

National Aeronautics and Space Administration Jet Propulsion Laboratory California Institute of Technology Pasadena, California To: M106 From 22 million light-years away, galaxy M106 extends two ultraviolet-bright spiral arms in this image from NASA's Galaxy Evolution Explorer. M106's extended arms are the blue filaments that curve around the edge of the galaxy, creating its outer disk. Tints of blue in the galaxy's arms reveal hot, young, massive stars. Meanwhile, traces of gold toward the center reveal an older stellar population and the presence of obscuring dust. Credit: NASA/JPL-Caltech www.nasa.gov
