Note.--The ratio of duties collected to the value of imports (sometimes referred to as the "average ad valorem equivalent") should be used with great reservation as a measure of the "height" of a country's tariff or of the tariff's restrictiveness of imports. Such a ratio for the schedule of duties as a whole (or even a ratio for most individual tariff categories) is heavily weighted by imports that enter either free of duty or at low unrestrictive rates; it is weighted less by imports that enter at high restrictive rates and not at all by imports that are precluded from entry. Moreover, an upward or downward trend in the "ratio" of duties collected may reflect alterations in the rates of duty applied, changes in the composition of imports from year to year, or changes in the prices of imported commodities. Also, presented dutiable values and calculated duties prior to 1993 are overstated because they were not adjusted to account for the nondutiable portion of imports entered under HTSUS provisions 9802.00.60 and 9802.00.80. Commerce implemented this adjustment beginning with data reported for June 1992.
