INTRODUCTION

The eighth in a series of bottom trawl surveys of the Gulf of Alaska (GOA) groundfish and invertebrate resources was completed during the summer of 2003 by the Resource Assessment and Conservation Engineering (RACE) Division, Alaska Fisheries Science Center (AFSC), National Marine Fisheries Service (NMFS). The 2003 biennial groundfish survey closely followed the design used for prior GOA surveys since 1984 (Brown (1986), Stark et al. (1988), Stark and Pashchenko (1989), Payne and Stark (1991), Payne and Martin (1994), Stark (1997), Stark and Raring (2000), and Raring (2008)) designed to describe and monitor the distribution, abundance and biological condition of important groundfish stocks.

The Gulf of Alaska forms the northeastern border of the Pacific Ocean and is comprised of complex bathymetric features ranging from jagged, mountainous pinnacles to muddy gullies. The features provide a wide variety of habitats resulting in a complex ecosystem and has been an important fishing grounds for a variety of groundfish species including Pacific ocean perch (*Sebastes alutus*), walleye pollock (*Theragra chalcogramma*), Pacific cod (*Gadus macrocephalus*), Pacific halibut (*Hippoglossus stenolepis*), sablefish (*Anoplopoma fimbria*), rockfishes (*Sebastes* spp.), arrowtooth flounder (*Atheresthes stomias*), lingcod (*Ophiodon elongatus*), Pacific herring (*Clupea pallasi*) and several invertebrate groups including crabs, scallops, and squid. The area surveyed included the entire Gulf of Alaska continental shelf out to a depth of 700 m. The entire area surveyed was approximately 308,416 km².

METHODS

The survey was conducted in four legs totaling 75 days aboard each of the three chartered commercial trawlers, the FV *Gladiator*, the FV *Northwest Explorer* and FV *Sea Storm*. The entire survey ran from 20 May to 9 August 2003 with the FV *Sea Storm* starting and ending a full week later than the other two vessels. Sampling began in the area of the Islands of Four Mountains (170° W long.) and continued eastward across the Gulf of Alaska to Dixon Entrance (133° 25' W long.) (Fig. 1).

VESSELS AND GEAR CHARACTERISTICS

All three chartered vessels are house-forward stern trawlers with hydraulic net reels and paired constant tension hydraulic trawl winches with 2.54 cm diameter steel cable (2.98 cm diameter for the FV *Northwest Explorer*) 1,800 m in length. All vessels have articulating hydraulic cranes for handling catches and gear. Each vessel has a single main diesel engine with a single-nozzled propeller (twin propellers on the FV *Northwest Explorer*). The FV *Gladiator* is 38 m long (LOA) with a main engine developing 1,715 continuous HP. The FV *Northwest Explorer* is 49.4 m long (LOA) with a 1,800 HP main engine. The FV *Sea Storm* is 37.5 m long (LOA) with a 1,800 HP main engine. Each vessel is equipped with a global positioning system (GPS) integrated with radar, computerized plotting and autopilot. Other essential electronics supplied by the vessels include color video fish finders, recording depth profilers, and trawl warp measuring systems. NMFS-supplied GPS-grade receivers recorded trawling position, time, and trackline position.

Standard methods as documented in Appendix 1 of “NOAA Protocols for Groundfish Bottom Trawl Surveys of the Nation’s Fishery Resources” (Stauffer 2004) were used for this survey. The rugged bathymetry prevalent in many areas requires the use of a roller gear footrope for all bottom trawling operations. The standard Poly-Nor’Eastern trawl with roller gear was used exclusively by all three vessels to sample the 807 assigned survey stations. Each trawl was measured and certified as conforming to standard measurements prior to use. The headrope is made of galvanized wire rope and is 27.2 m long with twenty-one 30-cm diameter plastic floats. The footrope is constructed of the same material and is 24.2 m long with sixteen 35.6-cm diameter rubber wing bobbins. The net was spread with 1.8×2.7 m steel V-doors weighing approximately 800 kg each. Detailed net specifications are documented by Stauffer (2004). A SCANMAR net mensuration system measured net width (wingtip-to-wingtip) and headrope height in near real time. After the haul was completed, data from a footrope-mounted

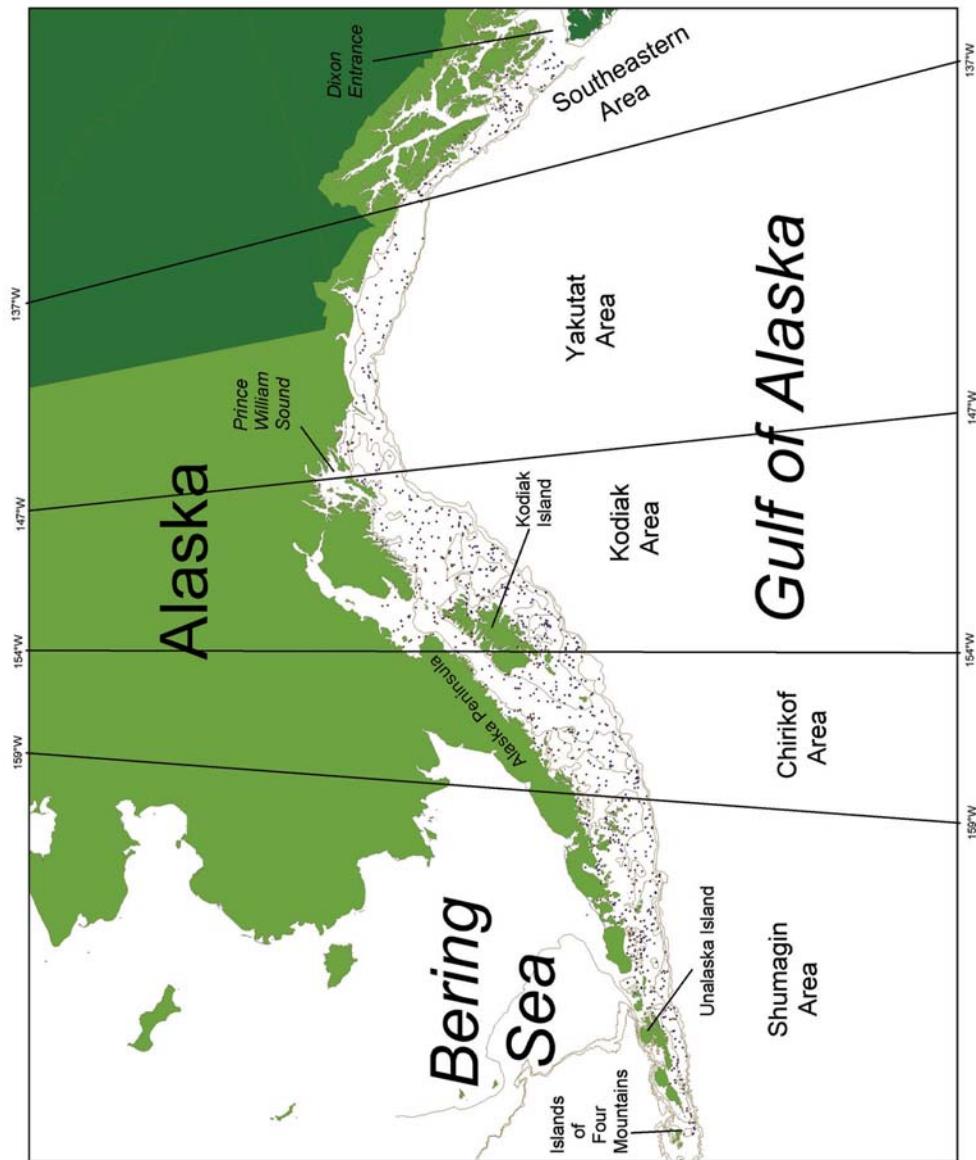

Figure 1.-- Survey stations attempted during the 2003 NMFS biennial Gulf of Alaska bottom trawl survey. Meridians shown define INPFC Management Area boundaries.

bottom contact sensor developed by the RACE Division was used to determine the actual time on bottom for the trawl. The bottom contact sensor is further described in Somerton and Weinberg (2001). Depth of each tow was measured and monitored with a Seabird (Model SBE 39) temperature-depth recorder mounted on the headrope of the net.

SURVEY DESIGN AND OPERATIONS

The 2003 survey design employed a stratified random sampling design consistent with previous surveys. The Gulf of Alaska was divided into 54 strata categorized by depth interval, type of geographical area (e.g., banks, gullies, and slopes) and International North Pacific Fisheries Commission (INPFC) statistical areas (Fig.1). Depth intervals were defined as less than 100, 101-200, 201-300, 301-500, and 501-700 m. In past years the survey included an additional depth stratum of 700 – 1,000 m, however this stratum was not sampled this particular year as none of the chartered vessels was equipped to effectively sample those depths. After the number of stations was allocated to each stratum, station grid cells were chosen randomly from a 5 x 5 km grid laid over the survey area.

During survey operations, the first suitable location encountered in the assigned grid cell was sampled. In choosing the exact location, only the condition of the seabed as indicated by the echo sounder was considered and not the presence or absence of fish. The target tow duration was 15 minutes; however, in cases where there was not enough trawlable bottom for a full 15 minute tow, shorter tows were completed. Minimal acceptable tow duration was 10 minutes. Attempts were made to maintain constant bottom depth, trawl wingspread, and towing speed (3 knots) during each tow. However, when depths changed significantly, the trawl warp was adjusted to maintain wingspread and bottom contact. The trawl opening tended to increase horizontally and decrease vertically with depth due to the increased amount of deployed trawl cable.

Catches weighing less than approximately 1,000 kg were completely sorted to species, weighed, and counted. Weights and numbers in larger catches (> 1,000 kg) were determined either by weighing with a load cell or by using volumetric calculations and subsample extrapolation. Biological data and specimens collected included fish lengths and weights, age structures, sexual maturities and special collections of stomachs, tissues, whole fish and invertebrates. Individual fish weight data were collected using a Marel Model M60 motion-compensated electronic scale.

Water temperature profiles were collected at each station using the headrope-mounted Seabird temperature-depth recorder and additional sea surface temperatures were measured using calibrated thermometers. All trawling procedures and protocols are described by Stauffer (2004).

RESULTS

Sampling proceeded east from the Islands of Four Mountains along the continental shelf to Dixon Entrance at fishing depths ranging from 13 to 667 m. Successful hauls were completed for 809 of 876 attempted tows. The average net opening was 15.9 m wide by 6.8 m high. Survey tow duration averaged 15.85 minutes, distance fished averaged 1.47 km and towing speed averaged 5.5 km (3.0 nautical miles) per hour over the bottom.

Catches included more than 180 species of fish and 350 species of invertebrates. The dominant fish species are ranked by mean catch per unit effort in Table 1, expressed as total catch in kilograms per hectare ($10,000 \text{ m}^2$) of bottom area sampled within each of the five sampled INPFC statistical areas. Arrowtooth flounder (91.41 kg/ha), Pacific halibut (20.48 kg/ha), Pacific ocean perch (14.83 kg/ha) and walleye pollock (13.73 kg/ha) accounted for the largest catches per area swept. Catch rates were generally highest in the Kodiak INPFC area (154° W long. to 147° W long.) followed by the Chirikof area (159° W long. to 154° W long.). In both areas high catch rates were due largely to very high catch rates of arrowtooth flounder (172.76 kg/ha and 77.27

kg/ha, respectively). The Shumagin area had the greatest catch rate of walleye pollock (33.70 kg/ha) as well as southern and northern rock sole (8.71 and 6.81 kg/ha, respectively), while the Kodiak area produced the highest rate for Pacific cod (13.30 kg/ha) as well as Pacific halibut (30.64 kg/ha). Catch rates were generally lowest in the Yakutat and Southeast areas (147° W long. to Dixon Entrance). Deepwater species occurring in catches along the continental slope generally included the grenadier family, sablefish, shortspine thornyhead (*Sebastolobus alascanus*), longspine thornyhead (*Sebastolobus altivelis*) and shorthraker rockfish (*Sebastodes borealis*). Catches of invertebrates are shown but should be viewed only as an index and not directly comparable to fish given our use of rollergear footropes on the trawls.

The biological data collected to determine length frequency distributions included measurements of nearly 280,000 fish representing 90 species. Specimen data were collected from 51 species including 15 rockfish, 10 flatfish, 6 skates, 3 salmonids, 2 gadids, and 3 sharks. The specimen data collection included 13,446 age structures and 13,005 individual weight measurements. Additionally, over 2,483 stomach samples were collected from 13 different species for AFSC Resource Ecology and Fisheries Management Division trophic interaction studies.

Oceanographic data included sea temperature measurements and bottom type classification. Sea surface temperatures were collected at 861 survey stations and averaged 9.93°C with a range of 5.6°C to 15.8°C. Bottom temperatures were taken from 858 stations and averaged 6.07°C with a range of 3.6°C to 11.8°C.

ORGANIZATION OF REPORT AND DATA STANDARDIZATIONS

The purpose of this report is to provide the fishing industry and public with pertinent catch information collected by the survey vessels. The report focuses on data collected at individual stations for the principal species encountered during the survey. The fishing

results are presented in Section 1 for the FV *Gladiator*, Section 2 for the FV *Northwest Explorer* and Section 3 for the FV *Sea Storm*. Each section has two parts: 1) station charts with haul numbers plotted adjacent to their respective geographical locations and 2) summary listings of species caught in each haul. A combined fishing log for all three vessels showing catches ranked by weight for selected commercial species is listed in Section 4. The combined fishing log includes catches of rockfish species, Atka mackerel (*Pleurogrammus monopterygius*), walleye pollock, Pacific cod, flatfish species, lingcod, Pacific herring, king and Tanner crab, scallops, shrimp, octopus, and red squid (*Berryteuthis magister*). Explanations of the performance codes appearing in the fishing logs are summarized in Table 2.

Table 2. -- Performance codes used during the 2003 Gulf of Alaska bottom trawl survey.

Codes	Performance
0	Good performance
1	Satisfactory performance, hung up
1.1	Satisfactory performance, minor hang(s)
1.11	Satisfactory performance, completed tow
1.12	Satisfactory performance, hauled back early due to hang(s)
2	Satisfactory performance, unspecified gear damage
2.1	Satisfactory performance, wing damaged
2.3	Satisfactory performance, footrope damaged
2.4	Satisfactory performance, belly damaged
3	Satisfactory performance, gear conflict, unspecified
3.1	Satisfactory performance, caught pot, unspecified type
3.13	Satisfactory performance, Alaskan crab pot
3.2	Satisfactory performance, caught on longline gear
4.1	Satisfactory performance, caught large rock
4.2	Satisfactory performance, caught large quantity of mud
4.4	Satisfactory performance, large fish catch affected net performance
5	Satisfactory performance, unspecified gear performance problem
5.1	Satisfactory performance, net came off bottom
5.41	Satisfactory performance, door digging or falling over
5.5	Satisfactory performance, net crabbing severely
6	Satisfactory performance, unspecified problems
6.1	Satisfactory performance, depth change over tow exceeds survey defined limits
6.24	Satisfactory performance, scope change during tow
6.31	Satisfactory performance, haulback delayed due to mechanical problems
-1	Unsatisfactory performance, hung up
-1.11	Unsatisfactory performance, completed tow
-1.12	Unsatisfactory performance, hauled back early due to hang(s)
-1.2	Unsatisfactory performance, major hang, stopped forward progress of vessel
-2	Unsatisfactory performance, unspecified gear damage
-2.1	Unsatisfactory performance, wing damaged
-2.4	Unsatisfactory performance, belly damaged
-2.5	Unsatisfactory performance, bridle damaged
-2.7	Unsatisfactory performance, net completely destroyed
-3.1	Unsatisfactory performance, caught pot, unspecified type

Table 2. -- (Continued).

-3.12	Unsatisfactory performance, Dungeness crab pot
-3.13	Unsatisfactory performance, Alaskan crab pot
-4	Unsatisfactory performance, caught unspecified object
-4.1	Unsatisfactory performance, caught large rock
-4.4	Unsatisfactory performance, large fish catch affected net performance
-5	Unsatisfactory performance, unspecified gear performance problem
-5.1	Unsatisfactory performance, net came off bottom
-5.2	Unsatisfactory performance, net improperly configured, unspecified reason
-5.23	Unsatisfactory performance, headrope/footrope tangled
-5.4	Unsatisfactory performance, unspecified door problem
-5.6	Unsatisfactory performance, codend not closed properly
-5.7	Unsatisfactory performance, net unable to reach bottom due to strong currents
-6	Unsatisfactory performance, unspecified problems
