

This report provides a broad income picture of a cross section of the population aged 55 or older, with special emphasis on income of the population aged 65 or older. The tabulations focus on the major sources and amounts of income in 2000, both separately and combined, for those age groups. The relative importance of particular sources to total income is measured for individual units, and the share of aggregate income from particular sources is measured for the aged as a whole. Proportions of the aged below the poverty line are presented in terms of the income of the families with whom they live. Several tables describe the economic situation of the aged with varying levels of Social Security benefits and total money income. These data are a valuable resource for policymakers and researchers in government and in the private sector.

Since 1941, the Social Security Administration (SSA) has periodically surveyed the economic situation of the aged as part of its legislative directive to study the most effective methods of providing economic security. Between 1963 and 1972, three national surveys were conducted that sampled nonbeneficiaries as well as beneficiaries. In 1963 and 1968, SSA administered its own questionnaire and combined data from those surveys with Social Security record data of the survey respondents. In 1972, SSA benefit record data were combined with U.S. Census Bureau data from the March Current Population Survey (CPS).

SSA then began a series of biennial studies of the income of the aged based on

the CPS data alone. The first report in the series described the income of the population aged 55 or older, and in some cases the population aged 65 or older, using 1976 data. The second report described apparent changes in the income of those age groups between 1976 and 1978. In the interest of publishing the data in a more timely fashion, however, beginning with the 1980 report, publications in the series have consisted of tabulations only. Starting with the 1990 report, we expanded the series with a companion publication, *Income of the Aged Chartbook*, which highlights selected data in charts and tables for the population aged 65 or older.

This edition has been redesigned to make it easier for readers to locate specific information. The new format divides the tables into sections by topic and uses headers to identify the subject of each table and the population being covered. Colored bands have been included in most of the tables to highlight supplemental information that may be of interest to the reader.

The source of data for this series is the March supplement of the CPS, which samples a large cross section of households in the United States each year and provides detailed information annually on income and labor force participation. Comparisons of CPS estimates with more precise estimates adjusted by federal income tax records and Social Security records indicate that some sources are underreported in the CPS. Also, changes that have been made in the survey from time to time have improved the measure-

ment of income and labor force participation but have reduced the comparability of estimates between years. Despite the shortcomings of the CPS data, they are used here because they provide the best available measures of income for detailed subgroups of the aged.

The data in this publication are presented in terms of either aged units or aged persons. An aged unit is a married couple living together or a nonmarried person. Using aged units or aged persons as the units of analysis allows one to measure incomes of the entire aged population either separately from or in combination with the income of other members of the families with whom they live. Earlier editions of this report had presented a measure of poverty for aged units based on their own income and on their family income. In the 1996 edition, however, we added a measure of poverty for aged persons based on their family income. That measure conforms to the official poverty measure currently used by the Census Bureau. Beginning with this edition, poverty status is presented only for aged persons in terms of their family income because that measure has emerged as the preferred measure of poverty.

The tables focus on the income of the aged population separately, whether or not they live with other relatives. In contrast, Census Bureau publications that use CPS data classify aged persons living with a younger relative who is considered the householder as “families under 65.” Thus, a portion of the aged population cannot be accounted for within the Census Bureau’s

Preface

categorization. But for the 24 percent of units aged 65 or older who lived with other family members in 2000, the income of the families with whom they lived is important information. Therefore, data on family income of aged units are presented.

Melissa Koenig was responsible for the preparation of this report, and Jeffrey Shapiro did the programming. The report was designed by Emil Loomis and edited by Celine Houget. Laurie Brown prepared the printed and Web versions for publication. For questions pertaining to the data, please call Melissa Koenig: 202-358-6312. For additional copies of this report, please telephone 202-358-6274 or e-mail ores.publications@ssa.gov. About This Report

This biennial report presents detailed statistical information on the major sources and amounts of income for people aged 55 or older. The tabulations focus on the major sources of total income by age, sex, marital status, race, and Hispanic origin. Several tables describe the economic situation of the aged with varying levels of Social Security benefits. Their poverty status is presented in terms of the income of the families they live with.

Source of Data

Data for this series are from the March Current Population Survey (CPS) of the U.S. Census Bureau.¹ The CPS samples a large cross section of households in the United States each year (approximately 60,000 in March 2001). The March supplement gathers detailed information on income and labor force participation of each person 15 years of age or older in the sample households. For this series, the Social Security Administration (SSA) creates a subsample of persons 55 or older arranged in aged units. A separate data record is made for each married couple living together—at least one of whom is 55 or older—and for each nonmarried person 55 or older. Married persons living apart are classified as nonmarried persons.

From time to time, changes have been made in the survey. Although the changes have improved the measurement of income and labor force participation, they have reduced the comparability of estimates made in different years.²

Definition and Explanation of Key Variables

Age. These tabulations cover units aged 55 or older. The age of a married couple is defined as the

age of the husband unless he is under 55 and the wife is 55 or older, in which case it is the age of the wife.

Aged unit. The major unit of analysis in Social Security surveys of the aged has been the aged unit rather than the construct of families and unrelated individuals used by the Census Bureau. With 55 as the age cutoff, aged units are married couples living together—at least one of whom is 55 or older—and nonmarried persons 55 or older. Persons who are married but not living with a spouse are counted as nonmarried persons.

Certain differences exist between Census Bureau and SSA figures because the units of analysis are not directly comparable. The Census Bureau classifies families by characteristics of the householder—the first person in whose name a home is listed as owned or rented. It therefore classifies aged persons living with a younger relative who is considered the householder as members of nonaged families. Also, SSA treats nonmarried individuals simply as nonmarried persons. In comparison, the Census Bureau counts nonmarried persons living with other relatives as part of a family and nonmarried persons who are living alone or with nonrelatives as unrelated individuals. The Census Bureau's family category includes both married couples and those nonmarried persons who are living with relatives.

Census data show that the number of households with a householder aged 65 or older in 2000 was 21,828,000.³ In comparison, SSA data show 25,230,000 such households. The SSA count generally includes the Census Bureau's aged households plus some aged units living in nonaged households or living with other aged units in the

¹ For a detailed description of the basic CPS sample design, see U.S. Census Bureau, *Current Population Survey: Design and Methodology*, Technical Paper No. 63 (March 2000).

² These changes are discussed in some detail in U.S. Census Bureau, *Current Population Reports, Series P-60*, various years.

³ *Money Income in the United States, 2000*, Current Population Reports, Series P-60, No. 213 (September 2001), Table A.

same household. The number of aged households was 87 percent of the number of aged units.

Aged unit income. The income of an aged unit is either the income of a nonmarried person or the sum of income from both spouses in a married couple. A married couple is counted as receiving income from a particular source if one or both persons are recipients of that source.

Family income. For a family, income is calculated as the sum of total money income of all persons related by blood, marriage, or adoption and residing together. Total money income is the same as family income for aged units who live with no other relatives.

Reporting of income. Income amounts reported by persons in the Current Population Survey are somewhat less than amounts derived from independent sources such as the Bureau of Economic Analysis, Social Security Administration, and Department of Veterans Affairs. A comparison of aggregates from the March 1990 CPS (reported and allocated) with independent estimates found that the CPS accounted for 97 percent of wages and salaries, 97 percent of Social Security and Railroad Retirement benefits, 103 percent of private pensions and annuities, 83 percent of federal government and military retirement pensions, 77 percent of state and local government retirement pensions, 89 percent of Supplemental Security Income payments, 51 percent of interest, and 33 percent of dividends.⁴

A matching of 1972 data from the Census Bureau, SSA, and the Internal Revenue Service has provided a rich source for methodological comparisons of record and survey information of individuals.⁵ In a report from the 1972 match, the adjusted mean income of families headed by a person aged 65 or

older was 41 percent higher than that found in the CPS.⁶

Social Security beneficiary status. A yes or no response to the question in the CPS on receipt of Social Security benefits is the measure of beneficiary status. Missing answers are imputed by the Census.

Although Social Security benefits are referred to as retirement benefits in these tabulations, Social Security beneficiaries include not only retired workers but also dependent spouses, dependents or survivors with young children in their care, and persons with a disability. At the end of 2000, SSA records showed that 98 percent of those aged 55–59 with a Social Security benefit were disabled; the remaining 2 percent were parents with young children in their care. At age 60, old-age benefits are available to survivors. Men aged 60–61 all received a benefit because of disability, except for a very small number of widowers. The proportion of female beneficiaries aged 60–61 who received a disability benefit was 63 percent; the remaining were aged widows and those with young children in their care. At age 62, reduced retired-worker and dependent's benefits are available. Among beneficiaries 62–64, 23 percent of men and 15 percent of women had disability benefits. Almost all remaining men in that age group were receiving retired-worker benefits. Only a small number received benefits as a father or widower. The remaining women 62–64 received benefits as retired workers, dependents, or survivors.⁷

Total money income. The amount of total money income is calculated as the sum of all income received by the aged unit before any deductions such as those for taxes, union dues, or Medicare premi-

⁴ Current Population Reports, No. 184 (September 1993), Table C-1.

⁷ *Annual Statistical Supplement to the Social Security Bulletin*, 2001, Tables 5.A1 and 5.A10.

ums. Income may come from any source that was regularly received. The sources include wages and salaries, self-employment income (including losses), Social Security, Supplemental Security Income, public assistance, interest, dividends, rent, royalties, estates or trusts, veterans' payments, unemployment compensation, workers' compensation, private and government retirement and disability pensions, alimony, and child support. Capital gains (or losses) and lump-sum or one-time payments such as life insurance settlements are excluded.

Total money income does not reflect nonmoney transfers such as food stamps, health benefits, subsidized housing, payments in kind, or fringe benefits from one's employment.

To reduce the amount of nonsampling error resulting from nonresponses, the Census Bureau has devised procedures to impute work and income data for all persons for whom this information is missing. Amounts assigned to a nonrespondent are those observed for another person with similar demographic and economic characteristics who did respond.⁸

Measurement of Poverty

The poverty concept, originally developed in 1964 by Mollie Orshansky of the Social Security Administration and revised by federal interagency committees in 1969 and 1981, consists of a set of thresholds that vary by family size and composition. There are 48 thresholds for families composed of one to nine or more persons cross-classified by the presence and number of family members under age 18 (from no children to eight or more). One- and two-person families are further differentiated by the age of the family householder (under age 65 and aged 65 or older). The poverty index for families of

three or more persons is based on the cost of the Department of Agriculture's economy food plan, multiplied by the ratio of income to food costs derived from the 1955 Household Food Consumption Survey. The factors used to derive the poverty index from food costs for one- and two-person families were higher.

These criteria for determining the extent of poverty in the United States have become the basis for the official statistics issued annually by the Census Bureau in *Poverty in the United States*, Current Population Reports, Series P-60. The poverty levels are adjusted to reflect changes in the annual average consumer price index.

Calculations of the poverty threshold do not consider nonmoney income. When the poverty index was originally developed, public noncash benefits for both non-needy and needy families were relatively small and unimportant. The index was therefore developed as a measure of the adequacy of money income only.

The official poverty measures used by the Census Bureau compare family total money income with the appropriate thresholds. Families as well as all persons in families with income below the appropriate threshold are considered poor. Tables 8.1 to 8.3 present measures of the poverty status of aged persons based on their family income, consistent with the official measures.

Interest also centers on the number of persons whose income is only slightly above the poverty line. Those groups, sometimes called the near poor, have income between the poverty line and 125 percent of the poverty line. Estimates of proportions of the aged who are poor or near poor are presented in Tables 8.1 and 8.2.

⁸ For a detailed discussion of these imputation procedures, see Emmett F. Spiers and Joseph J. Knott, "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," in American Statistical Association, *Proceedings of the Social Statistics Section, 1969*, New York, August 19-22, pp. 19-22. The CPS imputation technique is described in U.S. Census Bureau, *Current Population Survey: Design and Methodology*, Technical Paper No. 63 (March 2000). For an overview of imputation techniques and an extensive reference list, see Graham Kalton and Daniel Kasprzyk, "Imputing for Missing Survey Responses," in American Statistical Association, *Proceedings of the Section on Survey Research Methods, 1982*, Cincinnati, Ohio, August 16-19, pp. 22-31.

¹⁰ U.S. Census Bureau, *Experimental Poverty Measures: 1999*, Current Population Reports, Series P-60, No. 216 (October 2001).

In May 1995, the Committee on National Statistics of the National Academy of Sciences released a report on poverty measurement, titled *Measuring Poverty: A New Approach*, that contained a number of recommendations for improving the measurement of poverty.⁹ Among the recommendations were expanding the income definition to include the growing amount of nonmoney income (such as food stamps and subsidized housing) and taking into account such expenses as income and payroll taxes, child care and other work-related expenses, out-of-pocket medical expenses, and payments of child support made to another household. In 1997, the Office of Management and Budget formed a working group, under the auspices of the Interagency Council on Statistical Policy, to conduct a review of the available options for revising the definition of poverty. The group has coordinated with the Census Bureau to develop experimental poverty measures that incorporate the recommendations of the National Academy of Sciences.¹⁰

NOTE: The family money income of aged persons is compared with the official poverty lines of families in 2000.

- a. Social Security beneficiaries may be receiving retired-worker benefits, dependents' or survivors' benefits, disability benefits, transitionally insured benefits, or special age-72 benefits.
- b. Fewer than 75,000 weight cases.
- c. Includes persons who are separated or married but living apart from their spouse.
- d. Persons of Hispanic origin may be of any race.

- a. Includes persons who are separated or married but living apart from their spouse.
- b. Fewer than 75,000 weight cases.
- c. Persons of Hispanic origin may be of any race.

***Appendix: Reliability
of the Estimates***

Because the figures in this report are based on a sample of the older population, all reported statistics (counts, percentages, and medians) are only estimates of population parameters and may deviate somewhat from their true values—that is, from the values that would have been obtained from a complete census using the same questionnaires, instructions, and interviewers.¹

The standard error is primarily a measure of sampling variability—that is, it measures the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partly measures the effect of response and enumeration errors but does not measure systematic biases in the data. The chances are about 68 out of 100 that an estimate for the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

Standard Error of Estimated Percentages

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total on which the percentage is based. The approximate standard error S_x of an estimated percentage can be obtained using the formula

$$S_{x,p} = \sqrt{\frac{b}{x} p(100-p)}$$

Here x is the total number of persons, families, or households (the base of the percentage), p is the percentage, and b is the parameter from the follow-

ing table associated with the characteristic in the numerator of the percentage.

Characteristic	Total or white	Black	Hispanic
Below poverty level	3,927	3,927	3,927
All income levels	2,454	2,810	2,810

Use of this formula in calculating the standard error of a single percentage is illustrated as follows:

An estimated 30 percent of units aged 65 or older had total money income of \$30,000 or more in 2000 (Table 3.1). Because the base of this percentage is approximately 25,230,000—the number of units aged 65 or older—the standard error of the estimated 30 percent is approximately 0.5 percent. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.5 percent. The chances are 95 out of 100 that the estimate would have shown a figure differing from a complete census by less than 1.0 percent—that is, this 95 percent confidence interval would range from 29.0 percent to 31.0 percent.

For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between separate and uncorrelated characteristics. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

¹ Most of the discussion of estimation procedures has been excerpted from Current Population Reports, No. 114 (July 1978).

A comparison of the difference in the percentage of units aged 62–64 and 65 or older who had total money income of \$30,000 or more in 2000 illustrates how to calculate the standard error of a difference between two percentages:

Thirty percent of the 25,230,000 units aged 65 or older and 50 percent of the 4,049,000 units aged 62–64 had total money income of \$30,000 or more in 2000—a difference of 20 percentage points. The standard errors of those percentages are 0.5 and 1.2, respectively. The standard error of the estimated difference of 20 percentage points is about

$$1.3 = \sqrt{(0.5)^2 + (1.2)^2}$$

The chances are 68 out of 100 that the difference is between 18.7 and 21.3 percentage points and 95 out of 100 that it is between 17.4 and 22.6 percentage points. Because the confidence interval around the difference does not include zero, there is a statistically significant difference between the proportions who are 62–64 and those who are 65 or older with income of \$30,000 or more.

Confidence Limits of Medians

The sampling variability of an estimated median depends on the distribution as well as on the size of the base. Confidence limits of a median based on sample data may be estimated as follows: (1) Using the appropriate base, the standard error of a 50 percent characteristic is determined; (2) the standard error determined in step 1 is added to and subtracted from 50 percent; and (3) the confidence interval around the median corresponding to the two

points estimated in step 2 is then read from the distribution of the characteristic. A two-standard-error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error. This procedure may be illustrated as follows:

The median total money income of the estimated 25,230,000 units aged 65 or older was \$18,778 in 2000 (Table 3.1). The standard error of 50 percent of those units expressed as a percentage is about 0.50 percent. As interest usually centers on the confidence interval for the median at the two-standard-error level, it is necessary to add and subtract twice the standard error obtained in step 1 from 50 percent. This procedure yields limits of approximately 49 percent and 51 percent. By interpolation, 49 percent of units 65 or older had total money income below \$18,452 and 51 percent had total money income below \$19,246. Thus, the chances are about 95 out of 100 that the census would have shown the median to be greater than \$18,452 but less than \$19,246.
