NOAA Technical Memorandum NMFS

The National Marine Fisheries Service's Alaska Fisheries Science Center uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series reflect sound professional work and may be referenced in the formal scientific and technical literature.

The NMFS-AFSC Technical Memorandum series of the Alaska Fisheries Science Center continues the NMFS-F/NWC series established in 1970 by the Northwest Fisheries Center. The NMFS-NWFSC series is currently used by the Northwest Fisheries Science Center.

PREFACE

This data report is one of three types of standard reports presenting data from the 2007 Gulf of Alaska groundfish survey conducted by the National Marine Fisheries Service (NMFS). The three standard reports are:

- 1) **Cruise Report** outlines the survey objectives; documents itinerary, personnel, and vessels employed; and summarizes major accomplishments.
- 2) **Report to Industry** is a fishing log consisting of raw haul and catch data for each haul made during the survey, catch summaries for the major species, catch per unit effort by haul, and gear specifications and diagrams.
- 3) **Data Report** (this document), contains detailed descriptions of the survey planning and operation, species distribution and abundance charts, length frequency plots, tables of estimated biomass, catch per unit effort, average weight and length estimates, length frequency plots, length-weight regression parameters, list of identified species, survey strata specifications and charts, and trawl descriptions and diagrams.

ABSTRACT

Scientists of the Groundfish Assessment Program of Alaska Fisheries Science Center's Resource Assessment and Conservation Engineering (RACE) Division conducted the fifth biennial groundfish assessment survey of the Gulf of Alaska during the summer of 2007. These surveys extend the series of surveys, previously conducted every three years between 1984 and 1999, which comprise the time series used in stock assessments of Gulf of Alaska groundfish resources. The survey area covered the continental shelf and upper continental slope to 1,000 m in the Gulf of Alaska from Islands of Four Mountains (170°W long.) to Dixon Entrance (132°40'W long.). The survey was conducted aboard three chartered commercial trawlers, the F/V *Gladiator*, F/V *Sea Storm*, and F/V *Vesteraalen*. Trawl haul samples were collected successfully at 820 survey stations using standard RACE Division Poly Nor'Eastern high-opening bottom trawl nets with rubber bobbin roller gear.

The primary survey objectives were to define the distribution and estimate the relative abundance of the principal groundfish within the survey area and to collect data to estimate biological parameters useful to groundfish researchers and managers including age, growth, length-weight relationships, feeding habits, and size, sex, and age composition. The survey also collected ancillary data requested by other research groups. A total of 185 fish and 415 invertebrate species were captured in survey tows. Arrowtooth flounder (*Atheresthes stomias*), Pacific ocean perch (*Sebastes alutus*), giant grenadier (*Albatrossia pectoralis*), Pacific halibut (*Hippoglossus stenolepis*), and walleye pollock (*Theragra chalcogramma*) were, in order, the

most abundant species within the survey area. Northern rockfish (*Sebastes polypinus*), Pacific cod (*Gadus macrocephalus*), sablefish (*Anoplopoma fimbria*), and flathead sole (*Hippoglossoides elassodon*) were locally abundant in some areas. Survey results are presented including estimates of catch per unit of effort, biomass, population size composition, and length-weight relationships, as well as charts depicting the distribution of catch for commercially important species encountered during the survey.

INTRODUCTION

The fifth biennial groundfish survey of groundfish and invertebrate resources of the Gulf of Alaska (GOA) was conducted during the summer of 2007 by the National Marine Fisheries Service's (NMFS) Alaska Fisheries Science Center (AFSC). Scientists from the Groundfish Assessment Program of AFSC's Resource Assessment and Conservation Engineering (RACE) Division in Seattle, Washington, were responsible for the survey's design and operations. The biennial regimen extends the series begun in 1984, previously conducted every three years between 1984 and 1999, that have provided an information time series of distribution, abundance, and biological characteristics of GOA groundfish resources.

In this report, we document the operations and results of the 2007 GOA bottom trawl survey. Results of routine analyses of distribution, relative abundance, size composition, and biological characteristics are shown for the principal groundfish species in each of the five International North Pacific Fisheries Commission (INPFC) statistical areas in the GOA: Shumagin, Chirikof, Kodiak, Yakutat, and Southeastern. These results provide stock assessment scientists and resource managers the most current information to be used for subsequent stock assessments. Only the 2007 survey results are presented and no comparisons are made to previous GOA surveys.

The survey objectives were to:

- 1) Delineate the distributions of major groundfish and commercially important invertebrate species inhabiting the continental shelf and upper continental slope of the GOA in depths \leq 1,000 m.
- 2) Collect data used to estimate the abundance of the major groundfish species.
- 3) Collect data on specific biological characters of interest to researchers and resource managers including:
 - size, sex, and age composition
 - growth and length-weight relationships
 - food habits
- 4) Collect specimens and related information for special research projects on behalf of researchers at the Resource Assessment & Conservation Engineering (RACE), Resource Ecology & Fisheries Management (REFM), and Auke Bay Laboratories divisions of the Alaska Fisheries Science Center, the Alaska SeaLife Center, Sheldon Jackson College, the International Pacific Halibut Commission, Oregon State University, and the Northwest Fisheries Science Center. The projects included:
 - A study of how the condition of Pacific ocean perch larvae is affected by the age and size of adult female spawners;
 - Taxonomic studies of snailfish, eelpouts, cephalopods, crab, and sand lance;
 - Genetic studies of Pacific ocean perch, ronquils, flatfishes, gadoids, forage fishes, and deepwater corals;
 - A study on the relative trophic levels of Pacific sleeper shark;

- A study of light levels at trawl stations;
- A study of marine mammal food habits;
- A seabird/fishery interaction study;
- A study of arrowtooth flounder seasonal energetics.

METHODS

Survey Area

The Gulf of Alaska forms the northeastern border of the Pacific Ocean and consists of complex bathymetric features ranging from jagged, mountainous pinnacles to flat, muddy areas. These features provide a variety of habitats resulting in a complex ecosystem mosaic (Fig. 1). Prevailing rough bottom conditions in many areas require the standard use of rubber bobbin roller gear for all bottom trawling operations. The 2007 GOA survey included the entire continental shelf and upper portion of the continental slope down as deep as the 1,000 m depth contour.

The total area the survey represents is approximately 320,000 km² (Table 1). The continental shelf, waters shallower than about 200 m and consisting of about 79% of the total Gulf of Alaska survey area, extends approximately 220 km (120 nautical miles (nmi)) off Cook Inlet and narrows to 40 km (22 nmi) off Dixon Entrance and 20 km (11 nmi) off the Islands of Four Mountains. Gullies intrude onto the shelf in many areas, extending from the upper slope to the inner shore. These gully areas make up about 16% of the total survey area. The outer shelf

is bordered by the continental slope, a region approximately 20 km in width, which descends steeply to the abyssal Aleutian Trench in the western and central GOA and to the Alaska Plain in the eastern GOA. The survey assessed only that portion of the slope between 200 and 1,000 m, an area of approximately 68,635 km². About 32% (101,489 km²) of the total survey area is within the Kodiak INPFC area (Table 1). The portion of the survey area contained within the Chirikof INPFC area and the Shumagin INPFC area are approximately equal at about 21% (68,053 km²) and 20% (65,228 km²), respectively, while the Yakutat INPFC survey area makes up about 18% (57,197 km²). The Southeastern INPFC survey area comprises the smallest portion, about 9% of the total survey area (28,038 km²).

Vessels

Since the inception of the Gulf of Alaska bottom trawl survey series in 1984, commercial trawlers and crew have been chartered to conduct the survey operations under the supervision and guidance of RACE Groundfish Assessment Program staff. Three vessels (occasionally two) have been chartered each year the survey has been done. Since these surveys generate quantitative data for a time series to describe trends in abundance, distribution, and population biology characteristics of managed resources, it is essential that standardized methods be maintained. Stringent standards for selecting charter vessels are specified whenever new charters are arranged to ensure that the sampling platforms can adequately collect samples and do so in as similar a manner as possible within and between years. As such, vessels and crews must meet minimum criteria in terms of size, main engine horsepower, fishing machinery, skipper and crew experience, and navigational and safety equipment. Continuity of suitable

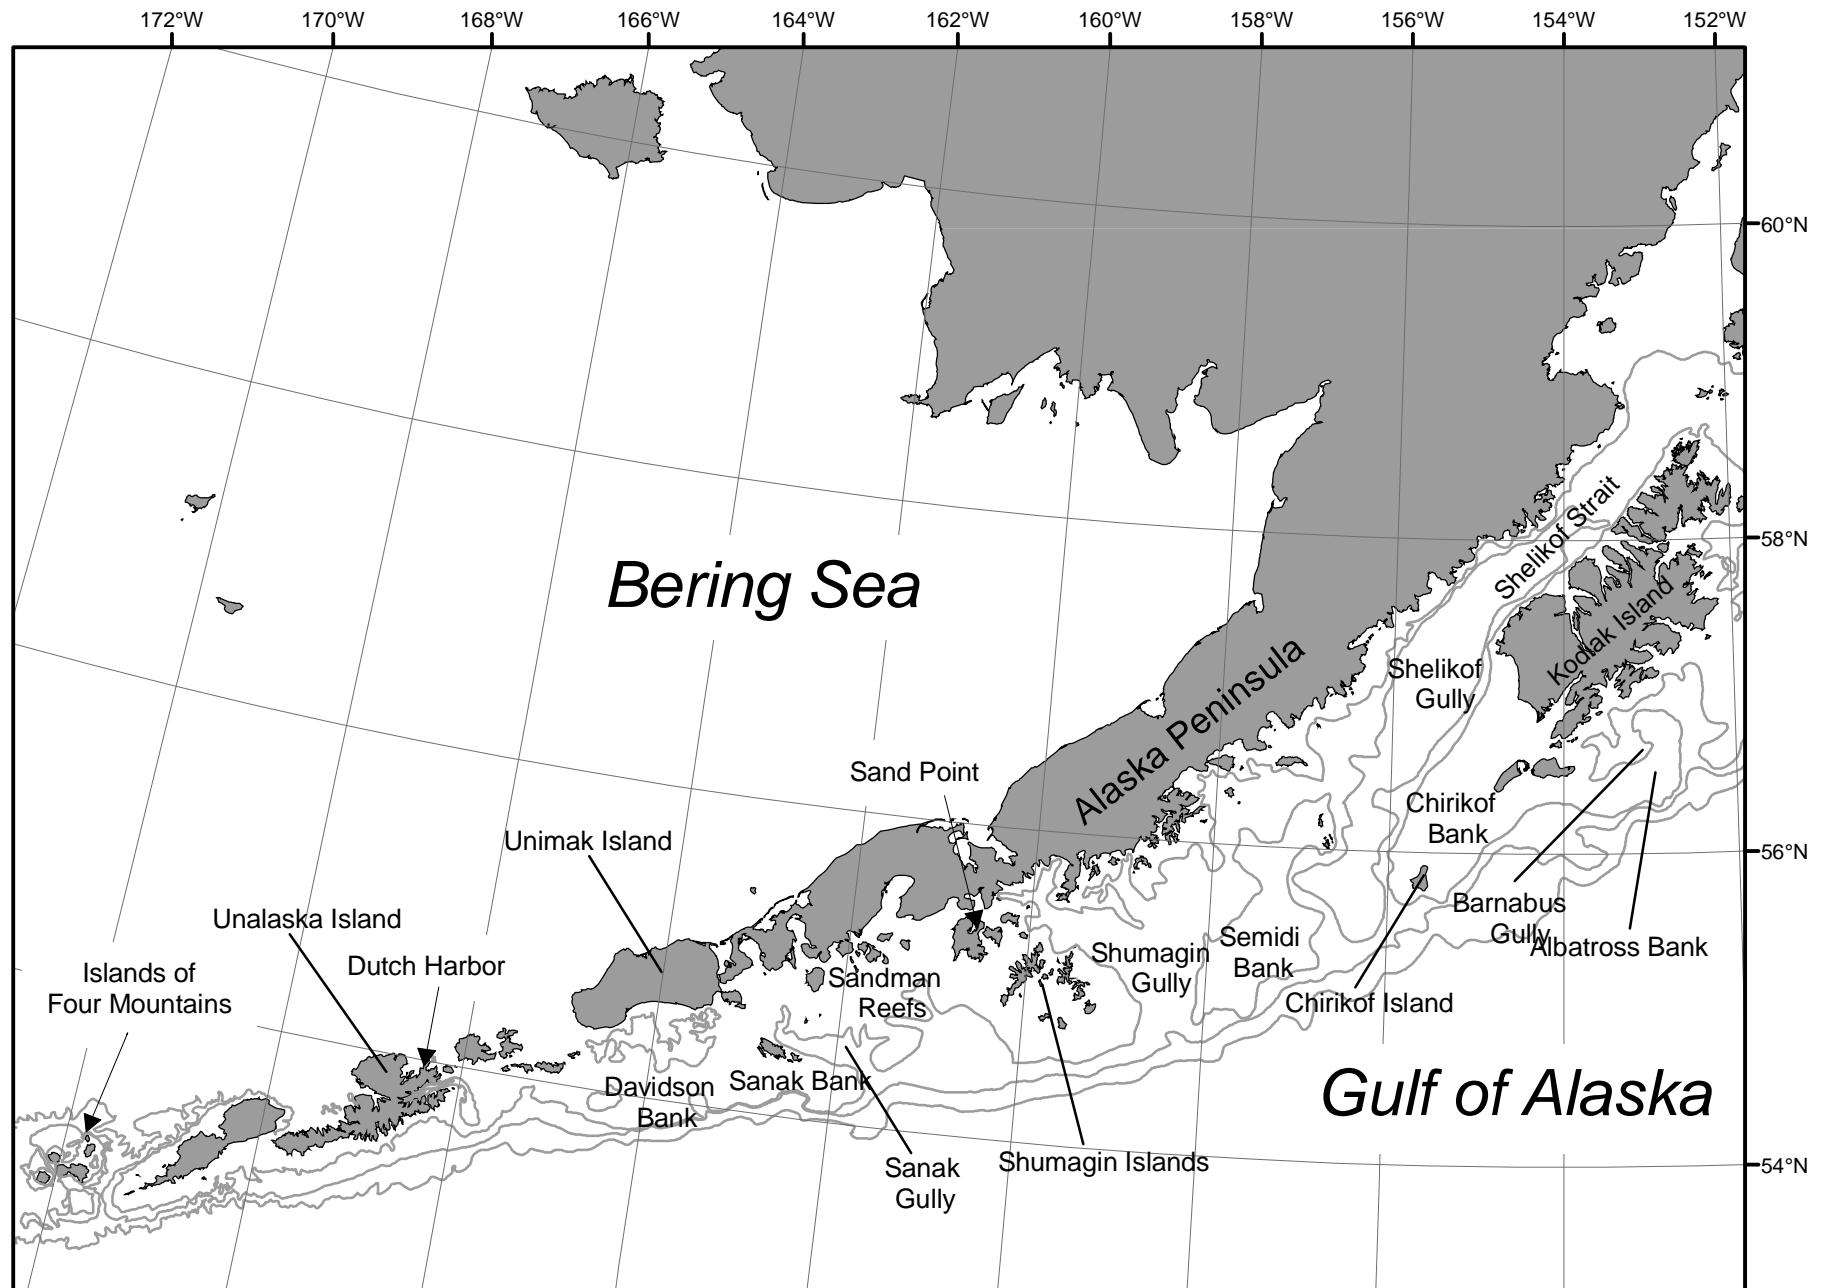

Figure 1.-- Bathymetric and geographic features of the survey area for the 2007 Gulf of Alaska biennial groundfish survey.

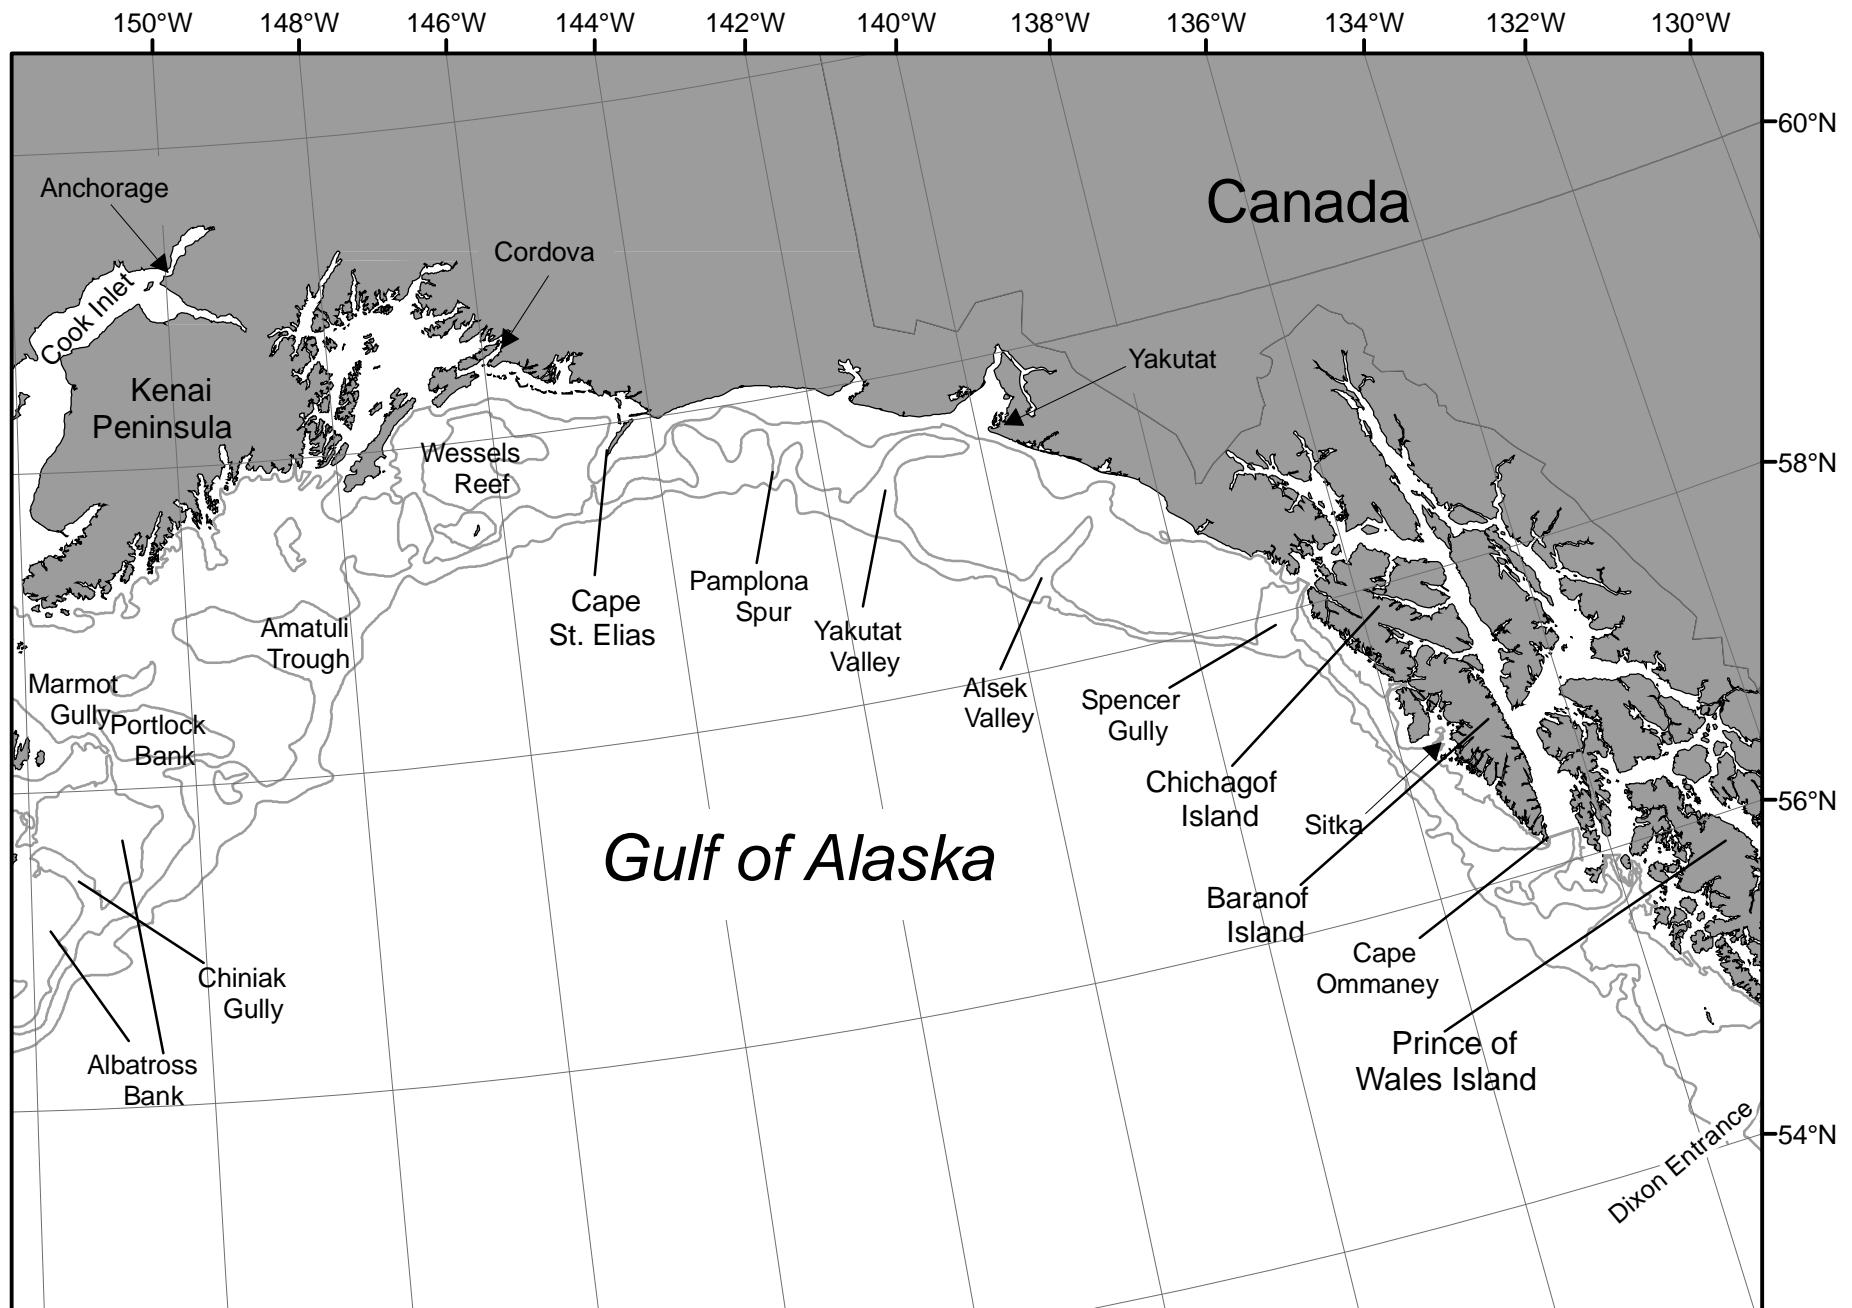

Figure 1. -- Continued.

platforms has been further enhanced in the past decade through the use of multi-year charters, assuring both the government and the contractors a stable planning situation for as much as four years at a time.

In 2007, three U.S. commercial fishing vessels, F/V *Gladiator*, F/V *Sea Storm*, and F/V *Vesteraalen* were chartered to conduct the Gulf of Alaska bottom trawl survey. All three vessels were house-forward stern trawlers with stern ramps; forward and aft net storage reels (mounted aft over the stern ramp and forward of the working deck); telescoping deck cranes; propeller nozzles; and paired, controlled-tension hydraulic trawl winches with 1,280 m, 1,460 m, and 2,200 m of 2.54 cm (*Gladiator*, *Sea Storm*, and *Vesteraalen*, respectively) diameter steel cable. The *Gladiator*, *Sea Storm*, and *Vesteraalen* are all 37.8 m in overall length (LOA) and powered by single 1,710 continuous HP main engines (1,725 HP on the *Vesteraalen*). The *Gladiator* was operated by Captain Ed French for the first and fourth legs and by Captain Buck Graham for the second and third legs. Captain Ken Sjong skippered the *Vesteraalen* for the first three legs, followed by Captain Tim Cosgrove on the final leg. The *Sea Storm* was operated by Captain Steve Branstiter for the first, second, and fourth legs, and by Captain Jerry Ellefson for the third leg. All vessels were equipped with GPS receivers with video position plotters, at least two radars, single sideband and VHF transmitter-receivers, color video fish-finders, paper recorder depth sounders, and autopilots.

Fishing Gear

The fishing gear and protocols for deployment are described in detail in Stauffer (2004).

All vessels used standard RACE Division Poly Nor'Eastern four-seam bottom trawls with 24.2 m roller gear constructed with 36 cm rubber bobbins separated by 10 cm rubber disks. The fishing dimensions of the trawls during deployment were monitored and recorded using Scanmar acoustic net mensuration equipment mounted on the wing-tips and headrope of the trawl. Each trawl and associated rigging was measured and certified as conforming to standard measurements prior to its use in the survey.

Survey Design

The 2007 biennial survey used stratified random sampling consistent with previous GOA surveys (Britt and Martin 2000, Martin and Clausen 1995, Stark and Clausen 1995, Munro and Hoff 1995). The Gulf of Alaska was divided into 59 strata defined by water depth, bottom terrain (e.g., shelf, gully, and slope), and INPFC statistical area (Appendix A). As in previous surveys, a modified Neyman optimal allocation strategy (Cochran 1977) catch rates from the 1990-2005 surveys was used to allocate effort among strata. Neyman optimum allocation calculations were made for each of the principal groundfish species for each previous survey year using the estimated time to perform a tow in a given stratum as the cost variable, since observations in deeper strata have a greater probability of unacceptable gear performance. A mean sample size was estimated for each species across years and then a weighted mean of the estimated sample sizes was calculated using each species's mean biomass multiplied by its ex-vessel value as the weighting variable. These numbers were rounded to whole numbers and represented the number of stations allocated to each stratum with the additional constraint that each stratum was required to have at least two samples.

The calculated number of stations was randomly selected without replacement from polygons formed from the intersection of a grid composed of cells 25 km² in area and the stratum boundaries. Since many of the polygons formed by this process are less than 25 km², the probability of selection was directly related to each polygon's area. Small polygons (less than 5 km² in area) were excluded from the pool available for assignment since a vessel would be unable to perform a valid tow within such a small area. To maximize efficient use of survey time and optimize fuel consumption, assignment of tows to vessels was non-random in the Central GOA where the shelf is nearly 200 km wide in places. In general, the *Vesteraalen* was assigned to sample the outer shelf and slope stations, the *Gladiator* the middle shelf stations, and the *Sea Storm* the near-shore stations. However, tows in all strata, with the exception of those between Kodiak Island and Cook Inlet, were assigned randomly between at least two boats.

We allocated 825 stations among the 59 strata. Geographic center points of the assigned station polygon were considered to define the location of the station. Vessels were assigned stations and were directed to thoroughly search each area using echosounder returns to locate sufficient trawlable bottom to perform a successful 15-minute tow, preferably through the center point. If trawlable bottom could not be found in the immediate area of the assigned point, a suitable location within the station polygon was sought. If, in the judgment of the field party chief and skipper, no trawlable grounds could be found within the polygon within 2 hours, a nearby alternate station was selected from successful tows completed during previous GOA surveys. If sufficient trawlable bottom was encountered while transiting to the alternate site, this location was instead selected for the sample.

Data Collection Techniques

The protocols used by the AFSC's RACE Division for conducting bottom trawl surveys have been standardized (Stauffer 2004). Criteria for a successful tow include maintaining a continuous vessel speed of 3 knots (5.56 m/sec) while keeping the net in contact with the bottom and in fishing configuration for 15 minutes. Occasionally, tows of shorter duration were necessary to avoid obstacles (and, hence, net damage) or when net configuration (e.g., reduced wing spread) indicated that an exceptionally large catch was affecting the performance of the trawl. The track of the vessel was recorded every 2 seconds during each tow using the vessel's global positioning system (GPS). Pressure at depth, water temperature, and time were recorded every 3 seconds during most tows using a Seabird SBE-39 bathythermograph placed on the headrope of the net. The vertical and horizontal net openings were monitored with Scanmar net mensuration equipment. Scanmar net spread data were generally not collected for tows over extremely rough bottom so as not to risk losing the instruments. Backup surface water temperatures were measured at most stations with a bucket thermometer. To minimize fishing power differences between the survey vessels, standardized trawling and gear handling methods were practiced including the use of scope ratio tables (trawl warp relative to bottom depth) and maintaining a 3-knot trawling speed.

A trawl sample was considered successful if horizontal and vertical net openings remained within established tolerances, the roller gear maintained consistent contact with the bottom, the net suffered little or no damage during the tow, and there were no conflicts with derelict fishing gear. Trawl samples were considered unsuccessful when the field party chief

judged that the catch was affected by trawl damage, an unstable trawl configuration, insufficient bottom contact, in the event the duration of the tow was less than 10 minutes.

Collection and Processing of Samples

Catches were sorted to species or other appropriate taxonomic levels and then weighed in aggregate using an electronic monion-compensating scale. Catches weighing less than approximately 1,000 kg were emptied directly onto a sorting table, sorted by species, and weighed to the nearest 0.1 kg using a Marel model M1100 digital scale. Species groups weighing less than about 2 kg were generally weighed to the nearest 2 g on a Marel model M60 digital scale. Larger catches were processed in like manner by iteratively filling the sorting table from the codend, sorting, and weighing until the entire catch had been processed. Alternatively, the total weight of the catch was weighed with Measurement Systems International Portaweigh Model 4300 crane scale and the sorting table was filled with a portion of the catch. The excess catch was dumped into a deck bin and the one-three dominant species making up the bulk of the catch were identified. The contents of the deck bin were sorted, discarding the predominant species and retaining the non-dominant species, which were sorted and weighed with those from the table. Total weight estimates for the predominant species were calculated by expanding their proportion by weight from the sorted sample to the difference between the total catch weight and the total weight of all non-dominant species. Pacific halibut were measured and discarded as promptly as possible and their weights were estimated from the length data. Numbers and weights of all taxa were estimated for each haul.

Additional biological information was recorded from individuals of species of commercial value, ecological importance, or abundance in the survey area. A random subsample of 100-300 individuals (target subsample size was species-dependent) of each of these species identified in the catch was sorted by sex and individual fork lengths (FL) were measured using Polycorder (Omnidata) data loggers with barcode readers and barcoded length strips. Fish that could not be readily sexed were classified as unsexed and measured. Age structures were collected from randomly selected samples of walleye pollock (See Appendix Table B-1 for scientific names of fish species) and stratified samples (by area, sex, and size) of other target species. Every attempt was made to distribute the age specimen collections over the entire survey area. Individuals sampled for age were measured to the nearest 1 cm (FL) and weighed to the nearest 2-5 g (scale accuracy depends on the weight of the specimen) with a Marel model M60 scale.

Stomach samples for selected species were collected throughout the survey area by biologists from the AFSC's Resource Ecology and Ecosystem Modeling (REEM) Program aboard the *Vesteraalen*. In addition, stomach samples for selected species were scanned for their content aboard the *Sea Storm* by REEM staff. Ancillary data and specimens including whole specimens, ovaries, a variety of tissues, and acoustic data, were collected for several other research projects including a study of how size and age of adult female Pacific ocean perch effect the condition of their larvae, taxonomic studies of snailfish, eelpouts, cephalopods, crabs, and sand lance, genetic studies of Pacific ocean perch, ronquils, several species of flatfishes, gadoids, forage fishes, and deepwater corals. Additional studies included a Pacific sleeper shark

study on relative trophic levels, studies of light level variability, marine mammal food habits, seabird abundance, and the seasonal energetics of arrowtooth flounder.

Abundance, Size composition, and Length-Weight Relations

Biomass estimates were calculated using the area-swept method (Alverson and Pereyra 1969). The area swept was calculated as the product of estimated distance towed by the estimated mean net spread for each tow. The distance towed was assumed to be represented by the distance traveled over ground by the vessel between the time when the footrope came into contact with the bottom (on-bottom) and the time when the center of the footrope left the bottom (off-bottom). The distance traveled by the vessel was estimated by smoothing the GPS location data and measuring the distance along this line. The mean net spread was estimated by averaging the smoothed net spread readings from the Scanmar units between on-bottom and off-bottom positions. Net spreads for tows for which there were insufficient or no Scanmar readings were estimated by a stepwise generalized additive model using net number, net height (when available), mean speed over ground (when available), depth, total catch and the actual scope/expected scope ratio as variables. For each species, catch-per unit effort (CPUE) was calculated as catch weight (kg) per area swept by the trawl in hectares (ha). Mean CPUE was calculated, including zero catches, within each stratum. Mean CPUE values of combined strata were calculated as the weighted average of the component strata CPUE means weighted by stratum area. Biomass estimates were calculated by multiplying each stratum mean CPUE by the stratum area and summing the results to obtain estimates by INPFC statistical areas and

depth intervals. The 95% confidence interval was calculated for each species biomass estimate. A detailed description of the analytical procedures is presented in Wakabayashi et al. (1985).

Population length compositions were estimated by expanding the length-frequency to the total catch for each species by length and sex category at each station (Wakabayashi et al. 1985). The stratum population within a sex-length category was calculated by multiplying the stratum population by the proportion of fish in that category from the summed station data. Population size composition estimates were summed over strata to derive estimates by area.

Individual length and weight measurements were used to establish length-weight relationships. The length-weight allometric relationship was expressed as:

$$W = a * L^b,$$

where W is weight (in grams), L is length (in mm), and a and b are the fitted parameters from a non-linear least squares regression.

Survey Limitations

Due to the nature of this survey, there are some limitations in its ability to estimate fish abundance across all species. Obviously, populations whose entire depth range is not covered by the survey are not fully sampled (e.g., sablefish, shortspine thornyhead). Populations that extend into areas untrawlable with the survey gear are not fully represented (e.g., many rockfish species). Populations of species that exhibit a highly contagious distribution pattern (e.g., Atka mackerel and Pacific ocean perch) or are highly restricted in the amount of available habitat in the Gulf of Alaska (e.g., yellowfin sole and starry flounder) would be better sampled with a different survey design. For these reasons, estimates of abundance are considered more reliable for species that are widely and more uniformly distributed from this survey.

Estimates of fish abundance within the survey area are routinely represented as absolute biomass estimates. These estimates make the assumption that 100% of the fish within the path of the trawl are captured. In fact, the situation is much more complex. As with any fishing gear, the survey trawl exhibits size selectivity (e.g., fish small enough to pass through the net mesh are not sampled well, or larger fish may be able to outswim the trawl, at least for a short time). Fish are herded into the path of the trawl by the doors and the bridles in front of the trawl. Some fish escape under the footrope of the net. The rate of herding and escapement depend upon several factors including the species, water temperature, and the speed of the vessel. This is an active area of research at the AFSC (Munro and Somerton, 2002; Somerton and Weinberg 2000; Somerton and Munro, 2001). Given these limitations, survey abundance estimates are probably

best considered as relative measures of abundance and are used to monitor trends across the time series.

RESULTS

Out of a total of 892 attempted tows, 820 (92%) were completed successfully at allocated survey stations and were included in the biomass and size composition analysis (Table 1). Three of the originally allocated stations were never occupied due to lack of time. Net spread measurements were successfully collected for 821 tows (96%). Headrope depth and temperature measurements were successfully collected for 809 tows (95%). Bottom temperatures ranged from 2.3° to 11.2°C. Sea surface temperatures were successfully collected at 847 stations (99+) (%) and ranged from 3.2° to 15.1°C.

Net height and spread were measured for all but 27 survey hauls (for these hauls net dimensions were estimated from other bottom trawl hauls). Net spread on average ranged from 13.4 to 19.5 m. Average net heights of successfully completed tows ranged from 3.9 to 8.9 m. Temperatures were successfully recorded for all but 38 tows. Average bottom temperatures ranged from 0. °C to 11.2°C. Sea surface temperatures ranged from 3.2° to 15.1°C.

Table 1. -- Number of stations allocated, attempted, and successfully completed and sampling density for the 2007 Gulf of Alaska biennial bottom trawl survey by International North Pacific Fisheries Commission statistical areas and depth intervals.

Catch Results by Area

At least 185 fish species from 40 families were captured during the 2007 survey.

Appendix B presents lists of fish (Appendix B-1) and invertebrate (Appendix B-2) species encountered during the survey. Relative abundance estimates, reported as CPUE, are presented in Table 2 for the 20 most abundant groundfish species in each of the five INPFC areas.

Over the entire survey area, arrowtooth flounder was the most abundant groundfish encountered during the survey (Table 2). Arrowtooth flounder had the highest CPUE of any species in four of the five INPFC areas and had the second highest CPUE in the Yakutat area. Pacific ocean perch, giant grenadier, Pacific halibut, and walleye pollock were also very important components of the Gulf-wide species composition.

In the Shumagin INPFC area, arrowtooth flounder had by far the greatest CPUE of any species. Giant grenadier, Pacific ocean perch, northern rockfish, Pacific cod, Pacific halibut and walleye pollock were also relatively abundant in this area. In the Chirikof INPFC area, arrowtooth flounder completely dominated all other species in terms of CPUE. Giant grenadier, northern rockfish, walleye pollock, Pacific halibut, flathead sole, and Pacific ocean perch were also important components of the species composition. In the Kodiak INPFC area, arrowtooth flounder was by far the dominant component of the groundfish CPUE. Pacific ocean perch, Pacific halibut, and giant grenadier were also relatively abundant in this area. In the Yakutat INPFC area, spiny dogfish and arrowtooth flounder were the two dominant species. The mean CPUEs of both species were more than twice that of the next two most abundant species: Pacific halibut and Pacific ocean perch. In the Southeastern INPFC area, arrowtooth flounder again

predominated with a mean CPUE almost three times that of the next most abundant groundfish, Pacific ocean perch. Pacific halibut, spotted ratfish, and walleye pollock were also important catch components.

Table 2. -- Mean CPUE (kg/ha) for the 20 most abundant groundfish in each International North Pacific Fisheries Commission area during the 2007 biennial Gulf of Alaska bottom trawl survey.

Catch Results by Species

For each commercially or ecologically important species, the following information is presented:

1. A brief synopsis of the data collected.
2. A table presenting the number of hauls, the number of hauls with catch, mean CPUE, estimated biomass with 95% confidence intervals, and mean weight of that species by INPFC area and depth.
3. A figure showing the distribution and relative abundance of that species.
4. A figure showing the estimated size composition of the population for that species.
5. CPUE and biomass estimates (with 95% confidence intervals) by stratum for that species.

For other species that were locally abundant (other flatfish and other rockfish, skates, capelin, eulachon, and Pacific hake), only items 1, 2, and 6 above are presented.

The scientific names follow the fifth edition of the Common and Scientific Names of Fishes from the United States and Canada (Robins et al. 1991). The exceptions to this are in the orders Pleuronectiformes (flatfish) and Scorpaeniformes (rockfish) scientific names. The names used throughout this report reflect recent reexamination of the phylogeny of these orders (Berendzen 1997, Cooper and Chapleau 1998, Ivankov 1996, Orr and Matarese 2000, Rass 1996, Orr and Blackburn 2004, Orr and Hawkins 2008).

FLATFISHES

Arrowtooth flounder (*Atherestes stomias*)

Arrowtooth flounder was the most abundant species caught in the 2007 survey (Table 2) with the highest mean CPUE in four out of the five INPFC areas. Arrowtooth flounder were caught throughout the survey area at all depths less than 700 m, occurring in 89% of tows at these depths, including 98% of the tows at depths between 101 and 500 m. The highest densities occurred on the broad continental shelf in the Kodiak and eastern Chirikof INPFC areas, especially on the Shelikof Edge and in the area northeast of Kodiak Island (Fig. 2 and Table 4). Mean densities were uniformly low on the continental slope at depths greater than 500 m and essentially zero at depths greater than 700 m. Length data were collected from almost 63,000 specimens. Mean weight generally increased with depth (Table 3), as fish less than 30 cm FL were relatively rare at depths greater than 300 m (Fig. 3). A distinct length mode around 40 to 45 cm for males occurred at depths between 101 and 200 m in the Yakutat and Southeastern INPFC areas and in all INPFC areas at depths between 201 m and 500 m except in the Chirikof INPFC area between 201 and 300 m. In addition, a length mode for females around 50 cm occurred in all INPFC areas between 201 and 500 m except in the Shumagin INPFC area between 201 and 300 m. The arrowtooth flounder population in the survey area was dominated by females, which accounted for approximately 68% of the total estimated population.

Table 3. -- Number of survey hauls, number of hauls with arrowtooth flounder, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Pacific halibut (*Hippoglossus stenolepis*)

Pacific halibut was the fourth most abundant species caught in the 2007 survey (Table 2) with the third highest mean CPUE in three out of the five INPFC areas. Pacific halibut were particularly abundant at depths less than 100 m where they were caught in approximately 97% of the tows, and 68% of the estimated halibut biomass was found at these depths. The highest CPUEs were found at this depth range in all INPFC areas except in the Yakutat area where the highest CPUEs were in the 101-200 m range. The frequency of occurrence of Pacific halibut in tows decreased from west to east, ranging from about 90% of the tows in the Shumagin INPFC area to 48% of the tows in the Southeastern INPFC area. The highest densities were recorded in the Southeastern Shallows to the west of Prince of Wales Island, on the Fairweather Shelf in the Yakutat area, on Albatross Banks northeast of Kodiak Island, and on the Shumagin Bank north of the Shumagin Islands (Fig. 4 and Table 6). The mean weight of Pacific halibut was highest at depths between 201 and 300 m in the Shumagin and Chirikof areas, and between 301 and 500 m in the Kodiak, Yakutat, and Southeastern INPFC areas (Table 5). A pronounced length mode around 60 cm was noted in the shallowest depth zone of the Southeastern INPFC area, whereas two more moderate length modes around 38 and 55 cm were noted in depths less than 100 m in the Shumagin area (Fig. 5).

Table 5. -- Number of survey hauls, number of hauls with Pacific halibut, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

INPFC area	Depth (m)	Number of hauls	Hauls with catch	Mean CPUE (kg/ha)	Estimated biomass (t)	Lower 95% biomass CI (t)	Upper 95% biomass CI (t)	Mean weight (kg)

Flathead sole (*Hippoglossoides elassodon*)

Flathead sole was the sixth most abundant species caught in the 2007 survey (Table 2). The population was primarily concentrated in bays around Kodiak Island and along the Alaska Peninsula, with 97% of the estimated biomass in waters less than 200 m deep and the remainder at depths between 201 and 300 m (Fig. 6 and Tables 7-8). Although the mean CPUE was considerably higher in the West Shumagin Gully, the lower Alaska Peninsula, and Albatross Shallows than in any of the other strata, the biomass of flathead sole was not predominant in any individual stratum. Only about 9% of the estimated biomass was found in the Yakutat and Southeastern INPFC areas even though they account for 27% of the total survey area. The mean weight of flathead sole did not exhibit a consistent correlation with depth among the individual INPFC areas, but over the entire survey area the mean weight increased somewhat with increasing depth (Table 7). The length frequency data did not exhibit a consistent length mode for either males or females in the different INPFC areas or depth ranges, but over the entire survey area and across all depth ranges a relatively broad length mode occurred between approximately 30 and 35 cm for males and between approximately 32 and 38 cm for females. A distinct length mode around 35 cm occurred in the 101 to 200 m depth range for males in the Kodiak and Yakutat INPFC areas and in the shallowest depth zone for females in the Yakutat area (Fig. 7). The sex ratio for flathead sole was relatively even with males comprising approximately 47% of the population.

Southern rock sole (*Lepidopsetta bilineata*)

The southern rock sole population was primarily confined to water depths less than 100 m in the Shumagin, Chirikof, and Kodiak INPFC areas, with the highest concentrations in bays around Kodiak Island and around the Shumagin Islands (Table 10 and Fig. 8). Ninety percent of the southern rock sole biomass occurred in these areas even though they comprise only 33% of the total survey area (Table 9). The CPUEs ranged from zero to very small throughout the Yakutat and Southeastern areas except in the Southeastern Shallows off of Sitka where a relatively high abundance was found. A consistent length mode around 35 cm for males occurred in the shallowest depth zone of the Shumagin, Chirikof, and Kodiak INPFC areas (Fig. 9). The corresponding length mode for females in these areas was around 40 cm. The southern rock sole population in the survey area was dominated by females, which accounted for approximately 70% of the total estimated population.

Table 9. -- Number of survey hauls, number of hauls with southern rocksole, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

INPFC area	Depth (m)	Number of hauls	Hauls with catch	Mean CPUE (kg/ha)	Estimated biomass (t)	Lower 95% biomass CI (t)	Upper 95% biomass CI (t)	Mean weight (kg)

Northern rock sole (*Lepidopsetta polyxystra*)

The Northern rock sole population was almost exclusively confined to depths less than 100 m in the Shumagin, Chirikof, and Kodiak INPFC areas, where approximately 93% of the total biomass was found (Tables 11-12 and Fig. 10). Northern rock sole were extremely rare east of 150°W (Fig. 10). Approximately 63% of the total biomass was concentrated in the shallowest depth zone of the Shumagin INPFC area, which comprises less than 13% of the total survey area. Northern rock sole occurred in approximately 94% of the tows in this area and depth range. A very distinct length mode around 30 cm for both males and females occurred at depths less than 100 m in the Shumagin INPFC area (Fig. 11). The length modes were less pronounced in the Chirikof and Kodiak areas for both males and females but occurred at approximately 35 cm for males and 40 cm for females. Females were considerably more abundant in the survey area and accounted for approximately 60% of the northern rock sole population.

Table 11. -- Number of survey hauls, number of hauls with northern rocksole, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Rex sole (*Glyptocephalus zachirus*)

The rex sole population was widely distributed throughout the survey area, occurring in 51 of the 54 strata shallower than 700 m deep. No catches were recorded in the 701 to 1000 m strata (Fig. 12 and Tables 13-14). Although large catches of rex sole were rare, they were present in approximately 86% of the tows between 101 and 500 m (Table 13). The mean weight of rex sole was substantially greater in the three westernmost INPFC areas than in the Yakutat and Southeastern INPFC areas. Although the smallest fish were generally found in the shallowest depth zone, there was not a consistent trend of increasing fish size with increasing depth at deeper depths (Table 13). The length frequency data did not exhibit a consistent length mode for either males or females in the different INPFC areas or depth ranges. A much higher fraction of large fish (greater than 40 cm FL) of both sexes occurred in the Shumagin, Chirikof, and Kodiak INPFC areas than in the Yakutat and Southeastern INPFC areas. A distinct length mode around 20 cm FL occurred in the shallowest depth zone for both males and females in the Southeastern INPFC area, and at 30 cm FL in the 101 to 200 m depth range (Fig. 13). The sex ratio for rex sole was even with females comprising approximately 51% of the population.

Dover sole (*Microstomus pacificus*)

The Dover sole population was distributed throughout the survey area and depth range and was caught in relatively modest numbers in 57 of the 59 survey strata (Fig. 14 and Tables 15-16). Although large catches of Dover sole were rare, they were present in approximately 87% of the tows at depths greater than 200 m (Table 15). The highest mean CPUEs were generally recorded at depths between 200 and 700 m south and southwest of Kodiak Island as well as due south of the Kenai Peninsula, but the highest densities were recorded on the Baranof-Chichagof Slope and the Southeastern Deep Gullies, both in the Southeastern INPFC area. The mean weight of Dover sole generally decreased from west to east. Although the smallest fish were in the shallowest depth zone, there was not a consistent trend of increasing fish size with increasing depth at deeper depths (Fig. 15 and Table 15). Males were considerably more abundant in the survey area, especially at water depths between 301 and 500 m where they were predominant. Overall, males comprised approximately 58% of the population.

Table 15. -- Number of survey hauls, number of hauls with Dover sole, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Yellowfin sole (*Limanda aspera*)

Yellowfin sole were locally abundant in bays around Kodiak Island and the Alaska Peninsula near the Shumagin Islands, but were not widely distributed in the survey area. Yellowfin sole were caught in only nine of the 59 strata, all but one of which were near shore in the shallowest depth zone (Fig. 16 and Tables 17-18). The highest mean CPUEs were noted in the Northern Kodiak Shallows and on the lower Alaska Peninsula (Table 18). These two strata accounted for approximately 75% of the survey area's biomass estimate despite comprising only 2.8% of the survey area. The sex ratio for yellowfin sole was approximately even, with females comprising approximately 53% of the population.

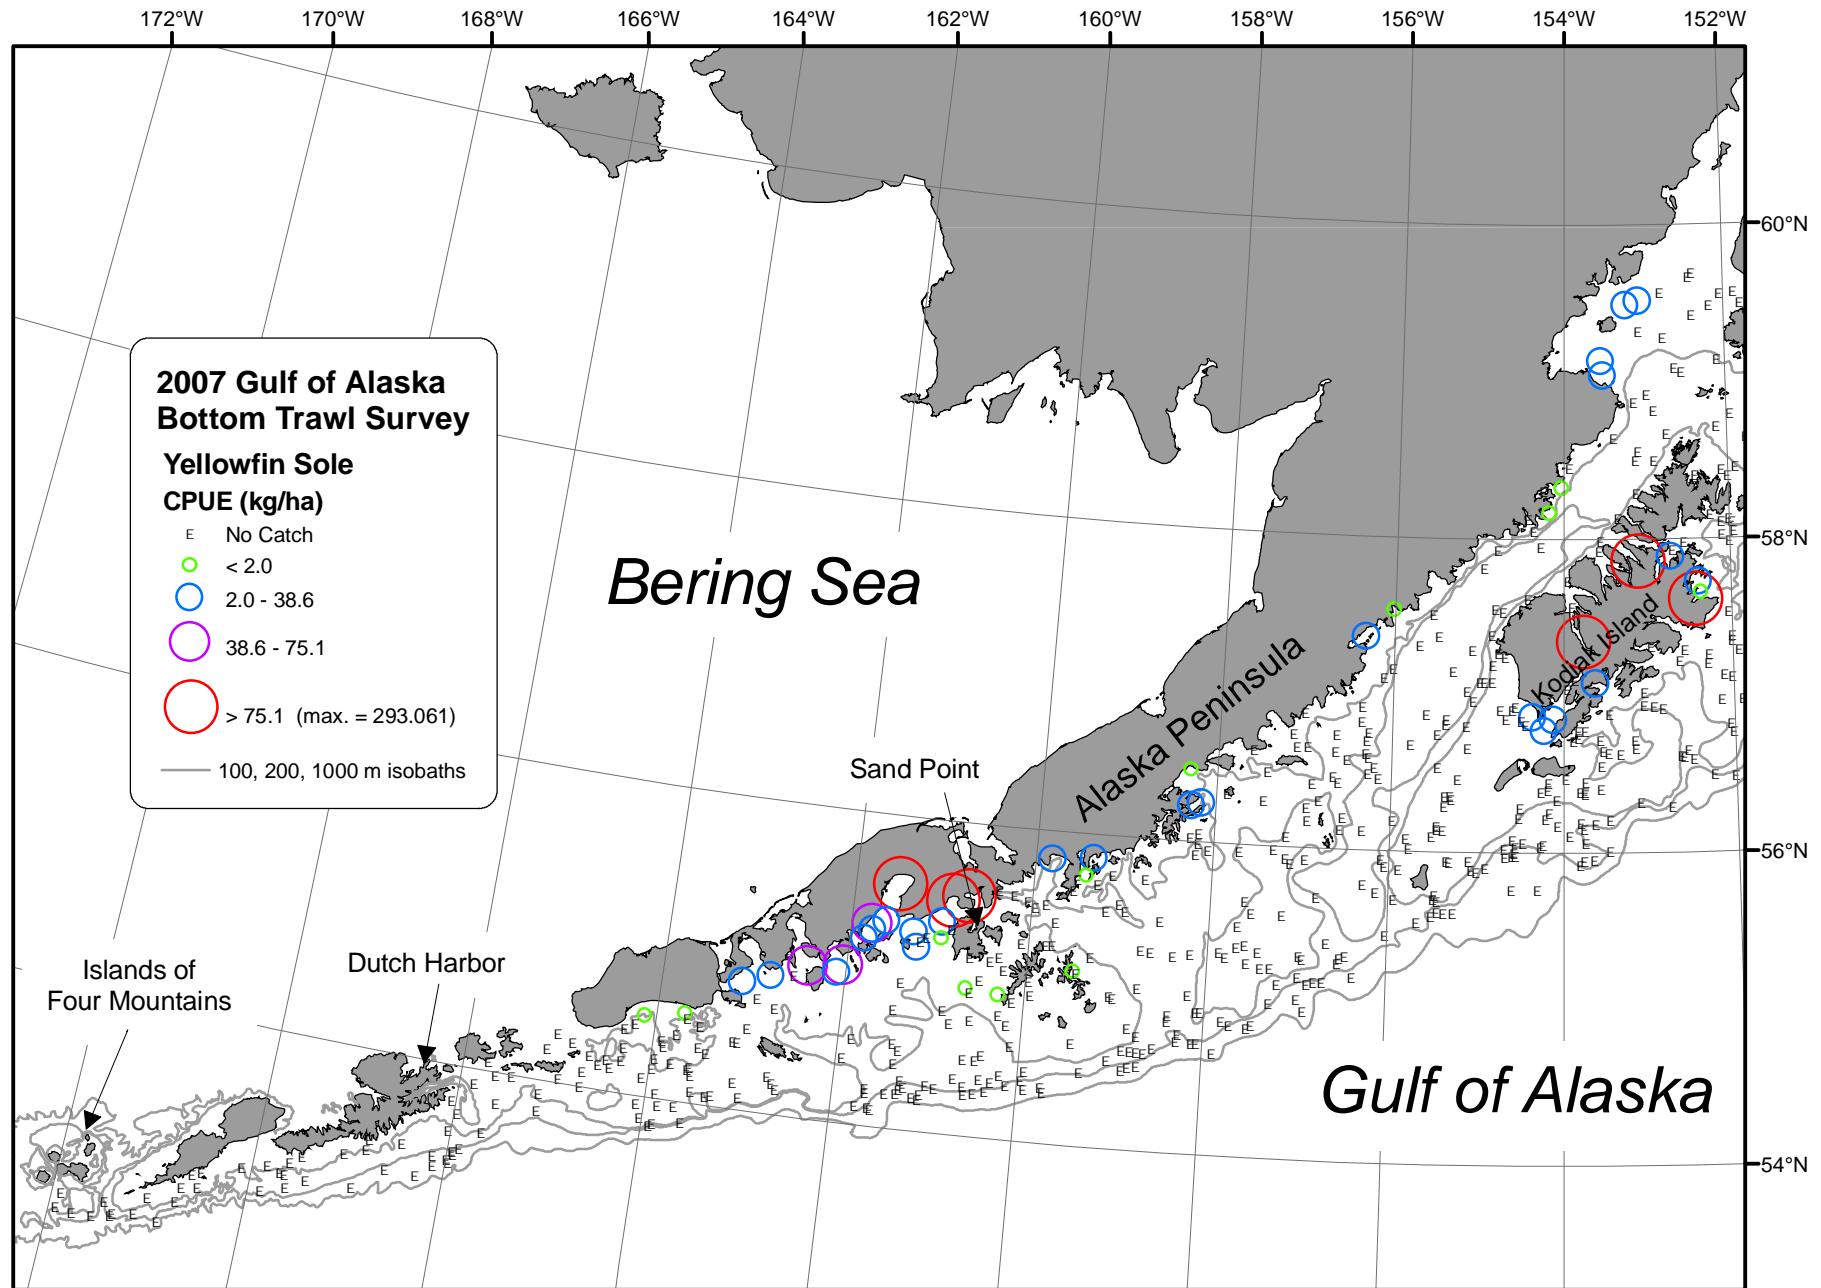

Figure 16. -- Distribution and relative abundance of yellowfin sole from the 2007 Gulf of Alaska bottom trawl survey. Relative abundance is categorized by no catch, sample CPUE less than the mean CPUE, between the mean CPUE and two standard deviations above the mean, between two and four standard deviations above the mean, and greater than four standard deviations above the mean.

Figure 16. -- Continued (yellowfin sole 2007).

Table 18. -- Catch per unit of effort by stratum for yellowfin sole sorted by descending CPUE for the 2007 Gulf of Alaska bottom trawl survey.

INPFC area	Depth range	Stratum name	Number of hauls	Hauls with catch	CPUE (kg/ha)	Biomass (t)	Lower CI biomass	Upper CI biomass
Kodiak	1 - 100	Northern Kodiak Shallows	9	2	46.48	10,225	0	26,054

Other Flatfishes

Alaska plaice (*Pleuronectes quadrituberculatus*)

Approximately 80% of the estimated biomass of Alaska plaice in the survey area came from the shallowest depth zone of the Upper and Lower Alaska Peninsula strata, which together comprise only 4.6% of the total survey area (Tables 19-20). Modest densities were also recorded in the shallowest depth zone of the Northern Kodiak Shallows and the Albatross Shallows in the Kodiak area. No Alaska plaice were caught in the Yakutat or Southeastern INPFC areas.

Starry flounder (*Platichthys stellatus*)

Catches of starry flounder were almost exclusively confined to water depths less than 100 m in all INPFC areas except Southeastern (Table 21). The highest densities were recorded in the Middleton Shallows in the Yakutat area, along the Alaska Peninsula, and in Cook Inlet (Table 22).

English sole (*Parophrys vetulus*)

Approximately 60% of the estimated biomass of English sole in the survey area came from three strata (Middleton Shallows, East Shumagin Gully, and Southeastern Shallows) in three of the five INPFC areas (Yakutat, Chirikof, and Southeastern), which together comprise only 7.6% of the survey area (Table 24). Densities ranged from small to relatively modest everywhere where English sole were caught, and almost the entire population was confined to depths less than 200 m (Table 23). Mean weight generally increased with depth.

Butter sole (*Isopsetta isolepis*)

Approximately 53% of the estimated biomass of butter sole in the survey area came from the Lower Cook Inlet stratum (Table 26). Densities ranged from small to relatively modest everywhere where butter sole were caught, and almost the entire population was confined to depths less than 100 m (Table 25). Catches of butter sole were recorded in all INPFC areas except Southeastern.

ROUNDFISHES

Walleye pollock (*Theragra chalcogramma*)

Walleye pollock was the fifth most abundant species caught in the 2007 survey (Table 2). Pollock were caught throughout the survey area in 52 of the 59 survey strata and at all depths less than 700 m (Fig. 17, Table 27). They were most abundant at depths less than 300 m, where they occurred in 73% of the tows, including 92% of the tows at depths between 201 and 300 m (Table 27). The highest densities occurred in bays around Kodiak Island and the Alaska Peninsula, with particularly high CPUEs recorded in the Albatross Shallows (Table 28). Mean weight increased with depth to 500 m in three of the five INPFC areas (Shumagin, Yakutat, Southeastern), but there was no consistent trend in mean weight with depth in the Chirikof and Kodiak areas. A distinct length mode of juveniles (both males and females) occurred around 20 cm at depths less than 200 m in the Yakutat INPFC area and at approximately 15 cm in the Shumagin, Chirikof, and Kodiak INPFC areas. The corresponding mode in the Southeastern area was not as well-defined as in the other areas but occurred at approximately 20 cm (Fig. 18). Other notable length modes occurred at approximately 40 to 45 cm (females at the higher end of the range) in the 201 to 300 m depth range of the Yakutat and Southeastern areas and at approximately 50 to 55 cm (again, with females at the higher end of the range) in the Shumagin area. There were no prominent length modes at this depth range the Chirikof and Kodiak INPFC areas. The sex ratio of the walleye pollock population in the survey area was relatively even, with females comprising approximately 54% of the total estimated population.

Pacific cod (*Gadus macrocephalus*)

Pacific cod was the seventh most abundant species caught in the 2007 survey (Table 2). Cod were caught throughout the survey area in 40 of the 59 survey strata at depths less than 300 m, although CPUEs were low at depths greater than 200 m (Fig. 19, Table 30). Approximately 63% of the survey-wide biomass was estimated to be at depths less than 100 m. Cod occurred in about 74% of the tows at this depth range. Ninety-six percent of the total Pacific cod biomass was estimated to be in the central and western Gulf of Alaska with very low densities in the Yakutat and Southeastern INPFC areas (Table 29). The highest densities were recorded around the Shumagin Islands and near the western end of the Alaska Peninsula (Fig. 19). Mean weight generally increased with depth in all areas. Distinct length modes (both males and females) at depths less than 100 m occurred around 20 cm in the Kodiak area and at approximately 30 and 40 cm in the Southeastern and Shumagin areas, respectively (Fig. 20). The sex ratio of the Pacific cod population in the survey area was even with males and females each accounting for approximately 50% of the total estimated population.

Table 29. -- Number of survey hauls, number of hauls with Pacific cod, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Atka mackerel (*Pleurogrammus monopterygius*)

Approximately 98% of the estimated Atka mackerel population was caught in the Shumagin INPFC area where local abundance was relatively high near the Islands of Four Mountains and around the western end of the Alaska Peninsula (Fig. 21 and Tables 31- 32). Almost the entire population was confined to depths less than 200 m with about 86% in waters less than 100 m. Atka mackerel were caught in about 23% of tows at depths less than 200 m in the Shumagin INPFC area. No Atka mackerel were caught east of the Kenai Peninsula. It appears that Atka mackerel segregated by depth with males dominant at depths less than 100 m and females dominant at depths between 101 and 200 m. Most of the fish captured were longer than 40 cm FL (Fig. 22). The sex ratio of the Atka mackerel population in the survey area was dominated by males, which comprised approximately 58% of the total estimated population.

Table 31. -- Number of survey hauls, number of hauls with Atka mackerel, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

INPFC area	Depth (m)	Number of hauls	Hauls with catch	Mean CPUE (kg/ha)	Estimated biomass (t)	Lower 95% biomass CI (t)	Upper 95% biomass CI (t)	Mean weight (kg)

Sablefish (*Anoplopoma fimbria*)

Sablefish was the ninth most abundant species caught in the 2007 survey (Table 2). They were caught throughout the survey area in 54 of the 59 survey strata and at all depths. Sablefish occurred in 90% of tows in waters deeper than 200 m, including all tows deeper than 500 m, and 91% of the estimated biomass was recorded at depths deeper than 200 m (Fig. 23, Table 33). CPUEs were consistently highest in the slope strata of all INPFC areas (Table 34). Mean weight generally increased with depth in all areas to 500 m and then remained relatively constant between 501 and 1,000 m (Table 33). A distinct length mode occurred around 65 cm FL at depths greater than 300 m in the Chirikof, Kodiak, and Yakutat INPFC areas, whereas the corresponding length mode occurred at somewhat shorter lengths in the Shumagin and Southeastern areas (55-60 cm, Fig. 24). Small fish (less than 50 cm FL) were almost exclusively confined to depths less than 300 m in all areas. The sex ratio of the sablefish population in the survey area was dominated by males in all INPFC areas and depth ranges. Overall, males comprised approximately 64% of the total estimated population.

Table 33. -- Number of survey hauls, number of hauls with sablefish, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Giant grenadier (*Albatrossia pectoralis*)

Giant grenadier was the third most abundant species caught in the 2007 survey (Table 2). They were caught throughout the survey area, although almost exclusively in slope strata at depths exceeding 300 m (Fig. 25, Tables 35-36). Approximately 93% of the biomass was found in the Shumagin, Chirikof, and Kodiak INPFC areas with most of the remainder in the Yakutat INPFC area. Giant grenadier occurred in 70% of tows in waters deeper than 300 m, including all tows deeper than 500 m, and over 99% of the estimated biomass was recorded at depths deeper than 300 m (Table 35). Mean CPUEs were very high in most of the strata where giant grenadier occurred. Mean weight generally declined somewhat with depth as the smaller males made up a larger fraction of the total population at deeper depths (Fig. 26, Table 35). A relatively distinct length mode occurred around 25-30 cm (snout to anal fin insertion) at all depths and INPFC areas for females, whereas males exhibited no discernable length mode. The sex ratio of the sablefish population in the survey area was dominated by females who comprised approximately 86% of the total estimated population.

Table 35. -- Number of survey hauls, number of hauls with giant grenadier, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

INPFC area	Depth (m)	Number of hauls	Hauls with catch	Mean CPUE (kg/ha)	Estimated biomass (t)	Lower 95% biomass CI (t)	Upper 95% biomass CI (t)	Mean weight (kg)

ROCKFISHES

Pacific ocean perch (*Sebastes alutus*)

Pacific ocean perch was the second most abundant species caught in the 2007 survey, and was by far the most abundant and widely distributed rockfish species encountered in the survey (Table 2). They were caught throughout the survey area, in 42 of the 59 survey strata at all depths to 500 m, with the highest concentrations on the Shumagin and Chirikof slopes (Fig. 27, Table 38). The CPUEs were by far highest in the 201-300 m depth range in all INPFC areas except the Yakutat area where the densities were higher in the 301-500 m depth range (Table 37). Approximately 53% of the estimated population biomass was recorded in the 201-300 m depth range and over 99% in the 101-500 m range. Mean weight generally increased with depth. The proportion of fish smaller than 30 cm was extremely small at depths greater than 200 m in the Shumagin, Chirikof, and Kodiak INPC areas and at depths greater than 300 m in the Yakutat and Southeastern INPFC areas (Fig. 28, Table 37). The sex ratio of the Pacific ocean perch population in the survey area was very close to even with males comprising approximately 51% of the total estimated population.

Northern rockfish (*Sebastodes pollyspinis*)

Northern rockfish was the eighth most abundant species overall and the second most abundant rockfish species caught in the 2007 survey (Table 2). Northern rockfish were found primarily in the western and central Gulf of Alaska with about 91% of the estimated biomass in the Shumagin and Chirikof INPFC areas and almost all of the remainder in the Kodiak area (Fig. 29, Table 39). They were primarily found shallower than 200 m, with less than 1% deeper than 200 m (Table 39). The highest CPUEs of northern rockfish were in the 101-200 m depth range on the Shelikof Edge and the Shumagin Outer Shelf (Table 40). The length distribution of northern rockfish caught during the survey was confined to a relatively narrow range between approximately 30 and 45 cm in all areas and depth ranges with a mode around 35 to 40 cm for both sexes in the three westernmost INPFC areas (Fig. 30). The sex ratio of the northern rockfish population in the survey area was relatively close to even with females comprising approximately 53% of the total estimated population.

Table 39. -- Number of survey hauls, number of hauls with northern rockfish, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

INPFC area	Depth (m)	Number of hauls	Hauls with catch	Mean CPUE (kg/ha)	Estimated biomass (t)	Lower 95% biomass CI (t)	Upper 95% biomass CI (t)	Mean weight (kg)

Rougheye rockfish (*Sebastodes aleutianus*)

Rougheye rockfish were found throughout the survey area primarily on the upper continental slope and in the deeper gullies in the 201-500 m depth range, where approximately 74% of its biomass was estimated to be (Fig. 31, Tables 41-42). The highest CPUEs were generally recorded in the 301-500 m range where rougheye rockfish were caught in approximately 78% of the tows (Table 41). Fish size generally increased with depth (Fig. 32, Table 41). The length mode for fish captured between 101 and 200 m was approximately 22 cm FL, while the mode for fish captured between 301 and 500 m was approximately 48 cm. The sex ratio of the rougheye rockfish population in the survey area was relatively close to even with females comprising approximately 52% of the total estimated population.

Table 41. -- Number of survey hauls, number of hauls with rougheye rockfish, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Blackspotted rockfish (*Sebastodes melanostictus*)

Blackspotted rockfish were found throughout the survey area primarily on the upper continental slope and in the deeper gullies in the 201-500 m depth range, where approximately 97% of its biomass was estimated to be (Fig. 33, Tables 43-44). The highest CPUEs were recorded in the 301-500 m range in all INPFC areas where blackspotted rockfish were caught in approximately 82% of the tows (Table 43). Fish size increased with depth (Fig. 34, Table 43). The length mode for fish captured between 301 and 500 m was approximately 44 cm FL, whereas the length modes for fish captured at other depths was difficult to discern due to small sample sizes. The sex ratio of the rougheye rockfish population in the survey area was relatively close to even with females comprising approximately 52% of the total estimated population.

Table 43. -- Number of survey hauls, number of hauls with blackspotted rockfish, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Dusky rockfish (*Sebastodes variabilis*)

Dusky rockfish was the fourth most abundant rockfish species caught in the 2007 survey (Table 2). Dusky rockfish were found throughout the survey area, almost exclusively in water depths less than 300 m, with approximately 82% of its estimated biomass in the 101 to 200 m depth range (Fig. 35, Table 45). The highest CPUEs were recorded on the Shelikof Edge and the Portlock Flats which, combined, accounted for over 62% of the estimated biomass even though these two strata comprise less than 5% of the survey area (Table 46). There was no general trend in size with depth although fish smaller than about 40 cm FL were almost exclusively confined to depths less than 100 m (Fig. 36). The sex ratio of the dusky rockfish population in the survey area was relatively even with females comprising approximately 55% of the total estimated population.

Dark rockfish (*Sebastodes ciliatus*)

Dark rockfish were rarely caught over the course of the survey (Fig. 37, Table 47). Modest CPUEs were recorded along the Alaska Peninsula and near Kodiak Island at depths less than 200 m but no catches were recorded in the Yakutat and Southeastern INPFC areas. Eighty-eight percent of the estimated biomass was found in the Albatross Banks and Shumagin Bank strata, which combined comprise less than 9% of the survey area (Table 48). This estimate was based on only six hauls out of the 75 conducted in these two strata. The small amount of length data make it difficult to discern a clear mode in the length distribution.

Table 47. -- Number of survey hauls, number of hauls with dark rockfish, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Sharpchin rockfish (*Sebastes zacentrus*)

Sharpchin rockfish were rarely captured west of Kodiak Island (Fig. 38). Over 99% of its biomass estimate occurred in the Kodiak, Yakutat, and Southeastern INPFC areas (Table 49). The highest CPUEs were recorded in the Kodiak Slope, Baranof-Chichagof Slope, and Prince of Wales Slopes/Gullies strata, which accounted for approximately 62% of the total biomass estimate even though they only comprise about 2% of the survey area (Table 50). Sharpchin rockfish were most abundant at depths between 201 and 300 m with approximately 73% of the estimated biomass in this depth range and most of the remainder between 101 and 200 m (Table 49). Overall, the size composition of female sharpchin rockfish was both broader and larger than that of males throughout the survey area (Fig. 39). The sex ratio of the sharpchin rockfish population in the survey area was even at 50:50.

Table 49. -- Number of survey hauls, number of hauls with sharpchin rockfish, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

Shortraker rockfish (*Sebastes borealis*)

Shortraker rockfish were found throughout the survey area although almost exclusively on the continental slope in the 200 to 700 m depth range (Fig. 40, Table 51). The highest CPUEs were consistently recorded in the 301 and 500 m depth range, which accounted for approximately 62% of the total biomass (Table 51). In this depth range, shortraker rockfish were caught in about 88% of the tows. Shortraker rockfish were considerably more abundant in the central and eastern Gulf of Alaska than in the western Gulf of Alaska. Approximately 87% of the estimated biomass was found in the Kodiak, Yakutat, and Southeastern INPFC areas. The highest concentrations of shortraker rockfish were in the Southeastern Slope and Baranof-Chichagof Slope strata, which accounted for 35% of its survey biomass estimate, even though their combined area comprises less than 1% of the survey area (Table 52). Mean weight and length generally increased from west to east (Fig. 41, Table 51). The sex ratio of the shortraker rockfish population in the survey area was relatively even with females comprising approximately 53% of the total estimated population.

Shortspine thornyhead (*Sebastolobus alascanus*)

Shortspine thornyhead was the third most abundant rockfish species caught in the 2007 survey (Table 2). Shortspine thornyhead were found throughout the survey area at all depths, including all tows greater than 300 m (Fig. 42, Table 53). The highest CPUEs were generally recorded on the continental slope and deeper gullies in the 301 and 700 m depth range, which accounted for approximately 53% of its total biomass (Tables 53 and 54). Population length distributions were similar in all areas and at all depths, with both males and females exhibiting length modes between approximately 24 and 32 cm FL (Fig. 43). The sex ratio of the shortspine thornyhead population in the survey area was about even with males comprising approximately 51% of the total estimated population.

Other Rockfishes

Redstripe rockfish (*Sebastes proriger*)

Redstripe rockfish were rare outside the Southeastern INPFC area and were not captured in the Yakutat INPFC area (Table 55). Approximately 94% of the total survey area biomass was estimated to be in the Southeastern INPFC area with most of the remainder in the Kodiak INPFC area. Three tows in the 101 to 200 m depth range of the Prince of Wales Shelf stratum accounted for almost 82% of the total biomass estimate even though this stratum only comprises a little over 2% of the entire survey area (Table 56).

Silvergray rockfish (*Sebastes brevispinis*)

Silvergray rockfish were rare outside the Yakutat and Southeastern INPFC areas and were not captured in the Shumagin INPFC area (Table 57). Silvergray rockfish was the sixth most abundant groundfish species in the Southeastern INPFC area (Table 2). The highest mean CPUEs were recorded in the Prince of Wales Shelf and Prince of Wales Slope and Gullies strata, which accounted for 66% of the total survey biomass estimate (Table 58). These two strata comprise just over 3% of the total survey area. Silvergray rockfish were almost exclusively caught in the 101 to 300 m depth range, which accounted for over 99% of its total estimated biomass. No fish were caught deeper than 500 m. Mean fish size generally increased with depth.

Harlequin rockfish (*Sebastes variegatus*)

Harlequin rockfish were caught infrequently and in modest numbers throughout the survey area, primarily in the 101 to 200 m depth range, which accounted for approximately 93% of its total biomass estimate (Table 59). The highest mean CPUEs were recorded in the Chirikof Outer Shelf, Prince of Wales Shelf, and Shumagin Outer Shelf strata, which accounted for approximately 84% of the estimated biomass. The combined area of these strata comprises just over 6% of the total survey area (Table 60).

Redbanded rockfish (*Sebastes babcocki*)

Redbanded rockfish were caught infrequently and in modest numbers in the Shumagin, Chirikof, and the western part of the Kodiak INPFC areas (Table 61). Approximately 83% of the total estimated biomass was in the Yakutat and Southeastern INPFC areas, with the highest mean CPUEs recorded in the 201 to 300 m depth range, which accounted for approximately 64% of its total biomass. Most of the remaining biomass was estimated to be in the 101 to 200 m depth range. No redbanded rockfish were caught deeper than 500 m. The highest mean CPUEs were noted in the Prince of Wales Slope/Gullies and the Yakutat Gullies strata, which accounted for about 44% of the total biomass (Table 62).

Yelloweye rockfish (*Sebastes ruberrimus*)

Yelloweye rockfish were caught very infrequently and in very modest numbers throughout the survey area (Table 63). Approximately 47% of the total biomass estimate was attributed to two hauls in the Prince of Wales Shelf stratum whose area comprises just over 2% of the survey

area (Table 64). No yelloweye rockfish were caught deeper than 300 m. The highest mean CPUEs were consistently recorded in the 101 to 200 m depth range of all INPFC areas, which accounted for over 95% of its total biomass.

Rosethorn rockfish (*Sebastes helvomaculatus*)

Except for a single haul with an extremely low CPUE in the Shumagin INPFC area, rosethorn rockfish were caught only in the Yakutat and Southeastern INPFC areas (Table 65). Mean CPUEs were modest in all strata where rosethorn rockfish were caught, with the highest values recorded in the Prince of Wales Slope/Gullies, Yakutat Gullies, and Fairweather Shelf strata (Table 66). Rosethorn rockfish were almost exclusively captured in the 101 to 300 m depth range, which accounted for more than 99% of its estimated biomass.

SKATES

Alaska skate (*Bathyraja parmifera*)

Alaska skate were caught infrequently and in modest numbers in the three westernmost INPFC areas in only 9 out of the 59 survey strata (Tables 67 and 68). No Alaska skate were caught in the Yakutat and Southeastern INPFC areas. CPUEs generally increased with depth to 300 m, but no fish were caught deeper than 300 m. Mean fish weight generally decreased with depth.

Aleutian skate (*Bathyraja aleutica*)

Aleutian skate were caught in approximately 12% of all survey hauls and in moderate numbers in the three westernmost INPFC areas (Table 69). Besides a small catch in one tow in the Southeastern INPFC area, no catches of Aleutian skates were recorded east of Prince William Sound. The highest mean CPUE was recorded in the Lower Shelikof Gully stratum, which accounted for approximately 53% of the total estimated biomass even though it comprises only 3% of the total survey area (Table 70). Aleutian skate were caught in all depths to 500 m, but the highest CPUEs were recorded in the 101 to 300 m depth range. No fish were caught deeper than 500 m. Mean fish weight generally decreased with depth.

Bering skate (*Bathyraja interrupta*)

Bering skate were caught in relatively modest numbers in approximately 13% of all survey hauls outside the Shumagin INPFC area, where no catches were recorded (Table 71). The highest CPUEs were recorded in the gullies of the Chirikof and Kodiak INPFC areas (Table 72). Bering skate were caught in all depths to 500 m but the highest CPUEs were generally recorded in the 101 to 300 m depth range. No fish were caught deeper than 500 m.

Big skate (*Raja binoculata*)

Big skate were caught in relatively modest numbers in approximately 7% of all survey hauls in all five of the INPFC areas (Table 73). The highest CPUEs were recorded in several of the shallowest strata of the survey area in waters less than 100 m (Table 74). Approximately 87% of its estimated biomass was located shallower than 100 m, with all of the remainder in waters between 101 and 200 m deep.

Longnose skate (*Raja rhina*)

Longnose skate were caught in relatively modest numbers in almost 20% of all survey hauls in all five of the INPFC areas (Table 75). Just over 50% of the estimated biomass was located in the Kodiak INPFC area. Longnose skate were caught in all depths to 500 m, with the highest densities recorded in the 101 to 500 m depth range. The highest CPUEs were recorded in the Yakutat Gullies and Kenai Flats strata (Table 76).

Table 67. -- Number of survey hauls, number of hauls with Alaska skate, mean CPUE, biomass, and mean weight based on the 2007 Gulf of Alaska biennial bottom trawl survey, by International North Pacific Fisheries Commission statistical areas and depth intervals.

MISCELLANEOUS SPECIES

Capelin (*Mallotus villosus*)

Capelin were caught in modest numbers in approximately 24% of hauls less than 100 m deep and in about 8% of hauls in the 101 to 300 m depth range. No capelin were caught deeper than 300 m (Table 77). The highest CPUEs were recorded in the Albatross Shallows and Albatross Banks strata, which accounted for approximately 61% of its estimated biomass even though these strata comprise less than 7% of the survey area (Table 78). Mean fish weight generally increased with depth.

Eulachon (*Thaleichthys pacificus*)

Eulachon were caught in moderate numbers in approximately 31% of hauls less than 300 m deep and in about 9% of hauls deeper than 300 m. No catches were recorded in the 700 to 1,000 m depth range (Table 79). The biomass was primarily confined to the Chirikof and Kodiak INPFC areas, which accounted for approximately 80% of its biomass estimate. The highest CPUEs were recorded in the Shelikof Edge, the Lower Shelikof Gully, and East Shumagin Gully strata, which accounted for approximately 51% of the biomass estimate even though these strata comprise only about 9% of the survey area (Table 80).

Pacific hake (*Merluccius productus*)

Pacific hake were predominantly caught in the Yakutat and Southeastern INPFC areas, which accounted for about 97% of the estimated biomass (Table 81). Single small catches were recorded in the Shumagin and Chirikof INPFC areas and 10 tows in the Kodiak INPFC area contained Pacific hake. The highest CPUEs were recorded in the Slope and Gully strata of the Southeastern and Yakutat INPC areas (Table 82). Ninety-eight percent of the biomass was estimated to be in the 101 to 500 m depth range. No fish were caught deeper than 700 m.

APPENDIX A**Strata Specifications and Locations**

Appendix table A-1 presents the survey strata definitions for the 2007 Gulf of Alaska biennial bottom trawl survey including depth range, stratum name, and the area in square nautical miles and square kilometers. Appendix Table A-2 presents the summary strata code definitions. Appendix Figures A-1 through A-5 are charts showing the locations and extent of the strata as defined.

Appendix Table A-1. -- Survey strata used for the 2007 Gulf of Alaska biennial survey including depth, stratum code, name and area in square nautical miles (nmi^2) and square kilometers (km^2).

Depth Range (m)	Stratum Code	Stratum Name	Area (nmi²)	Area (km²)
1 - 100	10	Fox Islands	2.430	8.333
	11	Davidson Bank	3.989	13.681
	12	Lower Alaska Peninsula	2.005	6.876
	13	Shumagin Bank	3.615	12.399
	20	Upper Alaska Peninsula	2.315	7.941
	21	Semidi Bank	2.129	7.302
	22	Chirikof Bank	3.147	10.792
	30	Albatross Shallows	1.681	5.766
	31	Albatross Banks	4.491	15.403
	32	Lower Cook Inlet	2.883	9.887
	33	Kenai Peninsula	1.534	5.260
	35	Northern Kodiak Shallows	641	2.200
	40	Yakutat Shallows	2.900	9.947

APPENDIX B**Fish and Invertebrate Taxa Encountered**

Appendix Tables B-1 and B-2 list fish and invertebrate taxa encountered and identified during the 2007 Gulf of Alaska biennial bottom trawl survey. Most common and scientific names are from Robins et al. (1991). Order of listings and common names used are for convenience and do not imply adherence to a particular phylogenetic system.

Appendix Table B-1. -- Fish species encountered during the 2007 Gulf of Alaska bottom trawl survey.

Family	Species Name	Common Name
Petromyzontidae	<i>Lampetra tridentata</i>	Pacific lamprey
Lamnidae	<i>Lamna ditropis</i>	salmon shark
Squalidae	<i>Squalus acanthias</i>	spiny dogfish
	<i>Somniosus pacificus</i>	Pacific sleeper shark
Rajidae	<i>Bathyraja abyssicola</i>	deepsea skate
	<i>Raja binoculata</i>	big skate
	<i>Bathyraja interrupta</i>	Bering skate
	<i>Raja rhina</i>	longnose skate
	<i>Bathyraja trachura</i>	roughtail skate
	<i>Bathyraja parmifera</i>	Alaska skate
	<i>Bathyraja aleutica</i>	Aleutian skate
	<i>Bathyraja lindbergi</i>	commander skate
	<i>Bathyraja maculata</i>	whiteblotched skate
	<i>Bathyraja minispinosa</i>	whitebrow skate
Chimaeridae	<i>Hydrolagus colliei</i>	spotted ratfish
Bothidae	<i>Citharichthys sordidus</i>	Pacific sanddab
Pleuronectidae	<i>Atheresthes stomias</i>	arrowtooth flounder
	<i>Reinhardtius hippoglossoides</i>	Greenland turbot
	<i>Hippoglossus stenolepis</i>	Pacific halibut
	<i>Hippoglossoides elassodon</i>	flathead sole
	<i>Lyopsetta exilis</i>	slender sole
	<i>Eopsetta jordani</i>	petrale sole
	<i>Parophrys vetulus</i>	English sole
	<i>Microstomus pacificus</i>	Dover sole
	<i>Embassichthys bathybius</i>	deepsea sole
	<i>Glyptocephalus zachirus</i>	rex sole
	<i>Limanda aspera</i>	yellowfin sole
	<i>Platichthys stellatus</i>	starry flounder
	<i>Psettichthys melanostictus</i>	sand sole
	<i>Lepidopsetta polyxystra</i>	northern rock sole
	<i>Lepidopsetta bilineata</i>	southern rock sole
	<i>Isopsetta isolepis</i>	butter sole

	<i>Pleuronectes quadrituberculatus</i>	Alaska plaice
Agonidae	<i>Sarritor frenatus</i>	sawback poacher
	<i>Xeneretmus latifrons</i>	blacktip poacher
	<i>Bathyagonus alascanus</i>	gray starsnout
	<i>Bathyagonus infraspinatus</i>	spinycheek starsnout
	<i>Bathyagonus pentacanthus</i>	bigeye poacher
	<i>Bathyagonus nigripinnis</i>	blackfin poacher
	<i>Podothecus acipenserinus</i>	sturgeon poacher
	<i>Anoplagonus inermis</i>	smooth aligatorfish
	<i>Hypsagonus quadricornis</i>	fourhorn poacher
Alepocephalidae	<i>Alepocephalus tenebrosus</i>	California slickhead
Ammodytidae	<i>Ammodytes hexapterus</i>	Pacific sand lance
Anarhichadidae	<i>Anarrhichthys ocellatus</i>	wolf-eel
	<i>Anarhichas orientalis</i>	Bering wolffish
Anoplopomatidae	<i>Anoplopoma fimbria</i>	sablefish
Bathylagidae	<i>Bathylagus pacificus</i>	Pacific blacksmelt
	<i>Bathylagus milleri</i>	robust blacksmelt
	<i>Leuroglossus schmidti</i>	northern smoothtongue
	<i>Bathylagus ochotensis</i>	popeye blacksmelt
Bathymasteridae	<i>Ronquilus jordani</i>	northern ronquil
	<i>Bathymaster caeruleofasciatus</i>	Alaskan ronquil
	<i>Bathymaster signatus</i>	searcher
Chauliodontidae	<i>Chauliodus macouni</i>	Pacific viperfish
Clupeidae	<i>Clupea pallasi</i>	Pacific herring
Macrouridae	<i>Coryphaenoides acrolepis</i>	Pacific grenadier
	<i>Albatrossia pectoralis</i>	giant grenadier
	<i>Coryphaenoides cinereus</i>	popeye grenadier
Cottidae	<i>Thyrsicus anoplus</i>	sponge sculpin
	<i>Icelinus borealis</i>	northern sculpin
	<i>Icelinus tenuis</i>	spotfin sculpin
	<i>Gymnophanrus tricuspidis</i>	Arctic staghorn sculpin
	<i>Gymnophanrus galeatus</i>	armorhead sculpin
	<i>Radulinus asprellus</i>	slim sculpin
	<i>Bolinia euryptera</i>	broadfin sculpin
	<i>Malacobocetus zonurus</i>	darkfin sculpin

	<i>Hemilepidotus spinosus</i>	brown Irish lord
	<i>Hemilepidotus zapus</i>	longfin Irish lord
	<i>Hemilepidotus hemilepidotus</i>	red Irish lord
	<i>Hemilepidotus jordani</i>	yellow Irish lord
	<i>Triglops forficata</i>	scissortail sculpin
	<i>Triglops scepticus</i>	spectacled sculpin
	<i>Triglops pingeli</i>	ribbed sculpin
	<i>Triglops macellus</i>	roughspine sculpin
	<i>Myoxocephalus verrucosus</i>	warty sculpin
	<i>Myoxocephalus polyacanthocephalus</i>	great sculpin
	<i>Myoxocephalus jaok</i>	plain sculpin
	<i>Myoxocephalus quadricornis</i>	fourhorn sculpin
	<i>Dasycottus setiger</i>	spinyhead sculpin
	<i>Psychrolutes paradoxus</i>	tadpole sculpin
	<i>Psychrolutes phrictus</i>	blob sculpin
	<i>Rhamphocottus richardsoni</i>	grunt sculpin
	<i>Hemitripterus bolini</i>	bigmouth sculpin
	<i>Triglops xenostethus</i>	scalybreasted sculpin
	<i>Icelus spiniger</i>	thorny sculpin
	<i>Icelus spatula</i>	spatulate sculpin
Trichodontidae	<i>Trichodon trichodon</i>	Pacific sandfish
Gadidae	<i>Microgadus proximus</i>	Pacific tomcod
	<i>Gadus macrocephalus</i>	Pacific cod
Moridae	<i>Antimora microlepis</i>	Pacific flatnose
	<i>Theragra chalcogramma</i>	walleye pollock
Hexagrammidae	<i>Ophiodon elongatus</i>	lingcod
	<i>Pleurogrammus monopterygius</i>	Atka mackerel
	<i>Hexagrammos stelleri</i>	whitespotted greenling
	<i>Hexagrammos decagrammus</i>	kelp greenling
Icosteidae	<i>Icosteus aenigmaticus</i>	ragfish
Cyclopteridae	<i>Aptocyclus ventricosus</i>	smooth lumpsucker
	<i>Eumicrotremus orbis</i>	Pacific spiny lumpsucker
	<i>Eumicrotremus barbatus</i>	papillose lumpsucker
	<i>Cyclopteroides phrynooides</i>	toad lumpsucker
	<i>Liparis dennyi</i>	marbled snailfish

	<i>Liparis gibbus</i>	variegated snailfish
	<i>Crystallichthys cyclospilus</i>	blotched snailfish
	<i>Liparis ochotensis</i>	Okhotsk snailfish
	<i>Elassodiscus caudatus</i>	humpback snailfish
	<i>Careproctus melanurus</i>	blacktail snailfish
	<i>Careproctus cypselurus</i>	blackfin snailfish
	<i>Paraliparis ulochir</i>	Blackfaced red snailfish
	<i>Careproctus giberti</i>	smalldisk snailfish
	<i>Careproctus colletti</i>	Alaska snailfish
	<i>Paraliparis dactylosus</i>	red snailfish
	<i>Paraliparis cephalus</i>	swellhead snailfish
	<i>Careproctus comus</i>	comic snailfish
	<i>Nectoliparis pelagicus</i>	tadpole snailfish
	<i>Allocareproctus unangas</i>	goldeneye snailfish
Melamphaeidae	<i>Poromitra crassiceps</i>	crested bigscale
	<i>Melamphaes lugubris</i>	highsnout bigscale
Melanostomiidae	<i>Tactostoma macropus</i>	longfin dragonfish
Merluccidae	<i>Merluccius productus</i>	Pacific hake
Myctophidae	<i>Stenobrachius leucopsarus</i>	northern lampfish
	<i>Stenobrachius nannochir</i>	garnet lampfish
	<i>Diaphus theta</i>	California headlightfish
	<i>Nannobrachium regale</i>	pinpoint lampfish
	<i>Lampanyctus jordani</i>	brokenline lampfish
	<i>Tarletonbeania crenularis</i>	blue lanternfish
Osmeridae	<i>Thaleichthys pacificus</i>	eulachon
	<i>Mallotus villosus</i>	capelin
	<i>Spirinchus thaleichthys</i>	longfin smelt
Salmonidae	<i>Oncorhynchus tshawytscha</i>	Chinook salmon
	<i>Oncorhynchus kisutch</i>	coho salmon
	<i>Oncorhynchus gorbuscha</i>	pink salmon
	<i>Oncorhynchus keta</i>	chum salmon
	<i>Oncorhynchus nerka</i>	sockeye salmon
Scomberesocidae	<i>Cololabis saira</i>	Pacific saury
Scopelarchidae	<i>Benthalbella dentata</i>	northern pearleye
Alepisauridae	<i>Alepisaurus ferox</i>	longnose lancetfish

Searsiidae	<i>Sagamichthys abei</i>	shining tubeshoulder
Cryptacanthodidae	<i>Lyconectes aleutensis</i>	dwarf wrymouth
	<i>Cryptacanthodes giganteus</i>	giant wrymouth
Stichaeidae	<i>Lumpenus maculatus</i>	daubed shanny
	<i>Lumpenus fabricii</i>	slender eelblenny
	<i>Lumpenus sagitta</i>	snake prickleback
	<i>Lumpenella longirostris</i>	longsnout prickleback
	<i>Chirolophis decoratus</i>	decorated warbonnet
	<i>Poroclinus rothrocki</i>	whitebarred prickleback
Pholididae	<i>Pholis laeata</i>	crescent gunnel
Zaproridae	<i>Zaprora silenus</i>	prowfish
Zoarcidae	<i>Bothrocara brunneum</i>	twoline eelpout
	<i>Bothrocara pusillum</i>	Alaska eelpout
	<i>Embryx crotalinus</i>	snakehead eelpout
	<i>Lycodes cortezianus</i>	bigfin eelpout
	<i>Lycodes palearis</i>	wattled eelpout
	<i>Lycodes diapterus</i>	black eelpout
	<i>Lycodes brevipes</i>	shortfin eelpout
	<i>Lycodes pacificus</i>	blackbelly eelpout
Scorpaenidae	<i>Sebastolobus alascanus</i>	shortspine thornyhead
	<i>Sebastolobus altivelis</i>	longspine thornyhead
	<i>Sebastes aleutianus</i>	rougheye rockfish
	<i>Sebastes melanostictus</i>	blackspotted rockfish
	<i>Sebastes alutus</i>	Pacific ocean perch
	<i>Sebastes brevispinis</i>	silvergray rockfish
	<i>Sebastes ciliatus</i>	dark rockfish
	<i>Sebastes variabilis</i>	dusky rockfish
	<i>Sebastes crameri</i>	darkblotched rockfish
	<i>Sebastes diploproa</i>	splitnose rockfish
	<i>Sebastes elongatus</i>	greenstriped rockfish
	<i>Sebastes emphaeus</i>	Puget Sound rockfish
	<i>Sebastes entomelas</i>	widow rockfish
	<i>Sebastes flavidus</i>	yellowtail rockfish
	<i>Sebastes helvomaculatus</i>	rosethorn rockfish
	<i>Sebastes maliger</i>	quillback rockfish

<i>Sebastes melanops</i>	black rockfish
<i>Sebastes paucispinis</i>	bocaccio
<i>Sebastes pinniger</i>	canary rockfish
<i>Sebastes polyspinis</i>	northern rockfish
<i>Sebastes proriger</i>	redstripe rockfish
<i>Sebastes ruberrimus</i>	yelloweye rockfish
<i>Sebastes babcocki</i>	redbanded rockfish
<i>Sebastes variegatus</i>	harlequin rockfish
<i>Sebastes wilsoni</i>	pygmy rockfish
<i>Sebastes zacentrus</i>	sharpchin rockfish
<i>Sebastes borealis</i>	shortraker rockfish
<i>Sebastes reedi</i>	yellowmouth rockfish

Appendix Table B2. -- Invertebrate species encountered during the 2007 Gulf of Alaska bottom trawl survey.

Phylum	Species/Taxon Name	Common Name
Cnidaria	<i>Periphylla periphylla</i>	
	<i>Chrysaora melanaster</i>	
	<i>Phacellophora camtschatica</i>	egg yolk jelly
	<i>Atolla</i> sp.	
	<i>Aurelia labiata</i>	
	<i>Cyanea capillata</i>	lion's mane
	<i>Alcyonium</i> sp.	
	<i>Gersemia</i> sp.	sea raspberry
	<i>Primnoa pacifica</i>	
	<i>Primnoa willeyi</i>	red tree coral
	<i>Lillipathes lilliei</i>	
	<i>Paragorgia arborea</i>	Kamchatka coral
	<i>Paragorgia pacifica</i>	
	<i>Paragorgia nodosa</i>	
	<i>Calcigorgia spiculifera</i>	
	<i>Virgularia</i> sp.	smoothstem seawhip
	<i>Halipterus willemoesi</i>	
	<i>Ptilosarcus gurneyi</i>	orange sea pen
	<i>Anthoptilum murrayi</i>	Murray sea pen
	<i>Actinauge verrillii</i>	reticulate anemone
	<i>Paractinostola faeculenta</i>	rough purple sea anemone
	<i>Actinoscyphia</i> sp.	
	<i>Metridium farcimen</i>	gigantic anemone
	<i>Stomphia didemon</i>	cowardly anemone
	<i>Stomphia coccinea</i>	swimming anemone
	<i>Urticina crassicornis</i>	mottled anemone
	<i>Bathyphelia australis</i>	hot dog sea anemone
	<i>Oractis diomedaeae</i>	grape anemone
	<i>Cribrinopsis fernaldi</i>	chevron-tentacled anemone
	<i>Liponema brevicornis</i>	tentacle-shedding anemone
	<i>Actinistola</i> sp.	
	<i>Javania borealis</i>	

	<i>Stylaster campyleucus</i>	
	<i>Stylaster moseleyana</i>	
	<i>Cyclohelia lamellata</i>	
	<i>Stylaster alaskanus</i>	
	<i>Thouarella superba</i>	
	<i>Errinopora zarhyncha</i>	
	<i>Isidella</i> sp.	articulated bamboo coral
	<i>Plumarella</i> sp.	
	<i>Thouarella</i> sp.	
	<i>Keratoisis</i> sp.	bamboo coral
	<i>Fanellia compressa</i>	
	<i>Fanellia fraseri</i>	
	<i>Muriceides nigra</i>	
	<i>Amphilaphis</i> sp.	
	<i>Muriceides</i> sp.	
	<i>Arthrogorgia otsukai</i>	
Ctenophora	<i>Ctenophora</i>	comb jelly
Annelida	<i>Polychaeta</i>	polychaete worm
	<i>Eunice valens</i>	
	<i>Chaetopterus</i> sp.	
	<i>Aphrodisia negligens</i>	sea mouse
	<i>Euphrosine multibranchiata</i>	
	<i>Nereidae</i>	
	<i>Eunoe nodosa</i>	giant scale worm
	<i>Eunoe depressa</i>	depressed scale worm
	<i>Gattyana ciliata</i>	
	<i>Serpula columbiana</i>	
	<i>Notostombdella</i>	
	<i>cyclostomum</i>	striped sea leech
Arthropoda	<i>Isopoda</i>	isopod
	<i>Rocinella angusta</i>	
	<i>Anuropus bathypelagica</i>	
	<i>Euphausiacea</i>	euphausiid unident.
	<i>Neognathophausia</i> sp.	
	<i>Balanus evermanni</i>	giant barnacle
	<i>Balanus nubilus</i>	

<i>Pandalus danae</i>	dock shrimp
<i>Pandalus jordani</i>	ocean shrimp
<i>Pandalus borealis</i>	northern shrimp
<i>Pandalus tridens</i>	yellowleg pandalid
<i>Pandalus platyceros</i>	spot shrimp
<i>Pandalus goniurus</i>	humpy shrimp
<i>Pandalus hypsinotus</i>	coonstripe shrimp
<i>Pandalus stenolepis</i>	roughpatch shrimp
<i>Pandalopsis longirostris</i>	
<i>Pandalopsis dispar</i>	sidestripe shrimp
<i>Penaeidae</i>	penaeid shrimps
<i>Eualus barbatus</i>	barbed eualid
<i>Eualus macrophthalmus</i>	bigeye eualid
<i>Eualus biunguis</i>	deepsea eualid
<i>Lebbeus groenlandicus</i>	spiny lebbeid
<i>Crangon communis</i>	twospine crangon
<i>Crangon dalli</i>	ridged crangon
<i>Crangon septemspinosa</i>	sevenspine bay shrimp
<i>Argis alaskensis</i>	common argid
<i>Argis dentate</i>	Arctic argid
<i>Sclerocrangon boreas</i>	sculptured shrimp
<i>Argis levior</i>	Nelson's argid
<i>Argis ovifer</i>	split-eye argid
<i>Pasiphaea pacifica</i>	Pacific glass shrimp
<i>Pasiphaea tarda</i>	crimson pasiphaeid
<i>Notostomus japonicus</i>	spinyridge shrimp
<i>Cancer branneri</i>	
<i>Cancer magister</i>	Dungeness crab
<i>Cancer oregonensis</i>	Oregon rock crab
<i>Oregonia bifurca</i>	
<i>Oregonia gracilis</i>	graceful decorator crab
<i>Chorilia longipes</i>	longhorned decorator crab
<i>Chionoecetes tanneri</i>	grooved Tanner crab
<i>Chionoecetes bairdi</i>	Tanner crab
<i>Chionoecetes angulatus</i>	triangle Tanner crab

<i>Hyas coarctatus</i>	circumboreal toad crab
<i>Hyas lyratus</i>	Pacific lyre crab
<i>Telmessus cheiragonus</i>	helmet crab
<i>Pagurus brandti</i>	sponge hermit
<i>Pagurus aleuticus</i>	Aleutian hermit
<i>Labidochirus splendescens</i>	splendid hermit
<i>Pagurus confragosus</i>	knobbyhand hermit
<i>Pagurus cornutus</i>	
<i>Pagurus dalli</i>	whiteknee hermit
<i>Pagurus kennerlyi</i>	bluespine hermit
<i>Pagurus trigonocheirus</i>	fuzzy hermit crab
<i>Pagurus beringanus</i>	Bering hermit
<i>Pagurus ochotensis</i>	Alaskan hermit
<i>Pagurus rathbuni</i>	longfinger hermit
<i>Pagurus tanneri</i>	longhand hermit
<i>Elassochirus tenuimanus</i>	widehand hermit crab
<i>Pagurus capillatus</i>	hairy hermit crab
<i>Elassochirus cavimanus</i>	purple hermit
<i>Elassochirus gilli</i>	Pacific red hermit
<i>Lopholithodes foraminatus</i>	box crab
<i>Acantholithodes hispidus</i>	fuzzy crab
<i>Lithodes couesi</i>	scarlet king crab
<i>Lithodes aequispinus</i>	golden king crab
<i>Hapalogaster grebnitzkii</i>	
<i>Rhinolithodes wosnessenskii</i>	rhinoceros crab
<i>Paralithodes camtschaticus</i>	red king crab
<i>Placetron wosnessenskii</i>	scaled crab
<i>Erimacrus isenbeckii</i>	horsehair crab
<i>Pugettia gracilis</i>	graceful kelp crab
<i>Munida quadrispina</i>	pinchbug
<i>Neomenia yamamoti</i>	
<i>Lepidozona abyssicola</i>	
<i>Placiphorella pacifica</i>	
<i>Mopalia swanii</i>	
<i>Mopalia egretha</i>	

Mollusca

<i>Tochuina tetraquetra</i>	giant orange tochui
<i>Dendronotus dalli</i>	Dall's dendronotid
<i>Tritonia festiva</i>	festive tritonia
<i>Tritonia diomedea</i>	rosy tritonia
<i>Triopha catalinae</i>	sea-clown triopha
<i>Chlamylla</i> sp.	
<i>Anisodoris nobilis</i>	Pacific sea lemon
<i>Anisodoris lentiginosa</i>	mottled pale sea-lemon
<i>Archidoris odhneri</i>	white night doris
<i>Cranopsis major</i>	great puncturella
<i>Scelitoboma bella</i>	
<i>Cryptonatica affinis</i>	Arctic moonsnail
<i>Cryptonatica aleutica</i>	Aleutian moonsnail
<i>Nucella lamellosa</i>	frilled dogwinkle
<i>Euspira pallidus</i>	pale moonsnail
<i>Crepidula</i> sp.	slipper shell
<i>Japelion aleutica</i>	
<i>Pyrulofusus dexius</i>	
<i>Pyrulofusus deformis</i>	warped whelk
<i>Pyrulofusus harpa</i>	left-hand whelk
<i>Volutopsius regularis</i>	regular whelk
<i>Beringius kennicottii</i>	
<i>Beringius undatus</i>	
<i>Beringius rotundus</i>	rotund whelk
<i>Neptunea amianta</i>	white neptune
<i>Neptunea pribiloffensis</i>	Pribilof whelk
<i>Neptunea lyrata</i>	lyre whelk
<i>Neptunea ventricosa</i>	fat whelk
<i>Plicifus oceanodromae</i>	seahorse whelk
<i>Plicifusus virens</i>	
<i>Plicifusus griseus</i>	gray whelk
<i>Boreotrophon stuarti</i>	winged trophon
<i>Fusitriton oregonensis</i>	Oregon triton
<i>Bathybembix bairdii</i>	
<i>Cidarina cidaris</i>	

<i>Buccinum oedematum</i>	swollen whelk
<i>Buccinum plectrum</i>	sinuous whelk
<i>Buccinum scalariforme</i>	ladder whelk
<i>Buccinum moarchianum</i>	
<i>Arctomelon stearnsii</i>	Alaska volute
<i>Modiolus modiolus</i>	northern horse mussel
<i>Mytilus edulis</i>	blue mussel
<i>Chlamys rubida</i>	reddish scallop
<i>Patinopecten caurinus</i>	weathervane scallop
<i>Delectopecten vancouverensis</i>	Vancouver scallop
<i>Cyclopecten davidsoni</i>	salmon glass-scallop
<i>Panopea abrupta</i>	Pacific geoduck
<i>Hiatella arctica</i>	Arctic hiatella
<i>Nucula</i> sp.	
<i>Yoldia seminuda</i>	crisscrossed yoldia
<i>Yoldia thraciaeformis</i>	broad yoldia
<i>Yoldia hyperborea</i>	northern yoldia
<i>Nuculana pernula</i>	northern nutclam
<i>Nuculana conceptionis</i>	
<i>Limopsis akutanica</i>	Akutan limops
<i>Embletonia vaginata</i>	vaginated limops
<i>Musculus discors</i>	discordant mussel
<i>Astarte borealis</i>	boreal astarte
<i>Astarte elliptica</i>	elliptical astarte
<i>Clinocardium nuttallii</i>	Nuttall cockle
<i>Clinocardium ciliatum</i>	hairy cockle
<i>Clinocardium californiense</i>	California cockle
<i>Clinocardium blandum</i>	strait cockle
<i>Saxidomus gigantea</i>	butter clam
<i>Humilaria kennerleyi</i>	Kennerley's venus
<i>Tellina modesta</i>	
<i>Macoma</i> sp.	
<i>Serripes groenlandicus</i>	Greenland cockle
<i>Serripes laperousii</i>	broad cockle
<i>Serripes notabilis</i>	oblique smoothcockle

<i>Pododesmus macrochisma</i>	Alaska falsejingle
<i>Pododesmus cepio</i>	abalone jingle
<i>Benthoctopus leioderma</i>	smoothskin octopus
<i>Japatella diaphana</i>	
<i>Opisthoteuthis californiana</i>	flapjack devilfish
<i>Octopus dofleini</i>	giant octopus
<i>Rossia pacifica</i>	eastern Pacific bobtail
<i>Loligo opalescens</i>	California market squid
<i>Gonatus</i> sp.	
<i>Berryteuthis magister</i>	magistrate armhook squid
<i>Berryteuthis anonychus</i>	
<i>Gonatopsis borealis</i>	boreopacific armhook squid
<i>Moroteuthis robusta</i>	robust clubhook squid
<i>Onychoteuthis borealijaponicus</i>	boreal clubhook squid
<i>Galiteuthis phyllura</i>	
<i>Chiroteuthis calyx</i>	
<i>Cranchiidae</i>	
<i>Taonius pavo</i>	
<i>Octopoteuthis deletron</i>	
<i>Histioteuthis hoylei</i>	
<i>Easterias troschelii</i>	mottled sea star
<i>Easterias echinosoma</i>	giant sea star
<i>Orthasterias koehleri</i>	redbanded sea star
<i>Leptasterias hylodes</i>	Aleutian sea star
<i>Leptasterias stolocantha</i>	
<i>Leptasterias coei</i>	
<i>Pycnopodia helianthoides</i>	sunflower sea star
<i>Styela forreri</i>	long-rayed star
<i>Ampheraster marianus</i>	
<i>Tarsaster alaskanus</i>	
<i>Lethasterias nanimensis</i>	blackspined sea star
<i>Pedicellaster magister</i>	majestic sea star
<i>Stephanasterias albula</i>	
<i>Poraniopsis inflata</i>	thorny sea star
<i>Henricia sanguinolenta</i>	sanguine sea star

<i>Henricia aspera</i>	ridged blood star
<i>Henricia leviuscula</i>	blood sea star
<i>Henricia longispina</i>	
<i>Henricia spiculifera</i>	spiny Henricia
<i>Odontohenricia fisheri</i>	
<i>Leptasterias katharinae</i>	
<i>Gephyreaster swifti</i>	Swift's sea star
<i>Pseudarchaster alasensis</i>	
<i>Hippasteria californica</i>	
<i>Hippasteria heathi</i>	
<i>Hippasteria spinosa</i>	spiny red sea star
<i>Pseudarchaster parelii</i>	scarlet sea star
<i>Cryptopeltaster lepidonotus</i>	
<i>Mediaster tenellus</i>	
<i>Mediaster aequalis</i>	vermilion sea star
<i>Ceramaster japonicus</i>	red bat star
<i>Ceramaster patagonicus</i>	orange bat sea star
<i>Ceramaster arcticus</i>	Arctic bat sea star
<i>Ceramaster clarki</i>	
<i>Ceramaster stellatus</i>	
<i>Luidia foliolata</i>	sand sea star
<i>Dermasterias imbricata</i>	leather sea star
<i>Solaster endeca</i>	northern sun sea star
<i>Solaster hypothrissus</i>	
<i>Solaster dawsoni</i>	morning sun sea star
<i>Solaster stimpsoni</i>	striped sun sea star
<i>Crossaster borealis</i>	grooved sea star
<i>Crossaster papposus</i>	rose sea star
<i>Heterozonias alternatus</i>	cannonball sun star
<i>Lophaster vexator</i>	crested star
<i>Lophaster furcilliger</i>	crested sea star
<i>Pteraster tesselatus</i>	
<i>Pteraster jordani</i>	
<i>Pteraster militaris</i>	wrinkled star
<i>Pteraster marssipus</i>	

<i>Pteraster obscurus</i>	obscure sea star
<i>Diplopteraster multipes</i>	pincushion sea star
<i>Asterias amurensis</i>	purple-orange sea star
<i>Ctenodiscus crispatus</i>	common mud star
<i>Leptochaster pacificus</i>	
<i>Leptochaster arcticus</i>	North Pacific sea star
<i>Dipsacaster borealis</i>	northern sea star
<i>Dipsacaster eximus</i>	
<i>Cheiraster dawsoni</i>	fragile sea star
<i>Nearchaster variabilis</i>	
<i>Nearchaster aciculosis</i>	
<i>Nearchaster pedicellaris</i>	
<i>Astronebris tatafilius</i>	
<i>Strongylocentrotus droebachiensis</i>	green sea urchin
<i>Strongylocentrotus franciscanus</i>	red sea urchin
<i>Strongylocentrotus polyacanthus</i>	
<i>Strongylocentrotus purpuratus</i>	purple sea urchin
<i>Allocentrotus fragilis</i>	orange-pink sea urchin
<i>Brisaster latifrons</i>	heart urchin
<i>Brisaster owstoni</i>	
<i>Echinarachnius parma</i>	parma sand dollar
<i>Florometra inexpectata</i>	
<i>Florometra asperrima</i>	common northern feather star
<i>Gorgonocephalus eucnemis</i>	basketstar
<i>Asteronyx loveni</i>	serpent sea star
<i>Astrochele laevis</i>	
<i>Ophiura sarsi</i>	notched brittlestar
<i>Amphiophiura</i> sp.	
<i>Stegophiura ponderosa</i>	
<i>Ophiacantha normani</i>	
<i>Ophiacantha catalleimmoidea</i>	
<i>Ophiopholis longispina</i>	

	<i>Ophiopholis aculeata</i>	ubiquitous brittle star
	<i>Ophiosphalma</i> sp.	
	<i>Ophiolebes</i> sp.	
	<i>Parastichopus leukothele</i>	giant orange cucumber
	<i>Parastichopus californicus</i>	California sea cucumber
	<i>Pseudostichopus mollis</i>	sandy sea cucumber
	<i>Molpadia arenicola</i>	
	<i>Molpadia intermedia</i>	sweet sea potato
	<i>Pentamera lissoplaca</i>	crescent sea cucumber
	<i>Bathyplotes</i> sp.	
	<i>Cucumaria fallax</i>	sea football
	<i>Cucumaria frondosa</i>	
	<i>Psolus squamatus</i>	whitescaled sea cucumber
	<i>Psolus japonicus</i>	
	<i>Thylonidium</i> sp.	
	<i>Synallactes challengeri</i>	
Porifera	<i>Suberites ficus</i>	
	<i>Suberites domuncula</i>	hermit sponge
	<i>Aphrocallistes vastus</i>	clay pipe sponge
	<i>Mycale loveni</i>	tree sponge
	<i>Mycale adhaerens</i>	smooth scallop sponge
	<i>Coelosphaeridae</i>	ginseng sponge
	<i>Geodia mesotriaena</i>	
	<i>Halichondria panicea</i>	barrel sponge
	<i>Rhabdocalyptus</i> sp.	cloud sponge
	<i>Mycale bellabellensis</i>	lampshade sponge
	<i>Phakellia cribrosa</i>	funnel sponge
	<i>Phakellia dalli</i>	cat-o-nine-tails sponge
	<i>Myxilla incrustans</i>	scallop sponge
	<i>Myxilla brunnea</i>	soft brown sponge
	<i>Phakellia beringensis</i>	hat sponge
	<i>Plicatellopsis amphispicula</i>	firm finger sponge
	<i>Histodermella</i> sp.	spud sponge
	<i>Leucosolenia blanca</i>	yellow leafy sponge
	<i>Tethya</i> sp.	ball sponge

	<i>Hyalonema</i> sp.	fiberoptic sponge
	<i>Halichondria sitiens</i>	black papilliate sponge
	<i>Halichondria cf. sitiens</i>	yellow green papillate
	<i>Polymastia</i> sp.	orange nipple ball sponge
	<i>Leucandra</i> sp.	hairy vase sponge
	<i>Neoesperiopsis rigida</i>	soft finger sponge
	<i>Neoesperiopsis infundibula</i>	rough China hat sponge
	<i>Neoesperiopsis digitata</i>	
	<i>Inflatella</i> sp.	orange papillate sponge
	<i>Stelletta</i> sp.	stone sponge
	<i>Polymastia fluegeli</i>	Flugel's nippled spong
	<i>Polymastia robusta</i>	long nippled sponge
	<i>Tentorum semisuberites</i>	two nipple sponge
	<i>Plakina tanaga</i>	white convoluted sponge
	<i>Latrunculia</i> sp.	green papillate sponge
	<i>Axinella</i> sp.	firm gray sponge
	<i>Stelodoryx alaskaensis</i>	Alaskan lobed sponge
	<i>Staurocalyptus</i> sp.	
	<i>Geodinella robusta</i>	calcareous finger sponge
	<i>Aulosaccus schulzei</i>	vase sponge
	<i>Farrea beringiana</i>	Bering lace sponge
Platyhelminthes	<i>Platyhelminthes</i>	flatworm unident.
Rhynchocoela	<i>Nemertea</i>	nemertean worm
	<i>Emplectonema</i> sp.	
	<i>Tubulanus</i> sp.	
Sipuncula	<i>Cerebratulus californienesis</i>	
	<i>Sipuncula</i>	peanut worm
Echiura	<i>Phascolosomatidae</i>	
Bryozoa	<i>Echiura</i>	echiuroid worm unident.
	<i>Leieschara orientalis</i>	
	<i>Bugula californica</i>	
	<i>Flustrellidra corniculata</i>	
	<i>Alcyonium pedunculatum</i>	
	<i>Myriozoum subgracile</i>	
	<i>Rhamphostomella costata</i>	ribbed bryozoan

	<i>Hippodiplosia insculpta</i>	
	<i>Microporina borealis</i>	
	<i>Dendrobeania</i> sp.	
Brachiopoda	<i>Terebratalia transversa</i>	common brachiopod
	<i>Frieleia halli</i>	
	<i>Terebratulina unguicula</i>	snakeshead brachiopod
	<i>Laqueus californianus</i>	California lamp shell
Chordata	<i>Styela rustica</i>	sea potato
	<i>Boltenia ovifera</i>	
	<i>Halocynthia igaboja</i>	
	<i>Halocynthia aurantium</i>	sea peach
	<i>Cnemidocarpa finmarkiensis</i>	broad base tunicate
	<i>Pyura haustor</i>	wrinkled tunicate
	<i>Distaplia occidentalis</i>	
	<i>Distaplia smithi</i>	
	<i>Amaroucium soldatovi</i>	
	<i>Aplidium</i> sp.	sea glob
	<i>Synoicum</i> sp.	sea blob
	<i>Ascidia paratropa</i>	glassy tunicate
	<i>Halocynthia hispidus</i>	hairy tunicate
	<i>Chelysoma productum</i>	
	<i>Molgula griffithsii</i>	sea grape
	<i>Molgula retortiformis</i>	sea clod
Miscellaneous	<i>Craniella cranium</i>	baseball sponge
	<i>Tetilla sigmaanchoratum</i>	spiny ball sponge
	<i>Craniella</i> sp.	puffball sponges brain sponge scapula sponge club sponge orange ball sponge slimy antler sponge pita sponge lobed tree sponge

APPENDIX C

Weight-length relationships

Appendix Table C-1. -- Length-weight parameters (a and b) for species where individual length and weight data were collected. The number of individuals measured and weighed (n) is also provided.

Species	Sex	a	b	n	Species	Sex	a	b	n
Arrowtooth flounder	Male	1.016E-05	2.967	452	Walleye pollock	Male	1.009E-05	2.955	648
	Female	3.965E-06	3.137	740		Female	8.997E-06	2.972	683
	Both	3.201E-06	3.161	1195		Both	9.764E-06	2.96	1338
Atka mackerel	Male	4.149E-07	3.583	110	Pacific ocean perch	Male	1.433E-05	2.993	546
	Female	4.002E-05	2.814	121		Female	2.670E-05	2.886	620
	Both	4.120E-05	2.818	231		Both	2.241E-05	2.916	1186
Blackspotted rockfish	Male	2.496E-05	2.921	236	Rex sole	Male	1.209E-06	3.286	291
	Female	1.675E-05	2.991	280		Female	8.495E-07	3.351	393
	Both	1.959E-05	2.963	518		Both	7.279E-07	3.375	684
Pacific cod	Male	2.947E-06	3.201	241	Rougheye rockfish	Male	2.438E-05	2.93	163
	Female	2.006E-06	3.263	241		Female	2.171E-05	2.948	189
	Both	2.129E-06	3.253	482		Both	2.280E-05	2.94	352
Dover sole	Male	4.524E-06	3.129	253	Sablefish	Male	4.042E-06	3.136	314
	Female	4.481E-06	3.132	251		Female	3.588E-06	3.155	283
	Both	4.143E-06	3.144	504		Both	3.715E-06	3.149	598
Dusky rockfish	Male	1.895E-05	2.986	475	Sharpchin rockfish	Male	1.216E-05	3.028	403
	Female	2.009E-05	2.978	604		Female	8.131E-06	3.104	525
	Both	1.854E-05	2.99	1079		Both	7.632E-06	3.114	938
Flathead sole	Male	1.006E-06	3.383	374	Shortraker rockfish	Male	1.820E-05	2.983	105
	Female	8.964E-07	3.396	445		Female	1.269E-05	3.043	170
	Both	1.194E-06	3.35	819		Both	1.309E-05	3.037	275
Giant grenadier	Male	1.005E-03	2.626	58	Southern rocksole	Male	5.848E-06	3.131	174
	Female	3.914E-04	2.801	100		Female	1.628E-06	3.347	275
	Both	3.580E-04	2.816	158		Both	1.816E-06	3.33	449
Northern rockfish	Male	1.032E-05	3.064	849	Shortspine thornyhead	Male	3.369E-06	3.212	305
	Female	1.001E-05	3.073	1009		Female	2.054E-06	3.293	339
	Both	8.678E-06	3.096	1858		Both	2.305E-06	3.275	707
Northern rocksole	Male	4.473E-06	3.168	234					
	Female	3.552E-06	3.215	307					
	Both	2.668E-06	3.261	541					

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167 (web site: www.ntis.gov). Paper and microfiche copies vary in price.
