

FIG. 23.—Plankton at the surface, northern channel, April 15, 1920 (station 20105), dominated by the copepods *Calanus finmarchicus*, *Acartia*, and *Metridia*. In connection with Figure 24 it illustrates vertical stratification of the plankton. $\times 10$

FIG. 24.—Plankton of the deeper levels, at the same station as the surface haul in Figure 23. This deep haul (150-0 meters) was dominated by the "nauplius" larvæ of barnacles (*Balanus*), with fewer *Calanus* and other copepods. $\times 10$
