SYSTEM GROUNDING

### §111.05-11 Hull return.

- (a) A vessel's hull must not carry current as a conductor except for the following systems:
- (1) Impressed current cathodic protection systems.
- (2) Limited and locally grounded systems, such as a battery system for engine starting that has a one-wire system and the ground lead connected to the engine.
- (3) Insulation level monitoring devices if the circulation current does not exceed 30 milliamperes under the most unfavorable conditions.
- (4) Welding systems with hull return except vessels subject to 46 CFR Subchapter D.

### §111.05-13 Grounding connection.

Each grounded system must have only one point of connection to ground regardless of the number of power sources operating in parallel in the system.

### §111.05-15 Neutral grounding.

- (a) Each propulsion, power, lighting, or distribution system having a neutral bus or conductor must have the neutral grounded.
- (b) The neutral of a dual-voltage system must be solidly grounded at the generator switchboard.

## §111.05-17 Generation and distribution system grounding.

The neutral of each grounded generation and distribution system must:

- (a) Be grounded at the generator switchboard, except the neutral of an emergency power generation system must be grounded with:
- (1) No direct ground connection at the emergency switchboard;
- (2) The neutral bus permanently connected to the neutral bus on the main switchboard; and
- (3) No switch, circuit breaker, or fuse in the neutral conductor of the bus-tie feeder connecting the emergency switchboard to the main switchboard; and
- (b) Have the ground connection accessible for checking the insulation resistance of the generator to ground be-

fore the generator is connected to the

# § 111.05-19 Tank vessels; grounded distribution systems.

- (a) If the voltage of a distribution system is less than 1,000 volts, line to line, a tank vessel must not have a grounded distribution system.
- (b) If the voltage of a distribution system on a tank vessel is 1,000 volts or greater, line to line, and the distribution system is grounded (including high-impedance grounding), any resulting current must not flow through a hazardous (classified) location.

### GROUND DETECTION

### §111.05-21 Ground detection.

There must be ground detection for each:

- (a) Electric propulsion system;
- (b) Ship's service power system;
- (c) Lighting system; and
- (d) Power or lighting distribution system that is isolated from the ship's service power and lighting system by transformers, motor generator sets, or other devices.

### § 111.05-23 Location of ground indicators.

Ground indicators must:

- (a) Be at the vessel's ship's service generator distribution switchboard for the normal power, normal lighting, and emergency lighting systems;
- (b) Be at the propulsion switchboard for propulsion systems; and
  - (c) Be readily accessible.
- (d) Be provided (at the distribution switchboard or at another location, such as a centralized monitoring position for the circuit affected) for each feeder circuit that is isolated from the main source by a transformer or other device.

NOTE TO PARAGRAPH (d): An alarm contact or indicating device returned to the main switchboard via a control cable, that allows the detecting equipment to remain near the transformer or other isolating device for local troubleshooting, is allowed.
