

enveloped RNA virus-like particles in vitro in insect cells using a recombinant baculovirus vector containing a cDNA coding for viral structural proteins. In vitro production and purification of hepatitis C virus (HCV)-like particles containing HCV core protein, E1 protein and E2 protein is described. Sucrose gradient purified HCV-like particles exhibited similar biophysical properties as putative HCV virions. Mice injected with HCV-like particles developed HCV-specific antibodies indicating that the particles are immunogenic. HCV-like particles, purified in large quantities, may be useful in HCV vaccine development or in diagnostic kits.
