Biobehavioral Influences on Cancer Biology

AN EMERGING OPPORTUNITY

Gene-Social Environment Interactions in Cancer A Bioinformatic Approach

Steven W. Cole, PhD

Associate Professor

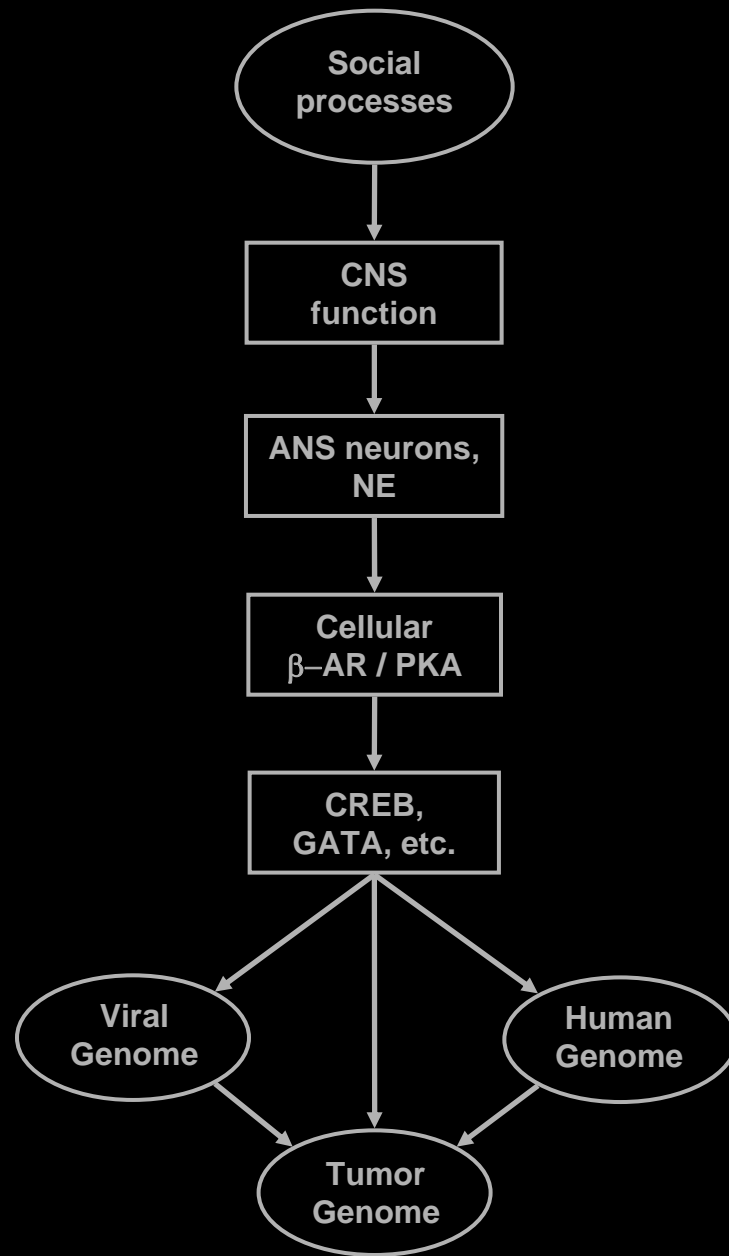

Department of Medicine

Division of Hematology-Oncology

UCLA School of Medicine

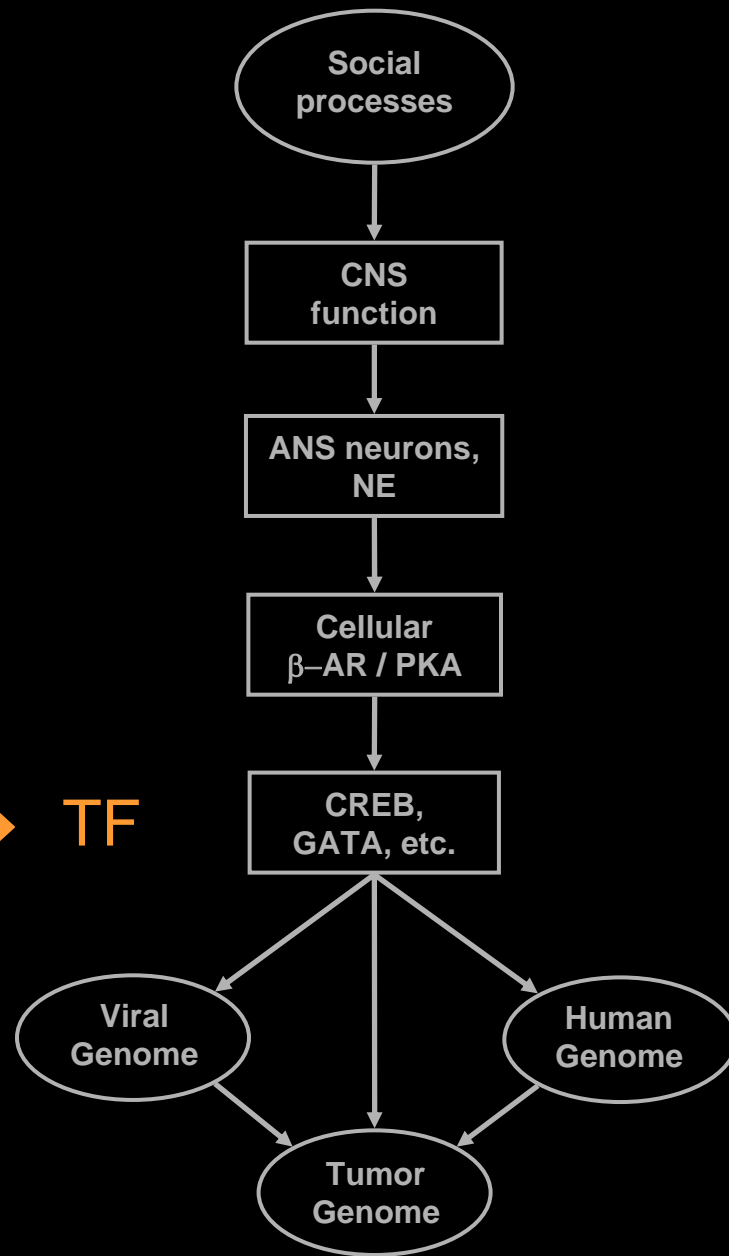

Biobehavioral regulation of gene expression in cancer

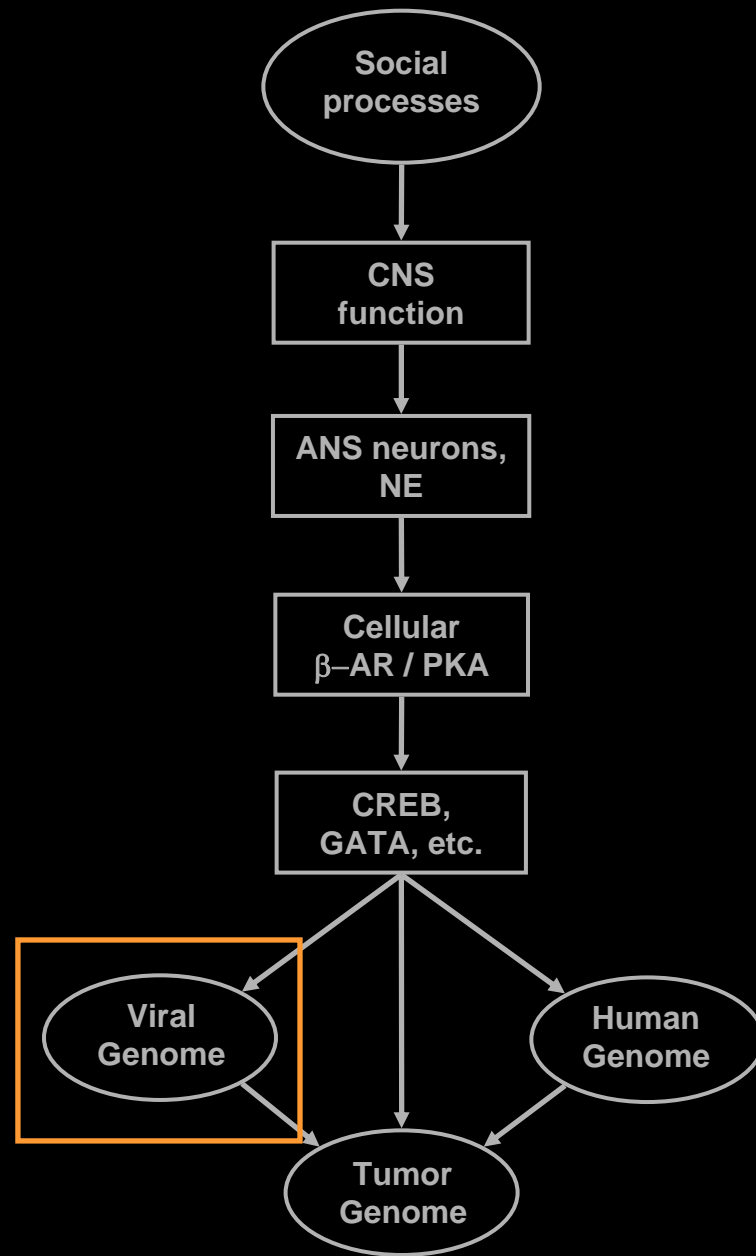

1. How do social factors regulate gene expression?
2. Are these “social signal transduction” pathways active in clinical cancer?
3. Do they shape the evolution of the tumor genome?
4. What are the prospects for protective intervention?

psychology → TF

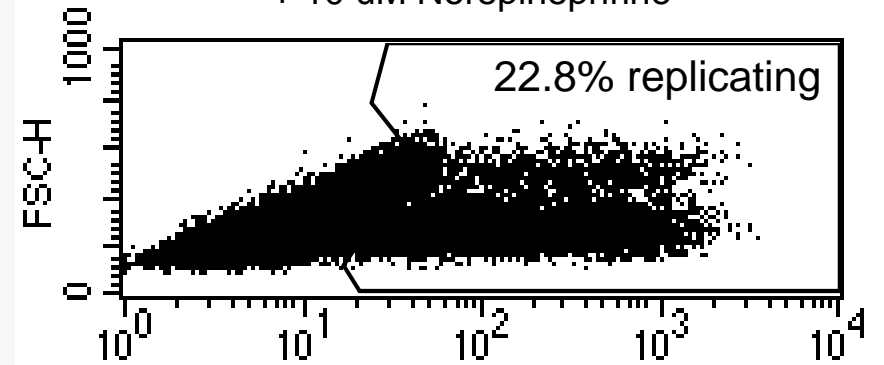

KSHV / HHV-8

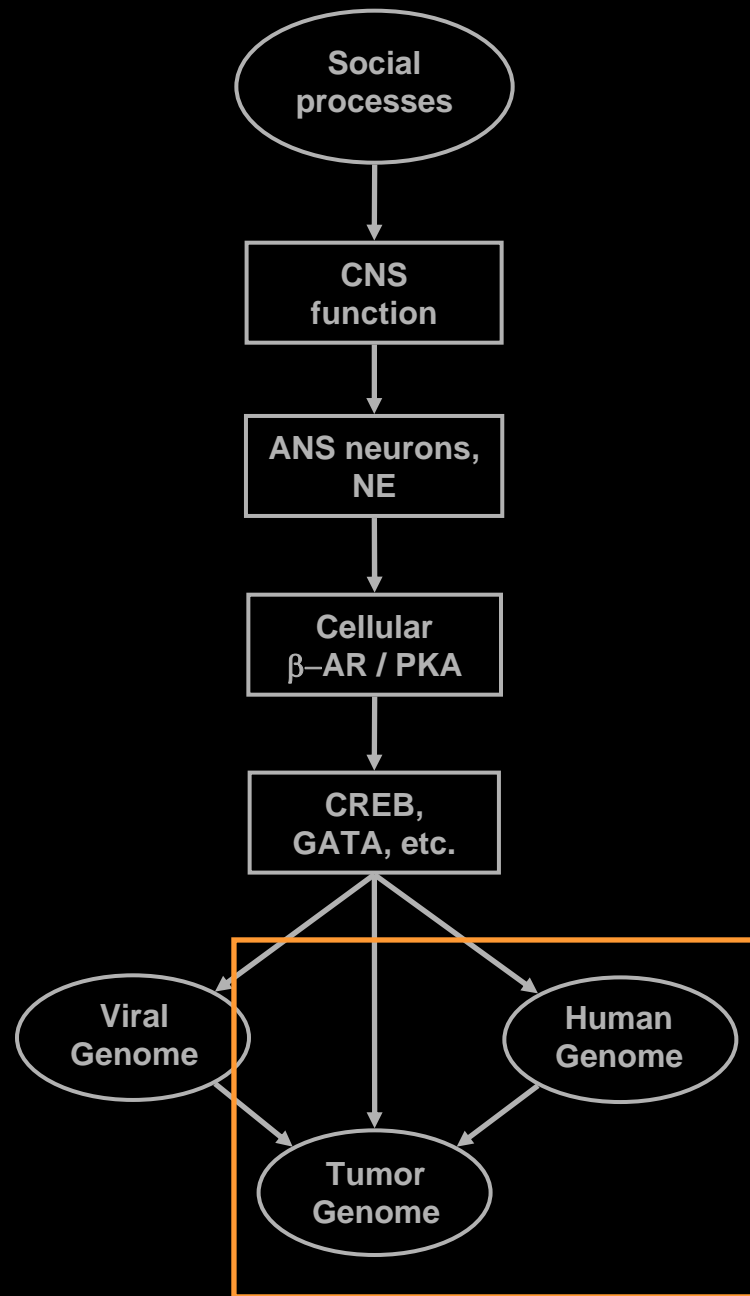

BC3 cells latently infected with KSHV

Biobehavioral regulation of gene expression in cancer

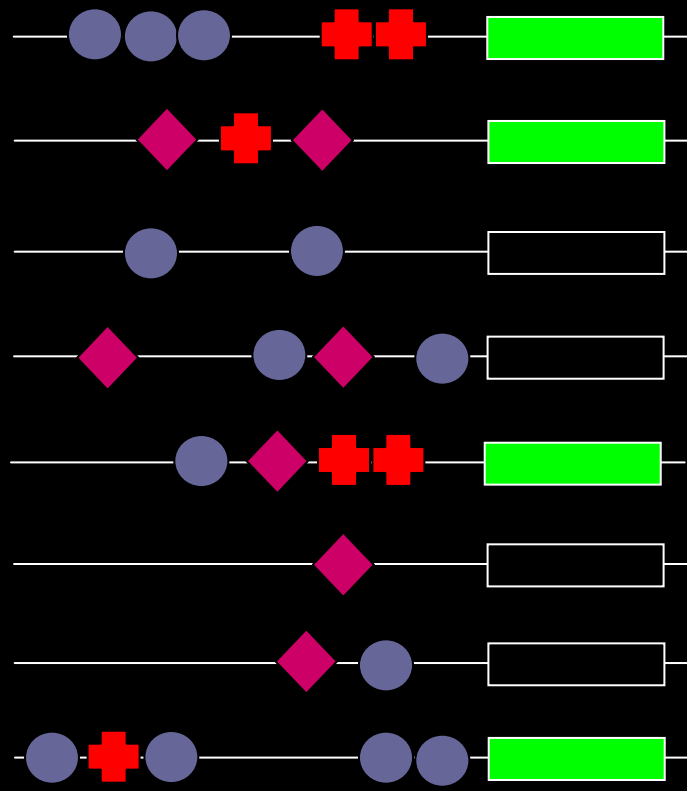

1. How do social factors regulate gene expression?
2. Are these “social signal transduction” pathways active in clinical cancer?
3. Do they shape the evolution of the tumor genome?
4. What are the prospects for protective intervention?

Answer: Neuroendocrine activation of cellular signal-transduction pathways.

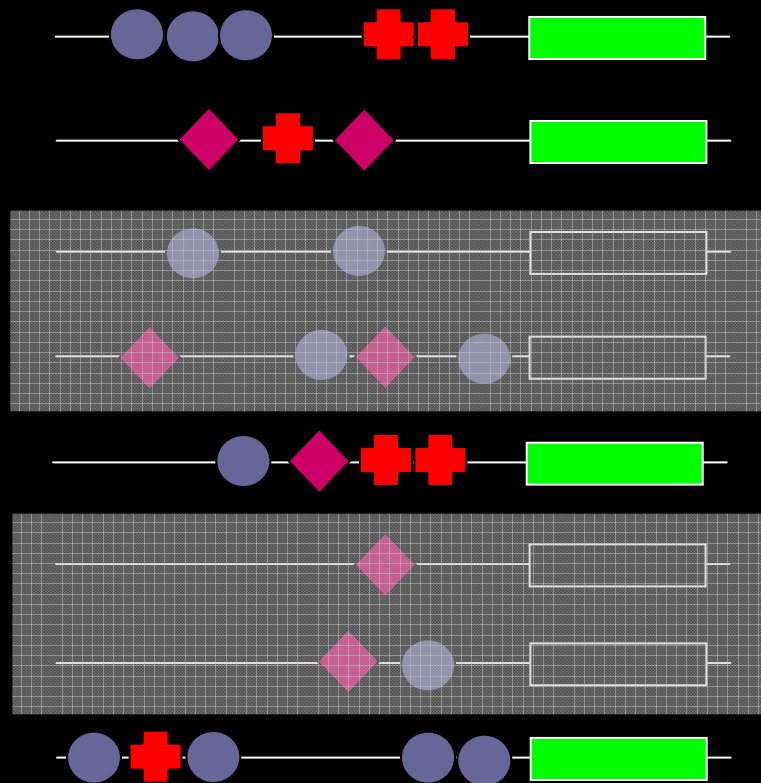

Biobehavioral regulation of gene expression in cancer

1. How do social factors regulate gene expression?
2. Are these “social signal transduction” pathways active in clinical cancer?
3. Do they shape the evolution of the tumor genome?
4. What are the prospects for protective intervention?

 ✚ NF-κB

Depression and ovarian carcinoma: functional genomics

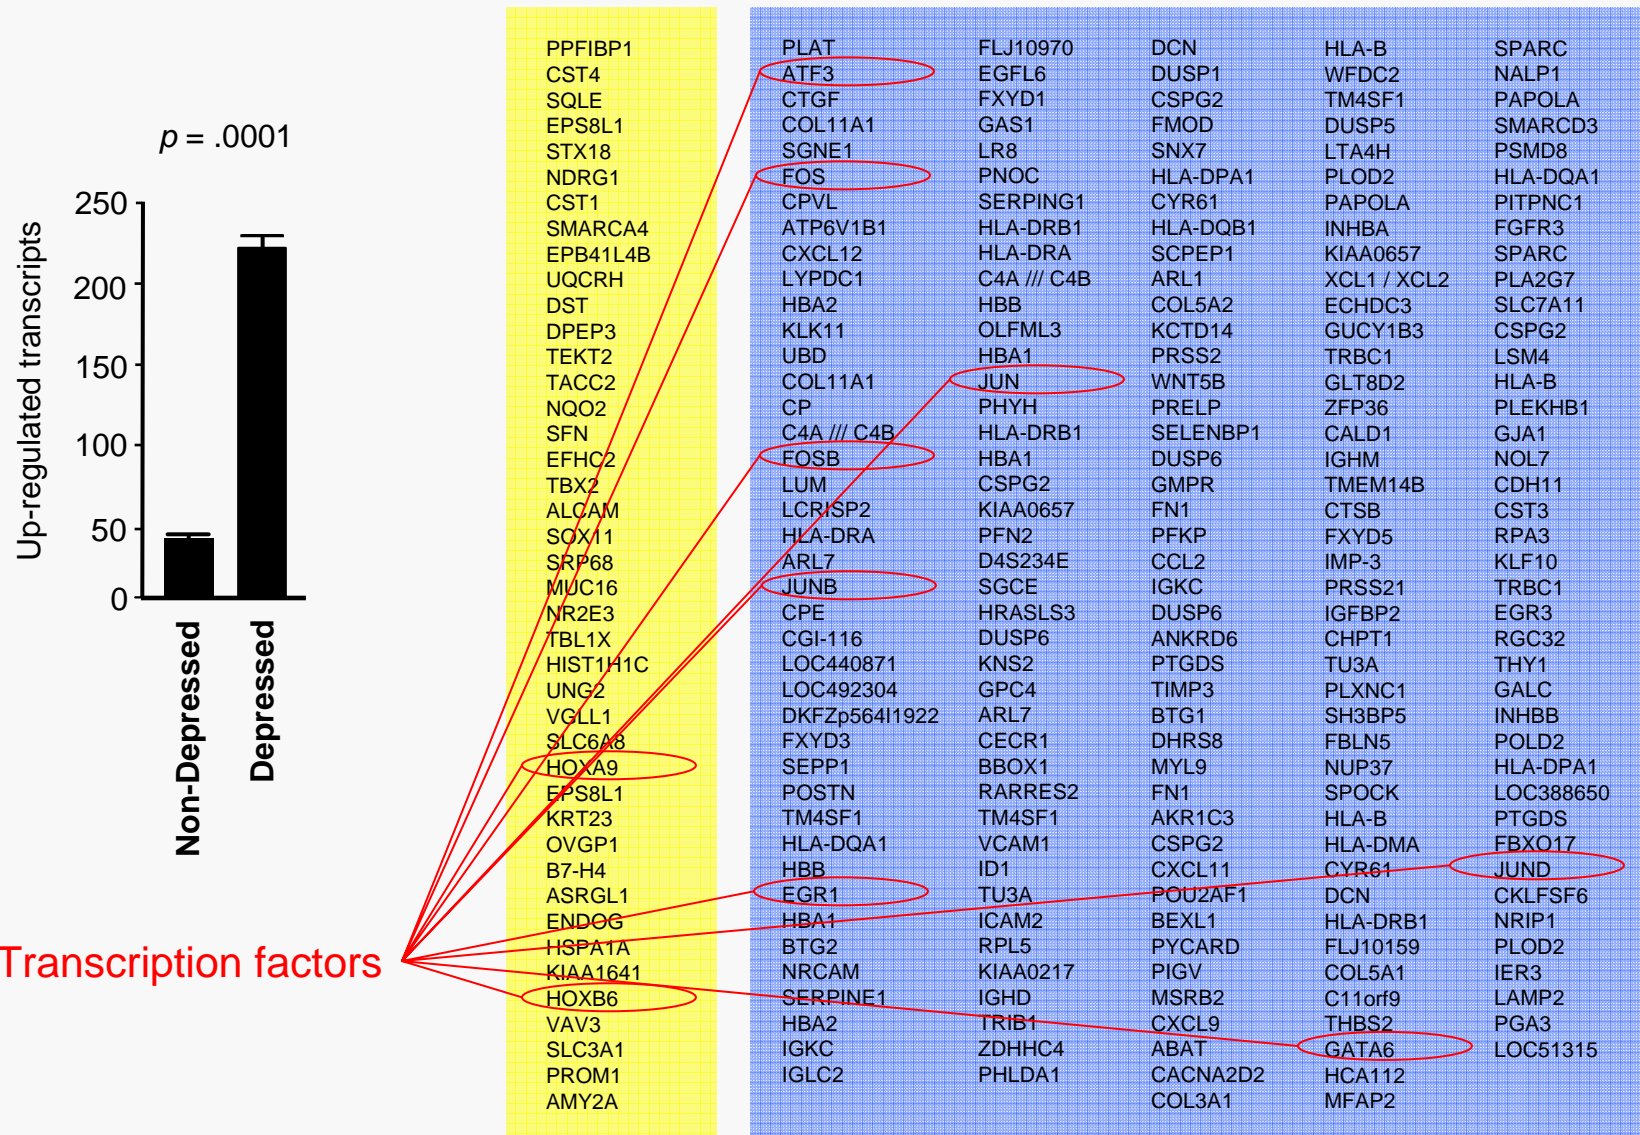

- 10 primary ovarian epithelial carcinomas
 - 5 pt. with high social support and low depression
 - 5 pt. with low social support and high depression
 - matched on Grade, Stage, and histological subtype
- Global gene expression profiling
 - Affymetrix U133A high-density oligonucleotide arrays
 - simultaneous hybridization in UCLA / Jonsson Cancer Center DNA Microarray Core
 - low-level expression analysis by Robust Multi-array Averaging (RMA)
- Bioinformatics
 1. Identify differentially expressed genes (> 2-fold)
 2. Identify upstream transcription control pathways (www.telis.ucla.edu)

Biobehavioral regulation of gene expression in cancer

1. How do social factors regulate gene expression?
2. Are these “social signal transduction” pathways active in clinical cancer?
3. Do they shape the evolution of the tumor genome?
4. What are the prospects for protective intervention?

Answer: Evidence of selection for β -AR / PKA genes in ovarian cancer

Biobehavioral regulation of gene expression in cancer

1. How do social factors regulate gene expression?
2. Are these “social signal transduction” pathways active in clinical cancer?
3. Do they shape the evolution of the tumor genome?
4. What are the prospects for protective intervention?

Biobehavioral regulation of gene expression in cancer

1. How do social factors regulate gene expression?
2. Are these “social signal transduction” pathways active in clinical cancer?
3. Do they shape the evolution of the tumor genome?
4. What are the prospects for protective intervention?

Basic science: Pathway identification

- rational targeting of interventions (agent selection, personal risk profiling)
- genomic biomarkers for intervention impact

Translational opportunity: β -AR pathway

- β -blockade (safe, cheap, effective?)
- molecular manipulation (*ADRB2*, *ADCY*, transcription factors, stay upstream for leverage)
