

## 5. VIEW MENU

Functions that are listed in the View menu depend on the type of window that is currently in focus:

- 1) If a table window is in focus (as shown above), you can use the View function to change the displayed font style and size.
- 2) If the Input Graphics window is in focus, you can use View functions to zoom and change various graphics attributes. See Section 7.1 for details.
- 3) If an Output Graphics window is in focus, you can use View functions to zoom and change various graphics attributes. See Section 11.2 for details.

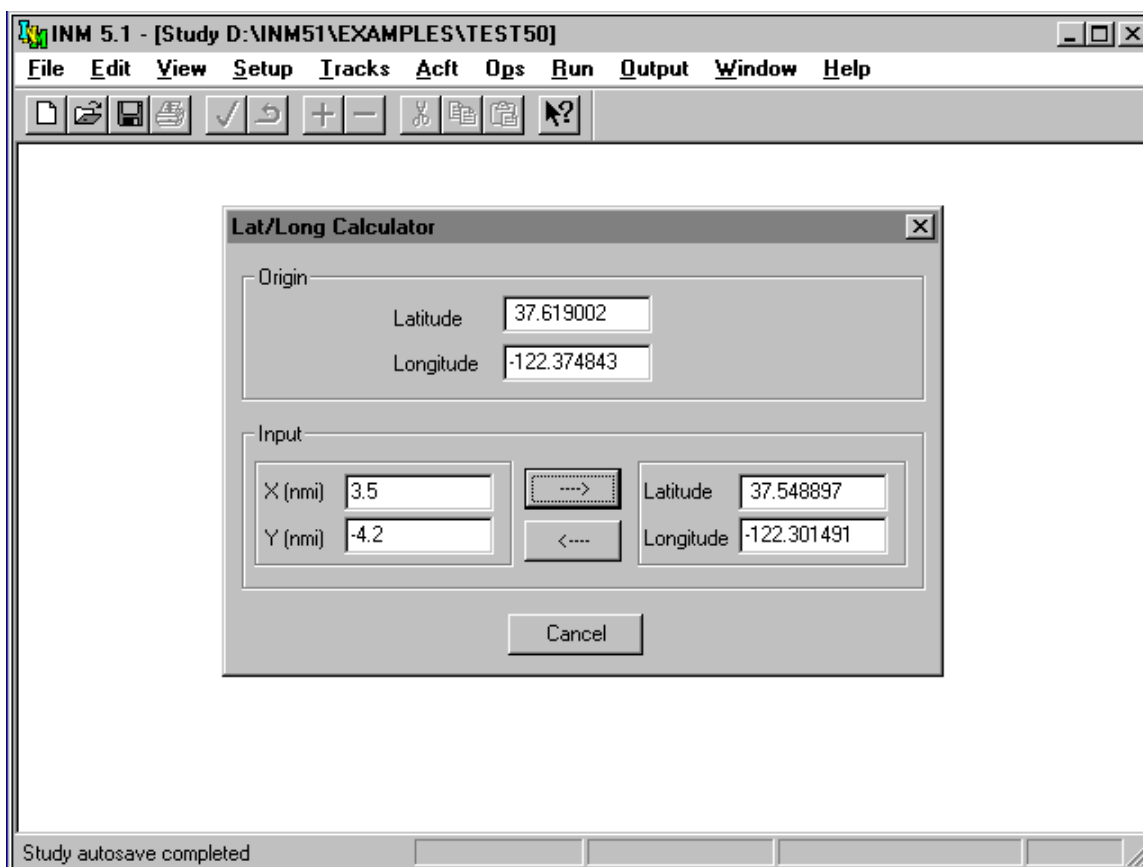

The View // Lat/Long Calculate function is available in all three types of windows.

## 5.1. Fonts

Menu Item: View // Fonts

You can use this standard Microsoft dialog box to select one of several operating system-supplied fonts, and then select the font style and font size that is available for that particular font. These selections are saved in the INM.INI file.

## 5.2. Lat/Long Calculate

Menu Item: View // Lat/Long Calculate

You can use this function to calculate the latitude and longitude values of given X,Y values. Or, you can calculate X,Y from lat/long.

The function automatically uses the Study lat/long for the origin of the coordinate system. You can input a new origin, if you wish; this will not change the Study origin.

Type the position values into one pair of boxes, and press the arrow button to display the same position in the other pair of boxes.
