#### SUPPLEMENTARY INFORMATION:

##### Background

Given that sea turtles are known to interact with the Pacific longline fishery, NMFS believes that research is needed to investigate ways to reduce these interactions. Consequently, NMFS proposes that the Honolulu Laboratory conduct experiments to test gear modifications designed to reduce sea turtle bycatch in longline fisheries.

The objective of the proposed research is to develop gear and fishing methods that will reduce the number of endangered and threatened sea turtles incidentally caught in longline fisheries in the Pacific Ocean. Regulations closing large segments of the North Pacific fishing area to the Hawaii-based U.S. longline fleet have proven to be effective in reducing the incidental catch of sea turtles by that fleet. However, foreign fisheries in the Pacific are responsible for the vast majority of longline bycatch of sea turtles. Development and export of commercially viable gear modifications are viewed as the best means to reduce foreign bycatch of sea turtles.

The research effort is intended to meet the priority one recovery goal identified in the Final Recovery Plans for the U.S. Pacific Populations of the Loggerhead, Leatherback, Olive Ridley, and Green Turtles adopted by NMFS and the U.S. Fish and Wildlife Service (FWS). In these plans, NMFS and FWS identified monitoring and reduction of sea turtle mortality in commercial fisheries as a recovery action needed for all four species (green, leatherback, loggerhead, and olive ridley). The four species of sea turtles are listed as either endangered or threatened under the ESA, which requires that actions taken
