

## FOREWORD

This river mile index for the Lower Colorado River lists river mileages that were determined from measurements made on Bureau of Reclamation aerial orthophotographs and U.S. Geological Survey topographic quadrangles. The Geological Survey and Bureau of Reclamation furnished information on stream gage locations, drainage areas and water surface elevation.

River mile distances were measured upstream to the nearest tenth of a mile. The starting point for the Lower Colorado River mile index is at the southerly international boundary with Mexico. In cases where tributary washes did not have a well defined channel from the Colorado River to where they met the valley floor, the starting point was located at a latitude and longitude where the channel was well defined. Tributaries are shown as entering from the right or left from a position facing downstream. Elevation of water surface is shown at the average elevations in impoundments.

The discharge pattern of the Colorado River between Davis Dam and Imperial Dam is influenced by daily power demands and seasonal irrigation and municipal and industrial requirements. The water surface elevations shown for this reach represent typical daily highs occurring during the summer period.

This index was prepared by the Boulder Canyon Operations Office, Lower Colorado Region, Bureau of Reclamation. August 2001
