

DATA CENTER EFFICIENCY

EPA Climate Leaders Boudler, CO Dec 2007

Mark Monroe

Director, Sustainable Computing Sun Microsystems, Inc. mark.monroe@sun.com

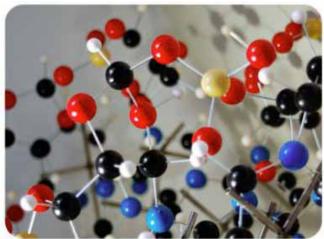

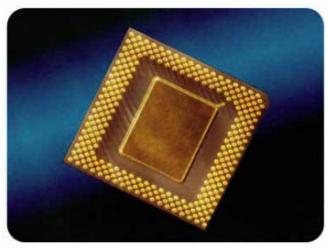

Sustainability through Computing

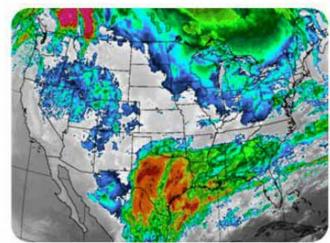

Demand and Capacity Are Colliding...

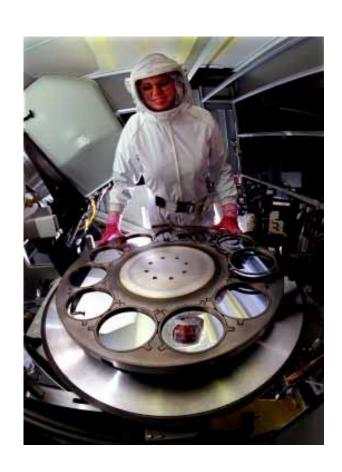

Is Computing Sustainable?

- •Three reasons to say "No" today ...
 - 1) Energy and natural resources to make the products
 - 2) Electricity to run them
 - 3) Energy and waste when recycle and dispose of them

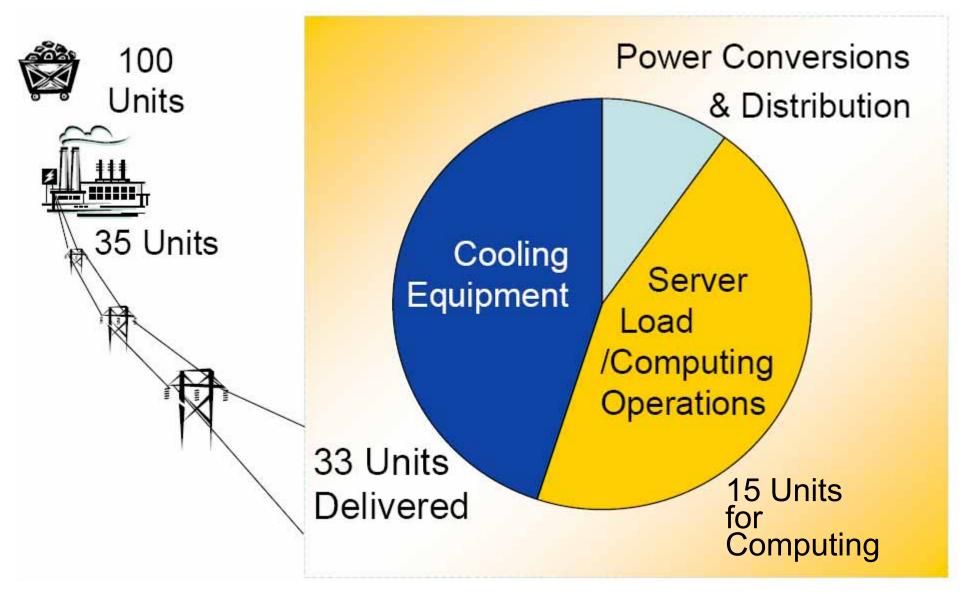

Energy Intensive Product

- Embodied energy in PCs studied since mid-1990s
- Results vary widely, but most are around 6,000 Mjoules per device*
- •6,000 MJ is approx. 1,800 KW-h, or about the energy consumed by the average U.S. House in 2 months
- •IDC estimates 229M units in 2006
- Total energy to manufacture = 400B KW-h
- Equivalent to 65 x 600MW power plants
- •230M metric Tons of CO₂

Powering a Server

Source: DOE, Paul Scheihing

Environmental Impact

Sun Datacenter

- 2006
- 10.5M kWh
- 10K tons of CO2

WW Datacenters

- 2006
- 290B kWh
- 200M tons of CO2

Growing eWaste Problem

300 million computers already obsolete by 2004...

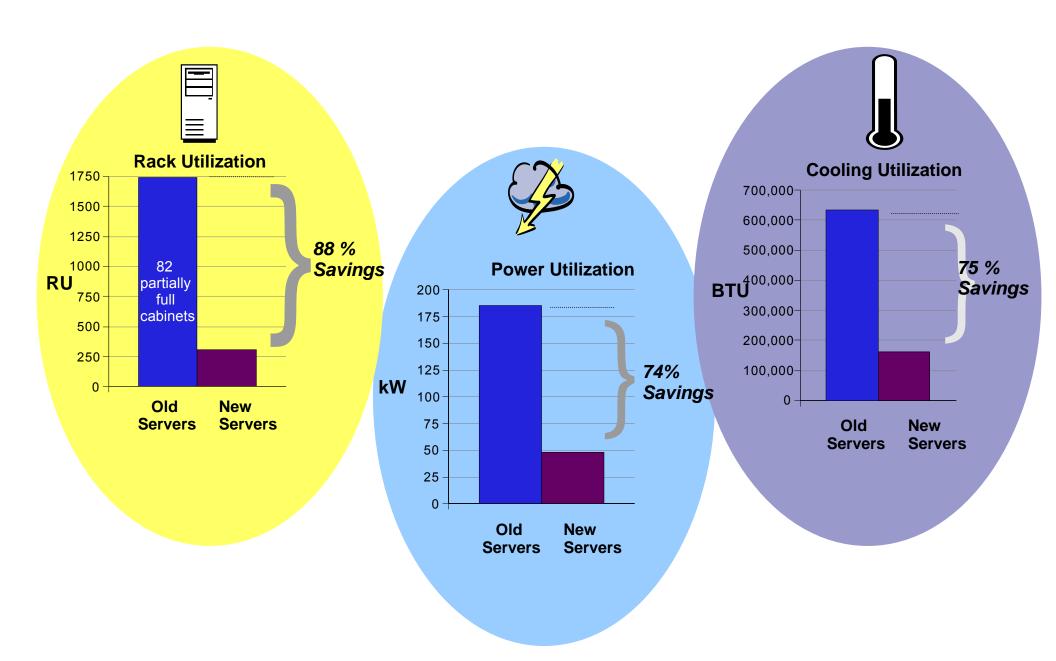

- Content problem: over 700 esoteric compounds in each PC
- Volume problem: 1 million computers amount to more than 25,000 tons of electronic junk
- Increasingly international problem

Holland Tech Refresh Savings

Break Out Innovation

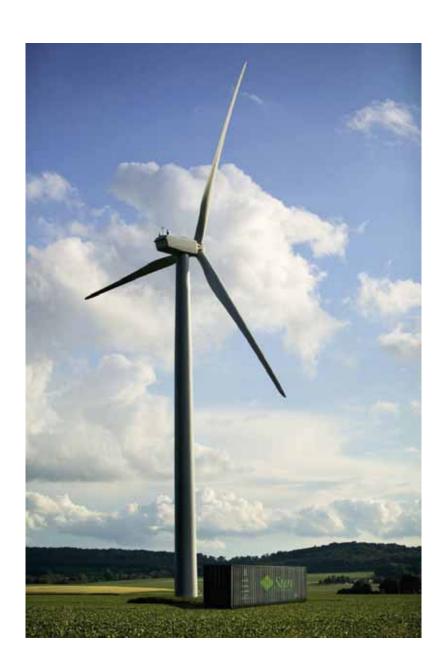

The First Virtualized Datacenter

Where Should Datacenters Be?

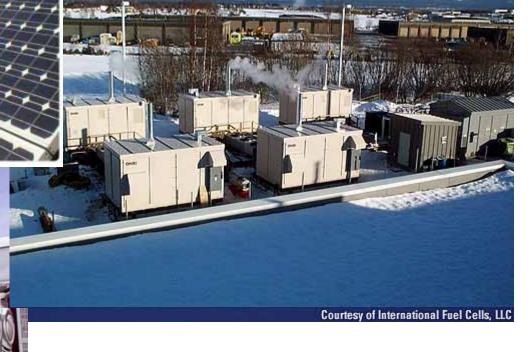

How Should We Do Datacenters When We Can Start From Scratch?

Solar PV

Natural Gas Microturbine

EPA Report to Congress – Aug 2007

Report to Congress on Server and Data Center Energy Efficiency Public Law 109-431

> U.S. Environmental Protection Agency ENERGY STAR Program

> > August 2, 2007

Table 6-1: Energy Cost Savings Comparison for DG/CHP in Data Centers

	Molten	Dhaanbaria		
CHP System	Carbonate	Phosphoric Acid Fuel Cell	Microturbine/	Gas Turbine/
O'll System	Fuel Cell/	/Chiller	Chiller Package	Chiller
	Chiller			2.224
Capacity, kW	1,000	200	200	3,364
Heat Rate, Btu/kWh	8,060	9,480	14,300	13,930
