Quarterly Launch Report

1st Quarter 2006

Featuring Launch results from the 4th Quarter 2005 and
Forecasts for the 1st Quarter 2006 and 2nd Quarter 2006.

Introduction

The First Quarter 2006 Quarterly Launch Report features launch results from the fourth quarter of 2005 (October-December 2005) and forecasts for the first quarter of 2006 (January-March 2006) and the second quarter of 2006 (April-June 2006). This report contains information on worldwide commercial, civil, and military orbital and commercial suborbital space launch events. Projected launches have been identified from open sources, including industry references, company manifests, periodicals, and government sources. Projected launches are subject to change.

This report highlights commercial launch activities, classifying commercial launches as one or both of the following:

- *Internationally-competed launch events (i.e., launch opportunities considered available in principle to competitors in the international launch services market)*
- *Any launches licensed by the Office of Commercial Space Transportation of the Federal Aviation Administration under 49 United States Code Subtitle IX, Chapter 701 (formerly the Commercial Space Launch Act)*

Contents

Fourth Quarter 2005 Highlights	2
Vehicle Use	3
Commercial Launch Events by Country	4
Commercial vs. Non-commercial Launch Events	4
Orbital vs. Suborbital Launch Events	5
Launch Successes vs. Failures	5

Payload Mass Class	6
Commercial Launch Trends	7
Commercial Launch History	8
Appendix A: Fourth Quarter 2005 Orbital and Suborbital Launch Events	A-1
Appendix B: First Quarter 2006 Projected Orbital and Suborbital Launch Events	B-1
Appendix C: Second Quarter 2006 Projected Orbital and Suborbital Launch Events	C-1

Cover (photo courtesy of Sea Launch, copyright © 2005): A Zenit 3SL vehicle, marketed by Sea Launch, lifts off from Odyssey Launch Platform in the Pacific Ocean carrying the payload Inmarsat 4 F2 on November 8, 2005.

Fourth Quarter 2005 Highlights

On October 1, the Soyuz ISS 11S mission lifted off from Baikonur carrying the third space tourist, Gregory Olsen, who paid \$20 million for the orbital flight. Soyuz ISS 11S successfully returned to Earth on October 11.

On October 4, the X Prize Foundation kicked off "The Countdown to the X Prize Cup" in Las Cruces, New Mexico, an expo showcasing private space vehicle developments and technologies. Technology demonstrations included Armadillo Aerospace's unmanned vertical-takeoff, vertical-landing vehicle; Starchaser Industries test firing of a Churchill MK2 engine; and two successful flights of XCOR Aerospace's EZ-Rocket plane, piloted by former astronaut Richard Searfoss. In addition to increasing public awareness, the X Prize Foundation intended the expo to serve as a prelude to the future introduction of the X Prize Cup. The X Prize Cup will be an ongoing competition aimed at giving the private "personal spaceflight industry" financial rewards for achieving new technical milestones in such categories as fastest turnaround time between the first launch and second landing, maximum number of passengers per launch, total number of passengers throughout the competition, maximum altitude, and fastest flight time achieved.

On October 19, Lockheed Martin's final Titan 4 rocket launched a classified National Reconnaissance Office (NRO) payload from Vandenberg Air Force Base (VAFB), California.

On November 2, AirLaunch LLC announced it had received a one-year, \$17.8 million contract to further develop its QuickReach launch vehicle concept under Phase 2B of the Defense Advanced Research Projects Agency (DARPA) Force Application and Launch from CONTinental United States (FALCON) program.

Also on November 2, more than a thousand Boeing union employees belonging to the International Association of Machinists and Aerospace Workers went on strike, delaying all Delta launches indefinitely. The strike affects operations at Cape Canaveral Air Force Station (CCAFS) and VAFB, as well as Boeing's rocket manufacturing plant in Decatur, Alabama and other locations. As this report went to press, the strike was still in progress.

On November 16, Congress approved \$16.5 billion for NASA's fiscal year 2006 budget. The sum includes funding for the Crew Exploration Vehicle (CEV), whose manufacturing contract is expected to be awarded in March 2006.

In November, the U.S. Air Force (USAF) awarded SpaceDev a \$2.7 million contract to develop a large 100,000-pound thrust hybrid rocket motor. The motor would yield nine times the power of the similar engine used to boost SpaceShipOne on its suborbital crewed demonstration flights in 2004.

In December, India announced plans to introduce in 2008 an enhanced, indigenously-produced variant of its Geostationary Satellite Launch Vehicle (GSLV) with a geosynchronous lift capacity of 4,000 kilograms, double the current capability.

On December 5, NASA released a draft call for proposals for commercial ISS cargo resupply concepts for post-2010, when the Space Shuttle is due to retire. Several companies are expected to submit proposals, with contracts set to be awarded in May 2006.

On December 13, Virgin Galactic announced a 20-year lease agreement to use a new spaceport planned in New Mexico for the first flights of its suborbital space tourism service, scheduled for 2008 or 2009. The \$225 million spaceport is expected to be funded primarily by the New Mexico and federal governments. Virgin Galactic will pay fees of \$1 million during each of the first five years of operation, and a larger undisclosed amount after that. The American-British joint venture also revealed that 38,000 people from 126 countries have registered their interest in a space tourism flight, including 100 passengers who have already paid the \$200,000 price in full.

In December, China announced further plans for its lunar space program. The first Chinese lunar orbiter, Chang'e 1, is slated for launch in 2007. A lunar landing mission will follow between 2007 and 2012, with a sample return mission expected between 2012 and 2017. By the end of 2017, China plans to begin the manned phase of its lunar program, with the goal of landing taikonauts on the Moon by a date not yet specified.

Boeing and Lockheed Martin announced that United Launch Alliance, the planned 50-50 merger of their government satellite launch service divisions, would be delayed until next year. Although both companies sought to finalize the merger before the end of 2005, as of late December the proposal was still undergoing regulatory review, so the formal merger is now expected to take effect in 2006.

Vehicle Use

(October 2005 – June 2006)

Figure 1: Fourth Quarter 2005 Total Launch Vehicle Use

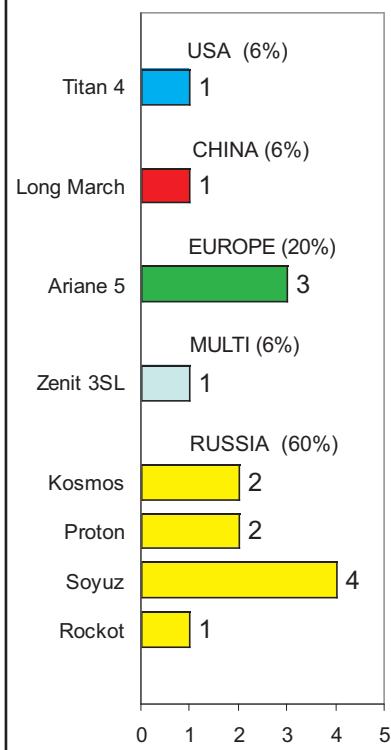

Figure 2: First Quarter 2006 Total Projected Launch Vehicle Use

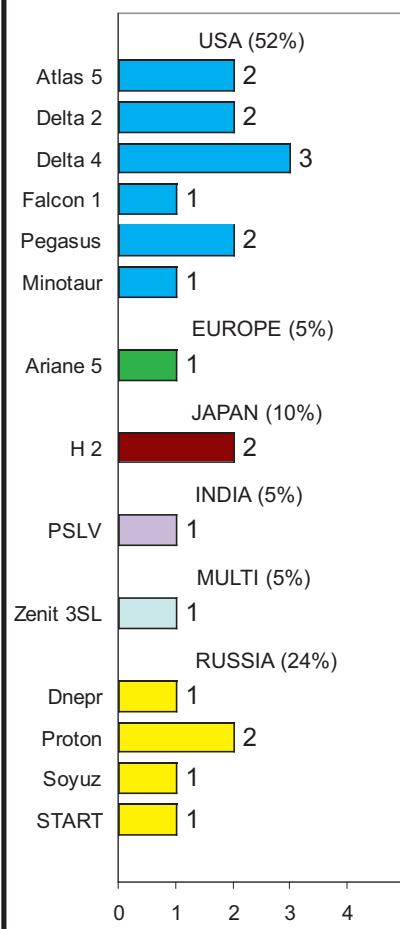

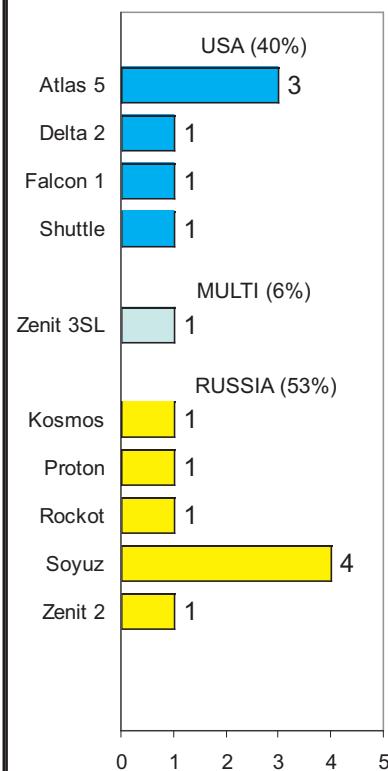

Figure 3: Second Quarter 2006 Total Projected Launch Vehicle Use

Total = 15

Total = 21

Total = 15

Figures 1-3 show the total number of orbital and suborbital launches (commercial and government) of each launch vehicle and the resulting market share that occurred in the fourth quarter of 2005, as well as projecting this information for the first quarter of 2006 and second quarter of 2006. The launches are grouped by the country in which the primary vehicle manufacturer is based. Exceptions to this grouping are launches performed by Sea Launch, which are designated as multinational.

Note: Percentages for these and subsequent figures may not add up to 100 percent due to rounding of individual values.

Commercial Launch Events by Country (October 2005 – June 2006)

Figure 4: Fourth Quarter 2005 Commercial Launch Events by Country

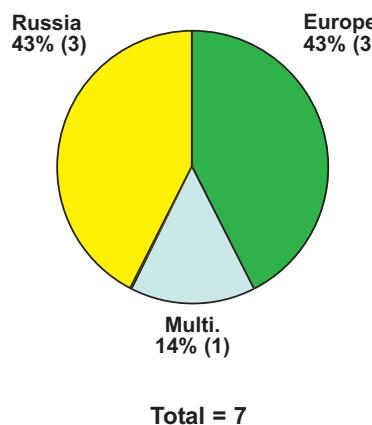

Figure 5: First Quarter 2006 Projected Commercial Launch Events by Country

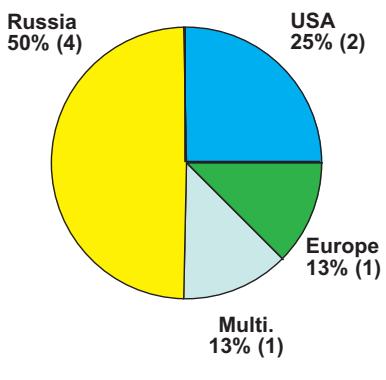

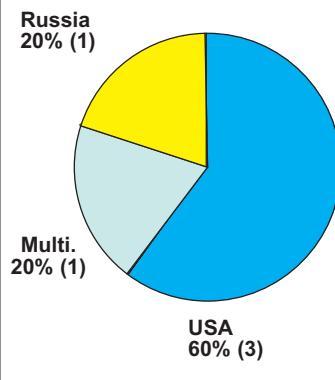

Figure 6: Second Quarter 2006 Projected Commercial Launch Events by Country

Figures 4-6 show all *commercial* orbital and suborbital launch events that occurred in the fourth quarter of 2005 and that are projected for the first quarter of 2006 and second quarter of 2006.

Commercial vs. Non-commercial Launch Events (October 2005 – June 2006)

Figure 7: Fourth Quarter 2005 Commercial vs. Non-commercial Launch Events

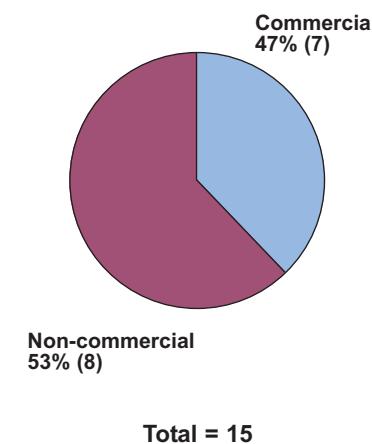

Figure 8: First Quarter 2006 Projected Commercial vs. Non-commercial Launch Events

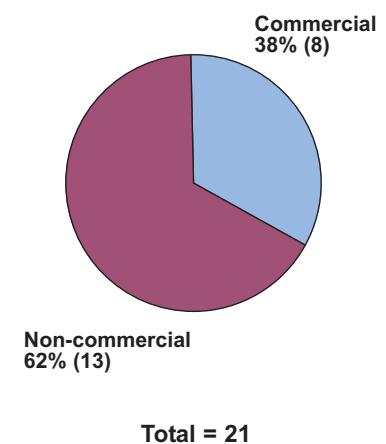

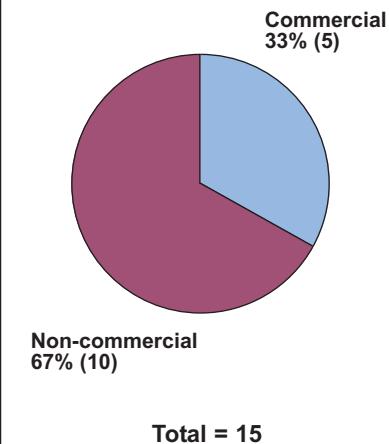

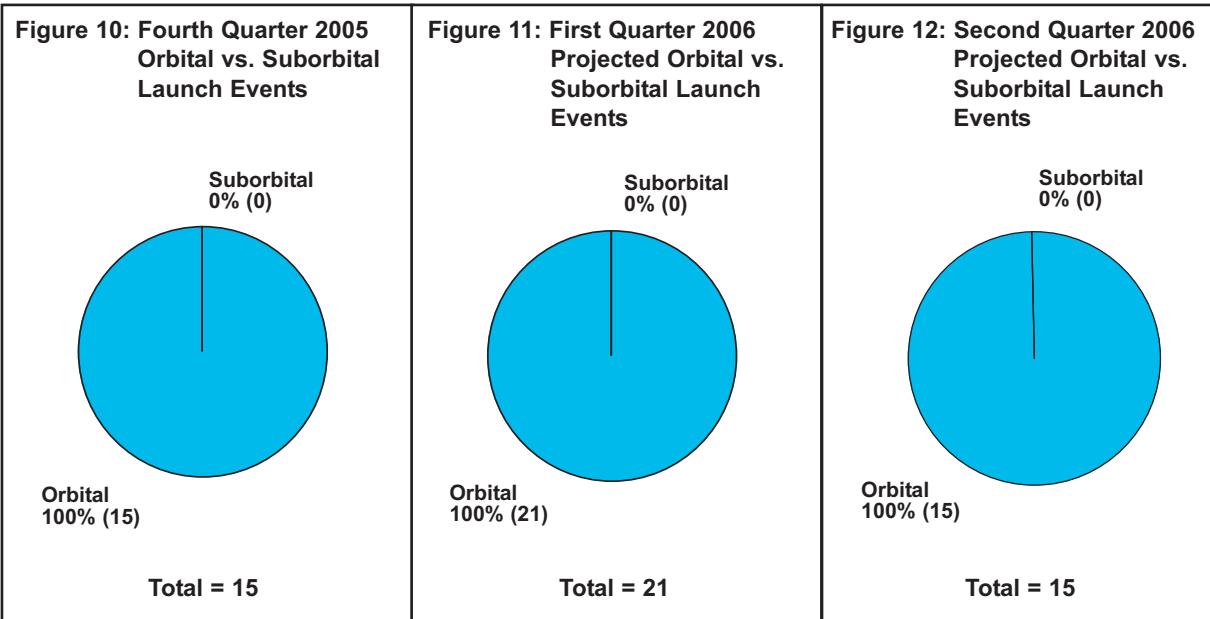

Figure 9: Second Quarter 2006 Projected Commercial vs. Non-commercial Launch Events

Figures 7-9 show commercial vs. non-commercial orbital and suborbital launch events that occurred in the fourth quarter of 2005 and that are projected for the first quarter of 2006 and second quarter of 2006.

Orbital vs. Suborbital Launch Events

(October 2005 – June 2006)

Figures 10-12 show orbital vs. suborbital launch events that occurred in the fourth quarter of 2005 and that are projected for the first quarter of 2006 and second quarter of 2006.

Launch Successes vs. Failures

(October 2005 – June 2006)

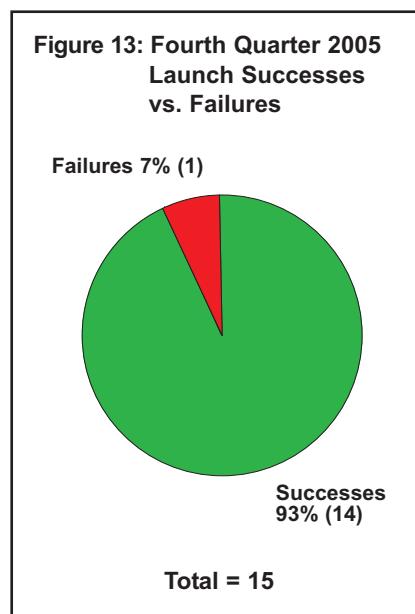

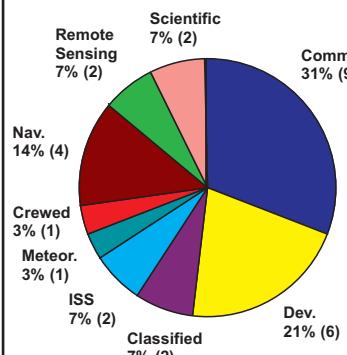

Figure 13 shows orbital and suborbital launch successes vs. failures for the period from October 2005 to December 2005. Partially-successful orbital launch events are those where the launch vehicle fails to deploy its payload to the appropriate orbit, but the payload is able to reach a useable orbit via its own propulsion systems. Cases in which the payload is unable to reach a useable orbit or would use all of its fuel to do so are considered failures.

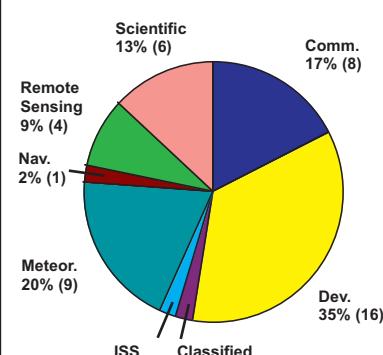

Payload Use (Orbital Launches Only) (October 2005 – June 2006)

Figure 14: Fourth Quarter 2005 Payload Use

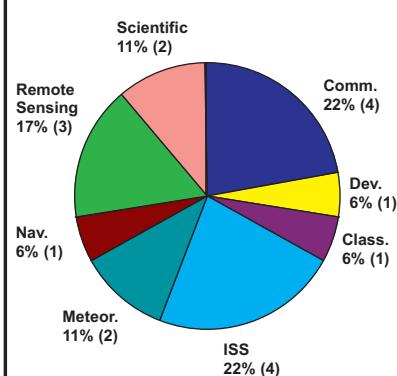

Total = 29

Figure 15: First Quarter 2006 Projected Payload Use

Total = 46

Figure 16: Second Quarter 2006 Projected Payload Use

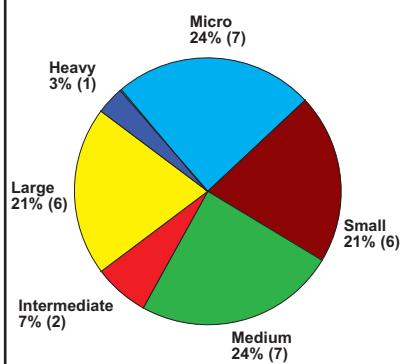

Total = 18

Figures 14-16 show total payload use (commercial and government), actual for the fourth quarter of 2005 and projected for the first quarter of 2006 and second quarter of 2006. The total number of payloads launched may not equal the total number of launches due to multi-manifesting, i.e., the launching of more than one payload by a single launch vehicle.

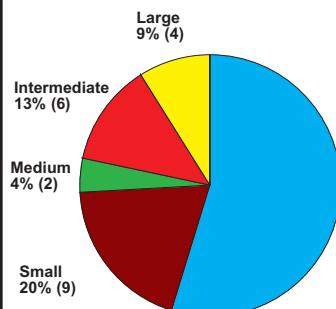

Payload Mass Class (Orbital Launches Only) (October 2005 – June 2006)

Figure 17: Fourth Quarter 2005 Payload Mass Class

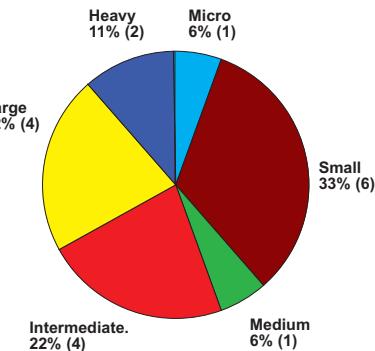

Total = 29

Figure 18: First Quarter 2006 Projected Payload Mass Class

Total = 46

Figure 19: Second Quarter 2006 Projected Payload Mass Class

Total = 18

Figures 17-19 show total payloads by mass class (commercial and government), actual for the fourth quarter of 2005 and projected for the first quarter of 2006 and second quarter of 2006. The total number of payloads launched may not equal the total number of launches due to multi-manifesting, i.e., the launching of more than one payload by a single launch vehicle. Payload mass classes are defined as Micro: 0 to 91 kilograms (0 to 200 lbs.); Small: 92 to 907 kilograms (201 to 2,000 lbs.); Medium: 908 to 2,268 kilograms (2,001 to 5,000 lbs.); Intermediate: 2,269 to 4,536 kilograms (5,001 to 10,000 lbs.); Large: 4,537 to 9,072 kilograms (10,001 to 20,000 lbs.); and Heavy: over 9,072 kilograms (20,000 lbs.).

Commercial Launch Trends (Orbital Launches Only) (January 2005 – December 2005)

Figure 20: Commercial Launch Events, Last 12 Months

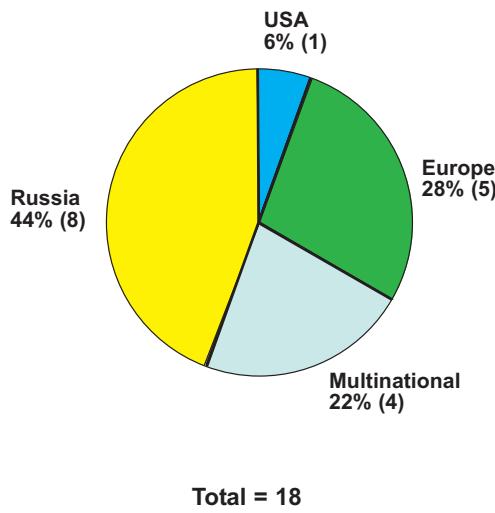

Figure 21: Estimated Commercial Launch Revenue, Last 12 Months

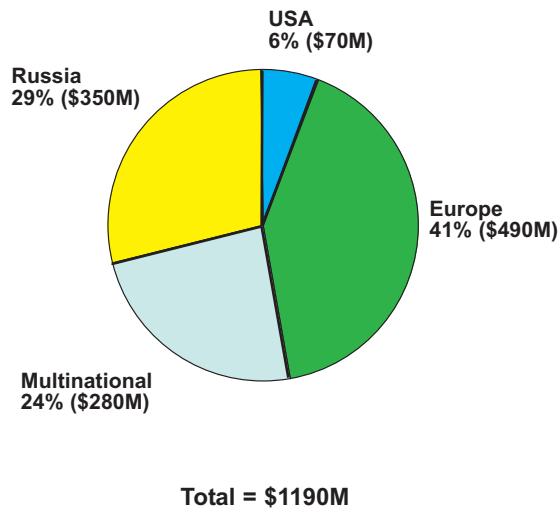

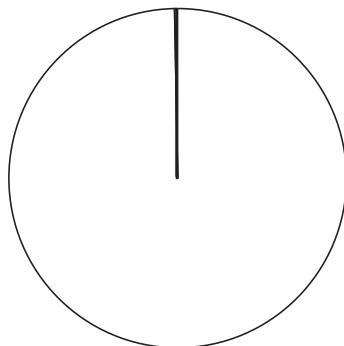

Figure 20 shows commercial orbital launch events for the period of January 2005 to December 2005 by country.

Figure 21 shows estimated commercial launch revenue for orbital launches for the period of January 2005 to December 2005 by country.

Commercial Launch Trends (Suborbital Launches Only) (January 2005 – December 2005)

Figure 22: Commercial Suborbital Launch Events, Last 12 Months

Total = 0

Figure 22 shows commercial suborbital launch events for the period of January 2005 to December 2005 by country.

Commercial Launch History (January 2001 – December 2005)

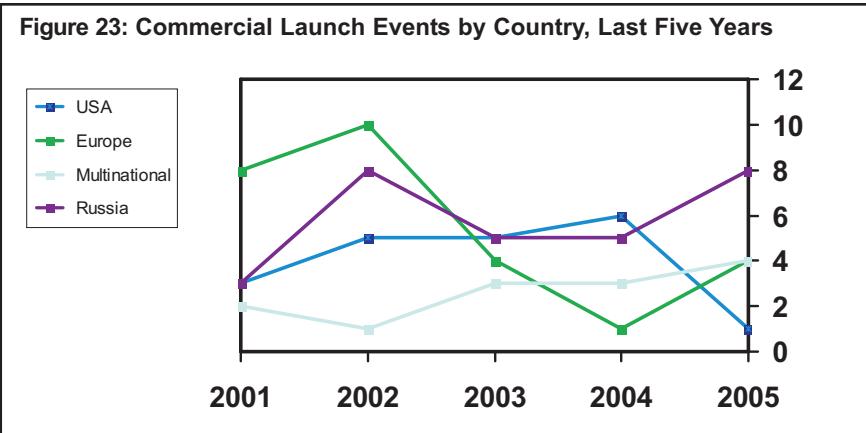

Figure 23 shows commercial launch events by country for the last five full years.

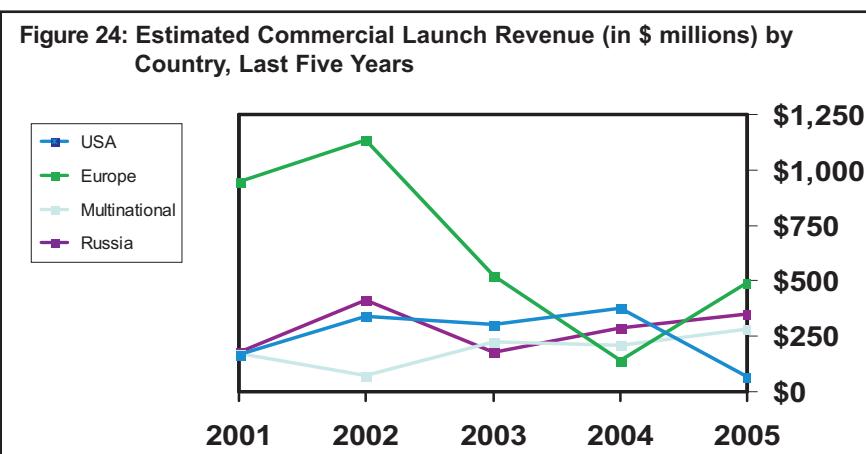

Figure 24 shows estimated commercial launch revenue by country for the last five full years.

Fourth Quarter 2005 Orbital and Suborbital Launch Events							
Date	Vehicle	Site	Payload or Mission	Operator	Use	Vehicle Price	L M

- ✓ Denotes commercial launch, defined as a launch that is internationally competed or FAA-licensed. For multiple manifested launches, certain secondary payloads whose launches were commercially procured may also constitute a commercial launch.
- + Denotes FAA-licensed launch.
- * Denotes a commercial payload, defined as a spacecraft that serves a commercial function or is operated by a commercial entity.

Notes: All prices are estimates, and vary for every commercial launch. Government mission prices may be higher than commercial prices. Ariane 5 payloads are usually multi-manifested, but the pairing of satellites scheduled for each launch is sometimes undisclosed for proprietary reasons until shortly before the launch date.
