October 1995

AFOS-ERA VERIFICATION OF GUIDANCE AND  
LOCAL AVIATION/PUBLIC WEATHER FORECASTS--NO. 20  
(APRIL 1993 - SEPTEMBER 1993)

Valery J. Dagostaro and J. Paul Dallavalle

1. INTRODUCTION

This office note continues the series of Techniques Development Laboratory (TDL) office notes which present verification results for TDL's automated guidance and National Weather Service (NWS) local forecasts made at Weather Service Forecast Offices (WSFO's). In order to streamline production of the documents and to encourage their use, the format was changed significantly a number of issues ago. Most text has been eliminated, and descriptive information about the verification data is presented in tabular form. In addition, the format includes a section for special items of interest or changes that occurred during the verification season. For more specific information about the forecasts, observations, and verification procedure for each weather element, see Dagostaro and Dallavalle (1991).

Verification statistics are presented here for the warm season months of April 1993 through September 1993 for maximum/minimum (max/min) temperature, probability of precipitation (PoP), cloud amount, surface wind, ceiling height, and visibility. Specific details about the local and objective forecasts and the verifying observations are summarized in Table 1.1. It's important to consider this information when interpreting the verification scores. For example, the objective max/min temperature forecast system is based on calendar day observations for Alaska, but on daytime/nighttime periods for the conterminous U.S. For Alaska, the definitions of the official local max/min temperature forecasts and verifying observations, in turn, differ from those of the guidance.

For this season, the objective guidance was based on forecast equations developed by use of the Model Output Statistics (MOS) technique (Glahn and Lowry 1972) and applied to forecast fields from the Limited-area Fine-mesh Model (LFM) (Gerrity 1977; Newell and Deaven 1981) and the Nested Grid Model (NGM) (Hoke et al. 1989). Additional information about the objective guidance prediction equations is available from the references listed in Table 1.2. Details regarding the local data collection in the conterminous U.S. and Alaska are described briefly in Dagostaro and Dallavalle (1991). For additional information about the local data collection process, see Ruth and Alex (1987). The central data collection and data processing system is described in Dagostaro (1985).

Verification statistics are provided for the 101 stations in the conterminous U.S. and Alaska listed in Table 1.3. The scores are those recommended in the NWS National Verification Plan (National Weather Service 1982). Definitions of the categories used for verification are given in Table 1.4. For the aviation weather elements, we verified the local forecasts associated with the FT issuance times of approximately 0900 and 1800 UTC. Objective guidance for the aviation weather elements, as well as all local and guidance forecasts for the public weather elements, were verified for the 0000 and 1200 UTC forecast cycles. Because verification data or forecast projections for Alaska differ from those of the conterminous U.S., data for the six Alaskan stations were verified separately from those of the conterminous U.S.

For most weather elements, verification results are presented for all stations in the conterminous U.S. combined, followed by results for each of the four NWS regions in the conterminous U.S. and for the Alaska Region. Max/min temperature and PoP scores are presented in Tables 2.1 - 2.12 and 3.1 - 3.12, respectively. Tables 4.1 - 4.12 show cloud amount verification scores for the conterminous U.S. stations and the Alaskan stations. For wind speed and direction, objective guidance verification results are presented in Tables 5.1 - 5.12, while the analogous local scores are given in Tables 5.13 - 5.24. Comparative verification results for the 42-h significant wind speed are presented for the Alaska Region only in Tables 5.25 and 5.26. For ceiling height and visibility, verification scores are shown only for the conterminous U.S. stations combined and for the Alaska Region. Tables 6.1 - 6.4 contain the objective ceiling height forecast results for the conterminous U.S. and the Alaska Region, while Tables 6.5 - 6.8 contain ceiling height scores for the local forecasts. Tables 7.1 - 7.8 show objective and local visibility forecast results for the conterminous U.S. and the Alaska Region.

## 2. SUMMARY (APRIL 1993 - SEPTEMBER 1993)

During the 1993 warm season, the NGM-based MOS replaced the LFM-based MOS as the official objective guidance for the conterminous U.S. For most stations, the local collection of NGM-based MOS began on June 21, 1993. Table 1.5 lists the forecast cycle when the conversion occurred (i.e., the first forecast cycle for which NGM-based guidance was collected) at each conterminous U.S. station. Note, therefore, that the official guidance was a mixture of LFM- and NGM-based MOS for this warm season. Wherever the heading "GUID" or "LFM/NGM" appears in the attached verification tables, the scores are based on the mixed sample. Please note that for some weather elements, forecast definitions for LFM- and NGM-based MOS differ slightly. For most weather elements, comparative verification results are also presented for NGM-based MOS that was archived centrally by TDL.

A new NGM MOS cloud amount forecast system replaced the existing NGM-based MOS cloud forecast system, and NGM MOS visibility guidance was added to the NGM MOS forecast bulletin (Dallavalle et al. 1992) on 1200 UTC July 7, 1993. Note that for a short period after the NGM MOS guidance became the official guidance, and before the NGM MOS visibility was added to the bulletin, no visibility guidance was available for stations in the conterminous U.S. For visibility, the centrally-archived NGM MOS guidance was not included in verification results presented here because NGM MOS visibility guidance was not produced for the first half of the warm season. Thus, in order to verify a matched sample of the locally-collected official guidance and the centrally-archived NGM MOS guidance, the sample would have covered only the second half of the warm season, coincident to the period when NGM MOS visibility guidance was collected as the official guidance.

For ceiling height and visibility, the categories used for verification now match the definitions of aviation flight rules (LIFR, IFR, MVFR, and VFR). Note that the NGM-based MOS ceiling and visibility categorical forecast definitions also match the flight rule definitions, while the LFM-based MOS categories differ slightly for MVFR and VFR. In general, care must be used when interpreting verification results for rare events, for example, the lower categories of ceiling height or visibility.

The climatic normal temperatures used in the max/min temperature verification were replaced with normals for a more recent period. Beginning with the 1993 warm season, the climatic normals were based on temperatures for the 1961-90

period. Prior to the 1993 warm season, the climatic normals were based on the 1951-80 period.

On July 1, 1993, Jackson, Mississippi was commissioned as an ASOS site. Because the ASOS cloud amount observations are incomplete, we set to missing the observed cloud amount data for Jackson after it was commissioned. In addition, the observed cloud amount data were set to missing for the five AEV ASOS sites listed in Table 1.3 that were commissioned during the 1992-93 cool season.

For stations in the conterminous U.S., the local data collection software used after approximately June 21, 1993, contained an error in which missing data were set equal to 15 instead of a coded value used by other parts of the local data collection software. For this reason, we eliminated from the data archive all local forecasts and observations equal to 15 after this version of the software was installed at a given forecast office. Note that legitimate values equal to 15 were probably also eliminated from the data sample. For the MOS guidance, locally-collected data were compared to TDL's centrally-archived values, and only data that differed were set to missing.

In June 1995, we discovered that the locally-collected MOS PoP forecasts for stations in the Alaska Region were valid for a different 12-h period than the local PoP forecasts and the 12-h precipitation amount observations. In fact, since the 1988-89 cool season, the local PoP forecasts and the LFM MOS forecasts verified for Alaska have been mismatched, that is, the LFM MOS PoPs have been valid 12 hours prior to the valid time of the local forecasts. The observations, however, matched the valid time of the local forecasts. Please disregard the MOS PoP verification results for Alaska presented in all previous office notes. Local PoP verification results presented here and in previous office notes are correct.

During the 1992-93 cool season, we found an error in the local software that collects the verifying observation for the 42-h significant wind for stations in the conterminous U.S. Because of this error, the projection of the verifying observation collected by the local software does not always match the valid time of the local and MOS forecasts. The mismatch of the forecast valid time and the verifying observation began in late June 1987. Consequently, the 42-h significant wind verification results are correct for some stations and incorrect for others. Thus, overall verification results for the conterminous U.S. for the 1993 warm season were not included in this office note. In addition, the 42-h significant wind verification results for the conterminous U.S. presented in office notes for the 1987 warm season through 1992 warm season should be disregarded. For the Alaska Region, the forecast valid time and the projection of the verifying observation are correct; therefore, verification results presented in previous office notes need not be disregarded, and results for the 1993 warm season were included in this office note.

Table 1.1. Forecasts and observations in the NWS verification data.

Weather Element	Type of Data	Data Source	Projections From Forecast Cycle	Forecast Cycle (UTC)	Comments
Max temp	LFM MOS	FXX	24, 48	0000	Daytime max temperature forecast for the conterminous U.S.; calendar day max temperature forecast for Alaska.
			36, 60	1200	
	NGM MOS	FWC	24, 48	0000	Daytime max temperature forecast for the conterminous U.S.; no guidance for Alaska.
			36, 60	1200	
Local Fcst	FP		24, 48	0000	Daytime max temperature for all stations. In the conterminous U.S., actual daytime period depends on time zone and differs slightly from the LFM MOS definition of daytime. For Alaska, forecasts are valid for 12-h periods ending at 30 (42) and 54 (66) hours after 0000 (1200) UTC.
			36, 60	1200	
Obs		SAO			Corresponds closely to the local and NGM MOS definitions of the max for all stations.
Min temp	LFM MOS	FXX	36, 60	0000	Nighttime min temperature forecast for the conterminous U.S.; calendar day min temperature forecast for Alaska.
			24, 48	1200	
	NGM MOS	FWC	36, 60	0000	Nighttime min temperature forecast for the conterminous U.S.; no guidance for Alaska.
			24, 48	1200	
Local Fcst	FP		36, 60	0000	Nighttime min temperature for all stations. In the conterminous U.S., actual nighttime period depends on time zone and differs slightly from the LFM MOS definition of nighttime. For Alaska, forecasts are valid for 12-h periods ending at 30 (42) and 54 (66) hours after 1200 (0000) UTC.
			24, 48	1200	
Obs		SAO			Corresponds closely to the local and NGM MOS definitions of the min for all stations.
PoP	LFM MOS	FXX	24, 36, 48	0000, 1200	For the conterminous U.S., forecasts are for 12-h periods ending at the indicated projections. For Alaska, the 12-h periods actually end at 30, 42, and 54 hours from the forecast cycle.
	NGM MOS	FWC	24, 36, 48	0000, 1200	For the conterminous U.S., forecasts are for 12-h periods ending at the indicated projections. There is no NGM-based PoP guidance for Alaska.
Local Fcst	FP		24, 36, 48	0000, 1200	Same as the guidance.
Obs		SAO			Precipitation amount for 12-h periods that match those of the local forecasts.

Table 1.1. Continued.

Weather Element	Type of Data	Data Source <sup>1</sup>	Projections From Forecast Cycle	Forecast Cycle (UTC)	Comments
Precipitation type <sup>2</sup>	LFM MOS	FXX	18, 30, 42	0000, 1200	Forecasts are valid at specific hours corresponding to the indicated projections. Guidance for the conterminous U.S. is for freezing, frozen, and liquid precipitation (mixed frozen and liquid is considered liquid). For Alaska, guidance is for frozen and unfrozen precipitation (freezing is considered unfrozen) but is not verified.
	NGM MOS	FWC	18, 30, 42	0000, 1200	For the conterminous U.S., forecasts are valid at specific hours corresponding to the indicated projections. Guidance is for freezing, frozen, and liquid precipitation (mixed frozen and liquid is considered liquid). There is no guidance for Alaska.
	Local Fcst	MEF	18, 30, 42	0000, 1200	Forecasts of freezing, frozen, and liquid precipitation (mixed frozen and liquid is considered frozen) for all stations. Forecasts are valid at specific hours corresponding to the indicated projections.
	Obs	SAO			Obs are collected at the verifying time and $\pm 1$ hour of the verifying time.
Snow amount <sup>2</sup>	LFM MOS	FXX	24	0000, 1200	For the conterminous U.S., categorical forecasts of snow amount for the 12-h period ending at the indicated projection; no comparable guidance for Alaska.
	NGM MOS	FWC	24	0000, 1200	For the conterminous U.S., categorical forecasts of snow amount for the 12-h period ending at the indicated projection; no comparable guidance for Alaska.
	Local Fcst	MEF	24	0000, 1200	Snow amount forecast in inches for the 12-h period ending at the indicated projection.
	Obs	SSM			12-h snow amount.
Cloud amount	LFM MOS	FXX	12, 18, 24	0000, 1200	Categorical forecasts of opaque sky cover.
	NGM MOS	FWC	12, 18, 24	0000, 1200	Categorical forecasts of opaque sky cover for the conterminous U.S.; no guidance for Alaska.
	Local Fcst	MEF	12, 18, 24	0000, 1200	Categorical forecasts of sky cover.
	Obs	SAO			Observed total sky cover (includes thin clouds) at the verifying hour.
Wind speed	LFM MOS	FXX	12, 18, 24, 42	0000, 1200	Valid at specific hours after 0000 or 1200 UTC.
	NGM MOS	FWC	12, 18, 24, 42	0000, 1200	For the conterminous U.S., forecasts are valid at the indicated hours after 0000 or 1200 UTC; no guidance for Alaska.
	Local Fcst	FT	3, 9, 15	0900, 1800	Aviation terminal forecasts are valid for variable time periods. Forecasts valid for the "projections" at left are verified. Approximate FT issuance times, at left, depend on time zone where station is located.
	Obs	MEF	42	0000, 1200	A yes/no forecast of $\geq 22$ kt wind speed valid at the specific hour after 0000 or 1200 UTC.
	Obs	SAO			Observed values collected at the stations for the specific hour and $\pm 3$ hours (highest sustained wind) correspond to the valid times of the local aviation terminal forecasts. Observed values corresponding to the 42-h significant wind should be based on 0000 or 1200 UTC, but are erroneously based on the FT issuance time for the conterminous U.S. Verifying obs corresponding to the guidance are from TDL hourly archives.

Table 1.1. Continued.

Weather Element	Type of Data	Data Source <sup>1</sup>	Projections From Forecast Cycle	Forecast Cycle (UTC)	Comments
Wind direction	LFM MOS	FXX	12, 18, 24	0000, 1200	Valid at specific hours after 0000 or 1200 UTC.
	NGM MOS	FWC	12, 18, 24	0000, 1200	For the conterminous U.S., forecasts are valid at the indicated hours after 0000 or 1200 UTC; no guidance for Alaska.
	Local Fcst	FT	3, 9, 15	0900, 1800	Same as for local aviation terminal forecasts of wind speed.
	Obs	SAO			Observed values collected at the stations for the specific hour correspond to the valid time of the local forecasts. Verifying obs corresponding to the guidance are from TDL hourly archives.
Ceiling height	LFM MOS	FXX	12, 18, 24	0000, 1200	Categorical value. Definitions of categories match the official definitions of LIFR and IFR, but differ slightly from the official definitions of MVFR and VFR.
	NGM MOS	FWC	12, 18, 24	0000, 1200	Categorical value. Definitions of categories match the official definitions of LIFR, IFR, MVFR, and VFR; no guidance for Alaska.
	Local Fcst	FT	3, 6, 9, 15	0900, 1800	Forecasts are converted to categorical values. See wind speed for FT valid times and issuance times.
	Persis	SAO			Persistence observations used for comparison with the local forecasts are collected at the stations and are the latest hourly obs available at the scheduled FT release time. Since March 1987, persistence obs used for comparison with the MOS guidance are from hourly obs taken at 0900 (2100) UTC for the 0000 (1200) UTC cycle. These latter obs are collected at TDL.
	Obs	SAO			Observations taken at specific hours. Obs corresponding to the valid times of the local forecasts are collected at the stations. Verifying obs that correspond to the valid times of the MOS guidance are from hourly obs collected at TDL.
Visibility	LFM MOS	FXX	12, 18, 24	0000, 1200	See ceiling height.
	NGM MOS	FWC	12, 18, 24	0000, 1200	See ceiling height.
	Local Fcst	FT	3, 6, 9, 15	0900, 1800	See ceiling height.
	Persis	SAO			See ceiling height.
	Obs	SAO			See ceiling height.

<sup>1</sup>Data sources are as follows:

- FXX - FPC bulletin contains LFM-based MOS guidance for all weather elements for stations in the conterminous U.S.; guidance for Alaska is obtained from the FMAK1 and FMAK2 bulletins
- FWC - FWC bulletin contains NGM-based MOS guidance for all weather elements for stations in the conterminous U.S. only; there is no NGM-based guidance for Alaska at this time
- FP - Coded city forecast (FPUS4) bulletin containing official local public weather element forecasts in the conterminous U.S.; data in Alaska are obtained from the FPAK4 bulletin
- FT - Aviation terminal forecast containing official local forecasts for aviation weather elements
- MEF - Manually entered forecast product containing official local forecasts of some weather elements
- SAO - Surface always observation containing verifying observations corresponding to local and MOS forecasts for most weather elements
- SSM - Surface synoptic report containing verifying observations of snow amount

<sup>2</sup>Precipitation type and snow amount forecasts are not verified for the warm season months of April through September.

<sup>1</sup>Cloud amount observations were not used after the station was commissioned as an ASOS site.

<sup>2</sup>TCC had no data for the max/min temperature and PoP verifications. Data also were not available for the local ceiling height, visibility, and surface wind verifications for the FT release time of approximately 0900 UTC, the MOS surface wind verification for the 1200 UTC cycle, and the MOS ceiling height and visibility verifications for the 0000 and 1200 UTC cycles.

<sup>3</sup>LBB and ELP were not included in the local ceiling height, visibility, and surface wind verifications.

<sup>4</sup>LAX was not included in the max/min temperature and PoP verifications.

Table 1.4. Definitions of categories used for verification.

Category	Precipitation Type	Snow Amount* (in)	Cloud Amount	Wind Speed (kt)	Wind Direction (degrees)	Ceiling Height (ft)	Visibility (mi)
1	ZL, ZR, any combination of precipitation types that includes ZL or ZR	<2	CLR, -SCT, -BKN, -OVC, -X	≤12	340-20.	≤400	<1
2	IC, IP, IPW, S, SG, SP, SW, any combination of frozen and liquid	2-3	SCT	13-17	30-60	500-900	1-2 3/4
