  
559 an independent risk factor for the development of peptic ulceration and bleeding with  
560 naproxen administration, elderly or debilitated patients seem to tolerate peptic ulceration  
561 or bleeding less well when these events do occur. Most spontaneous reports of fatal GI  
562 events are in the geriatric population (see WARNINGS).

563 Naproxen is known to be substantially excreted by the kidney, and the risk of toxic  
564 reactions to this drug may be greater in patients with impaired renal function. Because  
565 elderly patients are more likely to have decreased renal function, care should be taken in  
566 dose selection, and it may be useful to monitor renal function. Geriatric patients may be  
567 at a greater risk for the development of a form of renal toxicity precipitated by reduced  
568 prostaglandin formation during administration of nonsteroidal anti-inflammatory drugs  
569 (see PRECAUTIONS: *Renal Effects*).

## 570 **ADVERSE REACTIONS**

571 Adverse reactions reported in controlled clinical trials in 960 patients treated for  
572 rheumatoid arthritis or osteoarthritis are listed below. In general, reactions in patients  
573 treated chronically were reported 2 to 10 times more frequently than they were in short-  
574 term studies in the 962 patients treated for mild to moderate pain or for dysmenorrhea.  
575 The most frequent complaints reported related to the gastrointestinal tract.

576 A clinical study found gastrointestinal reactions to be more frequent and more severe in  
577 rheumatoid arthritis patients taking daily doses of 1500 mg naproxen compared to those  
578 taking 750 mg naproxen (see CLINICAL PHARMACOLOGY).

579 In controlled clinical trials with about 80 pediatric patients and in well-monitored, open-  
580 label studies with about 400 pediatric patients with juvenile arthritis treated with  
581 naproxen, the incidence of rash and prolonged bleeding times were increased, the

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

582 incidence of gastrointestinal and central nervous system reactions were about the same,  
583 and the incidence of other reactions were lower in pediatric patients than in adults.

584 In patients taking naproxen in clinical trials, the most frequently reported adverse  
585 experiences in approximately 1 to 10% of patients are:

586 **Gastrointestinal (GI) Experiences, including:** heartburn\*, abdominal pain\*, nausea\*,  
587 constipation\*, diarrhea, dyspepsia, stomatitis

588 **Central Nervous System:** headache\*, dizziness\*, drowsiness\*, lightheadedness, vertigo

589 **Dermatologic:** pruritus (itching) \*, skin eruptions\*, ecchymoses\*, sweating, purpura

590 **Special Senses:** tinnitus\*, visual disturbances, hearing disturbances

591 **Cardiovascular:** edema\*, palpitations

592 **General:** dyspnea\*, thirst

593 \* Incidence of reported reaction between 3% and 9%. Those reactions occurring in less  
594 than 3% of the patients are unmarked.

595 In patients taking NSAIDs, the following adverse experiences have also been reported in  
596 approximately 1 to 10% of patients.

597 **Gastrointestinal (GI) Experiences, including:** flatulence, gross bleeding/perforation, GI  
598 ulcers (gastric/duodenal), vomiting

599 **General:** abnormal renal function, anemia, elevated liver enzymes, increased bleeding  
600 time, rashes

601 The following are additional adverse experiences reported in <1% of patients taking  
602 naproxen during clinical trials and through post-marketing reports. Those adverse  
603 reactions observed through post-marketing reports are italicized.

604 **Body as a Whole:** *anaphylactoid reactions, angioneurotic edema, menstrual disorders,*  
605 *pyrexia (chills and fever)*

606 **Cardiovascular:** *congestive heart failure, vasculitis*

607 **Gastrointestinal:** *gastrointestinal bleeding and/or perforation, hematemesis, jaundice,*  
608 *pancreatitis, vomiting, colitis, abnormal liver function tests, nonpeptic gastrointestinal*  
609 *ulceration, ulcerative stomatitis*

610 **Hemic and Lymphatic:** *eosinophilia, leucopenia, melena, thrombocytopenia,*  
611 *agranulocytosis, granulocytopenia, hemolytic anemia, aplastic anemia*

612 **Metabolic and Nutritional:** *hyperglycemia, hypoglycemia*

613 **Nervous System:** *inability to concentrate, depression, dream abnormalities, insomnia,*  
614 *malaise, myalgia, muscle weakness, aseptic meningitis, cognitive dysfunction*

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

615 **Respiratory:** *eosinophilic pneumonitis*

616 **Dermatologic:** *alopecia, urticaria, skin rashes, toxic epidermal necrolysis, erythema*  
617 *multiforme, Stevens-Johnson syndrome, photosensitive dermatitis, photosensitivity*  
618 *reactions, including rare cases resembling porphyria cutanea tarda (pseudoporphyria)*  
619 *or epidermolysis bullosa. If skin fragility, blistering or other symptoms suggestive of*  
620 *pseudoporphyria occur, treatment should be discontinued and the patient monitored.*

621 **Special Senses:** *hearing impairment*

622 **Urogenital:** *glomerular nephritis, hematuria, hyperkalemia, interstitial nephritis,*  
623 *nephrotic syndrome, renal disease, renal failure, renal papillary necrosis*

624 In patients taking NSAIDs, the following adverse experiences have also been reported in  
625 <1% of patients.

626 **Body as a Whole:** fever, infection, sepsis, anaphylactic reactions, appetite changes, death

627 **Cardiovascular:** hypertension, tachycardia, syncope, arrhythmia, hypotension,  
628 myocardial infarction

629 **Gastrointestinal:** dry mouth, esophagitis, gastric/peptic ulcers, gastritis, glossitis,  
630 hepatitis, eructation, liver failure

631 **Hemic and Lymphatic:** rectal bleeding, lymphadenopathy, pancytopenia

632 **Metabolic and Nutritional:** weight changes

633 **Nervous System:** anxiety, asthenia, confusion, nervousness, paresthesia, somnolence,  
634 tremors, convulsions, coma, hallucinations

635 **Respiratory:** asthma, respiratory depression, pneumonia

636 **Dermatologic:** exfoliative dermatitis

637 **Special Senses:** blurred vision, conjunctivitis

638 **Urogenital:** cystitis, dysuria, oliguria/polyuria, proteinuria

## 639 **OVERDOSAGE**

640 Significant naproxen overdose may be characterized by lethargy, dizziness,  
641 drowsiness, epigastric pain, abdominal discomfort, heartburn, indigestion, nausea,  
642 transient alterations in liver function, hypoprothrombinemia, renal dysfunction, metabolic  
643 acidosis, apnea, disorientation or vomiting. Gastrointestinal bleeding can occur.  
644 Hypertension, acute renal failure, respiratory depression, and coma may occur, but are  
645 rare. Anaphylactoid reactions have been reported with therapeutic ingestion of NSAIDs,  
646 and may occur following an overdose. Because naproxen sodium may be rapidly  
647 absorbed, high and early blood levels should be anticipated. A few patients have  
648 experienced convulsions, but it is not clear whether or not these were drug-related. It is  
649 not known what dose of the drug would be life threatening. The oral LD<sub>50</sub> of the drug is

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

650 543 mg/kg in rats, 1234 mg/kg in mice, 4110 mg/kg in hamsters, and greater than 1000  
651 mg/kg in dogs.

652 Patients should be managed by symptomatic and supportive care following a NSAID  
653 overdose. There are no specific antidotes. Hemodialysis does not decrease the plasma  
654 concentration of naproxen because of the high degree of its protein binding. Emesis  
655 and/or activated charcoal (60 to 100 g in adults, 1 to 2 g/kg in children) and/or osmotic  
656 cathartic may be indicated in patients seen within 4 hours of ingestion with symptoms or  
657 following a large overdose. Forced diuresis, alkalinization of urine or hemoperfusion may  
658 not be useful due to high protein binding.

659 **DOSAGE AND ADMINISTRATION**

660 **Rheumatoid Arthritis, Osteoarthritis and Ankylosing Spondylitis:**

NAPROSYN	250 mg or 375 mg or 500 mg	twice daily twice daily twice daily
ANAPROX	275 mg (naproxen 250 mg with 25 mg sodium)	twice daily
ANAPROX DS	550 mg (naproxen 500 mg with 50 mg sodium)	twice daily
NAPROSYN Suspension	250 mg (10 mL/2 tsp) or 375 mg (15 mL/3 tsp) or 500 mg (20 mL/4 tsp)	twice daily twice daily twice daily
EC-NAPROSYN	375 mg or 500 mg	twice daily twice daily

661 To maintain the integrity of the enteric coating, the EC-NAPROSYN tablet should not be  
662 broken, crushed or chewed during ingestion.

663 During long-term administration, the dose of naproxen may be adjusted up or down  
664 depending on the clinical response of the patient. A lower daily dose may suffice for  
665 long-term administration. The morning and evening doses do not have to be equal in size  
666 and the administration of the drug more frequently than twice daily is not necessary.

667 In patients who tolerate lower doses well, the dose may be increased to naproxen 1500  
668 mg per day for limited periods of up to 6 months when a higher level of anti-  
669 inflammatory/analgesic activity is required. When treating such patients with naproxen  
670 1500 mg/day, the physician should observe sufficient increased clinical benefits to offset  
671 the potential increased risk (see CLINICAL PHARMACOLOGY and  
672 INDIVIDUALIZATION OF DOSAGE).

673 **Geriatric Patients:** Studies indicate that although total plasma concentration of naproxen  
674 is unchanged, the unbound plasma fraction of naproxen is increased in the elderly.  
675 Caution is advised when high doses are required and some adjustment of dosage may be  
676 required in elderly patients. As with other drugs used in the elderly, it is prudent to use  
677 the lowest effective dose.

**EC-NAPROSYN® (naproxen delayed-release tablets), NAPROSYN® (naproxen tablets), ANAPROX®/ANAPROX® DS (naproxen sodium tablets), NAPROSYN® (naproxen suspension)**

678 **Juvenile Arthritis:** The recommended total daily dose of naproxen is approximately 10  
679 mg/kg given in 2 divided doses (ie, 5 mg/kg given twice a day). A measuring cup marked  
680 in 1/2 teaspoon and 2.5 milliliter increments is provided with the NAPROSYN  
681 Suspension. The following table may be used as a guide for dosing of NAPROSYN  
682 Suspension:

683	<b>Patient's Weight</b>	<b>Dose</b>	<b>Administered as</b>
684	13 kg (29 lb)	62.5 mg bid	2.5 mL (1/2 tsp) twice daily
685	25 kg (55 lb)	125 mg bid	5.0 mL (1 tsp) twice daily
686	38 kg (84 lb)	187.5 mg bid	7.5 mL (1 1/2 tsp) twice daily

687 **Management of Pain, Primary Dysmenorrhea and Acute Tendonitis and Bursitis:** The  
688 recommended starting dose is 550 mg of naproxen sodium as ANAPROX/ANAPROX  
689 DS followed by 550 mg every 12 hours or 275 mg every 6 to 8 hours as required. The  
690 initial total daily dose should not exceed 1375 mg of naproxen sodium. Thereafter, the  
691 total daily dose should not exceed 1100 mg of naproxen sodium. NAPROSYN may also  
692 be used but EC-NAPROSYN is not recommended for initial treatment of acute pain  
693 because absorption of naproxen is delayed compared to other naproxen-containing  
694 products (see CLINICAL PHARMACOLOGY, INDICATIONS AND USAGE and  
695 INDIVIDUALIZATION OF DOSAGE).

696 **Acute Gout:** The recommended starting dose is 750 mg of NAPROSYN followed by 250  
697 mg every 8 hours until the attack has subsided. ANAPROX may also be used at a starting  
698 dose of 825 mg followed by 275 mg every 8 hours. EC-NAPROSYN is not  
699 recommended because of the delay in absorption (see CLINICAL PHARMACOLOGY).

700 **HOW SUPPLIED**

701 **NAPROSYN Tablets:** 250 mg: round, yellow, biconvex, engraved with NPR LE 250 on  
702 one side and scored on the other. Packaged in light-resistant bottles of 100.

703 100's (bottle): NDC 0004-6313-01.

704 375 mg: pink, biconvex oval, engraved with NPR LE 375 on one side. Packaged in light-  
705 resistant bottles of 100 and 500.

706 100's (bottle): NDC 0004-6314-01; 500's (bottle): NDC 0004-6314-14.

707 500 mg: yellow, capsule-shaped, engraved with NPR LE 500 on one side and scored on  
708 the other. Packaged in light-resistant bottles of 100 and 500.

709 100's (bottle): NDC 0004-6316-01; 500's (bottle): NDC 0004-6316-14.

710 Store at 15° to 30°C (59° to 86°F) in well-closed containers; dispense in light-resistant  
711 containers.

712 **NAPROSYN Suspension:** 125 mg/5 mL (contains 39 mg sodium, about 1.5  
713 mEq/teaspoon): Available in 1 pint (473 mL) light-resistant bottles (NDC 0004-0028-28).

**EC-NAPROSYN<sup>®</sup> (naproxen delayed-release tablets), NAPROSYN<sup>®</sup> (naproxen tablets), ANAPROX<sup>®</sup>/ANAPROX<sup>®</sup> DS (naproxen sodium tablets), NAPROSYN<sup>®</sup> (naproxen suspension)**

714 Store at 15° to 30°C (59° to 86°F); avoid excessive heat, above 40°C (104°F). Dispense  
715 in light-resistant containers.

716 **EC-NAPROSYN Delayed-Release Tablets:** 375 mg: white, capsule-shaped, imprinted  
717 with EC-NAPROSYN on one side and 375 on the other. Packaged in light-resistant  
718 bottles of 100.

719 100's (bottle): NDC 0004-6415-01.

720 500 mg: white, capsule-shaped, imprinted with EC-NAPROSYN on one side and 500 on  
721 the other. Packaged in light-resistant bottles of 100.

722 100's (bottle): NDC 0004-6416-01.

723 Store at 15° to 30°C (59° to 86°F) in well-closed containers; dispense in light-resistant  
724 containers.

725 **ANAPROX Tablets:** Naproxen sodium 275 mg: light blue, oval-shaped, engraved with  
726 NPS-275 on one side. Packaged in bottles of 100.

727 100's (bottle): NDC 0004-6202-01.

728 Store at 15° to 30°C (59° to 86°F) in well-closed containers.

729 **ANAPROX DS Tablets:** Naproxen sodium 550 mg: dark blue, oblong-shaped, engraved  
730 with NPS 550 on one side and scored on both sides. Packaged in bottles of 100 and 500.

731 100's (bottle): NDC 0004-6203-01; 500's (bottle): NDC 0004-6203-14.

732 Store at 15° to 30°C (59° to 86°F) in well-closed containers.
