*And*

**Charles M. Thompson, MDEQ Regional  
Biologist Central Region**

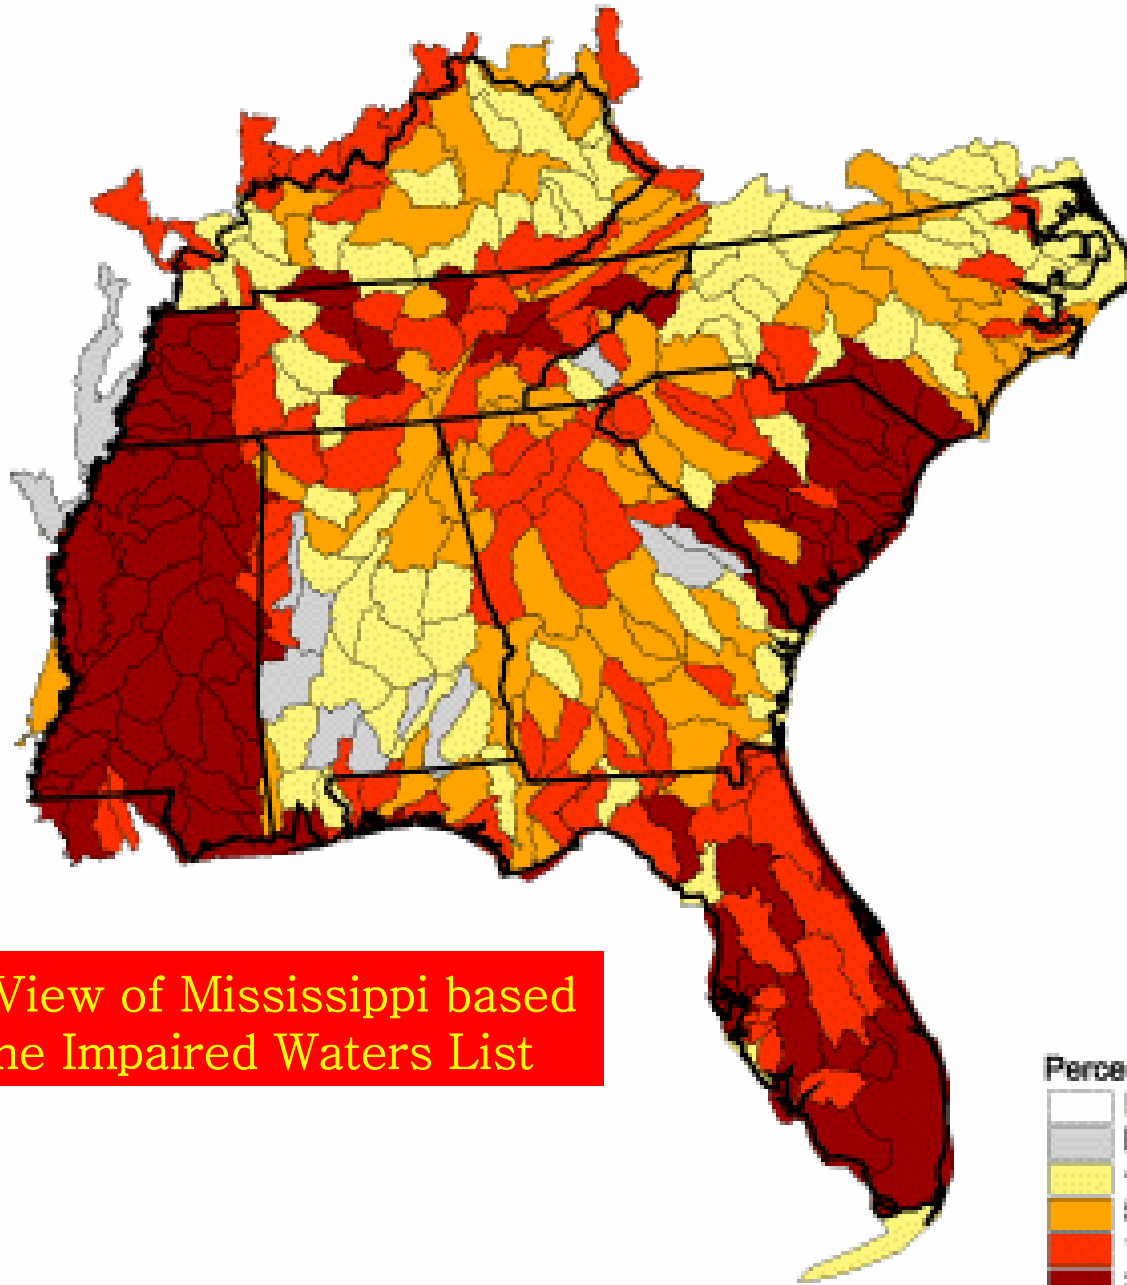

**[Charles\\_Thompson@deq.state.ms.us](mailto:Charles_Thompson@deq.state.ms.us)**

**Early 1980's**  
**environmental groups file**  
**lawsuits forcing EPA to**  
**establish impaired water**  
**bodies list a.k.a. 303(d)**  
**and declare TMDL's**

**1997 the Sierra Club sued**  
**EPA for not developing**  
**TMDL's**

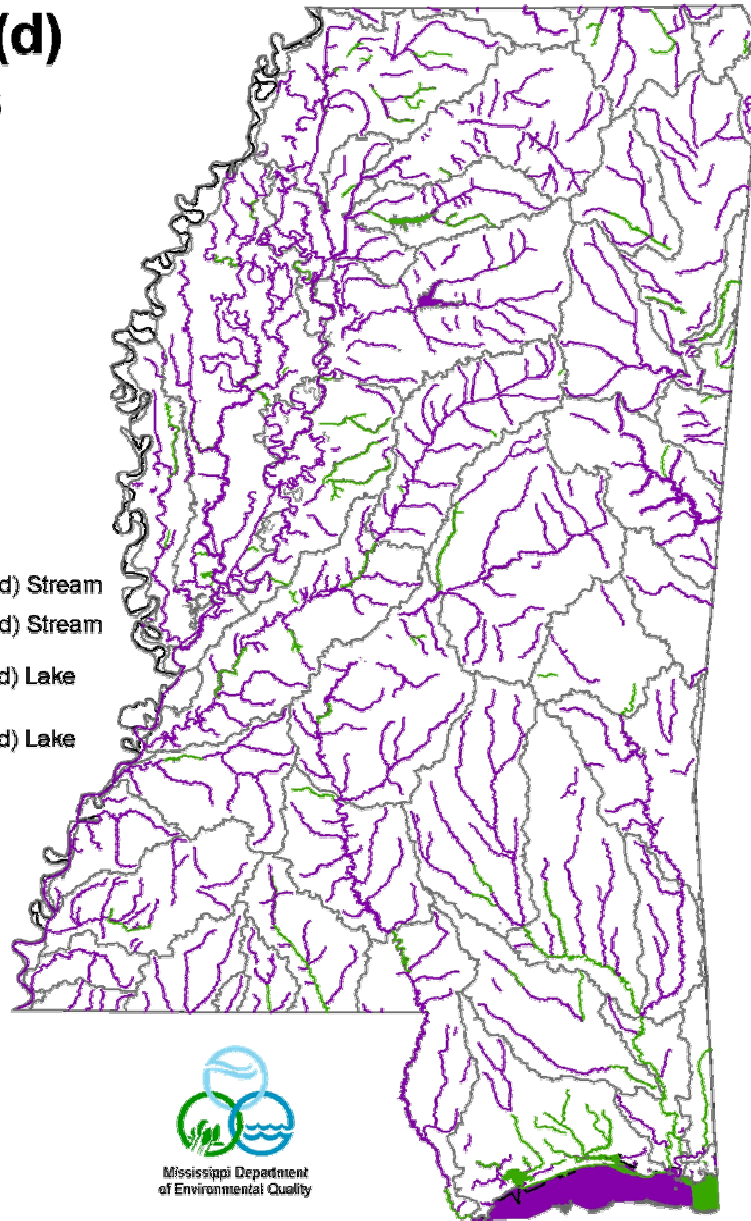

1998 View of Mississippi based  
on the Impaired Waters List

# 1998 303(d) Waters

## Legend

-  Evaluated 303(d) Stream
-  Monitored 303(d) Stream
-  Evaluated 303(d) Lake
-  Monitored 303(d) Lake
-  8 Digit HUC

# Large River Method Development

- **Wanted to collect nutrient samples for nutrient criteria development and other physical/chemical water quality parameters**
- **Wanted to develop a method to be used in non-wadeable streams and rivers**
  - **Biological Assessment using Benthics**
  - **Physical Habitat Assessment**
  - **Substrate Composition**
  - **Began to review Joe Flotemersch's work**
    - **Very involved**
    - **Too much work for our limited resources**

Example of the 6 transects and 6 sample zones for collection of benthic macroinvertebrates in the Pascagoula river of Mississippi. This example starts on river-right.

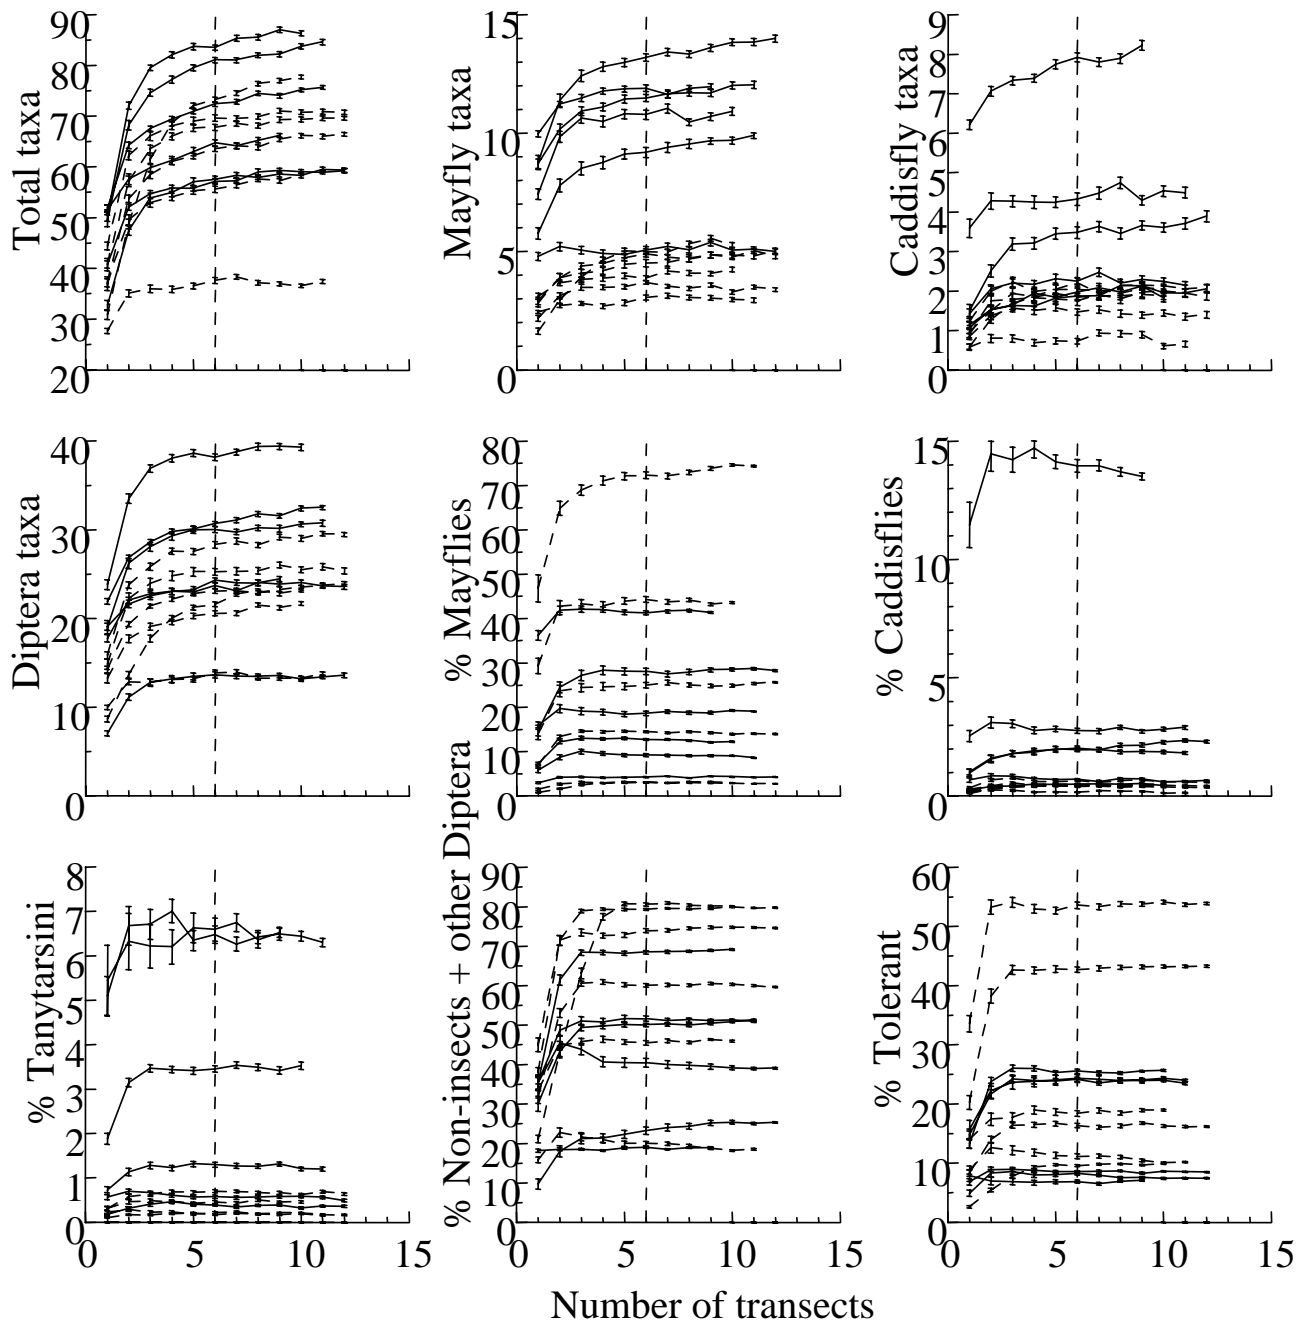

# Modifying the Sampling Protocol

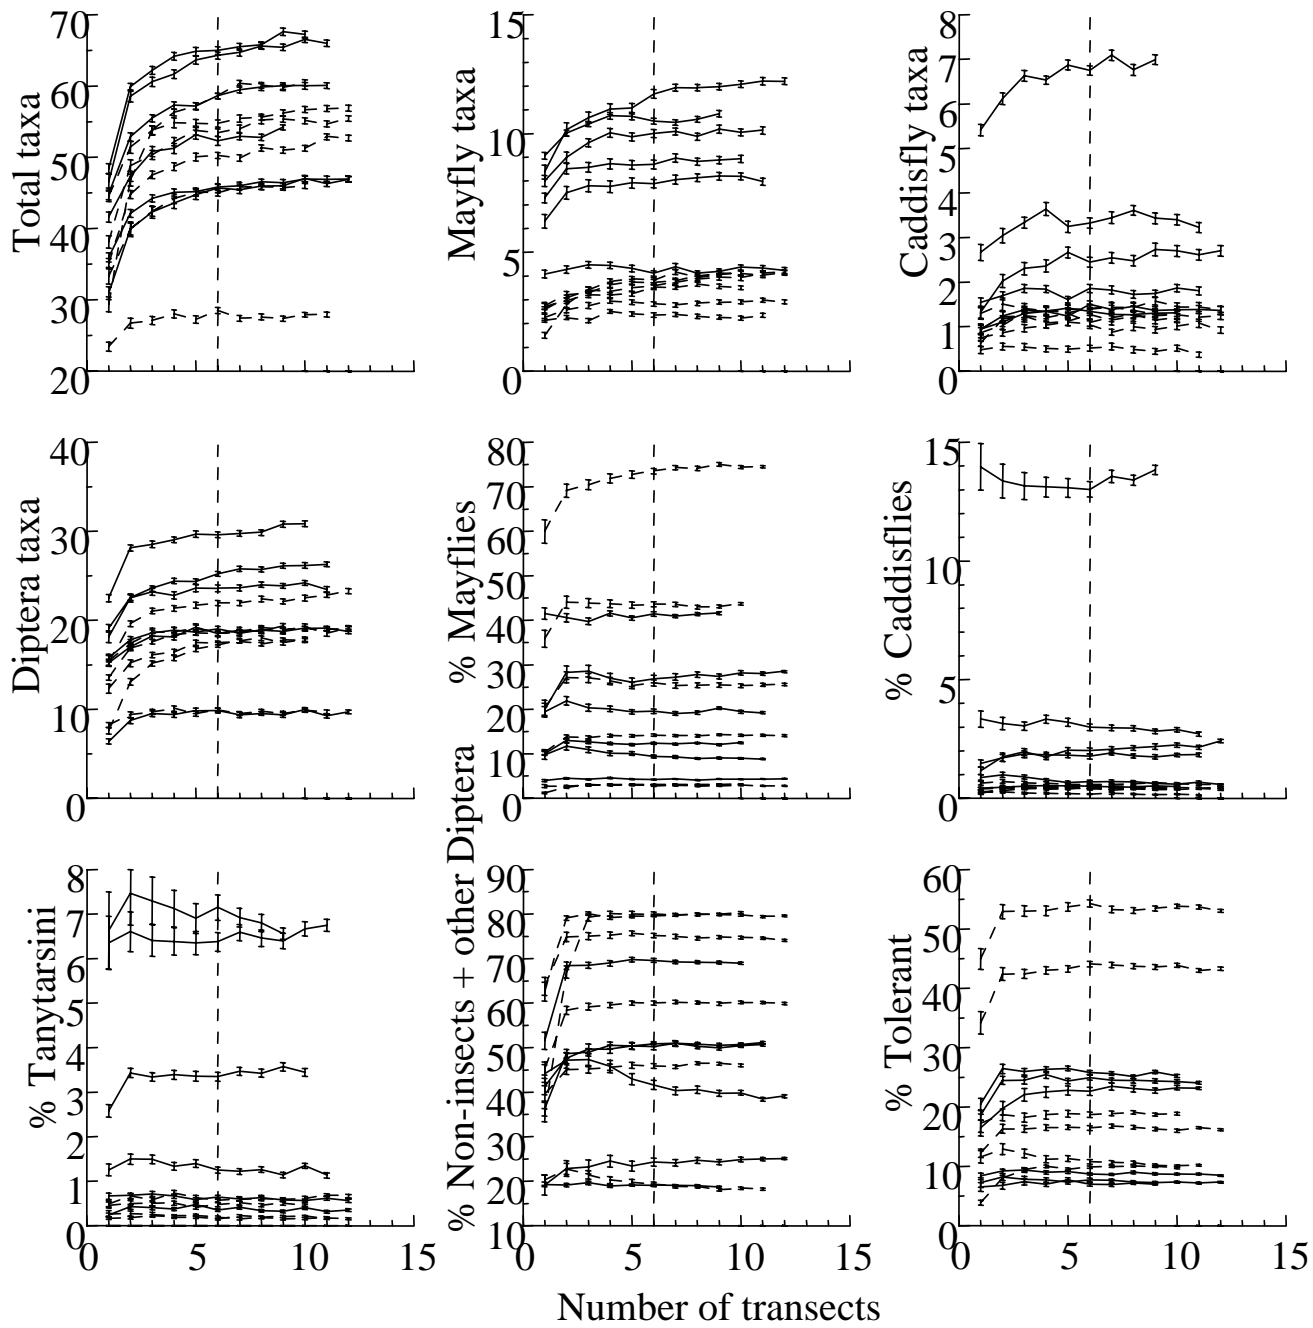

- Shorten the reach by 1/2 (i.e. 200 m) and sample both banks at all transects
- Establish the 500 m reach specified, then randomly select 3 of 6 transects to sample on both banks
- Establish the 500 m reach specified, then randomly select L or R bank and sample at all 6 transects
- Establish the 500 m reach specified, then randomly select L or R bank at lowermost reach and alternate banks for entire reach

# Number of Organisms

- **500 specified**
- **What if this is reduced from 500 to 300?**
- **What if this is reduced from 500 to 200?**

# Choices

**6 transects/both banks/500 organisms**

**6 transects/ both banks/300 organisms**

**6 transects/ alternative banks/300 organisms**

**6 transects/ alternative banks/200 organisms**

# Summary of the MDEQ Methodology

- 500 meter reach
- 6 transects, randomly select L or R bank at lowermost reach, then alternate through entire reach
- 300 organism sub-sample
- Habitat assessment (as per Joe's methods)
- Depth composited samples for nutrient criteria development collected at the lower-most reach only (USGS recommendation)
- In-situ measurements at the lower-most reach only
- Particle size distribution
- Phytoplankton sample collection
- Begin sampling 2005 (August, September, October(?))

# MDEQ Methodology continued

- **Data Generated to be used to develop an IBI (Biocriteria?)**
- **Data /IBI to be reported in states 305(b) report**

### Mississippi River Basin Groups

## “Where are we now”

- Will sample the Pascagoula River(22 sites) in 2006
- Possibly another river within this basin
- Processing of samples from the other sites continues at our lab
  - All samples thus far have met the targeted number of organisms
  - Taxonomy to begin soon
  - Phytoplankton samples to be shipped to taxonomist’s lab for identification
- After all samples are processed and identified (late 2006/mid 2007) development of IBI’s and site assessments
- Sampling additional non-wadeable water bodies and using the IBI tool to assess (2007and beyond)

## “Additional Issues”

- What about expanding the sampling zone from 10 to 20 or 30 meters to allow more woody debris to be sampled?
- Will this change the “answer”?
- What about allocating the 36 jabs throughout the entire reach proportionally as we now do for wadeable streams?
- What effect will this have on the data?
