

Assessing the Ecological Condition of Wetlands on a  
Watershed Basis using a Rapid Method:  
The Cuyahoga River as a Case Study

Siobhan Fennessy  
Kenyon College

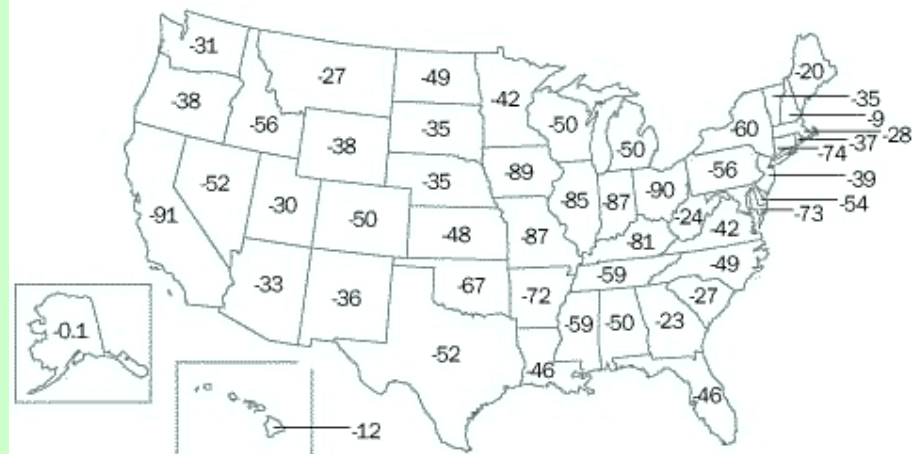

# Wetlands in the US

- ★ To date, nearly 55% of wetlands in the U.S. have disappeared (Dahl 1990)
- ★ 90% loss in Ohio
- ★ Results in loss of ecosystem services that wetlands provide

**Percentage of Wetlands Acreage Lost, 1780's-1980's**

Twenty-two states have lost at least 50 percent of their original wetlands. Seven states—Indiana, Illinois, Missouri, Kentucky, Iowa, California, and Ohio—have lost over 80 percent of their original wetlands. Since the 1970's, the most extensive losses of wetlands have been in Louisiana, Mississippi, Arkansas, Florida, South Carolina, and North Carolina.

# How do Ecosystems Respond to Disturbance?

(e.g., land-use or other human activity gradients)

# Tiered Assessment Methods

- ★ Comprehensive Assessment- level 3
  - Reference based
  - Data collection averages 4 hours for 4 people
  - *Index of Biotic Integrity*
- ★ Rapid Assessment- level 2
  - Data collection averages 1-2 hours for 1-2 people
  - Calibrated to Comprehensive Assessment
  - Combines stressor and condition metrics
  - *Ohio Rapid Assessment Method*
- ★ Landscape Assessment- level 1
  - GIS analysis
  - Calibrated with comprehensive assessment

# Application on a watershed scale: the Cuyahoga River Basin

# The Cuyahoga River Basin

- 815 square miles
- 3% of state land area, houses 16% of population
- Designated a Great Lakes *Area of Concern* due to legacy of industrial pollution

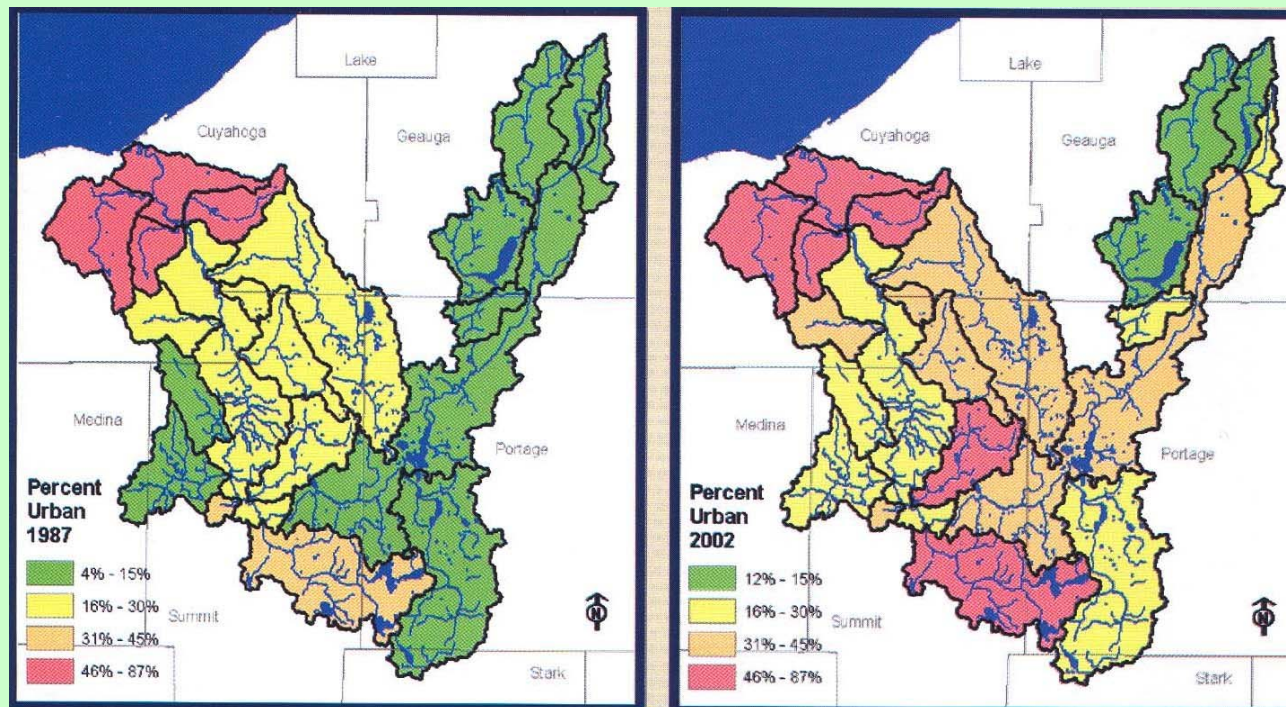

# The Cuyahoga River fires: catalyst for environmental protection

# Current Issues: urbanization

Courtesy Cuyahoga River RAP Committee

# Study design: selecting sites for assessment

## Define the sample frame

- \* Wetlands mapped by the Ohio Wetland Inventory
  - 5 classes

## EMAP study design

- \* Sample points selected using “GRTS” design
- \* Provides a spatially balanced sample with ordered points

All 3 levels of assessment employed

# Randomized Sample Points

- 1600 points generated for whole watershed
- Goal to sample 200
- 366 sites sampled
- of these, 243 wetlands

# Site Access and Sampling

- *what did we do?*

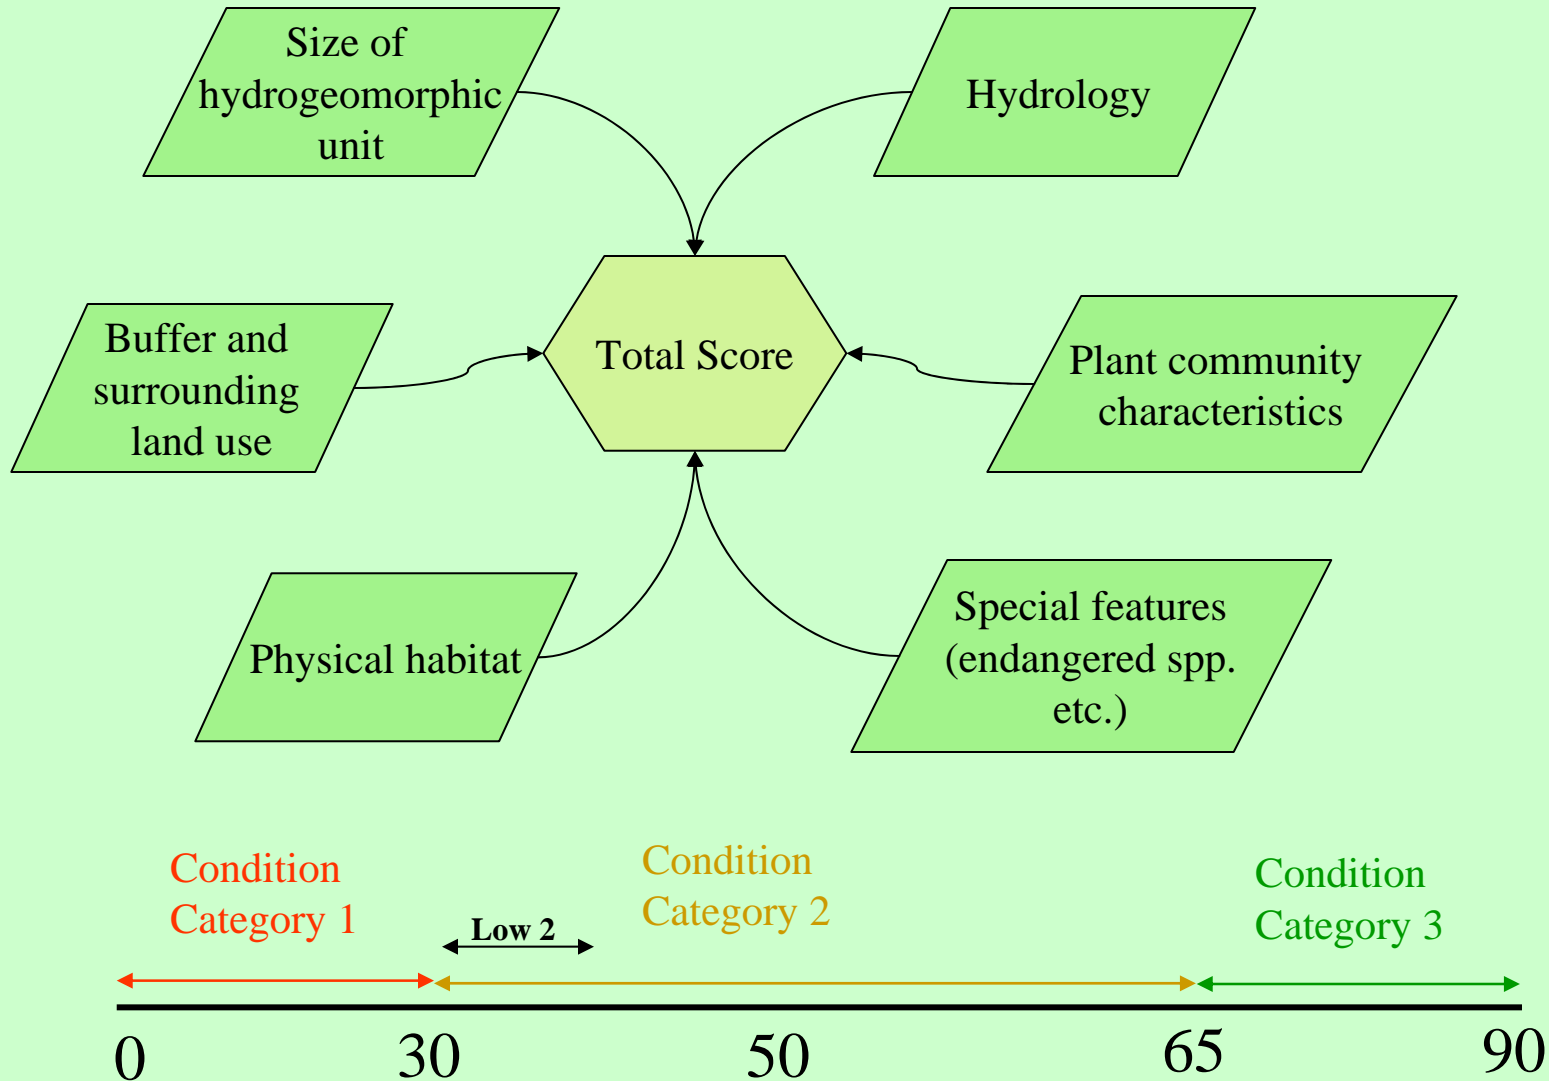

# Overview of ORAM metrics

# Comprehensive Sampling

- ★ At 10% of sites:
  - Vegetation IBI
  - Amphibian IBI
  
- ★ At all sites:
  - Soils, standard chemical and enzymatic analysis

The site view...

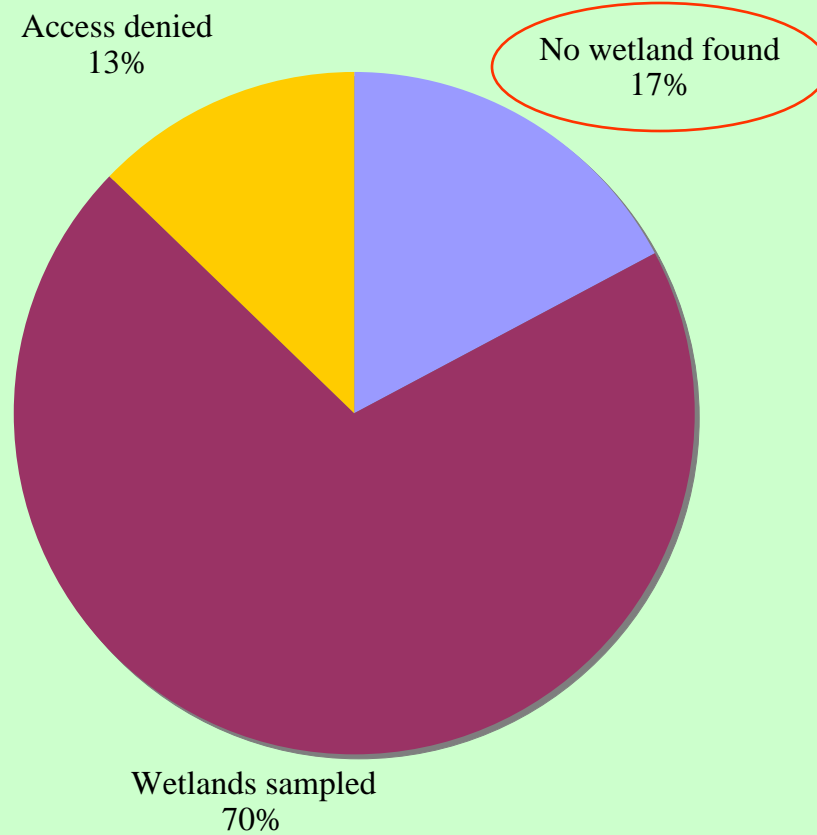

# Fate of sampled points

366 total sites

# Preliminary Project Results

Ordered distribution of scores for all sites sampled

# Urbanization and wetland conversion...

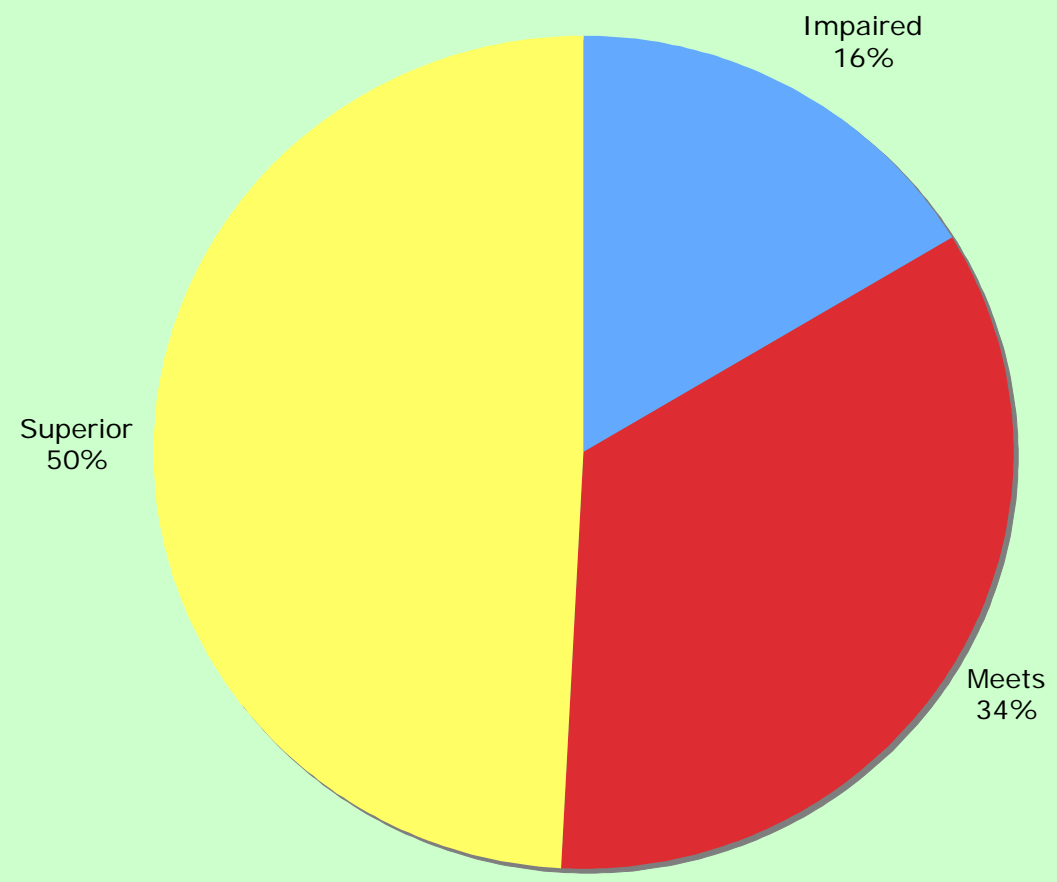

# Diversity of wetland types

$N = 243$

# Geauga County Wetland condition

67 wetlands

# Portage & Stark Counties

108 wetlands

# Cuyahoga and Medina Counties

12 wetlands

## Total acres per condition category

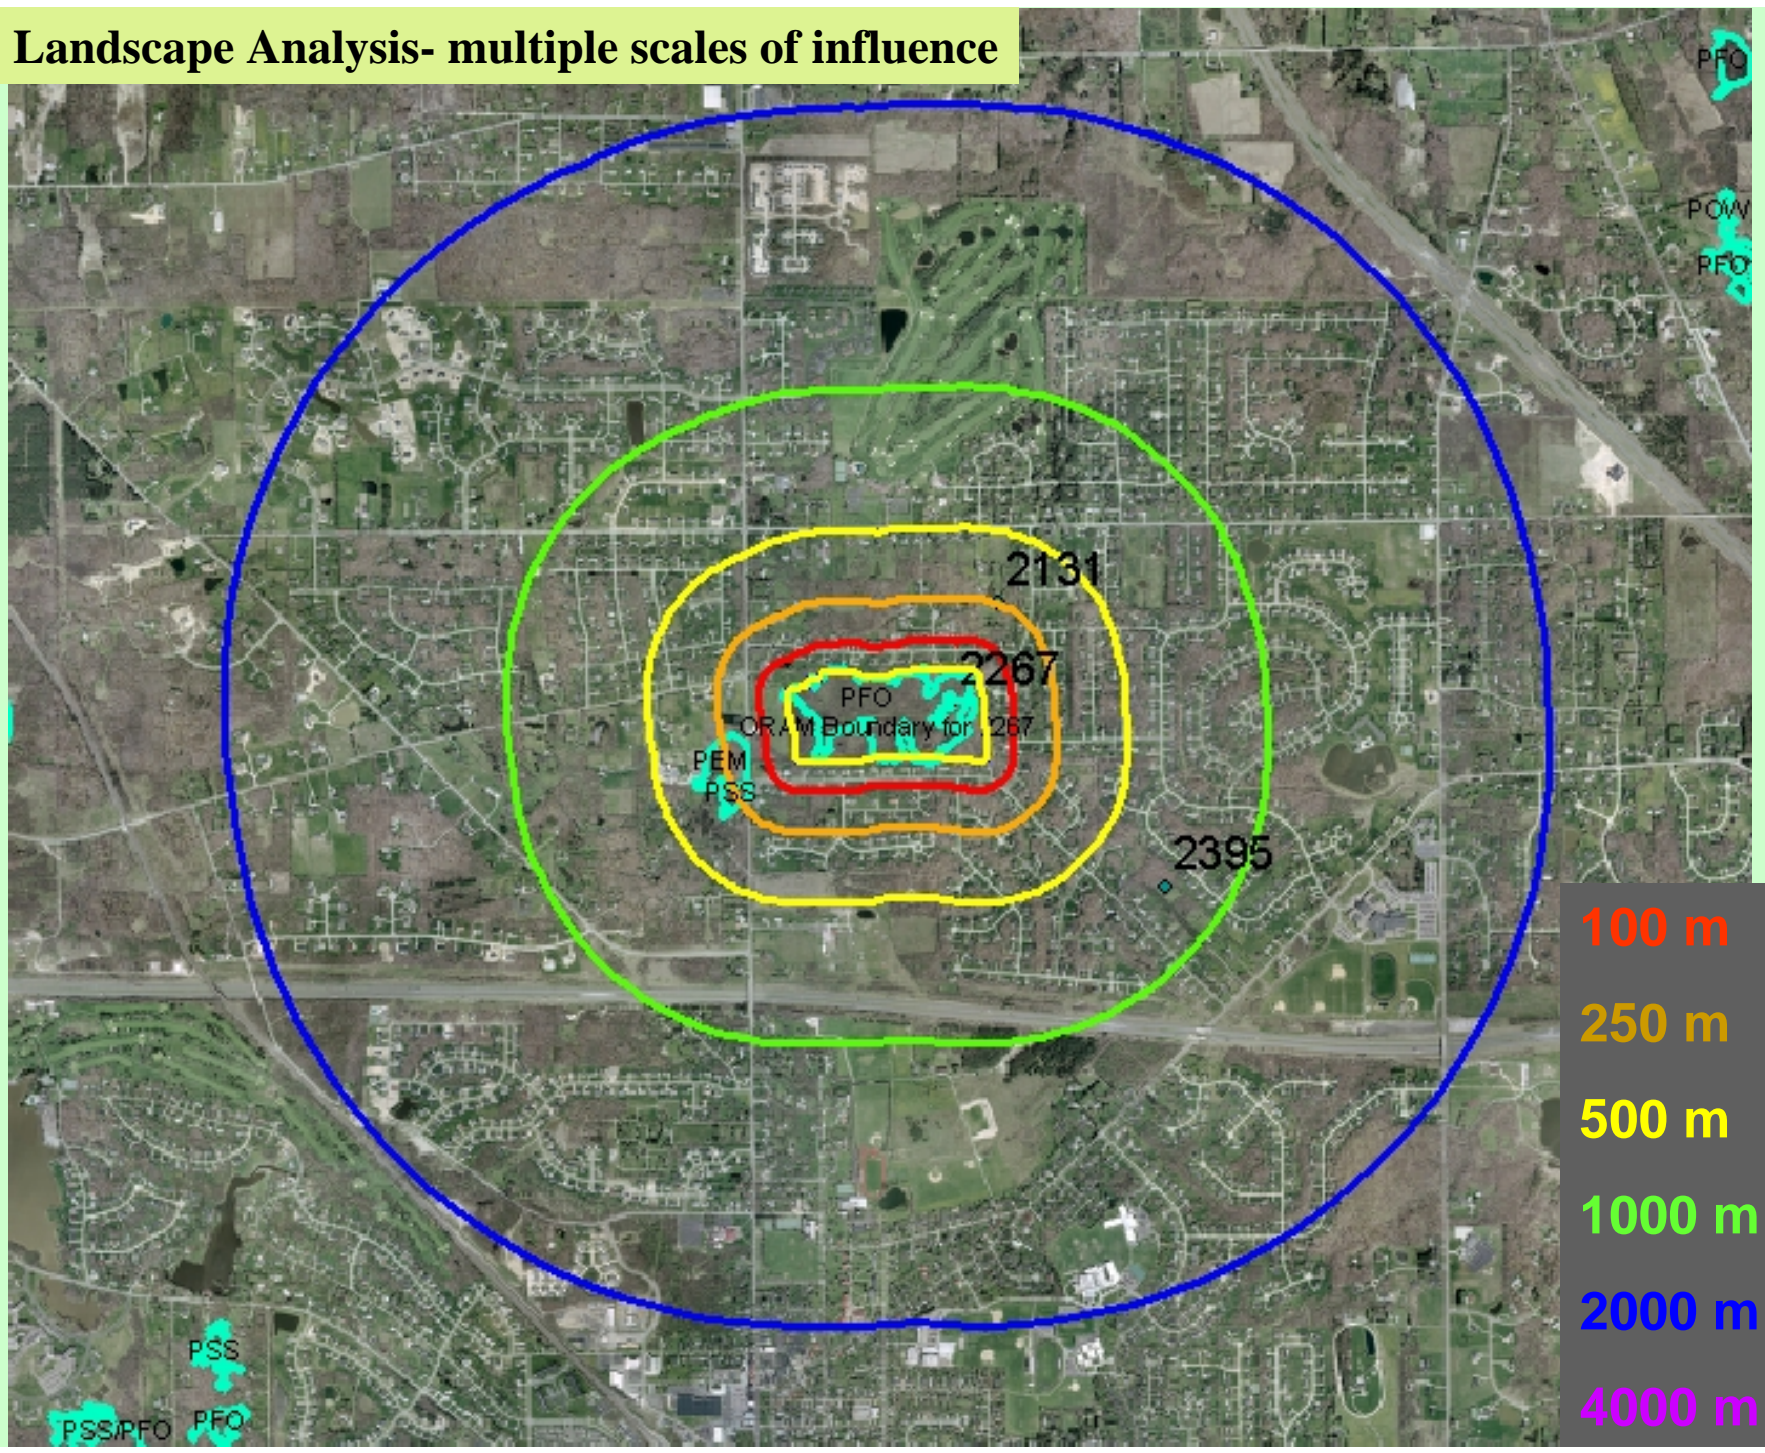

# Mean wetland size per condition category

Wetland condition categories

# Landscape Analysis- multiple scales of influence

- 100 m
- 250 m
- 500 m
- 1000 m
- 2000 m
- 4000 m

# Landscape Development Index (LDI)

$$LDI = \sum (\%LU_i * LDI_i) * 100$$

where  $\%LU_i$  = percent of area under land use  $i$   
and  $LDI_i$  = LDI coefficient for land use  $i$

## *LDI coefficients*

Natural areas = 0

Row Crops = 3.25

Suburban = 4.04

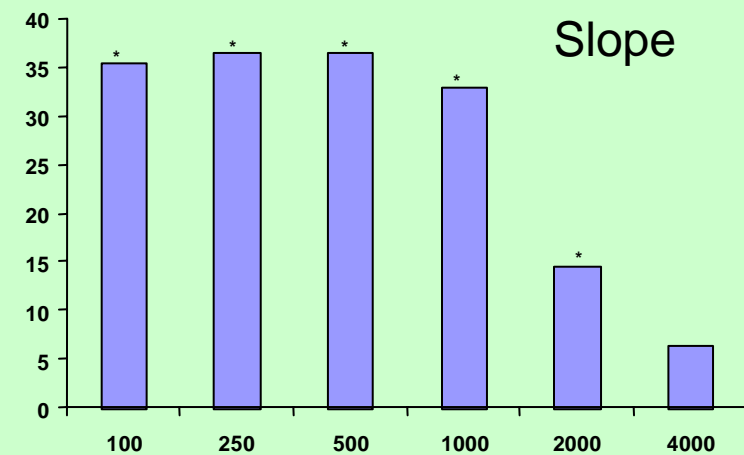

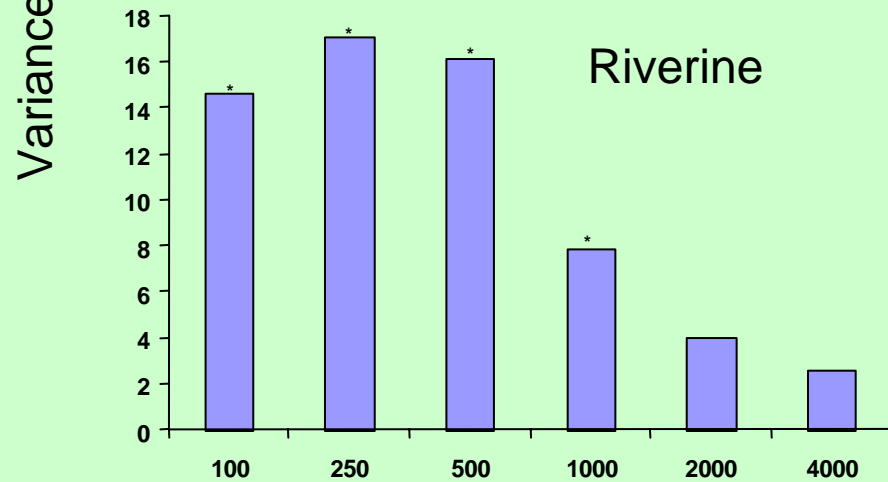

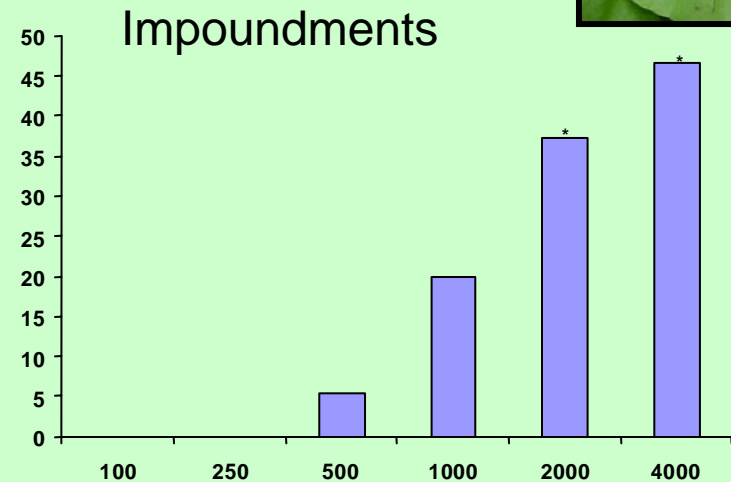

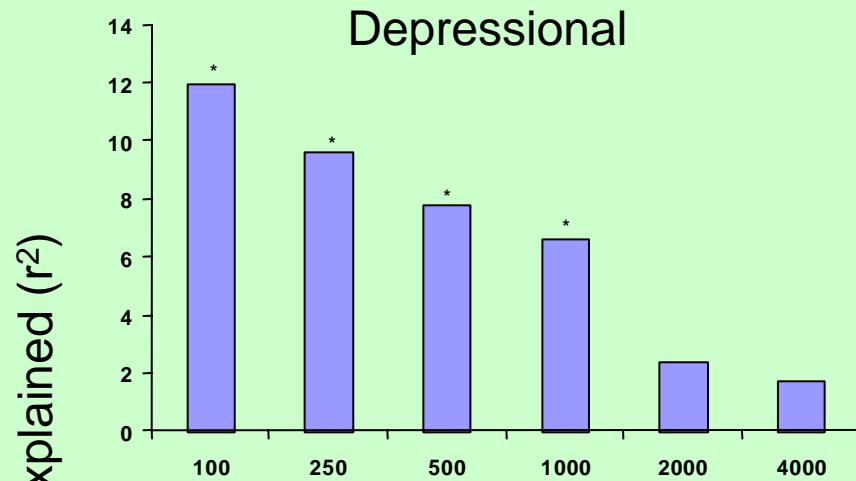

Pasture = 1.08

Urban = 4.65

## Variance explained in ORAM scores by LDI scores.

Buffer Distances (m)

*Diemeke et al. in prep*

# Nutrient Retention in Watershed

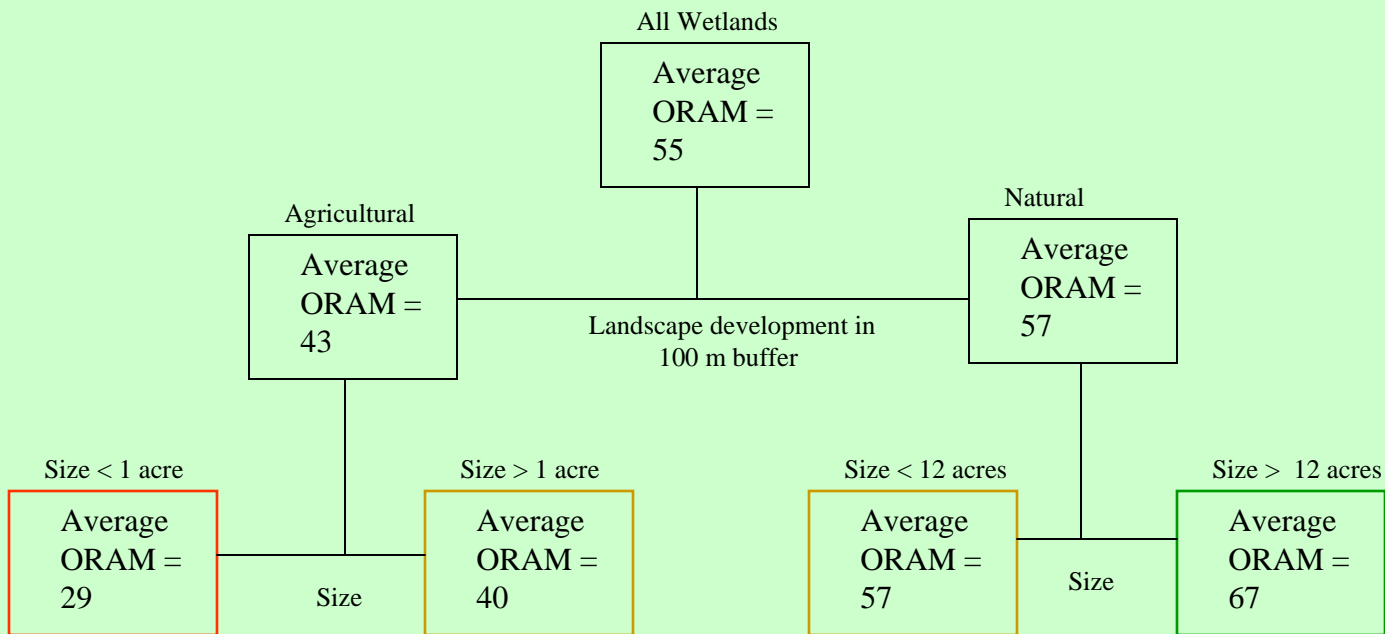

The annual P load to Lake Erie is 17,500 t, the TP held in 198 wetlands sampled account for 10% of this annual load

	<u>Total Population sampled</u>
<b>Area</b>	<b>1180 Ha</b>
<b>TP</b>	<b>1,500 t</b>
<b>TN</b>	<b>8,090 t</b>
<b>TC</b>	<b>114,000 t</b>
<b>P-sorption Capacity</b>	<b>101,000 t</b>

The P-sorption *capacity* of wetlands sampled accounts for 5 times the annual load of P to Lake Erie

# In sum: what factors most affect wetland condition?

# Conclusions

- ★ Historically, our preoccupation with the *quantity* of wetlands has led us to overlook a loss of *quality*
- ★ Preservation and restoration efforts require information on current environmental condition
- ★ Preservation and restoration must take into account the landscape setting of the wetland
