

What happened to willpower? I love fat people. Every fat person says it's not their fault, that they have gland trouble. You know which gland? The saliva gland. They can't push away from the table.

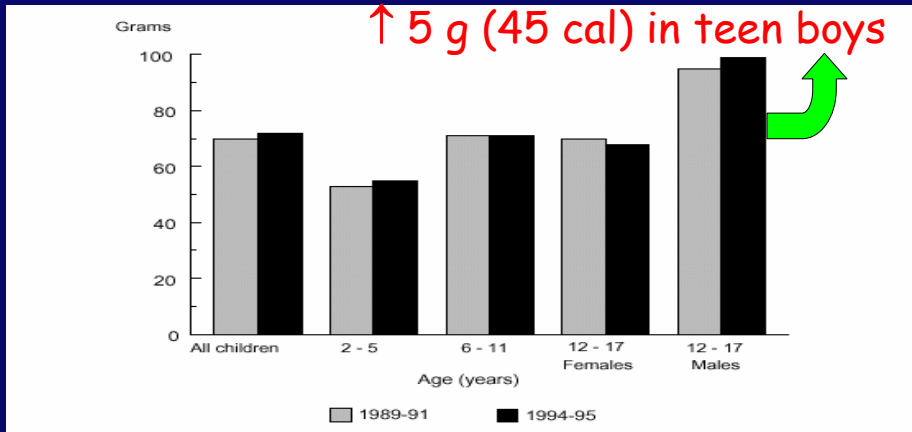

Jesse Ventura (I), Former Governor of Minnesota. *Playboy*, November 1999;46:55.

Total Caloric Intake

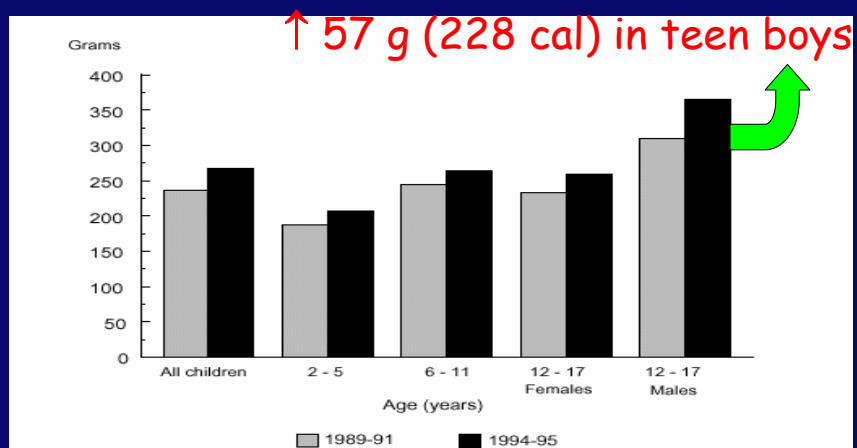

Children 2-17 yrs, CSFII (USDA) 1989-91 vs. 1994-95

**Juice is sucrose:
Change in BMI z-score in lower socioeconomic status
children versus number of fruit juice servings per day**

Faith MS et al. Pediatrics 118:2066, 2006

Fructose is not glucose

- Fructose is 7 times more likely than glucose to form Advanced Glycation End-Products (AGE's)
- Fructose does not suppress ghrelin
- Acute fructose does not stimulate insulin (or leptin)
- Hepatic fructose metabolism is different
- Chronic fructose exposure promotes the Metabolic Syndrome

Ethanol is a carbohydrate

Ethanol is a carbohydrate

Ethanol is a carbohydrate

But ethanol is also a toxin

Acute ethanol exposure

- CNS depression
- Vasodilatation, decreased BP
- Hypothermia
- Tachycardia
- Myocardial depression
- Variable pupillary responses
- Respiratory depression
- Diuresis
- Hypoglycemia
- Loss of fine motor control

Acute fructose exposure

- CNS depression
- Vasodilatation, decreased BP
- Hypothermia
- Tachycardia
- Myocardial depression
- Variable pupillary responses
- Respiratory depression
- Diuresis
- Hypoglycemia
- Loss of fine motor control

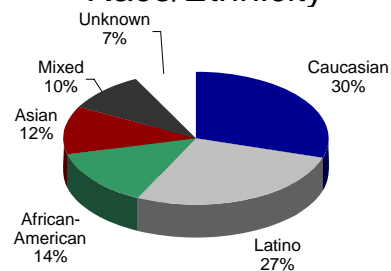

UCSF Weight Assessment for Teen and Child Health (WATCH) Clinic

Detrimental Effects of Fructose

Detrimental Effects of Fructose

Fructose increases de novo lipogenesis, triglycerides and free fatty acids in normal adults

FIG. 3. Mean fasting triglyceride concentration after control condition (□), after 28 days of fish oil supplementation (▨), after 6 days of high-fructose diet (■), and after 28 days of fish oil supplementation plus high-fructose diet (▤) in seven men. Values are mean \pm SE represented by vertical bars. Values not sharing the same superscripts are significantly different ($P < 0.05$).

FIG. 4. Mean baseline fractional hepatic DNL after control condition (□), after 28 days of fish oil supplementation (▨), after 6 days of high-fructose diet (■), and after 28 days of fish oil supplementation plus high-fructose diet (▤) in seven men. Values are mean \pm SE represented by vertical bars. Values not sharing the same superscripts are significantly different ($P < 0.05$).

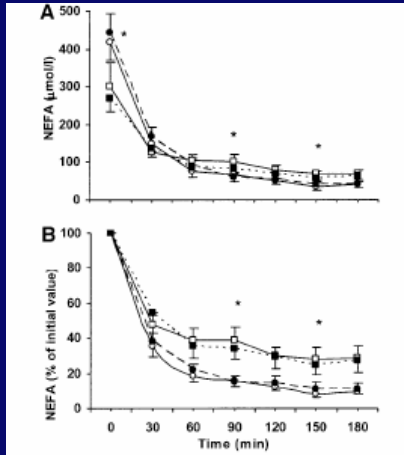

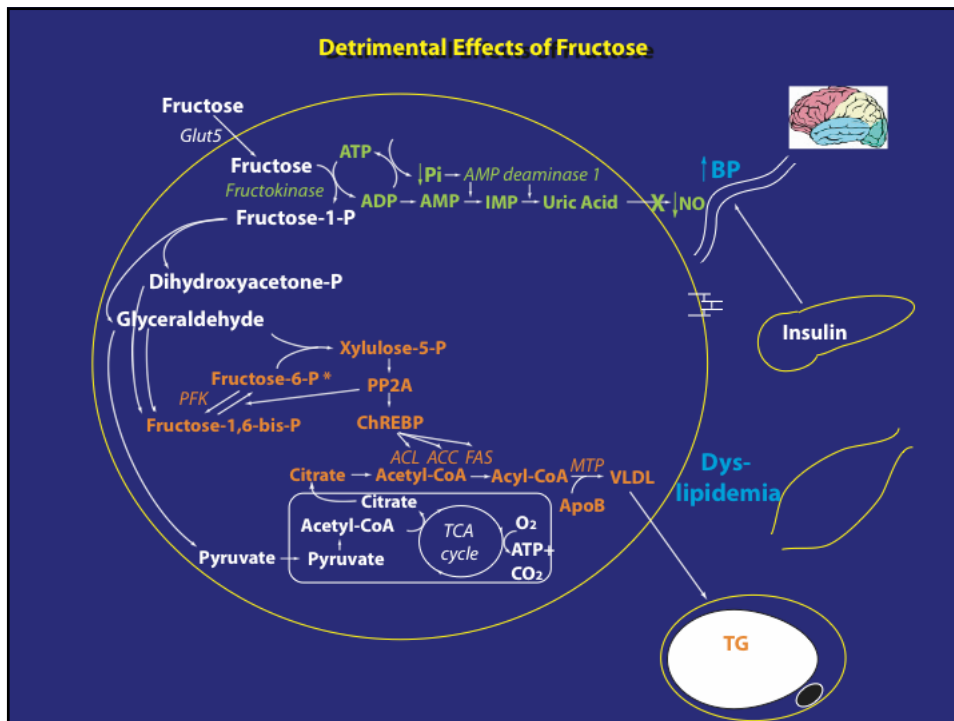

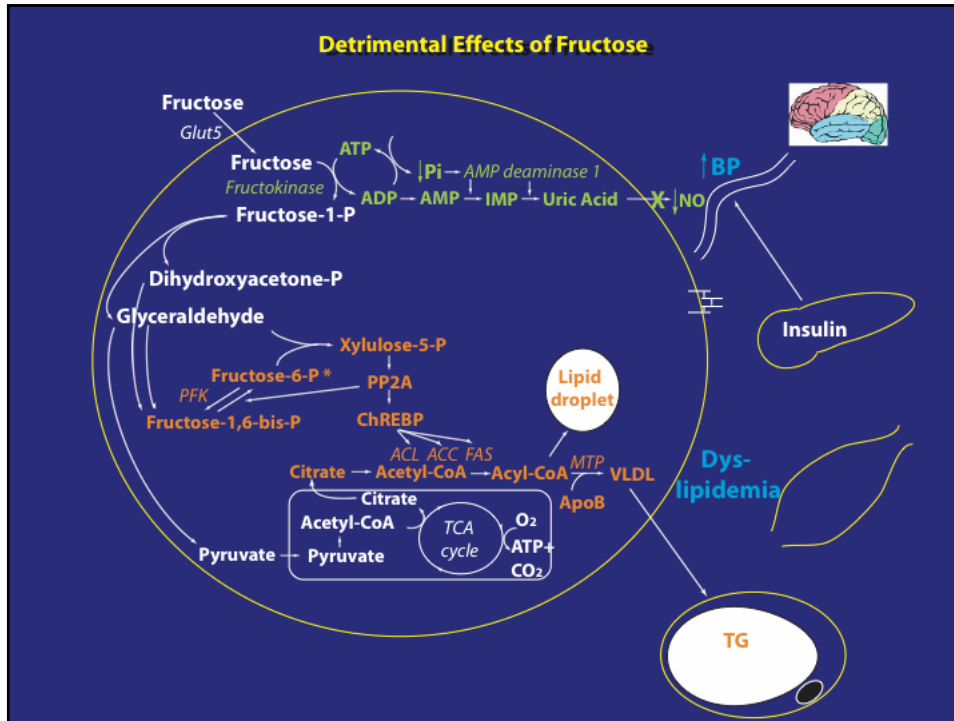

FIG. 7. NEFAs expressed as absolute values (A) and in percentage of the baseline value (B) during euglycemic-hyperinsulinemic clamping after control condition (○), after 28 days of fish oil supplementation (□), after 6 days of high-fructose diet (△), and after fish oil supplementation plus high-fructose diet (◇) in seven men. Values are mean \pm SE represented by vertical bars. * $P < 0.05$ high-fructose diet versus control.

Relation between ALT and liquid calorie consumption

UCSF WATCH Clinic

210 observations

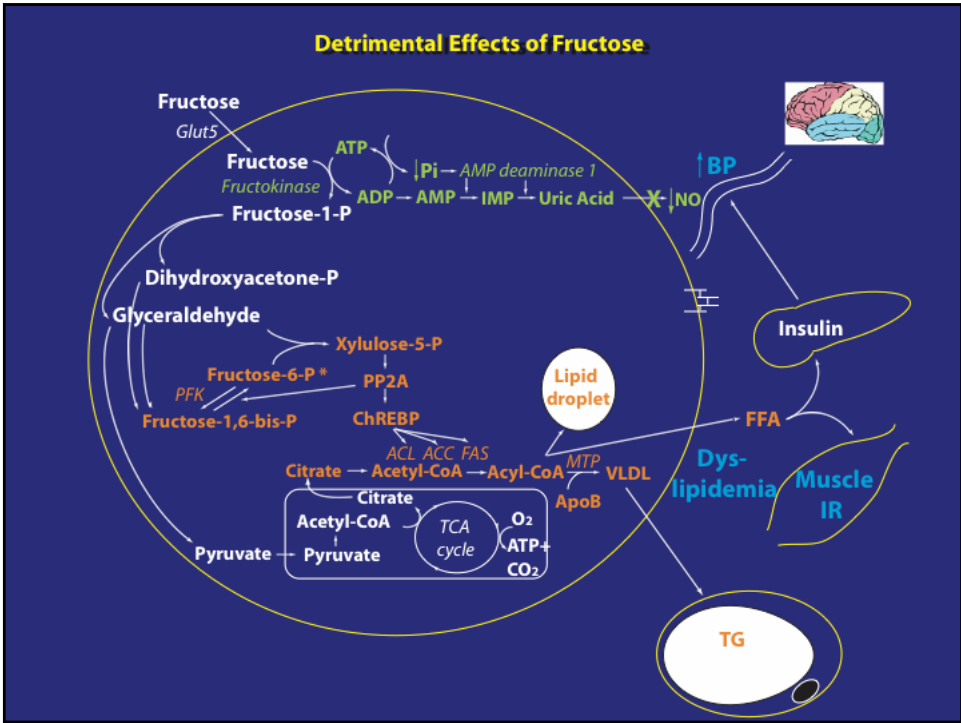

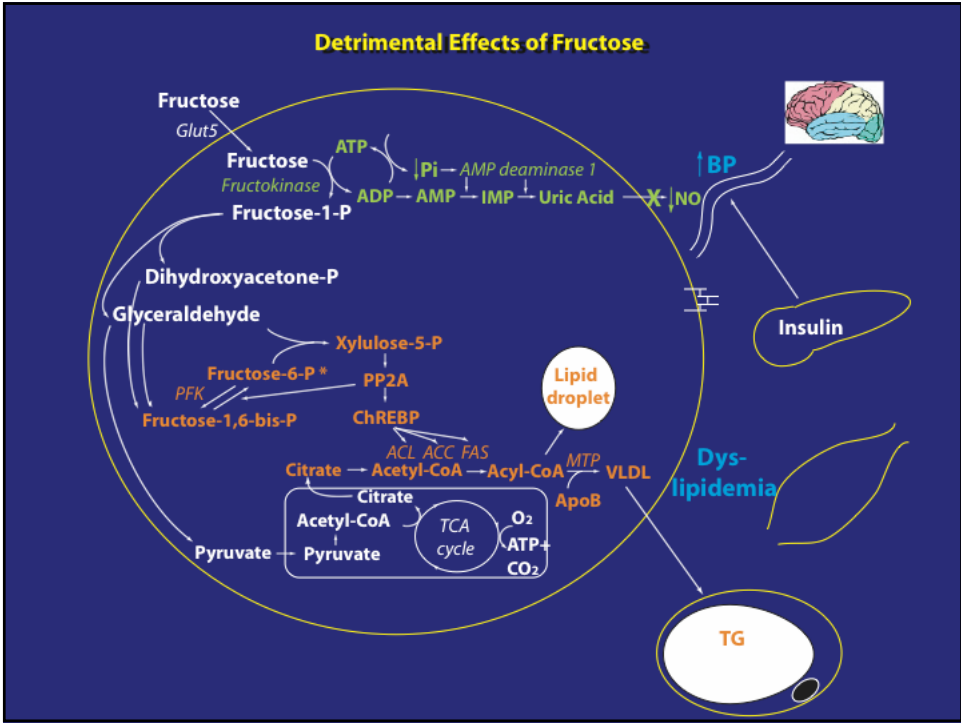

Univariate regression:

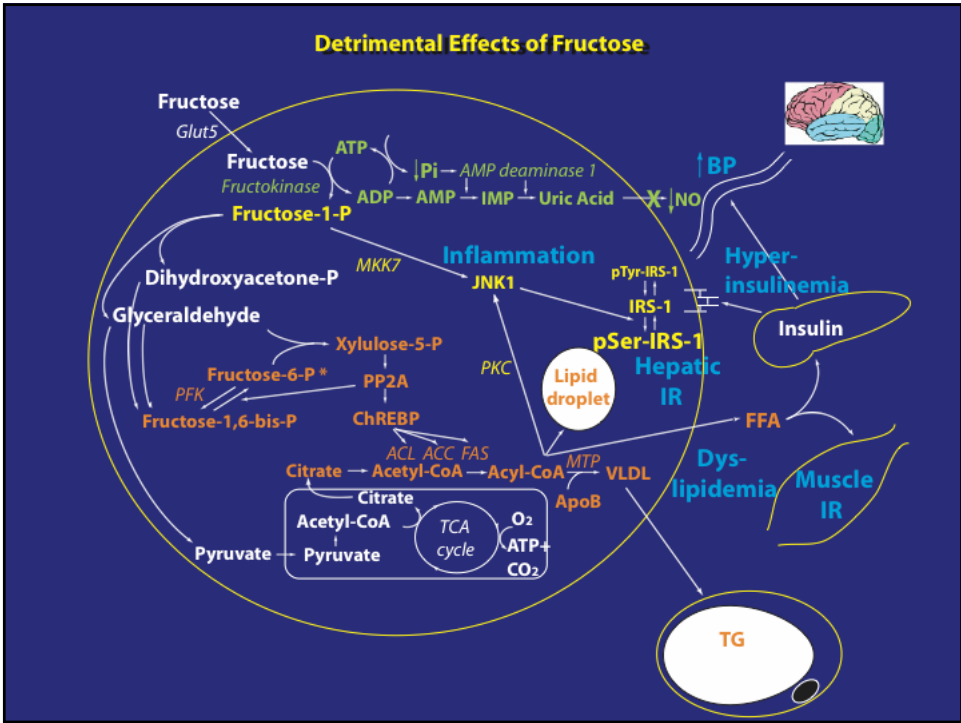

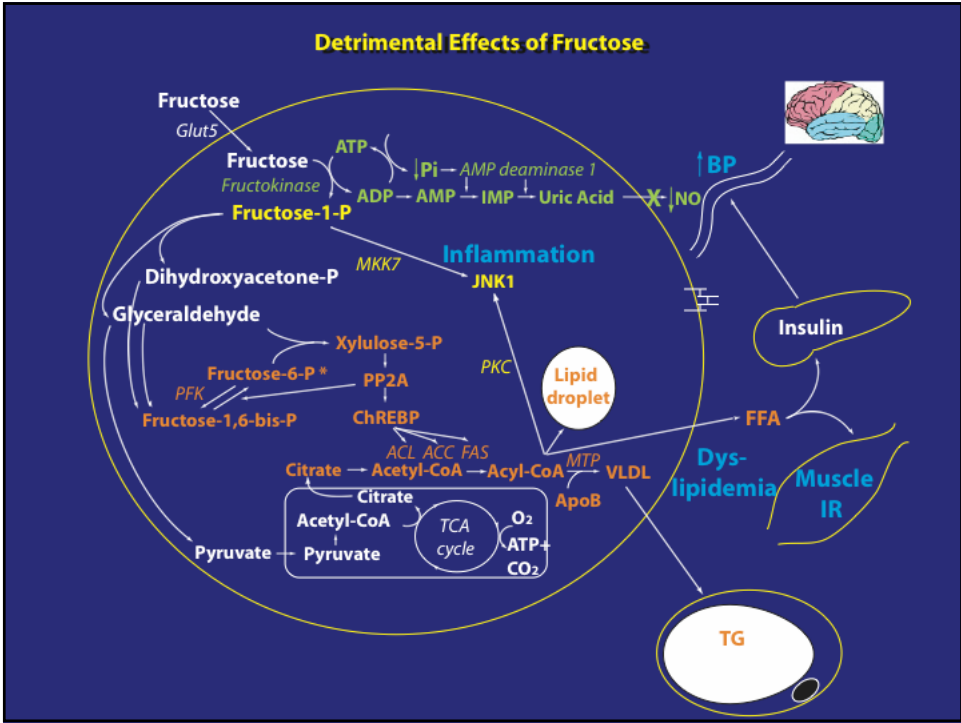

- Every 120 kcal/d increases ALT by 1 point ($p = 0.013$)

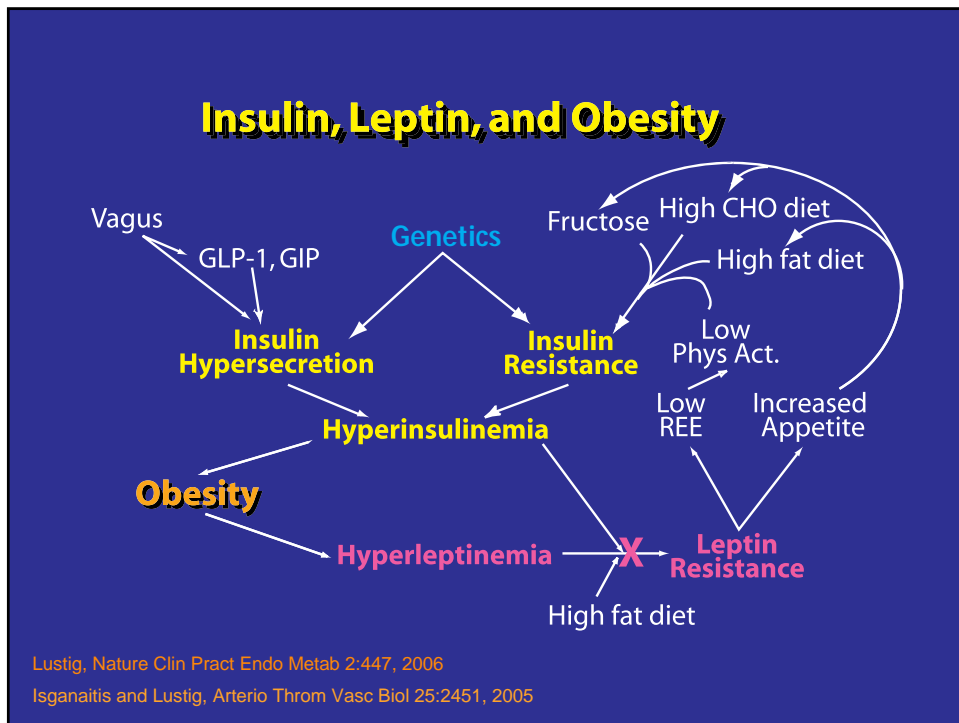

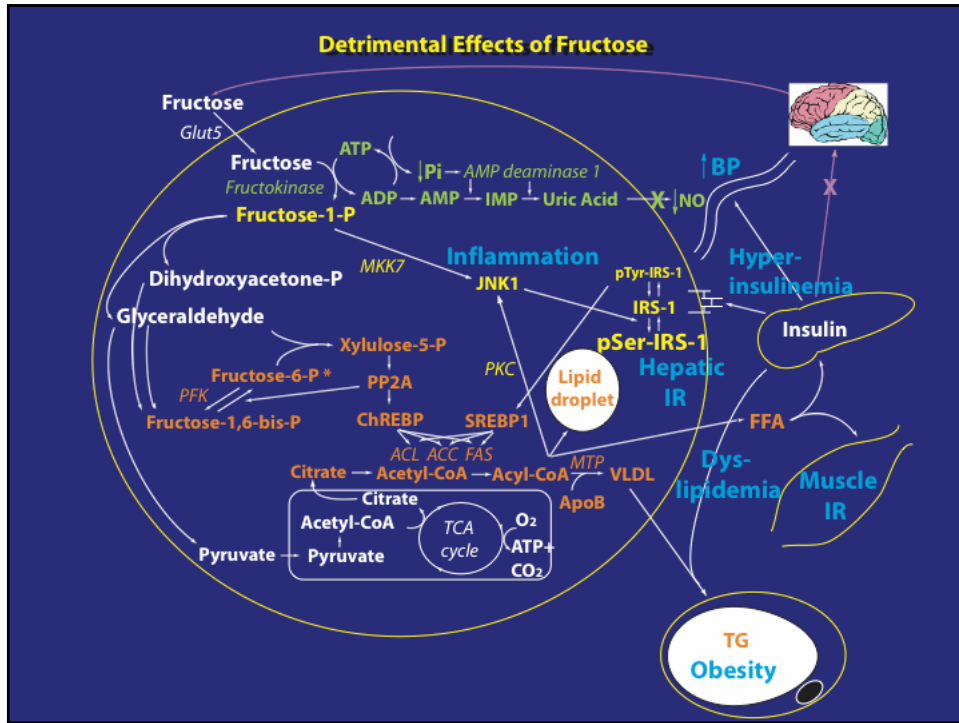

Multivariate regression:

- HOMA-IR (insulin resistance) predicts ALT ($p = 0.048$)
- liquid calories correlates with ALT less well ($p = 0.1$)

Fructose is a carbohydrate

Fructose is a carbohydrate

Fructose is metabolized like fat

Fructose is a carbohydrate

Fructose is metabolized like fat

Fructose is also a toxin

Summary

- Fructose (sucrose vs. HFCS) consumption has increased in the past 30 years, coinciding with the obesity epidemic
- Fructose is everywhere
- Fructose is not glucose
- Hepatic fructose metabolism leads to all the manifestations of the **Metabolic Syndrome**:
 - hypertension
 - de novo lipogenesis, dyslipidemia, and hepatic steatosis
 - inflammation
 - hepatic insulin resistance
 - obesity
 - CNS leptin resistance, promoting continuous consumption
- Fructose ingestion interferes with obesity intervention
- Fructose is a chronic toxin
