## INTRODUCTION

The purpose of this report is to provide information to the U.S. fishing industry and other interested parties on catch rates and length compositions of commercially important groundfish sampled during a groundfish assessment survey conducted in the eastern Bering Sea in the summer of 2006. The survey was conducted by the Resource Assessment and Conservation Engineering (RACE) Division of the Alaska Fisheries Science Center (AFSC) during the period from 30 May to 28 July.

This report provides a brief description of survey methods and figures illustrating the distribution, relative abundance, and size composition of commercially important species of groundfish observed in the 2006 survey. Species included are walleye pollock (*Theragra chalcogramma*), Pacific cod (*Gadus macrocephalus*), yellowfin sole (*Limanda asper*), rock sole (*Lepidopsetta polyxystra*), flathead sole (*Hippoglossoides elassodon* and *H. robustus*), Alaska plaice (*Pleuronectes quadrituberculatus*), arrowtooth flounder (*Atheresthes stomias* and *A. evermanni*), and Greenland turbot (*Reinhardtius hippoglossoides*). An appendix to the report presents detailed position and catch data for each station fished.

A counterpart report for species of crab is being prepared by personnel of the Shellfish Assessment Program, RACE Division, of the Kodiak Laboratory of the AFSC. Copies are available upon request from L. Rugolo (NOAA/NMFS/AFSC, P.O.Box 1638, Kodiak, AK 99615). Online information about crab species from the trawl survey can be found at the following web address:

<http://www.afsc.noaa.gov/kodiak/shellfish/crabbebs/crabsurvey.htm>

## METHODS

The standard survey area, which has been sampled annually since 1979, extends over a large part of the eastern Bering Sea continental shelf and encompasses a major portion of the distributions of commercially important groundfish species in the region. Beginning in 1987, a small area to the northwest of the standard area was added to the survey, but it is not normally reported as a ‘standard’ area. This report also shows the results in that area. Areas to the northwest of the standard area were sampled primarily to investigate the abundance of opilio crabs (*Chionoecetes opilio*). The survey began in Bristol Bay and progressed westward to the edge of the continental shelf with the two survey vessels fishing alternate columns of stations.

Chartered vessels involved were the FV *Northwest Explorer* and the FV *Arcturus*. Characteristics of these vessels are given in Table 1.

Table 1.--Vessels participating in the 2006 Bering Sea groundfish survey.

Vessel	Overall	Gross	Horsepower	Survey period	
	length(m)	tonnage		Start	Finish
<i>Northwest Explorer</i>	39.9	190	1,525	30 May	28 July
<i>Arcturus</i>	49.0	500	1,800	30 May	28 July

All fishing operations were conducted in strict compliance to national and regional protocols detailed in Stauffer (2004).

The RACE Division’s 83-112 eastern trawl was the standard sampling gear for both vessels. The length of the footrope was 34.1 m (112 ft) and the headrope 25.3 m (83 ft). The footrope was fished without roller gear. Mesh sizes were 10.2 cm (4 in) in

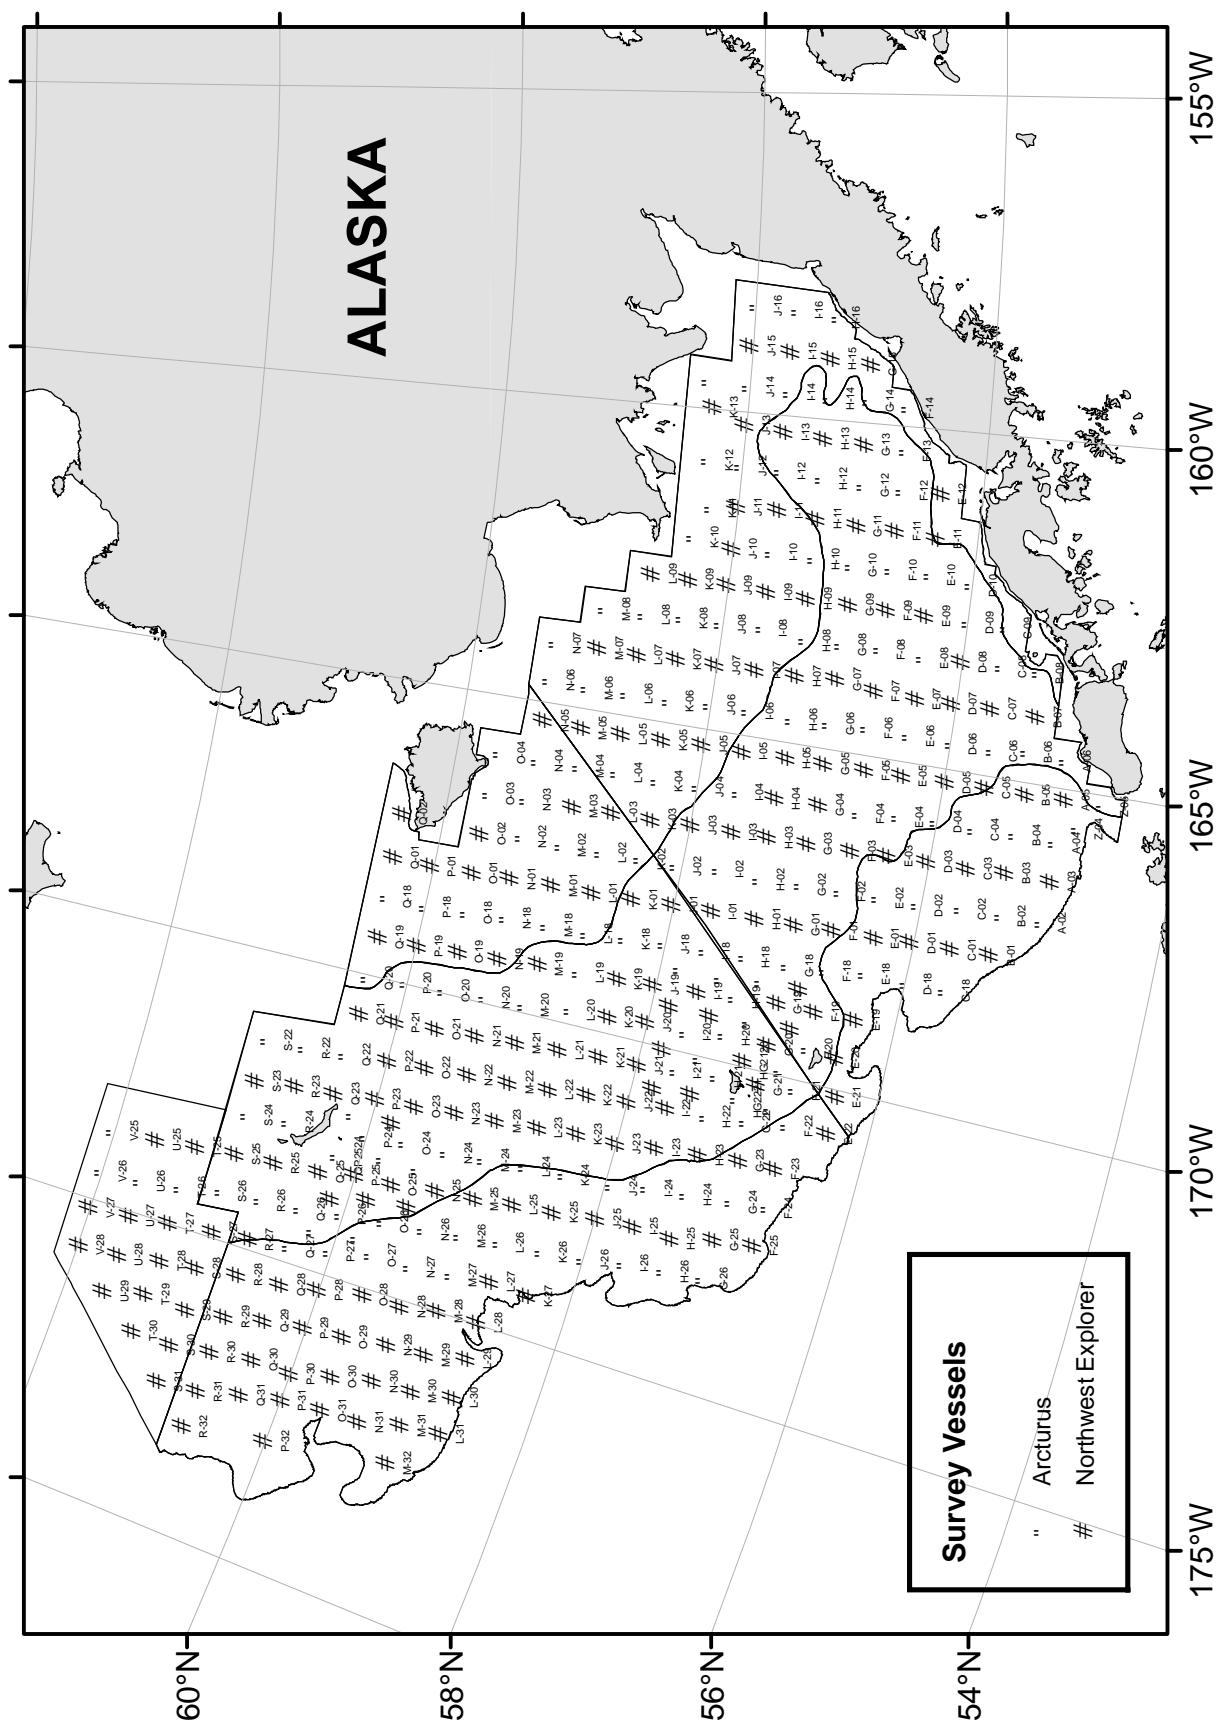

Figure 1.--Stations fished during the 2006 eastern Bering Sea bottom trawl survey.

the wings and body and 8.9 cm (3.5 in) in the intermediate and codend. The codend had a liner of 3.2-cm (1.25-in) mesh. The trawl width (distance between the wings while fishing) and vertical opening were monitored throughout the survey by NETMIND<sup>1</sup> net mensuration equipment. The vessels used steel V-doors measuring 1.8 by 2.7 m (6 ft by 9 ft) and double 54.9 m (30-fathom) dandylines with 0.61 m (2 ft) chain extensions between the lower dandylines and the footrope.

Samples were collected by trawling for 30 minutes near the centers of each square of a 20 by 20 nautical mile grid covering the survey area. Catch data from station tows that were not satisfactorily completed or sampled are not included in this report. Total catches weighing less than approximately 1,150 kg (2,500 lb) were placed directly onto a sorting table and sorted to individual species. Catches greater than 1,200 kg were placed in a splitting bin, a portion of which was lined with a cargo net. A representative subsample was then taken with the cargo net and transferred from the bin to the sorting table, where after sorting, individual species were weighed in aggregate and counted and these weights and numbers were expanded to the total catch. A random sample of up to 300 fish of each commercially important species was used for length measurements. Seawater temperature profiles were taken at most stations using a micro-bathythermograph attached near the headrope of the net; bottom temperatures are presented in Figure 18.

## RESULTS

Catch rates expressed as kilograms per hectare (1 hectare = 10,000 m<sup>2</sup>) for individual species of groundfish are shown in even-numbered Figures 2-16 and size composition in centimeters are presented in odd-numbered Figures 3-17. Though the survey area covers a major portion of the distributions of key species in the eastern Bering Sea, an exception is Greenland turbot. Most of the adult population of this fish occupies continental slope waters (deeper than 200 m). The catch rates and average lengths presented for Greenland turbot, therefore, represent predominantly the juvenile portion of the population. Information on the adults of this as well as other commercially important species of groundfish in continental slope waters is available as a NOAA *Technical Memorandum* reporting the 2004 survey of those waters (Hoff and Britt 2005). Copies of the report are available from J. Hoff (NOAA/NMFS/AFSC, 7600 Sand Point Way N.E., Seattle, WA 98115) or at the following web address:

<http://www.afsc.noaa.gov/Publications/AFSC-TM/NOAA-TM-AFSC-156.pdf>.

Stations shown in the distribution figures (even numbers) are arranged in a grid of numbered rows and columns and may be identified accordingly. All figures are labeled with individual station names beneath the trawl location. These station names are used to locate detailed position (latitude and longitude coordinates) and catch data (Appendix Tables 1 and 2). The stations are listed alphanumerically in ascending order.

The distribution figures use dot-plots rather than numerical values to make it easier to visually discern general patterns of abundance. Each dot size represents a range

of values and dot size is proportional to catch rate. The actual catch weight at a station is still available in the appendices. The length information is presented as a size distribution for locations within the Bering Sea so that the reader can see the actual range of sizes in general areas.

## APPENDIX

### Station, haul, and catch data

Table 1.--Haul and catch data for successfully completed tows by the FV *Arcturus*.

Table 2.--Haul and catch data for successfully completed tows by the FV *Northwest Explorer*.

### Definitions

1. Performance code "0" represents a satisfactory tow; performance codes greater than "0" represent a satisfactory tow, although some minor event occurred during the tow.
2. Gear code "44" refers to the 83-112 eastern trawl used by both vessels during the 2004 eastern Bering Sea crab-groundfish survey. The effective path width of the trawl was continuously monitored by net mensuration instruments (refer to page 4).
3. Geodetic positions are displayed in the tables as degrees and decimal minutes; for example, 16508.8 corresponds to 165° 08.8'W longitude.

### Units

1. Gear depths are in meters.
2. Distances are in kilometers.
3. Catch weights are given in kilograms.

**Appendix Table 1.-Haul and catch data for successfully completed tows by FV Arcturus.**
