

United States Department of the Interior
BUREAU OF LAND MANAGEMENT

Utah State Office
P.O. Box 45155
Salt Lake City, UT 84145-0155
<http://www.blm.gov>

IN REPLY REFER TO:

UT-090-1610-017J

Dear Reader:

Enclosed is the Proposed Resource Management Plan (PRMP) and Final Environmental Impact Statement (FEIS) for the Monticello Field Office. The Bureau of Land Management (BLM) prepared the PRMP/FEIS in consultation with cooperating agencies, taking into account public comments received during this planning effort. This PRMP/FEIS provides a framework for the future management direction and appropriate use of BLM-administered lands and resources located in San Juan and Grand counties, Utah. The document contains both land use planning decisions and implementation decisions to guide the BLM's management of the Monticello Field Office. The PRMP/FEIS is open for a 30-day review and protest period beginning the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability of the FEIS in the *Federal Register*.

This PRMP/FEIS has been developed in accordance with the National Environmental Policy Act of 1969 (NEPA) and the Federal Land Policy and Management Act of 1976 (FLPMA). The PRMP/FEIS is largely based on Alternative C, the Preferred Alternative in the Draft RMP and EIS, which was released in November 2007. This PRMP/FEIS contains the proposed plan and potential impacts of the proposed plan. The alternatives presented in the Draft RMP/EIS are also provided for comparative purposes. Major comments received during the public review period of the Draft RMP/EIS and responses to these comments are provided on an attached CD. To aid the reader, substantive changes made between the Draft RMP/EIS and the PRMP/FEIS are described in Chapter 1 and are detailed in Appendix S.

Pursuant to BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this PRMP and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions within 30 days from date the Environmental Protection Agency publishes the Notice of Availability in the *Federal Register*. For further information on filing a protest, please see the accompanying protest regulations in the pages that follow (labeled as Attachment 1). The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.). To aid in ensuring the completeness of your protest, a protest check list is attached to this letter (labeled as Attachment 2). If your protest does not include all of the elements outlined in 43 CFR 1610.5-2 the BLM will not respond to your protest.

E-mailed and faxed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular or overnight mail postmarked by the close of the protest period. Under these conditions, the BLM will consider the e-mailed or faxed protest as an advance copy and will

All protests, including the follow-up letter (if e-mailing or faxing) must be in writing and mailed to the following address:

Regular Mail:

Director (210)
Attention: Brenda Williams
P.O. Box 66538
Washington, D.C. 20035

Overnight Mail:

Director (210)
Attention: Brenda Williams
1620 L Street, N.W., Suite 1075
Washington, D.C. 20036

Before including your address, phone number, e-mail address, or other personal identifying information in your protest, be advised that your entire protest – including your personal identifying information – may be made publicly available at any time. While you can ask us in your protest to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

The BLM Director will make every attempt to promptly render a decision on each protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior.

Upon resolution of all land use plan protests, the BLM will issue an Approved RMP and Record of Decision (ROD). The Approved RMP and ROD will be mailed or made available electronically to all who participated in the planning process and will be available to all parties through the “Planning” page of the BLM national website (<http://www.blm.gov/planning>), or by mail upon request.

Unlike land use planning decisions, implementation decisions are not subject to protest under the BLM planning regulations, but are subject to an administrative review process, through appeals to the Office of Hearings and Appeals (OHA), Interior Board of Land Appeals (IBLA) pursuant to 43 CFR, Part 4 Subpart E. Implementation decisions generally constitute the BLM’s final approval allowing on-the-ground actions to proceed. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program regulations once the BLM resolves the protests to land use planning decisions and issues an Approved RMP and ROD. Implementation-level decisions in the PRMP/FEIS are indicated by *italic text* and an asterisk (*) in Chapter 2. The Approved RMP and ROD will also clearly identify the implementation decisions made in the plan that may be appealed to the Office of Hearing and Appeals.

Sincerely,

Selma Sierra
Utah State Director

TITLE 43--PUBLIC LANDS: INTERIOR

CHAPTER II--BUREAU OF LAND MANAGEMENT, DEPARTMENT OF THE INTERIOR

PART 1600--PLANNING, PROGRAMMING, BUDGETING--Table of Contents

Subpart 1610--Resource Management Planning

Sec. 1610.5-2 Protest procedures.

(a) Any person who participated in the planning process and has an interest which is or may be adversely affected by the approval or amendment of a resource management plan may protest such approval or amendment. A protest may raise only those issues which were submitted for the record during the planning process.

(1) The protest shall be in writing and shall be filed with the Director. The protest shall be filed within 30 days of the date the Environmental Protection Agency published the notice of receipt of the final environmental impact statement containing the plan or amendment in the Federal Register. For an amendment not requiring the preparation of an environmental impact statement, the protest shall be filed within 30 days of the publication of the notice of its effective date.

(2) The protest shall contain:

(i) The name, mailing address, telephone number and interest of the person filing the protest;

(ii) A statement of the issue or issues being protested;

(iii) A statement of the part or parts of the plan or amendment being protested;

(iv) A copy of all documents addressing the issue or issues that were submitted during the planning process by the protesting party or an indication of the date the issue or issues were discussed for the record; and

(v) A concise statement explaining why the State Director's decision is believed to be wrong.

(3) The Director shall promptly render a decision on the protest. The decision shall be in writing and shall set forth the reasons for the decision. The decision shall be sent to the protesting party by certified mail, return receipt requested.

(b) The decision of the Director shall be the final decision of the Department of the Interior.

**Resource Management Plan Protest
Critical Item Checklist**

**The following items *must* be included to constitute a valid protest
whether using this optional format, or a narrative letter.
(43 CFR 1610.5-2)**

Before including your address, phone number, e-mail address, or other personal identifying information in your **protest**, be advised that your entire **protest**--including your personal identifying information--may be made publicly available at any time. While you can ask us in your **protest** to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so. All submissions from organizations and businesses, and from individuals identifying themselves as representatives or officials of organizations and businesses, will be available for public inspection in their entirety.

Resource Management Plan (RMP) or Amendment (RMPA) being protested:

Selma Sierra
Utah State Director

Monticello Field Office
Proposed Resource Management Plan and Final Environmental Impact Statement

Lead Agency: U.S. Department of the Interior, Bureau of Land Management

Type of Action: Draft () Final (X)
Administrative (X) Legislative ()

Jurisdiction: Southern two-thirds of San Juan County with a small portion on the northern boundary within Grand County, Utah.

Abstract: The Monticello Proposed Resource Management Plan (RMP) and Final Environmental Impact Statement (EIS) describes and analyzes alternatives for the planning and management of public lands and resources administered by the Bureau of Land Management (BLM), Monticello Field Office. The Proposed RMP is open for a 30-day review and protest period beginning the date the U.S. Environmental Protection Agency publishes the Notice of Availability of the Final EIS in the Federal Register.

The **Proposed Plan** consists of a combination of proposed decisions taken from an array of all the alternatives but using Alternative C (Preferred Alternative) from the Draft RMP/Draft EIS as its base. This combination of decisions was developed in response to internal, public and cooperating agency comments. It provides a balanced means to accommodate the widest range of public and agency concerns over resources and resource uses. It provides for continued access to and development of resources with stipulations and mitigation to protect natural and cultural resources.

Alternative A (No Action) is a continuation of existing management practices defined in the 1991 San Juan Resource Management Plan, as amended. **Alternative B** minimizes human activities, offers more protection for wildlife and other natural resources, and favors natural systems over commodities development. **Alternative C** (Preferred Alternative) balances the protection of important environmental values and sensitive resources with commodities development. **Alternative D** emphasizes commodities development over the protection of natural resources. **Alternative E** is based on Alternative B, except it emphasizes protection of 582,360 acres of non-WSA lands with wilderness characteristics and allows for other activities consistent with that emphasis.

Protest/Comment: Protests must be postmarked or received no later than 30 days after publication of the EPA Notice of Availability in the Federal Register. The 30-day protest period (identified above) will not be extended. Refer to the instructions in the letter preceding this abstract for additional information on how to protest and comment. The close of the protest period will be announced in news releases, newsletters, and on the Monticello RMP website at: <http://www.blm.gov/ut/st/en/fo/monticello/planning.html>

3.13 Socioeconomics.....	3-110
3.13.1 County Overview	3-110
3.13.2 Historical Social Context	3-111
3.13.3 Recent Regional History	3-111
3.13.4 Current Day Social and Economic Context.....	3-112
3.13.4.1 Social Setting	3-112
3.13.4.2 Economic Setting	3-114
3.13.4.2.1 Population	3-115
3.13.4.2.2 Unemployment.....	3-116
3.13.4.2.3 Per-capita Personal Income	3-117
3.13.4.2.4 Poverty	3-118
3.13.4.2.5 Housing.....	3-118
3.13.4.2.6 Employment.....	3-119
3.13.4.2.7 Local Economic Activity Affected by BLM Management	3-122
3.13.4.3 Tribal Interests	3-128
3.13.5 Environmental Justice	3-129
3.13.5.1 Background and Regulatory Guidance	3-129
3.13.5.2 Minority and Low-income Populations	3-129
3.13.5.3 Additional Environmental Justice Issues	3-130
3.14 Soils and Water	3-130
3.14.1 Resource Overview	3-130
3.14.2 Watersheds and General Topography	3-130
3.14.3 Geology.....	3-131
3.14.4 Soils.....	3-131
3.14.4.1 Soil Data.....	3-132
3.14.4.2 Soil Classification	3-132
3.14.4.3 Sensitive Soils.....	3-133
3.14.4.3.1 Erodible Soils.....	3-133
3.14.4.3.2 Saline and Sodic Soils.....	3-134
3.14.4.3.3 Reclamation-sensitive Soils	3-134
3.14.4.3.4 Biological Soil Crusts	3-134

3.14.5 Surface Water Supply and Use	3-134
3.14.6 Municipal Watersheds	3-136
3.14.7 Surface Water Quality.....	3-137
3.15 Special Designations	3-140
3.15.1.1 Introduction.....	3-140
3.15.1.2 Regional Overview	3-141
3.15.1.3 Existing ACECs.....	3-141
3.15.1.4 Potential ACECs.....	3-142
3.15.2 Wild and Scenic Rivers.....	3-147
3.15.2.1 Introduction.....	3-147
3.15.2.2 Eligible Segments	3-148
3.15.3 Lands Studied for Congressional Wilderness Designation under FLPMA Section 603.....	3-150
3.15.3.1 Background and History	3-150
3.15.3.2 Planning Area Profile.....	3-151
3.16 Special Status Species	3-154
3.16.1 Special Status Species Habitat.....	3-154
3.16.2 Federally Threatened and Endangered Species	3-155
3.16.3 BLM Sensitive Species	3-159
3.16.3.1 Special Status Wildlife Species	3-159
3.16.3.2 Special Status Plant Species.....	3-162
3.17 Travel Management.....	3-165
3.17.1 Overview.....	3-165
3.17.2 Current Management Practices	3-165
3.17.3 Issues.....	3-165
3.17.4 Vehicular Routes.....	3-166
3.17.4.1 High Use Areas	3-166
3.17.4.2 Scenic Byways and Backways.....	3-166
3.17.4.2.1 Scenic Byways.....	3-167
3.17.4.2.2 Scenic Backways	3-167
3.17.4.3 San Juan River	3-168
3.18 Vegetation.....	3-168
3.18.1 Introduction and Resource Overview	3-168
3.18.1.1 Pinyon-juniper.....	3-169
3.18.1.2 Desert Shrub.....	3-170
3.18.1.3 Sagebrush/ Perennial Grass.....	3-170
3.18.1.4 Riparian and Wetland Communities.....	3-171
3.18.1.5 Conifer/ Mountain Shrub	3-171
3.18.1.6 Invasive Plants and Noxious Weeds.....	3-172
3.18.2 Seed and Plant Collection	3-174
3.19 Visual Resources	3-174

3.19.1 Resource Overview	3-174
3.19.2 Current Management Practices	3-175
3.19.2.1 Current Conditions.....	3-177
3.19.2.2 Trends	3-177
3.20 Wildlife and Fisheries.....	3-178
3.20.1 Resource Overview	3-178
3.20.2 Big Game Species	3-178
3.20.2.1 Mule Deer (<i>Odocoileus hemionus</i>)	3-178
3.20.2.2 Rocky Mountain Elk (<i>Cervus elaphus nelsoni</i>)	3-179
3.20.2.3 Pronghorn (<i>Antilocapra americana</i>).....	3-179
3.20.2.4 Desert Bighorn Sheep (<i>Ovis canadensis nelsoni</i>).....	3-180
3.20.2.5 Other Big Game Species.....	3-181
3.20.3 Avian Species.....	3-181
3.20.3.1 Raptors	3-181
3.20.3.2 Waterfowl	3-182
3.20.3.3 Upland Game Birds.....	3-182
3.20.3.4 Neotropical Migratory Birds.....	3-183
3.20.4 Fish and Amphibian Species.....	3-185
3.20.5 Other Wildlife Habitat	3-186
3.21 Woodlands	3-186
3.21.1 Resource Overview	3-186
3.21.2 Current Management Practices	3-187
3.21.2.1 Allocations	3-187
3.21.2.2 Current Conditions.....	3-188
3.21.3 Resource Demand and Forecast.....	3-189
Chapter 4: Environmental Consequences of the Proposed Plan and Draft Alternatives (Part 1)	4-1
4.1. Introduction.....	4-1
4.1.1. Analytical Assumptions and Guidelines	4-2
4.1.2. Assumptions and Methodology for Mineral Development	4-3
4.1.3. Types of Impacts to Be Addressed—Direct, Indirect, and Cumulative.....	4-6
4.2. Impacts to Critical Elements	7
4.2.1. Impacts of Alternatives on Prime and Unique Farmlands	7
4.2.2. Impacts of Alternatives on Invasive and/or Noxious Non-native Plants	7
4.2.3. Incomplete or Unavailable Information.....	7
4.3. Environmental Consequences of the Proposed Plan and All Alternatives.....	4-8
4.3.1. Air Quality and Climate.....	4-8
4.3.1.1. Global Climate Change.....	4-8
4.3.1.2. Impacts Common to All Alternatives	4-8

4.3.1.2.1. Potential Impacts from Prescribed Fire	4-9
4.3.1.2.2. Potential Impacts from Abandoned Mine Lands	4-10
4.3.1.3. Impacts from Alternatives.....	4-10
4.3.1.3.1. Analysis Assumptions.....	4-11
4.3.1.3.2. Alternative A.....	4-15
4.3.1.3.3. Alternative B.....	4-18
4.3.1.3.4. Alternative C.....	4-20
4.3.1.3.5. Alternative D.....	4-23
4.3.1.3.6. Alternative E.....	4-25
4.3.1.3.7. Proposed Plan	4-28
4.3.1.4. Summary of Impacts	4-30
4.3.1.5. Mitigation Measures	4-33
4.3.1.6. Unavoidable Adverse Impacts	4-36
4.3.1.7. Short-term Use versus Long-term Productivity.....	4-36
4.3.1.8. Irreversible and Irretrievable Impacts	4-36
4.3.2. Cultural Resources.....	4-37
4.3.2.1. Impacts Common to the Proposed Plan and All Alternatives.....	4-39
4.3.2.2. Impacts Common to the Proposed Plan and All Action Alternatives.....	4-41
4.3.2.3. Impacts from the Proposed Plan and Alternatives.....	4-42
4.3.2.3.1. Alternative A.....	4-42
4.3.2.3.2. Alternative B.....	4-46
4.3.2.3.3. Alternative C.....	4-50
4.3.2.3.4. Alternative D.....	4-53
4.3.2.3.5. Alternative E.....	4-56
4.3.2.3.6. Proposed Plan	4-58
4.3.2.4. Summary of Impacts	4-61
4.3.2.5. Mitigation Measures	4-62
4.3.2.6. Unavoidable Adverse Impacts	4-62
4.3.2.7. Short-term Use Versus Long-term Productivity	4-63
4.3.2.8. Irreversible and Irretrievable Impacts	4-63
4.3.3. Fire Management	4-64
4.3.3.1. Impacts Common to the Proposed Plan and All Alternatives.....	4-64
4.3.3.1.1. Impacts of Air Quality Decisions on Fire Management	4-64
4.3.3.1.2. Impacts of Fire Management Decisions on Fire Management	4-64
4.3.3.1.3. Impacts of Lands and Realty Decisions on Fire Management	4-65
4.3.3.2. Proposed Plan and Alternatives Impacts.....	4-65
4.3.3.2.1. Impacts of Cultural Resource Decisions on Fire Management	4-65
4.3.3.2.2. Impacts of Minerals Decisions on Fire Management	4-68
4.3.3.2.3. Impact of Non-WSA Lands with Wilderness Characteristics Decisions on Fire Management	4-69
4.3.3.2.4. Impact of Recreation Decisions on Fire Management.....	4-70
4.3.3.2.5. Impacts of Special Designations Decisions on Fire Management.....	4-71
4.3.3.2.6. Impacts of Travel Decisions on Fire Management	4-74
4.3.3.3. Summary of Impacts	4-75
4.3.3.4. Mitigation Measures	4-75
4.3.3.5. Unavoidable Adverse Impacts	4-75
4.3.3.6. Short-term Use versus Long-term Productivity.....	4-75

4.3.3.7. Irreversible and Irretrievable Impacts	4-75
4.3.4. Health and Safety	4-76
4.3.4.1. Impacts Common to All Alternatives and the Proposed Plan.....	4-76
4.3.4.2. Impacts from Alternatives and the Proposed Plan.....	4-79
4.3.4.2.1. Alternative A.....	4-79
4.3.4.2.2. Alternative B.....	4-79
4.3.4.2.3. Alternative C.....	4-79
4.3.4.2.4. Alternative D.....	4-80
4.3.4.2.5. Alternative E.....	4-80
4.3.4.2.6. Proposed Plan	4-80
4.3.4.3. Summary of Impacts	4-80
4.3.4.4. Mitigation Measures	4-80
4.3.4.5. Unavoidable Adverse Impacts	4-80
4.3.4.6. Short-term Use Versus Long-term Productivity	4-81
4.3.4.7. Irreversible and Irretrievable Impacts	4-81
4.3.5. Lands and Realty	4-82
4.3.5.1. Impacts Common to the Proposed Plan and All Alternatives.....	4-82
4.3.5.2. Impacts Common to the Proposed Plan and All Action Alternatives.....	4-83
4.3.5.3. Alternatives Impacts	4-84
4.3.5.3.1. Alternative A.....	4-84
4.3.5.3.2. Proposed Plan and Alternatives B through E.....	4-85
4.3.5.4. Mitigation Measures	4-85
4.3.5.5. Unavoidable Adverse Impacts	4-85
4.3.5.6. Short-Term Use Versus Long-Term Productivity	4-86
4.3.5.7. Irreversible and Irretrievable Impacts	4-86
4.3.6. Livestock Grazing	4-87
4.3.6.1. Impacts Common to the Proposed Plan and All Alternatives.....	4-89
4.3.6.2. Impacts Common to the Proposed Plan and All Action Alternatives.....	4-92
4.3.6.3. Proposed Plan and Alternatives Impacts.....	4-93
4.3.6.3.1. Alternative A.....	4-93
4.3.6.3.2. Alternative B.....	4-95
4.3.6.3.3. Alternative C.....	4-99
4.3.6.3.4. Alternative D.....	4-102
4.3.6.3.5. Alternative E.....	4-104
4.3.6.3.6. The Proposed Plan	4-106
4.3.6.4. Summary of Impacts	4-108
4.3.6.5. Mitigation Measures	4-110
4.3.6.6. Unavoidable Adverse Impacts	4-110
4.3.6.7. Short-term Use versus Long-term Productivity	4-110
4.3.6.8. Irreversible and Irretrievable Impacts	4-110
4.3.7. Minerals	4-112
4.3.7.1. Summary of Leasable Mineral RFD	4-113
4.3.7.2. Summary of Geophysical RFD	4-114
4.3.7.3. Summary of Locatable Mineral RFD and Salable Mineral RFD	4-114
4.3.7.4. Impacts Common to All Alternatives	4-114

4.3.7.4.1. Impacts of Cultural Resource Decisions on Mineral Resource Development.....	4-115
4.3.7.4.2. Impacts of Lands and Realty Decisions on Mineral Resource Development.....	4-115
4.3.7.4.3. Impacts of Recreation Decisions on Mineral Resource Development	4-115
4.3.7.4.4. Impacts of Riparian Resource Decisions on Mineral Resource Development.....	4-116
4.3.7.4.5. Impacts of Minerals Decisions on Mineral Resource Development	4-116
4.3.7.4.6. Impacts of Soils and Watershed Decisions on Mineral Resource Development.....	4-117
4.3.7.4.7. Impacts of Special Designations on Mineral Resource Development.....	4-117
4.3.7.4.8. Impacts of Special Status Species on Mineral Resource Development...	4-118
4.3.7.4.9. Impacts of Visual Resource Decisions on Mineral Resource Development.....	4-122
4.3.7.4.10. Impacts of Wildlife and Fisheries Decisions on Mineral Resource Development.....	4-123
4.3.7.4.11. Impacts of Other Lands Managed by BLM on Mineral Resource Development.....	4-123
4.3.7.5. Alternatives Impacts	4-123
4.3.7.5.1. Alternative A.....	4-123
4.3.7.5.2. Alternative B.....	4-135
4.3.7.5.3. Alternative C.....	4-146
4.3.7.5.4. Alternative D.....	4-155
4.3.7.5.5. Alternative E.....	4-164
4.3.7.5.6. Proposed Plan	4-172
4.3.7.6. Mitigation Measures	4-181
4.3.7.7. Unavoidable Adverse Impacts	4-181
4.3.7.8. Short-term Use versus Long-term Productivity.....	4-182
4.3.7.9. Irreversible and Irretrievable Impacts	4-182
4.3.7.10. Summary of Impacts	4-182

VOLUME 2

CHAPTER 4: Environmental Consequences of the Proposed Plan and Draft Alternatives (Part 2)

4.3.8. Non-WSA Lands with Wilderness Characteristics.....	4-183
4.3.8.1. Impacts of Cultural Resources Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-183
4.3.8.1.1. Alternative A.....	4-184
4.3.8.1.2. Alternative B.....	4-184
4.3.8.1.3. Alternative C.....	4-185
4.3.8.1.4. Alternative D.....	4-186
4.3.8.1.5. Alternative E.....	4-186
4.3.8.1.6. Proposed Plan	4-187
4.3.8.2. Impacts of Fire Management Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-188
4.3.8.3. Impacts of Lands and Realty Management Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-189
4.3.8.3.1. Impacts Common to the Proposed Plan and All Alternatives	4-189
4.3.8.3.2. Alternative A.....	4-189
4.3.8.3.3. Alternative B.....	4-193
4.3.8.3.4. Alternative C.....	4-194
4.3.8.3.5. Alternative D.....	4-194
4.3.8.3.6. Alternative E.....	4-195
4.3.8.3.7. Proposed Plan	4-195
4.3.8.4. Impacts of Livestock Grazing on Non- WSA Lands with Wilderness Characteristics.....	4-197
4.3.8.5. Impacts of Mineral Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-197
4.3.8.5.1. Oil and Gas	4-197
4.3.8.5.2. Impacts Associated with Oil and Gas Leasing/Development under the Proposed Plan and All Alternatives.....	4-200
4.3.8.5.3. Salable Minerals	4-218
4.3.8.5.4. Locatable Minerals	4-221
4.3.8.6. Impacts of Non- WSA Lands with Wilderness Characteristics Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-223
4.3.8.6.1. Alternatives A, B, C, and D	4-223
4.3.8.6.2. Alternative E.....	4-223
4.3.8.6.3. Proposed Plan	4-224
4.3.8.7. Impacts of Paleontological Resource Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-225
4.3.8.8. Impacts of Recreation Decisions on WSA Lands with Wilderness Characteristics.....	4-226
4.3.8.8.1. Special Recreation Management Areas (SRMAs).....	4-226
4.3.8.8.2. Extensive Recreation Management Areas (ERMAs)	4-241
4.3.8.9. Impacts of Travel Management Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-245
4.3.8.9.1. Off-Highway Vehicle (OHV) Travel Management.....	4-245

4.3.8.9.2. Mechanized Recreational Travel (Mountain Bikes).....	4-256
4.3.8.10. Impacts of Riparian Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-257
4.3.8.11. Impacts of Soils/Watershed Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-258
4.3.8.11.1. Alternative A.....	4-258
4.3.8.11.2. Alternatives B, C, and D.....	4-258
4.3.8.11.3. Alternative E.....	4-259
4.3.8.11.4. Proposed Plan	4-259
4.3.8.12. Impacts of Special Designation Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-259
4.3.8.12.1. Alternative A.....	4-260
4.3.8.12.2. Alternative B.....	4-263
4.3.8.12.3. Alternative C.....	4-266
4.3.8.12.4. Alternative D.....	4-267
4.3.8.12.5. Alternative E.....	4-268
4.3.8.12.6. Proposed Plan	4-269
4.3.8.13. Impact of Special Status Species Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-271
4.3.8.14. Impacts of Vegetation Decisions on Non-WSA Lands with Wilderness Characteristics.....	4-272
4.3.8.15. Impacts of Visual Resource Management Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-273
4.3.8.15.1. Impacts Common to the Proposed Plan and All Alternatives	4-273
4.3.8.15.2. Alternative A.....	4-277
4.3.8.15.3. Alternative B.....	4-278
4.3.8.15.4. Alternative C.....	4-278
4.3.8.15.5. Alternative D.....	4-278
4.3.8.15.6. Alternative E.....	4-279
4.3.8.15.7. Proposed Plan	4-279
4.3.8.16. Impacts of Wildlife and Fisheries Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-279
4.3.8.17. Impacts of Woodland and Forest Decisions on Non- WSA Lands with Wilderness Characteristics.....	4-283
4.3.8.17.1. Alternative A.....	4-284
4.3.8.17.2. Alternative B.....	4-285
4.3.8.17.3. Alternative C.....	4-285
4.3.8.17.4. Alternative D.....	4-286
4.3.8.17.5. Alternative E.....	4-286
4.3.8.17.6. Proposed Plan	4-286
4.3.8.18. Summary of Impacts.....	4-287
4.3.8.18.1. Alternative A–No Action.....	4-287
4.3.8.18.2. Alternative B.....	4-288
4.3.8.18.3. Alternative C.....	4-288
4.3.8.18.4. Alternative D.....	4-289
4.3.8.18.5. Alternative E.....	4-289
4.3.8.18.6. Proposed Plan	4-290
4.3.8.19. Mitigation Measures	4-290

4.3.8.20. Unavoidable Adverse Impacts	4-291
4.3.8.21. Short-term Use versus Long-term Productivity	4-292
4.3.8.22. Irreversible and Irretrievable Impacts	4-292
4.3.9. Paleontological Resources	4-294
4.3.9.1. Types of Paleontological Resource Impacts	4-296
4.3.9.1.1. Direct Impacts to Paleontological Resources	4-296
4.3.9.1.2. Indirect Impacts to Paleontological resources	4-297
4.3.9.2. Impacts Common to All Alternatives and the Proposed Plan.....	4-297
4.3.9.3. Alternatives and Proposed Plan Impacts.....	4-298
4.3.9.3.1. Impacts of Lands and Realty Decisions on Paleontological Resources ..	4-301
4.3.9.3.2. Impacts of Livestock Grazing Decisions on Paleontological Resources.....	4-303
4.3.9.3.3. Impacts of Minerals Decisions on Paleontological Resources	4-304
4.3.9.3.4. Impacts of Non-WSA Lands With Wilderness Characteristics Decisions on Paleontological Resources	4-309
4.3.9.3.5. Impacts of Recreation Decisions on Paleontological Resources	4-310
4.3.9.3.6. Impacts of Special Designations Decisions on Paleontological Resources.....	4-311
4.3.9.3.7. Impacts of Travel Decisions on Paleontological Resources	4-313
4.3.9.3.8. Impacts of Woodlands Decisions on Paleontological Resources	4-315
4.3.9.4. Summary of Impacts	4-316
4.3.9.5. Mitigation Measures	4-317
4.3.9.6. Unavoidable Adverse Impacts	4-318
4.3.9.7. Short-term Use versus Long-term Productivity Impacts	4-318
4.3.10. Recreation	4-319
4.3.10.1. Impacts Common to All Alternatives and the Proposed Plan.....	4-321
4.3.10.2. Impacts Common to All Action Alternatives and the Proposed Plan.....	4-323
4.3.10.3. Alternatives and Proposed Plan Impacts.....	4-325
4.3.10.3.1. Impacts of Cultural Decisions on Recreation	4-325
4.3.10.3.2. Impacts of Lands and Realty Decisions on Recreation	4-329
4.3.10.3.3. Impacts of Livestock Grazing Decisions on Recreation.....	4-330
4.3.10.3.4. Impacts of Minerals Decisions on Recreation	4-331
4.3.10.3.5. Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Recreation	4-333
4.3.10.3.6. Impacts of Recreation Decisions on Recreation	4-335
4.3.10.3.7. Impacts of Riparian Decisions on Recreation.....	4-364
4.3.10.3.8. Impacts of Soils/Watershed Resources Decisions on Recreation.....	4-365
4.3.10.3.9. Impacts of Special Designation–ACEC Decisions on Recreation.....	4-366
4.3.10.3.10. Impacts of Special Designation–Wild and Scenic Rivers Decisions on Recreation	4-381
4.3.10.3.11. Impacts of Special Designation–Wilderness Decisions on Recreation.....	4-389
4.3.10.3.12. Impacts of Travel Decisions on Recreation	4-389
4.3.10.3.13. Impacts of Vegetation Decisions on Recreation.....	4-395
4.3.10.3.14. Impacts of Visual Resources Decisions on Recreation	4-396
4.3.10.3.15. Impacts of Wildlife Resources Decisions on Recreation.....	4-397
4.3.10.4. Summary of Impacts	4-398

4.3.10.5. Mitigation Measures	4-399
4.3.10.6. Unavoidable Adverse Impacts	4-399
4.3.10.7. Short-term Use vs. Long-term Productivity.....	4-399
4.3.10.8. Irreversible and Irretrievable Impacts	4-399
4.3.11. Riparian Resources	4-400
4.3.11.1. Impacts Common to All Alternatives	4-400
4.3.11.1.1. Impacts of Riparian Decisions Common to the Proposed Plan and All Alternatives.....	4-400
4.3.11.1.2. Impacts of Fire Decisions Common to the Proposed Plan and All Alternatives.....	4-402
4.3.11.1.3. Impacts of Lands and Realty Decisions Common to the Proposed Plan and All Alternatives.....	4-402
4.3.11.1.4. Impacts of Soil and Water Resources Decisions Common to the Proposed Plan and All Alternatives.....	4-402
4.3.11.1.5. Impacts of Vegetation Decisions Common to the Proposed Plan and All Alternatives.....	4-402
4.3.11.1.6. Impacts of Wildlife Decisions Common to the Proposed Plan and All Alternatives.....	4-403
4.3.11.1.7. Impacts of Woodland Decisions Common to the Proposed Plan and All Alternatives.....	4-403
4.3.11.2. Alternatives Impacts	4-403
4.3.11.2.1. Impacts of Lands and Realty Decisions on Riparian Resources	4-403
4.3.11.2.2. Impacts of Livestock Grazing Decisions on Riparian Resources.....	4-403
4.3.11.2.3. Impacts of Non-WSA Lands with Wilderness Characteristics on Riparian Resources	4-405
4.3.11.2.4. Impacts of Recreation Decisions on Riparian Resources	4-405
4.3.11.2.5. Impacts of Special Designations Decisions on Riparian Resources.....	4-411
4.3.11.2.6. Impacts of Special Status Species Decisions on Riparian Resources....	4-413
4.3.11.2.7. Impacts of Vegetation Decisions on Riparian Resources.....	4-414
4.3.11.2.8. Impacts of Visual Resource Decisions on Riparian Resources	4-415
4.3.11.3. Summary of Impacts	4-417
4.3.11.4. Mitigation Measures	4-417
4.3.11.5. Unavoidable Adverse Impacts	4-417

4.3.19.3.2. Alternatives B and E.....	4-700
4.3.19.3.3. Alternative C.....	4-701
4.3.19.3.4. Alternative D.....	4-702
4.3.19.3.5. Proposed Plan	4-702
4.3.19.3.6. Impacts of Cultural Resource Decisions on Wildlife and Fisheries	4-703
4.3.19.3.7. Impacts of Fire Management Decisions on Wildlife and Fisheries.....	4-709
4.3.19.3.8. Impacts of Lands and Realty Decisions on Wildlife and Fisheries	4-710
4.3.19.3.9. Impacts of Livestock Grazing Decisions on Wildlife and Fisheries	4-712
4.3.19.3.10. Impacts of Minerals Decisions on Wildlife and Fisheries.....	4-713
4.3.19.3.11. Impacts of Non-WSAs with Wilderness Characteristics Decisions on Wildlife and Fisheries.....	4-726
4.3.19.3.12. Impacts of Recreation Decisions on Wildlife and Fisheries.....	4-727
4.3.19.3.13. Impacts of Riparian Decisions on Wildlife and Fisheries	4-731
4.3.19.3.14. Impacts of Soils/Watershed Decisions on Wildlife and Fisheries.....	4-731
4.3.19.3.15. Impacts of Special Designation Decisions on Wildlife and Fisheries.....	4-733
4.3.19.3.16. Impacts of Special Status Species Decisions on Wildlife and Fisheries.....	4-736
4.3.19.3.17. Impacts of Travel Management Decisions on Wildlife and Fisheries.....	4-736
4.3.19.3.18. Impacts of Vegetation Decisions on Wildlife and Fisheries.....	4-738
4.3.19.3.19. Impacts of Visual Resources Decisions on Wildlife and Fisheries	4-739
4.3.19.3.20. Impacts of Woodlands Decisions on Wildlife and Fisheries.....	4-741
4.3.19.3.21. Impacts of Habitat Fragmentation on Wildlife	4-742
4.3.19.4. Summary of Impacts	4-747
4.3.19.5. Mitigation Measures	4-747
4.3.19.6. Unavoidable Adverse Impacts	4-747
4.3.19.7. Short-Term Use Versus Long-Term Productivity	4-747
4.3.19.8. Irreversible and Irretrievable Impacts.....	4-747
4.3.20. Woodlands	4-749
4.3.20.1. Impacts Common to All Alternatives and the Proposed Plan.....	4-749
4.3.20.2. Impacts Common to All Action Alternatives and the Proposed Plan.....	4-749
4.3.20.3. Alternatives and Proposed Plan Impacts.....	4-750
4.3.20.3.1. Alternative A.....	4-751
4.3.20.3.2. Alternative B.....	4-755
4.3.20.3.3. Alternative C.....	4-759
4.3.20.3.4. Alternative D.....	4-761
4.3.20.3.5. Alternative E.....	4-763
4.3.20.3.6. Proposed Plan	4-767
4.3.20.4. Summary of Impacts	4-770
4.3.20.5. Mitigation Measures	4-770
4.3.20.6. Unavoidable Adverse Impacts	4-771
4.3.20.7. Short-term Use vs. Long-term Productivity.....	4-771
4.3.20.8. Irreversible and Irretrievable Impacts.....	4-771

4.4. Cumulative Impacts.....	4-772
4.4.1. Cumulative Impacts on Air Quality	4-773
4.4.2. Cumulative Impacts on Cultural Resources.....	4-774
4.4.3. Cumulative Impacts on Fire Management.....	4-775
4.4.4. Cumulative Impacts on Health and Safety.....	4-775
4.4.5. Cumulative Impacts on Lands and Realty	4-775
4.4.6. Cumulative Impacts on Livestock and Grazing.....	4-776
4.4.7. Cumulative Impacts on Minerals	4-776
4.4.8. Cumulative Impacts on Non-WSAs with Wilderness Characteristics.....	4-777
4.4.9. Cumulative Impacts on Paleontological Resources	4-778
4.4.10. Cumulative Impacts on Recreation.....	4-779
4.4.11. Cumulative Impacts on Riparian Resources	4-780
4.4.12. Cumulative Impacts on Socioeconomics	4-781
4.4.13. Cumulative Impacts on Soil and Water Resources.....	4-781
4.4.14. Cumulative Impacts on Special Designations.....	4-783
4.4.15. Cumulative Impacts on Special Status Species.....	4-784
4.4.16. Cumulative Impacts on Travel.....	4-785
4.4.17. Cumulative Impacts on Vegetation.....	4-786
4.4.18. Cumulative Impacts on Visual Resources	4-786
4.4.19. Cumulative Impacts on Wildlife and Fisheries.....	4-787
4.4.20. Cumulative Impacts on Woodlands	4-787

VOLUME 3

Chapter 5: Consultation and Coordination	5-1
5.1 Introduction.....	5-1
5.2 Consultation and Coordination with Tribes, State and Local Governments, and Federal Agencies	5-2
5.2.1 Native American Consultation.....	5-2
5.2.2 Cooperating Agency Involvement	5-4
5.2.3 State Agency Coordination	5-5
5.2.4 County Coordination.....	5-5
5.2.5 Consultation and Coordination with Other Federal Agencies	5-5
5.2.5.1 U.S. Fish and Wildlife Service	5-5
5.2.5.2 Environmental Protection Agency	5-6
5.2.5.3 Other Agency Involvement/Coordination.....	5-6
5.3 Consistency with Other Plans.....	5-6
5.4 Public Outreach and Participation	5-15
5.4.1 Notice of Intent to Plan and Scoping	5-15
5.4.2. Mailing List.....	5-16
5.4.3 Planning Bulletins	5-16
5.4.4 Website	5-17
5.4.5 Socioeconomic Workshops.....	5-17
5.4.6 Notice of Availability of the Draft RMP/EIS	5-17
5.4.7 Notice of Availability of the Final RMP/EIS	5-18
5.4.8 Public Meetings	5-18
5.5 Public Comments on the Monticello Draft RMP/EIS	5-18
5.5.1 Process and Methodology	5-18
5.5.2 Comment Analysis.....	5-19
5.5.3 Summary of Public Comments	5-25
5.5.4 Public Comments and Responses	5-25
5.6 Record of Decision	5-170
5.7 Distribution List for the Proposed RMP/Final EIS.....	5-170
5.8 List of Preparers	5-175
References.....	x-1
Acronyms and Glossary	x-23
Index	x-43

EXECUTIVE SUMMARY

ES. 1 INTRODUCTION

The Bureau of Land Management Utah (BLM) Monticello Field Office (Monticello FO) has prepared this Proposed Resource Management Plan and Final Environmental Impact Statement (Proposed RMP/Final EIS) to provide direction for managing public lands within the Monticello FO and to analyze the environmental effects of a range of management alternatives. A Draft RMP/EIS with five alternatives was presented to the public on November 2, 2007. A 90-day public comment period was held and the comments from the public were used to formulate the Proposed Plan.

The Proposed RMP will replace the San Juan Resource Area Resource Management Plan (RMP), which was signed in 1991. This revised Monticello RMP covers the same area as did the 1991 RMP, which is two-thirds of San Juan County, with a small portion located within southern Grand County (BLM 1991). The Monticello FO planning area (Monticello PA) comprises approximately 4.5 million acres of land, which includes approximately 2.5 million acres of mineral estate and 1.8 million acres of public land administered by the BLM. Elevations vary from 3,700 feet above sea level near Lake Powell to 11,360 feet in the Abajo Mountains.

The Monticello PA is situated in the canyon, plateau, and desert areas of the Colorado Plateau Physiographic Province. The Monticello PA encompasses Glen Canyon National Recreation Area, the Abajo Mountains of the Manti-La Sal National Forest, Canyonlands National Park, the Natural Bridges and Hovenweep National Monuments, and the White Mesa Ute and Navajo Indian Reservations. The Monticello FO shares boundaries with lands administered by the BLM Moab FO, and the Dolores FO in Colorado.

The Proposed RMP was prepared using the BLM's planning regulations and guidance issued under the authority of the Federal Land Policy and Management Act of 1976. An EIS is incorporated into this document to meet the requirements of the National Environmental Policy Act of 1969 (NEPA), the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR 1500-1508), and requirements of BLM's NEPA Handbook 1790-1.

ES. 2 PURPOSE AND NEED

ES. 2.1 PURPOSE

The Federal Land Policy and Management Act (FLPMA) requires that the BLM "develop, maintain, and when appropriate, revise land-use plans" (43 United States Code [U.S.C.] 1712 [a]). The BLM has determined it is necessary to revise the existing land-use plan (LUP) and prepare a new RMP for the Monticello PA based on a number of new issues that have arisen since preparation of the existing plan. In general, the purpose of this RMP is to provide a comprehensive framework for BLM's management of the public lands within the Monticello PA and its allocation of resources pursuant to the multiple-use and sustained-yield mandate of FLPMA. In addition, the purpose of this plan revision is to:

- Reevaluate, with public involvement, existing conditions, resources, and uses, and reconsider the mix of resource allocations and management decisions designed to balance uses and the protection of resources pursuant to FLPMA and applicable law.
- Resolve multiple-use conflicts or issues between resource values and resource uses. The resulting Monticello RMP will establish consolidated guidance and updated goals, objectives, and management actions for the public lands in the decision area. The RMP will be comprehensive in nature and will address issues that have been identified through agency, interagency, and public scoping efforts.
- Disclose and assess the direct, indirect, and cumulative impacts of the reasonably foreseeable future actions resulting from the management actions in each alternative pursuant to the requirements of the National Environmental Policy Act (NEPA), its implementing regulations, and other applicable laws.

ES. 2.2 NEED

A revision to the 1991 RMP is necessary because there have been significant alterations in the Monticello PA; specifically new information and changed resources, circumstances, and policies that may be relevant to the future management of public lands and allocation of resources under the multiple-use and sustained yield mandate. This determination is further corroborated by a Special Evaluation Report, completed in 2002 by the Monticello FO, which concluded that some of the decisions within the 1991 RMP are in need of revision.

There have been changes in the laws, policies, and regulations that direct the management of the resources on Monticello PA public lands. There has also been an increase in the amount of new information and resource data that need to be considered to better manage the public lands. Visitation to the region has grown and population demographics have changed; as have public awareness and use of lands within the Monticello PA. Specifically, there is a need to evaluate management prescriptions and resource allocations to address the increases in recreation and visitor use, including scenic quality and open spaces, as well as the increased interest in oil and gas development. Land-use plan decisions may be changed only through the amendment or revision process.

ES. 3 PUBLIC INVOLVEMENT

Public involvement has been an integral part of BLM's RMP effort. The scoping period for the Monticello RMP began on June 4, 2003, and ended on January 31, 2004. Scoping consisted of scheduled open houses in six communities (Green River, Monticello, Moab, Blanding, and Salt Lake City, Utah, and Grand Junction, Colorado) and visits to 12 locations throughout the planning area by BLM personnel. In addition, news releases and radio announcements were used to notify the public regarding the scoping period and the planning process and to invite the public to provide written comments. Comments obtained from the public during the scoping period were used to define the relevant issues that would be resolved by presenting a broad range of alternative management actions.

The Draft RMP/EIS was released to the public on November 2, 2007, with publication of the notice of availability (NOA) by the Environmental Protection Agency (EPA). A 90-day public comment period ended on February 4, 2007. The BLM hosted five open houses during the public comment period to provide information on the content of the Draft RMP/EIS and on how to comment. Portions of all the alternatives and information based on the public comment were used to formulate the Proposed Plan, which is presented in this document. Chapter 5 contains additional information on public involvement in the RMP process.

ES. 4 PROPOSED PLAN AND DRAFT EIS ALTERNATIVES

The Proposed Plan and the five alternatives that were presented in the Draft RMP/Draft EIS are now carried forward as part of the Proposed RMP/Final EIS. The Proposed Plan is most closely associated with Alternative C, which was the Preferred Alternative in the Draft RMP. The Proposed Plan has been adjusted based on public comment and review of the Draft RMP/EIS.

Some of the decisions in this Proposed Plan RMP/EIS are carried forward from the existing San Juan RMP (BLM 1991) because there are no conflicts or other issues that would cause BLM to change them. These decisions are common to the Proposed Plan and all alternatives from the Draft RMP because a range of alternative decisions is not necessary for these resources or uses. Other decisions are common to the Proposed Plan and all action alternatives (Alternatives B, C, D and E), but are different from the No Action Alternative (A) due to a change in circumstances. An overview of some specific components of the Proposed Plan and each alternative from the Draft RMP is provided below. A full discussion of the Proposed Plan and each alternative is provided in Chapter 2.

ES. 4.1 PROPOSED PLAN

The Proposed Plan consists of a combination of proposed decisions from the full range of alternatives presented in the Draft RMP/Draft EIS. The Proposed Plan was crafted based on public comments on the Draft RMP/Draft EIS, coordination with the Cooperating Agencies, and internal review and comment. It provides for the balance of use and protection of resources while considering the extent of the environmental impacts to the resources and uses. The Proposed Plan best resolves the major issues, provides common ground among conflicting opinions, and provides multiple uses of public lands in a sustainable fashion.

The Proposed Plan would protect important environmental values and sensitive resources while allowing for an appropriate level of development. It would provide a balance between protection of important natural resources and commodity production, as well as offer a full range of recreation opportunities, including additional opportunities for primitive recreation experiences.

Under the Proposed Plan, 0 acres would be open to cross-country, off-highway vehicle (OHV) use; 393,895 acres would be closed to OHV use; and 1,388,191 acres would be limited to designated routes (Table ES1). Approximately 1,947 miles of Class D travel routes would be designated (Table ES2). Under the Proposed Plan, seven Special Recreation Management Areas (SRMAs) (562,824 acres) would be designated (Table ES3).

Seven Areas of Critical Environmental Concern (ACECs) (73,492 acres) would be designated in the Proposed Plan, and four eligible rivers segments (35.7 miles) would be recommended as suitable for Wild and Scenic River (WSR) designation (Table ES4). Approximately 88,871 acres

of non-WSA lands with wilderness characteristics would be managed to protect, preserve, and maintain their wilderness characteristics. Approximately 493,400 acres would be closed to oil and gas leasing, 66,108 acres would be managed with No Surface Occupancy (NSO) stipulations, and 484,217 acres would be open with standard stipulations (Table ES6). The remaining 594,469 acres would be managed with timing limitations or controlled surface use stipulations.

ES. 4.2 ALTERNATIVE A – NO ACTION

Alternative A would continue of existing management under the current San Juan Resource Area Management Plan (1991) as amended.

ES. 4.3 ALTERNATIVE B

Alternative B would offer more protection for wildlife and other natural resources, and favor natural systems over commodities development. It would emphasize the protection of natural resources and landscapes as well as non-motorized recreation.

ES. 4.4 ALTERNATIVE C – PREFERRED

Alternative C (Preferred Alternative) would protect important environmental values and sensitive resources while allowing for commodities development. It would provide a balance between protection of important natural resources and commodity production, as well as offer a full range of recreation opportunities.

ES. 4.5 ALTERNATIVE D

Alternative D would emphasize commodity development over the protection of natural resources, and would emphasize motorized recreation.

ES. 4.6 ALTERNATIVE E

Alternative E would be the same as Alternative B except that 582,360 acres of non-WSA lands would be managed to preserve, protect, and maintain their wilderness characteristics. These lands would be managed as the following: closed to mineral leasing, closed to OHV use, proposed for withdrawal from mineral entry, right-of-way exclusion area, closed to disposal of mineral materials, closed to private and commercial woodland harvest, and managed as VRM I. Large areas on the west side of the Monticello FO would be difficult to access; any kind of surface-disturbing activities would be difficult to conduct in this area. Wilderness characteristics would be enhanced as would adjacent wilderness values found in WSAs.

Tables ES1 through ES6 summarize OHV categories, designated routes, SRMAs, special designations, non-WSA lands with wilderness characteristics, and oil and gas leasing categories for the Proposed Plan. These tables compare the Proposed Plan to the Draft EIS alternatives.

Table ES1. OHV Categories (Acres)

OHV Designation Category	Alternative A No Action	Alternative B	Alternative C Preferred	Alternative D	Alternative E	Proposed Plan
Open	611,310	0	2,311	2,311	0	0
Limited – designated	218,780	1,359,417	1,362,142	1,780,807	812,679	1,388,191
Limited use – seasonal	540,260	NA	3.8	NA	NA	0
Limited – existing	570,390	NA	NA	NA	NA	NA
Closed	276,430	423,698	418,667	0	970,436	393,895

Table ES2. Designated Routes

Areas Limited to Designated Road and Trails	Alternative A No Action	Alternative B	Alternative C Preferred	Alternative D	Alternative E	Proposed Plan
B Roads	0	875	873	873	875	873
D Roads	0	1,521	1,947	2,205	1,342	1,947

¹ Routes were not formally designated in the 1991 San Juan RMP. Use of existing routes includes 890 miles of B Roads and 2,179 miles of D Roads.

Table ES3. Special Recreation Management Areas

SRMAs	Alternative A No Action	Alternative B	Alternative C Preferred	Alternative D	Alternative E	Proposed Plan
Number	3	5	5	5	5	7
Acres	614,490	508,861	508,517	505,023	505,517	562,824

SRMAs are established to manage intensively used recreation areas and generally do not restrict other uses.

In Alternative B, non-motorized recreation is emphasized.

In Alternative C (preferred), opportunities for both non-motorized and motorized recreation are provided.

In Alternative D, motorized recreation is emphasized.

Table ES4. Special Designations

Type*		Alternative A No Action	Alternative B	Alternative C Preferred	Alternative D	Alternative E	Proposed Plan
ACEC	number	10	12	7	0	12	7
	acres	492,077	521,142	76,761	0	521,142	73,492
WSR	eligible river segments	6	12	12	12	12	12
		56.8 miles	92.4 miles	18.4 miles	0 miles	92.4 miles	35.7 miles
	suitable segments	not evaluated	12	3	0	12	4
WSA	number	13					
	acres	391,599					

* Area of Critical Environmental Concern (ACEC), Wild and Scenic River (WSR), and Wilderness Study Area (WSA)
Acreage may overlap (scenic Highway and Cedar Mesa) and are different than previously published values.

**Acreage based on the Statewide Report to Congress.

Table ES5. Non-WSA Lands with Wilderness Characteristics

Type		Alternative A No Action	Alternative B	Alternative C Preferred	Alternative D	Alternative E	Proposed Plan
WC Units	Number	0	0	0	0	29	5
	Acres	0	0	0	0	582,360	88,871

Table ES6. Oil and Gas Leasing Stipulations

Stipulation	Alternative A No Action	Alternative B	Alternative C Preferred	Alternative D	Alternative E	PROPOSED PLAN
Standard	578,604	365,170	629,472	962,283	213,290	484,217
TL & CSU	659,626	876,740	719,501	421,000	545,641	940,594
NSO	161,224	125,105	39,323	14,175	53,915	66,108
Closed	385,316	416,612	395,329	386,853	974,463	493,400
Projected Wells/LOP	73	66	74	75	54	72

Oil and gas stipulations would apply to other surface-disturbing activities where they are not contrary to laws, regulations, or policy.

The following stipulations would be applied to land-use authorizations: 1) standard stipulations, 2) timing limitations (TL), 3) controlled surface use (CSU), and 4) no surface occupancy (NSO). Areas identified as closed would not be available for oil and gas leasing.

Areas identified as NSO and closed would be avoidance and exclusion areas for rights-of-way, respectively. NSO and closed areas may be recommended for withdrawal of locatable minerals in the future if it is determined that unacceptable resource conflicts are occurring.

ES. 5 AFFECTED ENVIRONMENT

The Monticello FO is known for both its scenic quality and its recreational opportunities, which are an important land use in the planning area. Many visitors enjoy the diverse and varied recreational opportunities of the planning area. Recreation is an important part of San Juan County's economy. Recreational opportunities include scenic driving, mountain biking, hiking, rafting and boating, rock climbing, OHVs, and horseback riding. The many trail-based recreational activities in the planning area are highly dependent upon route systems. Mineral exploration and development comprise another major use of public lands in the Monticello PA. The oldest oil field in Utah is in the Monticello PA, where oil was discovered in Mexican Hat in 1879. In 1956, the development of the Aneth field sparked oil and gas exploration in San Juan County that continues to this day. Oil and gas production is currently taking place in Mexican Hat, Aneth, Lisbon Valley, and the Blanding Basin. There are approximately 42 active oil and/or gas fields in the Monticello PA

Uranium and vanadium deposits can be found within 17 historical mining districts throughout the planning area. With the recent rise in oil, gas and uranium prices, there has been renewed interest in exploration and development of these mineral resources in the Monticello FO. Other mineral resources within the planning area that are likely to be developed include: placer gold, limestone, building stone, sand and gravel, and clay. Other land uses within the planning area include rights-of-way (ROWs) for roads, pipelines, power lines, and communication sites, film permits, and livestock grazing.

Many important natural and cultural resources are found in the Monticello PA. Federally listed wildlife species inhabit the planning area including the Mexican spotted owl, Southwestern willow flycatcher, Colorado pikeminnow, humpback chub, and bonytail chub. The planning area also contains habitat for mule deer, elk, desert bighorn sheep, pronghorn, Gunnison Sage-grouse, and Gunnison's prairie dog.

Pre-Columbian cultural sites affiliated with Pueblo people, and sites related to Archaic and Paleo Indian cultures are present (12,000–5,000 B. C.). Historic Period (post-Columbian) occupation in the area includes one National Historic Trail (Old Spanish National Historic Trail) and one pioneer historic trail (Hole in the Rock). Other historic properties are related to Ute, Navajo, Apache sites and Anglo ranching, farming and mining locations. Over 28,000 cultural sites have been recorded.

ES. 6 ENVIRONMENTAL CONSEQUENCES

The Proposed Plan would allow for many uses to continue but would constrain certain activities to maintain or protect important natural resources, including some non-WSA lands with wilderness characteristics, and crucial wildlife habitats. This could result in some short-term adverse impacts to local economies and resource extraction businesses, but long-term economic benefits would be gained from the emphasis on a diversity of recreational activities.

Alternative A, the No Action Alternative, would maintain the current rate of progress in meeting rangeland health standards and protecting resource values. It would allow for use to mostly continue at current levels in the same places in the planning area, with adjustments required in order to meet Standards for Rangeland Health or to mitigate resource concerns in compliance with existing laws and regulations.

Alternative B would have the least potential to adversely impact physical and biological resources and would protect a variety of vegetation types and wildlife habitats. Alternative B would be restrictive to resource extraction. Alternative B would have the potential for adverse impacts to businesses that depend on public land for resource extraction.

Alternative C, the Preferred Alternative, would allow for many uses to continue but would constrain certain activities in order to maintain or protect important natural resources. This could result in some short-term adverse impacts to local economies and resource extraction businesses, but long-term economic benefits could be gained from the emphasis on a diversity of recreational activities.

Alternative D offers the greatest potential benefits to the local economy from resource extraction, although economic benefits from recreation use would not be maximized. Resource extraction uses would generally be least encumbered by management decisions under this alternative. Alternative D would result in greater impacts on the physical and biological environment than actions proposed under the Proposed Plan or Alternatives B, C, or E.

Alternative E would be the same as Alternative B, except 582,360 acres of non WSA lands with wilderness characteristics would be managed to protect, preserve and maintain their wilderness characteristics. This alternative would be the most restrictive for access and resource extraction. Some benefit to back country recreation would be realized.

Table 2.2 at the end of Chapter 2 summarizes potential impacts for the Proposed Plan and by alternatives from the Draft RMP. Detailed descriptions of impacts of the Proposed Plan and five draft alternatives are provided in Chapter 4, along with a discussion of the cumulative impacts, irretrievable and irreversible commitments of resources, and unavoidable adverse impacts of the alternatives.

ES. 7 BRIEF SUMMARY OF CHANGES BETWEEN THE PREFERRED ALTERNATIVE AND THE PROPOSED PLAN

As a result of public comment, coordination with cooperating agencies, and internal review of the Draft RMP/EIS, the Proposed Plan is based on the Preferred Alternative from the Draft RMP/Draft EIS (Alternative C). Major changes between the Preferred Alternative from the Draft RMP and the Proposed Plan include the following: protecting five areas for their wilderness characteristics; adding a segment of the San Juan River as suitable for inclusion into the National Wild and Scenic River System; reducing the size of the Indian Creek and San Juan River ACECs; expanding the Grand Gulch Plateau SRMA (also referred to as the Cedar Mesa SRMA) to include management zones for McLoyd Canyon–Moon House and Comb Ridge cultural areas (previously described as cultural special management areas) and changing the Beef Basin cultural special management area to a SRMA; allowing for OHV use for the full length of Arch Canyon; making Indian Creek a limited to designated routes OHV area; and expanding the wildlife crucial habitat boundaries, in accordance with the Utah Division of Wildlife Resources data. All of these changes fall within the range of alternatives presented in the Draft RMP/Draft EIS. Other changes between the Draft RMP/EIS and the Proposed RMP/FEIS include clarifications in wording, editing, expanded analysis, and the addition of new information. The end of Chapter 1 has a summary of these changes. Appendix S contains a complete listing of changes between the Draft RMP/EIS and the present document.

ES. 8 NEXT STEPS

Following publication by the EPA and the BLM of an NOA of the Proposed RMP/Final EIS in the Federal Register and distribution of the document, there will be a 30-day protest period. In addition, a 60-day Governor's Consistency Review period runs concurrently with the first half of the protest period. The state director will approve the Proposed RMP/Final EIS by issuing a public Record of Decision (ROD), which is a concise document summarizing the findings and decisions from the Proposed RMP. However, approval shall be withheld on any portion of a plan being protested until final action has been completed on such protest. Before such approval is given, there shall be public notice and opportunity for public comment on any significant change made to the Proposed Plan. Among other decisions, the proposed ACEC designations and OHV categories (limitations and closures) will be approved when the ROD is signed. Implementation-level decisions analyzed through this planning process will be appealable for 30 days after the ROD is signed.

THIS PAGE INTENTIONALLY LEFT BLANK

4.0 ENVIRONMENTAL CONSEQUENCES OF THE PROPOSED PLAN AND DRAFT ALTERNATIVES

4.1. INTRODUCTION

This chapter analyzes the environmental consequences of the management decisions proposed under the five alternatives and the Proposed Plan described in Chapter 2. These decisions were developed as alternative ways of managing and allocating resources and uses of the public lands within the Monticello Planning Area (PA) to balance these uses under the multiple-use, sustained-yield mandate of the Federal Land Policy and Management Act (FLPMA). The Bureau of Land Management (BLM) planning decisions about resource use and management in the Monticello Planning Area (PA) will be based on this analysis. Note that there are two sections on management decisions common to the alternatives. One section discusses management decisions shared by all of the alternatives (A, the No-Action Alternative, the Action Alternatives, and the Proposed Plan); the other section describes decisions shared by only the Action Alternatives (B through E and the Proposed Plan).

Alternative A (No Action) continues the existing management practices defined in the San Juan Resource Management Plan (RMP). Alternative B would minimize human activities within the Monticello PA. Alternative C would protect important environmental values and sensitive resources while allowing the development of oil and gas resources, recreational facilities, and other human uses. Alternative D would emphasize resource development and human consumption of resources. Alternative E would minimize human activities and manage more acreage for a natural state, primitive recreation, and solitude. The Proposed Plan would protect important environmental values and sensitive resources while allowing commodities development. This Proposed Resource Management Plan and Final Environmental Impact Statement (PRMP/FEIS) provides a landscape-scale, "big picture" analysis because in most cases the exact locations of projected development and other changes are not known at this time. Impacts for each specific resource or use presented in Chapter 3 are discussed under each alternative. *Impacts* are defined as modifications to the existing environment brought about by implementing an alternative. They can be beneficial or adverse, result from the decisions directly or indirectly, and be long-term, short-term, temporary, or cumulative.

BLM staff used existing data, current methodologies, professional judgments, and projected actions and levels of use to compile the analysis, which takes into account the mitigation measures and stipulations described in Chapter 2 and Appendices A, F, I, and M. If impacts are not discussed, the analysis has indicated that none would occur, or their magnitude would be negligible.

When impacts of a decision are the same under more than one alternative, they are disclosed under the first applicable alternative discussed, and then referenced under other pertinent alternatives.

Chapter 4 discusses and analyzes the environmental consequences of program decisions on each listed resource or use. Resources and uses are presented in alphabetical order. The environmental consequences of the decisions imposed by other programs on that resource are also delineated for each of the five alternatives and the Proposed Plan. For half of the resources, the analysis

identifies the impacts of each of the other program decisions on that resource value or use, by alternative. For example, the impacts of recreation decisions on vegetation are listed under each of the five alternatives:

Vegetation

Impacts of Recreation Decisions on Vegetation

Alternative A

Alternative B

Alternative C

Alternative D

Alternative E

Resources and uses organized this way include fire management, non-WSA lands with wilderness characteristics, paleontological resources, recreation, riparian resources, socioeconomic conditions, soils and water resources, special designations, special status species, travel management, vegetation, and wildlife and fisheries.

For resources and uses largely unaffected by other program decisions, the impacts are grouped under each of the five alternatives. This format made the disclosure of environmental consequences on these resources easier to understand. For example, the impacts of other program decisions on lands and realty under Alternative A appear all together:

Lands and Realty

Impacts of Alternative A

Impacts of Alternative B

Impacts of Alternative C

Impacts of Alternative D

Impacts of Alternative E

Resources and uses organized this way include air quality, cultural resources, health and safety, lands and realty, livestock grazing, minerals, visual resources, and woodlands.

4.1.1. ANALYTICAL ASSUMPTIONS AND GUIDELINES

Following are the general assumptions used to assess all alternatives. Assumptions specific to an individual resource value, use, or program (e.g., wildlife habitat, recreation, or fire management) appear at the beginning of the analysis for that section.

- All resource decisions recognize valid existing rights.
- The entire planning area is allocated one of the following leasing stipulations for oil and gas development:
 - Open subject to standard lease terms;
 - Timing limitations and controlled surface use;
 - No surface occupancy; or
 - Closed.
- BLM would have the funding and work force to implement the selected alternative.
- Additional National Environmental Policy Act (NEPA) analysis would be required to determine the impacts from site-specific actions (activity plans) and could identify additional mitigating measures.

- All lands identified for disposal are free of encumbrances and can be disposed of. This includes cultural-resource clearances.
- Demand for recreational activities (both dispersed and concentrated), energy production, vegetative resources, and wildlife use (nonconsumptive and consumptive) will increase over time.
- Short-term impacts are those that would last for fewer than 5 years.
- Long-term impacts are those that would last for 5 years or more.
- State highways and county B class roads through the Monticello PA will remain open and accessible.
- All decisions, projects, activities, and mitigation for the alternatives would be completed as described in Chapter 2 and Appendix A (Surface Stipulations Applicable to Oil and Gas Leasing and Other Surface-disturbing Activities).
- Acreages were calculated using GIS technology, so there may be slight variations in total acres between disciplines. These variations are negligible and will not affect analysis.
- WSA acreages in the following sections vary from those identified in the Statewide Report to Congress. GIS calculations were used only for analysis purposes.
- The decisions of the RMP apply only to public lands managed by the BLM. They do not apply to in-held or adjacent private, state, or other lands.
- Reasonable access across BLM lands to state lands must be provided under all alternatives.
- The required consultations for Section 106 of the National Historic Preservation Act are in progress and will be completed prior to signature of the ROD.

4.1.2. ASSUMPTIONS AND METHODOLOGY FOR MINERAL DEVELOPMENT

The BLM prepared a mineral potential report (MPR) for the Monticello PA in July 2005. The report outlined the potential for occurrence and reasonable foreseeable development (RFD) of all mineral resources for the Monticello PA for the next 15 to 20 years. The potential for future oil and gas activity and the associated surface disturbance are presented in Table 4.1, and the predicted geophysical activity and its consequences are outlined in Table 4.2. This activity includes potential mineral development and geophysical activities on state, private, United States Department of Agriculture Forest Service (USFS), tribal, BLM, and National Park Service (NPS) lands within the Monticello PA. Table 4.3 shows the existing and predicted cumulative surface disturbance for all of these lands.

Table 4.1. Predicted Oil and Gas Drilling and Associated Surface Disturbance for Each Development Area within the Monticello PA (see Map 17)

Development Area	Number of Wells Projected to Be Drilled	Estimated Future Surface Disturbance from Drilling Wells (acres)
Paradox fold and fault belt (per year)	1–6	9.6–57.6
Blanding sub-basin (per year)	3–13	28.8–124.8
Monument upwarp (per year)	1–2	9.6–19.2
Total per year for next 15 years	5–21	48.0–201.6
Average per year for next 15 years	13	124.8

Table 4.1. Predicted Oil and Gas Drilling and Associated Surface Disturbance for Each Development Area within the Monticello PA (see Map 17)

Development Area	Number of Wells Projected to Be Drilled	Estimated Future Surface Disturbance from Drilling Wells (acres)
Total for next 15 years	195	1,872.0

Source: BLM 2005b.

Table 4.2. Predicted Amount of Geophysical Activity and Associated Surface Disturbance for Each Development Area within the Monticello PA

Development Area	Projected Linear Miles of Geophysical Surveys	Estimated Future Surface Disturbance from Geophysical Surveys (acres)
Paradox fold and fault belt (per year)	24–53	43.6–96.4
Blanding sub-basin (per year)	18–40	32.7–72.7
Monument upwarp (per year)	9–20	16.4–36.4
Total per year for next 15 years	51–113	92.7–205.5
Average per year for next 15 years	82	149.1
Total for next 15 years	1,230	2,236.4

Source: BLM 2005b.

Table 4.3. Total Existing and Predicted Surface Disturbance from All Drilling Activities and Predicted Reclamation within the Monticello PA

	Number of Wells	Total Surface Disturbance
Total existing surface disturbance	1,615	15,504
Active wells	1,135	10,896
Abandoned wells	480	4,608
Future surface disturbance for the next 15 years	195	1,872
Gross surface disturbance for the next 15 years	1,810	17,376
Total predicted reclamation in the next 15 years	527	5,059
Reclamation of future dry wells	27	259
Reclamation of existing abandoned wells	480	4,608
Reclamation of future abandoned wells	20	192
Total net surface disturbance for the next 15 years		12,317

Source: BLM 2005b.

Predicted surface disturbance for oil and gas development by alternative on BLM lands was calculated by multiplying the percentage of BLM lands open for development under each of the alternatives by the total number of wells predicted for all lands. For oil and gas, the resultant number of wells was multiplied by surface-disturbance assumptions per well to arrive at the total disturbance (Table 4.4). Geophysical disturbances were calculated in the same manner (Table

4.5). It should be noted that the total number of wells cited in the RFD report do not represent upper limits on the number of wells that could be drilled in the Monticello PA during the next 15 years. The RFD is not intended to and does not place a cap on the total number of wells that may be drilled in the Monticello PA under this plan. The RFD well totals represent the BLM's best estimate of future reasonably foreseeable development to allow the BLM to assess the impacts of this development and inform the decision maker about anticipated consequences of the alternative management decisions. The total number of wells permitted would be determined through site-specific NEPA analysis of development projects.

Table 4.4. Summary of RFD-Predicted Wells and Surface Disturbance for Oil and Gas on BLM Lands

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Blanding Su-basin						
Avg. number of wells/LOP	41	38	41	41	38	40
Avg. surface disturbance/yr.	26	24	26	26	24	26
Avg. surface disturbance/LOP	394	363	395	395	364	387
Monument Upwarp						
Number of wells/LOP	7	8	9	9	7	7
Avg. surface disturbance/yr.	5	5	5	6	5	5
Avg. surface disturbance/LOP	69	79	82	86	71	72
Paradox Fold and Fault Belt						
Number of wells/LOP	25	20	24	25	18	24
Avg. surface disturbance/yr.	16	13	16	16	11	16
Avg. surface disturbance/LOP	236	194	233	240	170	233

¹ These numbers are based on several calculations that have been prorated and subsequently rounded, so there may be slight discrepancies in the summary numbers. For example, under Alternatives C and D, nine wells are predicted, but the resulting surface disturbance numbers are slightly different. This is a result of the base well numbers being rounded. You could assume under Alternative C that the well number was closer to 9, whereas under Alternative D the well number was closer to 10. Detailed information on the calculations is available in the Monticello FO.

Table 4.5. Summary of Geophysical Disturbances on BLM Lands

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Blanding Sub-basin						
Avg. miles/yr.	10	9	10	10	9	10
Avg. miles/LOP	205	188	205	205	188	201
Avg. acres/yr.	18	16	18	18	16	17
Avg. acres/LOP	271	249	271	271	250	266

Table 4.5. Summary of Geophysical Disturbances on BLM Lands

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Monument Upwarp						
Avg. miles/yr.	5	5	6	6	5	5
Avg. miles/LOP	83	95	99	103	85	86
Avg. acres/yr.	8	9	10	10	8	8
Avg. acres/LOP	120	137	143	149	123	125
Paradox Fold and Fault Belt						
Avg. miles/yr.	18	15	17	18	14	17
Avg. miles/LOP	271	224	269	277	211	269
Avg. acres/yr.	33	28	33	34	26	33
Avg. acres/LOP	495	408	489	504	388	489
All RFD Areas						
Total miles/yr.	37	34	38	39	32	32
Total acres/yr.	59	53	61	62	50	59
Total miles/LOP	559	507	572	585	484	556
Total acres/LOP	886	794	903	924	761	879

4.1.3. TYPES OF IMPACTS TO BE ADDRESSED—DIRECT, INDIRECT, AND CUMULATIVE

Direct impacts result from an alternative affecting a specific resource and generally occur at the same time and place. *Indirect impacts* can result from one resource affecting another (e.g., soil erosion and sedimentation affecting water quality) or can happen later in time or farther away (e.g., disturbed soil moving downslope into a stream and affecting water quality), but they are still reasonably foreseeable. *Long-term impacts* persist for years (longer than 5 years, for this PRMP/FEIS). *Short-term impacts* cause temporary or ephemeral changes to the environment that end once the activity stops (those that persist for less than 5 years, for this document), such as air-polluting emissions caused by earthmoving equipment during construction. Short-term impacts result in changes to the environment that are stabilized or mitigated rapidly, such as surface disturbance that is revegetated immediately after earthmoving is completed. Impacts can vary from a slightly discernible change to a full modification or elimination of the environmental condition. Cumulative impacts can also result from past, present, and reasonable foreseeable future actions by federal, state, and local governments; private individuals, and operators in or near the Monticello PA.

4.2. IMPACTS TO CRITICAL ELEMENTS

The following critical elements are not impacted by the decisions proposed in the alternatives, or are adequately mitigated to prevent significant impacts, and will not be discussed further in this analysis. The other critical elements are addressed in further detail in the analysis of the PRMP/FEIS.

4.2.1. IMPACTS OF ALTERNATIVES ON PRIME AND UNIQUE FARMLANDS

All alternatives in this PRMP/FEIS coincide with the intent of the Secretary of Agriculture's Memorandum 1827 for prime land. The Monticello PA does not include any prime farmland, nor do any of the alternatives impact any prime farmland soils (NRCS 1993).

4.2.2. IMPACTS OF ALTERNATIVES ON INVASIVE AND/OR NOXIOUS NON-NATIVE PLANTS

Vegetation and surface-disturbing changes would result from all the alternatives in this PRMP/FEIS. These disturbances all increase the risk of propagation of exotic, invasive or noxious nonnative plants. However, effective implementation of management decisions common to all of the alternatives would prevent the risk from becoming greater than at present and help reduce risk in the future.

4.2.3. INCOMPLETE OR UNAVAILABLE INFORMATION

This study was done using the best available information, data that are believed sufficient to make a programmatic analysis of the impacts of multidisciplinary decisions on management direction for the entire PA. This information includes, but is not limited to, landscape-level data, such as geophysical analysis program (GAP) vegetation data, Soil Survey Geographic database (SSURGO) soils data, and FO information on wildlife habitat boundaries. Additional site-specific data (including cultural-resource and threatened, endangered, and sensitive (TES) surveys) will be required to complete NEPA analysis necessary before actions can be implemented.

4.3. ENVIRONMENTAL CONSEQUENCES OF THE PROPOSED PLAN AND ALL ALTERNATIVES

4.3.1. AIR QUALITY AND CLIMATE

This section presents an emission inventory of air pollutants associated with the Proposed Plan. The projected emissions are compared to base year emissions (2005) for Grand and San Juan County to provide context for the emission estimates. No quantitative assessment of potential impacts to concentrations, visibility, or atmospheric deposition are included in this analysis. Existing conditions concerning air quality are described in Chapter 3.

The Monticello PA is located in an area designated as attainment for all pollutants (EPA 2003a). The alternatives discussed below have been evaluated to estimate emissions associated with each alternative and the Proposed Plan.

4.3.1.1. GLOBAL CLIMATE CHANGE

The assessment of climate changing pollutant emissions and climate change is in its formative phase; therefore, it is not yet possible to know with confidence the net impact to climate. However, the Intergovernmental Panel on Climate Change (IPCC 2007) recently concluded that "warming of the climate system is unequivocal" and "most of the observed increase in globally average temperatures since the mid-20th century is very likely due to the observed increase in anthropogenic [man-made] greenhouse gas concentrations."

The lack of scientific tools designed to predict climate change on regional or local scales limits the ability to quantify potential future impacts. Currently BLM does not have an established mechanism to accurately predict the effect of resource management-level decisions from this planning effort on global climate change. However, potential impacts to air quality due to climate change are likely to be varied. For example, if global climate change results in a warmer and drier climate, increased particulate matter impacts could occur due to increased wind blown dust from drier and less stable soils. Cool season plant species' spatial ranges are predicted to move north and to higher elevations, and extinction of endemic threatened/endangered plants may be accelerated. Due to loss of habitat, or due to competition from other species whose ranges may shift northward, the population of some animal species may be reduced. Less snow at lower elevations would be likely to impact the timing and quantity of snowmelt, which, in turn, could impact aquatic species. In the future, as tools for predicting climate changes in a management area improve and/or changes in climate affect resources and necessitate changes in how resources are managed, BLM may be able to re-evaluate decisions made as part of this planning process and adjust management accordingly.

4.3.1.2. IMPACTS COMMON TO ALL ALTERNATIVES

Certain management decisions for air quality resources apply to all alternatives. Management common to all alternatives and the Proposed Plan relate to the application of standard state and federal policy and regulations. These policies and regulations call for appropriate management of air quality within the Monticello PA. This includes application of the Best Available Control Technology (BACT), provided by the Utah Division of Air Quality (UDAQ), as needed to meet air quality standards. Compliance with Utah Air Conservation (UAC) regulation R307-205 requires appropriate dust-abatement measures for construction, demolition, clearing, or

excavation of land areas larger than one-quarter acre (UAC R307-205, August 1, 2006); and management of emissions must also prevent deterioration to air quality in PSD Class I Areas (UAC R307-405, August 1, 2006). These policies, standards, and guidelines are likely to have long term, beneficial impacts on PA air quality by ensuring the continued protection of human health and maintaining scenic quality.

Potential emissions common to all alternatives include particulate matter (PM₁₀ and PM_{2.5}), carbon monoxide (CO), sulfur dioxide (SO₂), nitrogen oxides (NO_x), volatile organic compounds (VOCs), and hazardous air pollutants (HAPs; e.g. N-hexane, benzene, toluene, formaldehyde, ethylbenzene, and xylenes). Actual pollutant loads produced are dependant on the number and type of pollutant sources, source location, duration of loading, local topographical and meteorological conditions and other site-specific factors.

4.3.1.2.1. POTENTIAL IMPACTS FROM PRESCRIBED FIRE

Under all alternatives and the Proposed Plan, approximately 15,000 acres of pinyon-juniper woodland vegetation would be subject to prescribed fire, and approximately 27,000 acres would receive non-fire treatments (42,000 acres total) over the next 10-year period. The preferred schedule of these treatments would be 5,000 to 10,000 acres per year across the PA, depending on budgetary and time constraints.

There are several pollutants of concern are specific to prescribed burning, chiefly particulate matter and carbon dioxide (CO₂). Particulate matter produced in prescribed burns is predominantly PM_{2.5} (70% of the smoke from burns falls into this category). The generation of increased particulate matter is especially noticeable in high-intensity, catastrophic wildland fire. Fire also produces carbon dioxide (CO₂), a gas that is potentially related to incremental global climate change. Biomass burning contributes to the release of greenhouse gases (such as CO₂) and eliminates a carbon sink. The detrimental air quality impacts from wildfire would likely be greater than those from prescribed fire and exert a larger adverse impact on air quality in the Monticello PA. Direct impacts of prescribed fire fall into two general categories: short-term and long-term. Short-term air quality impacts projected from prescribed burns include a general increase in particulate matter (primarily PM_{2.5}), CO₂ and ozone precursor emissions (NO_x and VOCs) in burn areas and those locations immediately downwind. Emissions are a function of size, burn time, fuel type, fuel organization (i.e., slash piles, broadcast, wind-rows), fuel moisture, wind speed, atmospheric stability, etc.

The type and amount of air pollutants released from burning wildland vegetation vary according to the type of fuel, moisture content, temperature of the fire, and amount of smoldering after the fire. Since prescribed burning occurs irregularly, it is generally possible to restrict burning in potential non-attainment areas on "bad air quality days" to avoid violating air quality standards. Long-term, direct air quality impacts projected from prescribed burns include a general increase in airborne particulate matter from the burn site as a result of ash dispersion and transport. BLM obtains a burn permit from UDAQ prior to initiating a prescribed burn. This increase would occur only until revegetation occurs and growth matures.

Indirect impacts on air quality from prescribed burns (short-term and long-term) include an increase in airborne particulate matter from the burn site as a result of wind-based erosion of devegetated areas. Vegetation management, an active part of fire management, would mitigate this potential impact. Fuel-reduction treatments, authorized by the LUP Amendment, could

potentially decrease the number and intensity of wildland fires with a concurrent potential “decrease” in the amount of particulate matter. A greater long-term effect of prescribed burning would be a reduction in particulate matter, CO₂, and ozone precursor emissions specific to wildfire in unmanaged areas. Ozone (a product of biomass combustion formed through the interaction of ozone precursors, volatile organic carbon compounds (VOCs), and nitrogen oxides) is a precursor to greenhouse gases and a major constituent of photochemical smog. Although generally ozone produced by prescribed fire is quickly diluted and dispersed into the air, it may contribute to the greenhouse effect. Since ozone is a criteria pollutant, its production may be regulated by a state implementation plan (SIP), or burns may be banned under ozone alerts.

BLM fire-management policy coincides with the UDAQ permitting process and, as such, would be timed in conjunction with meteorological conditions to minimize smoke. BLM would implement specific policy, rules and procedures to minimize the air quality impacts to regional haze for fire events. For example, BLM would comply with the current Smoke Management Plan (SMP) and Memorandum of Agreement (MOU) between BLM, USFS, and UDAQ. Compliance with UAC regulation R307-204 and implementation of surface stabilization would mitigate potential air quality impacts.

4.3.1.2.2. POTENTIAL IMPACTS FROM ABANDONED MINE LANDS

Abandoned mine sites, one aspect of health and safety management decisions general to all alternatives have the potential for direct, short-term, adverse impacts on air quality. Potential impacts are specific to the remediation of abandoned mine sites determined to pose a risk to human health and safety. Remediation techniques generally include collapsing or sealing open shafts and adits and/or capping or removing tailings or other hazardous materials. Land disturbance associated with these practices and operating heavy equipment during remediation could result in increases in short-term emissions of particulate matter (PM₁₀ and PM_{2.5}), SO₂, NO_x, hydrocarbons, and combustion by-products. Actual pollutant loads produced are dependent on the number and type of emission sources on-site, relative area of disturbance, source location, duration of work, local topographical and meteorological conditions, and other site-specific factors.

4.3.1.3. IMPACTS FROM ALTERNATIVES

The implementation of cultural resource management decisions to inventory, protect, preserve the resource, and to comply with Section 106 of the National Historic Preservation Act; paleontological decisions to protect, evaluate, support scientific research, and allow recreational collection of fossils, special status animal species management decisions to protect listed species; and visual resource management decisions to protect scenic quality would have negligible impacts on air quality because these management activities would likely produce low levels of emissions. Therefore, the management of these resources will not be discussed further in this section.

The implementation of livestock grazing, riparian, soil and watershed, travel, vegetation and TES vegetation, wildlife, and woodlands management decisions that limit or reduce surface and vegetation disturbance and grazing intensity and time; management for greater vegetation retention and generation; and improve/upgrade existing road surfaces would likely produce low levels of emissions. Proposed management decisions, including travel management, generally

include lower overall surface/soil disturbance. This is because managing livestock grazing allotments to ensure proper functioning conditions and forage utilization levels, protecting riparian vegetation and soils, protecting sensitive soils and water resources, improving vegetation communities through treatments, protecting wildlife species and their habitat, and managing woodlands for sustainable harvesting would not likely affect air quality. Potentially beneficial impacts from these management decisions would likely include reduced PM₁₀ and other wind-borne particulate matter from erosion of exposed soils as vegetation and soil cohesion improve over time. Short-term benefits to air quality would most likely not be measurable in the PA. Long-term impacts are likely to produce negligible to minor beneficial impacts on long-term air quality, primarily as a result of limiting vehicular travel during critical periods. As the impacts of these management decisions are likely to be beneficial, minor, and unmeasurable within site-specific areas, they will not be discussed further in this section.

Land and realty management decisions, other than those related to compressor stations, are projected to have no significant effect on air quality except as they affect other management decisions. It should be noted that while some compressor stations are authorized by rights-of-way, most are associated with oil and gas leases. The projections and modeling assumptions and impacts from these facilities are discussed in detail in Section 4.3.7, Minerals.

Recreation and mineral-extraction management decisions are expected to have the greatest effect on air quality. The potential effects of management decisions on these resources are discussed in detail below.

4.3.1.3.1. ANALYSIS ASSUMPTIONS

Mineral development potential in the Monticello PA was identified as low for the majority of commodities assessed: coal, potash and salt, tar sands, copper, and gold. A moderate to high extraction potential was identified for uranium/vanadium, depending on the mining area, and a high extraction potential exists for limestone, building stone, and clay. The extraction potential for sand and gravel was rated as moderate to high depending on the relative distance from an established road.

As mineral development is a permitted process, and a variety of multi-level regulatory processes (discussed in the introduction of this section) exist to ensure that pollutant levels do not increase above identified thresholds and/or air quality criteria, it is assumed that mineral development operations would be carried out in compliance with existing policies and regulations at both the state and federal level. It is further assumed that roads, pipelines, excavations, and other mineral development-related disturbances in areas with soils susceptible to wind erosion would be appropriately surfaced (covering of piles where appropriate, graveling or surfactants applied to roads, etc.) to reduce fugitive dust generated by traffic and related activities. Such treatments would be applied as appropriate on local and resource access roads that represent a dust problem. Lower speed limits, enforced by the appropriate authority, would also limit dust in project and adjacent areas.

state and federal preconstruction/excavation permit processes are required to consider cumulative impacts of proposed and surrounding future sources to ensure that proposed sources within the project area would not contribute to exceedances of the national ambient air quality standards (NAAQS). Development potential for mineral resources in the Monticello PA is discussed in greater detail in Section 4.3.7, Minerals.

Several areas with high to moderate fluid-hydrocarbon-extraction potential (oil and gas wells) are identified in Section 4.3.7, Minerals. Existing wells are relatively common in the Monticello PA. The total number of wells (oil and gas) within the PA (which includes lands other than those managed by the BLM) is 1,615. If approved, future drilling is projected to occur at a rate of 5 to 21 wells per year over the next 15 years.

BLM identified primary emission sources for oil and gas development as gas-fired compressors (about 1 compressor for 16 wells or a minimum of 2 per RFD area), glycol dehydrators (estimated at 1 per producing well), flaring (assumed to occur in 60% of the producing wells, with flared gas assumed to be 'sweet'), fugitive dust (from roadways and pads, with construction assumed to represent the critical period). Primary emission components were identified as CO, NOx, SO2, PM10, and PM2.5, CO2, volatile organic compounds (VOCs), and hazardous air pollutants (HAPs).

To assess the potential for air quality effects from oil and gas extraction, BLM assumed that assumed the average surface disturbance per existing well would be similar for future well sites. An average disturbance area of 9.6 acres per well was estimated using existing roads and pipelines associated with similar locations where oil and gas extraction has occurred. This figure, multiplied by the total number of wells for the Proposed Plan, was used to calculate a potential area of disturbance of 15,504 acres, based on the predicted RFD scenario for oil and gas (BLM 2005d). This acreage is divided into 5.5 acres of road developed per well and 4.1 acres of well pad disturbance.

For the purposes of this analysis, the number of wells drilled in any of the RFD areas (Blanding sub-basin, Monument upwarp, and Paradox fold and fault belt) was assumed to be proportional to the acreage of land open for mineral development under that alternative, as described in Section 4.3.7 Minerals. In addition, BLM assumed that 50% of the wells drilled would be dry holes. The assumed maximum well pads constructed per year were also derived from the analysis of oil and gas development described in Section 4.3.7. Future oil and gas development over the next 15 years is projected to be 7 to 8 wells per year. This assumption projects a total number (over 15 years) of total 54–75 wells and approximately 518–720 additional acres of disturbance. While special stipulations (timing limitations and controlled surface use) may impose minor restrictions, surface-disturbing activities could still occur and therefore, these special stipulations would not result in a reduction in the number of wells

Predicted number of wells and associated acreages on BLM lands within the RFD areas (Paradox Fold and Fault Belt, Blanding Sub-basin, and Monument Upwarp), were used as the basis of analysis for air quality impacts specific to future oil and gas development within the MPA. Impacts on air quality were assessed as annual estimated emissions at peak oil and gas production during the next fifteen years.)

.Dispersion modeling was not conducted for this analysis, because the locations of oil and gas wells can not be determined at the programmatic planning level. AP-42, Fifth Edition methodology was employed to calculate total emissions from the following sources: compressors, glycol dehydrators, flaring, fugitive dust associated with well pad construction and vehicle travel to and from wells (EPA 2005).

For each development scenario, the number of expected compressors was based on expected number of total producing wells and the expected gas production potential of each well. The

number of compressors necessary for each alternative was calculated from an assessment of the average number compressors (0.063 per producing well) required for potential oil and gas development in the Vernal FO, located to the north of the PA (Trinity and Nicholls 2006). To accommodate the expansive distances between wells and the separate RFD areas, a minimum of two compressors per RFD area was assumed. The analysis also assumed there would be one glycol dehydrator per gas well, with a well spacing of 40 acres.

Generalized projected emissions from compressors include CO, NO_x, CO₂, SO₂, PM₁₀, PM_{2.5}, VOCs, Total Organic Compounds (TOC), and a variety of hazardous air pollutants (HAPs). Emission rates were calculated using AP-42, Fifth Edition factors for 4-stroke lean-burn engines (EPA 2003e, EPA 2006). Conversion between AP-42 factors (pounds per million metric British thermal units [lb/MMBtu] fuel input) and emission rates used in the analysis (grams/second) were based on the following assumptions derived from the Vernal FO Air Quality Model Report (Trinity and Nicholls 2006). Required compression was calculated based on the assumption that 1,100 hp of compression is required to move 10 million feet³/day of gas from a field pressure of 250 pounds per square inch (PSI) to a sales line pressure of 800 PSI. The compressors are assumed to have a turbine efficiency of 34%. NO_x emission rates for compressors were calculated based on a Best Available Control Technology (BACT) limit of 0.7 grams per horsepower hour (g/hp-h). Emission rates calculated for each pollutant are assumed to be emitted evenly throughout the year and are displayed in Table 4.6.

Table 4.6. Emission Rates for Compressors

Pollutant	Emission Rate (g/sec)	Emissions (tons per year/unit)
Criteria Pollutants and Greenhouse Gases		
CO	0.58	20.08

VOC	0.12	4.25
TOC	1.52	52.99
Hazardous Air Pollutants		
Acetaldehyde	0.0087	0.30
Acrolein	0.0053	0.19
Benzene	0.00046	0.016
Ethylbenzene	0.00004	0.0014
Formaldehyde	0.055	1.90
Naphthalene	0.000077	0.0027
Toluene	0.00042	0.015
Xylenes	0.00019	0.0066
Other HAPs	0.0048	0.17

An average emission rate of 1.45×10^{-7} g/sec hydrogen sulfide (H₂S) was assumed for all glycol dehydrators (Trinity and Nicholls 2006). All H₂S was assumed to convert to SO₂ (ATSDR 1999) for the purposes of this assessment. Other emission estimates for glycol dehydrators are summarized in Table 4.7 and were derived from assumptions relating to glycol dehydrators in the Vernal FO (Trinity and Nicholls 2006).

Table 4.7. Emission Rates for Glycol Dehydrators

Pollutant	Emission Rate (g/sec)	Emissions (tons per year/unit)
SO ₂	0.000000145	0.000005041
Benzene	0.0368	1.28
Ethylbenzene	0.0067	0.23
H ₂ S	0.000000145	0.00000504
Toluene	0.058	2.01
Xylenes	0.109	3.80

Flaring was assumed to be required in 60% or less of the producing wells. Flared gas was assumed to be "sweet" and contain no sulfur. Flaring emissions applicable to this analysis were assumed to be primarily NO_x and CO. Flaring emissions and relative percentage of wells flared were calculated using the generalized flaring emissions identified for the Vernal FO RMP (Trinity and Nicholls 2006) and are summarized in Table 4.8.

Table 4.8. Emission Rates for Flaring

Pollutant	Emission Rate (g/sec)	Emissions (tons per year/unit)
CO	0.053	1.8
NO _x	0.0098	0.34
PM ₁₀	0.00089	0.031
PM _{2.5}	0.00089	0.031

Fugitive dust emissions were estimated using AP-42, Fifth Edition Section 13.2.2 for construction traffic on roads and Section 13.2.3 for heavy construction operations of well pads and new roads. Section 13.2.3 estimates total suspended particulate matter which are converted to PM₁₀ by applying a conversion factor of 0.26 (Trinity and Nicholls 2006). Conversion from PM₁₀ to PM_{2.5} is similarly achieved through a conversion factor of 0.15.

Construction activity was assumed to occur for 10 days for each well pad developed, both producing and dry. BLM assumed that the control efficiency (PM₁₀ and PM_{2.5}) for watering was 25% on construction sites including the well pad and on new resource roads. BLM assumed that watering of all exposed disturbance areas at the well pad site itself would occur as appropriate during the construction period. BLM assumed that 10% of the roads would be watered. The control efficient for graveling roads was assumed to be 75%; 40% of new roads were assumed to be graveled. It was therefore assumed that 50% of new roads would receive no treatment to reduce fugitive dust. All of these assumptions were taken from the Vernal FO Air Quality Model Report and fugitive dust calculations (Trinity and Nicholls 2006). A total of 12 construction

vehicles operating on-site at any one time were assumed with a total of 346 round trips (the majority of which are pick-up trucks for site visits). The average round trip distance was assumed to be 10 miles. Vehicle weights range from 8,000 lbs for a diesel pick-up truck to 85,000 lbs for diesel low-boy equipment haulers, cementer trucks, and completion rigs. BLM assumed that all mobile vehicles would be working at any one time on-site. This scenario is assumed to be representative of periods of intense activity and, therefore, serves as a conservative estimate of critical conditions.

Soils in the MPA have been characterized as having low to moderate wind-erodibility. Soil moisture content of 5% and soil silt content of 5% were assumed.

In addition to construction-specific actions, some additional post-construction particulate matter (dust) emissions are projected to occur on a short-term basis due to loss of vegetation within the construction and staging areas. Given appropriate soil stabilization and revegetation measures, these emissions are likely to be minimal to negligible.

The contribution to potential air quality impacts from other [non-oil and gas] mineral development was considered nominal and oil and gas related activities were assumed to be the largest component of mineral related activity within the MPA. Therefore, only oil and gas related emissions were directly considered in assessing emissions.

4.3.1.3.2. ALTERNATIVE A

4.3.1.3.2.1. Impacts of Mineral Decisions on Air Quality Under Alternative A

The minerals management decisions under Alternative A would maintain existing levels of use without additional constraints. Four primary BLM leasing categories for oil and gas have been identified within this assessment:

- Standard lease terms (Standard)
- Special Conditions, or Timing Limitations and/or Controlled Surface Use (Limited)
- No surface occupancy (NSO)
- Closed (lands designated as closed are not available for oil and gas development activities and therefore were not included in this analysis)

Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005f), it is estimated that 73 oil and gas wells would be drilled over the next fifteen years (Table 4.9) under Alternative A, and that 38 of these would produce oil or gas. Of the producing wells, 24 are estimated to require flaring (60%). The maximum number of well pads constructed per year is assumed to be 8 (See Section 4.3.7). Alternative A would require an estimated 5 compressors and 38 glycol dehydrators. Surface disturbance associated with these wells is estimated to involve approximately 701 acres over the next fifteen years. Oil and gas development is anticipated to occur in all RFD areas but is projected to be least likely to occur in the Monument Upwarp RFD area, while the Blanding Sub-basin area is projected to experience the greatest amount of development. Additional information on disturbance specific to salable resources, other leasable resources, and geophysical exploration is available in Section 4.3.7.4.5 Impacts of Mineral Decisions on Mineral Resource Development. Calculated numbers of wells for each RFD area in Alternative A are also listed in Table 4.9.

Table 4.9. Average Predicted Oil and Gas Wells on BLM Lands within RFD Areas under Alternative A over 15 years

RFD Area	Predicted Oil and Gas Wells ¹	Predicted Producing Oil and Gas Wells	Producing Oil and Gas Wells Estimated to Require Flaring	Estimated Compressors Necessary ²	Estimated Glycol Dehydrators Necessary ²
Paradox Fold and Fault Belt	25	13	8	1	13
Blanding Sub-basin	41	21	13	2	21
Monument Upwarp	7	4	3	2	4
Total	73	38	24	5	38

Note: Calculations based on BLM lands only, and are specific to a time period of 15 years.

¹ The number of oil and natural gas wells was calculated as a cumulative total, not independently. For the purpose of analyzing impacts of minerals decisions on the total number of oil and natural gas wells, BLM lands designated as No Surface Occupancy (NSO) were not considered open for development.

² Necessary compressors were calculated at 0.063 per producing well (minimum of 2 per RFD area). Necessary glycol dehydrators were calculated at 1 per producing well (Trinity and Nicholls 2006).

Total emissions (tons/year) of criteria pollutants and greenhouse gases from compressors, glycol dehydrators, flaring, and fugitive dust associated with construction activities for Alternative A are summarized in Table 4.10. The base-year emission inventory for Grand and San Juan Counties are also displayed for comparison purposes. Particulate matter emission increases are expected to be 1.3% for PM₁₀ and PM_{2.5} over base-year data respectively. A 0.5% increase in CO, a 1.5% increase in NO_x, and a 0.8% increase in Volatile Organic Compounds (VOCs) over base-year emissions is also expected. VOCs and NO_x are precursors to ozone formation. No base-year TOC data are available for comparison.

Table 4.10. Summary of Predicted Emissions and Comparison to Regional Base-year for the Monticello FO Related to Expected Oil and Gas Development under Alternative A

Pollutant	Estimated Emissions under Alternative A (tons/year)	Grand County Base-year ¹ (t/year)	San Juan County Base-year ¹ (t/year)	Regional Base-year ² (t/year)	Percent change from Regional Base-year

¹ 2005 Emission inventory obtained from Utah Division of Air Quality. URL: http://www.airquality.utah.gov/Planning/Emission-Inventory/2005_State/05_State_List.htm ² Regional base-year assumed to be total emissions in Grand and San Juan County.

Emissions of hazardous air pollutants (HAPs) are summarized in Table 4.11 for Alternative A. Base-year HAPs data from the State of Utah Division of Air Quality for Grand and San Juan Counties do not include emissions from existing oil and gas development and therefore were found not be appropriate for comparison. The largest potential emissions of HAPs are for benzene (49 t/year), toluene (77 t/year), and xylenes (144 t/year). All of the HAPs listed below with the exception of H₂S and naphthalene (one of the other HAPs) are also considered VOCs and are included as such in the criteria pollutant discussion above.

Table 4.11. Predicted Emissions of Hazardous Air Pollutants (HAPs) for the Monticello FO Related to Expected Oil and Gas Development under Alternative A

Pollutant	Emissions from Compressors (t/year)	Emissions from Glycol Dehydrators (t/year)	Total Emissions (t/year)
Benzene	0.1	48.6	48.7
Ethylbenzene	0.01	8.9	8.9

Other HAPs	0.8	No data	3.3

4.3.1.3.2.2. Impacts of Recreation Decisions on Air Quality Under Alternative A

Recreation management decisions under Alternative A would maintain existing levels of motorized vehicle use, without additional constraints. Potential affects on air quality would be primarily associated with combustion by-products from automobiles, OHVs, and other hydrocarbon-combustion based transport, and surface disturbance from off-trail and off-road activities. Potential air quality constituents of concern related to recreational use include particulate matter (PM₁₀ and PM_{2.5}), hydrocarbons, and combustion by-products.

Because the locations of all future recreation sites within the Monticello PA are not presently known, quantification of potential air quality impact is not appropriate. Since the Monticello PA is currently in attainment, continued recreational use at the current level is not likely to result in long-term, project-wide exceedances of ambient air quality standards. However, heavy recreational use may contribute to short term exceedances of air quality standards.

Recreation management decisions that limit or reduce surface and vegetation disturbance and OHV and other off-trail access, and improve existing road and trail surfaces are likely to have negligible impacts on air quality in the short term, and negligible to incrementally beneficial impacts on long-term air quality. This is because short-term benefits to air quality would most likely not be measurable in the Monticello PA, and because long-term benefits would include site-specific reductions in wind-borne particulate matter due to less erosion of exposed soils as vegetation and soil cohesion improve over time.

4.3.1.3.3. ALTERNATIVE B

Alternative B is expected to have a slightly lower overall impact on air quality in the Monticello PA than Alternative A because the emphasis of management decisions on conservation of resources under this alternative would limit surface disturbances and other impacts to air quality.

4.3.1.3.3.1. Impacts of Mineral Decisions on Air Quality Under Alternative B

Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005f), it is estimated that 66 oil and gas wells would be drilled over the next fifteen years (Table 4.12) under Alternative B, a decrease of approximately 10% from Alternative A. It is assumed that 33 wells would produce oil or gas. Of the producing wells, 21 are estimated to require flaring (64%). The maximum number of well pads constructed per year is assumed to be 7 (See Section 4.3.7). Alternative B would require an estimated 5 compressors and 33 glycol dehydrators. Surface disturbance associated with these wells is estimated to involve approximately 634 acres over the next fifteen years. Oil and gas development is anticipated to occur in all RFD areas but is projected to be least likely to occur in the Monument Upwarp RFD area, while the Blanding Sub-basin area is projected to experience the greatest amount of development, similar to Alternative A. Additional information on disturbance specific to salable resources, other leasable resources, and geophysical exploration is available in Section 4.3.7.4.5 Impacts of Mineral Decisions on Mineral Resource Development. Calculated numbers of wells for each RFD area in Alternative A are also listed in Table 4.12.

Table 4.12. Average Predicted Oil and Gas Wells on BLM Lands within RFD Areas under Alternative B over 15 years

RFD Area	Predicted Oil and Gas Wells ¹	Predicted Producing Oil and Gas Wells	Producing Oil and Gas Wells Estimated to Require Flaring	Estimated Compressors Necessary ²	Estimated Glycol Dehydrators Necessary ²
Paradox Fold and Fault Belt	20	10	6	1	10
Blanding Sub-basin	38	19	12	2	19
Monument Upwarp	8	4	3	2	4
Total	66	33	21	5	33

Note: Calculations based on BLM lands only, and are specific to a time period of 15 years.

¹ The number of oil and natural gas wells was calculated as a cumulative total, not independently. For the purpose of analyzing impacts of minerals decisions on the total number of oil and natural gas wells, BLM lands designated as No Surface Occupancy (NSO) were not considered open for development.

² Necessary compressors were calculated at 0.063 per producing well (minimum of 2 per RFD area). Necessary glycol dehydrators were calculated at 1 per producing well (Trinity and Nicholls 2006).

Total emissions (tons/year) of criteria pollutants and greenhouse gases from compressors, glycol dehydrators, flaring, and fugitive dust associated with construction activities for Alternative B are summarized in Table 4.13. The base-year emission inventory for Grand and San Juan Counties are also displayed for comparison purposes. Particulate matter emissions increases are expected to be 1% for PM₁₀ and PM_{2.5} over base-year data. A 1% increase in CO, NO_x, and

Volatile Organic Compounds (VOCs) over base-year emissions is also expected. VOCs and NO_x are precursors to ozone formation. No base-year TOC data are available for comparison.

Table 4.13. Summary of Predicted Emissions and Comparison to Regional Base-year for the Monticello FO Related to Expected Oil and Gas Development under Alternative B

² Regional base-year assumed to be total emissions in Grand and San Juan County.

Emissions of hazardous air pollutants (HAPs) are summarized in Table 4.14 for Alternative B. Base-year HAPs data from the State of Utah Division of Air Quality for Grand and San Juan Counties do not include emissions from existing oil and gas development and therefore were found not be appropriate for comparison. The largest potential emissions of HAPs are for benzene (42 t/year), toluene (66 t/year), and xylenes (125 t/year). All of the HAPs listed below with the exception of H₂S and naphthalene (one of the other HAPs) are also considered VOCs and are included as such in the criteria pollutant discussion above.

Table 4.14. Predicted Emissions of Hazardous Air Pollutants (HAPs) for the Monticello FO Related to Expected Oil and Gas Development under Alternative B

Pollutant	Emissions from Compressors (t/year)	Emissions from Glycol Dehydrators (t/year)	Total Emissions (t/year)
Benzene	0.1	42.2	42
Ethylbenzene	0.01	7.7	7.7
Formaldehyde	9.5	-	9.5
H ₂ S	-	0.0	0.0
Toluene	0.1	66.3	66
Xylenes	0.0	125.3	125
Other HAPs	0.8	-	3.3

4.3.1.3.3.2. Impacts of Recreation Decisions on Air Quality Under Alternative B

Under Alternative B, recreation-management decisions would place more restrictions on motorized OHV use, when compared to Alternative A.

Recreation management decisions under this alternative that limit or reduce surface and vegetation disturbance and OHV and other off-trail access, and improve existing road and trail surfaces are likely to produce negligible impacts on short-term air quality and negligible to minor, beneficial impacts on long-term air quality. This is because the beneficial outcomes include site-specific reduced PM₁₀ and other wind-borne particulate matter due to less erosion of exposed soils (and less production of fugitive dust) as vegetation and soil cohesion improve over time, and because the short-term air quality impacts would most likely not be measurable in the Monticello PA. Thus, the adverse impacts of recreation on air quality under Alternative B are would be similar to or less than those described for Alternative A.

4.3.1.3.4. ALTERNATIVE C

4.3.1.3.4.1. Impacts of Mineral Decisions on Air Quality Under Alternative C

Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005f), it is estimated that 74 oil and gas wells would be drilled over the next fifteen years under Alternative C (Table 4.15), a decrease of approximately 1% from Alternative A. It is assumed that 38 wells would produce oil or gas. Of the producing wells, 24 are estimated to require flaring (65%). The maximum number of well pads constructed per year is assumed to be 8 (See Section 4.3.7). Alternative C would require an estimated 5 compressors and 38 glycol dehydrators. Surface disturbance associated with these wells is estimated to involve approximately 710 acres over the next fifteen years (an increase of approximately 1% from Alternative A). Oil and gas development is anticipated to occur in all RFD areas but is projected to be least likely to occur in the Monument Upwarp RFD area, while the Blanding Sub-basin area is projected to experience the greatest amount of development, similar to Alternative A. Additional information on disturbance specific to salable resources, other leasable resources, and geophysical exploration is available in Section 4.3.7.4.5, Impacts of Mineral Decisions on Mineral Resource Development. Calculated numbers of wells for each RFD area under Alternative C are also listed in Table 4.15.

Table 4.15. Average Predicted Oil and Gas Wells on BLM Lands within RFD Areas under Alternative C over 15 years

RFD Area	Predicted Oil and Gas Wells ¹	Predicted Producing Oil and Gas Wells	Producing Oil and Gas Wells Estimated to Require Flaring	Estimated Compressors Necessary ²	Estimated Glycol Dehydrators Necessary ²
Paradox Fold and Fault Belt	24	12	8	1	12
Blanding Sub-basin	41	21	13	2	21
Monument Upwarp	9	5	3	2	5
Total	74	38	24	5	38

Note: Calculations based on BLM lands only, and are specific to a time period of 15 years.

¹ The number of oil and natural gas wells was calculated as a cumulative total, not independently. For the purpose of analyzing impacts of minerals decisions on the total number of oil and natural gas wells, BLM lands designated as No Surface Occupancy (NSO) were not considered open for development.

² Necessary compressors were calculated at 0.063 per producing well (minimum of 2 per RFD area). Necessary glycol dehydrators were calculated at 1 per producing well (Trinity and Nicholls 2006).

Total emissions (tons/year) of criteria pollutants and greenhouse gases from compressors, glycol dehydrators, flaring, and fugitive dust associated with construction activities for Alternative C are summarized in Table 4.16. The base-year emission inventory for Grand and San Juan Counties are also displayed for comparison purposes. Particulate emissions increases are expected to be 1% for PM₁₀ and PM_{2.5} over base-year data respectively. A 1% increase in CO, a 2% increase in NO_x, and a 1% increase in volatile organic compounds (VOCs) over base-year emissions are also expected. VOCs and NO_x are precursors to ozone formation. No base-year TOC data are available for comparison.

4.3.1.3.4.2. Impacts of Recreation Decisions on Air Quality Under Alternative C

Under Alternative C, recreation management decisions would place additional restrictions on motorized vehicle use as compared to Alternative A, specifically for lands with non-WSA wilderness characteristics.

Recreation management decisions under this alternative that limit or reduce surface and vegetation disturbance and OHV and other off-trail access, and improve existing road and trail surfaces are likely to produce negligible impacts on short-term air quality and negligible to minor beneficial impacts on long-term air quality. These beneficial outcomes include site-specific reduced PM₁₀ and other wind-borne particulates due to less erosion of exposed soils as vegetation and soil cohesion improve over time. Short-term benefits to air quality would most likely not be measurable in the overall PA.

The adverse impacts of recreation on air quality under Alternative C would be similar to or less than those described for Alternative A.

4.3.1.3.5. ALTERNATIVE D

4.3.1.3.5.1. Impacts of Mineral Decisions on Air Quality Under Alternative D

Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005f), it is estimated that 75 oil and gas wells would be drilled over the next fifteen years (Table 4.18), an

increase of approximately 1.03 times Alternative A. It is assumed that 39 wells would produce oil or gas. Of the producing wells, 24 are estimated to require flaring (62%). The maximum number of well pads constructed per year is assumed to be 8 (See Section 4.3.7). Alternative D would require an estimated 5 compressors and 39 glycol dehydrators. Surface disturbance associated with these wells is estimated to involve approximately 720 acres over the next fifteen years (an increase of approximately 3% from Alternative A). Oil and gas development is anticipated to occur in all RFD areas but is projected to be least likely to occur in the Monument Upwarp RFD area, while the Blanding Sub-basin area is projected to experience the greatest amount of development, similar to Alternative A. Additional information on disturbance specific to salable resources, other leasable resources, and geophysical exploration is available in Section 4.3.7.4.5, Impacts of Mineral Decisions on Mineral Resource Development. Calculated numbers of wells for each RFD area in Alternative D are also listed in Table 4.18.

Table 4.18. Average Predicted Oil and Gas Wells on BLM Lands within RFD Areas under Alternative D over 15 years

RFD Area	Predicted Oil and Gas Wells ¹	Predicted Producing Oil and Gas Wells	Producing Oil and Gas Wells Estimated to Require Flaring	Estimated Compressors Necessary ²	Estimated Glycol Dehydrators Necessary ²
Paradox Fold and Fault Belt	25	13	8	1	13
Blanding Sub-basin	41	21	13	2	21
Monument Upwarp	9	5	3	2	5
Total	75	39	24	5	39

Note: Calculations based on BLM lands only, and are specific a time period of 15 years.

¹ The number of oil and natural gas wells was calculated as a cumulative total, not independently. For the purpose of analyzing impacts of minerals decisions on the total number of oil and natural gas wells, BLM lands designated as No Surface Occupancy (NSO) were not considered open for development.

² Necessary compressors were calculated at 0.063 per producing well (minimum of 2 per RFD area). Necessary glycol dehydrators were calculated at 1 per producing well (Trinity and Nicholls 2006).

Total emissions (tons/year) of criteria pollutants and greenhouse gases from compressors, glycol dehydrators, flaring, and fugitive dust associated with construction activities for Alternative D are summarized in Table 4.19. The base-year emission inventory for Grand and San Juan Counties are also displayed for comparison purposes. Particulate emissions increases are expected to be 1% for PM₁₀ and PM_{2.5} over base-year data. A 1% increase in CO, a 2% increase in NO_x, and a 1% increase in volatile organic compounds (VOCs) over base-year emissions are also expected. VOCs and NO_x are precursors to ozone formation. No base-year TOC data are available for comparison.

² Regional base-year assumed to be total emissions in Grand and San Juan County.

Emissions of hazardous air pollutants (HAPs) are summarized in Table 4.20 for Alternative D. Base-year HAPs data from the State of Utah Division of Air Quality for Grand and San Juan Counties do not include emissions from existing oil and gas development and therefore were found not be appropriate for comparison. The largest potential emissions of HAPs are for benzene (50 t/year), toluene (78 t/year), and xylenes (148 t/year). All of the HAPs listed below with the exception of H₂S and naphthalene (one of the other HAPs) are also considered volatile organic compounds and are included as such in the criteria pollutant discussion above.

Table 4.20. Predicted Emissions of Hazardous Air Pollutants (HAPs) for the Moab FO Related to Expected Oil and Gas Development under Alternative D

Other HAPs	0.8	-	3.3

4.3.1.3.5.2. Impacts of Recreation Decisions on Air Quality Under Alternative D

Under Alternative D, recreation management decisions would place minor additional restrictions on motorized vehicle use as compared to Alternative A.

Recreation management decisions under this alternative that limit or reduce surface and vegetation disturbance and OHV and other off-trail access, and improve existing road and trail surfaces are likely to produce negligible impacts on short-term air quality and negligible to minor beneficial impacts on long-term air quality. These beneficial outcomes include site-specific reduced PM₁₀ and other wind-borne particulates due to less erosion of exposed soils as vegetation and soil cohesion improve over time. Short-term benefits to air quality would most likely not be measurable in the overall PA.

The adverse impacts of recreation on air quality under Alternative D are expected to be similar to those described for Alternative A.

4.3.1.3.6. ALTERNATIVE E

Alternative E is projected to have a lower overall impact on air quality in the Monticello PA than Alternative A because less surface disturbances and emissions would be allowed under this alternative than under Alternative A.

4.3.1.3.6.1. Impacts of Mineral Decisions on Air Quality Under Alternative E

Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005f), it is estimated that 54 oil and gas wells would be drilled over the next 15 years (Table 4.21), a decrease of approximately 26% from Alternative A. It is assumed that 28 wells would produce oil or gas. Of the producing wells, 18 are estimated to require flaring (64%). The maximum number of well pads constructed per year is assumed to be 7 (See Section 4.3.7). Alternative D would require an estimated 5 compressors and 28 glycol dehydrators. Surface disturbance associated with these wells is estimated to involve approximately 518 acres over the next 15 years (a decrease of approximately 26% from Alternative A). Oil and gas development is anticipated to occur in all RFD areas but is projected to be least likely to occur in the Monument Upwarp RFD area, while the Blanding Sub-basin area is projected to experience the greatest amount of development, similar to Alternative A. Additional information on disturbance specific to salable resources, other leasable resources, and geophysical exploration is available in Section 4.3.7.4.5, Impacts of Mineral Resource Development Decisions on Mineral Resource Development. Calculated numbers of wells for each RFD area in Alternative E are also listed in Table 4.21.

Table 4.21. Average Predicted Oil and Gas Wells on BLM Lands within RFD Areas under Alternative E over 15 years

4.3.1.3.6.2. Impacts of Recreation Decisions on Air Quality Under Alternative E

Under Alternative E, recreation management decisions would place additional restrictions on motorized vehicle use as compared to Alternative A, specifically for lands with non-WSA wilderness characteristics.

Recreation management decisions under this alternative that limit or reduce surface and vegetation disturbance and OHV and other off-trail access, and improve existing road and trail surfaces are likely to produce negligible impacts on short-term air quality, and negligible to minor, beneficial impacts on long-term air quality. These beneficial outcomes would likely include site-specific reduced PM₁₀ and other wind-borne particulates due to reduced erosion of exposed soils as vegetation and soil cohesion improve over time. Short-term benefits to air quality would most likely not be measurable in the overall project area.

The adverse impacts of recreation on air quality under Alternative E would be similar to or less than those described for Alternative A.

4.3.1.3.7. PROPOSED PLAN**4.3.1.3.7.1. Impacts of Mineral Decisions on Air Quality Under the Proposed Plan**

Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005f), it is estimated that 72 oil and gas wells would be drilled over the next 15 years under the Proposed Plan (Table 4.24), a decrease of approximately 1% from Alternative A. It is assumed that 37 wells would produce oil or gas. Of the producing wells, 24 are estimated to require flaring (65%). The maximum number of well pads constructed per year is assumed to be 8 (See Section 4.3.7). The Proposed Plan would require an estimated 5 compressors and 37 glycol dehydrators. Surface disturbance associated with these wells is estimated to involve approximately 691 acres over the next 15 years (a decrease of approximately 1% from Alternative A). Oil and gas development is anticipated to occur in all RFD areas but is projected to be least likely to occur in the Monument Upwarp RFD area, while the Blanding Sub-basin area is projected to experience the greatest amount of development, similar to Alternative A. Additional information on disturbance specific to salable resources, other leasable resources, and geophysical exploration is available in Section 4.3.7.4.5, Impacts of Mineral Decisions on Mineral Resource Development. Calculated numbers of wells for each RFD area under the Proposed Plan are also listed in Table 4.24.

Table 4.24. Average Predicted Oil and Gas Wells on BLM Lands within RFD Areas under the Proposed Plan over 15 years

RFD Area	Predicted Oil and Gas Wells ¹	Predicted Producing Oil and Gas Wells	Producing Oil and Gas Wells Estimated to Require Flaring	Estimated Compressors Necessary ²	Estimated Glycol Dehydrators Necessary ²
Paradox Fold and Fault Belt	24	12	8	1	12

Monument Upwarp	7	4	3	2	4
Total	72	37	24	5	37

Note: Calculations based on BLM lands only, and are specific to A time period of 15 years.

¹ The number of oil and natural gas wells was calculated as a cumulative total, not independently. For the purpose of analyzing impacts of minerals decisions on the total number of oil and natural gas wells, BLM lands designated as No Surface Occupancy (NSO) were not considered open for development.

² Necessary compressors were calculated at 0.063 per producing well (minimum of 2 per RFD area). Necessary glycol dehydrators were calculated at 1 per producing well (Trinity and Nicholls 2006).

Total emissions (tons/year) of criteria pollutants and greenhouse gases from compressors, glycol dehydrators, flaring, and fugitive dust associated with construction activities for the Proposed Plan are summarized in Table 4.25. The base-year emission inventory for Grand and San Juan Counties are also displayed for comparison purposes. Particulate matter emissions increases are expected to be 1% for PM₁₀ and PM_{2.5} over base-year data respectively. A 1% increase in CO, a 2% increase in NO_x, and a 1% increase in volatile organic compounds (VOCs) over base-year emissions are also expected. VOCs and NO_x are precursors to ozone formation. No base-year TOC data are available for comparison.

Table 4.25. Summary of Predicted Emissions and Comparison to Regional base-year for the Monticello FO Related to Expected Oil and Gas Development under the Proposed Plan

Pollutant	Estimated Emissions under Alternative C (t/year)	Grand County Base-year ¹ (t/year)	San Juan County Base-year ¹ (t/year)	Regional Base-year ² (t/year)	Percent change from Regional Base-year

¹ 2005 Emission inventory obtained from Utah Division of Air Quality. URL: http://www.airquality.utah.gov/Planning/Emission-Inventory/2005_State/05_State_List.htm

² Regional base-year assumed to be total emissions in Grand and San Juan County.

Emissions of hazardous air pollutants (HAPs) are summarized in Table 4.26 for Alternative C. Base-year HAPs data from the State of Utah Division of Air Quality for Grand and San Juan Counties do not include emissions from existing oil and gas development and therefore were found not be appropriate for comparison. The largest potential emissions of HAPs are for benzene (47 t/year), toluene (74 t/year), and xylenes (141 t/year). All of the HAPs listed below with the exception of H₂S and naphthalene (one of the other HAPs) are also considered VOCs and are included as such in the criteria pollutant discussion above.

Table 4.26. Predicted Emissions of Hazardous Air Pollutants (HAPs) for the Monticello FO Related to Expected Oil and Gas Development under Proposed Plan

Pollutant	Emissions from Compressors (t/year)	Emissions from Glycol Dehydrators (t/year)	Total Emissions (t/year)
Benzene	0.1	47.32	47
Ethylbenzene	0.0	8.62	8.6
Formaldehyde	9.5	-	9.5
H ₂ S	-	0.000	0.0
Toluene	0.1	74.39	74
Xylenes	0.0	140.51	141
Other HAPs	0.8	-	3.3

4.3.1.3.7.2. Impacts of Recreation Decisions on Air Quality Under Proposed Plan

Under the Proposed Plan, recreation management decisions would place additional restrictions on motorized vehicle use as compared to Alternative A, specifically for lands with non-WSA wilderness characteristics.

Recreation management decisions under this alternative that limit or reduce surface and vegetation disturbance and OHV and other off-trail access, and improve existing road and trail surfaces are likely to produce negligible impacts on short-term air quality and negligible to minor beneficial impacts on long-term air quality. These beneficial outcomes are likely to include site-specific reduced PM₁₀ and other wind-borne particulates due to less erosion of exposed soils as vegetation and soil cohesion improve over time. Short-term benefits to air quality would most likely not be measurable in the overall PA.

The adverse impacts of recreation on air quality under the Proposed Plan would be similar to or less than those described for Alternative A.

4.3.1.4. SUMMARY OF IMPACTS

Recreation and mineral management (oil and gas development) decisions would emit pollutants during operation (i.e., vehicle emissions, well operations, compressor engines, etc.), along with fugitive dust from public vehicle use, OHVs, construction and mineral development activities. Impacts to air quality from prescribed fire management decisions would likely be related to particulate matter (primarily PM_{2.5}) and carbon dioxide (CO₂). Impacts would likely be short term and would result in long-term benefits for other resources.

With respect to oil and gas development alternatives, all of the alternatives would lead to additional emissions and impacts to air quality. Although potential impacts were not assessed quantitatively, the analysis provides for comparison to base-year emissions and a relative comparison among alternatives. The Proposed Plan would result in a 1% increase of PM₁₀ and PM_{2.5} emissions over base-year data respectively. Increases in NO_x and VOCs over base-year, the precursors for ozone formation, would be 2% and 1% respectively. This slight increase in emissions could affect ozone concentrations in Canyonlands National Park which are already close to the new 8-hr standard of 0.075 ppm (see Chapter 3, Section 3.2.2). Of all of the alternatives analyzed, Alternative E is the most protective of air quality with total emissions ranging from 5 to 26% less than Alternative A for individual pollutants. The differences in air emissions between Alternative A and the Proposed Plan are very small (Table 4.27).

4.3.1.5. MITIGATION MEASURES

Required mitigation measures are outlined in state and federal policies and regulations that govern the air quality permit process and include application of the BACT; compliance with appropriate dust-abatement measures for construction, demolition, clearing, or excavation of land; management of emissions to prevent deterioration to air quality in PSD Class I Areas; and restrictions imposed by regulatory agencies and management authorities on equipment and vehicle air emissions.

Additional mitigation measures may include additional surface stabilization, lower vehicle speed limits, and reclamation to improve surface vegetation. BLM would consider mitigation for potential direct project impacts in an EIS for a proposed project. BLM would not prescribe a particular mitigation measure. BLM may consider requiring the proponent to demonstrate the potential project impacts are not greater than an applicable level-of-concern.

Mitigation may be applied to fugitive dust and NO_x impacts. Fugitive dust refers to any particulate matter that is not deliberately emitted by a well-defined source. Fugitive dust sources typically include windblown dust from un-vegetated lands, construction, and unpaved roads. Table 4.28 shows several fugitive dust mitigation options available.

Table 4.28. Effectiveness and Costs of Fugitive Dust Mitigation Measures (PM₁₀)

	Dust Sources					
	Disturbed Areas	Unpaved Roads ¹				
Effectiveness	Level proportional to percentage of land cover	0–50% reduction in uncontrolled dust emissions	33%–100% control efficiency	80% for 15 mph ³ 65% for 20 mph ³ 25% for 30 mph ³	30% reduction	90% reduction
Estimated Cost	Unknown	\$4,000/mile	\$2,000 to \$4,000/mile per year	Unknown	\$9,000/mile	\$11,000 to \$60,000/mile

NO_x emissions are associated with combustion. Table 4.29 shows several potential mitigation measures that could reduce impacts from NO_x emissions. The appropriate level of control will be determined by the State of Utah during the construction permit process.

Table 4.29. Efficiency of Nitrogen Oxides (NO_x) Mitigation Measures

	NO _x Emissions Sources			
	Field Compressors	Sales Compressors	Temporary Diesel Generators ¹	Heavy Equipment
Mitigation Options/Efficiency	Implement BACT Typically results in a NO _x emission rate of about 1 g/bhp-hr	Implement BACT Typically results in a NO _x emission rate of about 1 g/bhp-hr	Register with state; UDEQ regulate as appropriate	Voluntary use of diesel engines

In addition, Table 4.30 shows additional mitigation measures to be considered in the planning area impact assessment. These are general mitigation opportunities that should be considered and applied as appropriate. BLM has no authority to require application of these measures, although industry is encouraged to implement these measures on its own before they are required by the State of Utah. Advances in technology are likely to offer new mitigation options during the time covered by the RMP. Under NEPA, the planners of individual projects in the planning area must consider mitigation. The State of Utah, as the permitting authority, will review permit applications and require specific emission control devices and measures as appropriate. All costs shown in this table are approximate.

Table 4.30. Additional Mitigation Measures with Approximate Costs and Benefits

Type of Mitigation	Approximate Cost	Environmental Cost	Potential Limitations	Environmental Benefit
Selective Catalytic Reduction for Compressor Emissions	\$4,000 to \$27,000 per NO _x ton-year.	Possible NH ₃ releases.	May be cost prohibitive for oil and gas applications.	NO _x emission rate reduced to 0.1 g/hp-hr; decreased visibility impact.
"Green Completions" and Flowback Units	Capital cost ranges from \$1,000 to \$10,000. Operating cost is \$1,000/year. Payback 1–3 years.	Moving equipment to and from well completions. Fugitive dust from trucks.		Saves 100,000 cubic feet of gas per well per year. Reduces flaring emissions by 70%–90% at completion.
Electrical Compressors	Capital cost is 40% of gas turbine cost. Operating costs depend on location of transmission lines.	Displaced air emissions from compressor unit to electric power plant.		Moving air emissions away from sensitive PSD Class I areas.
Fugitive Dust Road Treatment	\$2,400–\$50,000 per mile.	Possible vegetation effects.		20%–100% dust control.

Table 4.30. Additional Mitigation Measures with Approximate Costs and Benefits

Type of Mitigation	Approximate Cost	Environmental Cost	Potential Limitations	Environmental Benefit
Fugitive Dust Administrative Control	\$13,000 per well for remote telemetry. A few added work hours per year traveling at enforced speed limits.	Minor/unknown.	Difficult to enforce.	Reduced VMTs with related emission reductions. Slower speeds give 20%–50% reductions in dust emissions.
Larger Diameter Sales Pipeline	Capital costs increase with larger pipes. Operating costs decrease with larger pipes.	Larger trench for burying line. Slightly more surface disturbance.	Probably applicable only for large producing operations.	Possibly resulting in lower compressor emissions.
Microhole Drilling	Cost of technology transfer; then potentially less than conventional drilling.	Additional impacts if duplicate drilling is necessary.		Lighter equipment on roads, smaller drilling sites, reduced gaseous emissions during drilling.
Condensate Pipelines	Cost of pipe and installation minus cost of eliminated storage tank and trucking.	Trench for burying line.	The cost may outweigh benefit.	Eliminate emissions from storage vessels; eliminate miles traveled by vacuum trucks.
Wind Farm Electric Generation	4 to 5 cents/kW-hr. Capital costs are large.	Visual impacts, impacts on raptors, maintenance.	Large capital costs required	Reduced power plant emissions. (VOC, NO _x , SO ₂ , CO, CO ₂)
Phased oil and gas Development	Short-term loss of state and federal royalties	Emissions averaged over a longer period.		Peak emissions and impacts are reduced.

The relationship between VOC and nitrogen oxides to form ozone is complex. At this time it is unclear how ozone concentrations would change with VOC and NO_x mitigation. However, Table 4.31 outlines potential VOC mitigation measures.

Table 4.31. VOC Mitigation Measures

Type of Mitigation	Approximate Cost	Environmental Cost	Potential Limitations	Environmental Benefit
Condenser on Glycol Dehydrator	\$1,000 to \$10,000	Unknown		95% VOC and HAP reduction.
Activated Carbon Filter on Condensate Storage Tank	\$1,000 and up	Energy required to recycle filter.		50%–80% VOC reduction.

Table 4.31. VOC Mitigation Measures

Type of Mitigation	Approximate Cost	Environmental Cost	Potential Limitations	Environmental Benefit
Stage I Vapor Controls for Condensate Transfer for Truck Loading	\$1,000–\$3,000	Potential fire risk with improper operation.		90% VOC emission reduction during transfer.

4.3.1.6. UNAVOIDABLE ADVERSE IMPACTS

Prescribed fire would result in degradation of air quality because smoke from an increase in wind-borne particulates (PM₁₀ and PM_{2.5}) resulting from loss of vegetative cover unless revegetation treatments are consistently implemented and evaluated for success with current monitoring techniques.

4.3.1.7. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Prescribed fire may result in short-term and, to a lesser degree, long-term degradation of air quality because of an increase in wind-borne particulates (PM₁₀ and PM_{2.5}) due to loss of vegetation. Such degradation is not expected to be substantial if revegetation measures are adequately monitored and supported for regrowth.

4.3.1.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

There are irretrievable impacts to air quality that would occur over the next 15 years. A number of activities contribute to the degradation of air quality, including smoke from prescribed burning, dust from motor vehicle travel on dirt roads, and industrial emissions to the atmosphere from motor vehicles and energy production. While these activities individually may not cause a significant quantity or duration of impacts, they would occur continuously over the next 15 years at some interval or frequency, and contribute some level of emissions to the air. Since the impacts would be continuous, impacts to air quality would be irretrievable over the next 15 years. However, because the impacts would cease if the activities ended, they would not be irreversible.

4.3.2. CULTURAL RESOURCES

Impacts to the cultural resources of the Monticello PA would primarily result from surface and subsurface disturbance such as development projects, recreational use/OHV travel, and fire management. Impacts might, however, also result from specific cultural-resource management decisions and non-surface visual and noise disturbances. These latter impacts would be felt primarily at sites or locations deemed sacred or traditionally important by Native American tribes and used by these groups in ways that might be disrupted by visual obstructions and/or noise levels.

Because the majority of cultural resources identified in the Monticello PA consist of archaeological sites, the primary resource impacts-related concern would be disturbance of the artifacts, features, and architecture of sites in ways that reduce their integrity and the potential to recover data and alter their association with traditional values. Archaeological data consist of both objects (in the broad sense of artifacts, architecture, features, etc.) and the spatial (horizontal and vertical) relationships among them. Our ability to interpret and understand the past is based on recovering not only its material culture in the form of artifacts, buildings, and the built environment but also on the spatial relationships among different aspects of that culture. Therefore, surface and subsurface disturbances that not only destroy material culture, but also the spatial relationships that are key to understanding and interpreting it, can have the greatest adverse impact on cultural resources. Impacts include elimination or reduction of the data, including the setting and physical integrity of sacred or other sites, National Register of Historic Places (NRHP)-listed or -eligible sites, landscapes, and cultural-landscape areas; disruption or reduction of the religious values of sites and areas; and damage to traditional use areas or resource sites. In general, impacts on cultural resources from surface disturbance are long-term (i.e., permanent): once an archaeological site has been damaged or disturbed, the impact typically cannot be reversed. Short-term visual or noise impacts, however, can often be mitigated or accommodated.

Potential impacts to cultural resources from the proposed management decisions are difficult to quantify as the revised PRMP/FEIS management decisions do not stipulate specific areas where surface-disturbing activities are likely to occur, nor have the exact locations of all cultural resources been identified in the PA. However, it is possible to estimate impacts based on the proposed general locations of activities and the relationships of these areas of activity to zones where cultural resources are more or less likely to be found.

Impacts on cultural resources may be direct, indirect, negligible, or nonexistent, depending on the resource-management decision. Specifically, PRMP/FEIS decisions for air quality, health and safety (e.g., maintaining public safety around abandoned mine land sites (AMLs) and reducing the risks of hazardous materials spills), and soils and watersheds would have negligible or very minor direct or indirect impact on cultural resources within the Monticello PA. Protection of air quality, protecting sensitive soils, and safeguarding streams, creeks, and other waterways would not affect management decisions to inventory and protect cultural resources. Therefore, they will not be considered further in this analysis. All other resource decisions that could potentially impact cultural resources either beneficially or adversely are discussed in detail below.

Analyzing impacts to cultural resources involves developing methods for assessing the impacts of nonspecific and/or program management decisions on areas where the precise number, type, and location of cultural resources are either poorly known or unknown. As described in Chapter 3, no more than approximately 10% of the Monticello PA has been systematically inventoried for cultural resources, and surveying the entire area would not be feasible within the parameters of an RMP (i.e., at the programmatic level of analysis and resource management). Therefore, it is not possible to determine, at the planning stage, if site-specific management decisions would affect cultural resources because many areas are lacking data on the location, type, and number of the cultural resources that lie within them.

Importantly, a management prescription common to the Proposed Plan and all five of the alternatives is that efforts to identify and assess cultural resources will be conducted as part of compliance with Section 106 of the National Historic Preservation Act (NHPA) prior to any site-specific actions. However, to conduct any kind of impact analysis, it is necessary to estimate the densities of sites that may be affected by management decisions under this DEIS. Including a site or sites in management decisions does not imply that they would necessarily be affected in any particular way. Management activities could have beneficial, adverse, or negligible impacts to cultural resource sites, and, by using the Section 106 process, adverse impacts can nearly always be avoided or mitigated. The goal of this analysis is to assess the relative impact of management decisions on cultural resources in a consistent and replicable manner.

The BLM developed a model of cultural-resource site density at a landscape level as a means of estimating the effect of management decisions on the resource. This model built upon techniques used by other researchers in the region to estimate site densities (e.g., Tipps et al. 1988). The goal of the model is to be able to estimate whether large or moderate numbers of sites are probable within a given area of the landscape. The model is not designed to predict specific site locations, nor does it intend to determine that certain portions of the landscape may or may not be used in any particular way. It is a mechanism for assessing relative site densities. The model supplements, but does not replace, what Monticello FO resource specialists, who make land-use decisions based on site-specific information, already know.

While this site-density prediction model is not perfect, it is sufficiently accurate to be used as a tool for analyzing potential impacts of management decisions on cultural resource sites. It has between a 70% and 80% success rate in defining 160-acre quadrants with 1, 2, or more cultural resource sites. The model is used in the analysis of impacts in this PRMP/FEIS as a way to gauge whether a proposed management decision under the Proposed Plan or a particular alternative would involve more acres of high or medium site-density land than another. The model cannot predict numbers of sites affected by decisions, nor should it be considered a replacement for cultural inventory. As noted, Section 106 of the NHPA requires that all specific actions with the potential to involve cultural resources must be supported by efforts, such as an inventory, to document cultural resources.

To assess the impacts of proposed management actions, it is important to ask how likely they are to produce surface-disturbing activities within high, medium, or low site-density zones. It is assumed that the potential for disturbance would be proportional to the total acres of land in each site-density category within the area likely to be disturbed. For example, assume that a proposed management area contains 100 acres, 20 acres (20%) of which the site-density model has classified with high site-density and 80 acres (80%) of which it has classified with medium or

low site-density. Assume also that a particular management decision is expected to disturb 50 acres within that 100-acre area. It follows logically that 10 acres (20%) of that disturbance would affect the high site-density area, and 40 acres (80%) would affect the medium or low site-density area. Again, while not precise, this method results in a quantifiable assessment of probable relative effects of proposed management decisions.

4.3.2.1. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Certain management decisions for various resource programs would apply to the Proposed Plan and all of the proposed alternatives. These decisions have the potential to impact cultural resources in a variety of ways. For example, the Proposed Plan and all alternatives stipulate that standard BLM policy and Sections 106, 110, and 111 of the NHPA should govern cultural resources. These policies and regulations call for both proactive and reactive management of cultural resources within the Monticello PA. *Proactive actions* include nominating worthy cultural sites for the NRHP, surveying areas for cultural resources in the absence of specific project-related activities, establishing cultural-resource interpretation programs, and prohibiting the use of ropes and other climbing aids to access cultural sites. *Reactive actions* include conducting or requiring site-identification surveys in response to applications for land development, use, or transfer; identifying measures to eliminate, reduce, or compensate for impacts to cultural sites resulting from management decisions; and limiting or eliminating access to cultural sites that are either being damaged by visitation or pose a threat to visitors. All of these proactive and reactive measures are designed to recognize the scientific and experimental, traditional, educational/public, and conservation values of cultural resources within the PA. Table 4.32 summarizes the anticipated impacts to cultural resources under the Proposed Plan and all of the alternatives.

Table 4.32. Impacts Common to the Proposed Plan and All Alternatives

Resource Program	Impact on Cultural Resources
Cultural Resources	Program measures provide for avoiding, minimizing, or compensating for impacts to cultural resources, and supporting public enjoyment of the majority of the resources within the PA. These measures would result in long-term beneficial impacts to these cultural resources. The beneficial impacts would result from 1) continuing to implement policies and to follow regulations that are designed to identify important resources and either minimize or reduce impacts to them, 2) educating the public about protecting and valuing cultural resources, 3) restricting or prohibiting land uses that are known to cause direct and indirect, adverse impacts to specific cultural resources, and 4) expanding the FO staff's knowledge about the location and nature of cultural resources within their management responsibility.
Fire Management	A total of 12,760 acres would undergo prescribed fire. Approximately 10,185 acres lie in high cultural-resource site-density areas and 2,575 acres in medium site-density areas. An additional 26,412 acres would receive non-fire treatments, with approximately 20,796 acres described as high site-density and 5,616 acres as medium site-density areas. BLM fire-management policy requires surveys to identify cultural resources prior to any type of treatment for fuel reduction. Consequently, the actual risk to cultural resources within the Monticello PA from fire-management decisions would be minor because sites would be identified and the potential impacts would be mitigated.
Health and Safety	The AML program, whereby abandoned mine sites that pose a risk to human health and safety are remediated, would cause minor, direct, long-term, adverse impacts to

Table 4.32. Impacts Common to the Proposed Plan and All Alternatives

Resource Program	Impact on Cultural Resources
	historical structures and features associated with the mine sites because of actions required to remediate the sites. However, the AML program would be conducted in compliance with the NHPA so that avoidance or mitigation measures would be implemented as appropriate, thereby minimizing the adverse impacts. Hazardous waste clean-up in the event of spills could also result in impacts to cultural resources that may be present in the area of the spill. Since the occurrence of spills is low, particularly large-scale spills, the actual risk to cultural resources is also low. However, in emergency situations where clean-up must take place immediately due to imminent risk to human health and safety, cultural resources may be impacted without prior documentation or development of avoidance and/or minimization measures.
Lands and Realty	Decisions under the Lands and Realty program, including land transfers, avoidances and exclusions, disposals, easements, issuances of rights-of-way, etc. can impact cultural resources depending on the use of the involved lands after the program. In all cases of disposals or transfers, the BLM requires an assessment of environmental impacts and adherence with the Section 106 process, thereby providing for the protection of cultural resources on involved lands. Because the impacts of program decisions on cultural resources for such decisions as issuances of rights-of-ways and easements and designation of avoidance and exclusion areas depends on the uses of the lands, the potential impacts are assessed based upon the future use. Please, see the impacts analysis for minerals development, non-WSA lands with wilderness characteristics, etc. for more information about impacts from actions authorized under the Lands and Realty program.
Livestock Grazing	Maintaining the five side canyons of the Comb Wash allotment as unavailable to grazing would have long-term, beneficial impacts on cultural resources by protecting 16,599 acres of known high site-density lands from potential livestock trampling and rubbing. These include Mule Canyon below Highway 95, Arch Canyon, Fish Canyon, Owl Canyon, and Road Canyon.
Minerals – Other than oil and gas or geophysical work	An estimated 851 acres of land within the Monticello PA could be subjected to surface disturbance over the next 15 years in association with the development of uranium and vanadium, placer gold, limestone, sand and gravel, building stone, and clay. Surface disturbance could occur in areas where cultural resources are present; however, pre-disturbance field surveys to identify such resources and design avoidance or mitigation measures would minimize or eliminate the potential for actual effects on cultural sites and materials.
Paleontology	Minor, adverse and beneficial impacts could occur from paleontological decisions. Beneficial impacts from predevelopment paleontological surveys could identify cultural resources and thereby allow site avoidance. Adverse impacts could result from scientific collection and excavation of vertebrate fossils that may be within cultural resource sites. Minor impacts may occur as a result of recreational fossil collection: casual collectors may not distinguish between paleontological materials and cultural resources or may not recognize the difference between paleontological and cultural artifacts, thereby causing unintentional impacts to cultural sites.

Table 4.32. Impacts Common to the Proposed Plan and All Alternatives

Resource Program	Impact on Cultural Resources
Recreation	<p>Recreational use of lands within the PA can have adverse impacts on cultural resources from inadvertent damage, looting, and vandalism associated with camping, mountain biking, backpacking, etc. Potential recreation decision impacts on cultural resources are largely unquantifiable since the exact locations of recreational activity relative to individual cultural sites and high site density areas are not known. Further, there is no way to specifically assess the potential impacts on cultural resources from differences in permitted group sizes or numbers of day or overnight use permits between alternatives other than to say that, generally speaking, smaller group sizes would presumably have a somewhat lesser impact on cultural resources since fewer people would be visiting a site at any one time and less trampling would occur. However, over the long-term, there is likely to be little difference between alternatives based upon group size or permit restrictions.</p> <p>More measurable impacts occur from recreational use associated with OHV activity. An analysis of potential impacts from OHV use is presented by alternative in the impacts tables under Travel. Proactive management of recreational activity through designation of specific recreation locations and issuance of permits, closing of climbing routes affecting cultural sites, and excluding camping in the Indian Creek riparian corridor would all have generally beneficial impacts on cultural resources by reducing the overall number of conflicts between recreation activities and cultural resources.</p>
Special Designations	<p>Under the Proposed Plan and all alternatives, WSAs would be managed under the IMP to protect wilderness values. The IMP stipulates that very low levels of surface disturbances would be allowed in order to maintain wilderness suitability for potential designation by Congress. The impacts would be beneficial and long term on cultural resources because surface disturbance-related impacts to cultural resources would be minimized.</p>
Special status Species / Wildlife	<p>Management decisions under these resource programs would have a direct beneficial impact on cultural resources because of spatial buffers around wildlife areas that would prevent ground-disturbing activities around cultural sites within the buffer.</p>
Vegetation	<p>Under the Proposed Plan and all alternatives, vegetation treatments would have negligible direct impacts on cultural resources because all areas proposed for treatments would have site-specific cultural inventories performed prior to treatment, and known cultural resources would be avoided. Exposure could create indirect adverse impacts, however, to avoided cultural sites in treatment areas because these sites would be noticeable to the public: treatment-avoidance of sites would make them obviously visible as areas that contrast with the surrounding treated areas, with potential disturbance through collection of artifacts.</p>

4.3.2.2. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ACTION ALTERNATIVES

Cultural resource management decisions common to the Proposed Plan and all action alternatives (B through E) would have long-term, beneficial impacts on cultural resources. These management decisions would include developing cultural resource management plans (CRMPs) or to inventory and protect cultural resources in specific management areas. In additions to protecting cultural resources, these plans would designate worthy sites to include in the NRHP, as appropriate, thereby raising awareness of the importance of the sites, removing access to specific sites at risk or otherwise restricting access, and proactively reducing fire hazards around

sensitive sites. These actions would reduce impacts to cultural resource sites through early identification, assessment, and implementation of protective measures.

4.3.2.3. IMPACTS FROM THE PROPOSED PLAN AND ALTERNATIVES

Proposed management decisions for many resource programs within the Monticello PA vary by the Proposed Plan and alternatives. The potential impacts of these varying decisions are discussed in the following sections by the Proposed Plan and alternatives.

4.3.2.3.1. ALTERNATIVE A

Impacts to cultural resources from various BLM resource program decisions under Alternative A, excluding special designations, are summarized in Table 4.33. Because special designations incorporate an array of individualized management decisions, discussion of their impact on cultural resources follows the Table 4.33 summary.

Table 4.33. Impacts to Cultural Resources under Alternative A

Resource	Impact on Cultural Resources
Cultural Resources	<p>Under Alternative A, the cultural resources on 37,433 acres of high site-density land in the Grand Gulch Special Emphasis area (GGSE)/Grand Gulch National Historic District (GGNHD) would be designated for special management. The plans for the GGSE/GGNHD provide protection for cultural resources that supplements that afforded by Section 106 of the NHPA. Cultural resources would be regularly monitored for impacts related to permissible uses, and measures to minimize or mitigate any impacts would be implemented when necessary. Restrictions on surface disturbances would reduce the risks of adverse impacts to cultural resources. These actions would also reduce the adverse impacts to sites, locations, and landscape features that are important to Native American tribes.</p> <p>The Old Spanish National Historic Trail would be afforded special consideration, including beneficial development of a management plan designed to protect the resource values that have made it nationally important.</p> <p>Under Alternative A, no allocation or group-size limits; restrictions on camping, OHV use, pets or dogs, or grazing; fire bans, fees, or other recreational limitations would be placed upon the Comb Ridge CSMA, the Butler Wash area east of Comb Ridge, the Tank Bench CSMA, the Beef Basin CSMA, or Monticello PA lands outside of these areas. No special considerations would be given to the proactive conservation, interpretation, investigation, or traditional allocation of cultural resources, except on an occasional case-by-case determination. Cultural resources in these areas would be avoided or impacts to them mitigated only through development or land uses that require permits or approval from the Monticello FO. There would be no restrictions on visits to the McLoyd Canyon-Moon House site, although visitors are presently causing deterioration to portions of it (personal communication with Nancy Shearin, Monticello FO, May 7, 2003). Cultural resources not associated with areas of development or permitted use would continue to be subject to direct and indirect, adverse impacts from recreational activity, including OHV travel, group and individual camping, and hiking and touring in sites. Impacts of this nature are presently not quantifiable because records of them are not kept, and many incidents are unknown to the BLM owing to the remote and undocumented locations of many cultural resources within the Monticello PA.</p>

Table 4.33. Impacts to Cultural Resources under Alternative A

Resource	Impact on Cultural Resources
Livestock Grazing	Allotments within the Monticello PA, with the exception of the five side canyons of Comb Wash and other areas designated unavailable for grazing, would be open to grazing, though site-specific closure or restrictions could be enacted if undue damage to cultural resources from livestock grazing occurred. Open allotments include 888,111 acres, in high site-density and 748,942 acres in medium site-density areas. This represents 90% of all estimated high site-density and 94% of all estimated medium site-density lands in the Monticello PA. Making grazing unavailable in certain high site-density areas such as Comb Ridge would have a long-term, beneficial impact on their cultural resources. Potential trampling of archaeological sites and brushing and rubbing against structures and rock-art panels by livestock would be eliminated in these areas, though impacts from hooved wildlife would continue. Alternative A grazing decisions would be expected to pose slightly greater adverse risks to cultural resources than the Proposed Plan and Alternatives B and C because Alternative A leaves more acres open to grazing. Alternative A would pose roughly comparable risk to cultural resources as Alternative D. However, under any alternative, the BLM may modify livestock grazing in specific areas when undue adverse impacts to cultural resource sites occur, which would reduce long-term adverse impacts.
Minerals, Oil, and Gas	Approximately 417 acres of land in high site-density and 313 acres in medium site-density areas would be subject to physical disturbance of varying degrees during the next 15 years as a result of predicted RFD oil and gas development. This amounts to approximately 0.06% of the total acres of high site-density and 0.05% of medium site-density lands available for mineral development under Alternative A. The BLM's standard procedures require inventory of areas proposed for mineral development before it can occur. These inspections allow cultural resource sites to be identified and minimization, avoidance, or mitigation measures to be implemented. The Monticello PA contains several locations and landscape features that have been deemed culturally and/or spiritually important to Native American tribes with cultural patrimony in the area. Most of these areas, including Montezuma Canyon, the San Juan River, Comb Ridge, Mancos Jim Mesa, Spanish Mossback Mesa, and Allen Canyon, would be managed under a combination of NSO, controlled surface use (CSU), and standard leasing stipulations. Applying NSO and CSU leasing stipulations and restrictions would reduce the opportunities for surface-disturbing and other landscape-altering activities that would otherwise decrease the cultural, traditional, and/or spiritual values of these resources.
Minerals, Geophysical	Direct, adverse impacts to known cultural resources and sites from geophysical activities under this alternative are likely to be negligible to minor because resources and sites would be avoided or mitigated. Surface disturbance throughout the Monticello PA from geophysical activities under this alternative is estimated to be 886 acres during the next fifteen years. Assuming that the potential for such disturbance to occur in high and medium site-density areas is equal to the ratio of these lands available for geophysical work within the PA, then surface disturbance from geophysical work would be expected on approximately 479 acres (0.05%) of high site-density and 407 acres (0.05%) of medium site-density lands.
Non-WSA Lands with Wilderness Characteristics	Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness values. Surface disturbances, impacts to cultural resources, and the mitigation applied to reduce impacts would be the same as analyzed and discussed under each resource for Alternative A.
Riparian Resources	Riparian resource-management decisions under Alternative A would be expected to have a negligible to minor, beneficial impact on cultural resources because they would restrict surface-disturbing activities in riparian zones and floodplains. Such management actions would affect approximately 14,383 acres of high site-density and 6,314 acres of medium

Table 4.33. Impacts to Cultural Resources under Alternative A

Resource	Impact on Cultural Resources
	<p>site-density lands within the PA. This represents approximately 1.5% of all estimated high site-density and 0.8% of all estimated medium site-density lands within the PA.</p> <p>Limitations on surface-disturbing activities and other landscape alterations within riparian areas would provide some beneficial protection to waterways that possess culturally important features for Native American tribes.</p>
Special status Species	The impacts would be the same as those described above under Impacts Common to All Alternatives (Section 4.3.2.1).
Travel	<p>Travel management decisions under Alternative A would close 142,008 acres to OHV use in high site-density areas. This represents 14% of all estimated high site-density lands in the PA and would have long-term, beneficial impacts on cultural resources by minimizing OHV-related surface disturbances. Travel on an additional 422,805 acres (43%) in high site-density areas would be limited to designated roads and trails, with the same expected impact because no new OHV surface disturbance would be allowed. Because 423,619 acres (43%) in high site-density areas would be open to cross-country OHV use without restrictions, OHV travel in these areas would result in long-term, adverse impacts to cultural resources.</p>
Visual Resources	<p>Approximately 395,797 acres of high site-density and 330,313 acres of medium site-density lands within the Monticello PA would be designated as VRM Class I or II. This represents 40% of all high site-density and 41% of all medium site-density lands in the PA. Management of these lands, especially those managed under VRM Class I objectives, would limit ground-disturbing activities that have the potential to impact cultural resources, which would have long-term, beneficial impacts on the resource.</p>
Woodlands	<p>Woodland harvesting zones would not be established, and all woodland areas within the PA, outside of WSAs, developed recreation areas, selected ACECs, and select cultural-resource management areas would be available for use. Within the PA, approximately 857,000 acres of land possess pinyon-juniper woodlands suitable for harvesting. Of those lands, approximately 464,446 acres are located in high site-density and 392,559 acres in medium site-density areas. This represents approximately 47% of all estimated high site-density and 49% of all estimated medium site-density lands in the PA. Permits to harvest and gather woodland products would be processed on a case-by-case basis. Collection of woodland products, except dead wood for camp fires, would be prohibited in all WSAs, as well as in several known high site-density areas, including the side canyons of Comb Wash (Arch Canyon, Fish Canyon, Owl Canyon, Road Canyon, and Mule Canyon south of Highway 95). Collection of woodland products would also be prohibited on known cultural resource sites. Further, woodland product gathering under a permit would require gathering identification and subsequent avoidance of cultural resources. Pinyon and juniper comprise the primary woodland targets for harvesting within the PA, and these vegetation environments are linked to relatively high densities of cultural resource sites. The restrictions placed on gathering and harvesting woodland products and the limited amount of ground disturbance associated with actual gathering within the Monticello PA under Alternative A would result in a low potential for direct, adverse impacts to cultural resources. However, the potential for indirect impacts would be relatively high because of OHV travel-related surface disturbances to harvest and collect woodland products, and the potential looting and vandalism resulting from use of the harvesting areas.</p>

Special-designations management decisions under Alternative A would have both direct and indirect, long-term impacts on cultural resources within the Monticello PA. WSAs account for 386,027 acres on land within the PA and overlap with other special designation lands (e.g., Areas of Critical Environmental Concern [ACECs]) to a great extent (see Map 87). A total of 230,969 acres in WSAs are lands classified with high site density, and 153,926 acres are classified as having medium site density (totaling 391,599 acres). The WSA acreage is the same under the Proposed Plan and all of the alternatives because WSA designation is not part of the PRMP/FEIS. WSAs are managed under the Interim Management Policy (IMP), which imposes restrictions on ground-disturbing activities that may impair the wilderness suitability of that WSA. Actions generally considered to meet this non-impairment standard are those that are short-term, do not create surface disturbances or do not allow the construction of permanent facilities. When completed, surface disturbances may not degrade the area to such an extent that they substantially constrain Congress's decision to designate the area as wilderness. Because of these restrictions on surface-disturbing activities, the impacts to cultural resources within WSAs would be long-term, indirect, and beneficial.

In addition to WSAs, special designation areas include ACECs and wild and scenic rivers (WSRs). The following discussion addresses these other special designation areas. High cultural-resource site-density areas pose the greatest concern for potential adverse impacts in special designation areas, so this discussion focuses on them. Special designation areas (excluding WSAs) under Alternative A encompass approximately 121,769 acres with high site-density. This represents approximately 12% of all estimated high site-density lands within the Monticello PA. Within these special designation areas, management decisions include a range of prescriptions that would benefit cultural resources by affording them direct and indirect protection from potentially adverse impacts. These decisions include implementing NSO stipulations for mineral development on approximately 2,539 acres, managing approximately 2,272 acres under VRM Class I objectives (with limitations on surface disturbances), eliminating OHV use on approximately 2,904 acres, and prohibiting mineral disposal and geophysical work on 3,171 acres of high site-density lands. Table 4.34 lists the special designation areas where these decisions apply and the acreage of high site-density lands they contain. If a special designation area is not listed in the table, either the decisions do not apply to it, or no estimated acres of high site-density lands occur within it. The restrictions noted in the table reduce the potential impacts to cultural resource sites from surface disturbance. These sites include ones identified by Native American tribes as culturally, traditionally, or spiritually important that may be located either in or adjacent to special designation areas.

Table 4.34. Acres of High Site-Density Lands in Special Designation Areas with Decisions Affecting Cultural Resources, Alternative A

Special Designation (All ACECs)	NSO for Mineral Development	Closed to Mineral Development	Closed to Mineral Disposal	Closed to Geophysical Work	Designated as VRM Class I	Closed to OHV Use
Alkali Ridge	0	0	0	0	0	0
Bridger Jack	0	0	0	0	0	1
Cedar Mesa	17,493	37	37	37	16,832	240
Dark Canyon	0	49	49	49	204	75

Table 4.34. Acres of High Site-Density Lands in Special Designation Areas with Decisions Affecting Cultural Resources, Alternative A

Special Designation (All ACECs)	NSO for Mineral Development	Closed to Mineral Development	Closed to Mineral Disposal	Closed to Geophysical Work	Designated as VRM Class I	Closed to OHV Use
Hovenweep	880	0	880	0	0	0
Indian Creek	3,443	0	3,443	0	3,907	3,443
Lavender Mesa	586	0	586	0	0	586
Scenic Highway Corridor	19,840	1	0	0	20,736	7
Shay Canyon	0	0	0	0	42	0
Total	42,242	87	4,995	86	41,721	4,352

Within many special designation areas, surface-disturbing activities would still be allowed, but for the most part, regulations would limit the amount of actual disturbance (e.g., CSU stipulations for mineral development and requirements for non-mechanized vegetation treatments). Many of these areas would also be managed under VRM Class II objectives, which, while less restrictive than VRM Class I, would still provide a high level of protection to cultural resources by limiting surface-disturbing activities.

4.3.2.3.2. ALTERNATIVE B

Table 4.35 summarizes impacts to cultural resources from various BLM resource program decisions under Alternative B, excluding special designations. Because special designations incorporate an array of individualized management actions, discussion of their impact on cultural resources follows the Table 4.35 summary.

Table 4.35. Impacts to Cultural Resources under Alternative B

Resource Program	Impact on Cultural Resources
Cultural Resources	The impacts to cultural resources would be the same as under Alternative A, except that 98,348 acres of land in high-density site areas would receive special management consideration (restrictions on surface disturbance and OHV use) to protect important cultural resource values. Cultural resource special management would increase the beneficial impacts.
	Segments of the Old Spanish National Historic Trail would be designated for types of travel that would not damage or alter their historic condition. Additionally, special recreation permits would be authorized only for heritage tours and reenactments on the trail. Limiting damaging travel and trail use would have a direct, long-term, beneficial impact on the trail because intact segments would be better preserved.

Table 4.35. Impacts to Cultural Resources under Alternative B

Resource Program	Impact on Cultural Resources
	<p>Imposing private and commercial size limits for recreational and land-use groups and implementing a permit system would have long-term beneficial impacts on cultural resources in restricted areas because reducing the number of people in or near cultural resource sites at any given time would minimize deterioration and degradation. The smaller the group-size on a given site at a given time, the lower the probable adverse recreational impact to a site. Specific group-size and visitation limits for the Moon House ruin would be more stringent than restrictions for other sites. These limitations would directly and beneficially impact the site in the long-term.</p>
Livestock Grazing	<p>Approximately 137,440 acres of land would be maintained as unavailable for grazing, and additional areas would also be unavailable for grazing in at least 11 known high site-density areas. Alternative B would also restrict livestock activities to trailing in at least 4 other high site-density locations. Beyond these unavailable or restricted areas, grazing would be permitted on 1,627,623 acres of land within the Monticello PA. These lands are located in both high (882,676 acres) and medium (744,947 acres) site-density areas. This represents 90% of all estimated high site-density and 93% of all estimated medium site-density lands in the PA. Cultural resource sites in these areas would be exposed to potentially adverse trampling by livestock. Alternative B would leave approximately the same total number of acres open to grazing as the Proposed Plan and Alternatives A and C; however, Alternative B has approximately 5,435 fewer acres in high site-density areas than does Alternative A. Alternative B leaves the same number of acres in high site-density areas open to grazing as the Proposed Plan and Alternative C, and approximately 9,200 fewer total acres than Alternative D. Consequently, Alternative B would presumably have a slightly lower, potentially adverse grazing impact on cultural resources than Alternatives A and D and roughly the same as the Proposed Plan and Alternative C.</p>
Minerals, Oil, and Gas	<p>The impacts to cultural resources would be the same as under Alternative A, except that approximately 338 acres of land in high site-density and 298 acres in medium site-density areas would be subject to varying degrees of disturbance during the next fifteen years, based on the RFD predicted development of oil and gas resources. This would be approximately 0.04% of the total acres of high site-density and 0.04% of medium site-density lands available for mineral development under Alternative B. The exact number of sites involved in development cannot be predicted at this time; however, impacts to specific sites are not expected to be any greater than under Alternative A because Alternative B specifies the same level of identification of sites and avoidance, minimization, or mitigation of impacts. Alternative B decisions could have slightly less impacts on cultural landscapes in developed areas than Alternative A because the total number of acres subject to disturbance under Alternative B would be somewhat lower than Alternative A. The Monticello PA contains several locations and landscape features that have been deemed culturally and/or spiritually important to Native American tribes. Most of these areas, including Montezuma Canyon, the San Juan River, Comb Ridge, Mancos Jim Mesa, Spanish Mossback Mesa, and Allen Canyon, would be managed under a combination of NSO, CSU, and standard leasing stipulations. Applying NSO and CSU stipulations would reduce the opportunities for surface-disturbing activities and other landscape-altering activities that could decrease the cultural, traditional, and/or spiritual values of these resources.</p>

Table 4.35. Impacts to Cultural Resources under Alternative B

Resource Program	Impact on Cultural Resources
Minerals, Geophysical	The impacts to cultural resources would be the same as under Alternative A, except that surface disturbance would be reduced to approximately 427 acres of high site-density and 367 acres of medium site-density lands. This represents 0.04% of all estimated high site-density and 0.05% of all estimated medium site-density lands within the PA. Alternative B would produce surface disturbance in approximately 92 fewer acres (52 in high site-density and 40 in medium site-density areas) than Alternative A.
Non-WSA Lands with Wilderness Characteristics	Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness values. Surface disturbances, impacts to cultural resources, and the mitigation applied to reduce impacts would be the same as analyzed and discussed under each resource for Alternative B.
Riparian Resources	The same impacts are predicted as under Alternative A, except Alternative B would implement additional restrictions that would indirectly protect cultural resources within certain riparian areas. These restrictions apply to OHV use and livestock grazing (see Chapter 2 Alternatives, Riparian). The additional restrictions on the use and disturbance of riparian and floodplain resources under Alternative B are expected to produce slightly greater beneficial impacts to cultural resources in these restricted zones by further reducing opportunities for surface-disturbing activities.
Special Status Species	Limited long-term, indirect, beneficial impacts to cultural resources are likely from restrictions on surface disturbance in areas of special-species habitat. The benefit would be slightly greater than under Alternative A because the wildlife protection spatial buffers would be larger.
Travel	Because of 238,879 acres in high site-density areas would be closed to OHV use under Alternative B, there would be similar beneficial impacts, but to a greater degree, than those discussed under Alternative A. This acreage represents 24% of all estimated high site-density lands within the PA. When compared to Alternative A, travel in an additional 325,669 acres (76%) in high site-density areas would be limited to designated roads and trails with the same long-term beneficial impacts to cultural resources. No areas within the Monticello PA would be open to cross-country OHV use, with greater long-term, beneficial impacts than Alternative A because 1) 423,619 acres (43%) in high site-density areas (open under Alternative A) would be protected from travel-related surface disturbances, and 2) Alternative B would identify approximately twice as many acres for limited use (designated route restrictions) as Alternative A, which would result in long-term beneficial impacts on cultural resources.
Visual Resources	Approximately 431,797 acres of high site-density and 315,022 acres of medium site-density lands within the Monticello PA would be managed under VRM Class I or Class II objectives. This represents 44% of all high site-density and 40% of all medium site-density lands in the PA. The impacts from Alternative B on cultural resources would be similar to, but greater in degree, than those under Alternative A because more area would be protected under VRM Class I and Class II designations.

Table 4.35. Impacts to Cultural Resources under Alternative B

Resource Program	Impact on Cultural Resources
Woodlands	Although 307,179 acres of high site-density and 197,212 acres of medium site-density areas would be open for woodland harvesting, there would be limited restrictions on OHV travel into these areas. These areas represent 31% of all estimated high site-density and 25% of all estimated medium site-density lands in the PA. Cultural-resources inventories would be required before woodlands could be harvested on lands within the North Comb (Comb Ridge) area north of Highway 95 and the Montezuma watershed. The Cedar Mesa Cultural SRMA, outside of the WSA, would be closed to harvesting. Gathering woodland products for private use would have a low potential for long-term, adverse impacts on cultural resources within open areas, except in instances where OHV travel to gather these products is permitted. Commercial woodland harvesting would have greater impact than private use because it would occur on a larger scale. Potential adverse impacts to cultural resources from woodlands management decisions under Alternative B would likely be slightly lower than those anticipated for Alternative A because Alternative B imposes greater travel restrictions, and imposes requirements for cultural-resource surveys, and would close at least one high site density area (Cedar Mesa) to harvesting.

Special-designations management decisions under Alternative B would have both direct and indirect long-term impacts on cultural resources within the Monticello PA. As noted with Alternative A, WSAs account for 391,599 acres on land within the PA and overlap with other special designation lands (e.g., ACECs) to a great extent (see Map 88). A total of 230,969 acres in WSAs are lands classified with high cultural resource site-density, and 153,926 acres are classified with medium site-density. The Proposed Plan and all alternatives would include the same acreage for WSAs. WSAs are managed under the IMP, which imposes restrictions on surface-disturbing activities. These restrictions, the same as those described for Alternative A, would have long-term, indirect, beneficial impacts on cultural resources within these areas by reducing opportunities for disturbance.

The following discussion addresses special designation areas other than WSAs. Within these other special designation areas, the Proposed Plan and different alternatives propose an array of management actions that vary widely in the level of surface disturbance they allow or prohibit. Since high cultural-resource site-density areas pose the greatest concern for potential adverse impacts in special designation areas, this discussion focuses on them. Special designation areas that would be managed under Alternative B include approximately 151,992 acres with high site-density. This represents approximately 15% of all estimated high site-density lands within the PA. Within these special designation areas, management decisions would include a range of prescriptions that would benefit cultural resources by affording them direct and indirect protection from adverse impacts. These prescriptions would include implementing NSO leasing stipulations for mineral development on approximately 44,185 acres, closing areas to mineral development on 17,833 acres, managing approximately 61,736 acres under VRM Class I objectives (with limitations on surface disturbance), eliminating OHV use on approximately 2,904 acres, and prohibiting mineral disposal and geophysical work on 85,141 acres of high site-density lands. Table 4.36 lists the special designation areas where these decisions apply and the acreage of high site-density lands they contain. If a special designation area is not listed in the table, either the decisions do not apply to it, or no estimated acres of high site-density lands

occur within it. The restrictions noted in the table reduce the risk of impact on cultural resource sites by surface-disturbing activities.

Table 4.36. Acres of High Site-density Lands in Special Designation Areas with Decisions Affecting Cultural Resources, Alternative B

Special Designations (All ACECs)	NSO for Mineral Development	Closed to Mineral Development	Closed to Mineral Disposal	Closed to Geophysical Work	VRM Class I Designation	Closed to OHV Use
Alkali Ridge ¹	1991	0	0	0	0	0
Bridger Jack	0	0	0	0	0	3
Cedar Mesa	4,632	5	5	5	13	0
Dark Canyon	0	204	204	204	204	0
Hovenweep	880	0	880	0	0	0
Indian Creek	3,907	0	3,907	0	3,908	3,908
Lavender Mesa	632	0	632	0	0	632
Lockhart Basin	34,059	927	34,059	0	34,986	0
San Juan River	1,738	497	1,738	0	710	567
Valley of the Gods	0	17,833	17,833	0	17,833	0
Total	47,839	88	59,258	209	57,646	5,110

¹Includes the Alkali Ridge National Historic Landmark (2,146 acres)

Within many special designation areas, surface-disturbing activities would still be allowed, but for the most part, management decisions would limit the amount of actual disturbance (e.g., CSU leasing stipulations for mineral development, and requirements for non-mechanized vegetation treatments). Many of these areas would also be managed under VRM Class II objectives, which, while less restrictive than VRM Class I, would still provide a measure of protection to cultural resources by limiting surface-disturbing activities.

4.3.2.3.3. ALTERNATIVE C

Table 4.37 summarizes impacts to cultural resources from various BLM resource program decisions under Alternative C, excluding special designations. Because special designations incorporate an array of individualized management decisions, discussion of their impact on cultural resources follows the Table 4.37 summary.

Table 4.37. Impacts to Cultural Resources under Alternative C

Resource Program	Impact on Cultural Resources
Cultural Resources	<p>As discussed under Alternative B, 98,348 acres of land in high-density site areas would be subject to special management consideration to protect important cultural resource values. Cultural-resource program decisions and impacts under Alternative C would be the same as discussed under Alternative B.</p> <p>The potential impacts related to the management of the Old Spanish National Historic Trail would be identical to those described for Alternative B.</p> <p>Impacts due to recreational use of cultural resources would be the same as for Alternative B, except that there would be a negligible increase in adverse impacts because of larger commercial group sizes allowed in high site-density areas.</p>
Livestock Grazing	Potential adverse and beneficial impacts to cultural resources under Alternative C would be the same as those described for Alternative B because the two alternatives would manage approximately the same areas open, unavailable, or restricted to livestock grazing.
Minerals, Oil, And Gas	Approximately 381 acres of land in high site-density and 329 acres in medium site-density areas would be subject to varying amounts of physical disturbance during the next fifteen years. These equates to approximately 0.05% of the total acres of high site-density and 0.05% of medium site-density lands available for mineral development under Alternative C. Alternative C could have a slightly greater impact on cultural landscapes than Alternative B because the total number of acres subject to disturbance would be somewhat higher, but less than Alternative A.
Minerals, Geophysical	Impacts would be the same but slightly greater in intensity than those described under Alternative A because surface disturbance is estimated to be 903 acres during the next fifteen years. Approximately 489 acres of high site-density and 414 acres of medium site-density lands would be involved. This represents 0.05% of all estimated high site-density and 0.05% of all estimated medium-site density lands within the PA. Alternative C would produce surface disturbance in approximately 17 more acres (10 in high site-density and 7 in medium site-density areas) than Alternative A.
Non-WSA Lands with Wilderness Characteristics	Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness values. Surface disturbances, impacts to cultural resources, and the mitigation applied to reduce impacts would be the same as analyzed and discussed under each resource for Alternative C.
Riparian Resources	The impacts are identical to those discussed for Alternative B.
Special Status Species	Limited, long-term, beneficial impacts on cultural resources would be expected in areas where spatial buffers against surface disturbance around habitats are created. Alternative C is expected to have greater long-term beneficial impact on cultural resources than Alternatives A and B because of the larger buffer areas.
Travel	The impacts would be the same as those discussed under Alternative A, except the long-term beneficial impacts would increase because of closed areas (234,890 acres [24%] in high site-density areas) and designated routes (an additional 750,153 acres [76%] in high site-density areas). The long-term adverse impacts within designated open OHV areas would be reduced to 2,311 acres (0.2% of the Monticello PA).

Table 4.37. Impacts to Cultural Resources under Alternative C

Resource Program	Impact on Cultural Resources
Visual Resources	Approximately 324,539 acres of high site-density and 242,876 acres of medium site-density lands within the Monticello PA would be managed for VRM Class I or II conditions. This represents 33% of all high site-density and 30% of all medium site-density lands in the PA. The beneficial impacts of Alternative C on cultural resources would be similar but less than with Alternative A because fewer acres would be protected under VRM Class I and Class II designations.
Woodlands	Under Alternative C, 367,319 acres of high cultural-resource site-density and 229,492 acres of medium site-density areas would be available for woodcutting. This represents 37% of all estimated high site-density and 29% of all estimated medium site-density lands within the PA. Off-road travel to gather woodland products would be permitted across a portion of the open areas. Cultural-resource inventories would be required before woodland products could be harvested on lands within the North Comb (Comb Ridge) area north of Highway 95, Cedar Mesa (outside of the WSA), and the Montezuma watershed. Potential impacts to cultural resources from woodlands management decisions under Alternative C would probably be lower than those anticipated for Alternative A because Alternative C imposes greater travel restrictions and requirements for cultural-resource inventories.

Special-designations management decisions under Alternative C would have both direct and indirect long-term impacts on cultural resources within the Monticello PA. As noted under Alternative A, WSAs account for 391,599 acres of land within the PA and overlap with other special designations (e.g., ACECs) to a great extent (see Map 90). WSAs are managed under the IMP, which implements stringent restrictions on surface-disturbing activities (see the discussion for special designations in Section 4.3.14). A total of 230,969 acres in WSAs are lands classified with high cultural-resource site density. Another 153,926 acres are classified with medium site density. The same acres and management prescriptions would apply to WSAs across the Proposed Plan and all alternatives. Consequently, the potential impacts on cultural resources in WSAs within special designation areas under Alternative C would be identical to those described previously for Alternatives A and B.

Special designation areas that would be managed under Alternative C include approximately 57,267 acres of lands with high cultural-resource site density. This represents approximately 6% of all estimated high site-density lands within the PA. Within these special designation areas, management actions include a range of prescriptions that would benefit cultural resources by affording them direct and indirect protection from adverse impacts. These decisions include implementing NSO leasing stipulations for mineral development on approximately 5,290 acres, closing areas to mineral development on 17,833 acres, managing approximately 22,841 acres under VRM Class I objectives (with strict limitations on surface disturbance), eliminating OHV travel on approximately 632 acres, and prohibiting mineral disposal on 23,123 acres of high site-density lands. Table 4.38 lists the special designation areas where these decisions apply and the acreage of high site-density lands they contain.

Table 4.38. Acres of High Site-Density Lands in Special Designation Areas with Decisions Affecting Cultural Resources, Alternative C

Special Designation (All ACECs)	NSO for Mineral Development	Closed to Mineral Development	Closed to Mineral Disposal	Closed to Geophysical Work	VRM Class I Designation	Closed to OHV Use
Alkali Ridge ¹	1,991	0	1,991	0	0	0
Hovenweep	880	0	880	0	0	0
Indian Creek	3,904	0	0	0	3,904	0
Lavender Mesa	632	0	632	0	0	632
San Juan River	1,738	497	1,738	0	710	567
Valley of the Gods	17,833	0	17,833	0	17,825	<1
Total	26,978	497	23,074	0	22,439	1,199

¹Includes the Alkali Ridge National Historic Landmark (2,146 acres)

If a special designation area is not listed in the table, either the decisions do not apply to it, or no estimated acres of high site-density lands occur within it. The restrictions noted in the table reduce opportunities for surface-disturbing activities to impact cultural resource sites.

Alternative C provides for approximately twice as many acres covered by NSO leasing stipulations in high site-density special designation areas as Alternative A but 8 times fewer acres than Alternative B. Alternative C would close more acres to mineral development in non-WSA special designation areas than Alternative A and the same number of acres as Alternative B. Alternative C would manage approximately 10 times more high site-density lands under VRM Class I objectives than would Alternative A but approximately 3 times less than Alternative B. Alternative C would close approximately 5 times fewer acres of land in high site-density areas to OHV travel than Alternatives A and B. Alternative C would close approximately 7 times more land in high site-density areas to mineral disposal and geophysical work than Alternative A but approximately 3 times less than Alternative B. In all cases, Alternative C would provide greater benefits to cultural resources in special designation areas than would Alternative D, which implements no special designation regulations.

Surface-disturbing activities would still be allowed, but in general, regulations would limit the level of actual disturbance (e.g., CSU stipulations for mineral development and requirements for non-mechanized vegetation treatments). Many of these areas would also be managed under VRM Class II objectives, which, while less restrictive than VRM Class I objectives, would still provide protection to cultural resources by limiting surface-disturbing activities.

4.3.2.3.4. ALTERNATIVE D

Cultural resource management decisions under Alternative D would produce all of the impacts discussed in Section 4.3.2.1, Impacts Common to the Proposed Plan and All Alternatives. However, as is the case with the Proposed Plan and all other alternatives, Alternative D proposes additional decisions that would also affect cultural resources within the PA. Table 4.39 summarizes the impacts to cultural resources from resource management decisions under Alternative D, excluding special designations. Because special designations incorporate an array

of individualized management actions, discussion of their impact on cultural resources follows the Table 4.39 summary.

Table 4.39. Impacts to Cultural Resources under Alternative D

Resource Program	Impact on Cultural Resources
Cultural Resources	<p>Special management consideration would be given to 38,995 acres of land in high-density site areas to protect important cultural resource values. Alternative D would designate similar, but slightly greater, acreage in high-density site areas for specific management consideration than Alternative A but only approximately one-third the acreage of the Proposed Plan and Alternatives B and C. The Comb Ridge/Butler Wash, the Tank Bench, and Beef Basin areas would not be managed as CSMAs. Because fewer acres of high site-density areas are designated for special management of cultural resources, the opportunities for long-term benefits would be reduced, and the risk that cultural resource sites in these areas could be impacted would increase. This would pose the same potential risks to cultural resources as Alternative A. The McLoyd Canyon-Moon House would be managed under Alternative D, for the most part, the same way as under the Proposed Plan and Alternative C, which are also very similar to Alternative B. Consequently, potential impacts to cultural resources under Alternative D are similar to those described for the Proposed Plan and Alternatives B and C. Compared to Alternative A, this alternative would be more beneficial because restrictions would be applied under this alternative to protect the site that would not be applied under Alternative A.</p> <p>The impact to historic trails would be the same as that of the Proposed Plan and Alternative C.</p> <p>Potential recreation impacts on cultural resources under Alternative D would be similar to those discussed with the Proposed Plan and Alternative C because similar limits are imposed on commercial group size in high site-density areas; however, Alternative D would allow four additional persons per private group. This larger group size would slightly increase the risk of potential impacts to cultural sites. The larger number of visitors per day to McLoyd Canyon-Moon House under Alternative D would intensify the potential impacts on the ruin and surrounding sites because of the "wear and tear" that comes with more foot traffic. Compared to Alternative A, this alternative would be more beneficial for the site for reasons discussed previously.</p>
Livestock Grazing	<p>The 137,440 acres currently unavailable to grazing would be maintained, and additional acreage would be unavailable to grazing in at least 9 known high site-density areas. Outside of these areas, grazing would be permitted on 1,636,844 acres of land within the PA. These lands are located in both high (887,971 acres) and medium (748,873 acres) site-density areas. Cultural resource sites in these areas would be exposed to potential trampling by livestock as described under Alternative B. Alternative D would manage approximately 9,200 acres more than any other alternative as available to grazing. Approximately 140 less grazing acres would be located in high site-density areas under Alternative D than under Alternative A, but Alternative D would make approximately 5,295 more acres in high site-density areas available to grazing than would the Proposed Plan and Alternatives B and C. Consequently, Alternative D would likely have greater potential adverse impacts on cultural resources than either the Proposed Plan or Alternatives B and C and roughly the same impacts as Alternative A. Alternative D would probably also have lower potential beneficial impacts to cultural resources than the Proposed Plan and Alternatives B and C, where fewer known high site-density areas would be unavailable for grazing. Potential beneficial impacts under Alternative D would be comparable to those under Alternative A.</p>

Table 4.39. Impacts to Cultural Resources under Alternative D

Resource Program	Impact on Cultural Resources
Minerals, Oil, and Gas	Approximately 391 acres of land in high site-density and 330 acres in medium site-density areas would be impacted by varying levels of disturbance from mineral development during the next fifteen years. This surface area would be approximately 0.05% of the total acres of high site-density and 0.05% of medium site-density lands available for mineral development under Alternative D. However, impacts to specific sites are not expected to be any greater under this alternative because the same level of identification of sites and avoidance, minimization, or mitigation of impacts prior to surface disturbance would be required. Alternative D could have a slightly greater impact on cultural landscapes in developed areas than Alternative B because the total number of acres subject to disturbance would be higher. Additionally, potential impacts to cultural landscapes under Alternative D would be greater than those anticipated for Alternative B, but slightly less than Alternative A because fewer acres would be potentially impacted.
Minerals, Geophysical	Temporary surface disturbance that is reclaimed within 10 years would be prescribed under Alternative D. All geophysical work would be subject to the BLM standard policy of resource identification and avoidance, minimization, and/or mitigation of adverse impacts. For this reason, impacts to cultural resources from geophysical activities under this alternative are expected to be minimal. Approximately 924 acres can potentially be disturbed during the next fifteen years. This consists of approximately 501 acres of high site-density and 423 acres of medium site-density lands and represents 0.05% of all estimated high site-density and 0.05% of all estimated medium site-density lands within the PA. Alternative D would produce surface disturbance in approximately 38 more acres (22 in high site-density and 16 in medium site-density areas) than Alternative A. It would also produce surface disturbance in 130 more acres (74 in high site-density and 56 in medium site-density areas) than Alternative B and 21 more acres (12 in high site-density and 9 in medium site-density areas) than the Proposed Plan and Alternative C.
Non-WSA Lands with Wilderness Characteristics	Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness values. Surface disturbances, impacts to cultural resources, and the mitigation applied to reduce impacts would be the same as analyzed and discussed under each resource for Alternative D.
Riparian Resources	Impact to riparian resources under Alternative D would be the same as Alternative A.
Special Status Species	Limited, long-term, beneficial impacts on cultural resources would result in areas where spatial buffers are created. Alternative D would likely have a greater long-term beneficial impact on cultural resources than Alternative A, which designates no buffers, but less than the Proposed Plan and Alternatives B and C, which have larger buffers.
Travel	Travel would be limited to designated routes, and more acres would be placed in this category under Alternative D than under any other alternative. However, fewer acres would be closed to OHV use under Alternative D than under the Proposed Plan and any other alternative. Alternative D would specify fewer acres open to unrestricted OHV use than Alternative A, more acres open than Alternative B, and the same number of acres open as the Proposed Plan and Alternative C. Alternative D would have slightly greater long-term beneficial impacts on cultural resources because travel would be restricted on more acreage to designated routes (985,043 acres in high site-density areas) than with Alternative A. There would also be fewer long-term adverse impacts to cultural resources than under Alternative A because the total acreage available for open OHV use (2,311 acres) would be less.

Table 4.39. Impacts to Cultural Resources under Alternative D

Resource Program	Impact on Cultural Resources
Visual Resources	Approximately 237,057 acres of high site-density and 162,201 acres of medium site-density lands within the Monticello PA would be managed under VRM Class I or Class II objectives. This represents 24% of all high site-density and 20% of all medium site-density lands in the PA. Management of these lands, especially under VRM Class I conditions, would limit ground-disturbing activities that have the potential to impact cultural resources. The potentially adverse impacts of Alternative D decisions on cultural resources would be similar to, but less than, Alternative A because a smaller area would be protected under VRM Class I and Class II designations.
Woodlands	The impacts to cultural resources would be the same as under the Proposed Plan and Alternative C, except that fewer restrictions would be placed on OHV travel to gather and transport harvested wood. Consequently, potential adverse impacts under Alternative D would likely be less than with Alternative A, which would have fewer travel restrictions.

Special-designations management decisions under Alternative D would have both direct and indirect long-term impacts on cultural resources within the Monticello PA. Under Alternative D, no ACECs would be designated nor would any Wild and Scenic River (WSR) segments be recommended as eligible for WSR status; however, existing WSAs would continue to be managed under the IMP, with stringent restrictions on surface-disturbing activities. As the same acres and management prescriptions would apply to WSAs across the Proposed Plan and all alternatives, the potential impacts on cultural resources within WSAs under Alternative D would be identical to those described previously for Alternatives A, B, and C. However, Alternative D would implement no other types of special designations with their associated limitations on surface-disturbing activities. Therefore, the beneficial impacts to cultural resources in special designation areas under Alternative D would be less than those anticipated for the Proposed Plan or any other proposed alternative.

4.3.2.3.5. ALTERNATIVE E

Potential impacts to cultural resources under Alternative E would be identical to those described for Alternative B, except that this alternative would propose management decisions that would provide greater protection for cultural resources. Under Alternative E, 582,357 acres of non-WSA lands with wilderness characteristics would be closed to mineral leasing and disposal of mineral materials, managed under VRM Class I objectives, retained in federal ownership, and closed to firewood gathering, woodland harvesting and OHV use. These areas would also be excluded from rights-of-way (ROWs) permitting. It would also be recommended that these lands be withdrawn from locatable mineral entry. These actions would reduce the potential for direct and indirect adverse impacts on cultural resources by eliminating surface-disturbing activities and motorized access into more remote, generally unmonitored areas that may contain such resources. Table 4.40 summarizes the impacts of Alternative E's resource-program decisions that differ from Alternative B.

Table 4.40. Impacts to Cultural Resources under Alternative E Where They Differ from Alternative B

Resource Program	Impact on Cultural Resources
Minerals, Oil, and Gas	Approximately 327 acres of land in high site-density and 192 acres in medium site-density areas would be impacted by varying degrees of disturbance over the next fifteen years. This amounts to approximately 0.03% of the total acres of high site-density and 0.02% of medium site-density lands available for mineral development under Alternative E. The precise number of sites involved in development cannot be predicted; however, impacts to specific sites are not expected to be any greater than under Alternative A because the same level of identification of sites and avoidance, minimization, or mitigation of impacts would be required. Alternative E could have slightly less impact on cultural landscapes in developed areas than Alternatives A and B because the total number of acres subject to disturbance is somewhat lower. Potential impacts to cultural landscapes under Alternative E would also be slightly less than those anticipated for the Proposed Plan and Alternatives C and D. The Monticello PA contains several locations and landscape features that have been deemed culturally and/or spiritually important to Native American tribes with cultural patrimony in the area. Most of these known areas, including Montezuma Canyon, the San Juan River, Comb Ridge, Mancos Jim Mesa, Spanish Mossback Mesa, and Allen Canyon, would be managed under a combination of NSO, CSU, and standard leasing stipulations. Applying NSO and CSU stipulations would reduce opportunities for surface-disturbing and other landscape-altering activities that could decrease the cultural, traditional, and/or spiritual values of these resources.
Non-WSA lands with Wilderness Characteristics	More restrictive, beneficial, management (e.g., no surface-disturbing activities, VRM Class I designation, no OHV use or ROW permitting) would be prescribed for cultural resources within non-WSA lands with wilderness characteristics; this is particularly notable for lands in the CRC SMA and BBC SMA. Non-WSA lands with wilderness characteristics in these CSMA s would include Comb Ridge (13,760 acres), Fish and Owl Creek Canyons (3,580 acres), Road Canyon (530 acres), the San Juan River (640 acres), Dark Canyon (13,280 acres), and Butler Wash (1,180 acres).
Travel	Approximately 474,291 acres in high site-density areas would be closed to OHV use. This encompasses 48% of all estimated high site-density lands within the PA. Travel in an additional 513,062 acres (52%) in high site-density areas would be limited to designated routes. No areas within the Monticello PA would be open to unrestricted, cross-country OHV use. Alternative E would close more acres to OHV use than the Proposed Plan and any other alternative, and approximately 179 miles of OHV routes would be closed in lands with non-WSA wilderness characteristics. Approximately one-third more areas would be restricted to limited use (through designated route restrictions) under Alternative E than under Alternative A. Alternative E would designate fewer acres for limited OHV use (through designated route restrictions) than would the Proposed Plan and Alternatives B, C, and D, though it would close more acres to OHV use than the Proposed Plan and Alternatives C and D. These travel decisions would have potential long-term beneficial impacts to cultural resource sites in high-density areas throughout the Monticello PA, and the beneficial impacts would likely be greater under Alternative E than the Proposed Plan or any other alternative because fewer sites away from designated routes could be impacted by direct and indirect OHV use. Long-term adverse impacts under Alternative E would be expected to be approximately the same as under Alternative B, which has similar acreage distributed among categories of closed and limited OHV use. Alternative E

Table 4.40. Impacts to Cultural Resources under Alternative E Where They Differ from Alternative B

Resource Program	Impact on Cultural Resources
	would produce fewer long-term adverse impacts than Alternatives A and D, which close substantially fewer acres to OHV use.
Visual Resources	Approximately 565,528 acres of high site-density and 544,314 acres of medium site-density lands within the Monticello PA would be managed under VRM Class I or Class II objectives. This represents 57% of all high site-density and 68% of all medium site-density lands in the PA. Managing these lands, especially for VRM Class I objectives, would limit ground-disturbing activities that have the potential to impact cultural resources. Therefore, cultural resources located on these lands would experience a long-term benefit. Alternative E would manage the most acres of land among the Proposed Plan and alternatives under VRM Class I or Class II designations, and would have more beneficial impacts on cultural resources than Alternative A because greater restrictions would be placed on surface disturbances within the PA.
Woodlands	Alternative E would open 241,712 acres of high site-density and 129,498 acres of medium site-density areas for woodland harvesting, with limited restrictions on OHV travel. This would encompass 24% of all estimated high site-density and 16% of all estimated medium site-density lands in the PA. Alternative E would likely have a lower potential for adverse impacts than the Proposed Plan and Alternatives B, C, and D because they would allow woodland harvesting on more land; non-WSA lands with wilderness characteristics would not be open to private or commercial woodland harvest. It should be noted, however, that the Proposed Plan and Alternatives C and D place greater restrictions on off-road travel to transport woodland products than does Alternative E. These travel restrictions would lower the potential risk of impacts to cultural resource sites.

4.3.2.3.6. PROPOSED PLAN

Table 4.41 summarizes impacts to cultural resources from various BLM resource program decisions under the Proposed Plan, excluding special designations. Because special designations incorporate an array of individualized management decisions, discussion of their impact on cultural resources follows the Table 4.41 summary.

Table 4.41. Impacts to Cultural Resources under the Proposed Plan

Resource Program	Impact on Cultural Resources
Cultural Resources	<p>As discussed under Alternative B, approximately 98,348 acres of land in high-density site areas would be subject to special management consideration to protect important cultural resource values. Cultural-resource program decisions and impacts under the Proposed Plan would be the same as discussed under Alternative B.</p> <p>The potential impacts related to the management of the Old Spanish National Historic Trail would be identical to those described for Alternative B, except that additional protective consideration would be given to individual landmarks along the trail.</p> <p>Impacts due to recreational use of cultural resources would be the same as for Alternative B, except that there would be a negligible increase in adverse impacts because of larger commercial group sizes allowed in high site-density areas.</p>

Table 4.41. Impacts to Cultural Resources under the Proposed Plan

Resource Program	Impact on Cultural Resources
Livestock Grazing	Potential adverse and beneficial impacts to cultural resources under the Proposed Plan would be the same as those described for Alternative B because the two alternatives would manage approximately the same areas open, unavailable, or restricted to livestock grazing.
Minerals, Oil, And Gas	Approximately 393 acres of land in high site-density and 299 acres in medium site-density areas would be subject to varying amounts of physical disturbance over the next 20 years. These acreages equate to approximately 0.05% of the total acres of high site-density and 0.05% of medium site-density lands available for mineral development under the Proposed Plan. The Proposed Plan could have a slightly greater impact on cultural landscapes than Alternative B because the total number of acres subject to disturbance would be somewhat higher, but less than Alternative A.
Minerals, Geophysical	Impacts would be the same but slightly greater in intensity than those described under Alternative A because surface disturbance is estimated to be 903 acres over the next 20 years. Approximately 513 acres of high site-density and 390 acres of medium site-density lands would be involved. This represents 0.05% of all estimated high site-density and 0.05% of all estimated medium-site density lands within the PA. The Proposed Plan would produce surface disturbance in approximately 17 more acres (34 more in high site-density but 17 less in medium site-density areas) than Alternative A.
Non-WSA lands with Wilderness Characteristics	More restrictive, beneficial, management (e.g., no surface-disturbing activities, VRM Class II designation, OHV use limited to designated trails, or ROW avoidance areas) would be prescribed for five areas of non-WSA lands with wilderness characteristics. Of the 88,871 acres where wilderness characteristics are being managed approximately 12,808 acres of high site-density lands.
Riparian Resources	The impacts are identical to those discussed for Alternative B.
Special status Species	Limited, long-term, beneficial impacts on cultural resources would be expected in areas where spatial buffers against surface disturbance around habitats are created. The Proposed Plan is expected to have similar long-term beneficial impact on cultural resources than Alternatives B and C because of the similar buffer areas and restrictions within them.
Travel	The impacts would be the same as those discussed under Alternative A, except the long-term beneficial impacts would increase because of closed areas (234,604 acres [24%] in high site-density areas) and designated routes (an additional 752,651 acres [76%] in high site-density areas). The long-term adverse impacts within designated open OHV areas would be reduced to zero acres.
Visual Resources	Approximately 351,283 acres of high site-density and 299,745 acres of medium site-density lands within the Monticello PA would be managed for VRM Class I or II conditions. This represents 36% of all high site-density and 38% of all medium site-density lands in the PA. The beneficial impacts of the Proposed Plan on cultural resources would be similar but less than with Alternative A because fewer acres would be protected under VRM Class I and Class II designations.
Woodlands	Under the Proposed Plan, 507,753 acres of high cultural-resource site-density and 333,708 acres of medium site-density areas would be available for woodcutting. This represents 51% of all estimated high site-density and 42% of all estimated medium site-density lands within the PA. Off-road travel to gather woodland products would be permitted across a portion of the open areas. Cultural-resource inventories would be required before woodland products could be harvested on lands within the North Comb

Table 4.41. Impacts to Cultural Resources under the Proposed Plan

Resource Program	Impact on Cultural Resources
	(Comb Ridge) area north of Highway 95, Cedar Mesa (outside of the WSA), and the Montezuma watershed. Potential impacts to cultural resources from woodlands management decisions under the Proposed Plan would probably be lower than those anticipated for Alternative A because the Proposed Plan imposes greater travel restrictions and requirements for cultural-resource inventories.

Special-designations management decisions under the Proposed Plan would have both direct and indirect long-term impacts on cultural resources within the Monticello PA. As noted under Alternative A, WSAs account for 386,027 acres of land within the PA and overlap with other special designations (e.g., ACECs) to a great extent (see Map 90). WSAs are managed under the IMP, which implements stringent restrictions on surface-disturbing activities (see the discussion for special designations in Section 4.3.14. A total of 230,969 acres in WSAs are lands classified with high cultural resource site density. Another 153,926 acres are classified with medium site density. The same acres and management prescriptions would apply to WSAs across all the Proposed Plan and all alternatives. Consequently, the potential impacts on cultural resources in WSAs within special designation areas under the Proposed Plan would be identical to those described previously for Alternatives A and B.

Six of the seven ACECs that would be managed under the Proposed Plan include approximately 61,077 acres of lands with high cultural resource site density. This represents approximately 6% of all estimated high site-density lands within the PA. Within these special designation areas, management actions include a range of prescriptions that would benefit cultural resources by affording them direct and indirect protection from adverse impacts. These decisions include implementing NSO leasing stipulations for mineral development on approximately 8,698 acres, closing areas to mineral development on 18,234 acres, managing approximately 22,345 acres under VRM Class I objectives (with strict limitations on surface disturbance), eliminating OHV travel on approximately 1,200 acres, and prohibiting mineral disposal on 23,123 acres of high site-density lands. Table 4.42 lists the special designation areas where these decisions apply and the acreage of high site-density lands they contain.

Table 4.42. Acres of High Site-Density Lands in Special Designation Areas with Decisions Affecting Cultural Resources, Proposed Plan

Special Designation (All ACECs)	NSO for Mineral Development	Closed to Mineral Development	Closed to Mineral Disposal	Closed to Geophysical Work	VRM Class I Designation	Closed to OHV Use
Alkali Ridge ¹	1,991	0	1,991	0	0	0
Hovenweep	880	0	880	0	0	0
Indian Creek	3,904	0	3,904	0	3,904	0
Lavender Mesa	632	0	632	0	0	632
San Juan River	2,139	0	2,139	0	615	567
Valley of the Gods	<1	17,833	17,833	0	17,825	<1

Table 4.42. Acres of High Site-Density Lands in Special Designation Areas with Decisions Affecting Cultural Resources, Proposed Plan

Special Designation (All ACECs)	NSO for Mineral Development	Closed to Mineral Development	Closed to Mineral Disposal	Closed to Geophysical Work	VRM Class I Designation	Closed to OHV Use
Total	9,546	17,833	27,379	0	22,344	1,199

¹Includes the Alkali Ridge National Historic Landmark (2,146 acres)

If a special designation area (ACEC or Wild and Scenic River) is not listed in the table, either the decisions do not apply to it, or no estimated acres of high site-density lands occur within it. The restrictions noted in the table reduce opportunities for surface-disturbing activities to impact cultural resource sites.

The Proposed Plan provides for approximately twice as many acres covered by NSO leasing stipulations in high site-density special designation areas as Alternative A but approximately 8 times fewer acres than Alternative B. The Proposed Plan would manage approximately 10 times as many high site-density lands under VRM Class I objectives than would Alternative A but approximately 3 times less than Alternative B. The Proposed Plan would close approximately 5 times fewer acres of land in high site-density areas to OHV travel than Alternatives A and B. The Proposed Plan would close approximately 7 times more land in high site-density areas to mineral disposal and geophysical work than Alternative A but approximately 3 times less than Alternative B. In all cases, The Proposed Plan would provide greater benefits to cultural resources in special designation areas than would Alternative D, which implements no special designation regulations.

Surface-disturbing activities would still be allowed, but in general, regulations would limit the level of actual disturbance (e.g., CSU stipulations for mineral development and requirements for non-mechanized vegetation treatments). Many of these areas would also be managed under VRM Class II objectives, which, while less restrictive than VRM Class II objectives, would still provide protection to cultural resources by limiting surface-disturbing activities.

4.3.2.4. SUMMARY OF IMPACTS

In general, impacts to cultural resources would be long-term, with short-term impacts typically being indirect and temporary, such as visual or auditory intrusions on traditional cultural sites or sacred properties. As the majority of management decisions proposed under the PRMP/FEIS would be for the long term, impacts to cultural resources from program decisions are considered to be long-term.

The Proposed Plan and all alternatives considered in this EIS have the potential to impact cultural resources within the Monticello PA. The risk of or potential for impact varies depending on the type of management decisions that the Proposed Plan or any given alternative would implement. The Proposed Plan and all alternatives would comply with applicable laws, such as the NHPA, and internal BLM policy. These laws and policies require the BLM to consider cultural resources when implementing management decisions; consider ways to avoid, minimize, or mitigate adverse impacts to important cultural resources; and consult with interested parties, including federally recognized Native American tribes.

In general, Alternative E provides the most potential beneficial impact to cultural resources within the Monticello PA among the Proposed Plan and all alternatives. This is because Alternative E would enact greater restrictions than the Proposed Plan or any other alternative on surface-disturbing activities such as mineral development, recreational use, and OHV travel and would include more special designation areas and non-WSA lands with wilderness characteristics with their proposed management restrictions on surface disturbance and OHV travel and managing areas under VRM Class I and II objectives. These management decisions would reduce the opportunities for adverse impacts to cultural resources. Alternatives B and E would focus on proactive management of cultural resources by developing integrated cultural/recreational management plans. Based upon these same decisions, the Proposed Plan and Alternative C would provide the next greatest benefit to cultural resources, followed by Alternative A. Alternative D would provide the least amount of benefit to cultural resources in the Monticello PA among the Proposed Plan and all the alternatives.

4.3.2.5. MITIGATION MEASURES

All decisions and actions described under the Proposed Plan and all the alternatives for the Monticello PA RMP must also comply with cultural resource laws, such as Section 106 of the NHPA, as well as internal agency guidelines. These laws and guidelines require consideration of alternatives to eliminate, reduce, and/or mitigate adverse impacts to cultural resources. Although the preferred treatment of important cultural resources within an area is complete avoidance, this is not always possible. Consequently, mitigation of impacts is an important alternative. While avoidance helps to preserve the physical archaeological record within an area, mitigation could result in the gradual elimination of the physical archaeological record and its conversion into a paper or archival record. Because mitigation of adverse impacts to a cultural resource must be specific to that resource—designating the values that render it eligible for the NRHP or important to a particular culture group, such as a Native American tribe—as well as to the nature of the impact, appropriate mitigation cannot be defined at this programmatic level of analysis. Should specific adverse impacts to individual cultural resources be identified during the site-specific NEPA and project-specific Section 106 processes, the BLM would develop and implement a mitigation plan in consultation with the Utah State Historic Preservation Office (SHPO) Native American tribes, the Advisory Council on Historic Preservation, and other interested parties, as appropriate.

4.3.2.6. UNAVOIDABLE ADVERSE IMPACTS

Because the location and nature of all cultural resources in the area under consideration are unknown, it is not possible to determine if there would be unavoidable adverse impacts to cultural resources and/or what they might be at this time. There is some potential for unavoidable adverse impacts with nearly any proposed management decision. However, following applicable law and policy would provide opportunities for prevention and/or mitigation of many of these impacts.

4.3.2.7. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Because the location and nature of all cultural resources in the area under consideration are unknown, it is not possible to determine if there would be changes in short-term uses or long-term productivity of these resources. However, it should be noted that adherence to applicable

law and policy would prevent any loss in the long-term productivity of this resource due to previously described short-term use.

4.3.2.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Because the location and nature of all cultural resources in the area under consideration are unknown, it is not possible to determine if there would be irreversible and/or irretrievable impacts to cultural resources and/or what they might be. Most of the proposed management decisions include the potential for impact. However, following applicable law and policy would prevent and/or mitigate many potential impacts.

4.3.3. FIRE MANAGEMENT

Impacts to the fire management program within the Monticello PA would result from both fire and non-fire management decisions. The impacts would vary by alternative, depending on specific program prescriptions that could either directly or indirectly reduce or contribute to fuels loading or increase or decrease the risks of wildland fire.

4.3.3.1. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

4.3.3.1.1. IMPACTS OF AIR QUALITY DECISIONS ON FIRE MANAGEMENT

Under the Proposed Plan and all alternatives, prescribed burns would be consistent with the Utah Division of Environmental Quality (UDEQ) permitting process and timed in conjunction with meteorological conditions so as to minimize smoke impacts. In addition, the BLM would comply with the current Smoke Management Memorandum of Agreement (MOU) between BLM, USFS, and UDAQ. The MOU, in accordance with UAC regulation R301-204, requires reporting size, date of burn, fuel type, and estimated air emissions from each prescribed burn. Additional restrictions on prescribed burns and Wildland Fire Use (WFU) treatments during certain conditions or near Visual Resource Management, Class I areas would also apply. All of these restrictions could impact the size and/or timing of fire management activities such as managed wildland fire and prescribed burns. However, these limitations would not substantially reduce the effectiveness of long-term fire management.

4.3.3.1.2. IMPACTS OF FIRE MANAGEMENT DECISIONS ON FIRE MANAGEMENT

The management decisions common to the Proposed Plan and all alternatives that impact fire management would consist of 1) establishing fire management priorities; 2) establishing fire suppression objectives; 3) using wildland fire for improving natural resources or accomplishing specific resource objectives; 4) reducing fuel loading; 5) preventing and mitigating wildland fire within the Monticello PA, and applying emergency stabilization and rehabilitation treatments to areas to protect human property and/or important natural and cultural resources.

The impacts of these decisions would directly and beneficially impact human safety and in the short-term and long-term by making the protection of human health, safety, and property (in wildland urban interfaces [WUIs] and at-risk communities) the highest priority of fire management, fire suppression, fire use for resource benefit, emergency stabilization and rehabilitation, and wildland fire prevention. Common fire management decisions would have long-term, direct and indirect, beneficial impacts on ecosystem health and watersheds by setting a high priority on the use of wildland fire (through prescribed burning), fire suppression, and emergency stabilization and rehabilitation to protect, maintain, and enhance native vegetation communities, to protect watersheds from soil erosion, and to protect land and aquatic habitat of listed and non-listed species.

Under the Proposed Plan and all alternatives, 5,000 to 10,000 acres of the Monticello PA would be treated annually across the planning area, depending on budgetary and time constraints. The majority of these treatments would likely be concentrated in the pinyon-juniper vegetation type, including historical sagebrush/grassland that has been encroached upon by pinyon-juniper (BLM 2005k). Approximately 92% of this vegetation type is in fire regime/condition class (FRCC) 3, which indicates that it suffers high departure (>66% variation) from historical fire return interval

and/or vegetation condition/fuel loading. The main reasons the majority of the pinyon-juniper in the planning area falls within this FRCC are 1) loss of native understory of pinyon-juniper stands; 2) cheatgrass invasion of disturbed pinyon-juniper stands; and 3) fuel loading in uncharacteristically thick pinyon-juniper stands (BLM 2005k). The Moab Fire District Fire Management Plan has a long-term goal to treat up to approximately 41,000 acres of pinyon-juniper vegetation in the Monticello PA with prescribed fire (14,600 acres) and non-fire treatments (26,400 acres) over the next 10-year period. These treatments would take place in five Fire Management Units (FMUs) throughout the planning area. These treatment acreages are only approximate long-term goals, but are the best available estimates for the purposes of analysis.

Fuels treatments for the Monticello PA would have additional long-term, beneficial impacts on vegetation communities by improving historic fire regimes to encourage native vegetation establishment and to control non-native, invasive species that could otherwise displace native vegetation. The fire management decisions common to the Proposed Plan and all alternatives would directly protect known, sensitive, and valuable cultural resources and cultural landscapes by setting priorities to prevent damage to these irreplaceable resources from wildland fire.

If the Moab Fire District is able to successfully implement fuels treatments over a maximum number of desired acres in a given year, a general transition toward improved FRCC and DWFC in the Monticello FO could eventually be realized. Landscape-level fuel treatments require a long-term commitment of resources to implement, monitor, and maintain; implementation can depend on a myriad of factors such as climate, funding, threats or infestation from invasive species, and other variables; and, acreage goals can be altered or transformed by unexpected factors such as catastrophic wildland fire, drought, or changes in habitat for T&E species. In consideration of these many aspects, improved FRCC and DWFC as well as other management goals and objectives may take generations for actual accomplishments to be realized.

4.3.3.1.3. IMPACTS OF LANDS AND REALTY DECISIONS ON FIRE MANAGEMENT

Under the Proposed Plan and all alternatives, minimum impact criteria for filming would limit the use of pyrotechnics and explosives, as well the numbers of people and vehicles in sensitive areas. This would provide a slight decrease in the risk of inadvertent fire starts from human causes.

4.3.3.2. PROPOSED PLAN AND ALTERNATIVES IMPACTS

Impacts to fire condition may be indirect, negligible, or non-existent, depending on the resource management decision. Specifically, resource program decisions for health and safety, livestock grazing, paleontology, soils and water resources, special status species, are expected to have little or no direct or indirect impact on fire condition within the Monticello PA. Decisions for these resources do not preclude surface-disturbing activities. As such, they will not be considered further in this analysis. All other Proposed Plan and alternative decisions with the potential to impact cultural resources either beneficially or adversely are discussed below.

4.3.3.2.1. IMPACTS OF CULTURAL RESOURCE DECISIONS ON FIRE MANAGEMENT

The majority of cultural resource decisions affecting fire management are associated with restrictions in cultural emphasis zones within SRMAs. Restrictions on vegetation treatments and woodland harvest can lead to fuel loading, particularly in pinyon-juniper and conifer vegetation

types, thereby resulting in increased risk of large catastrophic fires. Table 4.43 below summarizes these proposed restrictions under the Proposed Plan and each alternative.

Table 4.43. Acreage of CSMA Restrictions on Fire Management and Fuels Treatment (acres)

Restriction	Alt. A	Alt. B	Alt. C	Alt. D	Alt. E	Proposed Plan
No Surface-disturbing Vegetation Treatments (in pinyon-juniper)	26,902	46,042	0	0	46,042	0
No Woodland Harvest (in pinyon-juniper and conifer veg types)	26,915	79,163	45,703	44,139	79,163	0

4.3.3.2.1.1. Alternative A

Under Alternative A, Grand Gulch National Historic District, consisting of 37,433 acres, would be subject to conditional fire suppression with motorized suppression methods used only if necessary to protect life or property. The Comb Ridge, McLoyd Canyon-Moon House Tank Bench, and Beef Basin CSMA's, are not identified as CSMA's in the current management plan and would be available for fuels treatment and fuels management activities as outlined in the Moab Fire District Fire Management Plan (BLM 2005k). To reduce hazards and to restore ecosystems, authorized fuels management actions include wildland fire use, prescribed burns, and mechanical, manual, chemical, biological, and seeding treatments. Fuels treatments are focused on the desired wildland fire condition (DWFC) of restoring historic fire regimes to ecosystems when feasible, so that future wildland fire use actions can be more easily implemented. It should be noted that the Moab Fire District's revised FMP would confine virtually all (approximately 99.5%) of the proposed fire management-related vegetation treatments to the pinyon-juniper vegetation type (BLM 2005k). Accordingly, this alternative would contribute to returning approximately 36,344 acres of pinyon-juniper in these CSMA's to DWFC, but would prevent the opportunity for fire management-associated vegetation treatments on approximately 26,902 acres of pinyon-juniper (see Table 4.43). Woodland harvest (private and commercial) would not be allowed on 26,915 acres of pinyon-juniper and conifer vegetation types, which could lead to fuel loading, thereby resulting in increased risk of large catastrophic fires, unless other treatments were used.

4.3.3.2.1.2. Alternative B

Under Alternative B, the Comb Ridge (30,752 acres) and the Tank Bench (2,646 acres) CSMA's are available for non-surface-disturbing vegetation treatments, and the Beef Basin CSMA (20,302 acres) is available for any type of vegetation treatment. The Grand Gulch National Historic District (37,388 acres) is excluded from vegetation treatments, except non-motorized weed control with no surface disturbance, and the McLoyd Canyon-Moon House CSMA (1,607 acres) has no restrictions impacting decisions on fire management. Accordingly, a full array of fuels treatments would be available to contribute to returning 17,204 acres of pinyon-juniper to DWFC. This represents far less acreage available for all fire management options than

Alternative A. Additionally it would restrict surface-disturbing fire management treatments on approximately 46,042 acres of pinyon-juniper, although a total of 19,140 acres of that pinyon-juniper acreage would be available for non-surface-disturbing fire management. This would provide some assistance in moving these vegetation types towards DWFC; however, it would not be as effective as the management actions under Alternative A, which allow both surface and non-surface-disturbing treatments in these areas. Woodland harvest (private and commercial) would not be allowed on 79,163 acres, although in some cases, collection of dead wood for campsites would be allowed. This represents almost a threefold increase over the harvesting restrictions under Alternative A (see Table 4.43). Accordingly, the long-term impacts of wildland fires would be higher under this alternative than under Alternative A.

4.3.3.2.1.3. Alternative C

Under Alternative C, the Beef Basin (20,302 acres) and the McLoyd Canyon-Moon House (1,607 acres) CSMA's would be managed the same as under Alternative B. The Tank Bench CSMA (2,646 acres) would also be managed the same as under Alternative B except vegetation treatments and surface-disturbing land treatments consistent with PRMP/FEIS management objectives would be allowed. Under Alternative C, the Comb Ridge CSMA (30,752 acres) would be available for vegetation treatments and surface-disturbing land treatments that are consistent with management plan objectives. In the Grand Gulch National Historic District (37,388 acres), non-motorized vegetation treatments, including aerial seeding, hand reseeding, planting seedlings, and control of invasive non-native species are allowed as long as they do not impact cultural resources and are consistent with the IMP. This would represent the same types and amounts of vegetation for all fire management options as described under Alternative A, plus an additional 26,902 acres of pinyon-juniper to be available for treatment with the non-motorized treatments described above. Based on the allowable treatment (approximately 60% more of the area available for treatment than under Alternative A), this alternative would likely allow more opportunities than Alternative A to move these vegetation types to DWFC, with subsequent reductions in long-term fire impacts.

Woodland harvest (private and commercial) would not be allowed on 45,703 acres, although in some cases, collection of dead wood for campsites would be allowed. This is approximately 160% more restriction than under Alternative A, which could lead to fuel loading, unless other treatments were used (see Table 4.43).

4.3.3.2.1.4. Alternative D

Under Alternative D, the Tank Bench would not be managed as a CSMA; it would be managed the same as adjacent areas with no restrictions on fire management. Comb Ridge and Beef Basin would not be managed as CSMA's, but otherwise they would be managed the same as under Alternative C. The McLoyd Canyon-Moon House CSMA (1,607 acres) and the Grand Gulch National Historic District (37,388 acres) would be managed the same as under Alternative C. Woodland harvest (private and commercial) would not be allowed on 44,139 acres, although in some cases, collection of dead wood for campsites would be allowed (see Table 4.43).

This alternative would have virtually identical impacts on DWFC and long-term fire impacts as Alternative C.

4.3.3.2.1.5. Alternative E

Under Alternative E, the impacts of cultural resources decisions on fire management would be same as under Alternative B.

4.3.3.2.1.6. Proposed Plan

Under the Proposed Plan, all CSMAs will be managed as SRMAs or as recreation management zones within designated SRMAs and the Grand Gulch National Historic District would be managed as a recreation management zone within the Cedar Mesa SRMA. Impacts of recreation decisions on fire management are discussed in Section 4.3.3.2.4.

4.3.3.2.2. IMPACTS OF MINERALS DECISIONS ON FIRE MANAGEMENT

Minerals decisions impacting fire management are largely associated with potential increased risk of human-caused fires because of mineral development. These impacts are best compared by showing relative difference in acreage of lands open for surface-disturbing minerals development for the Proposed Plan and each alternative (Table 4.44).

Table 4.44. Acreage of Planning Area Lands Open and Closed to Surface-disturbing Mineral Development (% of Planning Area)

Development	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Leasable						
Open (Standard or Special Stipulations)	1,238,230 (69%)	1,241,910 (70%)	1,348,973 (76%)	1,383,283 (78%)	758,931 (42%)	1,224,811 (69%)
Closed (NSO/ Closed)	546,540 (31%)	541,717 (30%)	434,652 (24%)	401,028 (22%)	1,028,378 (58%)	559,508 (31%)
Locatable						
Open	1,652,743 (93%)	1,533,413 (86%)	1,663,211 (93%)	1,738,992 (97%)	951,053 (53%)	1,734,458 (97%)
Withdrawn	132,380 (7%)	251,710 (14%)	121,912 (7%)	46,131 (3%)	834,070 (47%)	50,665 (3%)
Salable						
Open/Open Special Conditions	1,405,340 (79%)	1,241,904 (70%)	1,348,968 (76%)	1,383,277 (78%)	758,931 (43%)	1,348,968 (76%)

In general, Alternative E has the least amount of land available for surface-disturbing mineral extraction, followed by the Proposed Plan and Alternatives A, B, C, and D respectively. However, the Proposed Plan and the alternatives are very similar in the amount of area they make available for mineral development. Additionally, it should be noted that the actual amount of development predicted over the next 15 years is relatively low; therefore, mineral

development activities would likely have a relatively low impact on fire management and fire risk in comparison to other human activities such as recreational visitation.

Minerals management decisions under the Proposed Plan and all alternatives would potentially impact fire management through the creation of additional WUI areas, which could increase the likelihood for fire suppression to protect minerals infrastructure and improvements in the event of wildland fire. However, the potential for wildland fire in minerals development areas would be low because of fire-related mitigation applied during minerals development; thus, the impacts would be negligible.

4.3.3.2.3. IMPACT OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON FIRE MANAGEMENT

4.3.3.2.3.1. Alternatives A, B, C and D

Under Alternatives A, B, C and D, lands with wilderness characteristics would be not managed to maintain these characteristics and fuels treatment response activities not would need to be compatible with the goals and objectives of protecting non-WSA lands with wilderness characteristics

4.3.3.2.3.2. Alternative E

Under Alternative E, a total of 582,360 acres of non-WSA lands with wilderness characteristics would be managed to maintain their these characteristics. These areas would be closed to OHV use, which would reduce the risk of human-caused fire starts and virtually eliminate the risk of fire starts from motorized vehicles. Non-WSA lands with wilderness characteristics would also be closed to mineral leasing and disposals and would prohibit new road construction or ROWs, which would also reduce the risk of human-caused fire starts associated with these activities and associated workers. However, non-WSA lands with wilderness characteristics would also be closed to woodland harvest, which would potentially increase fuel loading unless other vegetation treatments were used in its place. Fire and fuels treatment response activities would need to be compatible with the goals and objectives of protecting non-WSA lands with wilderness characteristics and would use light on the land techniques. This could restrict the method and equipment type used and fire operations within these lands. Compared to Alternatives A, B, C and D, Alternative E would reduce the risk of human-caused fire starts, but could potentially increase fuel loading in non-WSA lands with wilderness characteristics.

4.3.3.2.3.3. Proposed Plan

Under the Proposed Plan, a total of 88,871 acres of non-WSA lands would be managed to maintain their wilderness characteristics. These areas would be limited to designated routes and trails, which would reduce the risk of human-caused fire starts and lower eliminate the risk of fire starts from motorized vehicles. Grand Gulch, Mancos Mesa, and Nokai Dome West and Nokai Dome East would be closed to leasing and be exclusion areas for ROWs; Dark Canyon would be NSO and an avoidance area for ROWs. These actions would reduce the risk of human-caused fire starts associated with these activities and associated workers. Although campfire wood collection would be permitted, lands with wilderness characteristics would be closed to commercial and personal woodland harvest, which would potentially increase fuel loading unless other vegetation treatments were used in its place. Fire and fuels treatment response activities

would need to be compatible with the goals and objectives of protecting non-WSA lands with wilderness characteristics and would use light on the land techniques. This could restrict the method, equipment type, and fire operations within the non-WSA lands with wilderness characteristics. Compared to Alternatives A, B, C, and D, the Proposed Plan would reduce the risk of human-caused fire starts, but to a lesser degree than under Alternative E, but could potentially increase fuel loading in non-WSA lands with wilderness characteristics.

4.3.3.2.4. IMPACT OF RECREATION DECISIONS ON FIRE MANAGEMENT

Recreation decisions impacting fire management include development of recreation areas, which could limit wildland fire use; restrictions on woodland harvest, which could increase fuel loading and thus fire risk; campfires and dispersed camping, which could increase risk of human-caused wildland fire starts; and issuance of special recreation permits, which could provide additional opportunities to educate visitors on wildfire prevention.

Under the Proposed Plan and all alternatives, new sites/facilities would be developed in response to user demands, amenity value and critical resource protection needs. Developing and maintaining campgrounds, trails, routes, and other recreation infrastructure would increase the number of WUI areas, which would require increased fire suppression and would reduce the number of acres available for wildland fire use. Additionally developed recreation areas would be unavailable for private and/or commercial use of woodland products, including on-site collection of dead wood for campfires. This could increase fuel loading unless other vegetation treatments were used to reduce fuel loading.

There would be indirect, potentially adverse impacts on fire management from the increased risks of human-caused wildland fire from increased recreational and campfire use and restrictions on woodland harvesting. Table 2.45 provides a summary of fuels removal restrictions and SRP limits. Dispersed camping and campfire restrictions are outlined by SRMA in Table 2.1, Summary of Alternatives.

In general, Alternative A has the fewest restrictions on campfires and dispersed camping, and as shown in Table 2.45, provides fewer opportunities for fire prevention education via SRPs, actions which could reduce risk of wildland fire starts. However, Alternative A also places no restrictions on commercial and private collection of woodland products, which would help to reduce fuel loading in SRMAs (Table 4.45).

Table 4.45. Recreation Restrictions Impacting Fire Management

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
No Woodland Harvest* (acres)	0	495,830	120,091	120,091	495,830	159,086
SRP motorized vehicles OHVs limits	0	15 motorized vehicles/ OHVs	25 motorized vehicles/ OHVs	0	15 motorized vehicles/ OHVs	25 motorized vehicles/ OHVs

*Acreage overlaps with woodland harvest restrictions in Table 4.43.

Of the action alternatives, Alternatives C and D generally has the fewest dispersed camping and campfire restrictions and SRP educational opportunities, but slightly more woodland collection restrictions, which could increase fuel loading and fire risk as compared Alternative A. Alternatives B and E provide the most restrictions concerning dispersed camping and campfires, and provide more opportunities for educational through issuance of SRPs; however, more restriction on woodland gathering could increase fuel risk unless other vegetation treatments were used to reduce fuel loading. The Proposed Plan has more restrictions on woodland gathering than Alternatives A, C and D, but fewer than Alternatives B and E. The Proposed Plan also offers more opportunities for education through issuance of SRPs than Alternatives A and D.

Other recreation decisions impacting fire management include designation of the ERMA. Within the ERMA, there are no campfire restrictions. Management decisions for managing the ERMA are not specified under Alternative A. Alternative A therefore have the highest risk of human-caused wildland fire starts due to campfires/dispersed camping, followed by Alternative D, which would allow dispersed camping within 300 feet of designated routes. Alternatives B and E would have the lowest risk, allowing dispersed camping only in previously disturbed areas. Alternative C and the Proposed Plan would allow dispersed camping within 150 feet of designated routes.

4.3.3.2.5. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON FIRE MANAGEMENT

Special designations affect fire management, and consequently DWFC and long-term fire risk, by restricting vegetation treatments or restricting woodland harvest. Restricting vegetation treatments prevents managers from decreasing fuel loading and moving fire return interval and vegetation composition to levels closer to historic conditions. Restricting woodland harvest reduces the amount of fuels removed from an area, and thus increases fuel loading in the conifer and pinyon-juniper vegetation types where harvest most commonly occurs. Woodland harvest acts as a *de facto* vegetation treatment; therefore, its prohibition increases the risk of large or catastrophic fires if other treatments are not utilized in its place. Special designations vary across the Proposed Plan and alternatives based on size of area and type of restriction. This analysis will determine the acres of these types of restrictions due to special designations and the impacts of those acres on fire management goals and long-term fire risk. It should be noted that some of the proposed special designated areas include prohibitions on OHV use. The overall impacts of OHV restrictions are discussed in Section 4.3.10.4.17, Travel Decisions on Recreation.

Special designations in the Monticello PA include ACECs, WSRs, and WSAs. Proposed management prescriptions for WSRs have negligible impact on fire management as they do not restrict vegetation management or woodland harvest more than other management decisions. Additionally, fewer than 10 acres of fire management treatments are planned within riparian vegetation types in the Monticello PA under the Moab FMP; therefore, proposed WSRs are unlikely to affect or be affected by potential fire management actions. Accordingly, WSR impacts on fire management are not analyzed further.

Under the Proposed Plan and all alternatives, a total of 386,027 acres are WSAs. These acreages would be closed to woodland harvest and surface-disturbing vegetation treatments. Accordingly, this acreage (approximately 22% of the planning area) would have limited means to proactively reduce fuel loading or to move vegetation types to DWFC. However, over the long-term, some vegetation treatments may be allowed if they are non-impairing. These would include reseeding

with native species after a fire or pruning. However, stand conversion activities such as mechanical removal of pinyon-juniper encroachment or Douglas fir encroachment on aspen would not be permitted (H-8550-1 - Interim Management Policy For Lands Under Wilderness Review). Fire suppression would be permitted with the understanding that it be conducted with a minimum amount of mechanical and/or motorized resources.

ACECs have various management decisions by alternative for vegetation treatments. Overall, designation of potential ACECs and the subsequent restrictions on these areas would have the greatest impact on fire management activities in the planning area. All ACECs are considered under Alternatives B and E, no ACECs are considered under Alternative D. See Section 4.3.14, Special Designations, for a list of proposed ACECs by alternative. Table 4.46 below summarizes the restrictions of fire and fuels treatments and woodland harvest in ACECs in the planning area.

Table 4.46. Acreage of ACEC Restrictions on Fire Management and Fuels Treatment (acres)

Restriction	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
No Surface-disturbing Vegetation Treatments ¹ (in pinyon-juniper and conifer/mountain shrub)	7,099	59,079	608	0	59,079	768
No Woodland Harvest ² (in pinyon-juniper and conifer/mountain)	114,461	353,858	49,998	47,285	353,858	107,507

¹ Acreage overlaps with woodland harvest restrictions in Table 4.43 and includes areas not managed as ACECs but with woodland harvest restrictions.

² All or portions of Bridger Jack Mesa, Butler Wash North, Cedar Mesa, Dark Canyon, Indian Creek, and Lockhart Basin potential ACECs are also contained within WSAs. WSAs are managed under the IMP and would prohibit surface-disturbing vegetation treatments under all Alternatives. Acreage not closed to surface-disturbing treatments under potential ACEC designation is not included in this table.

4.3.3.2.5.1. Alternative A

Under Alternative A, a total of 492,077 acres of land would be designated as ACECs. These ACECs are shown in Table 4.133. Restrictions on vegetation treatments and woodland harvest within these ACECs could impact fire management. Under this alternative, a total of 7,099 acres of pinyon-juniper and conifer/mountain shrub land within these ACECs would not allow surface-disturbing vegetation treatments. This represents approximately 0.4% of the public lands in the Monticello FO that would have limited means to decrease fuel loading or to move vegetation types to DWFC. Additionally, a total of 137,275 acres of existing pinyon-juniper and conifer/mountain shrub (approximately 8% of the FO) would be restricted from either private or commercial woodland harvest. Although woodland harvest is not specifically targeted as a fire management activity, it does provide opportunities to thin dead wood from pinyon-juniper and conifer vegetation types. Thus, woodland harvest acts as a *de facto* vegetation treatment, and its prohibition increases the risk of large or catastrophic fires if other treatments are not utilized in its place.

4.3.3.2.5.2. Alternative B

Alternative B would carry forward the existing ACECs from Alternative A; however, some of them would be of different size or have different restrictions. A total of 521,142 acres of lands would be designated as ACECs under this alternative. Of these lands, a total of 59,079 acres of pinyon-juniper and conifer/mountain shrub (3.0% of the planning area) would be restricted from surface-disturbing vegetation treatments. This would provide significantly less opportunities to decrease fuel loading and move vegetation towards DWFC as compared to Alternative A. This alternative would also prohibit private or commercial woodland harvest on 353,858 acres of pinyon-juniper and conifer/mountain shrub vegetation in ACEC lands (approximately 20% of the planning area). This would result in much more acreage of these vegetation types likely to experience fuel loading or that would require active vegetation treatments to reduce fuel loading than under Alternative A.

Access to designated campsites was correlated with reduced human-caused fire ignitions in the Moab Fire District from 1999 to the present time in spite of increased levels of visitation (BLM 2005k). Under this alternative, a total 306,861 acres would include restrictions on dispersed camping, which would continue to slightly lower the risk of human-caused fire ignitions in the Cedar Mesa and Shay Canyon ACECs.

4.3.3.2.5.3. Alternative C

Alternative C would have seven designated ACECs. A total of 76,761 acres of lands would be designed as ACECs under this alternative. A total of 768 acres would be restricted from surface-disturbing vegetation treatments (approximately 0.03% of the planning area). This would result in substantially more opportunities to decrease fuel loading and move vegetation towards DWFC as compared to both Alternative B and Alternative A. This alternative would also prohibit private or commercial woodland harvest on 49,998 acres (approximately 3% of the planning area) of pinyon-juniper and conifer/mountain shrub vegetation in existing or proposed ACEC lands. This would result in over twice the acreage where pinyon-juniper and conifer vegetation would be open for fuel reduction resulting from woodland harvest as compared to Alternative A and approximately seven times more total acres than Alternative B. Overall, Special Designation decisions under Alternative C would provide more opportunities for fire management than Alternative A or B. Accordingly, Alternative C would likely result in less long-term fire risk to these areas than these alternatives.

Under this alternative, a total of 119 acres would include restrictions on dispersed camping, which would continue to slightly lower the risk of human-caused fire ignitions in the Shay Canyon ACEC.

4.3.3.2.5.4. Alternative D

Alternative D would designate no ACECs and would not restrict surface-disturbing vegetation treatments. However, it would impose woodland harvest restrictions on ACEC areas proposed under the Proposed Plan and other alternatives. This alternative would prohibit private or commercial woodland harvest on 47,285 acres of ACEC lands. This would result in over twice the total acres where pinyon-juniper and conifer/mountain brush vegetation types would be open for fuel reduction resulting from woodland harvest as compared to Alternative A. Overall,

Special Designation decisions under Alternative D would provide the most opportunities for fire management as compared to Alternatives A, B, C, E and the Proposed Plan.

4.3.3.2.5.5. Alternative E

Alternative E would have the same impacts as those under Alternative B as management prescriptions regarding surface-disturbing vegetation treatments, woodland harvest and dispersed camping are the same.

4.3.3.2.5.6. Proposed Plan

The Proposed Plan would designate seven ACECs with a total of 73,492 acres. In general, the Proposed Plan would have the similar impacts as those under Alternative C, as management prescriptions regarding surface-disturbing vegetation treatments and dispersed camping are the same. The Relevant and Important values of those ACECs that would not be designated would continue to be protected by other resource management decisions that may include restrictions on surface-disturbing vegetation treatments. The Proposed Plan would prohibit private or commercial woodland harvest on a total of 107,507 acres of where pinyon-juniper and conifer/mountain brush vegetation types. This would likely result in less long-term fire risk to these areas than Alternatives A, B, and E, but more than Alternative C and Alternative D.

4.3.3.2.6. IMPACTS OF TRAVEL DECISIONS ON FIRE MANAGEMENT

Travel management decisions impacting fire management include restrictions on OHV use. Motorized use creates a limited risk of human-caused fire. This risk includes heat and sparks from motors and exhaust systems. This risk is increased substantially if travel occurs off of designated routes. The cross-country motorized travel category poses the greatest risk of inadvertent wildland fire starts, followed by travel on designated routes. Cross country travel is much more likely to bring the heat and sparks from exhaust systems in direct contact with vegetation than travel on designated routes, which are typically devoid of vegetation. Closing areas to motorized travel largely eliminates the risk of inadvertent fire starts from motorized vehicles. (Table 4.47).

Table 4.47. Travel Restrictions Impacting Fire Management and Risk (acres)

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
OHV Use Categories						
Open to Cross-Country Travel	611,310	0	2,311	2,311	0	0
Limited to Existing/Designated Routes	1,329,430	1,359,417	1,362,142	1,780,807	812,679	1,388,191
Closed	276,430	423,698	418,667	0	970,435	393,895

*Acreage overlaps with woodland harvest restrictions in Table 4.43.

The Proposed Plan and all of the action alternatives would lessen the impact of human-caused fires more than Alternative A due to the reduction of motorized cross-country travel under those alternatives.

4.3.3.3. SUMMARY OF IMPACTS

Table 2.2 of Chapter 2 contains a summary of impacts of management decisions on fire management.

4.3.3.4. MITIGATION MEASURES

Management common to the Proposed Plan and all alternatives, described in Chapter 2, would serve to mitigate potential significant adverse impacts to fire management and fire risk. These include fire management treatments and prioritization, and fire suppression activities that would be designed to prevent impacts to people, property, and key ecosystem components.

4.3.3.5. UNAVOIDABLE ADVERSE IMPACTS

The prohibition of fuels reduction and vegetation treatments in various areas throughout the field office may have unavoidable impacts by increasing the long-term risk of large and/or catastrophic fires. These areas include cultural management zones within SRMAs, SRMAs and ACECs, as described in Chapter 2 and Sections 4.3.3.2.1, 4.3.3.2.4, and 4.3.3.2.5, respectively. If such fires occur, this would have an avoidable adverse impact on the resources, time and money needed to suppress such fires, as well as the potential subsequent loss of property and natural resource values.

4.3.3.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

The unavoidable impacts described above would potentially impact the long-term efficiency of fire management in the planning area. However, if non-surface-disturbing vegetation treatments and fire suppression are effectively implemented, they would not result in a long-term loss of key ecosystem components or the long-term productivity of natural resources in the planning area. There would be no irreversible impacts from fire management.

4.3.3.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

There would be no irreversible or irretrievable impacts to fire management (i.e., fuels treatments, fire suppression, emergency stabilization, prevention and mitigation).

4.3.4. HEALTH AND SAFETY

The sources, handling, and disposal of hazardous materials are subject to the federal and state laws discussed in Chapter 3 in Section 3.5, Health and Safety. These laws and regulations are designed to safeguard human health and safety and to protect the natural environment, and thus, minimize the short-term and long-term risks associated with the use, storage, and disposal of hazardous materials. Currently, the Monticello PA implements the Compliance Assessment—Safety, Health, and Environment (CASHE) and Environmental Management Systems (EMS) programs to manage hazardous materials.

Management decisions regarding the following resources and uses would have negligible impacts on the use, storage, and disposal of hazardous materials and so are not further analyzed in this section:

- Air Quality
- Cultural and Paleontological Resources
- Fire Management
- Lands and Realty
- Livestock Grazing
- Non-WSA Lands with Wilderness Characteristics
- Recreation and Travel
- Vegetation, including Woodlands, Riparian, Soils, and Water
- Wildlife and Special status Species
- Special Designations
- Visual Resources

The above resources would have negligible impacts because maintaining air pollutant concentrations below air quality standard threshold levels; protecting cultural resources and fossils; reducing fuel loads and treating vegetation to reduce the risks of wildland fire; acquiring, exchanging, and/or selling federal lands, and permitting ROWs; and protecting the wilderness values within lands with non-WSA wilderness characteristics would not affect the handling, storage, or disposal of hazardous materials nor affect the remediation of hazardous materials site. Likewise, managing recreational resources and recreational opportunities within SRMAs and the ERMA; maintaining travel access throughout the Monticello PA; providing opportunities for woodland harvesting; protecting riparian areas, sensitive soils and watersheds; protecting wildlife and federally listed species; managing WSAs, WSRs, and ACECs to protect sensitive and valued resources; and protecting scenic quality would also not affect the ability of the Monticello FO to control or dispose of hazardous materials, or affect FO cleanup of hazardous materials spills, and hazardous waste sites.

4.3.4.1. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Under all of the alternatives and the Proposed Plan, BLM management practices for dealing with hazardous substances would protect environmental resources because the authorized uses of materials that could potentially affect human health and safety would comply with federal and state requirements to reduce or eliminate any potential impacts. State, local agency, and BLM

procedures would address accidental spills and releases as well as unauthorized uses. These procedures would minimize the risks of public exposure to and environmental impacts from hazardous materials.

The Monticello PA RFD predictions for oil and gas development indicate that the average number of wells drilled within the life of the RMP would range from 54 wells (less than 4 wells per year) under Alternative E to 75 wells (5 wells per year) under Alternative D. The surface disturbance resulting from constructing a well pad, road, and associated pipelines is estimated to be approximately 9.6 acres. Thus, the total projected surface disturbance for oil and gas drilling would range from 516 acres under Alternative E to 720 acres under Alternative D. Given the small number of predicted wells that would be drilled within the next fifteen years, the health and safety risks due to hazardous materials under all alternatives would be negligible. However, any mineral exploration and development activities would increase the risks in the PA, and impacts from spills or releases would be adverse and long-term. The following are oil- and gas-related development activities that would pose risks from hazardous materials under all the alternatives.

Pipelines

Installing pipelines and support services for them (e.g., compressor stations) would be necessary for oil and gas development. The hazardous materials associated with pipelines include diesel fuel leaks or spills from compressor stations, and benzene and hexane leaks from natural gas condensation. Leaks or ruptures in the pipelines could also pose safety and environmental risks.

The operators installing and operating oil and gas pipelines would be responsible for understanding and complying with the applicable laws and regulations governing hazardous materials. The Monticello FO would be responsible for inspecting and monitoring these operations to ensure operator compliance, which would reduce the risks of pipeline-related leaks and spills.

Power Lines

It may be necessary to install power lines for oil and gas development. The operators that install and maintain these power lines would be responsible for understanding and complying with the applicable laws and regulations to prevent the release of hazardous materials related to power lines and transformers (e.g., PCB leaks from electrical transformers).

Transportation

Mineral-development activities would increase the risks associated with transporting hazardous materials. Transportation (e.g., trucking) companies would be responsible for understanding and abiding by all applicable transportation laws and regulations, which would reduce the risks of spills or releases.

Gas Flow-Line Leakage or Ruptures

The potential would exist for natural gas flow-line leakage or ruptures during extraction and processing (see Section 3.5.2.1, Health and Safety). The U.S. Department of Transportation (DOT) data indicate that an average of one rupture annually should be expected for every 5,000 miles of pipeline, with more than 50% of ruptures resulting from heavy equipment striking the pipeline. Such ruptures could potentially cause a fire or explosion if a spark or open flame

ignited the escaping natural gas. Compliance with the applicable DOT regulations discussed in Section 3.5.2.1 would reduce these risks.

Well Fires and Explosions

Even though these risks are low, oil and gas companies typically have a procedure within their emergency contingency plan to call a service company specializing in controlling and extinguishing well fires in the unlikely event of one.

Human-Caused Fires

Well-pad fires and explosions are a potential health and safety hazard, but implementing the Utah Division of Oil, Gas, and Mining (UDOGM) measures for surface fires would reduce the risks of human-caused wildland fires resulting from unsafe well practices. Well sites would be kept free of vegetation and trash to minimize fire fuel in the vicinity, thus reducing the risks to operators from this potential hazard.

Geologic Hazards

The potential risks associated with oil and gas development include geologic hazards. These hazards include hydrogen sulfide releases and abnormally high gas pressures that could result in fires and explosions. Following is a description of these risks and the standard measures required to minimize them.

- Hydrogen Sulfide—hydrogen sulfide releases (a byproduct of drilling, extraction, and processing) would be monitored by special detectors located near drill holes. If hydrogen sulfide gas was detected, then the well operator could implement a hydrogen sulfide emergency contingency plan.
- Abnormal High Pressure—High pressures could be encountered when drilling. Blowout prevention equipment would be used to control any abnormally high pressures safely. Onshore Oil and Gas Order No. 2 established the minimum equipment necessary to drill safely under high-pressure conditions, and all wells on federal mineral leases would be required to comply with this order. Wells drilled on private and state leases would be subject to similar requirements from the UDOGM. Pressure equipment would be site-specifically prescribed during the application for permit to drill (APD) permitting process, and operators would be required to maintain the equipment. The Monticello FO and the UDOGM would conduct inspections during drilling to verify compliance with these requirements, which would reduce the health and safety risks from this geologic hazard.

Abandoned Mine Land (AML)

In conformance with the BLM's long-term strategies and national policies, the Monticello FO recognizes the need to identify and address physical safety and environmental hazards at all AML sites on public lands. To accomplish this long-term goal, criteria from the national policies would be established under all alternatives to assist in determining priorities for site mitigation and reclamation (see Table 2.1 Summary Table of Alternatives-Health and Safety, for AML program priorities). Under all alternatives and the Proposed Plan, Health and Safety management decisions would prioritize all known AML sites for remediation and closure. The prioritized sites would be remediated, based on the need to protect public health and safety and watersheds, and on funds contributed by other agencies collaborating in site remediation.

Addressing the physical safety concerns and environmental hazards of AML sites would likely have long-term beneficial impacts on health and safety by reducing the risks to the public and improving the quality of natural resources. Remediation of sites would likely improve water and soil quality, therefore improving vegetation and wildlife habitat in the areas adversely impacted by mining operations. With several agencies working collaboratively to address the safety and environmental impacts, remediation would likely have a beneficial impact on BLM management decisions because the reclaimed lands would be considered in future planning for other resource uses, including consideration as potential recreation areas.

4.3.4.2. IMPACTS FROM ALTERNATIVES AND THE PROPOSED PLAN

Due to the small number of new oil and gas wells predicted within the LOP, and the small difference in predicted drilled wells among the proposed alternatives (54 to 75 wells), the impacts across the range of alternatives would not be broad. The greater the acreage open to oil and gas development, the more oil and gas infrastructure (e.g., pipelines, power lines, transportation routes) would be necessary; therefore, it was assumed that the alternative with more predicted development would have a slightly higher risk from hazardous materials than the alternative with less. For example, the potential health and safety risks and adverse impacts would be slightly higher with Alternative C than Alternative D because more acres would be open to development and thus would likely require more oil and gas infrastructure. The types of hazardous materials possibly resulting from oil and gas development include sodium hydroxide, diesel fuel, methanol, hydrochloric acid, acetic acid, zinc and copper compounds, and propane (see Section 3.5.2.1, Health and Safety, for a list of typical hazardous materials and their uses in oil and gas development).

4.3.4.2.1. ALTERNATIVE A

Under Alternative A, approximately 1,238,230 acres (69% of the PA) would be open to oil and gas exploration and development with standard and special (timing and CSU) lease stipulations. Oil and gas development under this alternative would potentially create health and safety risks from the use, generation, storage, transportation, and/or disposal of hazardous materials used in minerals exploration and development.

4.3.4.2.2. ALTERNATIVE B

Under Alternative B, approximately 1,241,910 acres of BLM-administered lands would be open for oil and gas development with standard and special lease stipulations (70% of the PA). This represents a 1% increase in the total amount of acres available for leasing compared to Alternative A and would present a negligible increase in the potential use, generation, storage, transportation, and/or disposal of hazardous materials.

4.3.4.2.3. ALTERNATIVE C

Under Alternative C, approximately 1,348,973 acres of BLM-administered lands would be open for oil and gas development with standard and special lease stipulations (76% of the PA), a 7% increase in the total area available when compared to Alternative A. Thus, Alternative C would minimally increase the use, generation, storage, transportation, and/or disposal of hazardous materials, with a minimal increase in the potential health and safety risks of these substances when compared to Alternative A.

4.3.4.2.4. ALTERNATIVE D

Under Alternative D, approximately 1,383,283 acres of BLM-administered lands would be open for oil and gas development with standard and special lease stipulations (78% of the PA), a 9% increase in the total amount of acres available under Alternative A. Alternative D would minimally increase the use, generation, storage, transportation, and/or disposal of hazardous materials, with a minimal increase in the potential health and safety risks of these substances when compared to Alternative A.

4.3.4.2.5. ALTERNATIVE E

Under Alternative E, approximately 758,931 acres of BLM-administered lands would be open for oil and gas development with standard and special lease stipulations (43% of the PA). This represents a 26% decrease in the total amount of acres available under Alternative A. Thus, Alternative E would moderately decrease the potential risks to human health and safety from oil and gas-related use, generation, storage, transportation, and/or disposal of hazardous materials.

4.3.4.2.6. PROPOSED PLAN

Under Alternative C, approximately 1,224,807 acres of BLM-administered lands would be open for oil and gas development with standard and special lease stipulations (69% of the PA), the same amount of total area available when compared to Alternative A. The impacts would be similar to Alternative A because of the relative sizes of the areas.

4.3.4.3. SUMMARY OF IMPACTS

Mineral management decisions would increase the risk of impacts due to hazardous materials. Due to the small amount of predicted wells during the next fifteen years, however, the difference in impacts among Alternatives A, B, C, D and the Proposed Plan would be negligible. Alternative E would moderately reduce risks to health and safety because the area available for mineral leasing under standard and special leasing regulations would be substantially less.

4.3.4.4. MITIGATION MEASURES

Using signs to identify the location of underground pipelines would help reduce the potential for pipeline ruptures by heavy equipment. No additional mitigation would be required to reduce impacts from hazardous materials because it is assumed that users and producers would comply with existing federal and state laws and regulations pertaining to the use, generation, storage, transportation, and disposal of hazardous materials. Compliance with existing regulations would reduce the health and safety risks to a minor or low level.

4.3.4.5. UNAVOIDABLE ADVERSE IMPACTS

The risks from hazardous materials would increase during mineral exploration and development, causing potentially unavoidable adverse impacts including the possible release of hydrogen sulfide (a byproduct of drilling, extracting, and processing), abnormally high pressure during drilling, seismic activity, gas flow-line leakage or rupture, well fires, and explosions. Risks and impacts would increase due to the disruption of mineral operations if these events occurred and the subsequent release of hazardous materials into the environment. It should be noted that the natural release of hydrogen sulfide is not covered under the Comprehensive Environmental

Response Compensation and Liability Act (CERCLA), but it could be a potential hazard according to the Occupational Safety and Health Administration (OSHA). All gases resulting from oil and gas exploration and production streams are CERCLA exempt (EPA 2002).

4.3.4.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Short-term mineral development or other resource use in the PA would not result in impacts to long-term productivity or ability to control and manage hazardous materials.

4.3.4.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

There are no irreversible or irretrievable impacts to the control or management of hazardous materials stemming from any of the alternatives.

4.3.5. LANDS AND REALTY

Lands and Realty is a resource use rather than an environmental component. Consequently impacts to lands and realty are determined by the emphasis of other resource programs. The discussion of the effects on lands and realty in each alternative will be limited to the effects on permitted or authorized uses and land tenure adjustments (LTAs).

Impacts to the lands and realty program stem from those resource decisions that limit or hinder permitting rights-of-way (ROWs) or other land-use authorizations, or affect the BLM's ability to acquire and dispose of land or make other LTAs. Restrictions to protect wildlife, vegetation, recreation, riparian areas, soils/watersheds, visual resources, special status species, and cultural resources programs can collectively impact the lands and realty program by limiting surface-disturbing activities and allowable land-use authorizations. As such, potential impacts from these program decisions will be analyzed in this chapter.

ROWs are issued for the placement of roads, power lines, pipelines, communications sites, and wind and solar energy sites on public lands. Within the Monticello PA, such decisions primarily result from minerals (access routes, pipelines, etc), special designations (WSAs are exclusion areas for ROWs), wilderness characteristics (could be exclusion areas for ROWs), and lands and realty itself (corridors for energy and access, filming authorizations).

The specific program management decisions regarding the following resources and resource uses would have no discernible impacts (short-term and/or long-term, as well as direct and/or indirect) on lands and realty regardless of the alternative chosen: air quality; fire management; hazardous materials management; livestock grazing; paleontological resources; and woodlands. Given the negligible impact of these resource program decisions on lands and realty, they will not be analyzed further in this chapter.

4.3.5.1. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Right-of-way (ROW) avoidance and exclusion areas would be consistent with the stipulations identified in Appendix A for oil and gas leasing and other surface-disturbing activities. NSO areas are avoidance areas for ROWs; no ROW would be granted in NSO areas unless there are no feasible alternatives. Closed areas would be exclusion areas for ROWs; no ROW would be granted in these areas.

The impacts of these exclusion/avoidance areas include restricting the placement of ROWs and facilities, limiting future access, delaying or increasing the cost of energy supplies, and creating communications dead zones or delaying the availability of communications services. Limitations on the placement of ROWs could also result in ROWs being located in less desirable or less economically feasible locations. All of these would add to the costs of constructing and time to process ROWs.

Lands and realty program decisions would manage actions proposed for public lands in accordance with standard BLM land policies as related to Recreation and Public Purposes Act leases and other LTAs. ROWs and LTAs would continue to be granted under all of the management alternatives. The granting of ROWs would accommodate the desired placement of facilities, enhance access to facilities and all lands within the Monticello PA, and promote efficient energy supply/transmission and communications. Granting ROWs would also help to

minimize the cost of energy and communications developments for the reasons discussed above, and promote trails and recreational use from the additional opportunities created along ROW access routes.

LTAs (disposals, access, easements, transportation and utility corridors, withdrawals, acquisitions) would help to facilitate access within the Monticello PA and adjoining properties, improve the BLM's management ability, reduce conflicts with adjoining landowners and surrounding communities, and accommodate surrounding communities' needs. The Monticello FO would work cooperatively with the State of Utah and with private landowners to identify opportunities for LTAs using the criteria established for disposal and acquisition of lands. LTAs would facilitate BLM efforts to meet management goals and objectives, as set forth in this PRMP/FEIS.

Under the Proposed Plan and all alternatives, filming permits would be issued within the Monticello PA on a case-by-case basis. The application of minimum-impact filming criteria (Appendix P) would streamline the permit application process by providing stipulations for mitigating filming impacts, and encourage the filming industry to use previously approved locations that meet the minimal impact criteria.

Impacts common to the Proposed Plan and all alternatives would occur due to VRM class designation decisions, cultural resource management decisions, and special status species management decisions. All ROW grants would comply with restrictions for cultural resources and special status species and the presence of protected resources. The impact could increase the cost and time required for processing of applications, and could delay or alter the route of proposed ROWs.

4.3.5.2. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ACTION ALTERNATIVES

Several lands and realty decisions would have impacts common to the Proposed Plan and all of the action alternatives, (all alternatives other than Alternative A—No Action).

A West Wide Energy Corridor (WWEC) EIS for Utility Corridors in 11 Western states, including Utah, is being developed by the Washington Office of the BLM in accordance with the Energy Policy Act of 2005. Under the Proposed Plan and all action alternatives, these corridors and all existing utility corridors would be available for utility and other types of ROWs, which could help to minimize the cost of energy and communications developments and encourage development of energy resources.

Under the Proposed Plan and all action alternatives, wind and solar energy development would be permissible within the Monticello PA. Authorizations for wind and energy uses would incorporate the best management practices contained in the Final Wind Energy Programmatic EIS (BLM 2005f: 2-10 to 2-24) and would be stipulated in ROW grants. Implementation of these measures would provide for the use of Monticello PA lands for alternative energy and communications uses, but utilizing BMPs could add to the cost to site and construct facilities.

Under the Proposed Plan and all action alternatives, a total of 6,581 acres of land has been identified for disposal (see Appendix C). These lands meet the BLM requirements for disposal and are consistent with the LTA policies of the agency.

4.3.5.3. ALTERNATIVES IMPACTS

A summary of the acreages for avoidance, exclusion, withdrawal, and restrictions are listed in Table 4.48, and the impacts are discussed below. Generally, the impacts to lands and realty under each alternative are similar, but vary in the sizes of the affected areas within the Monticello PA.

Table 4.48. Acreage of Avoidance, Exclusion, and Recommended for Withdrawal from Mineral Entry (acres)

Restriction	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Lands Excluded from new ROWs	120,800	416,612	395,329	386,853	974,463	416,115
Avoidance Areas for ROWs	253,790	125,105	39,323	14,175	53,915	133,293
Lands Available for ROWs with Standard Terms and Conditions	578,604	365,170	629,472	962,283	213,290	484,217
Lands Available for ROWs with CSU/CST/TL	659,626	876,739	719,501	421,000	545,641	740,594
Lands Recommended for Withdrawal from Mineral Entry**	132,380	251,710	121,912	46,131	834,070	50,665
Lands Available for Disposal	5,911*	6,581	6,581	6,581	6,581	6,581

*Published acreage from 1991 RMP (BLM 1991a).

** See Maps 5–9

4.3.5.3.1. ALTERNATIVE A

A total of 120,800 acres would be exclusion areas for new ROWs. An additional 253,790 acres are avoidance areas for new ROWs. Exclusion and avoidance areas impact lands and realty by restricting the placement of ROWs and facilities, limiting future access, delaying or increasing the cost of energy supplies, and creating communications dead zones or delaying the availability of communications services. Limitations on the placement of ROWs could also result in ROWs being located in less desirable or less economically feasible locations and would add to the costs and time to process ROWs. As the number of acres of land that are exclusion areas increase, the likelihood for adverse impacts would increase because of the increasing limitations on ROW placement. Alternative A has the smallest amount of exclusion areas (though not the smallest avoidance areas), and results in the fewest limitations on the placement of future ROWs.

Other resource management decisions could also affect or limit the placement of ROWs and facilities on BLM lands due to minerals-related timing or controlled surface use leasing limitations on surface-disturbing activities. The size and duration of impacted areas, and limitations on surface-disturbing activities would also likely occur because of riparian, soils and watershed, visual resources, special status species, and wildlife management decisions. Limitations on surface-disturbing activities from these resource management decisions would preclude or hinder the placement of new ROWs, with potential increases in ROW construction costs, by limiting access to some areas of the Monticello PA or delaying the completion of

ROWs (in the case of seasonal limitations). Alternative A proposes to manage 659,626 acres with timing and controlled surface use leasing stipulations and 578,604 acres with standard stipulations.

Minerals and energy development decisions would impact the BLM's workload (and time spent) processing ROW grants (primarily roads and pipelines). A total of 73 wells are projected to be developed under Alternative A. Under Alternative A, approximately 132,380 acres (or 7% of the PA) would be recommended for withdrawal from mineral entry (Map 5). This decision would potentially provide fewer opportunities for mineral resource development on this acreage and less production and supply of mineral resources; however, Alternative A proposes the least restrictions on surface-disturbing activities, and thus would have the least impact on the construction of future ROWs.

4.3.5.3.2. PROPOSED PLAN AND ALTERNATIVES B THROUGH E

The specific acreage affected under these alternatives is shown above in Table 4.48. Alternative E and the Proposed Plan have the greatest acreages of proposed exclusion/avoidance areas, followed by Alternatives B, C and D. Alternative A proposes the least amount of exclusion and avoidance areas, and thus would have less impact on the construction of future ROWs as compared to the Proposed Plan and all the action alternatives.

Minerals-related timing or controlled surface use leasing limitations on surface-disturbing activities would be greatest under Alternatives B and C and the Proposed Plan, which would have limitations on 9% (Alternative B), 12% (Proposed Plan) and 33% (Alternative B) more acreages as compared to Alternative A. Alternative D and E would have 36% and 17% less acres timing or controlled surface use leasing limitations as compared to Alternative A.

The ROW development associated with well development under Alternative A is similar to that projected for the Proposed Plan and Alternatives C and D, with 72, 74 and 75 wells, respectively. However, the ROW development associated with the 73 wells in Alternative A is 11% greater than the development associated with the 66 wells predicted under Alternative B, and 35% greater than the development associated with the 54 wells predicted under Alternative E.

Under Alternative D and the Proposed Plan, approximately 60% fewer lands would be recommended for withdrawal from mineral entry than under Alternative A. This decision would potentially provide more opportunities for mineral resource development on this acreage and less production and supply of mineral resources as compared to Alternative A. Alternative C would recommend approximately 8% fewer lands, resulting in opportunities similar to Alternative A. Alternative B and E proposed 41% more acres be recommended for withdrawal. This decision would potentially provide fewer opportunities for mineral resource development as compared to Alternative A.

4.3.5.4. MITIGATION MEASURES

No mitigation measures are proposed under any of the alternatives.

4.3.5.5. UNAVOIDABLE ADVERSE IMPACTS

There would be no unavoidable adverse impacts.

4.3.5.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

There would be no loss of long-term productivity from short-term uses.

4.3.5.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

The Proposed Plan and all alternatives permit LTAs that may result in the permanent loss of lands from public ownership if they enter state or private land ownership.

There are no irreversible or irretrievable impacts to Lands or Realty for the Proposed Plan or any alternative.

4.3.6. LIVESTOCK GRAZING

Impacts on livestock grazing activities are generally the result of activities that affect forage levels (and are quantified as animal unit months [AUMs]). Management decisions that are likely to have the greatest beneficial impacts on livestock grazing would include vegetation treatments and fire treatments that could increase vegetation productivity and forage (AUMs) available for livestock in the long-term from improvements in vegetation communities. Management decisions that allow and activities that produce surface disturbance and reduce vegetation productivity (e.g., minerals exploration and development, right of way (ROW) construction, recreational area development, cross-country motorized off-highway vehicle [OHV] travel) or resource decisions and activities that limit surface disturbances (e.g., special designation areas, non-WSA lands with wilderness characteristics, soil and water resources, and visual resources) would also impact livestock grazing by affecting forage levels. The analyses of these impacts on livestock grazing are based on the follow assumptions:

- Livestock grazing occurs throughout the Monticello PA, and the acreages used in this analysis represent the grazing allotments on BLM-administered lands.
- Livestock grazing is and would continue to be managed in accordance with the Standards for Rangeland Health and Guidelines for Grazing Management for BLM Lands in Utah (see Appendix D). If a grazing allotment fails to meet rangeland standards, and where it is determined that livestock grazing management practices would be a substantial factor in this failure, grazing practices would be modified so that progress could be made toward achieving the standard(s). Such modifications could include a change in stocking rate, the kind of livestock, the season of use and/or length of season, or a combination of these. Livestock grazing management modifications could also include making allotments or portions of allotments temporarily unavailable to livestock grazing in order to repair or rehabilitate areas not meeting rangeland health standards. These repair and/or rehabilitation modifications could result in a short-term or long-term loss of livestock grazing acreages and AUMs available for livestock grazing.
- Changes to livestock grazing preferences found necessary through adaptive management and monitoring and inventories acceptable to the BLM Authorized Officer would be made on an allotment-specific determination during the implementation phase of the RMP. The only changes in grazing preference considered in this analysis would be the management decisions whereby grazing allotments or portions of allotments would be proposed as unavailable for livestock grazing as part of the alternative.
- Data collected from rangeland monitoring studies would be used to assist the BLM Field Manager in determining to what extent changes to livestock grazing would be needed to maintain or restore rangeland health, meet resource objectives, and assure that livestock use levels are sustainable. When required, temporary suspension of livestock use would be implemented to restore an area so that it could continue to sustainably support livestock grazing and other uses.
- Under all alternatives and the Proposed Plan, specified allotments would undergo season-of-use changes to facilitate grazing management while maintaining rangeland health standards. Changes in season-of-use do not necessarily affect available acreage or forage in AUMs. The season-of-use changes, common to all action alternatives as well as the Proposed Plan, are shown in Table 4.49 below.

Table 4.49. Season-of-Use Changes, under All Action Alternatives and the Proposed Plan

Allotment	1991 RMP Season-of-Use	2006 RMP Proposed Season-of-Use	Season-of-Use Change
Church Rock	12/1 to 3/31	12/1 to 5/31	Increased spring use 61 days
Indian Rock	11/15 to 3/31	11/15 to 4/15	Increased spring use 15 days
Owens Dugout	11/25 to 3/31	11/25 to 4/30	Increased spring use 30 days
Laws	9/1 to 3/31	4/16 to 11/15	Decreased fall and winter use 136 days, increased spring and summer use 138 days
Bear Trap	7/15 to 11/30	09/01 to 12/02	Decreased summer and fall use 139 days, increased winter use 103 days
Monument Canyon	12/5 to 5/31	12/1 to 5/31	Increased winter use 5 days

New allotments have been established since the approval of the 1991 RMP. These allotments were split from existing allotments so there was no change in acres available for grazing or AUMs. The new areas and their seasons-of-use are shown in Table 4.50.

Table 4.50. New Allotments Created Since the 1991 RMP, Existent under All Alternatives and the Proposed Plan

Allotment	2006 RMP Proposed Season-of-Use	AUMs	Acreage
South Vega	1/6 to 2/28	6	455
Upper Mail Station	11/14 to 2/28	106	1821
Big Westwater	10/15 to 12/15, or 4/1 to 5/31	50	480

While changes in these seasons-of-use are proposed in this PRMP/FEIS, they may be modified at a later date along with the seasons-of-use on other allotments as part of general allotment administration at the activity-based decision level. Compliance with existing laws and regulations and appropriate analysis would be conducted prior to any season-of-use change, and an amendment to the forthcoming revised RMP would not be required.

There are 74 grazing allotments in the Monticello PA. These grazing allotments encompass approximately 1,761,351 acres of BLM-administered land, and approximately 78,796 AUMs (active preference) of forage are administered by the Monticello FO. The main quantitative units for comparison between alternatives as well as the Proposed Plan are acres and AUMs available (gained or lost) to livestock grazing use. Length of grazing season will also be used when comparing grazing impacts between alternatives and the Proposed Plan.

In order to calculate a loss or gain in AUMs for any area unavailable or available to livestock grazing under this PRMP/FEIS, the acreage of the area is divided by the area of the grazing allotment(s) within which it occurs. This percentage is used to calculate the number of AUMs of forage likely to occur within the area of consideration. The exception to this method would be

for situations in which an entire allotment or part of an allotment allocated to a permittee separately from the other permittee(s) in the remainder of the allotment is to be unavailable to grazing. In this case, the entire grazing preference of the permittee is affected and that figure is used. It is assumed that the calculated number of AUMs in an allotment as shown in the Monticello FO Analysis of Management Situation (AMS) (BLM 2005c) correctly represents the amount of forage available.

4.3.6.1. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Management decisions common to the Proposed Plan and all alternatives that would affect the livestock grazing resource by directly decreasing or increasing acres and AUMs available to livestock, are as follows:

Under the Fire Management Plan (FMP), wildland fires could be allowed to burn unless they threaten Wildland-Urban Interface (WUI) areas, threatened, endangered, or special status species, high priority sub-basins or watersheds, cultural resources and/or cultural landscapes, or sensitive ecosystems. If wildland fire occurs on rangeland, it may result in a short-term loss of acres and AUMs available to livestock because of 1) vegetation loss, and 2) because of the BLM grazing guidelines that require burned areas that are re-seeded to be rested from livestock use for at least two growing seasons after a fire. Burned areas that are not re-seeded require a minimum rest period of one growing season (BLM 1997, and BLM 1999a). These rest periods from livestock grazing may need to be adjusted on a site-specific basis to ensure the establishment of sufficient vegetation post fire to promote soil stability and long-term plant productivity and sustainability.

Under all alternatives and the Proposed Plan, livestock grazing decisions currently do and would continue to make designated areas unavailable for grazing, including (see Table 4.51): Bridger Jack Mesa, the Grand Gulch area of Cedar Mesa, Dark Canyon (partially unavailable), Lavender Mesa, five identified mesa tops (in the White Canyon area), Pearson Canyon, Rogers Exclusion, and developed recreation sites. Note that Lavender Mesa, 5 identified mesa tops, and Bridger Jack Mesa are physically inaccessible to livestock, so the impacts to livestock grazing would be negligible. Unavailability of the Grand Gulch and Dark Canyon would have long-term, adverse impacts on livestock grazing because these areas and their potential AUMs are currently unavailable for livestock grazing and would continue to be unavailable.

For all alternatives as well as for the Proposed Plan, health and safety decisions to reduce the risks of hazardous materials spills and improve public safety around abandoned mine land (AML) sites would have negligible impacts on livestock grazing in the short term because livestock grazing acreages and AUMs would not change. In the long term, the reclamation of AML sites could potentially expand livestock grazing acreage and increase AUMs.

Table 4.51. Areas to Remain Unavailable for Grazing, Under the Proposed Plan and All Alternatives

Areas Unavailable for Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing¹	Justification
Bridger Jack Mesa	Indian Creek	6,260	Difficult access to livestock, no water, sparse vegetation, protect relict vegetation.
Dark Canyon areas (includes 962 acres in Fable Valley that is limited to trailing/emergency use)	Indian Creek, White Canyon	38,050	Protect scenic quality and wildlife habitat, and maintain primitive recreational opportunities.
Five mesa tops	Lake Canyon, White Canyon	33,576	No water, sparse vegetation, protect wildlife habitat.
Grand Gulch	Lake Canyon, Slickhorn	15,658	Protect cultural resources and maintain primitive recreation opportunities.
Lavender Mesa	Indian Creek	649	Inaccessible to livestock, no water, sparse vegetation, protect relict vegetation.
Pearson Canyon Hiking Trail	Little Boulder	1,118	Maintain recreational opportunities.
Comb Wash (Arch, Fish & Owl, Mule, Road)		16,599	Protect cultural resources and maintain primitive recreational opportunities.
Developed Recreation Sites		467	Protect recreational values.
Wildlife Habitat (East Canyon)		8,204	Allocated to wildlife habitat.
Wildlife Habitat (Peter's Canyon)		7,516	Allocated to wildlife habitat.
Total Unavailable Acres		128,098	

¹ Acreages for particular areas may vary slightly due to the differences in shapefiles for GIS calculations.

Proposed land disposals (6,581 acres), exchanges, and sales under lands and realty for all of the alternatives and the Proposed Plan could potentially reduce acres and AUMs available for livestock grazing in the long-term. Land acquisitions would potentially increase livestock grazing acreages and AUMs. Construction of energy or communication sites, or ROWs could result in a short-term loss of acres and AUMs during construction and a permanent loss if the structure or ROW prohibits grazing indefinitely in the area.

Surface-disturbing activities due to minerals exploration and development would result in both short-term losses of AUMs and total acres accessible for livestock grazing during exploration drilling and geophysical exploration, until the disturbed areas are reclaimed. There would be long-term losses of AUMs and livestock grazing acreage from surface disturbances if wells were drilled and developed for production of oil and gas (this would include losses of AUMs and acreage from related infrastructure and pipelines construction) for the production life of the well, and from the extraction of locatable and salable minerals. The potential long-term loss of livestock grazing acreage from oil and gas development is predicted to range from 721 acres maximum (Alternative D) to 519 acres minimum (Alternative E). Disturbance from any type of construction could indirectly and adversely affect livestock by increasing the numbers of exotic, invasive and/or noxious weed species, many of which are toxic to livestock (Young et al. 1999) or unpalatable and could result in a loss of grazable acres or AUMs. The noise, dust, and human presence associated with certain construction activities (e.g., minerals access road construction, well drilling, and pipeline construction/maintenance) could decrease the acreages or AUMs in the short-term.

Grazing would be unavailable on existing developed recreation sites (presently encompassing approximately 467 acres) or future developed recreation sites, with permanent losses of livestock grazing acreage and AUMs within the new site developments.

Since improper livestock grazing can have adverse impacts on riparian ecosystems (Armour et al. 1991), it may be necessary to modify grazing practices when it is determined that a riparian area is identified as "Functioning at Risk" (see Table 3.24) and livestock have been determined to be a causal factor in this condition. Restrictions could be imposed under all alternatives and the Proposed Plan (in compliance with BLM Riparian Policy) within the 28,997 acres of riparian areas, causing a short-term loss of acres and AUMs available to livestock through seasonal restrictions, forage utilization limits, or making affected riparian areas unavailable for livestock grazing.

Generally, highly dispersed livestock grazing has minor impact on soils, but modified management practices may be necessary where soils are found to be sensitive to disturbances by livestock. This could result in a decrease in acres and AUMs available to livestock.

Existing vegetation treatments would be maintained through retreatment of sites, and new treatments would be implemented as needed to meet management objectives. Vegetation treatments would reduce livestock grazing acreages and AUMs in the short-term, but could increase the AUMs available in the long term for livestock from potentially increased vegetation productivity after the site has been rehabilitated.

In general, where livestock grazing could potentially impact the habitats of special status species and species that are listed, or proposed for listing, or candidates for listing under the Endangered Species Act (ESA), changes would be made to grazing management practices to protect species and their habitat. This could decrease AUMs and acreages available to livestock and/or increase management requirements under the terms and conditions of the permit.

Any area available for grazing because of other resource management activities that had previously been unavailable could increase the number of acres and AUMs available to livestock if conditions allow.

If an allotment occurs in bighorn sheep habitat, it would not be possible to change the animal permitted in that allotment from cattle to sheep. Domestic sheep can transmit diseases such as pneumonia to native bighorn sheep, which is thought to have caused high numbers of bighorn sheep fatalities (Foreyt and Jessup 1982, Jessup 1985). Forage and water competition by livestock also creates stress to bighorn sheep, and all such interactions would be avoided (Desert Bighorn Council 1990).

A portion of the Comb Wash Allotment (those areas closed by court order and encompassing approximately 16,599 acres and 337 AUMs within Mule Canyon below U-95, and Arch, Fish, Owl, and Road Canyons) would be unavailable to livestock grazing under all alternatives as well as under the Proposed Plan. This would result in a long-term, adverse impact from loss of forage for livestock grazing. The impact would be minor because the unavailable acreages total less than 0.01% of the available livestock acreage within the Monticello PA.

Special designation decisions for all alternatives and the Proposed Plan would make acreages within Bridger Jack Mesa (6,260 acres), Dark Canyon areas (38,050 acres), and Lavender Mesa (649 acres) unavailable for livestock grazing in order to protect scenic quality, natural values, and relict vegetation. The impacts to livestock grazing would be negligible within Bridger Jack and Lavender Mesas because, as mentioned above, these areas are physically inaccessible nearly so in the case of Bridger Jack Mesa to livestock. Managing portions of Dark Canyon as unavailable to livestock grazing would have minor, adverse impacts due to limits on livestock-related water development construction and maintenance, and limits on livestock grazing fencing installation, because much of the area lies within a WSA.

Wildlife and fisheries decisions under all alternatives and the Proposed Plan would manage the five mesa tops as unavailable to livestock grazing in order to protect bighorn sheep habitat. This would have negligible impacts on livestock grazing because available forage is sparse, and no water is available.

For all alternatives and the Proposed Plan, a total of 1,633,253 acres and 78,459 AUMs would be unavailable to livestock grazing within the Monticello Field Office.

4.3.6.2. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ACTION ALTERNATIVES

Under all action alternatives and the Proposed Plan, cultural resources decisions in special designation areas would prescribe special conditions to protect at-risk resources from possible damage due to livestock grazing. This could result in fewer acres or AUMs available in the long-term for livestock if it is determined that site closures are necessary in order to protect cultural resources. The impacts would be minor because livestock grazing limitations and/or unavailability would be site-specific within the approximately 62,567 acres encompassing the Comb Ridge Recreation Management Zone, Beef Basin SRMA, Tank Bench SRMA, and McLoyd Canyon-Moon House Recreation Management Zone.

Recreation decisions for all action alternatives and the Proposed Plan would potentially restrict livestock grazing, with a potential loss of acres and AUMs, if it is determined that livestock pose a risk of damaging cultural/recreation resources (e.g., petroglyph or pictograph panels, and interpretive sites).

Recreation-related travel decisions under the Proposed Plan and all of the action alternatives would limit motorized OHV use by reducing the current level of open, cross-country use from

611,310 acres to 0 acres open under Alternatives B and E, 2,311 acres under Alternative C and D, and 0 acres under the Proposed Plan. This would have 1) long-term, direct, beneficial impacts on livestock grazing from reduced noise and human-activity-related disturbances to livestock, and 2) indirect, beneficial impacts on livestock grazing from potential improvements in forage productivity through reduced surface disturbance impacts to vegetation.

4.3.6.3. PROPOSED PLAN AND ALTERNATIVES IMPACTS

Under the Proposed Plan and all alternatives, there would be negligible impacts to livestock grazing from decisions on air quality, paleontology, non-WSA lands with wilderness characteristics, WSAs and WSRs, visual resources, and woodlands, so these resources will not be discussed and analyzed further. The impacts would be negligible because meeting National Ambient Air Quality Standards (NAAQS) and Prevention of Significant Deterioration (PSD) program air quality standards, allowing scientific study and recreational collection of fossils, protecting wilderness values within WSAs and non-WSA lands with wilderness characteristics, maintaining ORVs along eligible WSR segments, protecting scenic quality, and maintaining sustainable woodland resources for harvesting would not change the size of grazing allotments, improve or degrade forage productivity or utilization levels, or change AUMs for livestock grazing.

4.3.6.3.1. ALTERNATIVE A

4.3.6.3.1.1. Impacts of Cultural Resource Decisions on Livestock Grazing Under Alternative A

Under this alternative, cultural resource management decisions for the Comb Ridge, Beef Basin, and Tank Bench areas would not restrict or impact current livestock grazing activities. Within the Grand Gulch Special Emphasis Area, livestock grazing would be available except for approximately 15,659 acres in Grand Gulch and its tributaries. However, as discussed above under Impacts Common to the Proposed Plan and All Alternatives, the Grand Gulch Special Emphasis Area is and would remain closed to grazing, with minor impacts to grazing from the relatively small area unavailable for grazing, in order to protect cultural resources.

4.3.6.3.1.2. Impacts of Livestock Grazing Decisions on Livestock Grazing Under Alternative A

Impacts would be the same as those discussed under Impacts Common to the Proposed Plan and All Alternatives. Actions under this alternative would require the closure of 128,098 acres of land from livestock grazing, which would remove 337 AUMs of forage from access. Approximately 1,633,253 acres and 78,459 AUMs would remain accessible to livestock for grazing under this alternative.

4.3.6.3.1.3. Impacts of Mineral Decisions on Livestock Grazing Under Alternative A

The predicted RFD surface disturbance due to oil and gas development that would occur under this alternative would be approximately 699 total acres, which would have minor, long-term impacts on livestock grazing from loss of acreages and AUMs through surface disturbances, and wellpad and access road construction. The impacts would be negligible to minor because the size

of the affected area would be relatively small (0.04% of available livestock grazing acreage within the PA).

4.3.6.3.1.4. Impacts of Recreation Decisions on Livestock Grazing Under Alternative A

As discussed under Impacts Common to the Proposed Plan and All Alternatives, Pearson Canyon and all developed recreation sites would be unavailable to livestock grazing. The impacts of these management decisions would have negligible to minor impacts on livestock grazing as Pearson Canyon (1,118 acres) and existing recreational facilities (totaling approximately 467 acres) comprise a relatively small area (approximately 0.08% of the total area available for livestock grazing within the Monticello PA). Under this alternative, livestock grazing would be allowed within the San Juan SRMA and the Cedar Mesa C-SRMA, with beneficial impacts to livestock from maintained grazing acreages and AUMs.

4.3.6.3.1.5. Impacts of Riparian Decisions on Livestock Grazing Under Alternative A

There are no specific management decisions under this alternative that would impact riparian resources. However, as discussed under Impacts Common to the Proposed Plan and All Alternatives, there would be potentially short term and long-term impacts to livestock grazing from acres made unavailable to livestock to protect Functioning At Risk riparian resources.

4.3.6.3.1.6. Impacts of Special Designation Decisions on Livestock Grazing Under Alternative A

As discussed under Impacts Common to the Proposed Plan and All Alternatives, livestock grazing would be unavailable in the Bridger Jack ACEC (6,260 acres), canyon bottoms of Dark Canyon ACEC (38,050 acres), and Lavender Mesa ACEC (649 acres), with impacts to livestock grazing as discussed in that subsection. The impacts from management of WSAs and WSRs would be minor because, while no areas are unavailable to livestock grazing, limits on surface disturbances could limit improvements in livestock-water structures, and fencing.

4.3.6.3.1.7. Impacts of Special Status Species Decisions on Livestock Grazing Under Alternative A

Under Alternative A, there are no special status species decisions that restrict or make livestock grazing acreages unavailable. Thus, the impacts to livestock grazing from special status species decisions would be negligible.

4.3.6.3.1.8. Impacts of Travel Decisions on Livestock Grazing Under Alternative A

The continuation of current travel decisions would have long-term impacts on livestock grazing from motorized OHV use on 611,310 acres designated as open to cross-country use. The adverse impacts would result from 1) engine noise-related, and human activity and presence-related disturbances to livestock, and 2) surface disturbances to forage productivity.

4.3.6.3.1.9. Impact of Vegetation Decisions on Livestock Grazing Under Alternative A

Under Alternative A, existing vegetation treatments would be maintained and new treatments applied on 232,130 acres that could adversely impact livestock grazing in the short term and/or long term, depending on the type of treatment (BLM 1991b): mechanical treatments could remove shrub and woodland shelter need by livestock for cover, prescribed burning could potentially create conditions for the establishment or spread of toxic, invasive plant species that lack forage value. However, maintaining existing vegetation treatment areas and applying new treatments would also have long-term, beneficial indirect impacts on livestock from potentially improved forage conditions. Protection of relict vegetation within the Lavender Mesa and Bridger Jack Mesa ACECs would have negligible impacts on livestock grazing, as discussed above under Special Designation, because the mesas are and would remain inaccessible to livestock.

4.3.6.3.1.10. Impacts of Wildlife and Fisheries Decisions on Livestock Grazing Under Alternative A

There are no specific management decisions that would impact livestock grazing, except for the five mesa tops discussed above under Impacts Common to the Proposed Plan and All Alternatives.

4.3.6.3.2. ALTERNATIVE B

4.3.6.3.2.1. Impacts of Cultural Management Decisions on Livestock Grazing Under Alternative B

Cedar Mesa (including Comb Ridge Management Zone [MZ], Grand Gulch National Historic District [NHD], and the McLoyd Canyon Moon House MZ), Tank Bench, and Beef Basin Special Recreational Management Areas (SRMAs) would be open to grazing under this alternative, but with stipulations to restrict livestock access if cultural resources become impacted. Compared to Alternative A, the impacts would be the same (negligible) because these areas would remain available for livestock grazing.

4.3.6.3.2.2. Impacts of Livestock Grazing Decisions on Livestock Grazing Under Alternative B

The following areas (shown in Table 4.52 below) would be unavailable for grazing (with a reduction in available AUMs) under this alternative, in addition to those listed for the Proposed Plan and all alternatives in Table 4.51 above. Compared to Alternative A, the reduction in acreages and AUMs would have long-term, adverse impacts on livestock grazing because grazing opportunities would be lost for the foreseeable future.

Table 4.52. Acres and AUMs of Forage Unavailable under Alternative B in Addition to Those Listed under Alternative A (No Action)¹

Area Unavailable for Livestock Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing ¹	Forage Lost (AUMs)	Justification
Dodge Canyon	Dodge Canyon	1,598	110	Sparse livestock forage, protect wildlife habitat.
Horsehead Canyon	Montezuma Canyon	571	38	Lack of livestock water, protect wildlife and riparian habitat.
Portions of Butler Wash Canyons	Perkins Brothers, Tank Bench/ Brushy Basin, White Mesa	208	20	Protect cultural resources.
Slickhorn Canyon	Perkins Brothers	2,600	210	Maintain primitive recreational opportunities, confined canyon has limited forage availability, protect cultural resources.
Rone Bailey Mesa	Upper Mail Station	1,162	68	Limited accessibility, lack of livestock water, sparse livestock forage.
Mule Canyon (including North and South Forks north of U-95)	Comb Wash, Texas-Muley	1,328	157	Maintain primitive recreation opportunities, protect cultural resources.
Rogers	Rogers	40	No active preference allotted	Sparse livestock forage, small isolated parcel difficult to manage.
Subtotal		7507		
Limited to Livestock Trailing Only	Lake Canyon, Harts Draw, Indian Creek	5,555		Confined canyons have limited forage availability, balance potential conflicts with other resources or uses (wildlife habitat, primitive recreation, vegetation, cultural, etc), maintain riparian habitat.
Total		13,062	603	

¹Acreages are for BLM-administered land only. Acres for particular areas may vary slightly due to differences in shapefiles used in GIS acre calculations.

These restrictions would allow a total of 1,620,191 acres and 77,856 AUMs available for livestock grazing under this alternative. This would be a 0.8% reduction in livestock grazing acres (and 0.8% fewer AUMs) when compared to Alternative A.

4.3.6.3.2.3. Impacts of Mineral Decisions on Livestock Grazing Under Alternative B

Under Alternative B, it is predicted that 636 acres of land would be disturbed due to oil and gas development. This is 63 fewer acres than Alternative A, and compared to Alternative A this alternative would have fewer adverse impacts on livestock grazing from the potential reduction in AUMs due to minerals exploration and development.

4.3.6.3.2.4. Impacts of Recreation Management Decisions on Livestock Grazing Under Alternative B

Grazing would be allowed within special recreation management areas (SRMAs), with a timing restriction in the riparian areas within the San Juan River SRMA (affecting the Perkins Brothers, East League, and McCracken Wash Allotments) that confines the grazing season to the period of October 1 through May 31. There would be no change in the season of use as the current seasons of use fall within the prescribed period. Under this alternative, although grazing would be allowed in the Cedar Mesa Cultural SRMA, at-risk cultural resources would be protected against possible damage due to grazing. Thus, grazing areas could potentially become unavailable, resulting in a loss of acres and AUMs, if it is determined that livestock pose a risk of damaging cultural resources. As discussed above, this management prescription would be the same discussed under impacts common to all action alternatives, with negligible impacts on livestock grazing activities and opportunities because of the likelihood that a relatively small area would become unavailable to livestock grazing. The impacts of recreation-related OHV travel decisions would be the same as discussed under Impacts Common to All Action Alternatives. Compared to Alternative A, recreation management decisions under Alternative B would have the same impacts.

4.3.6.3.2.5. Impacts of Riparian Management Decisions on Livestock Grazing Under Alternative B

This alternative would restrict grazing access in the following riparian areas, and would allow trailing only: Moki Canyon, Lake Canyon, Harts Canyon, and Indian Creek from Kelley Ranch vicinity to Forest Service. These decisions would restrict livestock grazing and have long-term, adverse, but minor, impacts on opportunities for livestock grazing in these riparian areas. Compared to Alternative A, the riparian decisions under Alternative B would have the same impacts because the degree of impacts to livestock grazing would be the same.

4.3.6.3.2.6. Impacts of Special Designation Management Decisions on Livestock Grazing Under Alternative B

The proposed Shay Canyon ACEC is the only special designation area that would change its status from open to limited to livestock trailing only under this alternative. The ACEC would be reduced in size, its acreage decreasing from 1,770 acres under Alternative A to 119 acres under Alternative B. So, there would be a loss of grazing acreage under this alternative. Compared to Alternative A, special designation decisions under this alternative would have the same (negligible) impacts on livestock grazing because the affected area is relatively small.

4.3.6.3.2.7. Impacts of Special Status Species Management Decisions on Livestock Grazing Under Alternative B

Livestock grazing would be prohibited between March 20 and May 15 on allotments within sage-grouse habitat. In year-round habitat, grazing would be limited as necessary to maintain and/or improve habitat in areas within six miles of active sage-grouse strutting ground. Allotments subject to these restrictions are Sage Flat, Upper East Canyon, Sage-grouse and Dry Farm. The impacts on grazing would be negligible, as the prohibitions would not make livestock grazing unavailable on the affected allotments, but temporally restricted to protect species habitat. Compared to Alternative A, this alternative would have the same impacts.

4.3.6.3.2.8. Impacts of Travel Decisions on Livestock Grazing Under Alternative B

Travel decisions to reduce acreages of open motorized OHV travel from 611,310 acres to no acres would have long term, beneficial impacts on livestock by reducing noise and human presence disturbances and surface disturbances to livestock forage. Compared to Alternative A, this alternative would be more beneficial to livestock grazing because potential impacts to livestock from motorized OHV travel would be substantially less.

4.3.6.3.2.9. Impacts of Vegetation Management Decisions on Livestock Grazing Under Alternative B

Under this alternative, vegetation treatment on 1,000 acres of existing land treatments would continue and new treatments on 6,600 acres per year would be implemented. Over 20 years, this would result in approximately 152,000 acres of vegetation treatments throughout the Monticello PA. Compared to Alternative A, this would be a reduction of approximately 72,530 acres of vegetation treatments or 33% less than the total 232,130 acres of treatments under Alternative A. The treated areas would be unavailable for grazing in the short-term, as discussed above under management common to all alternatives, but likely improvements to the rangeland conditions would likely result in greater AUMs available or more acres open to grazing if an area is rehabilitated to the point of meeting the Standards for Rangeland Health. Compared to Alternative A, this alternative would have less indirect, beneficial impacts on livestock grazing because fewer acres would be treated to improve vegetation communities and AUMs.

It is important to note that not all of these treated areas would lead to an increase in acres or AUMs available to livestock. At this programmatic level of analysis, no specific areas for these vegetation treatments have been established, and it is not possible to determine whether there would be an increase or decrease in AUMs or acreage without data on treatment site locations or rehabilitation goals.

4.3.6.3.2.10. Impacts of Wildlife Management Decisions on Livestock Grazing Under Alternative B

Spring grazing (April 15 to June 15) would be eliminated on grazing allotments or pastures of the allotments that occur within pronghorn habitat. These allotments, as shown in Table 4.53, are: Hart Draw (partial), Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, and Tank Draw (see Appendix D).

Table 4.53. Changes to Livestock Season of Use in Certain Allotments under Alternative B as Compared to Alternative A (No Action)

	Total BLM Acres in Allotment or Part of Allotment	Alternative A Season of Use	Alternative B Proposed Season of Use	Change In Number of Days of Access	Percent Change in Season of Use
Mail Station	6,499	11/01 to 4/30	11/01 to 4/15	- 15	- 6%
Upper Mail Station	1,821	11/14 to 2/28	11/14 to 2/28	0	0%
Dry Valley/Deer Neck	4,172	12/01 to 4/30	12/01 to 4/15	- 15	- 7%
Lone Cedar	18,426	12/01 to 4/30	12/01 to 4/15	- 15	- 7%
Tank Draw	9,454	12/01 to 4/30	12/01 to 4/15	- 15	- 7%
Hart Draw (partial)	69,470	10/16 to 6/15	10/16 to 4/15	- 61	- 25%

Since these are seasonal restrictions, there would be no change in acreage or AUMs available for livestock, so the impacts on livestock grazing would be negligible. The impacts of this alternative, when compared to Alternative A would be the same.

4.3.6.3.3. ALTERNATIVE C

Management of cultural, Special Designation (ACEC), recreation, and riparian resources decisions would also be the same as discussed under Alternative B, with the same impacts to livestock grazing.

4.3.6.3.3.1. Impacts of Livestock Grazing Decisions on Livestock Grazing Under Alternative C

Table 4.54 lists the areas that would be unavailable to grazing under this alternative, in addition to those listed under Alternative A in Table 4.51.

The same areas would be available for grazing under Alternative C as in Alternative B, with the exception of Mule Canyon which would be unavailable for grazing below U-95. These restrictions would allow a total of 1,621,515 acres and 78,013 AUMs to be available for livestock grazing under this alternative. This is 0.7% fewer acres and 0.6% fewer AUMs than Alternative A.

Table 4.54. Acres and AUMs of Forage Unavailable under Alternative C in Addition to Those Listed under Alternative A (No Action)¹

Area Unavailable for Livestock Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing ¹	Forage Lost (AUMs)	Justification
Dodge Canyon	Dodge Canyon	1,598	110	Sparse livestock forage, protect wildlife habitat.
Horsehead Canyon	Montezuma Canyon	571	38	Lack of livestock water, protect wildlife and riparian habitat.
Portions of Butler Wash Canyons	Perkins Brothers, Tank Bench/ Brushy Basin, White Mesa	208	20	Protect cultural resources.
Slickhorn Canyon	Perkins Brothers	2,600	210	Maintain primitive recreational opportunities, confined canyon has limited forage availability, protect cultural resources.
Rone Bailey Mesa	Upper Mail Station	1,162	68	Limited accessibility, lack of livestock water, sparse livestock forage.
Rogers	Rogers	40	No active preference allotted	Sparse livestock forage, small isolated parcel difficult to manage.
Subtotal		6179		
Limited to Livestock Trailing only	Lake Canyon, Harts Draw, Indian Creek	5,555		Confined canyons have limited forage availability, balance potential conflicts with other resources or uses (wildlife habitat, primitive recreation, vegetation, cultural, etc), maintain riparian habitat.
Total		11,734	446	

¹Acreages are for BLM-administered land only. Acres for particular areas may vary slightly due to differences in shapefiles used in GIS acre calculations.

4.3.6.3.3.2. Impacts of Mineral Decisions on Livestock Grazing Under Alternative C

Approximately 710 acres are predicted to have minerals-related surface disturbance under this alternative. This is 11 acres or 1.7% more than Alternative A, so compared to Alternative A, there would likely be a slightly greater long-term, adverse (but minor) reduction in acreages and

AUMs from loss of vegetation due to wellpad, access road, infrastructure construction, and from mineral extraction.

4.3.6.3.3.3. Impacts of Special Status Species Management Decisions on Livestock Grazing Under Alternative C

Livestock grazing under Alternative C would be prohibited between March 20 and May 15 on allotments within sage-grouse habitat. In year-round habitat, grazing levels would be limited as necessary to maintain and/or improve habitat in areas within six miles of active sage-grouse strutting ground. Allotments subject to these restrictions would be Sageflat, Upper East Canyon, Sage-grouse and Dry Farm. The impacts on grazing would be the same as discussed under Alternative B (negligible), as the prohibitions would not make livestock grazing unavailable on the affected allotments, but temporally restricted to protect species habitat. Compared to Alternative A, this alternative would have the same impacts.

4.3.6.3.3.4. Impacts of Travel Decisions on Livestock Grazing Under Alternative C

The impacts from travel decisions would be the same as discussed under Alternative B because the travel decisions are similar. While approximately 2,311 acres would be managed as open to cross-country OHV use, these areas are relatively small, located in close proximity to each other, and are currently used as OHV play areas. Thus, the impacts to livestock grazing would be negligible.

4.3.6.3.3.5. Impacts of Vegetation Management Decisions on Livestock Grazing Under Alternative C

Vegetation treatments on 1,500 acres of existing land treatments would continue, and new treatment would be annually conducted on 7,800 acres. Grazing on these areas would be temporarily suspended, but in the long-term could possibly result in an increase in AUMs available to livestock. The impacts to livestock grazing would be the same as discussed under Alternative B, but to a slightly greater degree, as more acreage would be treated. Compared to Alternative A, Alternative C impacts on livestock grazing would have more potentially adverse impacts because 9,300 acres would be treated annually to improve rangeland conditions and vegetation communities (approximately 186,000 over 20 years), which would be 20% fewer acres throughout the Monticello PA than the proposed acreage treatments under Alternative A.

4.3.6.3.3.6. Impacts of Wildlife Management Decisions on Livestock Grazing Under Alternative C

Current grazing management would continue and, where possible, would be altered to benefit forb production on pronghorn ranges in the following grazing allotments: Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, Tank Draw and Hart Draw. This could result in fewer AUMs available to livestock than under Alternative A, but there are no specific prescriptions under this alternative, and therefore quantitative analysis is not possible. When compared to Alternative A, this alternative would have the same impacts on livestock grazing.

4.3.6.3.4. ALTERNATIVE D

Management of cultural and recreation resources as they affect livestock grazing would be the same as all other action alternatives as discussed in the Alternative B analysis above. Management of riparian resources as it pertains to grazing would be the same as Alternative A.

4.3.6.3.4.1. Impacts of Livestock Grazing Decisions on Livestock Grazing Under Alternative D

The areas listed in Table 4.55 would be unavailable to grazing, in addition to those listed under Alternative A in Table 4.51:

Table 4.55. Acres and AUMs of Forage Unavailable under Alternative D in Addition to Those Listed under Alternative A (No Action)¹

Area Unavailable for Livestock Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing ¹	Forage Lost (AUMs)	Justification
Portions of Butler Wash Canyons	Perkins Brothers, Tank Bench/ Brushy Basin, White Mesa	208	20	Protect cultural resources.
Slickhorn Canyon	Perkins Brothers	2,600	210	Maintain primitive recreational opportunities, confined canyon has limited forage availability, protect cultural resources.
Rone Bailey Mesa	Upper Mail Station	1,162	68	Limited accessibility, lack of livestock water, sparse livestock forage.
Rogers	Rogers	40	No active preference allotted	Sparse livestock forage, small isolated parcel difficult to manage.
Subtotal		4,010		
Limited to Livestock Trailing Only	None in addition to Alternative A.	N/A		
Total		4,010	298	

¹Acreages are for BLM-administered land only. Acres for particular areas may vary slightly due to differences in shapefiles used in GIS acre calculations.

These restrictions would leave a total of 1,629,240 acres and 78,161 AUMs available for livestock grazing under this alternative. This would be 0.4% fewer AUMs and 0.2% fewer acres than Alternative A, with the same impacts as discussed under Alternative A.

4.3.6.3.4.2. Impacts of Mineral Decisions on Livestock Grazing Under Alternative D

Under this alternative, RFD predictions of minerals development indicate that approximately 721 acres would lose the potential for livestock grazing due to surface-disturbing oil and gas

exploration and development activities. This is 22 acres or 3.1% more than Alternative A, which, when compared to Alternative A, would have more long-term impacts to livestock grazing from the loss of AUMs.

4.3.6.3.4.3. Impacts of Special Designation Management Decisions on Livestock Grazing Under Alternative D

Under Alternative D, the only addition would be 649 acres on the Lavender Mesa that would not be managed as an ACEC and therefore would be opened to livestock grazing. However, this land is on a mesa top and is physically inaccessible to cattle, and therefore the impacts to grazing would be the same as Alternative A and as discussed in the Impacts Common to All Alternatives subsection.

4.3.6.3.4.4. Impacts of Special Status Species Management Decisions on Livestock Grazing Under Alternative D

Livestock grazing under Alternative D would be prohibited between March 20 and May 15 on allotments within sage-grouse habitat. Grazing would be managed to maintain Rangeland Health. Allotments subject to these restrictions are Sage Flat, Upper East Canyon, Sage-grouse and Dry Farm. These management decisions, and their impacts on livestock grazing and AUMs, would be the same as discussed under Alternative B.

4.3.6.3.4.5. Impacts of Travel Decisions on Livestock Grazing Under Alternative D

The impacts from travel decisions would be the same as discussed under Alternative B because the travel decisions are similar. While approximately 2,311 acres would be managed as open to cross-country OHV use, these areas are relatively small, located in close proximity to each other, and are currently used as OHV play areas. Thus, the impacts to livestock grazing would be negligible.

4.3.6.3.4.6. Impacts of Vegetation Management Decisions on Livestock Grazing Under Alternative D

Approximately 9,300 acres/year of new vegetation treatments would be conducted and 2,000 acres of existing treatments would be maintained per year to improve vegetation communities within the Monticello PA. Over 20 years, a potential total of 226,000 acres would be treated, with short-term and long-term impacts as discussed under Impacts Common to All Alternatives above. Compared to Alternative A, this alternative would have the same short-term and long-term impacts on livestock grazing because Alternative D would treat over 97% of the acreage proposed for treatment under Alternative A.

4.3.6.3.4.7. Impacts of Wildlife Management Decisions on Livestock Grazing Under Alternative D

Current grazing management would continue, and where possible, would be altered to favor for production on pronghorn ranges in the same grazing allotments and with the same impacts as discussed under Alternative C. As also discussed under Alternative C, it is not possible to analyze the management changes in a quantitative sense, but it should be noted that this management decision could decrease AUMs available to livestock to some degree within these allotments, when compared to Alternative A.

4.3.6.3.5. ALTERNATIVE E

The analysis and impacts from cultural, special designation, recreation, riparian, special status species, visual, vegetation, and wildlife resources management decisions as they pertain to livestock grazing management would be the same as discussed under Alternative B because the management decisions would be the same.

4.3.6.3.5.1. Impacts of Livestock Grazing Decisions on Livestock Grazing Under Alternative E

The following areas would be unavailable for grazing under this alternative (Table 4.56), in addition to those listed under Alternative A in Table 4.51.

These restrictions would allow a total of 1,620,191 acres and 77,856 AUMs to be available for livestock grazing under this alternative. This is 0.8% fewer acres and 0.8% fewer AUMs than Alternative A.

Table 4.56. Acres and AUMs of Forage Unavailable under Alternative E in Addition to Those Listed under Alternative A (No Action)¹

Area Unavailable for Livestock Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing ¹	Forage Lost (AUMs)	Justification
Dodge Canyon	Dodge Canyon	1,598	110	Sparse livestock forage, protect wildlife habitat.
Horsehead Canyon	Montezuma Canyon	571	38	Lack of livestock water, protect wildlife and riparian habitat.
Portions of Butler Wash Canyons	Perkins Brothers, Tank Bench/Brushy Basin, White Mesa	208	20	Protect cultural resources.
Slickhorn Canyon	Perkins Brothers	2,600	210	Maintain primitive recreational opportunities, confined canyon has limited forage availability, protect cultural resources.
Rone Bailey Mesa	Upper Mail Station	1,162	68	Limited accessibility, lack of livestock water, sparse livestock forage.
Mule Canyon (including North and South Forks north of U-95)	Comb Wash	1,328	157	Maintain primitive recreational opportunities, protect cultural resources.
Rogers	Rogers	40	No active preference allotted	Sparse livestock forage, small isolated parcel difficult to manage.
Subtotal		7507		

Table 4.56. Acres and AUMs of Forage Unavailable under Alternative E in Addition to Those Listed under Alternative A (No Action)¹

Area Unavailable for Livestock Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing ¹	Forage Lost (AUMs)	Justification
Limited to Trailing Only	Lake Canyon, Harts Draw, Indian Creek	5555		Confined canyons have limited forage availability, balance potential conflicts with other resources or uses (wildlife habitat, primitive recreation, vegetation, cultural, etc), maintain riparian habitat.
Total		13,062	603	

¹Acreages are for BLM-administered land only. Acres for particular areas may vary slightly due to differences in shapefiles used in GIS acre calculations.

4.3.6.3.5.2. Impacts of Mineral Decisions on Livestock Grazing Under Alternative E

Under Alternative E, it is predicted that 519 acres of land would be disturbed due to minerals exploration and development. This is 181 fewer acres than proposed under Alternative A, or 25.9% less, but the impacts to grazing would be the same as discussed under Alternative A, but to a lesser degree, because fewer acres available for grazing and fewer AUMs would be lost in the long-term from minerals-related surface disturbances.

4.3.6.3.5.3. Impacts of Non-WSA Lands with Wilderness Characteristics on Livestock Grazing Under Alternative E

Potential beneficial impacts to livestock grazing could occur due to the 582,357 acres of non-WSA lands with wilderness characteristics not being available for surface-disturbing activities or recreational OHV travel. Forage would not be reduced due to surface-disturbing activities (road construction, oil and gas facilities, ROWs, etc). In addition, conflicts with motorized recreational users (livestock harassment, noise, gates left open, etc.) would be eliminated in non-WSA lands with wilderness characteristics. Compared to Alternative A, this alternative would be more beneficial because there would be a reduced potential for forage reductions from surface disturbance activities.

4.3.6.3.5.4. Impacts of Travel Decisions on Livestock Grazing Under Alternative E

No acres would be open to OHV use under this alternative. This is the same as Alternative B. Travel decisions to reduce acreages of open motorized OHV travel from 611,310 acres to no acres would have long term, beneficial impacts on livestock by reducing noise and human presence disturbances and surface disturbances to livestock forage. Compared to Alternative A, this alternative would be more beneficial to livestock grazing because potential impacts to livestock from motorized OHV travel would be substantially less.

4.3.6.3.6. THE PROPOSED PLAN

Management of cultural, Special Designation (ACEC), recreation, and riparian resources decisions would also be the same as discussed under Alternative B, with the same impacts to livestock grazing.

4.3.6.3.6.1. Impacts of Livestock Grazing Decisions on Livestock Grazing Under the Proposed Plan

Table 4.57 lists the areas that would be unavailable to grazing under this alternative, in addition to those listed under Alternative A in Table 4.51.

The same areas would be available for grazing under the Proposed Plan as in Alternative B, with the exception of Mule Canyon which would be unavailable for grazing below U-95. These restrictions would allow a total of 1,621,515 acres and 78,013 AUMs to be available for livestock grazing under this alternative. This is 0.7% fewer acres and 0.6% fewer AUMs than Alternative A.

Table 4.57. Acres and AUMs of Forage Unavailable under the Proposed Plan in Addition to Those Listed under Alternative A (No Action)¹

Area Unavailable for Livestock Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing¹	Forage Lost (AUMs)	Justification
Dodge Canyon	Dodge Canyon	1,598	110	Sparse livestock forage, protect wildlife habitat.
Horsehead Canyon	Montezuma Canyon	571	38	Lack of livestock water, protect wildlife and riparian habitat.
Portions of Butler Wash Canyons	Perkins Brothers, Tank Bench/ Brushy Basin, White Mesa	208	20	Protect cultural resources.
Slickhorn Canyon	Perkins Brothers	2,600	210	Maintain primitive recreational opportunities, confined canyon has limited forage availability, protect cultural resources.
Rone Bailey Mesa	Upper Mail Station	1,162	68	Limited accessibility, lack of livestock water, sparse livestock forage.
Rogers	Rogers	40	No active preference allotted	Sparse livestock forage, small isolated parcel difficult to manage.
Subtotal		6179		

Table 4.57. Acres and AUMs of Forage Unavailable under the Proposed Plan in Addition to Those Listed under Alternative A (No Action)¹

Area Unavailable for Livestock Grazing	Allotment(s)	BLM Acres Remaining Unavailable for Grazing ¹	Forage Lost (AUMs)	Justification
Limited to Livestock Trailing only	Lake Canyon, Harts Draw, Indian Creek	5,555		Confined canyons have limited forage availability, balance potential conflicts with other resources or uses (wildlife habitat, primitive recreation, vegetation, cultural, etc), maintain riparian habitat.
Total		11,734	446	

¹Acres are for BLM-administered land only. Acres for particular areas may vary slightly due to differences in shapefiles used in GIS acre calculations.

4.3.6.3.6.2. Impacts of Mineral Decisions on Livestock Grazing Under the Proposed Plan

Approximately 710 acres are predicted to have minerals-related surface disturbance under this alternative. This is 11 acres or 1.7% more than Alternative A, so compared to Alternative A, there would likely be a slightly greater long-term, adverse (but minor) reduction in acreages and AUMs from loss of vegetation due to wellpad, access road, infrastructure construction, and from mineral extraction.

4.3.6.3.6.3. Impacts of Special Status Species Management Decisions on Livestock Grazing Under the Proposed Plan

Livestock grazing under the Proposed Plan would be prohibited between March 20 and May 15 on allotments within sage-grouse habitat. In year-round habitat, grazing levels would be limited as necessary to maintain and/or improve habitat in areas within four miles of active sage-grouse strutting ground. Allotments subject to these restrictions would be Sage Flat, Upper East Canyon, Sage-grouse and Dry Farm. The impacts on grazing would be the same as discussed under Alternative B (negligible), as the prohibitions would not make livestock grazing unavailable on the affected allotments, but temporally restricted to protect species habitat. This alternative would have the same impacts as Alternative A.

4.3.6.3.6.4. Impacts of Travel Decisions on Livestock Grazing Under the Proposed Plan

The impacts from travel decisions would be the same as discussed under Alternative B because the travel decisions are similar. No acres would be managed as open to cross-country OHV use; there would be no impacts to livestock grazing would be negligible.

4.3.6.3.6.5. Impacts of Vegetation Management Decisions on Livestock Grazing Under the Proposed Plan

Vegetation treatments on 1,500 acres of existing land treatments would continue, and new treatment would be annually conducted on 7,800 acres. Grazing on these areas would be temporarily suspended, but in the long-term could possibly result in an increase in AUMs available to livestock. The impacts to livestock grazing would be the same as discussed under Alternative B, but to a slightly greater degree, as more acreage would be treated. Compared to Alternative A, the Proposed Plan would have more potentially adverse impacts on livestock grazing as 9,300 acres would be treated annually to improve rangeland conditions and vegetation communities (approximately 186,000 over 20 years), which would be 20% fewer acres throughout the Monticello PA than the proposed acreage treatments under Alternative A.

4.3.6.3.6.6. Impacts of Wildlife Management Decisions on Livestock Grazing Under the Proposed Plan

Current grazing management would continue and, where possible, would be altered to benefit forb production on pronghorn ranges in the following grazing allotments: Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, Tank Draw and Hart Draw. This could result in fewer AUMs available to livestock than under Alternative A, but there are no specific prescriptions under this alternative, and therefore quantitative analysis is not possible. When compared to Alternative A, this alternative would have the same impacts on livestock grazing.

4.3.6.4. SUMMARY OF IMPACTS

Grazing restrictions due to resource management decisions would cause the following losses to acres and AUMs under the Proposed Plan and each alternative (Table 4.58):

Table 4.58. Acres and AUMs Lost due to Grazing Restrictions from Resource Management Decisions

	Proposed Plan	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E
Acres Closed	134,277	127,136	134,642	133,318	131,149	134,642
Acres Limited To Trailing Only	5,555	962	6,518	6,518	962	6,518
Total	139,832	128,098	141,160	139,836	132,111	141,160
AUMs	783	337	940	783	635	940

When subtracted from the 1991 RMP totals of 1,761,351 BLM acres and 78,796 AUMs, proposed livestock grazing restrictions would leave the following total acreages available for grazing (Table 4.59)

Table 4.59. Total Acres Available to Livestock under the Proposed Plan and Each Alternative as well as Percent Difference Comparisons

	Proposed Plan	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E
Acres available	1,621,515	1,633,253	1,620,191	1,621,515	1,629,240	1,620,191
Compared to Proposed Plan	--	0.7% more	0.08% less	same	0.5% more	0.08% less
Compared to A	0.7% less	--	0.8% less	0.7% less	0.2% less	0.08% less
Compared to B	0.08% more	0.8% more	--	0.08% more	0.6% more	same
Compared to C	same	0.7% more	0.08% less	--	0.5% more	0.08% less
Compared to D	0.5% less	0.2% more	0.6% less	0.5% less	--	0.6% less
Compared to E	0.08% more	0.8% more	same	0.08% more	0.6% more	--

Total AUMs available under each alternative are listed in Table 4.60:

Table 4.60. Total AUMs Available under Each Alternative and Comparisons Between Alternatives

	Proposed Plan	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E
AUMs available	78,013	78,459	77,856	78,013	78,161	77,856
Compared to Proposed Plan	--	0.6% more	0.2% less	same	0.2% more	0.2% less
Compared to A	0.6% less	--	0.8% less	0.6% less	0.4% less	0.8% less
Compared to B	0.2% more	0.8% more	--	0.2% more	0.4% more	same
Compared to C	same	0.6% more	0.2% less	--	0.2% more	0.2% less
Compared to D	0.2% less	0.4% more	0.4% less	0.2% less	--	0.4% less
Compared to E	0.2% more	0.8% more	same	0.2% more	0.4% more	--

As shown in the above table, there is very little difference between the numbers of acres and AUMs available when analyzed within the context of the area available for livestock grazing within the PA.

Disturbance caused by minerals extraction would have the following impacts in terms of annual acres under each alternative (Table 4.61):

Table 4.61. Annual Acres of Disturbance Due to Minerals Extraction Activities Under the Proposed Plan and All Alternatives

	Proposed Plan	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E
Acres of disturbance	688	699	636	710	721	519

Table 4.61. Annual Acres of Disturbance Due to Minerals Extraction Activities Under the Proposed Plan and All Alternatives

	Proposed Plan	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E
Compared to Proposed Plan	--	1.6% more	7.6% less	3.2% more	4.8% more	24.6% less
Compared to A	1.6% less	--	9.0% less	1.5% more	3.0% more	25.9% less
Compared to B	8.2% more	9.9% more	--	11.6% more	13.4% more	18.5% less
Compared to C	3.1% less	1.5% less	10.4% less	--	1.5% more	27.0% less
Compared to D	4.8% less	3.0% less	11.8% less	1.5% less	--	28.2% less
Compared to E	32.6% more	34.9% more	22.7% more	37.1% more	39.2% more	--

As shown, Alternative D would have the highest degree of surface disturbance and Alternative E would have the least.

4.3.6.5. MITIGATION MEASURES

All mitigation measures to minimize or avoid impacts have been addressed in the management common to all subsections found in Chapter 2 and in livestock grazing practices described in Appendices A, I, and O.

4.3.6.6. UNAVOIDABLE ADVERSE IMPACTS

The loss due to other management decisions that cause permanent surface disturbances (e.g., trail construction, facility construction, wellpad access roads) of acres or AUMs that would otherwise be available for livestock use would be unavoidable. Unavoidable adverse impacts would also include invasive weed species that become established and spread as a result of soil and vegetation disturbances (including those disturbances caused by livestock). Impacts adjacent to livestock management facilities such as water troughs and handling facilities would be unavoidable. Some conflicts with recreational activities would be unavoidable.

4.3.6.7. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Management decisions for some resources would cause short-term, adverse impacts to livestock grazing but would eventually be a benefit to the resource and contribute to long-term productivity. Vegetation treatments and fire management treatments would cause short-term loss of acres and AUMs available to livestock from vegetation and surface disturbances, but would potentially contribute to a greater area and amount of forage in the long-term by improving the productivity of vegetation and reducing woodlands.

4.3.6.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Irretrievable impacts to the livestock grazing resource would include the establishment and spread of weedy, exotic, and/or noxious native-vegetation-displacing plant species that could

occur as a result of surface disturbances from minerals development; vegetation and fire treatments, woodland harvesting, and improper livestock management. Irreversible impacts to acres and AUMs available to livestock would occur anywhere a permanent structure is constructed, which would eliminate vegetation productivity for use as livestock forage.

4.3.7. MINERALS

This section presents the environmental consequences of resource management decisions proposed under each of the alternatives described in Chapter 2 on mineral resource development. Existing conditions concerning minerals are described in Chapter 3.

Negligible impacts to mineral resource development would result from air quality, fire, health and safety, livestock grazing, paleontology, travel, or woodlands management decisions. The impacts would be negligible because maintaining air quality within NAAQS thresholds through appropriate mitigation; identifying and reducing wildland fire risks; reducing the risks of hazardous spills; maintaining safety around AML sites; establishing utilization levels and applying grazing standards and guidelines; designating recreational OHV access within the planning area; and permitting woodland harvesting would not reduce the opportunities for minerals leasing or for the exploration and development of mineral resources. Therefore, the impacts of management actions for these resources or programs on mineral resource development will not be analyzed further in this section. No impacts to mineral resource development would result from "casual use" activities.

For the Monticello PA and the expected number of wells (76 wells over the next 15 years) and other mineral development air quality does reach a level that precludes or impairs mineral resource development. In full field development scenarios, or if production was substantially higher than predicted, air quality could become more impacted and would be analyzed in future environmental documentation. Further discussion of air quality can be found in Chapters 2 and 3.

In accordance with BLM policy and its recognition of the National Energy Policy and Conservation Act of 2000 (EPCA), as discussed in Chapters 2 and 3, mineral resource development would be allowed throughout the Monticello PA subject to standard terms and conditions unless precluded by other program prescriptions. Stipulations would be followed to mitigate the impacts of oil and gas and other mineral activity (see Appendix A-Stipulations Applicable to Oil and Gas Leasing and Other Surface-disturbing Activities). The stipulations would apply to all surface-disturbing activities, aside from the exception, modification, and waiver situations as determined by an Authorized Officer and guided by the criteria in Appendix A. The area specific restrictions on surface-disturbing activities listed in the table in Appendix A vary by alternative and detail limits on timing, surface use, and occupancy, as well as closures throughout the Monticello FO.

As described in Chapter 3, mineral resources are categorized into three mineral program types: leasable, locatable, and salable. Leasable minerals are subject to disposal by lease under the authority of the Minerals Leasing Act of 1920, as amended, and include oil, natural gas, coal, potash, and tar sands.

Locatable minerals are usually the base and precious metal ores, ferrous metal ores, and certain classes of industrial minerals for which acquisition is made by staking a mining claim (location) over the deposit and then acquiring the necessary permits to explore or mine. For purposes of this planning effort these include uranium and vanadium, placer gold, and limestone.

-Salable minerals are defined as mineral commodities disposed of sales contract or free use permit issued by the federal government. Salable minerals are generally common varieties of

construction materials and aggregates, such as sand, gravel, and roadbed and ballast material. For purposes of this planning effort these include sand and gravel, building stone, and clay.

The BLM allocates land as available or unavailable for use for the three mineral programs, and stipulates conditions of use. *Leasing* uses Standard Lease Terms, Special Conditions (Timing Limitations and/or Controlled Surface Use, TL/CSU), No Surface Occupancy, and closed. Lands classified for *locatable* minerals are identified as open to mineral entry or recommended for withdrawal from mineral entry. Lands recommended for withdrawal would be managed as prescribed in the PRMP/FEIS until such time as they are actually withdrawn by Congress. Lands identified for *salable* minerals are open with standard terms and conditions, open with special conditions, or closed.

Summaries of the RFD scenario for leasable, locatable, and salable minerals as well as predicted geophysical exploration activity levels are summarized below and discussed in detail in the Mineral Potential Report and RFD.

4.3.7.1. SUMMARY OF LEASABLE MINERAL RFD

The RFD prepared for this PRMP/FEIS utilizes data on past and current oil and gas development to predict future development for all lands in the Monticello PA, both BLM lands and non-BLM lands (BLM 2005b, 2005d). The RFD estimates the average acreage of disturbance per well (including the well pad, roads, and pipelines) to be 9.6 acres; the total number of existing oil and gas wells to be 1,615; and the existing surface disturbance as 15,504 acres.

The BLM administers 38.2% of the lands in the Monticello PA (see Table 1.1). Assuming the RFD applies uniformly across all lands in the Monticello PA, any calculations made, in conjunction with the disturbance per well number (9.6 acres) and the alternatives matrix in Chapter 2, can be used to estimate potential mineral resource development impacts (measured in number of wells and resulting acres of surface disturbance) on BLM lands for each alternative.

For the purposes of this analysis, it was assumed that the number of wells likely to be drilled under each alternative would be proportional to the acreage of land open for mineral resource development under that alternative. For example, if an alternative had 90% of BLM lands in the Monticello FO open for development, it would be assumed that 90% of the RFD on BLM lands would be drilled under that alternative. Table 4.62 shows the acreages of and predicted number of wells on BLM lands over the next 15 years within the three RFD areas, which are to be the focus of this analysis and of future oil and gas development within the Monticello FO.

Table 4.62. Baseline/RFD Acreages of Lands and Predicted Number of Wells in the 3 RFD Areas over the next 15 Years

RFD Area	Acreage		BLM% of Total	Wells	
	Total	BLM		Total	BLM
Paradox Fold and Fault Belt	531,671	257,412	48	53	25
Blanding Sub-basin	1,173,537	405,664	35	120	42
Monument Upwarp	1,950,562	734,523	38	23	9
Total	3,655,770	1,397,599		196	76

4.3.7.2. SUMMARY OF GEOPHYSICAL RFD

Calculations can be made regarding impacts of geophysical exploration on BLM lands for each alternative in conjunction with the disturbance associated with linear miles of source line within the Monticello FO (disturbance of 2,236 acres caused by 1,230 linear miles of source line; BLM 2005d) and the alternatives matrix in Chapter 2. It is assumed that the linear miles of source line likely to be used under a given alternative would be proportional to the acreage of land open for mineral resource development under that alternative.

4.3.7.3. SUMMARY OF LOCATABLE MINERAL RFD AND SALABLE MINERAL RFD

The same procedure can be applied to calculations regarding impacts of locatable and salable mineral resource development on BLM lands for each alternative, in conjunction with the acres of disturbance within the Monticello FO (disturbance of 360 acres caused by locatable mineral resource development and of 491 acres caused by salable mineral resource development; BLM 2005b) and the alternatives matrix in Chapter 2. It is assumed that the acreage likely to be developed for locatable and salable mineral resources under a given alternative would be proportional to the acreage of land open for these types of development under that alternative.

As mentioned in the introduction to Chapter 4, short-term impacts are those that would last for up to 5 years, and long-term impacts are those that would be longer than 5 years. Because the impact indicators for this resource were number of wells and the number of acres available for mineral resource development over the next 15 years, short-term impacts were not distinguished from long-term impacts.

4.3.7.4. IMPACTS COMMON TO ALL ALTERNATIVES

In the next 15 to 20 years, 27 dry holes, 20 abandoned wells, and all 480 currently abandoned wells would be successfully reclaimed totaling 5,059 acres. . This would result in the surface being reclaimed and the restoration of vegetation and soils. Additionally, in the next 15 years, approximately 559 linear miles of source line for 2-D and 3-D geophysical exploration would be conducted on BLM lands and would result in approximately 886 acres of surface disturbance, which would be reclaimed within 10 years. This exploration would beneficially impact mineral resource development and production in that it would improve the data available for making prudent mineral resource development decisions (BLM 2005d). Geophysical exploration can increase the probability of drilling a successful well and reduce the amount of unnecessary exploratory drilling (such as step-out drilling) which could reduce operational costs and make mineral development more profitable. This is a beneficial impact.

Under all alternatives and the Proposed Plan, standard conditions (e.g., standard lease terms, best management practices [BMPs], conditions of approval (COAs), and standard operating procedures [SOPs]) are applied to all mineral development activities on a site-specific basis. These standard conditions include compliance with non-discretionary laws (e.g., threatened and endangered species and cultural laws) and are intended to mitigate impacts to other resources (e.g., VRM, cultural, wildlife, soils, vegetation, recreation). The standard conditions add to operation costs and often result in longer processing time for applications and, delays in operations.

4.3.7.4.1. IMPACTS OF CULTURAL RESOURCE DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Under all of the alternatives and the Proposed Plan, the development of specific restrictions for culturally sensitive areas such as Cedar Mesa could slow the processing of proposed mineral resource development for these areas. Generally, more rigorous protection or mitigation measures would be applied in culturally sensitive areas. Such plans may specify monitoring systems, protective measures, equipment used, the development of research designs, and/or treatment. These restrictions and mitigations could add to the cost (in time, labor, or materials) of gaining cultural resource clearances for a given mineral resource development project.

Grand Gulch National Historic District (37,388 acres) would be unavailable for oil and gas leasing, closed to mineral material disposal, and open to geophysical exploration, except for the Special Emphasis area. There would be an adverse impact on the development of 37,388 acres as these resources would not be available for development and production and royalties would be reduced. The Old Spanish Trail and Hole-in-the-Rock trail would be managed for historic values. The prescriptions would generally be impairments to mineral development; but are not expected to be prohibitive.

4.3.7.4.2. IMPACTS OF LANDS AND REALTY DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Under all alternatives and the Proposed Plan, the disposal out of federal ownership of up to 6,581 acres of BLM lands within the Monticello FO (see Appendix C and Chapter 2) would result in fewer opportunities for mineral resource development on those parcels and less production and supply of mineral resources. This is somewhat mitigated because lands are evaluated for mineral potential as part of the disposal process. High potential lands may not be disposed of because it would not be in the public interest.

WSAa are exclusion areas for ROWs but are still available to locatable mineral development. Exclusion of ROWs in WSAs would have a negative impact on mineral resource development because it would be more costly and timely to develop and mitigate impacts. These impacts are also discussed under special designations because the reason for the exclusion is protection of wilderness (WSAa); however, the mechanism of exclusion of ROWs is a realty action.

4.3.7.4.3. IMPACTS OF RECREATION DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Under all alternatives and the Proposed Plan developed recreation sites—existing and future—would be subject to NSO, recommended for withdrawal from mineral entry, and closed to mineral materials disposal. Oil and gas developers who wish to lease resources underlying developed recreation sites would be required to conduct directional drilling, which adds costs and logistical challenges to individual projects. Removing these sites from mineral entry and disposal would result in fewer options for developers of locatable and salable mineral resources, and potentially would lower the yield and commercial supply of these resources. It is likely that mineral resource development would be thus limited on more than 460 acres because they become developed recreation sites (see Section 4.3.10, Recreation) and would be a minor impact to mineral resource development.

4.3.7.4.4. IMPACTS OF RIPARIAN RESOURCE DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Under all alternatives and the Proposed Plan riparian areas (approximately 20,435 acres) and lands within active floodplains or within 100 m of riparian areas would be subject to NSO. The impacts to mineral resource development resulting from protection of riparian resources on 20,435 acres would be increased costs. Producing oil and gas on lands subject to NSO is higher than it is on lands subject to standard and special stipulations due to the necessity of drilling directionally from adjacent locations where surface occupancy is allowed.

Under all alternatives and the Proposed Plan minor, beneficial impacts to mineral resource development could result from allowing non-surface-disturbing geophysical work within floodplains and riparian/aquatic areas. Geophysical exploration can increase the probability of drilling a successful well and reduce the amount of unnecessary exploratory drilling. Surface-disturbing exploration techniques (such as step-out drilling) could be reduced, thereby making mineral development more profitable by reducing operational costs.

Under all alternatives and the Proposed Plan, oil and gas developers would be required to follow the Guidance for Pipeline Crossings (see Appendix F), including conducting hydraulic analysis during the design phase to eliminate potential environmental degradation. This may result in minor to negligible, adverse impacts to oil and gas development because it would potentially increase the up front cost of specific development projects.

Minor, beneficial impacts to mineral resource development could result from allowing mineral operations within floodplains and riparian/aquatic areas on a limited basis if there are no practical alternatives for avoidance or if impacts could be fully mitigated. Direct beneficial impacts occur by having more acreage (20,435 acres) available for mineral resource development. Small, indirect, beneficial impacts (less operating cost) occur by having sand and gravel available in locations near other mineral development operations.

4.3.7.4.5. IMPACTS OF MINERALS DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Under all alternatives and the Proposed Plan including the No Action alternative mineral decisions could impact development of minerals by creating restrictions between incompatible developments. Generally, prohibitive conflicts would occur between two leasable minerals (such as oil and gas versus potash) where large acres of land would exclude other resource development. However, potash and coal were determined to be low potential for development so this potential conflict will not be analyzed in detail for the Monticello PA.

A more likely conflict would be between Leasable and Locatable/Salable mineral development, where placement of one facility prohibits placement of another. Small surface disturbances (e.g., gravel pits, mine locations) could impact oil and gas development. Usually, small locatable/salable operations do not prohibit oil and gas development; they only restrict placement. Adverse impacts (e.g., increased costs due to directional drilling) may occur where placement of an oil and gas facility is required to be moved away from an existing mine/pit. For reasons stated in the MPR, development potential is low for coal, tar sand, and salt and potash resources in the Monticello FO during the foreseeable future. Thus, mineral resource development decisions would result in negligible impacts to the development of these resources under all alternatives and the Proposed Plan, and these mineral resources are not discussed further in this section.

Because of rights granted to claimants under the mining laws, the BLM may impose only those surface use restrictions that are necessary to prevent undue or unnecessary degradation. Therefore, based on the RFD scenario, locatable mineral development (primarily uranium and vanadium) would likely continue during the next 15 years, regardless of the alternative implemented. This would result in beneficial impacts to the mineral resource industry by increasing the domestic supply of uranium and vanadium. On the other hand, increased extraction of these resources would also, over time, reduce the quantities of finite uranium-vanadium resources in the Monticello FO.

4.3.7.4.6. IMPACTS OF SOILS AND WATERSHED DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Under all alternatives and the Proposed Plan any mineral resource development occurring in sensitive soils (see Chapter 2 and Section 3.14.4.3, Sensitive Soils) would require BMPs and applicable mitigation measures (Appendix A and I) to minimize impacts. Moderately and highly wind erodible soils (892,228 acres) would require a project proponent to comply with BMPs and mitigation measures, which could result in increased costs and time required to implement a mineral resource exploration or development project in sensitive soils. The same impact would occur for highly water erodible soils on 27,704 acres. Soil characteristics were not used in determining lease categories, these are based on criteria such as ACEC designations, floodplains, or Special Status Species or wildlife needs; however, the amount of soils that may potentially be considered “sensitive” varies under the different alternatives because of the variation in the areas assigned different lease categories in each alternative. The presence of “sensitive soils” may increase the costs associated with developing areas due to the need for erosion control plans or implementation of soil protection measures, therefore comparing the amount of potential “sensitive soils” under each lease category provides a basis for comparing potential impacts on mineral resource development by alternative from this resource.

4.3.7.4.7. IMPACTS OF SPECIAL DESIGNATIONS ON MINERAL RESOURCE DEVELOPMENT

The Monticello FO has 13 existing WSAs or ISA complexes. WSAs are areas that must be managed in a manner that does not impair their suitability for congressional designation as Wilderness (BLM 1991c; Table 4.39).

These WSA designations would continue to apply across all alternatives and the Proposed Plan and 386,027 acres (or 21.6%) of BLM lands would remain closed to leasing. These closures are non-discretionary. Adding to or removing acreage from these WSAs is beyond the scope of this Proposed Plan. Maintaining the WSAs would have negative impacts upon mineral resource extraction and development because they would exclude lands from mineral resource development and lower the number of locations where potential wells could be drilled (BLM 1990; see Table 4.63). The lower number of locations could lead to a lower production and supply of oil and natural gas and fewer royalties paid to the federal government and/or the State of Utah. The finite, non-renewable resource found beneath the WSAs would not be depleted.

Table 4.63. Acres of WSAs within Each RFD Area

RFD Area	RFD Acres within WSAs	Total RFD Acres*	% of RFD within WSA
Paradox Fold and Fault Belt	10,893	268,305	4.1

Table 4.63. Acres of WSAs within Each RFD Area

RFD Area	RFD Acres within WSAs	Total RFD Acres*	% of RFD within WSA
Blanding Sub-basin	15,582	421,246	3.7
Monument Upwarp	359,552	1,094,076	32.9
Total	386,027	1,783,627	21.6

* The administrative definition of RFD areas precludes WSAs, and WSAs were *not* included in the calculations and projections of the RFD (BLM 2005d). However, this number represents the total physical, geographic acreage (rather than the administrative acreage) and includes WSA acreages to depict how much of each geographic area is lost to mineral resource exploration and development due to being WSAs (i.e., closed to leasing). Note that the vast majority of RFD acres within WSAs—both in area and percentage—occur in the Monument Upwarp RFD Area.

4.3.7.4.8. IMPACTS OF SPECIAL STATUS SPECIES ON MINERAL RESOURCE DEVELOPMENT

All alternatives and the Proposed Plan require some degree of spatial or temporal limitation on surface-disturbing activities to protect special status species and wildlife populations and their important habitats. In the case of mineral and energy resource development, specific conditions of approval or lease terms are often required to mitigate the adverse affects of development activities on special status species. Measures needed to comply with non-discretionary laws (e.g., Section 7 consultation with the U.S. Fish and Wildlife Service [USFWS]) are provided for in the Standard Lease Terms and lease notices. Under all alternatives and the Proposed Plan, there would be continued application of lease notices for federally listed plant and animal species as determined by Section 7 consultation between the BLM and USFWS and for any non-listed special status plant or animal species that occurs or has potential to occur in proposed lease areas. In addition, all special status species-related measures outlined in Stipulations Applicable to Oil and Gas Leasing and Other Surface-disturbing Activities (Appendix A), Conservation Measures and Best Management Practices for Federally Listed Species (Appendix Q) would be followed.

Spatial and temporal limitations (hereafter referred to as controlled surface use and timing limitations, respectively) would have an adverse impact on mineral resource development by increasing exploration costs, time, and effort. However, the degree and magnitude of such increases depend on many factors, including the options for project siting, the locale of the lease, and the drilling window. Operators may experience adverse economic impacts if drilling operations are curtailed during special status species protection periods or if drilling operations must be moved to another area on the lease. Impacts to mineral resource development resulting from the following species and general wildlife protection measures would apply under all alternatives and the Proposed Plan.

4.3.7.4.8.1. Bald Eagle

All alternatives and the Proposed Plan would implement controlled surface use and timing limitations near Bald Eagle nesting or winter roost habitat or during the nesting or roosting season. Table 4.64 summarizes the seasonal restrictions on mineral resource development by species that occur in the Monticello FO, including the Bald Eagle. Restrictions occur for eight months of the year. Potential adverse impacts to mineral resource development could be more time and costs for requirements such as nest monitoring or surveys, the exclusion of certain areas, avoidance of certain areas for up to eight months, and scheduling extra time for processing

applications and drilling. Operators can have difficulty in scheduling a rig due to a timing limitation or may incur additional costs having a rig on stand-by.

Table 4.64. Seasonal Restrictions within Established Buffer Zones Applied to Mineral Resource Development under All Alternatives

Species	Dates	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Burrowing Owl – Nesting (0.25 mile)	3/1 – 8/31												
Cooper's Hawk – Nesting (0.5 mile)	3/15 – 8/31												
Ferruginous Hawk – Nesting (0.5 mile)	3/1 – 8/1												
Golden Eagle – Nesting (0.5 mile)	1/1 – 8/31												
Northern Goshawk – Nesting (0.5 mile)	3/1 – 8/15												
Peregrine Falcon – Nesting (1.0 mile)	2/1 – 8/31												
Prairie Falcon – Nesting (0.25 mile)	4/1 – 8/31												
Red-tailed Hawk – Nesting (0.5 mile)	3/15 – 8/15												
Short-eared Owl – Nesting (0.25 mile)	3/1 – 8/1												
Swainson's Hawk – Nesting (0.5 mile)	3/1 – 8/31												
Bald Eagle – Nesting (1.0 mile)	1/1 – 8/31												
Bald Eagle – Roosting (0.5 mile)	11/1 – 3/31												
Mexican Spotted Owl – Breeding (0.5 mile)	3/1 – 8/31												
SWW Flycatcher – Breeding (0.25 mile)	5/1 – 9/30												
Yellow-billed Cuckoo – Breed. (0.25 mile)	5/1 – 8/31												
California Condor – Known nest (1.0 mile)	3/1 – 8/31												
Migratory birds – Known priority habitat	5/1 – 7/31												

Source: Romin and Muck 2002.

4.3.7.4.8.2. Mexican Spotted Owl (MSO)

Surveys for nesting and foraging habitat suitability and individual owls are common components of the preservation of the MSO and its habitat in the Monticello FO (see Table 4.64 for seasonal restrictions). Under all alternatives and the Proposed Plan two-year surveys for MSO are required in the case of permanent structures (e.g., new producing oil and gas wells), as is the occasional noise analysis if noise generating facilities are sited in or near habitat. Spatial buffers of 0.5 mile around nests or habitat are typically adequate. The full avoidance and minimization measures specified in the alternatives matrix in Chapter 2 would result in FO-wide impacts on mineral resource development similar to those described for the Bald Eagle (above).

4.3.7.4.8.3. Southwestern Willow Flycatcher and Western Yellow-billed Cuckoo

Under all alternatives and the Proposed Plan the protection of riparian habitat within the range of these two species may include surveys or monitoring, timing limitations during the nesting season (see Table 4.64), and spatial and noise buffers around suitable habitat, particularly if permanent facilities are developed nearby. A 300-foot buffer around suitable riparian habitat is required year-round to prevent surface-disturbing activities. This particular species management decision would have a negative, minor impact on individual mineral resource development projects sited near riparian areas. Costs, time, and effort may increase if surveys are conducted to find out if the habitat is suitable, and if it is suitable, costs, time, and effort may increase again in the re-routing and re-siting of facilities and/or directional drilling. The full avoidance and minimization measures specified in the alternatives matrix in Chapter 2 would result in impacts on mineral resource development similar to those described for the Bald Eagle (above).

4.3.7.4.8.4. Endangered Colorado River Fishes

Within the Monticello FO, mineral resource development may encroach on riparian habitat in the 100-year floodplain of designated critical habitat for the bonytail, humpback chub, Colorado pikeminnow, and razorback sucker. Under all alternatives and the Proposed Plan restrictions on development in and around riparian habitat would have impacts on mineral resource development similar to those described for the riparian habitat of the Southwestern Willow Flycatcher and the Western Yellow-billed Cuckoo (above). Additionally, any water depletion affecting the Colorado River system requires consultation with the USFWS and would likely result in operators paying water depletion fees if they are using surface water to supply drilling operations. This would likely increase both development time and costs.

4.3.7.4.8.5. California Condor

Under all alternatives and the Proposed Plan mineral resource development in the Monticello FO would be timed and sited to avoid the nesting season (see Table 4.64) and locales of California condor. The protection of nesting habitat for this species may involve measures similar to those described for the Southwestern Willow Flycatcher and the Western Yellow-billed Cuckoo (above). No permanent structures or roads, including new producing oil and gas wells and access roads, would be allowed within 1.0 mile of known condor nest sites. This particular species management decision would have a negative, minor impact on individual mineral resource development projects sited near known nest sites. Costs, time, and effort may increase if surveys are conducted to find out if nests are nearby, and if nests are nearby, costs, time, and effort may

increase again in the re-routing and re-siting of facilities. The full avoidance and minimization measures specified in the alternatives matrix in Chapter 2 would result in impacts on mineral resource development similar to those described for the Bald Eagle (above).

4.3.7.4.8.6. Migratory Birds and Raptors

Under all alternatives and the Proposed Plan occupied, migratory bird habitat would require mineral resource developers to avoid or minimize surface-disturbing activities during nesting season. This in turn would result in impacts on mineral resource development similar to those described for the Bald Eagle (above). Occupied priority migratory bird habitat will be determined with the use of Utah Partners in Flight Avian Conservation Strategy, Intermountain West Joint Venture Bird Habitat Conservation Areas, and other migratory bird conservation plans.

4.3.7.4.8.7. Summary of Impacts Common to All Special Status Species Decisions on Mineral Resource Development

Exact acreages of habitat to be restricted would depend on the results of field surveys associated with specific projects within the Monticello FO and cannot be quantified at this time. However, some general conclusions can be drawn regarding the timing limitations. As is evident from Table 4.64, developers would be able to conduct mineral resource exploration, development, and production without timing limitations for only one month out of the year (i.e., October). The fall and winter months (i.e., September through February) would have the fewest timing limitations on mineral resource development, while the spring and summer months (i.e., March through August) would have the most. The most restrictive months of the year would be May through July; nearly all timing limitations would be in effect during that period.

4.3.7.4.9. IMPACTS OF VISUAL RESOURCE DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Mineral resource development would be subject to the VRM class objectives of the area within which development would occur. VRM management on areas designated as VRM Class III and IV imposes minimal restrictions on mineral resource development. Designation of an area as VRM Class I essentially closes the area to mineral resource activity. Management of areas as VRM Class II allows alteration of line, form, color and texture that characterize the existing landscape, although the resulting contrast should not attract the attention of the casual observer. Meeting VRM Class II objectives imposes additional costs on mineral resource developers and may restrict development in certain areas.

Under all action alternatives and the Proposed Plan, areas managed as VRM Classes II, III, and IV would typically be available to leasing with either standard lease terms or controlled surface use stipulations. This visual resource decision would generally have a beneficial effect on mineral resource development because more areas would be available under standard lease terms or controlled surface use stipulations, rather than being restricted with NSO. The beneficial impact would be that mineral exploration and development could still occur.

Under all action alternatives and the Proposed Plan, direct, adverse impacts to mineral resource development resulting from VRM Class I designations would include the exclusion of lands available for mineral resource development, a lower number of locations where potential wells

could be drilled, a lower yield and commercial supply of oil and natural gas, and fewer royalties. All WSAs (386,027 acres) are managed as VRM Class I for all alternatives.

4.3.7.4.10. IMPACTS OF WILDLIFE AND FISHERIES DECISIONS ON MINERAL RESOURCE DEVELOPMENT

Crucial big game habitats are subject to special conditions regulating surface-disturbing activities during certain seasons. These seasonal conditions would not impact maintenance and operation activities for mineral production. The seasonal conditions would result in negative, minor impacts to mineral resource development, in the form of slowed production from mineral resource development facilities in this area due to timing limitations.

4.3.7.4.11. IMPACTS OF OTHER LANDS MANAGED BY BLM ON MINERAL RESOURCE DEVELOPMENT

Under all alternatives and the Proposed Plan, the BLM manages federal leases on certain lands not administered by the BLM, including:

- 101,720 acres within the Glen Canyon National Recreation Area (NRA),
- 366,850 acres within the Manti-LaSal National Forest, Monticello Ranger District,
- 51,610 acres within the Navajo Indian Reservation,
- 1,080 acres within Indian Trust Lands, and
- 55,390 acres on private, split-estate lands.

The impacts of permitting leasing on these non-BLM lands within the Monticello FO—a total of 576,650 acres—would have beneficial and long-term impacts upon mineral resource development, especially oil and gas. Leasing of these non-BLM lands would result in the permitting of additional wells, which in turn would result in an increase in the domestic supply of oil and gas and increased royalties to the federal government or the State of Utah. The Navajo Nation would also receive economic benefits from the leasing of their lands, including fees from the use of surface permits and ROWs. However, continued oil and gas extraction would, over time, reduce the quantities of finite fossil fuel resources in the Monticello FO.

4.3.7.5. ALTERNATIVES IMPACTS

4.3.7.5.1. ALTERNATIVE A

4.3.7.5.1.1. Impacts of Cultural Resource Decisions on Mineral Resource Development Under Alternative A

Various SRMAs, historic districts and landmarks and historic trails have been designated throughout the Monticello FO. Some cultural designations are located within recreational designations or special designations.

- The Cedar Mesa SRMA and its impacts on mineral resource development are discussed in full in Section 4.3.7.4.3, Impacts of Recreation Decisions on Mineral Resource Development.

- The Grand Gulch Historic District is within WSAs that are managed under the IMP. This section assesses impacts of the cultural resource decisions associated with this entity. The Alkali Ridge Historic Landmark is discussed in Section 4.3.7.5.1.8 Impacts of Special Designations on Mineral Resources..
- Under the No Action Alternative cultural resource decisions regarding the 37,433-acre Grand Gulch Historic District (already within a WSA) and the 4,240-acre special emphasis area (within the historic district) would result in the entire historic district being closed to disposal of mineral materials (Table 4.65) and the special emphasis area being closed to leasing and geophysical work.

These cultural resource decisions for the Grand Gulch Historic District would have negative, minor impacts on mineral resource development, particularly mineral materials. These decisions would account for a 2.1% decrease in BLM lands available for mineral materials disposal and a 0.2% decrease in BLM lands available for leasing and geophysical work, which in turn would result in less oil and gas productivity and geophysical exploration within the historic district. Ultimately, direct impacts would be manifest as a slightly lower yield of oil and gas; less sand, gravel, building stone, and clay available for public consumption; and poorer data on the mineral resource reserves underlying the historic district. Indirect impacts would include increased time and cost of individual mineral resource development projects within this historic district because of the likelihood of needing to re-route pipelines, access roads, and well pads to avoid cultural resource sites.

4.3.7.5.1.2. Impacts of Lands and Realty Decisions on Mineral Resource Development Under Alternative A

Under the No Action Alternative, the existing transportation and utility ROW corridors would have a beneficial impact on mineral resource exploration and development because additional travel corridors would allow easier access to mineral resource development facilities, sites, and well pads within the Monticello FO.

Under Alternative A, approximately 132,380 acres would be recommended for withdrawal from mineral entry. This decision has the potential to result in fewer opportunities for mineral resource development on this acreage and less production and supply of mineral resources.

Table 4.65. Acres of BLM Lands Available for Mineral Resource Development under Each Alternative and the Proposed Plan

Resource	Alternative A – No Action*	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
LEASABLE MINERAL RESOURCE DEVELOPMENT, INCLUDING OIL AND GAS						
Standard Lease Terms	578,604 *(584,270)	365,170	629,472	962,283	213,290	484,217

LOCATABLE MINERAL RESOURCE DEVELOPMENT (MINERAL ENTRY)						
Open	1,652,743	1,533,413	1,663,211	1,738,992	951,053	1,734,458
Withdrawn	132,380	251,710	121,912	46,131	834,070	50,665
SALABLE MINERAL RESOURCE DEVELOPMENT (MINERAL MATERIAL DISPOSAL)****						
Standard Terms and Conditions	578,604 (584,270)	365,168	624,734	962,279	213,290	624,734
Special Conditions	810,652 (821,070)	876,736	724,234	420,998	545,641	724,234
<i>Subtotal of Open Lands</i>	<i>1,389,256 (1,405,340)</i>	<i>1,241,904</i>	<i>1,348,968</i>	<i>1,383,277</i>	<i>758,931</i>	<i>824,811</i>
Closed	395,514 (373,850)	542,402	435,338	401,026	1,025,378	435,338

*The acreages currently managed (the first acreage listed) differ from the 1991 RMP acreages (the second acreage listed in parenthesis) because of WSAs (closed to leasing under IMP after the 1991 RMP was signed), which were not taken into account at the time of the 1991 RMP. Most of these WSAs were ACECs and available for leasing subject to special conditions.

** Approximately 386,027 of these acres are closed due to WSA designation, across all alternatives (BLM 1990; see the IMP; see also Section 4.3.7.4.7 and Table 2.1, Summary of Impacts, for an itemized list of all closures and their acreages). WSA closures are non-discretionary and, thus, are beyond the scope of this EIS analysis. Due to improvements in GIS technology since the 1991 RMP and differences in datasets and methods of calculation, the Closed sub-categories (e.g., WSAs, ACECs) *do not add up to the total Closed acreage* (e.g., 385,316 under the No Action).

*** WSA designations account for all closures under the No Action.

**** See Maps 21 – 26 for mineral material disposals under each alternative.

¹ There is overlap between ACECs and WSAs so they are not additive under Alternatives B-C and the Proposed Plan.

4.3.7.5.1.3. Impacts of Mineral Decisions on Mineral Resource Development Under Alternative A

Oil and Gas Resources

In total, approximately 1,238,230 acres of BLM lands within the Monticello FO would remain administratively open for oil and gas leasing under Standard and Special lease stipulations within the three RFD development areas (see Table 4.65). Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005d), it is estimated that 73 predicted oil and gas wells would be drilled over the next 15 years (Table 4.66; Map 27). The socioeconomic analysis in this chapter (Section 4.3.12, Socioeconomic Resources) estimates the yield of oil and gas—in terms of barrels and thousand cubic feet (Mcf), respectively—that would result from implementation of the No Action Alternative.

Under this alternative, approximately 47% of all open BLM lands would be available under standard stipulations, and approximately 53% of all open BLM lands would be available under special stipulations. Oil and gas development would occur in all three RFD areas. Although the largest acreage available for development is in the Monument Upwarp RFD Area, it is worth noting that this area would likely see the least amount of development in terms of wells (i.e., 7). Among all RFD areas, it also is the one with the greatest proportion and amount of its lands subject to special stipulations from management prescriptions used to protect ACECs, WSAs, and VRM Class I or II. Most wells (i.e., 41) would be drilled in the Blanding Sub-basin RFD Area.

Under this alternative, the federal government and/or the State of Utah would continue to receive royalties from the production and sale of oil and gas (see Section 4.3.12, Socioeconomic Resources). Continued oil and gas extraction would also, over time, reduce the quantities of finite fossil fuel resources found in the Monticello FO, though it is difficult to quantify the proportional impact on these reserves.

Geophysical Exploration

Under the No Action Alternative, approximately 559 linear miles of source line for 2-D and 3-D geophysical exploration would be conducted during the next 15-20 years and would result in approximately 886 acres of surface disturbance. This exploration would beneficially impact mineral resource development and production because it would refresh or increase the data available for making prudent mineral resource development decisions (BLM 2005d). More costly and surface-disturbing exploration techniques (e.g., step-out drilling) would be reduced, making mineral development more profitable. Geophysical exploration would occur in all three RFD areas, as detailed in Table 4.66.

Table 4.66. Predicted Oil and Gas Wells and Geophysical Exploration on BLM Lands within RFD Areas under Alternative A—No Action, Average over 15 Years and Maximum per Year (MPY)

RFD Area	Acres of BLM Lands Available			% of BLM Lands Available	Predicted Wells*	Geophysical Exploration	
	Standard	Special	Total			Linear Miles of Source Line	Acres
AVERAGE OVER 15 YEARS							
Paradox Fold and Fault Belt	163,953	89,121	253,074	98	25	271	495
Blanding Sub-basin	270,410	127,657	398,067	98	41	205	271
Monument Upwarp	144,241	442,848	587,089	80	7	83	120
LOP Total	578,604	659,626	1,238,230		73	559	886
MAXIMUM PER YEAR (MPY)**							
Paradox Fold and Fault Belt	***	***	***	***	3	25	45
Blanding Sub-basin	***	***	***	***	4	14	25
Monument Upwarp	***	***	***	***	1	6	11
MPY Total	***	***	***		8	45	81

Note: Calculations based on BLM lands only.

*Oil and natural gas wells are considered together.

**Based on the RFD (BLM 2005d), MPY reflects the maximum development that *could* occur in *any given year* for the next 15 years. During most Plan years, development per year will be less than this maximum. To find the *average* development per year, take the value of interest in the first part of the table divide the value by 15, which is the number of years the Plan is expected to be in effect.

Other Leasable Mineral Resources

Although 1,238,230 acres of BLM land are administratively open for the leasing of potash and salt and tar sands development, potential (and thus impacts) are low. The Cane Creek and Lisbon Valley Known Potash Leasing Areas (KPLAs) (less than 9,000 acres), and the White Canyon Designated Tar Sand Area (DTSA) (approximately 10,000 acres) are considered low development potential as discussed in the Mineral Potential Report for the Monticello PA (BLM 2005b, pages 34-35). Based on the low potential and infrequent development/interest in potash and salt and tar sands leasing because of mineral resource development decisions, impacts would be negligible under the No Action Alternative.

Locatable Mineral Resources

In total, approximately 1,675,057 acres of BLM land would remain open to development of uranium-vanadium, copper, gold, and limestone under the No Action Alternative. Oil and gas development has a high potential to co-occur with uranium-vanadium development and some potential to co-occur with limestone development (in the south-central and southeastern Monticello FO). However, uranium-vanadium and limestone mining operations are typically small enough to preclude conflict or adverse impacts with oil and gas development (BLM 2005d). This is evident in the Lisbon Valley area, a historically well established uranium mining district and a prolific producer of oil and gas. The impacts of any future development of locatable resources would be analyzed through site-specific NEPA when and if the project(s) are proposed.

Salable Mineral Resources

In total, approximately 1,405,340 acres of BLM land would remain open to development of sand and gravel, building stone, and clay (Map 21), and there is high potential for continued development of known deposits at existing levels for the next 15 years, regardless of the alternative chosen. Although unexplored areas of high development potential are dispersed throughout the Monticello PA, and although development of these resources may be co-located with oil and gas and other mineral resource development, particularly in the northeastern portion of the Monticello PA, mineral material disposal operations are typically discrete sites, small enough to avoid conflicts with the development of other mineral resources. Negligible impacts to salable resources from development of other mineral resources would be anticipated. Based on increased acreages available for oil and gas leasing or other mineral development, an indirect impact could be the increased need for sand and gravel for road maintenance and construction.

4.3.7.5.1.4. Impacts of Management of Non-WSA Lands with Wilderness Characteristics on Mineral Resource Development Under Alternative A

Under the No Action Alternative, no BLM lands would be managed as non-WSA lands with wilderness characteristics and therefore there would be no impacts on mineral resource development.

4.3.7.5.1.5. Impacts of Recreation Decisions upon Mineral Resource Development Under Alternative A

Under the No Action Alternative, mineral resource development in the 15,100-acre San Juan River SRMA would be subject to NSO within the 100-m riparian area and to standard or special stipulations outside that area. No impacts on mineral resource development in this SRMA would result from recreation decisions under the No Action Alternative.

Under the No Action Alternative, leasing and other mineral resource development activities would be subject to standard or special stipulations for the portions of the 385,000-acre Cedar Mesa SRMA that are outside a WSA. Therefore, no impacts on mineral resource development in these areas would result from recreation decisions under this alternative.

4.3.7.5.1.6. Impacts of Riparian Resource Decisions on Mineral Resource Development Under Alternative A

The impacts of riparian resource decisions on mineral resource development are the same for all alternatives and the Proposed Plan and are discussed above under Section 4.3.7.4, Impacts Common to All Alternatives.

4.3.7.5.1.7. Impacts of Soils and Watershed Decisions on Mineral Resource Development Under Alternative A

Under the No Action Alternative, a minimum of 1,063,019 acres of BLM lands open to surface-disturbing mineral resource development (i.e., leasing under Standard or Special Stipulations, and lands that are subject to No Surface Occupancy but are Open to minerals entry, or 76.5% of open BLM lands) are overlain by sensitive soils with medium and high limitations (Table 4.67). Stipulations required to protect sensitive soils would require a project proponent to comply with BMPs and mitigation measures, which could result in increased costs and time required to implement a mineral resource exploration or development project in sensitive soils.

Table 4.67. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under Alternative A–No Action

RFD Area	Leasing Category	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
Blanding Sub-basin	Standard	270,410	Alkalinity	223,674	82.7
	Special	127,657	Alkalinity	107,629	84.3
	NSO, Open to ME ¹	4,078	Alkalinity	2,971	72.9
	Subtotal	402,145		334,274	83.1
Monument Upwarp	Standard	144,241	Alkalinity	95,694	66.3
	Special	442,848	Alkalinity	323,125	73.0
	NSO, Open to ME ¹	142,032	Alkalinity	111,175	78.3
	Subtotal	729,121		529,994	72.7

Table 4.67. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under Alternative A–No Action

RFD Area	Leasing Category	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
Paradox Fold and Fault Belt	Standard	163,953	Alkalinity	125,069	76.3
	Special	89,121	Rooting Depth	69,434	77.9
	NSO, Open to ME ¹	4,916	Rooting Depth	4,248	86.4
	Subtotal	257,990		198,751	77.0
Total		1,389,256		1,063,019	76.5

1. NSO, Open to ME = No Surface Occupancy but Open to Mineral Entry.

2. Possible limiting factors are water erosion, wind erosion, droughty soils, excess salt, excess sodium, rooting depth, and alkalinity.

4.3.7.5.1.8. Impacts of Special Designations Decisions on Mineral Resource Development Under Alternative A

Impacts from ACECs on Mineral Resource Development

Protection of the relevant and important values identified for ACECs generally result in "special management attention" which is usually greater restrictions on mineral resource development and other surface-disturbing activities. These restrictions are often implemented with a shift away from Standard Terms and Conditions to CSU, NSO, or Closure.

Under the No Action Alternative 492,077 acres of BLM lands occur in ACECs, of which 387,535 are subject to NSO or closed to leasing. Of the 387,535 acres there are 268,138 acres closed to leasing because they are also located in WSAs. The remaining 119,397 acres have been limited as a direct result of designation of the ACECs. Closure of 6.7% of all BLM lands (119,397 acres) due to ACEC designation (Table 4.68) would have a negative impact on mineral resource extraction and development. These areas would be excluded from mineral resource development and lower the number of locations where potential wells could be drilled. The lower number of locations could indirectly lead to a lower production and supply of oil and natural gas and fewer royalties paid to the federal government and/or the State of Utah. The finite non-renewable resource found beneath these lands would not be depleted.

The exact acreage of each ACEC varies by alternative. Across all alternatives, the following existing and proposed ACECs are entirely or partially within one or more WSAs: Bridger Jack Mesa, Butler Wash North, Cedar Mesa, and Dark Canyon. For each of these ACECs, the portion(s) that overlap with a WSA would be managed as WSAs and would be impacted the same as described above for WSAs (Map 87).

Table 4.68. Acreages of Existing and Potential ACECs that are Available to Mineral Resource Development, if Designated under Alternative A–No Action²

ACEC	Acres			VRM Outside WSA ²	Acres in Each Lease Category				Other Activities Outside WSAs		
	Total	Within WSA ¹	Outside WSA		Standard	Special	NSO	Closed	Mineral Entry	Mineral Disposal	Geophysical Exploration

Scenic Highway Corridor	57,637	9,930	47,807	I (Var.)	303	2,879	65,893	9,934	--	yes	--

"NA" and "--" both mean Not Applicable. Items in parenthesis are subsets of the first number above that is *not* in parenthesis.

1. Always VRM I and Closed to leasing.

2. According to Alternatives Matrix in Chapter 2, if specified. 3. Portions of Cedar Mesa ACEC lie within eight WSAs.

² There are slight variances between total ACEC acres and Acres in Each Lease Category due to GIS polygon variances.

Impacts from WSRs on Mineral Resource Development

The number of miles of recommended WSRs varies by alternative. Impacts on mineral resource development resulting from WSR decisions include prescriptions for mineral resource development in riparian and floodplain areas; these are discussed in detail above, in Section 4.3.7.4.4, Impacts of Riparian Resources Decisions on Mineral Resource Development. Many WSR recommendations prescribe NSO in riparian areas as a condition of designation. However, as NSO leasing would occur in riparian areas regardless of the WSR recommendations of these segments, designation of the following recommended segments would result in no additional impacts to mineral resource development under No Action:

- Arch Canyon (2,208 acres, BLM river miles, 6.9)
- Colorado River Segment #1 (352 acres, BLM river miles, 2.2)
- Indian Creek (1,536 acres, BLM river miles, 4.8)
- San Juan River Segment #1 (1,360 acres, BLM river miles, 8.5)
- Dark Canyon (2,048 acres, BLM river miles, 6.4)
- Fable Valley (2,176 acres, BLM river miles, 6.8)

Under the No Action Alternative, Colorado River Segments #2 and #3 and San Juan River Segments #2 through #5 have been determined to be eligible for WSR designation. Therefore, adverse impacts resulting from WSR decisions, in the form of limited mineral resource development (e.g., NSO leases and other strict limitations) would occur on 7,168 acres. This acreage accounts for a 0.4% decrease in BLM lands available for optimal mineral resource development; therefore, the impacts, although adverse, are negligible.

4.3.7.5.1.9. Impact of Special Status Species and Other Wildlife and Fisheries Decisions on Mineral Resource Development Under Alternative A

Bighorn Sheep Lambing and Rutting

Under the No Action Alternative, oil and gas exploration, development, and geophysical work would be prohibited on 329,750 acres of bighorn sheep crucial habitat (or 18.4% of all BLM lands) during the lambing season (106 days) and rutting season (92 days; Table 4.69). Other mineral resource development may continue with a plan of operation. These management decisions would result in negative, minor impacts to mineral resource development, in the form of slowed production from mineral resource development facilities in this area due to timing limitations.

Pronghorn Fawning Area

Under the No Action Alternative, oil and gas exploration, development, and/or production and geophysical work would be prohibited on the 12,960-acre pronghorn crucial habitat area (or 0.7% of all BLM lands) during the fawning season (31 days; see Table 4.69). Other mineral resource development may continue with a plan of operation. These management decisions would result in impacts similar in type to those that would occur in bighorn lambing and rutting habitat, though at slightly less magnitude.

Table 4.69. Additional Seasonal Restrictions within Established Buffer Zones Applied to Mineral Resource Development under Alternative A

Species	Dates	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Bighorn – Lambing (329,750 acres)	4/1 – 7/15												
Bighorn – Rutting (329,750 acres)	10/15 – 12/31												
Pronghorn – Fawning (12,960 acres)	5/15 – 6/15												
Deer – Winter use (197,550 acres)	12/15 – 4/30												

Deer Winter Range

Under the No Action Alternative, oil and gas exploration, development, and/or production and geophysical work would be prohibited on the 197,550-acre deer crucial winter range (or 11.1% of all BLM lands) during the period of critical winter use (151 days; see Table 4.69). Other mineral resource development may continue with a plan of operation. These management decisions would result in impacts similar in type to those that would occur in bighorn lambing and rutting habitat, though at slightly less magnitude.

In all, wildlife decisions necessitating special stipulations would impact various acreages at various times of the year. Under the No Action Alternative, no wildlife related timing limitations would be enforced on any acreage from July 15 through October 15 (92 days). However, the most limitations would occur from December 15–31 and for the month of April, at which times wildlife related restrictions on up to 527,300 acres (or 29.5% of all BLM lands, if habitats do not overlap) would be enforced.

4.3.7.5.1.10. Impacts of Vegetation Management Decisions on Mineral Resource Development Under Alternative A

Under the No Action Alternative, maintenance of existing vegetation treatments and the implementation of new treatments on approximately 232,130 acres of lands in the Monticello PA would have minimal impacts on exploration, development, and production of mineral resources.

Under this alternative, however Bridger Jack Mesa (5,290 acres) and Lavender Mesa (649 acres) ACECs are protected for near relict and relict vegetation. The management prescriptions include open to oil and gas leasing, but NSO. This will have an adverse impact, as the cost to directionally drill is higher than conventional vertical drilling.

The ACECs are also closed to mineral materials, which removes the acreage and minerals available. However, the mineral materials in this area are lower grade and access would be very difficult and costly.

The ACECs are available for locatable minerals with an approved plan of operation. Access would likely be along escarpments and not on the mesa tops. However, surface disturbance for ventilation shafts might be limited or more costly and be an adverse impact.

Generally, the impacts of vegetation management on mineral resource development are minor because the acreage is small and access is difficult. Additionally, most of the area is protected by the IMP as it falls within a WSA (see Section 4.3.14, Special Designations).

4.3.7.5.1.11. Impacts of Visual Resource Management Decisions on Mineral Resource Development Under Alternative A

Mineral resource development would be subject to the VRM Class objectives of the area within which development would occur. Areas managed as VRM III and VRM IV allow a wider range of impacts on visual resources and generally would have negligible impacts on mineral resource development in the Monticello PA. Areas managed as VRM I and VRM II result in more limitations to mineral resource development in the Monticello PA since fewer changes to the line, form, color and texture that characterize the existing landscape would be allowed. Table

4.70 quantifies the acreages of land within each VRM Class, which dictate the level of surface disturbance allowed.

Table 4.70. Acreages of Each VRM Class by Alternative

VRM Class	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
I	371,575	497,668	425,179	390,424	998,370	422,989
II	355,112	250,641	132,001	8,838	111,478	228,041
III	416,806	426,350	531,920	692,741	264,369	507,583
IV	637,875	608,463	693,995	691,119	407,459	623,002
Total	1,781,368	1,783,122	1,783,095	1,783,122	1,781,676	1,781,615

Note that these acreages include WSAs, which are managed as VRM I. Table 4.63 and other tables discussing the impacts of mineral resource development decisions on mineral resource development exclude WSAs, and thus reflect different acreages.

Under the No Action Alternative, approximately 371,575 acres (or 20.9% of BLM lands) would fall into the VRM I class, and in these areas, mineral resource development would be subject to NSO or closed to leasing due to the restrictions on surface disturbance in this VRM class. Most of the lands managed as VRM Class I are also WSAs (see discussion for Impacts Common to all and Special Designations). These lands would be closed to oil and gas leasing. Lands managed as VRM Class I would have little if any surface-disturbing activities, as it is difficult to accomplish oil or gas activities of any kind (directional or otherwise) and yet achieve the VRM objectives in a VRM I area. Accordingly, it is likely that such areas, including NSO areas, could have adverse impacts on mineral resource development, thus resulting in a lower number of locations where potential wells could be drilled, a lower yield and commercial supply of oil and natural gas, and fewer royalties.

Areas that inventory as VRM II but are in areas that are available to leasing subject to standard or special stipulations would be managed as VRM III, unless otherwise specified in the special management prescriptions found in the 1991 RMP. These visual resource decisions would have a beneficial, minor impact on mineral resource development because areas normally subject to NSO could be available under standard or special stipulations. The beneficial impact would take the form of simplified exploration and production, with corresponding lower costs.

4.3.7.5.2. ALTERNATIVE B

4.3.7.5.2.1. Impacts of Cultural Resource Decisions on Mineral Resource Development Under Alternative B

The Comb Ridge CSMA (30,752 acres) and the Tank Bench CSMA (2,646) would be closed to locatable mineral entry, mineral material disposal, and geophysical exploration. Oil and gas leasing and development would be subject to NSO. In addition McLoyd-Moon House (1,607 acres) would be unavailable for oil and gas leasing. These cultural resource decisions would account for a 2.0% decrease in BLM lands available for mineral entry and mineral material disposal, though leasing in all but McLoyd-Moon House could continue subject to NSO. Impacts on mineral resource development in the historic district would be the same as impacts under the No Action Alternative, except that closing the entire historic district to geophysical exploration

under Alternative B is more restrictive than the No Action Alternative (accounting for 2.1% of all BLM lands). Because no gathering of geophysical data would occur in the historic district under Alternative B, no new data or knowledge of the mineral resource reserves underlying the historic district would be collected.

4.3.7.5.2.2. Impacts of Lands and Realty Decisions for Alternative B on Mineral Resource Development Under Alternative B

Under Alternative B, approximately 251,710 –acres (or 14.0.0% of all BLM lands) would be recommended for withdrawal from mineral entry. This decision has the potential to result in adverse impacts of the same type as the No Action Alternative, but at a greater magnitude. Alternative B, along with Alternative E, represents the greatest acreage recommended for withdrawal.

4.3.7.5.2.3. Impacts of Mineral Decisions on Mineral Resource Development Under Alternative B

Oil and Gas Resources

Approximately 1,241,910 acres of BLM lands within the Monticello FO would be administratively open for oil and gas leasing under standard and special lease stipulations, within the three RFD development areas (see Table 4.65). Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005d), it is estimated that 66 predicted oil and gas wells would be drilled over the next 15 years (Table 4.71; Map 28; BLM 2005c). This alternative would result in an increase of approximately 3,680 acres available for development (or 0.3%) but a decrease of 7 predicted oil and gas wells (or 9.6%) compared to the No Action Alternative. See the socioeconomic analysis in this chapter (Section 4.3.12, Socioeconomic Resources) for the projected yield of oil and gas for Alternative B.

Alternative B has a slightly larger (0.3%) acreage open to leasing while but has more stipulations for protection of resources. Alternative B has less development (as measured in wells), compared to Alternative A. The increase in BLM lands administratively open to leasing compared to Alternative A is negligible.

The decrease of wells compared to the No Action Alternative could be due to the smaller acreages of BLM lands available under standard stipulations (the most open stipulations). Under Alternative B, approximately 29% of all BLM lands available for leasing would be subject to standard stipulations, and approximately 71% of all open BLM lands would be subject to special stipulations. Considerably more land is subject to special stipulations. The adverse impacts of more stipulations include increased costs for development, increased time for processing of applications, and fewer months each year that surface-disturbing activities could be conducted.

Table 4.71. Predicted Oil and Gas Wells and Geophysical Exploration on BLM Lands within RFD Areas under Alternative B, Average over 15 Years and Maximum per Year (MPY)

RFD Area	Acres of BLM Lands Available			% of BLM Lands Available	Predicted Wells*	Geophysical Exploration	
	Standard	Special	Total			Linear Miles of Source Line	Acres
AVERAGE OVER 15 YEARS							
Paradox Fold and Fault Belt	24,359	182,875	207,234	81	20	224	408
Blanding Sub-basin	148,521	217,919	366,440	90	38	188	249
Monument Upwarp	192,290	475,946	668,236	91	8	95	137
LOP Total	365,170	876,740	1,241,910		66	507	794
MAXIMUM PER YEAR (MPY)**							
Paradox Fold and Fault Belt	***	***	***	***	2	21	37
Blanding Sub-basin	***	***	***	***	4	13	23
Monument Upwarp	***	***	***	***	1	7	13
MPY Total	***	***	***		7	41	73

Note: Calculations based on BLM lands only.

*Oil and natural gas wells are considered together.

**Based on the RFD (BLM 2005d), MPY reflects the maximum development that *could* occur in *any given year*. During most Plan years, development per year will be less than this maximum.

Oil and gas development would occur in all three RFD areas. Similar to the No Action Alternative, the Monument Upwarp RFD Area would see the least amount of development in terms of wells (i.e., 8), despite having the most lands administratively open to development. Also similar to the No Action Alternative, most wells (i.e., 38) would be drilled in the Blanding Sub-basin RFD Area. In looking at the individual RFD areas, other possible factors for the notable decrease in wells under Alternative B become apparent. First, approximately 81,100 acres of open BLM lands have shifted from the Blanding Sub-basin and Paradox Fold and Fault Belt RFD Areas (the areas of more active development) to the Monument Upwarp RFD Area (the area of least development) under Alternative B. The loss of projected wells from the active areas (a loss of 8 wells, compared to the No Action Alternative) is not compensated with the gain of wells in the less active area (a gain of 1 well, compared to the No Action Alternative). Second, of the acres of BLM lands open to leasing, the Blanding Sub-basin and Paradox Fold and Fault Belt RFD areas both have more lands subject to special stipulations than standard stipulations. In the Blanding Sub-basin RFD area, 2.5 times more open lands are subject to special stipulations under Alternative B than under the No Action Alternative. In the Paradox Fold and Fault Belt RFD Area, 1.9 times more open lands are subject to special stipulations under Alternative B than under the No Action Alternative.

Ultimately, under Alternative B, the direct impacts of mineral resource development decisions on oil and gas production would be somewhat adverse compared to the No Action Alternative. A small decrease in the potential number of oil and gas wells under Alternative B (a 9.6% decrease) would lead to a small decrease in the available supply of oil and/or natural gas. The federal government and/or the State of Utah would continue to receive royalties from the production and sale of oil and gas, though at somewhat lower rates than under the No Action Alternative (see Section 4.3.12, Socioeconomic Resources). However, the decreased number of predicted wells would also decrease the rate at which finite reserves of fossil fuel resources in the Monticello FO are extracted and consumed (compared to the No Action Alternative), which would have a beneficial impact on the long-term viability and availability of these resources.

Geophysical Exploration

Under Alternative B, approximately 507 linear miles of source line for 2-D and 3-D geophysical exploration would be conducted over the next 15 years for the purposes outlined in Section 4.3.7.1, Summary of Leasable RFD, and would result in approximately 794 acres of surface disturbance over the next 15 years. This exploration would result in beneficial impacts to mineral resource development of the same type and quality described in Section 4.3.7.1 and for the same reasons (BLM 2005d). However, less exploration would happen under Alternative B than under the No Action Alternative; 52 fewer miles of source line (a decrease of 9.3%) would be used under Alternative B compared to the No Action Alternative. Geophysical exploration would occur in all three RFD areas, as detailed in Table 4.71.

Other Leasable Mineral Resources

Although 1,241,910 acres of BLM land would be administratively open under Alternative B for the leasing of potash and salt and tar sands (an increase of approximately 3,700 acres, or 0.3% acres, compared to the No Action Alternative); because the level of development expected is low, impacts to potash and salt and tar sands leasing due to mineral resource development decisions would be negligible; the same as impacts under the No Action Alternative.

Locatable Mineral Resources

Approximately 1,527,656 acres of BLM land would be open under Alternative B to mineral entry of uranium-vanadium, copper, gold, and limestone: a decrease of approximately 147,401 acres compared to the No Action Alternative. Impacts of locatable resource decisions under this alternative would be essentially the same as those described for the No Action Alternative, except that there would be slightly less acreage and mineral available for development. The surface disturbance and occupation associated with mining operations for uranium-vanadium, copper, gold, and limestone are usually small enough that they do not prohibit leasable mineral development and therefore the impact is negligible. Small, beneficial impacts could occur to leasable minerals as more roads are maintained or developed for access to locatable minerals.

Salable Mineral Resources

Approximately 1,241,904 acres of BLM land would be open to development of sand and gravel, building stone, and clay under Alternative B (Map 22). This represents a decrease of approximately 147,350 acres (11%) compared to the No Action Alternative. Impacts of salable resource decisions under this alternative would be essentially the same as those described for the No Action Alternative, except that there would be slightly less acreage and minerals available for development. The surface disturbance and occupation associated with mining operations for sand and gravel, building stone, and clay are usually small enough that they do not prohibit leasable mineral development, and therefore the impact is negligible. Small, beneficial impacts could occur to leasable minerals as more roads are maintained or developed for access to locatable minerals.

4.3.7.5.2.4. Impacts of Management of Non-WSA Lands with Wilderness Characteristics on Mineral Resource Development under Alternative B

Impacts under Alternative B would be the same as under Alternative A, for the same reasons.

4.3.7.5.2.5. Impacts of Recreation Resource Decisions on Mineral Resource Development Under Alternative B

Under Alternative B, in the 10,203-acre San Juan River SRMA, surface disturbance from mineral resource development on existing claims would be minimized without curtailing valid existing rights. Leasing in the SRMA would be subject to NSO. The SRMA would be closed to and recommended for withdrawal from mineral entry. Finally, the SRMA would be closed to mineral materials disposal except for the area above the rim in the vicinity of the Bluff Airport lease. These recreation decisions would account for a 0.6% decrease in BLM lands available for leasing-related surface disturbance, mineral entry, and mineral materials disposal compared to the No Action Alternative. Thus they would have generally negative but negligible impacts upon mineral resource development compared to the No Action Alternative, which does not specify restrictions on mineral resource development in this SRMA.

Under Alternative B, portions of the 375,734-acre Cedar Mesa Cultural SRMA that are outside a WSA would be leased under standard or special stipulations. As this same area presently includes some amount of land subject to NSO (and would continue this categorization under the No Action Alternative), Alternative B represents a negligible, beneficial impact to mineral resource development in comparison to the No Action Alternative. Standard and special

stipulations are the less restrictive leasing stipulations, and if more lands are available under these stipulations, a larger yield and commercial supply of oil and gas would potentially result.

4.3.7.5.2.6. Impacts of Soils and Watershed Decisions on Mineral Resource Development Under Alternative B

Under Alternative B, a minimum of 1,049,158 acres of BLM lands open to surface-disturbing mineral resource development (or 76.7% of open BLM lands) are overlain by sensitive soils with medium and high limitations (Table 4.72). The particular requirements and limitations on such mineral resource development and the resulting impacts on mineral resource development would be the same as those under the No Action Alternative.

Table 4.72. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under Alternative B

RFD Area	Leasing Stipulation	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
Blanding Sub-basin	Standard	148,521	Alkalinity	127,525	85.9
	Special	217,919	Alkalinity	182,212	83.6
	NSO, Open to ME ¹	39,805	Alkalinity	29,888	75.1
	Subtotal	406,245		339,625	83.6
Monument Upwarp	Standard	192,290	Alkalinity	133,552	69.5
	Special	475,946	Alkalinity	354,952	74.6
	NSO, Open to ME ¹	35,826	Rooting Depth	24,142	67.4
	Subtotal	704,062		512,646	72.8
Paradox Fold and Fault Belt	Standard	24,359	Alkalinity	19,544	80.2
	Special	182,875	Rooting Depth	142,307	77.8
	NSO, Open to ME ¹	49,473	Rooting Depth	35,036	70.8
	Subtotal	256,707		196,887	76.7
Total		1,241,910		1,049,158	76.7

1. NSO, Open to ME = No Surface Occupancy but Open to Mineral Entry.

2. Possible limiting factors are water erosion, wind erosion, droughty soils, excess salt, excess sodium, rooting depth, and alkalinity.

Under Alternative B, in addition to the Gold Book Standards (BLM and FS 2005), a plan (and BLM approval) would be required for surface disturbance occurring on slopes between 21 and 40%, and no surface disturbance would be allowed on slopes over 40%. These soils and watershed management decisions would have minor, negative impacts on surface-disturbing mineral resource development in several ways. For a given mineral resource development project occurring on slopes of 21%–40%, costs, time, and effort for mineral resource development would increase due to the necessity of preparing and implementing an erosion control plan. For a given mineral resource development project on lands including slopes over 40%, mineral resource development facilities such as pads and pipelines would need to be re-sited or re-routed which, in addition to increasing costs, time, and effort for the project, would have the potential to be less than optimal in design, according to the specific goals of the project proponent.

4.3.7.5.2.7. Impacts of Special Designations Decisions for Alternative B on Mineral Resource Development Under Alternative B

ACECs

All ACECs are considered for management in Alternative B. ACECs are designated when special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards.

In Alternative B, there are 521,142 acres of BLM lands that occur in ACECs (Table. 4.73) that require special management protection. Generally, the impacts to mineral development are increased costs to implement mitigation, delayed times for processing applications, decreased areas available for development and exploration, and limitations of the types of equipment, processes, and time available for development. All of these would be considered impediments to development and exploration for leasable, locatable, and salable minerals.

In all, 373,349 of these acres are subject to NSO or closed to leasing. If 285,782 acres (out of 373,349 acres) are closed to leasing because they are located in WSAs, the remaining 87,567 acres are limited to mineral resource development as a direct result of designation of the ACECs (see Table 4.73). Therefore, for the purposes of this analysis, implementation of Alternative B represents a closure of 4.9% of all BLM lands (87,567 acres) due to ACEC designation. ACEC designation under Alternative B has slightly less negative impact upon mineral resource development (about 1.8% less) than it does under the No Action Alternative.

WSAs

Impacts would be the same as Alternative A and were presented in Impacts Common to All.

WSRs

Under Alternative B, all WSR segments are recommended suitable.

- A total of 7,984 acres—comprising Colorado River Segment #3, Dark Canyon, and San Juan River Segments #3 and #5—are recommended with prescriptions of VRM I, closure to oil and gas development, and recommendations for withdrawal from mineral entry.
- A total of 3,056 acres—comprising Colorado River Segment #2 and Fable Valley—are recommended with prescriptions of VRM II and NSO restrictions on leasing.
- A total of 2,272 acres—comprising San Juan River Segments #2 and #4—are recommended with prescriptions of VRM III and standard stipulations for leasing except in riparian areas.

Therefore, under Alternative B, a total of 11,040 acres is effectively unavailable for leasing due to WSR recommendation decisions. This unavailable acreage accounts for 2.6% of all BLM lands and amounts to a minor to negligible, adverse impact, in comparison to the No Action Alternative.

Table 4.73. Acreages of Existing and Potential ACECs that are Available to Mineral Resource Development, if Designated under Alternative B

ACEC	Acres			VRM Outside WSA ²	Lease Stipulation (Acres)				Other Activities Outside WSAs		
	Total	Within WSA ¹	Outside WSA		Standard	Special	NSO	Closed	Entry	Disposal-	Geophysical

"NA" and "--" both mean Not Applicable. Items in parenthesis are subsets of the first number above that is *not* in parenthesis.

1. Always VRM I, or closed to leasing.
2. According to Alternatives Matrix in Chapter 2, if specified.
3. To be managed as SRMA in this alternative.
4. Portions of Cedar Mesa ACEC lie within eight WSAs.

4.3.7.5.2.8. Impacts of Special Status Species and Other Wildlife and Fisheries Decisions on Mineral Resource Development Under Alternative B

Gunnison Sage-grouse

Under Alternative B, management decisions regarding Gunnison Sage-grouse would include reserving 4,524 acres of BLM lands (or 0.2% of all BLM lands) for crucial year-round habitat.

In lek habitat on these lands (within .06 miles of active strutting grounds), the species management decisions detailed in the Alternatives Matrix in Chapter 2 would result in negligible, adverse impacts to mineral resource development, primarily from leasing limitations on surface use near active strutting grounds, including reduced opportunities for geophysical work and limitations on activities from March 20 through May 15 of each season. These surface and timing limitations would not prohibit or deter mineral resource development; they would merely slow down development and/or production of the resource.

Oil and gas exploration and development subject to standard stipulations would be allowed in year-round habitat on these lands (within 6.0 miles of active strutting grounds), though mineral resource developers would follow the Suggested Management Practices in the Gunnison Sage-grouse Rangewide Conservation Plan (BLM 20051), which in some cases may necessitate more rigorous conservation practices during standard leasing. Nonetheless, adverse impacts to mineral resource development from implementation of the Gunnison Sage-grouse Rangewide Conservation Plan would be negligible.

Alternative B would result in the most restrictions on mineral resource development due to Gunnison Sage-grouse management decisions.

Bighorn Sheep Lambing and Rutting

Under Alternative B, on the 453,388-acre bighorn crucial habitat area (or 25.4% of all BLM lands), the special conditions described in Chapter 2 would be enforced for the duration of the lambing season and rutting season (Table 4.74; see also the No Action Alternative for the duration). These management decisions would result in the same timing related impacts as the No Action Alternative. However, because this crucial habitat area is 123,638 acres (37.9%) larger than it is under the No Action Alternative, the net impact to mineral resource development under Alternative B would be somewhat negative compared to the No Action Alternative.

Pronghorn Fawning Area

Under Alternative B, on the 29,365-acre pronghorn crucial habitat area (or 1.6% of all BLM lands) the special conditions described in Chapter 2 would be enforced for the duration of the fawning season (46 days; see Table 4.74). These management decisions would result in minor impacts on mineral resource development, in the form of slightly slowed production from mineral resource development facilities in this area because of timing limitations, though more so than under the No Action Alternative.

Table 4.74. Additional Seasonal Restrictions within Established Buffer Zones Applied to Mineral Resource Development under Alternative B

Species	Dates	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Gunnison Sage-grouse leks (2.0 miles)													
Non-disturbing geophysical work	3/20 – 5/15												
All permitted activities (nighttime)	3/20 – 5/15												
Bighorn – Lambing (453,388 acres)	4/1 – 7/15												
Bighorn – Rutting (453,388 acres)	10/15 – 12/31												
Pronghorn – Fawning (29,365 acres)	5/1 – 6/15												
Deer – Winter use (785,921 acres)	11/1 – 5/15												
Elk – Winter use (191,173 acres)	11/1 – 5/15												

Because this crucial habitat area is 16,405 acres (129%) larger and the fawning season is 15 days (32.6%) longer than under the No Action Alternative, impacts on mineral resource development from this wildlife decision would occur over more than twice the area and for a longer period of time under Alternative B compared to the No Action Alternative. However, considering the low acreage of BLM lands devoted to this habitat under Alternative B, even though the difference between this alternative and the No Action Alternative is dramatic, the overall impact on the FO-wide mineral resource development program remains very minor to negligible.

Deer Winter Range

Under Alternative B, on the 785,921-acre deer crucial winter range (or 44.1% of all BLM lands), the special conditions described in Chapter 2 would be enforced for 196 days of critical winter use (i.e., more than half the year; see Table 4.74). This crucial habitat area is 588,371 acres (297.8%) larger and the duration of enforcement is 45 days (29.8%) longer than under the No Action Alternative. These management decisions would result in major impacts on mineral resource development compared to the No Action Alternative, both in terms of the large area restricted as winter range and the duration of enforcement of the restrictions. Major impacts would include delays in permitting for production of mineral resources and restrictions on the period of surface disturbance.

Elk

Under Alternative B, on the 191,173-acre elk crucial winter range (or 10.7% of all BLM lands), the special conditions described in Chapter 2 would be enforced during the period of winter use (196 days, or more than half the year; see Table 4.74). These management decisions would result in impacts on mineral resource development compared to the No Action Alternative, similar to those described above for deer winter range, though over a much smaller area.

In all, wildlife decisions necessitating special stipulations would impact various acreages at various times of the year. Under Alternative B, as under the No Action Alternative, no wildlife related timing limitations would be enforced on any acreage from July 15 through October 15 (92 days). At the other end of the spectrum, restrictions from May 1 through 15 would be enforced on up to 876,736 acres (or 49% of all BLM lands, assuming overlap; see Table 4.65) under Alternative B which, throughout this analysis, is the single largest restriction of mineral resource development (in area) because of preservation of other resources.

4.3.7.5.2.9. Impacts of Vegetation Management Decisions on Mineral Resource Development Under Alternative B

Impacts to mineral resource development under Alternative B would be essentially the same as under the No Action Alternative, except that fewer acres of vegetation would be treated (1,000 acres/year), and because the same acreages of vegetation in ACECs would be protected from surface disturbance.

4.3.7.5.2.10. Impacts of Visual Resource Decisions on Mineral Resource Development Under Alternative B

Under Alternative B, approximately 497,668 acres (or 27.9% of BLM lands) would fall into the VRM I class, and in these areas, mineral resource development would be subject to NSO or closed to leasing because of the restrictions on surface disturbance in this VRM class. Adverse

impacts under Alternative B would be of the same type as in the No Action Alternative, for the same reasons, but at a greater magnitude (7.0%).

4.3.7.5.3. ALTERNATIVE C

4.3.7.5.3.1. Impacts of Cultural Resource Decisions on Mineral Resource Development—Alternative C

Under Alternative C, cultural resource decisions regarding the 30,752-acre Comb Ridge CSMA and the 37,388-acre Grand Gulch National Historic District would result in the same impacts to mineral resource development as occur under Alternative B.

Under Alternative C, the 2,646-acre Tank Bench CSMA would be open to mineral entry, mineral materials disposal, geophysical exploration, and oil and gas leasing and development with standard stipulations. The No Action Alternative does not specify cultural resource decisions affecting mineral resource development for the Tank Bench CSMA; therefore, Alternative C would result in negligible, beneficial impacts to mineral resource development in the Tank Bench CSMA, compared to the No Action Alternative. Direct impacts would include a very slight increase in oil and gas productivity and productivity of locatable and salable minerals, as well as improved data on the mineral resource reserves underlying the CSMA.

4.3.7.5.3.2. Impacts of Lands and Realty Decisions on Mineral Resource Development—Alternative C

Under Alternative C, approximately 121,912 acres (or 8.2% of all BLM lands) would be recommended for withdrawal from mineral entry. This decision has the potential to result in adverse impacts of the same type as the No Action Alternative, but at a much lower magnitude.

4.3.7.5.3.3. Impacts of Mineral Resource Development Decisions on Mineral Resource Development—Alternative C

Oil and Gas Resources

In total, approximately 1,348,973 acres of BLM lands within the Monticello FO would be administratively open for oil and gas leasing under standard and special lease stipulations within the three RFD development areas (see Table 4.65). Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005c), it is estimated that 74 predicted oil and gas wells would be drilled over the 15 years (Table 4.75; Map 32; BLM 2005c). This alternative would result in an increase of approximately 110,743 acres available for development (or 8.9%) and an increase of 1 predicted oil and gas well (or 1.4%) compared to the No Action Alternative. See the socioeconomic analysis in this chapter (Section 4.3.12, Socioeconomic Resources) for the projected yield of oil and gas for Alternative C.

Table 4.75. Predicted Oil and Gas Wells and Geophysical Exploration on BLM Lands within RFD Areas under Alternative C, Average 15 Years and Maximum per Year (MPY)

RFD Area	Acres of BLM Lands Available			% of BLM Lands Available	Predicted Wells*	Geophysical Exploration	
	Standard	Special	Total			Linear Miles of Source Line	Acres
AVERAGE OVER 15 YEARS							
Paradox Fold and Fault Belt	81,564	169,204	250,768	97	24	269	489
Blanding Sub-basin	254,706	142,314	397,020	98	41	205	271
Monument Upwarp	293,201	407,984	701,185	95	9	99	143
LOP Total	629,471	719,502	1,348,973		74	573	903
MAXIMUM PER YEAR (MPY)**							
Paradox Fold and Fault Belt	***	***	***	***	3	25	45
Blanding Sub-basin	***	***	***	***	4	14	25
Monument Upwarp	***	***	***	***	1	7	13
MPY Total	***	***	***		8	46	83

Note: Calculations based on BLM lands only.

*Oil and natural gas wells are considered together.

**Based on the RFD (BLM 2005c), MPY reflects the maximum development that *could* occur in *any given year*. During most Plan years, development per year will be less than this maximum.

Under this alternative, approximately 47% of all open BLM lands would be available under standard stipulations, and approximately 53% of all open BLM lands would be available under special stipulations. Although the overall acreage administratively open to leasing is greater under this alternative than under the No Action Alternative, Alternative C's standard stipulations/special stipulations ratio is very similar to that of the No Action Alternative.

Oil and gas development would occur in all three RFD areas. Similar to the No Action Alternative, the Monument Upwarp RFD area would see the least amount of development in terms of wells (i.e., 9), despite having the most lands administratively open to development. Also similar to the No Action Alternative, most wells (i.e., 41) would be drilled in the Blanding Sub-basin RFD Area. Some notable differences in the RFD areas' land categorizations can be seen between Alternative C and the No Action Alternative. In the Paradox Fold and Fault Belt RFD area, under Alternative C, more than two-thirds of available lands are subject to special stipulations, whereas under the No Action Alternative, nearly two-thirds of available lands are available under standard stipulations. In the Monument Upwarp RFD area, more than twice as much land is subject to standard stipulations under Alternative C compared to the No Action Alternative, while the land subject to special stipulations decreases by only about 7.9% under Alternative C.

Ultimately under Alternative C the direct impacts of mineral resource development decisions on oil and gas production would be beneficial, but negligible, compared to the No Action Alternative. A very small increase in the potential number of oil and gas wells under Alternative C (a 1.4% increase) would lead to a very small increase in the available supply of oil and/or natural gas and in royalties (see Section 4.3.12, Socioeconomic Resources).

Geophysical Exploration

Under Alternative C, approximately 573 linear miles of source line for 2-D and 3-D geophysical exploration would be conducted over 15 years for the purposes outlined in Section 4.3.7.2, Summary of Geophysical RFD and would result in approximately 903 acres of surface disturbance over 15 years. This exploration would result in beneficial impacts to mineral resource development of the same type and quality described in Section 4.3.7.2 and for the same reasons (BLM 2005c), to a greater degree than the No Action Alternative. Fourteen more miles of source line (an increase of 2.5%) would be used under Alternative C compared to the No Action Alternative. Geophysical exploration would occur in all three RFD areas, as detailed in Table 4.75.

Other Leasable Mineral Resources

Although 1,348,973 acres of BLM land would be administratively open under Alternative C for the leasing of potash and salt and tar sands (an increase of approximately 110,743 acres, or 8.9%, compared to the No Action Alternative), because the level of development expected is so low, impacts to potash and salt and tar sands leasing because of mineral resource development decisions would be nearly identical to those described under the No Action Alternative.

Locatable Mineral Resources

Approximately 1,734,458 acres of BLM land would be open under Alternative C to mineral entry of uranium-vanadium, copper, gold, and limestone, a decrease of approximately 81,715 acres, or an increase of approximately 4.6% compared to the No Action Alternative. The types

and forms of impacts under Alternative C would be the same as those described for the No Action Alternative.

Salable Mineral Resources

Approximately 1,358,968 acres of BLM land would be open to development of sand and gravel, building stone, and clay under Alternative C. This represents a decrease of approximately 40,288 acres compared to the No Action Alternative. Impacts under Alternative C would be essentially the same as those described for the No Action Alternative.

4.3.7.5.3.4. Impacts of Management of Non-WSA Lands with Wilderness Characteristics on Mineral Resource Development—Alternative C

Impacts under Alternative C would be the same as under Alternative A, for the same reasons.

4.3.7.5.3.5. Impacts of Recreation Decisions on Mineral Resource Development—Alternative C

Under Alternative C, in the 9,859-acre San Juan River SRMA, recreation decisions that pertain to mineral resource development would be the same as Alternative B, except that the entire SRMA, including the Bluff Airport vicinity, would be closed to mineral materials disposal. These recreation decisions would result in essentially the same impacts as Alternative B.

Under Alternative C, recreation decisions regarding the 375,739-acre Cedar Mesa Cultural SRMA would result in the same impacts that would occur under Alternative B.

4.3.7.5.3.6. Impacts of Soils and Watershed Decisions on Mineral Resource Development—Alternative C

Under Alternative C, a minimum of 1,063,652 acres of BLM lands open to surface-disturbing mineral resource development (or 76.6% of available BLM lands) are overlain by sensitive soils with medium and high limitations (Table 4.76). The particular requirements and limitations on such mineral resource development and the resulting impacts on mineral resource development would be the same as those under the No Action Alternative.

Table 4.76. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under Alternative C

RFD Area	Leasing Category	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
Blanding Sub-basin	Standard	254,706	Alkalinity	214,035	84.0
	Special	142,314	Alkalinity	117,263	82.4
	NSO, Open to ME ¹	8,213	Alkalinity	7,316	89.1
	Subtotals	405,233		338,614	83.6
Monument Upwarp	Standard	293,201	Alkalinity	207,717	70.8
	Special	407,984	Alkalinity	298,098	73.1
	NSO, Open to ME ¹	25,171	Alkalinity	24,069	95.6

Table 4.76. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under Alternative C

RFD Area	Leasing Category	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
	Subtotals	726,356		529,884	73.0
Paradox Fold and Fault Belt	Standard	81,564	Rooting Depth	64,994	79.7
	Special	169,204	Rooting Depth	124,877	73.8
	NSO, Open to ME ¹	5,939	Rooting Depth	5,283	89.0
	Subtotals	256,707		195,154	76.0
Total		1,388,296		1,063,652	76.6

1. NSO, Open to ME = No Surface Occupancy but Open to Mineral Entry.

2. Possible limiting factors are water erosion, wind erosion, droughty soils, excess salt, excess sodium, rooting depth, and alkalinity.

Under Alternative C, the impacts of requiring a plan for slopes between 21% and 40% and implementing the Gold Book Standards (BLM and FS 2005) would be the same as Alternative B. Implementing surface-disturbing mineral resource development on slopes over 40% is still generally disallowed under Alternative C, but if re-siting would cause "undue or unnecessary degradation" it may be allowed. Therefore, the negative, minor impacts of Alternative C on mineral resource development on slopes above 40% are similar in type to Alternative B but somewhat less in magnitude.

4.3.7.5.3.7. Impacts of Special Designations Decisions on Mineral Resource Development—Alternative C

Under Alternative C, 76,764 acres of BLM lands would occur in ACECs (Table 4.77). In all, 41,876 of these acres are subject to NSO or closed to leasing. If 4,602 acres (out of 41,876 acres) are automatically closed to leasing because they are located in WSAs, we assume that the remainder—37,274 acres—has been limited to mineral resource development as a direct result of designation of the ACECs (see Table 4.77). Therefore, for the purposes of this analysis, implementation of Alternative C represents a closure of 2.1% of all BLM lands (37,274 acres) due to ACEC designation. ACEC designation under Alternative C has less of a negative impact on mineral resource development than it does under the No Action Alternative (about 4.6% less) or under Alternative B (about 2.8% less).

Table 4.77. Acreages of Existing and Potential ACECs that are Available to Mineral Resource Development, if Designated under Alternative C

ACEC	Acres			VRM Outside WSA ²	Acres in Each Lease Category				Other Activities Outside WSAs

Shay Canyon	119	--	119	II	0	0	119	0	yes	no	yes
Valley of the Gods	22,863	--	22,863	I	0	0	22,863	0	--	no	--

"NA" and "--" both mean Not Applicable. Items in parenthesis are subsets of the first number above that is *not* in parenthesis.

1. Always VRM I, or closed to leasing.
2. According to Alternatives Matrix in Chapter 2, if specified.
3. To be managed as SRMA in this alternative.
4. Portions of Cedar Mesa ACEC lie within eight WSAs.

Under Alternative C, Colorado River Segments #2 and #3 and the Dark Canyon segment, a total of 3,968 acres, are recommended suitable for WSR designation. As the suitable segments would be managed as VRM I and II, these recommendations would effectively make these areas unavailable for leasing. This acreage accounts for a 0.2% decrease in BLM lands available for optimal mineral resource development in comparison with the No Action Alternative. Accordingly, this would result in essentially the same potential mineral resource development as the No Action Alternative.

4.3.7.5.3.8. Impacts of Special Status Species and Other Wildlife and Fisheries Decisions on Mineral Resource Development—Alternative C

Gunnison Sage-grouse

Approximately 4,524 acres of Gunnison Sage-grouse crucial year-round habitat, would be available for leasing subject to NSO. This represents less than 1.0% of the BLM lands in the Monticello Field Office. This would have a negligible impact on potential mineral resource development.

Bighorn Sheep Lambing and Rutting

The bighorn lambing and rutting seasons are shorter under Alternative C than they are under the No Action Alternative and Alternative B (30 days shorter for lambing and 16 days shorter for rutting; Table 4.78). Under Alternative C, the lambing timing restrictions would occur on 415,395 acres of crucial lambing habitat (or 23.3% of all BLM lands). This area is larger than that designated under the No Action Alternative (by 85,645 acres, or 26.0%), but smaller than that designated under Alternative B (by 37,993 acres, or 8.4%). Because Alternative C's lambing timing limitations are less than the No Action Alternative while the crucial habitat is greater, it cannot be determined whether the net, negative impacts on mineral resource development from Alternative C are more or less than the No Action Alternative. However, the impacts on mineral resource development from Alternative C are definitively less in magnitude than Alternative B, due to the smaller acreage of habitat and the shortened duration of the timing limitations.

Table 4.78. Additional Seasonal Restrictions within Established Buffer Zones Applied to Mineral Resource Development under Alternative C

Species	Dates	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Gunnison Sage-grouse leks (0.6 miles)													
Non-disturbing geophysical work	3/20 – 5/15												
All permitted activities (dawn hours)	3/20 – 5/15												
Bighorn – Lambing (415,395 acres)	4/1 – 6/15												
Bighorn – Rutting (453,390 acres)	10/15 – 12/15												
Pronghorn – Fawning (29,365 acres)	5/1 – 6/15												
Deer – Winter use (266,406 acres)	11/15 – 4/15												
Elk – Winter use (97,471 acres)	11/15 – 4/15												

Under Alternative C, the rutting timing restrictions would occur across a habitat area that is essentially the same size as under Alternative B. Because Alternative C's rutting timing limitations are less than the No Action Alternative while its crucial habitat acreage is greater, it cannot be determined whether the net, negative impacts on mineral resource development from Alternative C are more or less than the No Action Alternative. However, the impacts on mineral resource development from Alternative C are definitively less than Alternative B, due to the shortened duration of the timing limitations under Alternative C.

Pronghorn Fawning Area

Under Alternative C, impacts on mineral resource development due to pronghorn decisions would be the same as under Alternative B.

Deer Winter Range

Under Alternative C, on the 266,406-acre deer crucial winter range (or 14.9% of all BLM lands), the special conditions described in Chapter 2 would be enforced for 181 days of critical winter use (see Table 4.78). These management decisions would result the same type and quality of impacts to mineral resource development as are described under the No Action Alternative, but to a greater degree. Alternative C results in greater impacts both in terms of the larger area being restricted as winter range (larger by 68,856 acres, or 34.9% compared to the No Action Alternative) and the longer duration of enforcement of the restrictions (longer by 30 days, or 16.6% compared to the No Action Alternative).

Elk

Under Alternative C, on the 97,471-acre elk crucial winter range (or 5.5% of all BLM lands), the special conditions described in Chapter 2 would be enforced for 181 days of critical winter use (see Table 4.78). These management decisions would result in the same type and quality of impacts to mineral resource development as are described under Alternative B, but to a lesser degree. Alternative C results in fewer impacts both in terms of the smaller area being restricted as winter range (smaller by 93,702 acres, or 49.0% compared to Alternative B) and the shorter duration of enforcement of the restrictions (shorter by 15 days, or 7.7% compared to Alternative B).

In all, wildlife decisions necessitating special stipulations would impact various acreages at various times of the year. Under Alternative C, no wildlife related timing limitations would be enforced on any acreage from June 15 through October 15 (122 days). This amounts to less restriction to mineral resource development compared to Alternative B and the No Action Alternative, in the form of an additional month of mineral resource development without wildlife related timing limitations. At the other end of the spectrum, restrictions from November 15 through December 15 would be enforced on up to 729,567 acres (or 41% of all BLM lands, assuming overlap; see Table 4.65) under Alternative C³. This maximum is less restrictive than Alternative B but more restrictive than Alternative D.

³ The maximum of 729,567 acres was derived from the acres subject to special stipulations in Table 4.41, rather than the maximum acreage in Table 4.54 (which would have been 817,267 acres, assuming no overlap). As 817,267 acres is greater than the acreage subject to special stipulations in Table 4.41 (729,567 acres), it is evident that there is considerable overlap among the various habitats. Therefore, at the most limited time of November 15–December 15, the maximum acreage that can be assumed is the one in Table 4.41.

4.3.7.5.3.9. Impacts of Vegetation Management Decisions on Mineral Resource Development—Alternative C

Impacts on mineral resource development under Alternative C would be essentially the same as under the No Action Alternative. Although only the vegetation of the Lavender Mesa ACEC would be protected, the area of the Bridger Jack Mesa ACEC—in which surface disturbance would be allowed—is such a small proportion of the total planning area that the impacts at the PA-wide level would be essentially the same at approximately 0.03%.

4.3.7.5.3.10. Impacts of Visual Resource Decisions on Mineral Resource Development—Alternative C

Under Alternative C, approximately 425,179 acres (or 23.8% of BLM lands) would fall into the VRM I class, and in these areas, mineral resource development would be subject to NSO or closed to leasing because of the restrictions on surface disturbance in this VRM class.

Adverse impacts under Alternative C would be of the same type as the No Action Alternative, for the same reasons. The magnitude of these impacts would be greater than Alternative A (by 2.9%) but less than Alternative B.

4.3.7.5.4. ALTERNATIVE D

4.3.7.5.4.1. Impacts of Cultural Resource Decisions on Mineral Resource Development Under Alternative D

Under Alternative D, Comb Ridge would not be managed as a CSMA and no cultural resource decisions affecting mineral resource development are specified. Therefore, impacts on the mineral resource development of Comb Ridge under Alternative D would be the same as impacts under the No Action Alternative. Under Alternative D, Tank Bench would not be managed as a CSMA; however, the impacts on mineral resource development would be the same as under Alternatives A and C. Under Alternative D, impacts to development of mineral resources underlying the Grand Gulch Historic District would be the same as Alternative B, except that "casual use" geophysical exploration (as defined under 43 CFR § 3150; see Chapter 2) would be allowed, resulting in negligible but beneficial impacts in the form of improvements in the accuracy and amount of data and knowledge on the mineral resource reserves underlying the historic district.

4.3.7.5.4.2. Impacts of Lands and Realty Decisions on Mineral Resource Development Under Alternative D

Under Alternative D, approximately 46,131 acres (or 2.6% of all BLM lands) would be recommended for withdrawal from mineral entry. This decision would result in a very low level of adverse impacts to mineral resource development (see Alternative A for impact types and forms), similar to Alternative C.

4.3.7.5.4.3. Impacts of Mineral Decisions on Mineral Resource Development Under Alternative D

Oil and Gas Resources

In total, approximately 1,383,283 acres of BLM lands within the Monticello FO would be administratively open for oil and gas leasing under standard and special lease stipulations, within the three RFD development areas (see Table 4.65). Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005d), it is estimated that 75 predicted oil and gas wells would be drilled over the next 15 years (Table 4.79; Map 30; BLM 2005c). This alternative would result in an increase of approximately 145,053 acres available for development (or 11.7%) and an increase of 2 predicted oil and gas wells (or 2.7%) compared to the No Action Alternative. See the socioeconomic analysis in this chapter (Section 4.3.12, Socioeconomic Resources) for the projected yield of oil and gas for Alternative D.

Of all the alternatives, Alternative D represents the largest amount of land open for mineral resource development, under the least restrictive terms; Alternative D has the most land available under standard stipulations (at approximately 962,300 acres, or 69.6% of available lands) and represents a substantial increase in lands available under standard stipulations over the No Action Alternative—an increase of nearly 383,700 acres, or 66.3%. The shift toward standard stipulations under Alternative D also requires lowering the proportion of available lands subject to special stipulations from 53.3% of available lands under the No Action Alternative to 30.4% of available lands under Alternative D (see Table 4.79).

Oil and gas development would occur in all three RFD areas. Similar to the No Action Alternative, the Monument Upwarp RFD area would see the least amount of development in terms of wells (i.e., 9), despite having the most lands administratively open to development. Also similar to the No Action Alternative, most wells (i.e., 41) would be drilled in the Blanding Sub-basin RFD area. Between the No Action Alternative and Alternative D, leasing stipulations appear to have shifted out of special stipulations and into standard stipulations, particularly in the Monument Upwarp and Blanding Sub-basin RFD areas. It also appears that the acreage difference between the No Action Alternative and Alternative D can be found almost entirely within the Monument Upwarp RFD area: there is a difference of almost 141,000 acres between the No Action Alternative and Alternative D in the Monument Upwarp RFD area, while the other two RFD areas stay about the same size.

Table 4.79. Predicted Oil and Gas Wells and Geophysical Exploration on BLM Lands within RFD Areas under Alternative D, Average over the 15 Years and Maximum per Year (MPY)

RFD Area	Acres of BLM Lands Available			% of BLM Lands Available	Predicted Wells*	Geophysical Exploration	
	Standard	Special	Total			Linear Miles of Source Line	Acres
AVERAGE OVER 15 YEARS							
Paradox Fold and Fault Belt	153,496	104,374	257,870	100	25	277	504
Blanding Sub-basin	303,258	94,233	397,491	98	41	205	271
Monument Upwarp	505,529	222,393	727,922	99	9	103	149
LOP Total	962,283	421,000	1,383,283		75	585	924
MAXIMUM PER YEAR (MPY)**							
Paradox Fold and Fault Belt	***	***	***	***	3	25	46
Blanding Sub-basin	***	***	***	***	4	14	25
Monument Upwarp	***	***	***	***	1	8	14
MPY Total	***	***	***		8	47	85

Note: Calculations based on BLM lands only.

*Oil and natural gas wells are considered together.

**Based on the RFD (BLM 2005d), MPY reflects the maximum development that *could* occur in *any given year*. During most Plan years, development per year will be less than this maximum.

Ultimately, under Alternative D, the direct impacts of mineral resource development decisions on oil and gas production would be beneficial, but negligible, compared to the No Action Alternative. A very small increase in the potential number of oil and gas wells under Alternative D (a 2.7% increase) would lead to a very small increase in the available supply of oil and/or natural gas and in royalties (see Section 4.3.12, Socioeconomic Resources).

Geophysical Exploration

Under Alternative D, approximately 585 linear miles of source line for 2-D and 3-D geophysical exploration would be conducted over the next 15 years for the purposes outlined in Section 4.3.7.2, Summary of Geophysical RFD and would result in approximately 924 acres of surface disturbance over the next 15 years. This exploration would result in beneficial impacts to mineral resource development of the same type and quality described in Section 4.3.7.2, for the same reasons (BLM 2005d), to a greater degree than the No Action Alternative. Under Alternative D, 26 more miles of source line (an increase of 4.7%) would be used compared to the No Action Alternative. Geophysical exploration would occur in all three RFD areas, as detailed in Table 4.79.

Other Leasable Mineral Resources

Although 1,348,973 acres of BLM land would be administratively open under Alternative D for the leasing of potash and salt and tar sands (an increase of approximately 110,743 acres, or compared to the No Action Alternative), because the level of development expected is so low, impacts on potash and salt and tar sands leasing because of mineral resource development decisions would be nearly identical to those described under the No Action Alternative.

Locatable Mineral Resources

Approximately 1,739,389 acres of BLM land would be open under Alternative D to mineral entry of uranium-vanadium, copper, gold, and limestone, an increase of nearly 64,332 acres, or 3.8% compared to the No Action Alternative. Impacts on locatable resources would be beneficial compared to the No Action Alternative, due to the increased acreage available for the development of these resources.

Salable Mineral Resources

Approximately 1,383,277 acres of BLM land would be open to development of sand and gravel, building stone, and clay under Alternative D (Map 24). This represents a decrease of nearly 6,000 acres (0.4%) compared to the No Action Alternative. Impacts under Alternative D would be essentially the same as those described for the No Action Alternative.

4.3.7.5.4.4. Impacts of Management of Non-WSA Lands with Wilderness Characteristics on Mineral Resource Development Under Alternative D

Impacts under Alternative D would be the same as under Alternative A, for the same reasons.

4.3.7.5.4.5. Impacts of Recreation Decisions on Mineral Resource Development Under Alternative D

Under Alternative D, recreation decisions regarding the 10,203-acre San Juan River SRMA and the 375,734-acre Cedar Mesa Cultural SRMA would result in essentially the same impacts that would occur under Alternative B.

4.3.7.5.4.6. Impacts of Soils and Watershed Decisions on Mineral Resource Development Under Alternative D

Under Alternative D, a minimum of 1,069,495 acres of BLM lands open to surface-disturbing mineral resource development (or 76.5% of available BLM lands) are overlain by sensitive soils with medium and high limitations (Table 4.80). The particular requirements and limitations on such mineral resource development and the resulting impacts on mineral resource development would be the same as those under the No Action Alternative.

Table 4.80. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under Alternative D

RFD Area	Leasing Stipulation	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage

	Special	104,374	Rooting Depth	73,794	70.7
	NSO, Open to ME ¹	0	—	0	—
	Subtotal	257,870		196,123	76.1
Total		1,397,459		1,069,495	76.5

1. NSO, Open to ME = No Surface Occupancy but Open to Mineral Entry.

2. Possible limiting factors are water erosion, wind erosion, droughty soils, excess salt, excess sodium, rooting depth, and alkalinity.

Under Alternative D, the impacts of requiring a plan only for slopes greater than 40% would be the same as Alternatives B and C in type. However, the impacts under Alternative D would be much less than Alternatives B and C in magnitude.

4.3.7.5.4.7. Impacts of Special Designations Decisions on Mineral Resource Development Under Alternative D

Under Alternative D, zero acres of BLM lands would be designated as ACECs (Table 4.81). Though management prescriptions are made for these parcels of land (e.g., leasing and VRM categories, whether to allow minerals entry, disposal, or geophysical work) none of these prescriptions are associated with an ACEC designation. Therefore, under Alternative D, special designation decisions regarding ACECs would have no impacts on mineral resource development.

Under Alternative D, none of the river segments recommended for WSR designation in other alternatives are recommended as suitable. Therefore, under Alternative D, WSR decisions would cause no impacts on mineral resource development.

4.3.7.5.4.8. Impacts of Special Status Species and Other Wildlife and Fisheries Decisions on Mineral Resource Development Under Alternative D

Gunnison Sage-grouse

Impacts to mineral resource development under Alternative D would be of the same type and quality as under Alternative B, except that the reserved year-round habitat would be slightly smaller (at 2,877 acres, which is a decrease of 1,647 acres, or 36.4%, compared to Alternative B) and that the lek habitat buffer zone would be slightly smaller (i.e., 0.25-mile buffer around lek habitat under Alternative D, compared with the 2.0-mile buffer in Alternative B). Of all the action alternatives, Alternative D represents the fewest Gunnison Sage-grouse related restrictions on mineral resource exploration, development, and production.

Bighorn Sheep Lambing and Rutting

The bighorn lambing and rutting seasons under Alternative D are identical to those under Alternative C (i.e., shorter than under the No Action Alternative and Alternative B; Table 4.82). Under Alternative D, the lambing and rutting timing restrictions would occur on 299,009 acres of crucial habitat (or 16.8% of all BLM lands). This area is smaller than that designated under the No Action Alternative (by 30,741 acres, or 9.3%), smaller than that designated under Alternative B (by 154,379 acres, or 34.1%), and smaller than that designated under Alternative C (by at least 116,386 acres, or 28.0%), making Alternative D by far the least restrictive to mineral resource exploration, development and production in terms of wildlife decisions of both timing limitations and habitat acreage restrictions. Nonetheless, impacts from these wildlife decisions would be of the type and quality described under the No Action Alternative.

Pronghorn Fawning Area

Under Alternative D, impacts on mineral resource development from pronghorn decisions would be the same in type and quality as under Alternative B, except they would occur over a smaller area: 13,961 acres (or 1.0% of all BLM lands; see Table 4.82). This crucial habitat area is approximately 1,000 acres (7.7%) larger than it is under the No Action Alternative but approximately 15,400 acres (52.5%) smaller than under Alternatives B and C. Ultimately, impacts would be greater than under the No Action Alternative but less than under Alternatives B and C.

"NA" and "--" both mean Not Applicable. Items in parenthesis are subsets of the first number above that is *not* in parenthesis.

1. Always VRM I, or closed to leasing.
2. According to Alternatives Matrix in Chapter 2, if specified.
3. To be managed as SRMA in this alternative.
4. Portions of Cedar Mesa ACEC lie within eight WSAs.

Table 4.82. Additional Seasonal Restrictions within Established Buffer Zones Applied to Mineral Resource Development under Alternative D

Species	Dates	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Gunnison Sage-grouse leks (0.25 miles)													
Non-disturbing geophysical work	3/20 – 5/15												
Minerals Ops activities (dawn hours)	3/20 – 5/15												
Bighorn – Lambing (299,009 acres)	4/1 – 6/15												
Bighorn – Rutting (299,009 acres)	10/15 – 12/15												
Pronghorn – Fawning (13,961 acres)	5/1 – 6/15												
Deer – Winter use (182,315 acres)	12/1 – 4/15												
Elk – Winter use (62,484 acres)	12/1 – 4/15												

Deer Winter Range

Under Alternative D, on the 182,315-acre deer crucial winter range (or 10.2% of all BLM lands), the special conditions described in Chapter 2 would be enforced for 136 days of critical winter use (see Table 4.82). These management decisions would result the same type and quality of impacts on mineral resource development as are described under the No Action Alternative, but to a lesser degree. Alternative D results in fewer impacts both in terms of the smaller area being restricted as winter range (smaller by 15,235 acres, or 7.7% compared to the No Action Alternative) and the shorter duration of enforcement of the restrictions (shorter by 15 days, or 9.9%, compared to the No Action Alternative). Therefore, of all the alternatives, Alternative D represents the least amount of restriction to mineral resource development due to deer winter range decisions.

Elk

Under Alternative D, on the 62,484-acre elk crucial winter range (or 3.5% of all BLM lands), the special conditions described in Chapter 2 would be enforced for 136 days of critical winter use (see Table 4.82). These management decisions would result the same type and quality of impacts on mineral resource development as are described under Alternative B, but to a much lesser degree. Alternative D would result in fewer impacts to mineral resource development both in terms of the smaller area being restricted as winter range (smaller by 128,689 acres, or 67.3%, compared to Alternative B) and the shorter duration of enforcement of the restrictions (shorter by 60 days, or 30.6%, compared to Alternative B). Elk management decisions under Alternative E would result in the least impacts on mineral resource development of all the alternatives.

In all, wildlife decisions necessitating special stipulations would impact various acreages at various times of the year. Under Alternative D, no wildlife related timing limitations would be enforced on any acreage from June 15 through October 15—identical to Alternative C (122 days). At the other end of the spectrum, restrictions from April 1–15 and from December 1–15 would be enforced on up to 420,998 acres (or 23.6% of all BLM lands, assuming overlap; see Table 4.65) under Alternative D.⁴ This acreage represents the least restriction of mineral resource development of all the alternatives.

4.3.7.5.4.9. Impacts of Vegetation Management Decisions on Mineral Resource Development Under Alternative D

Under Alternative D, no relict or near relict vegetation would be protected. Therefore, no impacts on mineral resource development would result from vegetation management decisions.

4.3.7.5.4.10. Impacts of Visual Resource Decisions on Mineral Resource Development Under Alternative D

Under Alternative D, approximately 390,424 acres (or 21.9% of BLM lands) would fall into the VRM I class, and in these areas, mineral resource development would be subject to NSO or closed to leasing because of the restrictions on surface disturbance in this VRM class.

⁴ The maximum of 420,998 acres was derived from the acres subject to special stipulations in Table 4.41, rather than the maximum acreage in Table 4.55 (which would have been 543,808 acres, assuming no overlap). As 543,808 acres is greater than the acreage subject to special stipulations in Table 4.41 (420,998 acres), it is evident that there is considerable overlap among the various habitats. Therefore, at the most limited times of April 1–15 and December 1–15, the maximum acreage that can be assumed is the one in Table 4.41.

Of the action alternatives, Alternative D most closely resembles the No Action Alternative. Adverse impacts under Alternative D would be of the same type as the No Action Alternative, for the same reasons. The magnitude of these impacts would be greater than Alternative A (by 1.0%) but less than Alternatives B and C.

4.3.7.5.5. ALTERNATIVE E

4.3.7.5.5.1. Impacts of Cultural Resource Decisions on Mineral Resource Development Under Alternative E

Impacts under Alternative E would be the same as under Alternative B, except that the 30,752-acre Comb Ridge CSMA would be closed to mineral resource development instead of subject to NSO. This additional restriction on mineral resource development from cultural resource decisions would be a more adverse impact on mineral resource development than Alternative B, as not even directional drilling would be allowed in this CSMA.

4.3.7.5.5.2. Impacts of Lands and Realty Decisions on Mineral Resource Development Under Alternative E

Under Alternative E, approximately 582,360 acres of non-WSA lands with wilderness characteristics would be managed as exclusion areas for ROWs. This would limit mineral production and access for exploration. Existing production could be limited by not allowing needed ROWs. Non-WSA lands with wilderness characteristics would also be recommended for withdrawal from mineral entry, prohibiting development of uranium-vanadium, copper, gold, and limestone on 582,360 acres.

4.3.7.5.5.3. Impacts of Mineral Decisions on Mineral Resource Development Under Alternative E

Oil and Gas Resources

In total, approximately 758,931 acres of BLM lands within the Monticello FO would be administratively open for oil and gas leasing under standard and special lease stipulations, within the three RFD development areas (see Table 4.65). Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005d), it is estimated that 54 predicted oil and gas wells would be drilled over the next 15 years (Table 4.83; Map 31; BLM 2005c). This alternative would result in a decrease of approximately 479,300 acres available for development (or 38.7%) and a decrease of 19 predicted oil and gas wells (or 26.0%) compared to the No Action Alternative. See the socioeconomic analysis in this chapter (Section 4.3.12, Socioeconomic Resources) for the projected yield of oil and gas for Alternative E.

Table 4.83. Predicted Oil and Gas Wells and Geophysical Exploration on BLM Lands within RFD Areas under Alternative E, Average over 15 Years and Maximum per Year (MPY)

RFD Area	Acres of BLM Lands Available			% of BLM Lands Available	Predicted Wells*	Geophysical Exploration	
	Standard	Special	Total			Linear Miles of Source Line	Acres
AVERAGE OVER 15 YEARS							
Paradox Fold and Fault Belt	21,584	132,087	153,671	60	15	165	301
Blanding Sub-basin	130,253	217,905	348,158	86	36	179	237
Monument Upwarp	61,451	195,648	257,099	35	3	36	53
Lop Total	213,288	545,640	758,928		54	380	591
MAXIMUM PER YEAR (MPY)**							
Paradox Fold and Fault Belt	***	***	***	***	2	15	28
Blanding Sub-basin	***	***	***	***	4	12	22
Monument Upwarp	***	***	***	***	1	3	5
MPY Total	***	***	***		7	30	55

Note: Calculations based on BLM lands only.

*Oil and natural gas wells are considered together.

**Based on the RFD (BLM 2005d), MPY reflects the maximum development that *could* occur in *any given year*. During most Plan years, development per year will be less than this maximum.

By far, Alternative E would result in the most adverse impacts on mineral resource development, compared to the No Action Alternative. One contributing factor in the decrease of acres available and wells (compared to the No Action Alternative) is that Alternative E has the smallest acreage of BLM lands available under standard stipulations (the most open stipulations), of all the alternatives. Under this alternative, approximately 28% of all open BLM lands would be available under standard stipulations, and approximately 72% of all open BLM lands would be subject to special stipulations. However, the greatest contributing factor in the decrease of acres available and wells is the closure of non-WSA lands with wilderness characteristics under Alternative E.

Oil and gas development likely would occur in all three RFD areas, but most years, the Monument Upwarp RFD area would see no development in terms of wells (see Table 4.83). Alternative E is the only alternative in which the Monument Upwarp RFD area has fewer lands open to leasing than another RFD area—specifically, the Blanding Sub-basin RFD area. Indeed, the Blanding Sub-basin RFD area is the area that changes least in terms of acres available under Alternative E compared to the No Action Alternative; the Blanding Sub-basin RFD area is only 49,909 acres smaller under Alternative E. Similar to the No Action Alternative, most wells (36) would be drilled in the Blanding Sub-basin RFD area. In a comparison between Alternative E and the No Action Alternative, the notable difference between percentage of lands available and percentage of wells drilled over 15 years can be explained by the fact that many of the non-WSA lands with wilderness characteristics in the Monument Upwarp RFD Area, which already has a lower development potential than the other 2 RFD areas.

Ultimately, a decrease in the potential number of oil and gas wells under Alternative E (a 26% decrease) would lead to a decrease in the available supply of oil and/or natural gas. The federal government and/or the State of Utah would continue to receive royalties from the production and sale of oil and gas, though at lower rates than under the No Action Alternative (see Section 4.3.12, Socioeconomic Resources). However, the decreased number of predicted wells would also decrease the rate at which finite reserves of fossil fuel resources in the Monticello FO are extracted and consumed (compared to the No Action Alternative), which would have a beneficial impact on the long-term viability and availability of these resources.

Geophysical Exploration

Under Alternative E, approximately 380 linear miles of source line for 2-D and 3-D geophysical exploration would be conducted over the next 15 years for the purposes outlined in Section 4.3.7.2, Summary of Geophysical RFD, and would result in approximately 591 acres of surface disturbance over the next 15 years. This exploration would result in beneficial impacts to mineral resource development of the same type and quality described in Section 4.3.7.2, for the same reasons (BLM 2005d). However, less exploration would happen under Alternative E than under the No Action Alternative: 179 fewer miles of source line (a decrease of 32.0%) would be used under Alternative E compared to the No Action Alternative. Geophysical exploration would occur in all three RFD areas, as detailed in Table 4.83.

Other Leasable Mineral Resources

Although 758,929 acres of BLM land would be administratively open under Alternative E for the leasing of potash and salt and tar sands (a decrease of approximately 479,301 acres, or 39%, compared to the No Action Alternative), because the level of development expected is so low,

impacts on potash and salt and tar sands leasing from mineral resource development decisions would be the same as impacts under the No Action Alternative.

Locatable Mineral Resources

Approximately 1,015,384 acres of BLM land would be open under Alternative E to mineral entry of uranium-vanadium, copper, gold, and limestone, a decrease of approximately 659,673 acres, compared to the No Action Alternative. Impacts of locatable resource decisions under this alternative would be essentially the same as those described for the No Action Alternative, except that there would be slightly less acreage available for the development of these resources.

Salable Mineral Resources

Approximately 758,931 acres of BLM land would be open to development of sand and gravel, building stone, and clay under Alternative E (Map 25). This represents a decrease of approximately 630,324 acres compared to the No Action Alternative. Impacts of salable resource decisions under this alternative would be essentially of the same form and type as those described for the No Action Alternative, except that they would be more adverse under Alternative E.

4.3.7.5.5.4. Impacts of Management of Non-WSA Lands with Wilderness Characteristics on Mineral Resource Development Under Alternative E

Under Alternative E, approximately 582,360 acres of non-WSA lands with wilderness characteristics (or 32.6%) would be managed as closed to mineral leasing, proposed for withdrawal from mineral entry, ROW avoidance area, closed to disposal of mineral materials, and managed as VRM I.

These management decisions would have an adverse impact on mineral resource development. Fewer lands would be available for oil and gas leasing and subsequent mineral resource development; this would result in fewer wells drilled over the next 15 years. Adverse impacts on mineral entry could occur because 32.6% fewer acres would be available for development of locatable minerals, resulting in less mining activity and less production of uranium-vanadium, copper, and placer gold.

4.3.7.5.5.5. Impacts of Recreation Resource Decisions on Mineral Resource Development Under Alternative E

Impacts from recreation decisions under Alternative E would be the same as under Alternative B. Impacts of recreation decisions under Alternative E would result in an adverse impact compared to the No Action Alternative, of essentially the same magnitude as Alternative B. Non-WSA lands with wilderness characteristics which would be closed to leasing, occur within many SRMAs, but these closures are not a result of recreation decisions.

4.3.7.5.5.6. Impacts of Soils and Watershed Decisions on Mineral Resource Development Under Alternative E

Under Alternative E, a minimum of 659,170 acres of BLM lands open to surface-disturbing mineral resource development (or 81.1% of open BLM lands) are overlain by sensitive soils with medium and high limitations (Table 4.84). The particular requirements and limitations on such

mineral resource development and the resulting impacts on mineral resource development would be the same as those under the No Action Alternative; however, Alternative E is unique because, while it reflects the lowest minimum acreage, it also reflects the highest percentage of open BLM lands overlain by sensitive soils.

Table 4.84. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under Alternative E

RFD Area	Leasing Category	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
Blanding Sub-basin	Standard	130,253	Alkalinity	110,367	84.7
	Special	217,905	Alkalinity	182,198	83.6
	NSO, Open to ME ¹	21,427	Alkalinity	19,319	90.2
	Subtotal	369,585		311,884	84.4
Monument Upwarp	Standard	61,451	Alkalinity	42,971	69.9
	Special	195,648	Alkalinity	153,274	78.3
	NSO, Open to ME ¹	7,960	Droughty	7,678	96.5
	Subtotal	265,059		203,923	76.9
Paradox Fold and Fault Belt	Standard	21,584	Alkalinity	17,702	82.0
	Special	132,087	Rooting Depth	103,840	78.6
	NSO, Open to ME ¹	24,528	Droughty	21,821	89.0
	Subtotal	178,199		143,363	80.5
Total		812,843		659,170	81.1

1. NSO, Open to ME = No Surface Occupancy but Open to Mineral Entry.

2. Possible limiting factors are water erosion, wind erosion, droughty soils, excess salt, excess sodium, rooting depth, and alkalinity.

Under Alternative E, impacts on areas of over 20% slope would be the same as under Alternative B, for the same reasons.

4.3.7.5.5.7. Impacts of Special Designations Decisions on Mineral Resource Development Under Alternative E

Under Alternative E, 521,141 acres of BLM lands would occur in ACECs (Table 4.85). In all, 432,145 of these acres are subject to NSO or closed to leasing. If 393,477 acres (out of 432,145 acres) are automatically closed to leasing because they are located in WSAs or are non-WSA lands with wilderness characteristics, we assume that the remainder—38,668 acres—has been limited to mineral resource development as a direct result of designation of the ACECs (see Table 4.85). Therefore, for the purposes of this analysis, implementation of Alternative E represents a limitation of 2.2% of all BLM lands (38,668 acres) due to ACEC designation. ACEC designation under Alternative E has less of a negative impact on mineral resource development than it does under the No Action Alternative (about 4.5% less) or Alternative B (about 2.7% less). Alternative E is most like Alternative C in terms of impacts to mineral resource development from ACEC designation.

Table 4.85. Acreages of Existing and Potential ACECs that are Available to Mineral Resource Development, if Designated under Alternative E

ACEC	Acres			VRM Outside WSA and LWC ²	Lease Stipulations (Acres)				Other Activities Outside WSAs

Valley of the Gods	22,863	20,743	2,120	I	0	0	0	22,863	no	no	--

"NA" and "--" both mean Not Applicable. Items in parenthesis are subsets of the first number above that is *not* in parenthesis.

LWC = Lands with Wilderness Characteristics; bolded ACECs indicate those with LWCs.

1. Always VRM I, or closed to leasing.
2. According to Alternatives Matrix in Chapter 2, if specified.
3. Portions of Cedar Mesa ACEC lie within eight WSAs.
4. To be managed as SRMA in this alternative.

Impacts due to WSR recommendations under Alternative E would be the same in type and form as under Alternative B.

4.3.7.5.5.8. Impacts of Special Status Species and Other Wildlife and Fisheries Decisions on Mineral Resource Development Under Alternative E

Gunnison Sage-grouse

Under Alternative E, management decisions regarding Gunnison Sage-grouse would be the same as under Alternative B, as would the impacts on mineral resource development from these management decisions.

Bighorn Sheep Lambing and Rutting

Under Alternative E, on the 453,386-acre bighorn crucial habitat area (or 25.4% of all BLM lands), the special conditions described in Chapter 2 would be enforced for the duration of the lambing season and rutting season (Table 4.86; see also the No Action Alternative for the duration). These management decisions would result in the same impacts as Alternative B.

Pronghorn Fawning Area

Impacts under Alternative E would be the same as under Alternative B, for the same reasons.

Deer Winter Range

Impacts under Alternative E would be the same as under Alternative B, for the same reasons.

Elk

Impacts under Alternative E would be the same as under Alternative B, for the same reasons.

4.3.7.5.5.9. Impacts of Vegetation Management Decisions on Mineral Resource Development Under Alternative E

Impacts on mineral resource development under Alternative E would be essentially the same as under Alternative B, except that fewer acres of vegetation would be treated (2,000 acres/year), and because the same acreages of vegetation would be protected from surface disturbance.

4.3.7.5.5.10. Impacts of Visual Resource Decisions on Mineral Resource Development Under Alternative E

Under Alternative E, approximately 998,370 acres (or 56.0% of BLM lands) would fall into the VRM I class, and in these areas, mineral resource development would be subject to NSO or closed to leasing because of the restrictions on surface disturbance in this VRM class. Adverse impacts under Alternative E would be of the same type as under the No Action Alternative, for the same reasons, but at a greater magnitude (35.1%). Alternative E proposes the greatest VRM related limits to mineral resource development.

Table 4.86. Additional Seasonal Restrictions within Established Buffer Zones Applied to Mineral Resource Development under Alternative E

Species	Dates	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Gunnison Sage-grouse leks (2.0 miles)													
• Non-disturbing geophysical work	3/20 – 5/15

Bighorn – Lambing (453,388 acres)	4/1 – 7/15												
Bighorn – Rutting (453,388 acres)	10/15 – 12/31												
Pronghorn – Fawning (29,365 acres)	5/1 – 6/15												
Deer – Winter use (785,921 acres)	11/1 – 5/15												
Elk – Winter use (191,173 acres)	11/1 – 5/15												

4.3.7.5.6. PROPOSED PLAN

4.3.7.5.6.1. Impacts of Cultural Resource Decisions on Mineral Resource Development Under The Proposed Plan

Under the Proposed Plan, cultural resource decisions regarding the 37,388-acre Grand Gulch National Historic District, Comb Ridge Management Zone (30,752 acres) McLoyd-Moon House (1,609 acres), and Beef Basin SRMA (20,302 acres) would result in the same impacts to mineral resource development as occur under Alternative B.

4.3.7.5.6.2. Impacts of Lands and Realty Decisions on Mineral Resource Development Under The Proposed Plan

Under the Proposed Plan, approximately 50,665 acres (or 2.9% of all BLM lands) would be recommended for withdrawal from mineral entry. This decision has the potential to result in adverse impacts of the same type as the No Action Alternative, but at a much lower magnitude.

4.3.7.5.6.3. Impacts of Mineral Decisions on Mineral Resource Development Under The Proposed Plan

Oil and Gas Resources

In total, approximately 1,224,811 acres of BLM lands within the Monticello FO would be administratively open for oil and gas leasing under standard and special lease stipulations within the three RFD development areas (see Table 4.65). Based on the proportion of BLM lands open for leasing and the RFD (BLM 2005d), it is estimated that 72 predicted oil and gas wells would be drilled over the next 15 years (Table 4.87; Map 32; BLM 2005c). This alternative would result in a decrease of approximately 17,102 acres available for development and a decrease of 1 predicted oil and gas well (or 1.4%) compared to the No Action Alternative. See the socioeconomic analysis in this chapter (Section 4.3.12, Socioeconomic Resources) for the projected yield of oil and gas for the Proposed Plan.

Under this alternative, approximately 40% of all open BLM lands would be available under standard stipulations, and approximately 60% of all open BLM lands would be available under special stipulations. Although the overall acreage administratively open to leasing is greater under this alternative than under the No Action Alternative, standard stipulations/special stipulations ratio under the Proposed Plan is very similar to that of the No Action Alternative.

Oil and gas development would occur in all three RFD areas. Similar to the No Action Alternative, the Monument Upwarp RFD area would see the least amount of development in terms of wells (i.e., 9), despite having the most lands administratively open to development.

Table 4.87. Predicted Oil and Gas Wells and Geophysical Exploration on BLM Lands within RFD Areas under The Proposed Plan, Average over 15 Years and Maximum per Year (MPY)

RFD Area	Acres of BLM Lands Available			% of BLM Lands Available	Predicted Wells*	Geophysical Exploration	
	Standard	Special	Total			Linear Miles of Source Line	Acres
AVERAGE OVER 15 YEARS							
Paradox Fold and Fault Belt	40,242	210,525	250,767	97	24	269	489
Blanding Sub-basin	224,265	145,007	369,272	96	41	205	271
Monument Upwarp	230,925	376,945	607,870	83	7	99	143
LOP Total	629,471	732,477	1,227,909		72	573	903
MAXIMUM PER YEAR (MPY)**							
Paradox Fold and Fault Belt	***	***	***	***	3	25	45
Blanding Sub-basin	***	***	***	***	4	14	25
Monument Upwarp	***	***	***	***	1	7	13
MPY Total	***	***	***		8	46	83

Note: Calculations based on BLM lands only.

*Oil and natural gas wells are considered together.

**Based on the RFD (BLM 2005d), MPY reflects the maximum development that *could* occur in *any given year*. During most Plan years, development per year will be less than this maximum.

Also similar to the No Action Alternative, most wells (i.e., 41) would be drilled in the Blanding Sub-basin RFD Area. Some notable differences in the RFD areas' leasing stipulations can be seen between the Proposed Plan and the No Action Alternative. In the Paradox Fold and Fault Belt RFD area, under the Proposed Plan, more than two-thirds of available lands are subject to special stipulations, whereas under the No Action Alternative, nearly two-thirds of available lands are available under standard stipulations. In the Monument Upwarp RFD area, more than twice as much land is subject to standard stipulations under the Proposed Plan compared to the No Action Alternative, while the land subject to special stipulations decreases by only about 7.9% under the Proposed Plan.

Ultimately under the Proposed Plan the direct impacts of mineral resource development decisions on oil and gas production would be beneficial, but negligible, compared to the No Action Alternative. A very small increase in the potential number of oil and gas wells under the Proposed Plan (a 1.4% increase) would lead to a very small increase in the available supply of oil and/or natural gas and in royalties (see Section 4.3.12, Socioeconomic Resources).

Geophysical Exploration

Under the Proposed Plan, approximately 556 linear miles of source line for 2-D and 3-D geophysical exploration would be conducted over the next 15 years for the purposes outlined in Section 4.3.7.2, Summary of Geophysical RFD and would result in approximately 879 acres of surface disturbance over the next 15 years. This exploration would result in beneficial impacts to mineral resource development of the same type and quality described in Section 4.3.7.2 and for the same reasons (BLM 2005d), to a greater degree than the No Action Alternative. Fourteen more miles of source line (an increase of 2.5%) would be used under the Proposed Plan compared to the No Action Alternative. Geophysical exploration would occur in all three RFD areas, as detailed in Table 4.87.

Other Leasable Mineral Resources

Although 1,348,973 acres of BLM land would be administratively open under the Proposed Plan for the leasing of potash and salt and tar sands (an increase of approximately 110,743 acres, or 8.9%, compared to the No Action Alternative), because the level of development expected is so low, impacts to potash and salt and tar sands leasing because of mineral resource development decisions would be nearly identical to those described under the No Action Alternative.

Locatable Mineral Resources

Approximately 1,682,865 acres of BLM land would be open under the Proposed Plan to mineral entry of uranium-vanadium, copper, gold, and limestone, a decrease of approximately 7,808 acres, or less than 1%, compared to the No Action Alternative. The types and forms of impacts under the Proposed Plan would be the same as those described for the No Action Alternative.

Salable Mineral Resources

Approximately 1,358,968 acres of BLM land would be open to development of sand and gravel, building stone, and clay under the Proposed Plan (Map 26). This represents a decrease of approximately 40,288 acres compared to the No Action Alternative. Impacts under the Proposed Plan would be essentially the same as those described for the No Action Alternative.

4.3.7.5.6.4. Impacts of Management of Non-WSA Lands with Wilderness Characteristics on Mineral Resource Development Under The Proposed Plan

Under the Proposed Plan, approximately 88,871 acres of non-WSA lands with wilderness characteristics (or 5.0 %) would be managed as NSO and closed to mineral leasing, proposed for withdrawal from mineral entry (approximately 4,280 acres), ROW avoidance area, closed to disposal of mineral materials, and managed as VRM II.

These management decisions would have an adverse impact on mineral resource development. Fewer lands would be available for oil and gas leasing and subsequent mineral resource development; this would result in fewer wells drilled over the next 15 years. Adverse impacts on mineral entry could occur because 5.0 % fewer acres would be available for development of locatable minerals, resulting in less mining activity and less production of uranium-vanadium, copper, and placer gold.

4.3.7.5.6.5. Impacts of Recreation Decisions on Mineral Resource Development Under The Proposed Plan

Under the Proposed Plan, in the 9,859-acre San Juan River SRMA, recreation decisions that pertain to mineral resource development would be the same as Alternative B, except that the entire SRMA, including the Bluff Airport vicinity, would be closed to mineral materials disposal. These recreation decisions would result in essentially the same impacts as Alternative B.

Under the Proposed Plan, recreation decisions regarding the 375,734-acre Cedar Mesa Cultural SRMA would result in the same impacts that would occur under Alternative B.

4.3.7.5.6.6. Impacts of Soils and Watershed Decisions on Mineral Resource Development Under The Proposed Plan

Under The Proposed Plan, a minimum of 1,063,652 acres of BLM lands open to surface-disturbing mineral resource development (or 76.6% of available BLM lands) are overlain by sensitive soils with medium and high limitations (Table 4.88). The particular requirements and limitations on such mineral resource development and the resulting impacts on mineral resource development would be the same as those under the No Action Alternative.

Table 4.88. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under The Proposed Plan

RFD Area	Leasing Stipulation	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
Blanding Sub-basin	Standard	254,706	Alkalinity	214,035	84.0
	Special	142,314	Alkalinity	117,263	82.4
	NSO, Open to ME ¹	8,213	Alkalinity	7,316	89.1
	Subtotal	405,233		338,614	83.6
Monument Upwarp	Standard	293,201	Alkalinity	207,717	70.8
	Special	407,984	Alkalinity	298,098	73.1

Table 4.88. Minimum Acreages of High- and Medium-risk Sensitive Soils within Lands Open to Surface-disturbing Mineral Resource Development, by RFD Area, under The Proposed Plan

RFD Area	Leasing Stipulation	Total Acreage	Largest Single Limiting Factor ²	Acreage	% Total Acreage
	NSO, Open to ME ¹	25,171	Alkalinity	24,069	95.6
	Subtotal	726,356		529,884	73.0
Paradox Fold and Fault Belt	Standard	81,564	Rooting Depth	64,994	79.7
	Special	169,204	Rooting Depth	124,877	73.8
	NSO, Open to ME ¹	5,939	Rooting Depth	5,283	89.0
	Subtotal	256,707		195,154	76.0
Total		1,388,296		1,063,652	76.6

1. NSO, Open to ME = No Surface Occupancy but Open to Mineral Entry.

2. Possible limiting factors are water erosion, wind erosion, droughty soils, excess salt, excess sodium, rooting depth, and alkalinity.

Under the Proposed Plan, the impacts of requiring a plan for slopes between 21% and 40% and implementing the Gold Book Standards (BLM and FS 2005) would be the same as Alternative B. Implementing surface-disturbing mineral resource development on slopes over 40% is still generally disallowed under the Proposed Plan, but if re-siting would cause "undue or unnecessary degradation" it may be allowed. Therefore, the negative, minor impacts of the Proposed Plan on mineral resource development on slopes above 40% are similar in type to Alternative B but somewhat less in magnitude.

4.3.7.5.6.7. Impacts of Special Designations Decisions on Mineral Resource Development Under The Proposed Plan

Under the Proposed Plan, 73,492 acres of BLM lands would occur in ACECs (Table 4.89). In all, 41,292 of these acres are subject to NSO or closed to leasing. If 4,602 acres (out of 41,292 acres) are automatically closed to leasing because they are located in WSAs, we assume that the remainder—34,942 acres—has been limited to mineral resource development as a direct result of designation of the ACECs (see Table 4.89). Therefore, for the purposes of this analysis, implementation of the Proposed Plan represents a closure of 1.9% of all BLM lands (34,942 acres) due to ACEC designation. ACEC designation under the Proposed Plan has less of a negative impact on mineral resource development than it does under the No Action Alternative (about 4.4% less) or under Alternative B (about 2.6% less).

Under the Proposed Plan, Colorado River Segments #2 and #3, San Juan Segment # 5, and the Dark Canyon segment, a total of 35.7 miles (BLM River Miles) , are recommended suitable for WSR designation. As the suitable segments would be managed as VRM I and II, these recommendations would effectively make these areas unavailable for leasing. This mileage accounts for a 0.2% decrease in BLM lands available for optimal mineral resource development in comparison with the No Action Alternative for WSR segments. Accordingly, this would result in essentially the same potential mineral resource development as the No Action Alternative.

4.3.7.5.6.8. Impacts of Special Status Species and Other Wildlife and Fisheries Decisions on Mineral Resource Development Under The Proposed Plan

Gunnison Sage-grouse

Impacts to mineral resource development under the Proposed Plan would be of the same type and quality as under Alternative B, except that the lek habitat buffer zone would be slightly smaller (i.e., a 0.6-mile buffer around lek habitat under the Proposed Plan, compared with a 2.0-mile buffer in Alternative B), in favor of mineral resource exploration and development.

Table 4.89. Acreages of Existing and Potential ACECs that are Available to Mineral Resource Development, if Designated under the Proposed Plan

ACEC	Acres			VRM Outside WSA ²	Lease Stipulation (Acres)				Other Activities Outside WSAs		
	Total	Within WSA ¹	Outside WSA		Standard	Special	NSO	Closed	Entry	Disposal	Geophysical

Valley of the Gods	22,863	--	22,863	I	0	0	22,863	0	--	no	--

"NA" and "--" both mean Not Applicable. Items in parenthesis are subsets of the first number above that is *not* in parenthesis.

1. Always VRM I, or closed to leasing.
2. According to Alternatives Matrix in Chapter 2, if specified.
3. To be managed as SRMA in this alternative.
4. Portions of Cedar Mesa ACEC lie within eight WSAs.

Bighorn Sheep Lambing and Rutting

The bighorn lambing and rutting seasons are shorter under the Proposed Plan than they are under the No Action Alternative and Alternative B (30 days shorter for lambing and 16 days shorter for rutting; Table 4.90). Under the Proposed Plan, the lambing timing restrictions would occur on 415,395 acres of crucial lambing habitat (or 23.3% of all BLM lands). This area is larger than that designated under the No Action Alternative (by 85,645 acres, or 26.0%), but smaller than that designated under Alternative B (by 37,993 acres, or 8.4%). Because the Proposed Plan's lambing timing limitations are less than the No Action Alternative while the crucial habitat is greater, it cannot be determined whether the net, negative impacts on mineral resource development from The Proposed Plan are more or less than the No Action Alternative. However, the impacts on mineral resource development from the Proposed Plan are definitively less in magnitude than Alternative B, due to the smaller acreage of habitat and the shortened duration of the timing limitations.

Under the Proposed Plan, the rutting timing restrictions would occur across a habitat area that is essentially the same size as under Alternative B. Because timing limitations for rutting under the Proposed Plan are less than the No Action Alternative while its crucial habitat acreage is greater, it cannot be determined whether the net, negative impacts on mineral resource development from the Proposed Plan are more or less than the No Action Alternative. However, the impacts on mineral resource development from the Proposed Plan are definitively less than Alternative B, due to the shortened duration of the timing limitations under the Proposed Plan.

Pronghorn Fawning Area

Under the Proposed Plan, impacts on mineral resource development due to pronghorn decisions would be the same as under Alternative B.

Deer Winter Range

Under the Proposed Plan, on the 266,406-acre deer crucial winter range (or 14.9% of all BLM lands), the special conditions described in Chapter 2 would be enforced for 181 days of critical winter use (see Table 4.90). These management decisions would result the same type and quality of impacts to mineral resource development as are described under the No Action Alternative, but to a greater degree. The Proposed Plan results in greater impacts both in terms of the larger area being restricted as winter range (larger by 68,856 acres, or 34.9% compared to the No Action Alternative) and the longer duration of enforcement of the restrictions (longer by 30 days, or 16.6% compared to the No Action Alternative).

Elk

Under the Proposed Plan, on the 97,471-acre elk crucial winter range (or 5.5% of all BLM lands), the special conditions described in Chapter 2 would be enforced for 181 days of critical winter use (see Table 4.90). These management decisions would result in the same type and quality of impacts to mineral resource development as are described under Alternative B, but to a lesser degree. The Proposed Plan results in fewer impacts both in terms of the smaller area being restricted as winter range (smaller by 93,702 acres, or 49.0% compared to Alternative B) and the shorter duration of enforcement of the restrictions (shorter by 15 days, or 7.7% compared to Alternative B).

Table 4.90. Additional Seasonal Restrictions within Established Buffer Zones Applied to Mineral Resource Development under The Proposed Plan

Species	Dates	Jan		Feb		Mar		Apr		May		Jun		Jul		Aug		Sep		Oct		Nov		Dec	
Gunnison Sage-grouse leks (0.6 miles)																									
Non-disturbing geophysical work	3/20 – 5/15																								
All permitted activities (dawn hours)	3/20 – 5/15																								
Bighorn – Lambing (415,395 acres)	4/1 – 6/15																								
Bighorn – Rutting (453,390 acres)	10/15 – 12/15																								
Pronghorn – Fawning (29,365 acres)	5/1 – 6/15																								
Deer – Winter use (266,406 acres)	11/15 – 4/15																								
Elk – Winter use (97,471 acres)	11/15 – 4/15																								

In all, wildlife decisions necessitating special stipulations would impact various acreages at various times of the year. Under the Proposed Plan, no wildlife related timing limitations would be enforced on any acreage from June 15 through October 15 (122 days). This amounts to less restriction to mineral resource development compared to Alternative B and the No Action Alternative, in the form of an additional month of mineral resource development without wildlife related timing limitations. At the other end of the spectrum, restrictions from November 15 through December 15 would be enforced on up to 729,567 acres (or 41% of all BLM lands, assuming overlap; see Table 4.65) under the Proposed Plan⁵. This maximum is less restrictive than Alternative B but more restrictive than Alternative D.

4.3.7.5.6.9. Impacts of Vegetation Management Decisions on Mineral Resource Development Under The Proposed Plan

Impacts on mineral resource development under the Proposed Plan would be essentially the same as under the No Action Alternative, except that fewer acres of vegetation would be treated (1,500 acres/year). Although only the vegetation of the Lavender Mesa ACEC would be protected, the area of the Bridger Jack Mesa ACEC—in which surface disturbance would be allowed—is such a small proportion of the total planning area that the impacts at the PA-wide level would be essentially the same at approximately 0.03%

4.3.7.5.6.10. Impacts of Visual Resource Decisions on Mineral Resource Development Under The Proposed Plan

Under the Proposed Plan, approximately 422,989 acres (or 23.8% of BLM lands) would fall into the VRM I class, and in these areas, mineral resource development would be subject to NSO or closed to leasing because of the restrictions on surface disturbance in this VRM class.

Adverse impacts under the Proposed Plan would be of the same type as the No Action Alternative, for the same reasons. The magnitude of these impacts would be greater than Alternative A (by 2.9%) but less than Alternative B.

4.3.7.6. MITIGATION MEASURES

None of the alternatives would result in impacts that would necessitate mitigation of mineral resource development other than those found in standard operating procedures (Appendix A and I, and O). Furthermore, the various leasing stipulations and policies (see Appendix A) serve as a framework for best management practices for mineral resource development in the Monticello FO.

4.3.7.7. UNAVOIDABLE ADVERSE IMPACTS

Unavoidable, adverse impacts for mineral resource development include the slow, steady depletion of finite mineral resources under the surface of the Monticello FO, including oil, natural gas, potash, salt, tar sands, uranium-vanadium, copper, gold, limestone, sand, gravel, building stone, and clay. To a lesser extent, unavoidable, adverse impacts also include the

⁵ The maximum of 729,567 acres was derived from the acres subject to special stipulations in Table 4.41, rather than the maximum acreage in Table 4.54 (which would have been 817,267 acres, assuming no overlap). As 817,267 acres is greater than the acreage subject to special stipulations in Table 4.41 (729,567 acres), it is evident that there is considerable overlap among the various habitats. Therefore, at the most limited time of November 15–December 15, the maximum acreage that can be assumed is the one in Table 4.41.

relatively small, project-sized alterations to the geological surfaces and topography of the Monticello FO because of mineral resource extraction practices.

4.3.7.8. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Short-term uses of mineral resources at the predicted rate (RFD) are unlikely to affect the long-term productivity of the resource over the next 15 years.

4.3.7.9. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

The extraction and development of mineral resources from the Monticello FO would result in both an irreversible and irretrievable loss of those mineral resources because of the finite nature of the resource. The impacts would be irretrievable and irreversible because once extracted, the mineral resource cannot be used again, nor can it be replaced in the foreseeable future.

4.3.7.10. SUMMARY OF IMPACTS

The summary of impacts on mineral resource development can be found in Table 2.2.

4.3.8. NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

Non-WSA lands with wilderness characteristics are areas having 5,000 acres, or areas less than 5,000 acres that are contiguous to designated wilderness, WSAs, or other lands administratively endorsed for wilderness; or in accordance with the Wilderness Act's language, areas "of sufficient size as to make practicable its preservation and use in an unimpaired condition." These are areas in a natural or undisturbed condition that provide outstanding opportunities for solitude or primitive forms of recreation (non-motorized and non-mechanized activities in undeveloped settings). BLM used the same criteria for determining wilderness characteristics as in the 1979 wilderness inventory. The 5,000 acre value was helpful to BLM in making preliminary judgments, but it was not considered a limiting factor.

The Proposed Plan and all of the alternatives would impact the values of non-WSA lands with wilderness characteristics to some degree. Generally, actions that create surface disturbance adversely affect the natural characteristics of these areas and the setting for experiences of solitude and primitive recreational activities. Motorized uses in these areas detract from opportunities for both solitude and primitive forms of recreation.

Under the Proposed Plan, parts of four non-WSA lands with wilderness characteristics totaling 88,871 acres would be managed with emphasis on protection of the area's wilderness characteristics. All or parts of 29 non-WSA lands with wilderness characteristics, totaling 493,489 acres would be managed with emphasis on other resources values and uses. Under Alternatives A, B, C, and D, no non-WSA lands with wilderness characteristics would be managed with specific emphasis on protection of the wilderness characteristics. Under Alternative E, all 29 non-WSA lands with wilderness characteristics would be managed with emphasis on protection of wilderness characteristics on 582,360 acres. See Table 2.1, Summary Table of Alternatives

The analysis that follows will disclose the effects of the various actions prescribed under the Proposed Plan and each alternative on the wilderness characteristics of non-WSA lands with wilderness characteristics proposed for management and protection of those characteristics and non-WSA lands with wilderness characteristics that are proposed for management with emphasis on other resource values and uses.

Resources or uses determined to have negligible impacts on non-WSA lands with wilderness characteristics include air quality and health and safety. This is because 1) maintaining air quality within threshold levels for constituent pollutants would not affect wilderness characteristics within the non-WSA lands with wilderness characteristics, and 2) there are no abandoned mine lands, unauthorized dumping sites, or hazardous materials spills that have been identified in non-WSA lands with wilderness characteristics; therefore, it is not an issue or resource for further analysis.

4.3.8.1. IMPACTS OF CULTURAL RESOURCES DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

Under the Proposed Plan and all alternatives, the BLM would provide for legitimate field research by qualified scientists and institutions. These activities could create temporary surface-disturbing activities by digging and excavation. If conducted in non-WSA lands with wilderness characteristics, it would create a loss of naturalness and temporarily disturb opportunities for

solitude and primitive recreation in the immediate area of research due to excavation activities. In the long-term, however, knowing more about the cultural resources of an area, interpreting the resource in a fashion consistent with protection of wilderness characteristics, and viewing cultural resource sites in the non-WSA lands with wilderness characteristics would all add to the enjoyment of these areas for primitive recreational purposes. Protection of historic and prehistoric resources in non-WSA lands with wilderness characteristics would enhance opportunities for primitive forms of recreation. And, protection of cultural resources adds to the character of the setting that supports these recreational opportunities.

4.3.8.1.1. ALTERNATIVE A

4.3.8.1.1.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Alternative A would not designate any Cultural Special Management Areas or Special Recreation Management Areas (SRMAs), thus there would be no impacts from this decision on non-WSA lands with wilderness characteristics. Because there would be no CSMA or SRMA prescriptions for protecting cultural resources in portions of the Butler Wash, Dark Canyon, Comb Ridge, Fish and Owl Creeks, Road Canyon, and San Juan River non-WSA lands with wilderness characteristics, archeological site integrity may be endangered by OHV use and other surface-disturbing activities that are currently allowed under the existing land-use plan. Loss of archeological site integrity would reduce opportunities for primitive recreation associated with viewing and studying cultural resources sites.

4.3.8.1.2. ALTERNATIVE B

4.3.8.1.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Under Alternative B, Comb Ridge would be managed as a 38,012-acre Cultural Special Management Area (CSMA). This includes all 13,760 acres of Comb Ridge, 3,580 acres of Fish and Owl Creeks, 530 acres of Road Canyon, and 640 acres of the San Juan River non-WSA lands with wilderness characteristics. Under management prescriptions for this CSMA, the area would be closed to geophysical work, closed to disposal of mineral materials, open to oil and gas leasing subject to an NSO stipulation, and closed to private and commercial firewood cutting. Vegetation treatments would be allowed by non-surface-disturbing methods only, OHV use would be limited to designated routes, the area would be closed to dispersed camping, and group sizes would be limited. Improvements for range, wildlife habitat, and watershed would be allowed.

Beef Basin would be managed as a 20,302-acre CSMA. This would include 13,280 acres of the Dark Canyon and 1,180 acres of the Butler Wash non-WSA lands with wilderness characteristics. Management would include closing the CSMA to private and commercial firewood cutting, limiting OHV use to designated routes, and limiting group size. Improvements for range, wildlife habitat, watershed, and vegetation treatments would be allowed, and primitive car camping areas would be designated in Ruin Park, Middle Park, House Park, and along the

Beef Basin Loop Road within the Dark Canyon non-WSA lands with wilderness characteristics. The CSMA has moderate potential for oil and gas production, and would be open to oil and gas leasing subject to controlled surface use or timing limitation.

In both of these CSMA's, the majority of management prescriptions would protect the natural characteristics of portions of the non-WSA lands with wilderness characteristics and continue to provide opportunities for solitude and primitive recreation. Improvements for range, wildlife habitat and watershed would diminish the natural characteristics of the areas, depending on the methods used in both CSMA's. In the Beef Basin CSMA, vegetation treatments could be by mechanical, biological, chemical, or fire. If mechanical treatments are used within the non-WSA lands with wilderness characteristics, the natural characteristics of the areas would be compromised within the treatment area because it would leave an apparent imprint of human work on the land that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. During the time of the treatments, opportunities for solitude and primitive recreation would be foregone in and around the areas being treated due to noise and human activity associated with the vegetation manipulations. Road and well pad construction associated with oil and gas development in the Beef Basin CSMA would reduce the natural characteristics of the non-WSA lands with wilderness characteristics. The noise and presence of people and equipment, and the alteration of the landscape would reduce opportunities for solitude and primitive forms of recreation.

OHV use on designated routes in both CSMA's would detract from the opportunities for solitude and conflict with primitive recreation when vehicles (and associated motorized noise) are in the non-WSA lands with wilderness characteristics. In addition, developing a car campground in Ruin Park and designating car camping sites in Dark Canyon non-WSA lands with wilderness characteristics would detract from the natural characteristics of these lands and reduce opportunities for solitude and primitive recreation in the immediate areas where car camping is occurring.

4.3.8.1.3. ALTERNATIVE C

4.3.8.1.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Management proposed for the Comb Wash CSMA would be different from Alternative B in that the area would be open to private and commercial firewood cutting and available for vegetation treatments and surface-disturbing land treatments. These types of activities, if done within the non-WSA lands with wilderness characteristics, would have long-term impacts to the natural characteristics of the landscape by leaving chain-sawed stumps from firewood cutting and allowing for other types of mechanical surface disturbance that do not appear natural. During the time of the activities, opportunities for solitude and primitive recreation would be interrupted by chain saw noise and other mechanical equipment as well as by the human working presence.

Management proposed for the Beef Basin CSMA would generally be the same as in Alternative B, thus the same impacts to non-WSA lands with wilderness characteristics would ensue.

4.3.8.1.4. ALTERNATIVE D

4.3.8.1.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Under Alternative D, Comb Ridge would not be managed as a CSMA and Beef Basin would not be managed as a CSMA either. The cultural resources in the Comb Ridge area would be managed with the same prescriptions as the surrounding lands. Harvest of woodland products; construction of livestock, wildlife, and watershed facilities; land treatments, and motorized use of designated routes would disturb the landscape and natural characteristics of portions of the Comb Wash, Fish and Owl Creeks, Road Canyon, and San Juan River non-WSA lands with wilderness characteristics. The noise and presence of people, equipment, and vehicles used for these activities would also change the setting needed to support opportunities for primitive recreation and reduce opportunities to find solitude.

The cultural resources in the Beef Basin area would be managed by closing the area to private or commercial use of woodland products, and allowing for a commercial campground in the Ruin Park area. Closing the area to firewood cutting would continue to protect the natural characteristics within the Dark Canyon and Butler Wash non-WSA lands with wilderness characteristics. However, managing the area for mineral, energy, and mineral material production; constructing livestock, wildlife, and watershed facilities; implementing vegetation treatments; and developing a commercial campground within the Ruin Park area would create surface disturbances and introduce human-made facilities that would degrade the natural characteristics of the affected portions of the non-WSA lands with wilderness characteristics, and the opportunity for a primitive recreation experience would be lost in portions of the non-WSA lands with wilderness characteristics where these activities would be developed.

4.3.8.1.5. ALTERNATIVE E

4.3.8.1.5.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under this alternative, all 29 non-WSA lands with wilderness characteristics, totaling 582,360 acres, would be managed to protect and preserve their wilderness characteristics. Management of the Comb Ridge and Beef Basin CSMA's would be similar to Alternative B, except that the prescription would be more restrictive. They would be closed to oil and gas leasing, closed to OHV use in those areas within the non-WSA lands with wilderness characteristics, and construction of new range, wildlife, or watershed facilities would not be allowed. All of these management actions would fully protect the wilderness characteristics of the 13,760 acres of Comb Ridge, 3,580 acres of Fish and Owl Creeks, 530 acres of Road Canyon, 640 acres of San Juan River, 13,280 acres of the Dark Canyon, and 1,180 acres of the Butler Wash non-WSA lands with wilderness characteristics that fall within these CSMA's, as no surface-disturbing activities would be allowed.

4.3.8.1.6. PROPOSED PLAN

4.3.8.1.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under the Proposed Plan, five areas totaling 88,871 acres of non-WSA lands with wilderness characteristics comprising Dark Canyon (11,540 acres), Nokai Dome East (18,618 acres), Nokai Dome West (14,988 acres), Mancos Mesa (30,068 acres), and Grand Gulch (13,657 acres) would be managed to protect their wilderness characteristics.

Under the Proposed Plan, Comb Ridge would be managed as a Recreation Management Zone within the Cedar Mesa SRMA. The prescription for the Comb Ridge Recreation Management Zone would be different than management proposed under Alternative B. Under the Proposed Plan, the area would be open to private and commercial firewood cutting and available for vegetation treatments and surface-disturbing land treatments, where consistent with plan objectives. These types of activities, if done within the Grand Gulch non-WSA lands with wilderness characteristics in the SRMA, would have long-term impacts to the natural characteristics of the landscape, leaving chain-sawed stumps from firewood cutting, vegetation clearing, and other types of mechanical surface disturbance that would not appear natural. During the time of the activities, opportunities for solitude and primitive recreation would be interrupted by the noise of chain saws and other mechanical equipment, as well as by the presence of people working, and the loss of the natural characteristics that provide the setting for primitive recreation activities and experiences of solitude.

Management proposed for the Beef Basin SRMA would generally be the same as in Alternative B, except vegetation treatments in the Dark Canyon non-WSA lands with wilderness characteristics would only be permitted if consistent with plan objectives, protecting the natural characteristics of the non-WSA lands with wilderness characteristics. During the treatment, however, the presence and noise of people and equipment would reduce opportunities for solitude and conflict with primitive forms of recreation. When implementation of the treatment was finished, and any needed reclamation occurred, those opportunities would return.

4.3.8.1.6.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

The management prescription for the Comb Ridge Recreation Management Zone within the Cedar Mesa SRMA would have the same effects on the wilderness characteristics of Lime Creek, Valley of the Gods, Road Canyon, Comb Ridge, and Fish and Owl Creeks non-WSA lands with wilderness characteristics as described for Grand Gulch above (see Section 4.3.8.1.6.1 above). However, under the Proposed Plan, these non-WSA lands with wilderness characteristics would not be managed with emphasis on protection of their wilderness characteristics.

Management proposed for the Beef Basin SRMA would have the same effect on the wilderness characteristics of Butler Wash non-WSA lands with wilderness characteristics as described for Dark Canyon above (see Section 4.3.8.1.6.1 above).

In summary, cultural resources decisions affect non-WSA lands with wilderness characteristics. Decisions that protect cultural resources also tend to protect wilderness characteristics. Under the Proposed Plan and Alternatives B, C, and E, CSMAs, SRMAs, and Recreation Management Zones within SRMAs are established with management actions to protect cultural resources.

Alternative E is the most restrictive, and fully protects the wilderness characteristics of all or portions of the six non-WSA lands with wilderness characteristics that fall within two of the CSMA. The Proposed Plan would allow for firewood cutting and surface-disturbing land treatment when consistent with plan objectives. These actions would have some impacts on the natural characteristics of non-WSA lands with wilderness characteristics in the SRMAs and Recreation Management Zones within the SRMAs. Alternative B is very similar to Alternative E, but allows for some surface-disturbing activities associated with watershed, wildlife, range facilities and vegetation treatments, which would affect the naturalness of portions of the non-WSA lands with wilderness characteristics, if implemented. Alternative C establishes CSMA at Cedar Mesa (including Comb Ridge) and Beef Basin. In the Cedar Mesa CSMA, the effect of cultural resource decisions on non-WSA lands with wilderness characteristics would be similar to Alternative B, except that harvest of woodland products and land treatments would be permitted with impacts to the wilderness characteristics of non-WSA lands with wilderness characteristics. In the Beef Basin CSMA, the effects of cultural resources decisions on wilderness characteristics would be similar to Alternative B, except in Dark Canyon. There, limitation on vegetation treatments to non-surface-disturbing methods would protect the natural characteristics of the Dark Canyon non-WSA lands with wilderness characteristics. Alternatives A and D propose no CSMA and apply the same management as surrounding public lands. Many of those decisions would allow for surface-disturbing actions that would degrade the wilderness characteristics of the non-WSA lands with wilderness characteristics.

4.3.8.2. IMPACTS OF FIRE MANAGEMENT DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

Under the Proposed Plan and all alternatives, the BLM would attempt to restore natural fire regimes in fire-dependent and adapted ecosystems through the use of prescribed or managed wildland fire. The Monticello FO would base its priorities for all aspects of fire management decisions based on five categories (see Chapter 2, Table 2.1 Fire Management) to determine where fire is desired and where it is not. Further, following any wildland fire event, emergency stabilization and restoration (ESR) actions would be developed and implemented, as appropriate. Fuels treatment and management activities would be consistent with the resource goals and objectives in the PRMP/FEIS and may include mechanical treatments, manual treatments, prescribed fire, chemical spraying, or biological treatments and seeding.

Restoration of fire to fire-dependent and adapted ecosystems would restore a more natural vegetation community (in both species and composition) and watershed conditions and wildlife populations dependent on those communities. In the short-term, a burned landscape may reduce desire (opportunities) for primitive recreation. In the long-term, following reclamation of fire management disturbances, however, a more natural vegetation community would benefit the natural characteristics of non-WSA lands with wilderness characteristics and enhance the setting and opportunities for primitive forms of recreation, including hiking, backpacking, hunting, wildlife viewing, photography, and nature study. This would enhance the natural conditions of the non-WSA lands with wilderness characteristics.

Setting fire objectives through fire management categories would identify where fire is desired on the land, leading to the same benefits to natural characteristics as restoring fire to fire-dependent and adapted ecosystems. When it is necessary to suppress fire in non-WSA lands with wilderness characteristics, development and implementation of the ESR plan would restore fire

suppression disturbances to the land and vegetation (e.g., fire line construction), resulting in the restoration of the natural characteristics of the non-WSA lands. Fuels treatments in non-WSA lands with wilderness characteristics would aid in restoration of a more natural fire regime in these lands. The use of fire to accomplish this reduction would be compatible with the natural characteristics of these areas. The use of mechanical treatments would leave an apparent imprint of human work on the land that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics.

In the short-term, fire operations (e.g., fire line construction) would create surface disturbances that degrade the natural landscape and characteristics of the non-WSA lands with wilderness characteristics. The noise and presence of the people, equipment, and operations would also diminish opportunities for solitude and conflict with primitive forms of recreation. In the long-term, however, surface disturbance associated with the fire treatment would be restored, with little to no net impact on the natural characteristics. The impacts of the noise and presence of fire operations on opportunities for solitude and primitive recreation would cease, restoring those opportunities.

4.3.8.3. IMPACTS OF LANDS AND REALTY MANAGEMENT DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

4.3.8.3.1. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

An existing utility corridor overlies slivers of Comb Ridge, Road Canyon, and San Juan River non-WSA lands with wilderness characteristics along Highway 163. Although none are currently proposed, placement of future utility ROWs within these portions of the corridors would diminish the wilderness characteristics of these areas. Construction and placement of utility lines would cause surface-disturbing activities and placement of surface facilities that would reduce the natural characteristics of the lands within the non-WSA lands with wilderness characteristics, and alter the setting needed to support opportunities for primitive recreation activities and experiences of solitude.

4.3.8.3.2. ALTERNATIVE A

4.3.8.3.2.1. Impacts Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Surface disturbances and impacts resulting from lands and realty management decisions would degrade natural characteristics, diminish opportunities for solitude, and conflict with opportunities for primitive recreation.

Portions of four non-WSA lands with wilderness characteristics, totaling 8,880 acres, would be proposed for mineral withdrawal, to give management emphasis to other resource values and uses, under Alternative A.

- 280 acres of the Dark Canyon non-WSA lands with wilderness characteristics
- 390 acres of the Gooseneck non-WSA lands with wilderness characteristics
- 3,890 acres of the Indian Creek non-WSA lands with wilderness characteristics
- 4,320 acres of the San Juan River non-WSA lands with wilderness characteristics

The proposed mineral withdrawals would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation in each of the non-WSA lands with wilderness characteristics by preventing surface disturbance created by mining and the noise and presence people, vehicles, and equipment associated with mining.

A total of 113,240 acres in all or portions of 19 non-WSA lands with wilderness characteristics would continue to be ROW avoidance or exclusion areas (Table 4.91).

Table 4.91. Acres of Avoidance or Exclusion for ROWs in Non-WSA Lands with Wilderness Characteristics (all acreage not under exclusion or avoidance remain open for ROWs)

Name of Non-WSA Land with Wilderness Characteristics	Total Acres	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E (all avoidance areas)	Proposed Plan
Arch Canyon	50	50	0	0	0	50	0
Bridger Jack Mesa	23,050	1,220	670	690	0	23,050	690
Butler Wash	1,660	40	0	0	0	1,660	0

San Juan River	14,340	5,110	4,820	4,180	0	14,340	4,180
Shay Mountain	6,710	0	100	100	0	6,710	100
Sheep Canyon	4,000	0	0	0	0	4,000	0
Squaw and Papoose Canyons	3,570	0	0	0	0	3,570	0
Upper Red Canyon	24,920	1,500	0	0	0	24,920	0
Valley of the Gods	13,670	13,450	13,670	13,670	0	13,670	13,670
White Canyon	9,080	50	0	0	0	9,080	0
Total Acres	582,360	113,240 (19%)	98,280 (17%)	34,940 (6%)	0 (0%)	582,360 (100%)	119,721 (20%)

¹Of this 33,606 acres, 18,618 acres are in Nokai Dome East and 14,988 acres are in Nokai Dome West.

The majority of lands within the Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics would be within ROW avoidance areas. Only the 5,110 acres in the San Juan River non-WSA would be an exclusion area, the rest would be avoidance areas. These areas are to be avoided but may be available for location of ROWs with special stipulations if the proposal meets the goals and objectives of other resources and uses in the land-use plan. There are no ROW proposals for these areas at this time, and the avoidance areas would protect the natural characteristics of the non-WSA lands with wilderness characteristics in these areas. However, the rest of the non-WSA lands with wilderness characteristics (469,120 acres) would remain available for the placement of ROWs. More permanent, long-term impacts would occur if the ROW is for an overhead power line than for a buried pipeline. However, any surface-disturbing activity and/or placement of permanent visual facilities would detract from the natural characteristics of the area and disrupt the setting needed to support primitive forms of recreation.

4.3.8.3.3. ALTERNATIVE B

4.3.8.3.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Nine non-WSA lands with wilderness characteristics areas, totaling 49,835 acres, intersect with proposed mineral withdrawals under Alternative B:

- 40 acres of the Butler Wash non-WSA
- 280 acres of the Dark Canyon non-WSA
- 3,570 acres of the Gooseneck non-WSA
- 155 acres of the Harts Point non-WSA
- 18,870 acres of the Indian Creek non-WSA
- 5,560 acres of the Lime Creek non-WSA
- 1,530 acres of the Road Canyon non-WSA
- 6,160 acres of the San Juan River non-WSA
- 13,670 acres of the Valley of the Gods non-WSA

The proposed mineral withdrawals would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation in all of the Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics and portions of the other seven non-WSA lands with wilderness characteristics by preventing the location of mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining.

A total of 98,280 acres in all or portions of 16 non-WSA lands with wilderness characteristics would be ROW avoidance or exclusion areas (see Table 4.91). All of the lands within the Comb Ridge, Gooseneck, Hatch/Lockhart/Hart, Lime Creek, and Valley of the Gods non-WSA lands with wilderness characteristics would be within ROW avoidance areas. Only the 4,820 acres in the San Juan River non-WSA area would be an exclusion area, the rest would be avoidance areas. These areas are to be avoided but may be available for location of ROWs with special stipulations if the proposal meets the goals and objectives of other resources and uses in the land-use plan. There are no ROW proposals for these non-WSA lands with wilderness characteristics at this time, and the avoidance area prescription would prevent surface disturbance and placement of structures, and protect the natural characteristics of the non-WSA lands with

wilderness characteristics. However, the rest of the non-WSA lands with wilderness characteristics (484,080 acres) would remain available for the placement of ROWs. More permanent, long-term impacts would occur if the ROW is for an overhead power line than for a buried pipeline. However, any surface-disturbing activity and/or placement of permanent visual facilities would detract from the natural characteristics of the area and disrupt the setting needed to support primitive forms of recreation.

4.3.8.3.4. ALTERNATIVE C

4.3.8.3.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Three non-WSA lands with wilderness characteristics areas, totaling 10,230 acres, intersect with proposed mineral withdrawals under Alternative C:

- 390 acres of the Gooseneck non-WSA
- 3,890 acres of the Indian Creek non-WSA
- 5,950 acres of the San Juan River non-WSA

The proposed mineral withdrawals would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation in each of these areas by preventing mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining.

A total of 34,940 acres in all or portions of 12 non-WSA lands with wilderness characteristics would continue to be ROW avoidance or exclusion areas (see Table 4.91). All of the lands within the Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics would be within ROW avoidance areas. Only the 4,180 acres in the San Juan River non-WSA would be an exclusion area, the rest would be avoidance areas. These areas are to be avoided but may be available for location of ROWs with special stipulations if the proposal meets the goals and objectives of other resources and uses in the land-use plan. There are no ROW proposals for these areas at this time, and it is expected and assumed that the avoidance areas would protect the natural characteristics of the non-WSA lands with wilderness characteristics. However, the rest of the non-WSA lands with wilderness characteristics (547,420 acres) would remain available for the placement of ROWs. More permanent, long-term impacts would occur if the ROW is for an overhead power line than for a buried pipeline. However, any surface-disturbing activity and/or placement of permanent visual facilities would detract from the natural characteristics of the area and disrupt the setting needed to support primitive forms of recreation.

4.3.8.3.5. ALTERNATIVE D

4.3.8.3.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

One non-WSA lands with wilderness characteristics, totaling 1,960 acres, intersects with proposed mineral withdrawals under Alternative D:

- 1,960 acres of the San Juan River non-WSA

This proposed mineral withdrawal would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation in this non-WSA lands with wilderness characteristics by preventing location of mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining.

All 582,360 acres would be open for placement of ROWs (see Table 4.91). No specific ROWs are proposed at this time, but if implemented, more permanent, long-term impacts would occur if the ROW is for an overhead power line than for a buried pipeline. However, any surface-disturbing activity and/or placement of permanent visual facilities would detract from the natural characteristics of the non-WSA lands with wilderness characteristics and disrupt the setting needed to support primitive forms of recreation.

4.3.8.3.6. ALTERNATIVE E

4.3.8.3.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

All 29 areas of non-WSA lands with wilderness characteristics, totaling 582,360 acres would be proposed for mineral withdrawal. The proposed mineral withdrawal would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation in each of the non-WSA lands with wilderness characteristic by preventing location of mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining. If surface-disturbing activities occur on existing mining claims in non-WSA lands with wilderness characteristics, natural characteristics would be lost in the immediate area of the mining activities. Opportunities for solitude and primitive recreation would also be forgone in those areas, but would be regained as the recreationists moved farther away from the mining activity.

Under this alternative, all 29 areas of non-WSA lands with wilderness characteristics would be managed as ROW exclusion areas (see Table 4.91). Exclusion from future ROW development for pipelines and power lines, corridor designation, or other ROWs would protect the natural characteristics of the non-WSA lands with wilderness characteristics. Protection of the natural landscape would also preserve the setting needed to support primitive forms of recreation and experiences of solitude.

4.3.8.3.7. PROPOSED PLAN

4.3.8.3.7.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

A total of 88,871 acres in portions of five non-WSA lands with wilderness characteristics would be ROW avoidance areas (see Table 4.91). All of the lands located in the Dark Canyon, Mancos Mesa, Nokai Dome East, Nokai Dome West, and Grand Gulch non-WSA lands with wilderness characteristics that would be managed to protect those characteristics under the Proposed Plan would be managed as ROW avoidance areas. These areas are to be avoided but may be available for location of ROWs with special stipulations if the proposal meets the goals and objectives of other resources and uses in the land-use plan. There are no ROW proposals for these non-WSA lands with wilderness characteristics at this time, and the avoidance area prescription would protect the natural characteristics of the non-WSA lands with wilderness characteristics.

4.3.8.3.7.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Three non-WSA lands with wilderness characteristics areas, totaling 10,230 acres, intersect with proposed mineral withdrawals under the Proposed Plan:

- 390 acres of the Gooseneck non-WSA
- 3,890 acres of the Indian Creek non-WSA
- 5,950 acres of the San Juan River non-WSA

The proposed mineral withdrawals would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation in each of the non-WSA lands with wilderness characteristics by preventing location of mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining.

A total of 30,850 acres in all or portions of eight non-WSA lands with wilderness characteristics would be ROW avoidance or exclusion areas (see Table 4.91). All of the lands within the Valley of the Gods non-WSA lands with wilderness characteristics would be within a ROW exclusion area. The lands in Lime Creek non-WSA lands with wilderness characteristics would be in an avoidance area. Only the 4,180 acres in the San Juan River non-WSA would be an exclusion area, the rest would be avoidance areas. These areas are to be avoided but may be available for location of ROWs with special stipulations if the proposal meets the goals and objectives of other resources and uses in the land-use plan. There are no ROW proposals for these non-WSA lands with wilderness characteristics at this time, and the avoidance area prescription would protect the natural characteristics of the non-WSA lands with wilderness characteristics. However, the rest of the non-WSA lands with wilderness characteristics (463,329 acres) would remain available for the placement of ROWs. More permanent, long-term impacts would occur if the ROW is for an overhead power line than for a buried pipeline. However, any surface-disturbing activity and/or placement of permanent visual facilities would detract from the natural characteristics of the area and disrupt the setting needed to support primitive forms of recreation.

In summary, Alternative E would protect all 582,360 acres of the non-WSA lands with wilderness characteristics by precluding surface-disturbing activities associated with mining and ROWs by proposing mineral withdrawals and managing them as ROW exclusion areas. In contrast, Alternative D would not manage any of the non-WSA lands as ROW avoidance or exclusion areas and only proposes a portion of one non-WSA lands with wilderness characteristics (1,960 acres) for mineral withdrawal. This would leave the majority of all 582,360 acres of non-WSA lands vulnerable to surface-disturbing activities that would allow them to lose their wilderness characteristics. The Proposed Plan and other three alternatives provide descending protections from ROW avoidance or exclusion areas. The Proposed Plan protects 20% of the non-WSA lands with wilderness characteristics by managing them as avoidance or exclusion areas, Alternative A protects 19%, Alternative B protects 17%, and Alternative C protects 6%.

Proposed mineral withdrawals under Alternative A protect the wilderness characteristics on portions of four non-WSA lands with wilderness characteristics totaling 8,880 acres, Alternative B protects all or portions of nine non-WSA lands with wilderness characteristics totaling 49,835 acres, and the Proposed Plan and Alternative C protects a portion of three non-WSA lands with wilderness characteristics totaling 10,230 acres.

4.3.8.4. IMPACTS OF LIVESTOCK GRAZING ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

Livestock grazing is guided by livestock objectives set in the Standards for Rangeland Health and Guidelines for Grazing Management. Proper levels of livestock use are guided by these objectives, thus, it is not anticipated that livestock grazing would have impacts on the natural characteristics of the non-WSA lands with wilderness characteristics under the Proposed Plan or any alternative because meeting these objectives would maintain healthy vegetation communities and watershed condition of the lands. When livestock use is properly managed, it would not affect the appearance of the natural characteristics of the non-WSA lands with wilderness characteristics. Grazing assessments completed by Monticello FO staff and any subsequent actions taken to remedy impending issues would maintain and enhance the natural characteristics of non-WSA lands with wilderness characteristics. Further, improved natural characteristics would sustain the setting needed to support opportunities for primitive and unconfined recreation and the experience of solitude that visitors seek.

While there would be some visual evidence of livestock use in the non-WSA lands with wilderness characteristics (presence of livestock, feces, trampling of soil, fences, and consumption of vegetation), rangeland health and riparian conditions would be maintained through proper management under the Standards and Guidelines assessments, and the appearance of natural characteristics of these areas would be maintained. For some visitors, the presence of livestock would be an adverse impact on the desired experience (connection with the natural world and experiences of solitude). However, this impact would be seasonal. At other times of the year, livestock would not be present, soils would recover, and vegetation would re-grow, reducing the impact on the visitor.

Under the Proposed Plan and all alternatives, some allotments, or some parts of allotments, that overlie portions of non-WSA lands with wilderness characteristics would be unavailable for grazing. When some visitors encounter an area with little or no evidence of livestock use, their experience of solitude and primitive recreation may be enhanced.

4.3.8.5. IMPACTS OF MINERAL DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

4.3.8.5.1. OIL AND GAS

The mineral assumptions for analysis and the RFD scenarios presented in the beginning of this chapter were used in the analysis of impacts to non-WSA lands with wilderness characteristics. These RFD scenarios for oil and gas development were derived from the MPR for the Monticello FO (BLM 2005b). Three development areas, each with its own RFD, have been identified in the Monticello PA: the Paradox Fold and Fault Belt, the Monument Upwarf, and the Blanding Sub-basin. Non-WSA lands with wilderness characteristics lie within all three of them.

The Paradox Fold and Fault Belt area totals 259,390 acres of public lands outside of WSAs. It encompasses all of four and portions of two areas of non-WSA lands with wilderness characteristics which total 79,750 acres, or about 31% of the public land within this minerals development area (Table 4.92). About 70 acres within two of the non-WSA lands with wilderness characteristics are currently leased for oil and gas development or have pending leases.

Table 4.92. Paradox Fold and Fault Belt Development Area and Non-WSA Lands with Wilderness Characteristics

Name of Non-WSA Lands with Wilderness Characteristics	Acres and (% of Non-WSA within Public Lands in Paradox Fold and Fault Belt Area)	Acres of Non-WSA with Existing Leases and (% of Lease Total of Non-WSA)
Bridger Jack Mesa	19,900 (8%)	0
Gooseneck	3,570 (1%)	0
Harts Point	24,740 (10%)	60 (< 1%)
Hatch/Lockhart/Hart	1,760 (<1%)	0
Indian Creek	23,280 (9%)	10 (<1%)
Shay Mountain	6,500 (3%)	0

The Monument Upwarp area has a total of 739,640 acres of public lands outside of WSAs. It includes all of 16 and portions of seven non-WSA lands with wilderness characteristics, which total 465,000 acres, or about 63% of the public land area (Table 4.93). About 3,340 acres within six non-WSA lands with wilderness characteristics are currently leased for oil and gas development or have pending leases.

Table 4.93. Monument Upwarp Area and Non-WSA Lands with Wilderness Characteristics

Name of Non-WSA Lands with Wilderness Characteristics	Acres and (% of Non-WSA within Public Lands in Monument Upwarp Area)	Acres of Non-WSA with Existing Leases and (% of Lease Total of Non-WSA)
Arch Canyon	50 (<1%)	0
Bridger Jack Mesa	3,150 (<1%)	0
Butler Wash	1,660 (<1%)	0
Cheesebox Canyon	13,240 (2%)	0
Comb Ridge	1,080 (<1%)	0
Dark Canyon	66,330 (9%)	0
Fish and Owl Creeks	18,800 (3%)	210 (1%)
Fort Knocker Canyon	12,410 (2%)	0
Grand Gulch	55,240 (7%)	1,600 (3%)
Gravel and Long Canyon	36,890 (5%)	0
Hammond Canyon	4,700 (<1%)	380 (8%)
Harmony Flat	9,660 (1%)	660 (7%)
Lime Creek	5,200 (<1%)	290 (6%)
Mancos Mesa	61,570 (8%)	0
Nokai Dome	94,270 (13%)	0
Red Rock Plateau	17,010 (2%)	0
Road Canyon	3,360 (<1%)	0

Table 4.93. Monument Upwarp Area and Non-WSA Lands with Wilderness Characteristics

Name of Non-WSA Lands with Wilderness Characteristics	Acres and (% of Non-WSA within Public Lands in Monument Upwarp Area)	Acres of Non-WSA with Existing Leases and (% of Lease Total of Non-WSA)
San Juan River	7,570 (1%)	0
Shay Mountain	210 (<1%)	0
Sheep Canyon	4,000 (<1%)	0
Upper Red Canyon	24,920 (3%)	0
Valley of the Gods	13,670 (2%)	200 (1%)
White Canyon	9,080 (1%)	0

The Blanding Sub-basin area has a total of 406,770 acres of public lands outside of WSAs. It includes all of two and portions of five non-WSA lands with wilderness characteristics, which total 38,540 acres, or about 9% of the public land area (Table 4.94). About 1,030 acres within two non-WSA lands with wilderness characteristics are currently leased for oil and gas development or have pending leases.

Table 4.94. Blanding Sub-basin Area and Non-WSA Lands with Wilderness Characteristics

Name of Non-WSA Lands with Wilderness Characteristics	Acres and (% of Non-WSA within Public Lands in Blanding Sub-Basin Area)	Acres of Non-WSA with Existing Leases and (% of Lease Total of Non-WSA)
Comb Ridge	12,680 (3%)	0
Cross Canyon	1,350 (<1%)	740 (55%)
Fish and Owl Creeks	5,850 (1%)	0
Lime Creek	360 (<1%)	0
Road Canyon	7,960 (2%)	0
San Juan River	6,770 (2%)	0
Squaw and Papoose Canyon	3,570 (1%)	290 (8%)

Each of the three development areas has differing RFD projections for oil and gas development by alternative. Table 4.4 in Section 4.1.2, Assumptions and Methodology for Mineral Development, portrays those projections. Table 4.95 below summarizes that information.

Table 4.95. Development Areas with RFD Projected Number of Wells/Year Over the Next 15 years

Development Areas	Alternative A Projected Wells Per Year/LOP	Alternative B Projected Wells Per Year/LOP	Alternative C Projected Wells Per Year/LOP	Alternative D Projected Wells Per Year/LOP	Alternative E Projected Wells Per Year/LOP	Proposed Plan Projected Wells Per Year/LOP
Paradox Fold and Fault Belt	~2/ 25	~1/ 20	~2/24	~2/25	~1/15	~2/24
Monument Upwarp	~1 / 7	~1 / 8	~1 / 9	~1 / 9	~1/ 3	~1 / 9
Blanding Sub-Basin	~3 / 41	~3 / 38	~3/ 41	~3 / 41	~2/ 36	~3/ 41

It is assumed that 9.6 acres would be disturbed for every well drilled. The assumed disturbance for the RFD by well is inclusive of well pads, road access, associated infrastructure, pipelines, gas plants, and for water disposal facilities, among other things.

4.3.8.5.2. IMPACTS ASSOCIATED WITH OIL AND GAS LEASING/DEVELOPMENT UNDER THE PROPOSED PLAN AND ALL ALTERNATIVES

A number of variables would determine the degree of impact to non-WSA lands with wilderness characteristics, including where surface-disturbing activities occur, land form or topography, vegetation type, sequence of development, and reclamation time. Soil types and climate would affect the time it takes to reclaim disturbances. Successful reclamation would take about 10 years.

Construction and operation of oil and gas wells and associated support facilities, including roads, surface and buried pipelines, power lines, and compressor stations would create soil and vegetation disturbance and the presence of permanent structures (for the life of the oil/gas field) that would degrade the natural characteristics of non-WSA lands with wilderness characteristics. In addition to site-specific surface disturbance, the cumulative number of wells would change the appearance of natural characteristics.

Noise from construction and operation of producing wells, including the presence of work crews, vehicles, and equipment, would degrade opportunities for solitude and conflict with primitive recreational opportunities in proximity to industrial development. As recreational visitors move away from the sources of development, the sights and sounds of development would diminish. However, it can be expected that sights and sounds from development would reduce opportunities for solitude and primitive and unconfined recreation up to one-half mile beyond the direct loss of natural characteristics.

Table 4.96 displays the oil and gas leasing stipulations, by alternative, for each of the non-WSA lands with wilderness characteristics.

¹CSU/TL = Controlled Surface Use/Timing Limitations

NSO = No surface occupancy

4.3.8.5.2.1. Alternative A

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Surface disturbances resulting from oil and gas leasing decision that permit development would degrade natural characteristics, diminish opportunities for solitude, and conflict with primitive recreation activities. All or portions of 28 of the 29 non-WSA lands with wilderness characteristics, comprising 470,590 acres, would remain open to leasing and development under standard oil and gas stipulations or under CSU or TL stipulations (see Table 4.96). This comprises over 80% of the non-WSA wilderness lands with wilderness characteristics. Twenty percent of the non-WSA lands with wilderness characteristics (all of one and portions of 18 non-WSAs with wilderness characteristics) would be either closed to leasing or have an NSO stipulation on the leases.

In the Paradox Fold area, all or portions of the six non-WSA lands with wilderness characteristics, comprising 74,850 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 29% of the public lands within the development area. Approximately 4,900 acres (1,220 acres in Bridger Jack Mesa and 3,680 acres in Indian Creek non-WSAs) would have an NSO stipulation applied to the lease, or about 2% of the development area. Based on the percentage of non-WSA lands with wilderness characteristics and the existing or pending leases within those six areas, the highest potential for leasing and/or development would be in Harts Point, Indian Creek or Bridger Jack Mesa non-WSAs lands with wilderness characteristics. Given that the projection for drilling for oil and gas is about two wells per year for the public lands within the Paradox Fold area, and that 31% of the development area encompasses non-WSA lands with wilderness characteristics, up to one well per year, or up to 15 wells over a 15-year period, could be drilled within these areas. This could disturb up to 9.6 acres per year, or approximately 144 acres over the next 15 years within the non-WSA wilderness characteristics lands. Leasing and development within these non-WSA lands with wilderness characteristics would cause the affected portions to lose their natural characteristics. The effects on opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 144 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the number of projected wells in this development area over the next 15 years.

In the Monument Upwarp area, 22 of the 23 non-WSA lands with wilderness characteristics would remain all or partially open to leasing under standard stipulations or under CSU or TL stipulations (357,200 acres, or 48% of the development area). Approximately 107,800 acres in 17 non-WSA lands with wilderness characteristics would be under an NSO stipulation or closed to leasing, which is about 15% of the public land within the development area. This includes 50 acres in Arch Canyon (100% of this non-WSA land with wilderness characteristics); 40 acres in Butler Wash (2%); 2,630 acres in Cheesebox Canyon (20%); 520 acres in Comb Ridge (4%); 2,110 acres in Fish and Owl Creeks (9%); 5,710 acres in Fort Knocker Canyon (5%); 17,180 in Grand Gulch (31%); 6,020 acres in Gravel and Long Canyon (16%); 2,900 acres in Harmony Flat (30%); 5,530 acres in Lime Creek (99%); 27,490 acres in Mancos Mesa (45%); 15,200 acres in Nokai Dome (16%); 2,220 in Road Canyon (20%); 5,110 acres in San Juan River (36%);

1,500 acres in Upper Red Canyon (6%); 13,540 acres in Valley of the Gods (99%); and 50 acres in White Canyon (1%). Based on the percentage of non-WSA lands with wilderness characteristics and the existing and pending leases within those areas, the highest potential for leasing and/or development would be in Nokai Dome, Dark Canyon, Mancos Mesa, and Grand Gulch non-WSA lands with wilderness characteristics. Given that the projection for drilling for oil and gas is less than one well per year for all of the public lands in the Monument Upwarp area, and that 63% of the development area encompasses non-WSA lands with wilderness characteristics, that projected one well per year, or up to seven wells over a 15-year period, could be drilled within the non-WSA lands with wilderness characteristics. This could disturb up to 9.6 acres per well, or approximately 67 acres over the next 15 years. Leasing and development within these non-WSA lands with wilderness characteristics could cause the affected portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 67 acres of direct surface-disturbing activities, and would impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the next 15 years.

In the Blanding Sub-basin area, all seven non-WSA lands with wilderness characteristics, totaling 38,540 acres (or 9% of the development area), would remain open to leasing under standard stipulations or under CSU or TL stipulations. None of the lands would be under an NSO stipulation or closed to leasing. Based on the percentage of non-WSA lands with wilderness characteristics and/or the existing and pending leases within those areas, the highest potential for leasing and/or development would be in Cross Canyon, Squaw and Papoose Canyon, and the east side of Comb Ridge non-WSA lands with wilderness characteristics. Given that the projection for drilling for oil and gas is three wells per year for all of the public lands within the Monument Upwarp area, and that 9% of the development area encompasses non-WSA lands with wilderness characteristics open to leasing under standard stipulations, CSU, or TL, up to one well per year, or up to 15 wells over a 15-year period, could be drilled within the non-WSA lands with wilderness characteristics. This could disturb up to 9.6 acres per year, or up to 144 acres over the next 15 years. Leasing and development within these non-WSA lands with wilderness characteristics would cause the affected portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 144 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the next 15 years.

Geophysical exploration activities would be authorized for all non-WSA lands with wilderness characteristics, subject to the oil and gas leasing stipulations and the exceptions to those activities that are non-surface-disturbing as defined in Appendix A. Geophysical activities would have short-term, minimal impacts on naturalness due to crushed vegetation, tire tracks, and small drill holes and their cuttings. Solitude and primitive recreation opportunities would be impacted in the short-term by the presence of equipment, people, noise, and work associated with geophysical exploration activities. When the geophysical activity ceases, solitude and primitive

recreation opportunities would resume and disturbances to the naturalness would be restored in the short-term.

In summary, up to 37 wells over the 15-year RFD scenario, disturbing up to 355 acres, could occur in non-WSA lands with wilderness characteristics under this alternative. Ten of the 29 areas have a higher potential for these wells to be drilled based on existing leases and/or percentages of non-WSA lands within the development areas. All of Arch Canyon and the majority (99%) of Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics would be protected from surface-disturbing activities associated with oil and gas leasing due to an NSO stipulation or closed to leasing.

4.3.8.5.2.2. Alternative B

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Surface disturbances resulting from oil and gas leasing decision that permit development would degrade natural characteristics, diminish opportunities for solitude, and conflict with primitive recreation activities. All or portions of 24 of the 29 non-WSA lands with wilderness characteristics, comprising 485,010 acres, would remain open to leasing and development under standard oil and gas stipulations or under CSU or TL stipulations (see Table 4.96). This comprises nearly 83% of these non-WSA lands. Seventeen percent of the non-WSA lands with wilderness characteristics (all of five and portions of 11 non-WSAs) would be either closed to leasing or have an NSO stipulation on the leases. It is assumed that the various waivers, exceptions, and modifications under the NSO stipulation would not be granted because they would not be in concert with other resource goals and objectives in these areas.

In the Paradox Fold area, portions of four of the six non-WSA lands with wilderness characteristics, comprising 53,720 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 21% of the public lands within the development area. Approximately 26,030 acres, which includes 670 acres in Bridger Jack Mesa (3% of the non-WSA); 3,570 acres in Gooseneck (100%), 170 acres in Harts Point (1%); 1,760 acres in Hatch/Lockhart/Hart (100%); 19,760 acres in Indian Creek (85%); and 100 acres in Shay Mountain (1%), would have an NSO stipulation applied to the lease or be closed to leasing. This comprises about 10% of the development area. Based on the percentage of non-WSA lands with wilderness characteristics and the existing or pending leases within those six areas, the highest potential for leasing and/or development would be in Harts Point or Bridger Jack Mesa non-WSAs wilderness characteristics areas. Given that the projection for drilling for oil and gas is about one well per year for all of the public lands within the Paradox Fold area, and that 30% of the development area encompasses non-WSA lands with wilderness characteristics open for leasing, up to one well per year, or up to 15 wells over a 15-year period, could be drilled within these areas. This could disturb up to 9.6 acres per year, or approximately 144 acres over the next 15 years within the non-WSA lands. No surface disturbance associated with oil and gas activities would occur in Gooseneck or Hatch/Harts/Lockhart non-WSA lands with wilderness characteristics or on over 85% of the Indian Creek non-WSA lands with wilderness characteristics. Leasing and development within the Bridger Jack Mesa, Harts Point, Indian Creek, or Shay Mountain non-WSA lands with wilderness characteristics would cause the affected portion to lose its natural characteristics and diminish opportunities for solitude and

primitive recreation due to exploration for and development of oil and gas resources. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the number of projected wells in this development area over the next 15 years.

In the Monument Upwarp area, all of 14 and portions of six non-WSA lands with wilderness characteristics, comprising 407,870 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 55% of the public lands within the development area. Approximately 57,130 acres or about 8% of the lands in the development area, in all or portions of nine non-WSA lands with wilderness characteristics would be under an NSO stipulation or closed to leasing. This includes 1,080 acres in Comb Ridge (100% of this non-WSA); 3,310 acres in Dark Canyon (5%); 3,590 acres in Fish and Owl Creeks (15%); 100 acres in Grand Gulch (<1%); 5,200 acres in Lime Creek (100%); 12,760 acres in Mancos Mesa (21%); 12,600 acres in Nokai Dome (13%); 4,820 acres in San Juan River (63%); and 13,670 acres in Valley of the Gods (100%). Based on the percentage of non-WSA lands with wilderness characteristics and the existing and pending leases within those areas, the highest potential for leasing and/or development would be the same as in Alternative A: Nokai Dome, Dark Canyon, Mancos Mesa, and Grand Gulch non-WSA lands with wilderness characteristics. However, all of Comb Ridge, Lime Creek and Valley of the Gods non-WSA land with wilderness characteristics would be protected from surface-disturbing oil- and gas-related activities, thus protecting their wilderness characteristics. Given that the projection for drilling for oil and gas is less than one well per year for all of the public land within the Monument Upwarp area, and that 63% of the development area encompasses non-WSA lands with wilderness characteristics, the projected one well per year, or up to eight wells over a 15-year period, could be drilled within the non-WSA lands with wilderness characteristics. This would disturb up to 9.6 acres per well, or approximately 77 acres over the next 15 years. Surface disturbance associated with leasing and development within these non-WSA wilderness characteristics lands would cause the affected portion to lose their natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 77 acres of direct surface-disturbing activities, and would impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the next 15 years.

In the Blanding Sub-basin area, all of four and a portion of one non-WSA land with wilderness characteristics, totaling 23,420 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This comprises 6% of the public lands in the development area. Approximately 15,120 acres in three non-WSA lands with wilderness characteristics would be under an NSO stipulation or closed to leasing, which is about 4% of the public land development area. This includes 12,680 acres in Comb Ridge (100% of this non-WSA with wilderness characteristics); 360 acres in Lime Creek (100%); and 2,080 acres in Road Canyon (26%). Based on the percentage of non-WSA lands with wilderness characteristics and/or the existing and pending leases within those areas, the highest potential for leasing and/or development would be in Cross Canyon and Squaw and Papoose Canyon. Given that the projection for drilling for oil and gas is three wells per year for the all of the public land in the Blanding Sub-basin area, and that just over 5% of the development area encompasses non-WSA lands with wilderness

characteristics open to leasing under standard, CSU, or TL stipulations, it is still anticipated that up to one well per year could be drilled in the non-WSA lands because the Blanding Sub-basin area contains oil and gas fields and the majority of existing wells within the whole Monticello FO. This could disturb up to 9.6 acres per year, or up to 144 acres over the next 15 years; however, none of the surface-disturbing activities would be within Comb Ridge or Lime Creek non-WSA lands with wilderness characteristics, thus protecting those values. Leasing and development within these non-WSAs wilderness lands with wilderness characteristics would cause the affected portion to lose its natural characteristics and opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the next 15 years.

Impacts from geophysical activities would be the same as Alternative A.

In summary, up to 38 wells over the 15-year RFD scenario, disturbing up to 365 acres could occur in non-WSA lands with wilderness characteristics under this alternative. Eight of the 29 areas have a higher potential for these wells to be drilled based on existing leases and/or percentages of non-WSA lands within the development areas. All of Gooseneck, Hatch/Lockhart/Hart, Lime Creek, Valley of the Gods, Comb Ridge, and 85% of Indian Creek non-WSA lands with wilderness characteristics would be protected from surface-disturbing activities associated with oil and gas leasing due to NSO or closed to leasing stipulations.

4.3.8.5.2.3. Alternative C

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Surface disturbances resulting from oil and gas leasing decision that permit development would degrade natural characteristics, diminish opportunities for solitude, and conflict with primitive recreation activities. All or portions of 27 of the 29 non-WSA lands with wilderness characteristics, comprising 547,420 acres, would remain open to leasing and development under standard oil and gas stipulations or under CSU or TL stipulations (see Table 4.96). This comprises nearly 94% of these non-WSA lands. Six percent of the non-WSA lands with wilderness characteristics totaling 34,940 acres (all of two and portions of 10 non-WSAs wilderness areas) would be either closed to leasing or have an NSO stipulation on the leases. It is assumed that the various waivers, exceptions, and modifications under the NSO stipulation would not be granted because they would not be in concert with other resource goals and objectives in these areas.

In the Paradox Fold area, all or portions of the six non-WSA lands with wilderness characteristics, comprising 73,850 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 29% of the public lands within the development area. Approximately 5,900 acres, which includes 690 acres in Bridger Jack Mesa (3% of the non-WSA); 970 acres in Gooseneck (27%), 4,140 acres in Indian Creek (18%), and 100 acres in Shay Mountain (2%) non-WSA lands with wilderness characteristics would have an NSO stipulation applied to the lease or be closed to leasing. This comprises about 2% of the development area. Based on the percentage of non-WSA lands with wilderness characteristics and the existing or pending leases within those six areas, the highest potential for leasing and/or

development would be in Bridger Jack Mesa, Harts Point, or Indian Creek non-WSAs. Given that the projection for drilling for oil and gas is about two wells per year for all of the public lands in the Paradox Fold area, and that 31% of the development area encompasses non-WSA lands with wilderness characteristics open for leasing, up to one well per year, or up to 15 wells over a 15-year period, could be drilled within these areas. This could disturb up to 9.6 acres per year, or up to 144 acres over the next 15 years within the non-WSA wilderness lands. Leasing and development within the seven non-WSAs wilderness characteristics areas would cause that portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 144 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the number of projected wells in this development area over the next 15 years.

In the Monument Upwarp area, all of 15 and portions of six non-WSA lands with wilderness characteristics, comprising 437,860 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 59% of the public lands within the development area. Approximately 27,140 acres, or about 4% of the lands in the development area, in all of two and portions of six non-WSA lands with wilderness characteristics would be under an NSO stipulation or closed to leasing. This includes 3,350 acres in Dark Canyon (5% of this non-WSA); 70 acres in Grand Gulch (<1%); 5,200 acres in Lime Creek (100%); 250 acres in Mancos Mesa (<1%); 420 acres in Nokai Dome (<1%); 4,180 acres in San Juan River (55%); and 13,670 acres in Valley of the Gods (100%). Based on the percentage of non-WSA lands with wilderness characteristics and the existing and pending leases within those areas, the highest potential for leasing and/or development would be the same as in Alternative A: in Nokai Dome, Dark Canyon, Mancos Mesa, and Grand Gulch non-WSA lands with wilderness characteristics. However, all of Lime Creek and Valley of the Gods non-WSAs would be protected from surface-disturbing oil- and gas-related activities, thus protecting their wilderness characteristics. Given that the projection for drilling for oil and gas is less than one well per year for the public lands within the Monument Upwarp area, and that 63% of the development area encompasses non-WSA lands with wilderness characteristics, the projected one well per year, or up to nine wells over a 15-year period, could be drilled within the non-WSA lands. This could disturb up to 9.6 acres per well, or approximately 86 acres over the next 15 years. Leasing and development within these non-WSA lands could cause that portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 86 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the life of the next 15 years.

In the Blanding Sub-basin area, all of five and a portion of one non-WSA lands with wilderness characteristics, totaling 36,640 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This comprises over 9% of the public lands in the development area. Approximately 1,900 acres in two non-WSA lands with wilderness characteristics would be under an NSO stipulation or closed to leasing, which is less than 1% of the public lands within

this development area. This includes 360 acres in Lime Creek (100% of the non-WSA) and 1,540 acres in Road Canyon (24%). Based on the percentage of non-WSA lands with wilderness characteristics and/or the existing and pending leases within those areas, the highest potential for leasing and/or development would be in Comb Ridge, Cross Canyon, and Squaw and Papoose Canyon. Given that the projection for drilling for oil and gas is three wells per year for the all of the public lands within the Blanding Sub-basin area, and that just over 9% of the development area encompasses non-WSA lands with wilderness characteristics open to leasing under standard stipulations, CSU, or TL stipulations, it is still anticipated that up to one well per year could be drilled in the non-WSA lands because the Blanding Sub-basin area contains oil and gas fields and the majority of existing wells within the Monticello PA. This could disturb up to 9.6 acres per year, or approximately 144 acres over the next 15 years, however, none of the surface-disturbing activities would be within Lime Creek non-WSA lands with wilderness characteristics, thus protecting those values. Leasing and development within these non-WSA wilderness lands could cause that portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 144 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the next 15 years.

Impacts from geophysical activities would be the same as Alternative A.

In summary, up to 39 wells over the 15-year RFD scenario, disturbing up to 374 acres could occur in non-WSA lands with wilderness characteristics under this alternative. Ten of the 29 areas have a higher potential for these wells to be drilled based on existing leases and/or percentages of non-WSA wilderness lands within the development areas. However, all of Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics would be protected from surface-disturbing activities associated with oil and gas leasing due to an NSO stipulation.

4.3.8.5.2.4. Alternative D

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, non-WSA lands with wilderness characteristics would not be protected or managed to preserve their wilderness characteristics. Surface disturbances resulting from oil and gas leasing decision that permit development would degrade natural characteristics, diminish opportunities for solitude, and conflict with primitive recreation activities. All of the 29 non-WSA lands with wilderness characteristics would remain open to leasing and development under standard oil and gas stipulations or under CSU or TL stipulations under this alternative.

In the Paradox Fold area, all six non-WSA lands with wilderness characteristics would remain open to leasing under standard stipulations or under CSU or TL stipulations (79,750 acres). This is 31% of all of the public lands within this development area. Based on the percentage of non-WSA lands with wilderness characteristics and the existing leases within those areas, the highest potential for leasing and/or development would be in Bridger Jack Mesa, Indian Creek, and Harts Point. Because well projections under this alternative are similar to Alternative A, and generally the same percentage of lands in the development area encompass non-WSA lands with

wilderness characteristics, the same analysis of impacts to non-WSA lands with wilderness characteristics resulting from development of one well in this area would occur.

In the Monument Upwarp area, all 23 non-WSA lands with wilderness characteristics would remain open to leasing under standard stipulations or under CSU or TL stipulations (465,000 acres). This is 63% of the public lands in the whole development area. Based on the percentage of non-WSA lands with wilderness characteristics and the existing leases within those areas, the highest potential for leasing and/or development would be in the Dark Canyon, Grand Gulch, Mancos Mesa, and Nokai Dome non-WSA lands with wilderness characteristics. Because well projections under this alternative are generally the same as in Alternative A, and generally the same percentage of lands in this development area encompass non-WSA lands with wilderness characteristics, the same analysis of impacts to non-WSA lands with wilderness characteristics resulting from development of one well would occur.

In the Blanding Sub-basin area, all seven non-WSA lands with wilderness characteristics, totaling 38,540 acres (or 9% of the public lands in the development area), would remain open to leasing under standard stipulations or under CSU or TL stipulations. Based on the percentage of non-WSA lands with wilderness characteristics and/or the existing and pending leases within those areas, the highest potential for leasing and/or development would be in Cross Canyon, Squaw and Papoose Canyon, and the east side of Comb Ridge non-WSA lands with wilderness characteristics. Given that the projection for drilling for oil and gas is generally the same as Alternative A and the same acreage is available for leasing, the same assumptions and impacts to non-WSA lands with wilderness characteristics would occur.

Impacts from geophysical activities would be the same as Alternative A.

In summary, up to 37 wells over the 15-year RFD scenario, disturbing up to 355 acres could occur in non-WSA lands with wilderness characteristics under this alternative. All areas would remain available for leasing and development. Ten of the 29 non-WSAs have a higher potential for these wells to be drilled based on their large acreage and existing leases within the development areas.

4.3.8.5.2.5. Alternative E

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under Alternative E, all the non-WSA lands with wilderness characteristics would be managed to protect their wilderness characteristics and closed to leasing. However, existing leases still remain in 10 of the 29 non-WSA lands with wilderness characteristics. Development of these leases could compromise wilderness characteristics values in these areas. Below is a breakdown of how or where that may occur based on the development areas and the predicted surface disturbance for oil and gas activity under this alternative. Those non-WSA lands with wilderness characteristics that are not currently leased would be fully protected under the leasing closure under this alternative. This would preserve the naturalness of the areas and maintain the outstanding opportunities for primitive recreation and solitude.

In the Paradox Fold and Fault Belt area, all non-WSA lands with wilderness characteristics would be closed to future leasing. However, portions of two non-WSA lands with wilderness characteristics are under existing leases comprising 70 acres. Based on the size of the leases in the non-WSA lands with wilderness characteristics, the highest potential for development would

be in Harts Point and Indian Creek non-WSA wilderness areas. The projection for drilling for oil and gas is one well per year for the all of the public lands within the development area under this alternative. The leased lands comprise far less than 1% of the public lands within the development area. It is not expected that these leases would be developed based on this low RFD and the amount of other public lands available for leasing and development. However, if they are developed, and one well would, on average, cause surface disturbance on up to 9.6 acres, far less than 1% of each of the non-WSA lands with wilderness characteristics would be impacted. Surface disturbance associated with development of these small, leased areas within the non-WSA lands with wilderness characteristics would cause the affected portion to lose its natural characteristics and opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources.

In the Monument Upwarp area, all non-WSA lands with wilderness characteristics would be closed to future leasing. However, portions of six of the 23 non-WSA lands with wilderness characteristics are under existing leases comprising 3,340 acres. Based on the size of the leases within the non-WSA lands with wilderness characteristics, the highest potential for development of those leases could be in Grand Gulch or Harmony Flat. The RFD projection for drilling for oil and gas is less than one well per year (or seven wells over the next 15 years) for all of the public lands in this development area under this alternative. The leased lands comprise far less than 1% of the public lands within the development area. However, because of the amount of public land that would be closed to leasing under this alternative in this development area, it is assumed that the leases within any of the six areas could be developed. If they are developed and one well would, on average, cause surface disturbance on up to 9.6 acres, far less than 1% of each of the non-WSA lands with wilderness characteristics would be impacted. Even if all of the projected seven wells over the next 15 years are developed in the 1,600 acres leased in Grand Gulch, the total disturbance would be 67 acres within this 55,240-acre area (far less than 1%). Development of any of these small leased areas within the non-WSA lands with wilderness characteristics would cause the affected portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 67 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, the majority of the areas would maintain their wilderness characteristics integrity.

In the Blanding Sub-basin area, all non-WSA lands with wilderness characteristics would be closed to future leasing. However, portions of two of the seven non-WSA lands with wilderness characteristics are under existing leases comprising 1,030 acres. Both of these non-WSAs, Cross Canyon and Squaw and Papoose Canyon, are vulnerable to development of the existing leases since they are near an existing oil and gas field and they lie within an area of the Monticello FO that has had the most oil and gas activity. The leases within the development area, however, comprise far less than 1% of the public lands within this development area. Given that the projection for drilling for oil and gas is two wells per year for the whole 406,770 acres of public land within the Blanding Sub-basin area, and only 1,030 acres is available for development within the non-WSA lands with wilderness characteristic, it is not anticipated that any wells would be drilled in the non-WSA lands with wilderness characteristics. If developed, however, it would cause these non-WSA wilderness areas to lose a small portion of their natural characteristics and opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources. However, it is not anticipated that any of the areas would

lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the 15-year scenario.

Geophysical operations would be considered if they are not surface-disturbing (i.e., heliportable drilling, walked lines, etc.) See Appendix A for a definition of surface-disturbing activities. Impacts to wilderness characteristics would be negligible except for the actual time of operations. Noise and movement associated with the activities could temporarily disrupt the opportunities for solitude and conflict with primitive recreation activities.

In summary, existing leases within 10 non-WSA lands would allow for development on those leases; however, it is not anticipated that development would occur in any of the areas except possibly within the Monument Upwarp area due to the limited amount of land that would remain available for leasing. All other non-WSA lands with wilderness characteristics would be protected from oil and gas leasing and developments activities by closing the areas to future leasing.

4.3.8.5.2.6. Proposed Plan

Under the Proposed Plan, five non-WSA lands with wilderness characteristics (88,871 acres) would be managed to preserve their wilderness characteristics. Of these five areas, Dark Canyon (11,540 acres) would be available for leasing with a NSO stipulation. The remaining four areas, Nokai Dome East, Nokai Dome West, Mancos Mesa, and Grand Gulch, totaling 77,331 acres would not be available for leasing. This comprises about 15% of the non-WSA lands with wilderness characteristics that have been identified in the planning area. It is assumed that the various waivers, modifications, and exceptions to the NSO stipulation would not be granted because they would not be in concert with other resources objectives of the Dark Canyon non-WSA lands with wilderness characteristics.

All or portions of 27 of the 29 non-WSA lands with wilderness characteristics, comprising 460,093 acres, would remain open to leasing and development under standard oil and gas stipulations or under CSU or TL stipulations (see Table 4.96). This comprises nearly 79% of these non-WSA lands. Twenty-one percent of the non-WSA lands with wilderness characteristics totaling 123,197 acres (all of two and portions of nine non-WSAs lands with wilderness characteristics) would be either closed to leasing or have an NSO stipulation on the leases. It is assumed that the various waivers, exceptions, and modifications under the NSO stipulation would not be granted because they would not be in concert with other resource goals and objectives in these areas.

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

In the Monument Upwarp area, all of 15 and portions of six non-WSA lands with wilderness characteristics, comprising 349,603 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 47% of the public lands within the development area. Approximately 88,871 acres or about 12% of the lands in the development area, in portions of five non-WSA lands with wilderness characteristics would be available for leasing with an NSO stipulation or closed to leasing. This includes 11,540 acres in Dark Canyon (17% of this non-WSA); 13,657 acres in Grand Gulch (25%); 30,068 acres in Mancos Mesa (49%); 18,618 acres in Nokai Dome East (20%); and 14,988 acres in Nokai Dome West (16%). Based on the percentage of non-WSA lands with wilderness characteristics and the existing and pending leases within those areas, the highest potential for leasing and development would be the

same as in Alternative A: in Nokai Dome East, Nokai Dome West, Dark Canyon, Mancos Mesa, and Grand Gulch non-WSA lands with wilderness characteristics, but outside the portions of these non-WSA lands with wilderness characteristics managed for their wilderness characteristics (and NSO or closed to leasing) under the Proposed Plan. Since these five non-WSA lands with wilderness characteristics are NSO or closed to leasing and do not contain any existing leases, there would be no impacts to the natural characteristics or opportunities for solitude or primitive recreation from surface disturbance, noise, or presence of people, vehicles, and equipment use during exploration and production of oil or gas.

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

In the Paradox Fold area, all or portions of the six non-WSA lands with wilderness characteristics, comprising 73,850 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 28% of the public lands within the development area. Approximately 5,900 acres, which includes 690 acres in Bridger Jack Mesa (3% of the non-WSA); 970 acres in Gooseneck (27%), 4,140 acres in Indian Creek (18%), and 100 acres in Shay Mountain (2%) non-WSA lands with wilderness characteristics would have an NSO stipulation applied to the lease or be closed to leasing. This comprises about 2% of the development area. Based on the percentage of non-WSA lands with wilderness characteristics and the existing or pending leases within those six areas, the highest potential for leasing and/or development would be in Bridger Jack Mesa, Harts Point, or Indian Creek non-WSA lands with wilderness characteristics. Given that the projection for drilling for oil and gas is about two wells per year for all of the public lands in the Paradox Fold area, and that 31% of the development area encompasses non-WSA lands with wilderness characteristics open for leasing, up to one well per year, or up to 15 wells over a 15-year period, would be drilled within non-WSA lands with wilderness characteristics. This would disturb up to 9.6 acres per year, or up to 144 acres over the next 15 years within the non-WSA lands with wilderness characteristics. Leasing and development within these non-WSAs lands with wilderness characteristics would cause the affected portion to lose its natural characteristics. The loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 144 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the non-WSA lands with wilderness characteristics would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the number of projected wells in this development area over the next 15 years.

In the Monument Upwarp area, all of 15 and portions of six non-WSA lands with wilderness characteristics, comprising 349,603 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This is about 47% of the public lands within the development area. Approximately 23,050 acres or about 3% of the lands in the development area, in all two and a portion of one non-WSA lands with wilderness characteristics would be available for leasing with an NSO stipulation or closed to leasing. This includes 5,200 acres in Lime Creek (100%); 4,180 acres in San Juan River (55%); and 13,670 acres in Valley of the Gods (100%). Based on the percentage of non-WSA lands with wilderness characteristics and the existing and pending leases within those areas, the highest potential for leasing and development would be the same as in Alternative A: in Nokai Dome, Dark Canyon, Mancos Mesa, and Grand Gulch non-WSA lands with wilderness characteristics, outside portions of these non-WSA lands with wilderness characteristics managed for their wilderness

characteristics (and NSO or closed to leasing) under the Proposed Plan. However, all of Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics would be protected from surface-disturbing oil- and gas-related activities, thus protecting their wilderness characteristics. Given that the projection for drilling for oil and gas is less than one well per year for the public lands within the Monument Upwarp area, and that 63% of the development area encompasses non-WSA lands with wilderness characteristics, the projected one well per year, or up to nine wells over a 15-year period, would be drilled within the non-WSA lands with wilderness characteristic. This would disturb up to 9.6 acres per well, or approximately 86 acres over the next 15 years. Leasing and development within these non-WSA lands with wilderness characteristics would cause the affected portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 86 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the next 15 years.

In the Blanding Sub-basin area, all of five and a portion of one non-WSA lands with wilderness characteristics, totaling 36,640 acres, would remain open to leasing under standard stipulations or under CSU or TL stipulations. This comprises over 9% of the public lands in the development area. Approximately 1,900 acres in two non-WSA lands with wilderness characteristics would be available for leasing with an NSO stipulation or closed to leasing, which is less than 1% of the public lands within this development area. This includes 360 acres in Lime Creek (100% of the non-WSA lands with wilderness characteristics) and 1,540 acres in Road Canyon (24%). Based on the percentage of non-WSA lands with wilderness characteristics and the existing and pending leases within those areas, the highest potential for leasing and development would be in Comb Ridge, Cross Canyon, and Squaw and Papoose Canyon. Given that the projection for drilling for oil and gas is three wells per year for all of the public lands within the Blanding Sub-basin area, and that just over 9% of the development area includes non-WSA lands with wilderness characteristics open to leasing under standard stipulations, CSU, or TL stipulations, it is still anticipated that up to one well per year would be drilled in the non-WSA lands with wilderness characteristics because the Blanding Sub-basin area contains oil and gas fields and the majority of existing wells within the Monticello PA. This would disturb up to 9.6 acres per year, or approximately 144 acres over the next 15 years, however, none of the surface-disturbing activities would be within Lime Creek non-WSA lands with wilderness characteristics, thus protecting those values. Leasing and development within these non-WSA lands with wilderness characteristics would cause the affected portion to lose its natural characteristics. Loss of opportunities for solitude and primitive recreation due to exploration for and development of oil and gas resources would be broader than just for the 144 acres of direct surface-disturbing activities, and could impact these values for up to one-half mile from the ongoing activity. However, it is not anticipated that any of the areas would lose their wilderness characteristics in totality because of the small amount of acreage projected to be disturbed and the few projected wells in this development area over the next 15 years.

Impacts from geophysical activities would be the same as Alternative A.

In summary, up to 39 wells over the 15-year RFD scenario, disturbing up to 374 acres would occur in non-WSA lands with wilderness characteristics under the Proposed Plan. Ten of the 29

areas have a higher potential for these wells to be drilled based on existing leases and/or percentages of non-WSA lands with wilderness characteristics within the development areas. However, all of Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics would be protected from surface-disturbing activities associated with oil and gas leasing due to an NSO stipulation.

Under the Proposed Plan and each alternative, the following percentage of non-WSA lands with wilderness characteristics would remain open to leasing and development under standard oil and gas stipulations or under CSU or TL stipulations:

- Alternative A, 81% of all non-WSA lands (470,590 acres)
- Alternative B, 83% of all non-WSA lands (485,010 acres)
- Alternative C, 94% of all non-WSA lands (548,350 acres)
- Alternative D, 100% of the non-WSA lands (582,360 acres)
- Alternative E, 0% of the 29 non-WSA lands (0 acres)
- Proposed Plan, 79% of the 29 non-WSA lands (460,093 acres)

Based on the low RFDs for the Monticello PA, up to three wells could be drilled per year in the non-WSA lands with wilderness characteristics that are open to leasing and development under the Proposed Plan and Alternatives A, B, C, and D. It is assumed that 9.6 acres of surface disturbance would be associated with each well drilled. Under the Proposed Plan and all four alternatives, the maximum amount of surface disturbance would be between 355 acres and 374 acres over the 15-year RFD scenario. Although oil and gas well development would cause surface-disturbing activities that would result in loss of wilderness characteristics in some areas, it is not expected under the Proposed Plan or any alternative that the amount of disturbance based on well projections and the scattered nature of the wells would be substantial. Although small acreages may be lost in some of the non-WSA lands with wilderness characteristics, it is not predicted that any of the areas would lose their wilderness characteristics in whole.

4.3.8.5.3. SALABLE MINERALS

4.3.8.5.3.1. Impacts Common to the Proposed Plan and All Alternatives

Salable minerals are managed following the same objectives as oil and gas resources. The same non-WSA lands with wilderness characteristics that are open under standard stipulations or minor constraints for oil and gas leasing would be available for salable mineral disposal, just as those non-WSA lands with wilderness characteristics either closed to leasing or under NSO stipulations would be unavailable for salable mineral disposal (see Table 4.96). The non-WSA lands with wilderness characteristics with the highest potential for sand and gravel occurrence within 3 miles of a road overlie portions of the Comb Ridge, Harts Point, Valley of the Gods, Mancos Mesa, Nokai Dome, Upper Red Canyon, Fort Knocker Canyon, and Gravel and Long Canyon areas. Currently there is only one sand and gravel pit contiguous to the northernmost end of Comb Ridge. All or portions of 26 non-WSA lands with wilderness characteristics have high potential for building stone occurrence. None of the non-WSA lands with wilderness characteristics are currently near a building stone quarry. Those non-WSAs with wilderness characteristics that do not intersect with the building stone resource are Grand Gulch, Lime Creek and Valley of the Gods. The San Juan River non-WSA land with wilderness

characteristics has a high potential for limestone occurrence, and there is a limestone quarry near the area.

4.3.8.5.3.2. Alternative A

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

All or portions of 28 of the 29 non-WSA lands with wilderness characteristics, comprising 469,660 acres, would remain open to salable mineral disposal. This comprises over 80% of these non-WSA lands. Most of the Comb Ridge non-WSA land with wilderness characteristics (13,240 acres) would remain open to sand and gravel disposal and 9,230 acres of the San Juan River non-WSA lands with wilderness characteristics would be open to limestone disposal. Where surface disturbance would occur, natural characteristics and opportunities for primitive recreation and solitude would be foregone. If the gravel pits or building rock quarries have associated support facilities, including roads and power lines, soil and vegetation disturbance, the presence of permanent structures would degrade the natural characteristics of non-WSA lands with wilderness characteristics. Noise from the operation of sand and gravel pits or rock quarries, including the presence of work crews, vehicles, and equipment, would degrade opportunities for solitude and conflict with primitive recreational opportunities in proximity to industrial development. As recreational visitors move away from the sources of development, the sights and sounds of development would diminish. However, it can be expected that sights and sounds from development would reduce opportunities for solitude and primitive and unconfined recreation up to one-half mile beyond the direct loss of natural character, depending on topography.

Twenty percent of the non-WSA lands with wilderness characteristics totaling 112,700 acres (all of one and portions of 18 non-WSAs) would be closed to salable mineral disposal; thus, the wilderness characteristics of those areas would be maintained.

4.3.8.5.3.3. Alternative B

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

All or portions of 24 of the 29 non-WSA lands with wilderness characteristics areas, comprising 484,080 acres, would remain open to salable mineral disposal. This comprises nearly 83% of these non-WSA lands. Where surface disturbance would occur, natural characteristics and opportunities for primitive recreation and solitude would be foregone. The same impacts to wilderness values as described under Alternative A would ensue. Seventeen percent of the non-WSA lands with wilderness characteristics totaling 98,280 acres (all of five and portions of 11 non-WSAs) would be closed to salable mineral disposal, thus, the wilderness characteristics of those areas would be maintained. The Comb Ridge non-WSA lands with wilderness characteristics would be closed to sand and gravel disposal, but 9,520 acres of the San Juan River non-WSA lands with wilderness characteristics would be open to limestone disposal.

4.3.8.5.3.4. Alternative C

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

All or portions of 27 of the 29 non-WSA lands with wilderness characteristics, comprising 547,420 acres, would remain open to salable mineral disposal. This comprises nearly 94% of these non-WSA lands. The Comb Ridge non-WSA would remain open to sand and gravel

disposal. Where surface disturbance would occur, naturalness and opportunities for primitive recreation and solitude would be foregone. The same impacts to wilderness values as described under Alternative A would ensue. Six percent of the non-WSA lands with wilderness characteristics totaling 34,940 acres (all of two and portions of 10 non-WSAs) would be closed to salable mineral disposal, thus the wilderness characteristics of those areas would be protected. The San Juan River non-WSA would be closed to limestone disposal.

4.3.8.5.3.5. Alternative D

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

All of the 29 non-WSA in the 582,360 acres of non-WSA lands with wilderness characteristics would remain open to disposal of salable minerals under standard conditions or minor constraints. Where surface disturbance occurs, natural characteristics and opportunities for primitive recreation and solitude would be diminished or lost, with the same impacts to wilderness characteristics as described under Alternative A.

4.3.8.5.3.6. Alternative E

Non-WSA Lands with Wilderness Characteristic Managed to Protect Wilderness Characteristics

Under Alternative E, all lands within the non-WSA lands with wilderness characteristics would be closed to salable mineral disposal as part of the prescription to manage for protection of their wilderness characteristics. These areas would not be developed for production of sand, gravel, and building stone under this alternative. This would preserve natural characteristics and maintain the outstanding opportunities for primitive recreation and solitude of the non-WSA lands with wilderness characteristics.

4.3.8.5.3.7. Proposed Plan

Non-WSA Lands with Wilderness Characteristic Managed to Protect Wilderness Characteristics

Portions of five non-WSA lands with wilderness characteristics, including 88,871 acres would be closed to mineral material disposal. This comprises 15% of all the non-WSA lands with wilderness characteristics. Under the Proposed Plan, Dark Canyon (11,540 acres), Mancos Mesa (30,068 acres), Nokai Dome East (18,618 acres), Nokai Dome West (14,988 acres), and Grand Gulch (13,657 acres) would be managed to protect their wilderness characteristics and would be closed to mineral material disposal.

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

All or portions of 27 of the 29 non-WSA lands with wilderness characteristics, comprising 459,163 acres, would remain open to salable mineral disposal. This comprises nearly 79% of these non-WSA lands with wilderness characteristics. The Comb Ridge would remain open to sand and gravel disposal. Where surface disturbance would occur, naturalness and opportunities for primitive recreation and solitude would be foregone. The same impacts to wilderness characteristics as described under Alternative A would ensue. Six percent of the non-WSA lands with wilderness characteristics totaling 34,326 acres (all of two and portions of six non-WSA lands with wilderness characteristics) would be closed to salable mineral disposal, thus the wilderness characteristics of those areas would be maintained. The San Juan River non-WSA lands with wilderness characteristics would be closed to limestone disposal.

4.3.8.5.4. LOCATABLE MINERALS

4.3.8.5.4.1. Impacts Common to the Proposed Plan and All Alternatives

Portions of 17 non-WSA lands with wilderness characteristics are located within areas of moderate to high potential for uranium and vanadium and are within historic mining districts: Bridger Jack Mesa (8,670 acres within the non-WSA), Butler Wash (80 acres), Cheesebox Canyon (12,440 acres), Comb Ridge (470 acres), Fort Knocker Canyon (1,180 acres), Gooseneck (3,330 acres), Gravel and Long Canyon (19,270 acres), Hammond Canyon (340 acres), Harmony Flat (180 acres), Harts Point (18,860 acres), Hatch/Lockhart/Hart (1,520 acres), Indian Creek (10,020 acres), Red Rock Plateau (15,480 acres), Shay Mountain (5,380 acres), Squaw and Papoose Canyon (3,570 acres), Upper Red Canyon (9,550 acres), and White Canyon (1,170 acres). In all, 111,510 acres within non-WSA lands with wilderness characteristics, or 19% of the non-WSA lands are within areas of moderate to high potential for uranium and vanadium occurrence, and in historic mining districts.

Future development of these resources is expected to occur within the historic mining districts, and currently there are over 7,000 mining claims for this resource, many within the non-WSA lands with wilderness characteristics within the Monticello FO. If new mining development occurs within these areas, direct loss of wilderness characteristics would be unavoidable due to surface-disturbing activities. To date, however, there has been no new activity associated with the existing claims within the non-WSA lands with wilderness characteristics. New mining claims are filed continually, and changes could occur that would impact lands with wilderness characteristics by removing vegetation, moving soils, and disrupting the natural landscape. It would also alter the setting needed to support primitive recreation activities and opportunities to find solitude for those non-WSA lands with wilderness characteristics where new mining activities occur. For purposes of analysis, it is assumed that development for uranium and vanadium mining could occur anywhere within the moderate to high development potential areas in the historic mining districts.

Some lands in the non-WSA lands with wilderness characteristics have been recommended for withdrawal from mineral entry to give management emphasis to other resource values and uses. The withdrawals would prevent surface disturbance that would reduce or eliminate wilderness characteristics. The following is an analysis of the effects of proposed mineral withdrawals on the wilderness characteristics of non-WSA lands with wilderness characteristics.

4.3.8.5.4.2. Alternative A

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

There are two non-WSA lands with wilderness characteristics within historic uranium and vanadium mining districts, totaling 4,280 acres, where mineral withdrawals have been proposed:

- 390 acres of the Gooseneck non-WSA lands with wilderness characteristics
- 3,890 acres of the Indian Creek non-WSA lands with wilderness characteristics

The proposed mineral withdrawals would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation in each of these areas by preventing location of mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining in those areas. However, if mining claims currently exist in

these areas, wilderness characteristics could be at risk of development for uranium and vanadium mining as described in Section 4.3.8.5.3.1, Impacts Common to the Proposed Plan and All Alternatives.

4.3.8.5.4.3. Alternative B

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

There are three non-WSA lands with wilderness characteristics areas within historic uranium and vanadium mining districts, totaling 13,505 acres, where mineral withdrawals have been proposed:

- 3,330 acres of the Gooseneck non-WSA wilderness characteristics area
- 155 acres of the Harts Point non-WSA wilderness characteristics area
- 10,020 acres of the Indian Creek non-WSA wilderness characteristics area

The proposed mineral withdrawals would preserve the natural characteristics and opportunities for both solitude and primitive forms of recreation by preventing location of mining claims and the noise and presence of surface disturbance, people, vehicles, and equipment associated with mining in those areas. However, if mining claims currently exist in these areas, wilderness characteristics could be at risk of development for uranium/vanadium mining as described in Section 4.3.8.5.3.1, Impacts Common to the Proposed Plan and All Alternatives.

4.3.8.5.4.4. Alternative C

The impacts would be the same as Alternative A because management decisions are the same.

4.3.8.5.4.5. Alternative D

Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

None of the withdrawals proposed under this alternative would occur in non-WSA lands with wilderness characteristics within an historic uranium or vanadium mining district. All non-WSA lands with wilderness characteristics within the historic mining areas could be claimed and mined. If new mining development occurs within these areas, the natural characteristics of the landscape would be altered and opportunities for solitude and primitive recreation would be diminished due to surface-disturbing activities related to mining.

4.3.8.5.4.6. Alternative E

Non-WSA Lands with Wilderness Characteristic Managed to Protect Wilderness Characteristics

All non-WSA lands with wilderness characteristics would be proposed for mineral withdrawal under this alternative as part of the management prescription to protect wilderness characteristics. However, uranium and vanadium mining claims currently exist in the majority of the historic mining districts. If new mining development occurs within these areas, direct loss of natural characteristics and opportunities for solitude and primitive recreation would be unavoidable due to surface-disturbing activities.

4.3.8.5.4.7. Proposed Plan

The effects of proposed mineral withdrawals on uranium and vanadium mining, and the resultant impact on non-WSA lands with wilderness characteristic would be the same as Alternative A because management decisions are the same.

4.3.8.6. IMPACTS OF NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

There are 29 areas, outside of existing WSAs, totaling 582,360 acres, in the Monticello PA that were inventoried and found to have wilderness characteristics. See Table 3.19 for a list of areas by name and acreage with wilderness characteristics and Maps 33 and 34 for locations and names of non-WSA lands with wilderness characteristics.

4.3.8.6.1. ALTERNATIVES A, B, C, AND D

4.3.8.6.1.1. Non-WSA Lands with Wilderness Characteristic Managed for Other Resource Values and Uses

Under these alternatives, there are no specific actions prescribed to directly protect or enhance the natural characteristics and opportunities for solitude or primitive recreation in the non-WSA lands with wilderness characteristics. Thus, there are no effects on the natural characteristics or opportunities for solitude or primitive recreation of the non-WSA lands with wilderness characteristics.

4.3.8.6.2. ALTERNATIVE E

4.3.8.6.2.1. Non-WSA Land with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under Alternative E, all 29 non-WSA lands with wilderness characteristics, totaling 582,360 acres, would be managed with emphasis on protection of their wilderness characteristics, by the following prescription:

- VRM Class I objectives
- Closed to commercial or personal woodland harvest
- Closed to OHV use
- Managed with “Light-on-the-Land” fire suppression techniques
- ROW exclusion areas
- Proposed for withdrawal from locatable mineral entry
- Closed to mineral leasing
- Closed to disposal of mineral materials

These decisions would prevent surface disturbances that would degrade the natural characteristics of the non-WSA wilderness lands, prevent surface disturbances and uses that would be incompatible with primitive recreation activities, and protect the setting needed to support the experience of solitude. These management decisions would protect the natural characteristics of all of the non-WSA wilderness lands, and maintain the opportunities for solitude or primitive recreation that exists within these areas.

Many elements of the prescription to protect the wilderness characteristics of the non-WSA lands with wilderness characteristics would prevent surface disturbances that would degrade the natural characteristics of these areas. Closure of the non-WSA lands with wilderness characteristics to oil and gas leasing, ROW exclusion objectives, and closure to harvest of woodland products would prevent surface disturbances that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Protection of the undeveloped nature of the non-WSA lands with wilderness characteristics would also maintain the setting needed to support primitive forms of recreation and experiences of solitude. Management to visual resource management Class I objectives would prevent landscape modifications that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics.

Closing the non-WSA lands with wilderness characteristics to (OHV) travel would prevent expansion of OHV use and surface disturbance that would degrade the natural characteristics of these lands. This element of the prescription would also prevent the noise and presence of motor vehicles would degrade opportunities for solitude and conflict with primitive forms of recreation like hiking, backpacking, wildlife viewing, and nature study.

Under this alternative, the non-WSA lands with wilderness characteristics would be recommended for mineral withdrawal. This action would prevent mineral entry and surface disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics, diminish opportunities for solitude, and conflict with primitive forms of recreation. Use of “Light-on-the-Land” fire suppression techniques would minimize surface disturbances resulting from fire suppression efforts that would degrade the natural characteristics of these areas. It would also reduce and minimize the reclamation effort that would be needed following fire suppression to restore the natural characteristics of the non-WSA lands with wilderness characteristics.

4.3.8.6.3. PROPOSED PLAN

4.3.8.6.3.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under the Proposed Plan five non-WSA lands with wilderness characteristics would be managed to protect their wilderness characteristics: Dark Canyon (11,540 acres), Grand Gulch (13,657 acres), Mancos Mesa (30,068 acres), and Nokai Dome East (18,618 acres), and Nokai Dome West (14,988 acres). To give emphasis to management of wilderness characteristics, the five non-WSA lands with wilderness characteristics would be managed by the following prescription:

- VRM Class II objectives
- OHV use limited to designated roads and trails
- ROW avoidance areas
- NSO for mineral leasing in Dark Canyon non-WSA lands with wilderness characteristics
- Closed to mineral leasing in Grand Gulch, Mancos Mesa, Nokai Dome East, and Nokai Dome West non-WSA lands with wilderness characteristics
- Closed to disposal of mineral materials
- Existing facilities (e.g., livestock or wildlife facilities) would be maintained

- Closed to commercial or personal woodland harvest
- Managed with “Light-on-the-Land” fire suppression techniques

These decisions would limit surface disturbances that would degrade the natural characteristics of the non-WSA wilderness lands. Closure to woodland harvest, limiting motorized vehicle use to designated routes, ROW avoidance objectives, NSO and closure to mineral leasing, and closure to mineral material production would prevent surface disturbances that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. VRM Class II objectives, however, would allow minor developments that would result in localized surface disturbances that would degrade the natural characteristics of small areas of the non-WSA lands with wilderness characteristics. Overall, however, the natural character of the landscape, and thus its natural characteristics, would remain in tact.

Motorized use of designated routes in the non-WSA lands with wilderness characteristics would be inconsistent with primitive forms of recreation and the noise and presence of the vehicles would degrade opportunities for solitude. For some visitors, the impacts would be temporary, lasting only while the vehicles are present. For others, the presence and noise of motor vehicles would have a longer lasting effect on their desired experience. However, no routes are designated in the five non-WSA lands with wilderness characteristics managed for those values under the Proposed Plan. Maintenance of existing facilities would temporarily diminish opportunities for solitude and primitive forms of recreation. Once the noise and presence of people and equipment is removed, those opportunities would return.

4.3.8.6.3.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the Proposed Plan, no specific actions are prescribed to directly protect or enhance the wilderness characteristics of all or portions of 29 non-WSA lands with wilderness characteristics. Thus, there would be no effect on the wilderness characteristics of the non-WSA lands with wilderness characteristics.

4.3.8.7. IMPACTS OF PALEONTOLOGICAL RESOURCE DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

Paleontology decisions common to the Proposed Plan and all alternatives provide for mitigation of impacts to fossils resulting from BLM-authorized activities, interpretation of fossils, collection of common invertebrate and plant fossils, and protection of significant vertebrate and invertebrate fossils. As with cultural resources, knowing more about the paleontological resources of the area, interpreting the resource in a manner consistent with protection of wilderness characteristics, viewing fossil sites in the non-WSA lands with wilderness characteristics, and protecting significant fossils from collection or damage would add to the enjoyment of these areas for primitive recreational purposes. Protection of fossils would add to the character of the setting that supports these recreational opportunities. However, collection of even common invertebrate fossils, while providing a primitive recreational experience, would remove an element of the natural landscape, and thus the areas’ natural characteristics.

4.3.8.8. IMPACTS OF RECREATION DECISIONS ON WSA LANDS WITH WILDERNESS CHARACTERISTICS

4.3.8.8.1. SPECIAL RECREATION MANAGEMENT AREAS (SRMAs)

4.3.8.8.1.1. Alternative A

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Three existing SRMAs include all or portions of 13 non-WSA lands with wilderness characteristics. All other non-WSA wilderness lands would be managed as part of the Extensive Recreation Management Area (ERMA).

San Juan River SRMA: A portion (4,240 acres) of the San Juan River non-WSA land with wilderness characteristics lies within the San Juan River SRMA. The SRMA is more than double the size of the non-WSA, and the primary objective for management of this scenic area is for outstanding recreational opportunities and visitor experience for back-country river running, camping, and cultural appreciation. Management under this alternative allows for motorized boating, 40,000 user days per year, restricted camping areas along the river, and vehicle camping in the uplands. Portions of the SRMA would be open to leasing under standard stipulations and under NSO, and a portion would be recommended for locatable mineral withdrawal. The area would be a mixture of open, closed, and limited OHV use. The SRMA would remain closed to woodland product harvest. The SRMA prescription would partially protect the natural characteristics of the landscape and opportunities for solitude and primitive forms of recreation in that portion of the San Juan non-WSA within the SRMA, but would disrupt the opportunity for solitude and primitive recreation along the river due to motorized boat noise and the number of user days per year allowed on the river. Motorized vehicle activity, especially cross-county driving would create surface disturbance that reduces the natural characteristics of the area and allow for disruption of the opportunities for solitude and primitive recreation when vehicles are in the vicinity. Some areas would remain open for surface disturbance associated with oil and gas leasing activity which, if leased and developed, would cause the loss of natural characteristics within the non-WSA lands with wilderness characteristics.

Canyon Basin SRMA: This 214,390-acre SRMA includes all or portions of the Bridger Jack Mesa (22,380 acres), Butler Wash (1,530 acres), Dark Canyon (52,290 acres), Harts Point (14,070 acres), Indian Creek (14,750 acres), and Shay Mountain (6,450 acres) non-WSA lands with wilderness characteristics. The purpose of this large SRMA is to provide outstanding recreational opportunities and experiences. Management allows for creating designated parking areas for rock climbers and firewood cutting. There are no group limits or group size limits and the majority of the area is open to dispersed camping and vehicle use, including dispersed camping in many areas along the Indian Creek Corridor. Detailed management for this SRMA is not proposed that would protect or enhance the wilderness characteristics of these non-WSA lands with wilderness characteristics. In fact, providing no group size or number of group limits and dispersed vehicle camping throughout the SRMA would result in numbers of visitors and types of activities that detract from the solitude and primitive recreation experiences of the non-WSA lands with wilderness characteristics. Surface-disturbing activities such as development of new parking areas or cutting firewood would degrade the natural characteristics of the affected areas.

Grand Gulch Plateau SRMA: There are 122,704 acres in six non-WSA lands with wilderness characteristics located in the Grand Gulch Plateau SRMA (in the other alternatives the name of the SRMA is changed to the Cedar Mesa Cultural SRMA). This includes 13,654 acres in Comb Ridge, 23,560 acres in Fish and Owl Creeks, 54,970 acres in Grand Gulch, 5,560 acres in Lime Creek, 11,290 acres in Road Canyon, and 13,670 acres in Valley of the Gods non-WSA lands with wilderness characteristics. The SRMA includes all of the acreage in Lime Creek and Valley of the Gods and almost all acreage in Fish and Owl Creeks, Grand Gulch and Road Canyon non-WSA lands with wilderness characteristics. The objective for management of this SRMA is to provide outstanding recreational opportunities and visitor experience to engage in back-country and front-country recreation, and rural cultural appreciation. The management prescription includes restrictions on numbers of visitors, commercial uses and numbers, and equestrian use in certain areas of the SRMA, as well as restrictions on camping and limits of days and people. There are numerous implementation-level decisions included in the management prescriptions for this SRMA, the most salient, and the ones most affecting wilderness characteristics being:

- Open to commercial and/or private firewood cutting
- No limit on recreation day-use permits
- Mesa Top Day Use, no group size limit
- Mesa Top Overnight Camping, open to dispersed camping with no group size limit
- Canyons for Day Use, private and commercial group size limit of 12, including stock trips
- Canyons for Day Use, no limit on numbers of parties for private or commercial use per day per trailhead
- Canyons Overnight Camping, group size limit of 12
- Canyons Overnight Camping, commercial trips limited to one per day per trailhead
- Trailhead allocations range from 22 -26 overnight visitors per day

These prescriptions would affect the non-WSA lands with wilderness characteristics primarily due to the numbers of people, group size limits, and commercial activities allowed to occur in this SRMA under this alternative. The opportunities for solitude and primitive recreation would be diminished because a person seeking that experience would, inevitably, meet other people, groups, and commercial outfitting and stock activities. In addition, allowing private and commercial woodcutting within these areas would deter from the natural characteristics of the area by leaving cross-county vehicle tracks, tree stumps and cut limbs. The noise associated with chain saws and vehicles would, temporarily impact the opportunities for solitude, as well.

None of the remaining non-WSA lands with wilderness characteristics are within SRMAs under this alternative, therefore, there would be no recreation management objectives or focus within those areas. Because these lands are not within a managed SRMA with specific recreation objectives, they would be available for other surface-disturbing uses including commercial permitting activities, special recreation permits, new road construction, and other activities that could impact the natural characteristics and opportunities for primitive recreation and solitude that currently exist in the non-WSA lands with wilderness characteristics.

4.3.8.8.1.2. Alternative B

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Five SRMAs would be designated that include all or portions of 16 non-WSA lands with wilderness characteristics. All other non-WSA lands would be managed as part of the ERMA.

San Juan River SRMA: A portion (4,120 acres) of the San Juan River non-WSA land with wilderness characteristics lies within the 10,203-acre San Juan River SRMA. The primary objective for management of this scenic area is for outstanding recreational opportunities and visitor experiences for back-country river running, camping, and cultural appreciation. The SRMA management prescription under this alternative would not allow motorized boating, permits 30,000 user days per year, restricts camping areas along the river, restricts vehicle camping in the uplands, and provides for oil and gas leasing subject to NSO stipulations. The SRMA would be closed to disposal of mineral materials and recommended for locatable mineral withdrawal. The SRMA would be closed to OHV use in some areas and limited to designated routes in others. The area would remain closed to woodland product harvest. The SRMA management prescription would protect the natural characteristics of the landscape and opportunities for solitude and primitive forms of recreation in that portion of the San Juan non-WSA within the SRMA. Compared to Alternative A, motorized boating would be prohibited and user days would be reduced by 10,000. This would enhance the recreation setting to provide greater opportunities to experience solitude and primitive recreation. Vehicle use on designated routes would disrupt the opportunities for solitude and primitive recreation when vehicles are in the vicinity, but opportunities would return when the vehicle noise has subsided. Surface-disturbing activities associated with mineral development would not be allowed, protecting and enhancing both the natural characteristics of the area and opportunities for solitude and primitive forms of recreation.

Indian Creek SRMA: This 89,271-acre SRMA (a portion of the Canyon Basins SRMA in Alternative A) encompasses portions of four non-WSA lands with wilderness characteristics totaling 47,390 acres: Bridger Jack Mesa (22,780 acres), Harts Point (8,970 acres), Indian Creek (12,980 acres), and Shay Mountain (960 acres). The management prescription would close the SRMA to commercial and private firewood cutting and only allow vehicle camping in designated sites. The majority of use within this SRMA is outside of the non-WSA lands with wilderness characteristics, although some rock climbing does occur. Closing the area to private or commercial firewood cutting would protect the natural characteristics of the area and would prevent the noise and activities associated with this action. Allowing camping only in designated sites would focus vehicle camping to specific areas where disturbance has already occurred and not permit new surface disturbance, thereby protecting the natural characteristics of the non-WSA lands.

Dark Canyon SRMA: This 30,820-acre SRMA (a portion of the Canyon Basins SRMA in Alternative A) encompasses small portions of the Dark Canyon (1,563 acres) and Gravel and Long Canyon (220 acres) non-WSA lands with wilderness characteristics. Group size would be limited to 10 people in a private party and 12 people in a commercial party. Only one commercial trip per week is allowed and no more than 15 private users per day would be allowed. Camping would only be allowed in designated sites. The SRMA would be closed to private or commercial firewood cutting which would protect the natural characteristics of the non-WSA lands. Because the topography is rough with numerous canyons bisecting the SRMA, and the

limits on numbers of private and commercial user is low, the potential to experience solitude and a primitive recreation experience would be enhanced. Closing the SRMA to firewood cutting would protect the natural characteristics of the non-WSA lands with wilderness characteristics. In addition, designating camping areas would also protect the SRMA from additional surface-disturbing activity, thereby protecting the natural characteristics of the non-WSA lands with wilderness characteristics.

Cedar Mesa Cultural SRMA: There are 109,700 acres in six non-WSA lands with wilderness characteristics included in the Cedar Mesa Cultural SRMA. This includes 640 acres in Comb Ridge, 23,560 acres in Fish and Owl Creeks, 54,980 acres in Grand Gulch, 5,560 acres in Lime Creek, 11,290 acres in Road Canyon, and 13,670 acres in Valley of the Gods non-WSA lands with wilderness characteristics. The C-SRMA includes all of the acreage in Lime Creek and Valley of the Gods non-WSA lands with wilderness characteristics and almost all acreage in Fish and Owl Creeks, Grand Gulch and Road Canyon non-WSA lands with wilderness characteristics. The objective for management of this C-SRMA is to provide outstanding recreational opportunities and visitor experiences to engage in back-country and front-country recreation, and rural cultural appreciation. The C-SRMA management prescription would include restrictions on numbers of visitors, type and number of commercial uses, and equestrian use in certain areas of the C-SRMA, as well as restrictions on camping and limits of length of stay and numbers of people. There are numerous planning- and implementation-level decisions included in the management prescriptions for this C-SRMA, the most salient, and the ones that would most affect wilderness characteristics include:

- Closed to commercial and private firewood cutting
- Available for construction of watershed, range, and wildlife improvements and vegetation treatments
- 25-person limit on recreation day-use permits
- Mesa Top Day Use, 10-person group size limit
- Mesa Top Overnight Camping, designated primitive campsites, 12-person group size limit
- Canyons for Day Use, 10-person group size limit for private and commercial groups; one commercial group limit every other day; no stock trips allowed in canyon
- Canyons Overnight Camping, 6-person private group size limit and 10-person commercial group size limit; commercial trips limited to one per day per trailhead
- Trailhead allocations are 16 overnight visitors per day

These prescriptions would affect the non-WSA lands with wilderness characteristics primarily due to the limits on numbers of people, group size, and commercial activities allowed to occur in this C-SRMA under this alternative. Compared to Alternative A, the opportunities for solitude and primitive recreation would be augmented because a person seeking that experience would meet fewer people, groups, and commercial outfitting and stock activities. Closing the area to woodcutting would maintain the natural characteristics of the non-WSA lands with wilderness characteristics. Impacts to natural characteristics would occur to varying degrees, depending on the types of watershed, range, wildlife facilities or vegetation treatments that would be implemented in the non-WSA lands with wilderness characteristics. If vegetation treatment would be implemented with biological or chemical methods, or with prescribed fire, the area would have temporary visual impacts, but surface disturbance would be limited and the

treatments would have a natural appearance. If mechanical methods would be used, surface disturbance would be evident and visual imprints of people would be apparent. During the time of the activities, the opportunities for solitude and primitive recreation would be temporarily affected due to noise and human activities in the area.

White Canyon SRMA: This 2,828-acre SRMA includes small portions of four non-WSA lands with wilderness characteristics: 400 acres in Cheesebox Canyon, 1,258 acres in Fort Knocker Canyon, 430 acres in Gravel and Long Canyon, and 960 acres in Sheep Canyon. The SRMA management prescription would exclude the area from private or commercial firewood cutting, which would protect the natural characteristics of the non-WSA lands with wilderness characteristics. Primitive campgrounds would be developed at Soldier and Gravel Crossings and implementation-level actions such as packing out human waste and use of fire pans would be enacted. Surface disturbance and the presence of human-made structures associated with developing primitive campgrounds would reduce the natural characteristics of those specific localities of the non-WSA lands with wilderness characteristics.

None of the remaining non-WSA lands with wilderness characteristics are within SRMAs under this alternative, therefore, there would be no recreation management objectives or focus within those areas. Because these lands are not within a managed SRMA with specific recreation objectives, they would be available for other surface-disturbing uses including commercial and special recreation permit activities, new road construction, and other uses that would impact the natural characteristics and opportunities for primitive recreation and solitude that currently exist in those non-WSA lands with wilderness characteristics.

4.3.8.8.1.3. Alternative C

4.3.8.8.1.3.1 Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Five SRMAs would be designated that overlie all or portions of 16 non-WSA lands with wilderness characteristics. All other non-WSA lands would be managed as an ERMA.

San Juan River SRMA: A portion (3,810 acres) of the San Juan River non-WSA land with wilderness characteristics lies within the 9,859-acre San Juan River SRMA. The primary objective for management of this scenic area is for outstanding recreational opportunities and visitor experience for back-country river running, camping, and cultural appreciation. Management under this alternative allows for motorized boating, 40,000 user days per year, restricted camping areas along the river, restricted vehicle camping in the uplands and leasing subject to NSO stipulations. The area is closed to mineral material disposal and recommended for locatable mineral withdrawal. The SRMA would be closed to OHV use in some areas and limited to designated routes in others. The area would remain closed to woodland product harvest. The SRMA management would partially protect the natural characteristics of the landscape and opportunities for solitude and primitive forms of recreation in that portion of the San Juan non-WSA that overlies the SRMA. Like Alternative A, motorized boating would be allowed on the river, and 40,000 user days would be permitted. This could impact the opportunity for solitude and primitive recreation by having so much human activity on the river, as well as noise from motorized boat engines. Like Alternative B, surface-disturbing activities associated with minerals would be precluded, protecting the natural characteristics of this area. In addition, fewer non-WSA lands would be protected because the SRMA would be smaller than

Alternative B and the acreage of non-WSA lands with wilderness characteristics overlying it would be reduced by 310 acres.

Dark Canyon SRMA: This 30,820-acre SRMA (formerly a portion of the Canyon Basins SRMA) encompasses small portions of the Dark Canyon (1,563 acres) and Gravel and Long Canyon (220 acres) non-WSA lands with wilderness characteristics. Group size limits include 15 people in a private party and 15 people in a commercial party. Three commercial trips per week are allowed and no more than 20 private users per day would be allowed. Camping would only be allowed in designated sites. The SRMA is closed to private or commercial firewood cutting which would protect the natural characteristics of the non-WSA lands. Although an increased level of human use would be allowed in this area from Alternative B, because the topography is rough with numerous canyons bisecting the SRMA the potential to experience solitude and a primitive recreation experience is high, even with the increased level of human use. In addition, designating camping areas would also protect the SRMA from additional surface-disturbing activity, thereby protecting the natural characteristics of the non-WSA lands.

Indian Creek SRMA: This 89,271-acre SRMA (formerly a portion of the Canyon Basins SRMA in Alternative A) encompasses portions of four non-WSA lands with wilderness characteristics totaling 47,390 acres: Bridger Jack Mesa (22,780 acres), Harts Point (8,970 acres), Indian Creek (12,980 acres), and Shay Mountain (960 acres). Management prescriptions would be the same as in Alternative B except that some dispersed vehicle camping would be allowed in some areas along the Indian Creek corridor and designated to specific sites in other areas. Dispersed vehicle camping allows for new surface disturbance as vehicles pull off routes and establish new camp sites. This would detract from the natural characteristics of the non-WSA lands if the dispersed camping were to occur there. Otherwise, the analysis would be the same as Alternative B.

Cedar Cultural Mesa SRMA: There are 109,700 acres in six non-WSA lands with wilderness characteristics that overlie the Cedar Mesa Cultural SRMA. This includes 640 acres in Comb Ridge, 23,560 acres in Fish and Owl Creeks, 54,980 acres in Grand Gulch, 5,560 acres in Lime Creek, 11,290 acres in Road Canyon, and 13,670 acres in Valley of the Gods non-WSA lands with wilderness characteristics. This is all of the acreage in Lime Creek and Valley of the Gods and almost all acreage in Fish and Owl Creeks, Grand Gulch and Road Canyon non-WSA lands with wilderness characteristics. The objective for management of this C-SRMA is to provide outstanding recreational opportunities and visitor experience to engage in back-country, front-country and rural cultural appreciation recreation. Management includes restrictions on numbers of visitors, commercial uses and numbers, and equestrian use in certain areas of the C-SRMA, as well as restrictions on camping and limits of days and people. There are numerous planning and implementation-level decisions included in the management prescriptions for this C-SRMA, the most salient, and the ones most affecting wilderness characteristics being:

- Open to commercial and/or private firewood cutting
- Available for watershed, range, and wildlife improvements and vegetation treatments
- 25 person limit on recreation day-use permits
- Mesa Top Day Use, 12 person group size limits
- On Mesa Top Overnight Camping, designated primitive campsites, with group size limit of 24

- In Canyons for Day Use, private and commercial group size limit of 12, one commercial group allowed each day, no stock trips in canyons, elsewhere stock limited to 8 animals
- In Canyons Overnight Camping, group size limits of 8 for private and 12 for commercial; commercial trips limited to one per day per trailhead
- Trailhead allocations are all 20 overnight visitors per day

Similar to Alternative A, these prescriptions would affect the non-WSA lands with wilderness characteristics primarily due to the numbers of people, group size limits, and commercial activities allowed to occur in this C-SRMA under this alternative. The opportunities for solitude and primitive recreation would be diminished because a person seeking that experience would, inevitably, meet other people, groups, and commercial outfitting and stock activities. In addition, allowing private and commercial woodcutting within these areas would deter from the natural characteristics of the area by leaving cross-county vehicle tracks, tree stumps and litter from cutting limbs. The noise associated with chain saws and vehicles would temporarily impact the opportunities for solitude, as well. Impacts to natural characteristics could also occur depending on the types of watershed, range, wildlife or vegetation treatments that would be implemented in the non-WSA lands with wilderness characteristics. Treatments by biological, chemical, or fire methods, the area would have temporary visual impacts, but surface disturbance would be limited and the treatments would have more of a natural appearance. If by mechanical methods, surface disturbance would be evident and visual imprints of humans would be apparent. During the time of the activities, the opportunities for solitude and primitive recreation would be temporarily affected due to noise and human activities in the area.

White Canyon SRMA: Generally the same impacts as Alternative B.

None of the other non-WSA lands with wilderness characteristics are within SRMAs under this alternative, therefore, there would be no recreation management objectives or focus within those areas. Because these lands are not within a managed SRMA with specific recreation objectives, they would be vulnerable to surface-disturbing uses including commercial and special recreation permit activities, new road construction, and other uses that could impact the natural characteristics and opportunities for primitive recreation and solitude that currently exist in those areas.

4.3.8.8.1.4. Alternative D

4.3.8.8.1.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Five SRMAs would be designated that include all or portions of 16 non-WSA lands with wilderness characteristics. All other non-WSA lands with wilderness characteristics would be managed as part of the ERMA.

San Juan River SRMA: A portion (1,960 acres) of the San Juan River non-WSA lands with wilderness characteristics lies within the 3,365-acre San Juan River SRMA. The primary objective for management of this scenic area is for outstanding recreational opportunities and visitor experiences for back-country river running, camping, and cultural appreciation. The SRMA management prescription under this alternative would allow for motorized boating, 45,000 user days per year, some restricted camping areas along the river, some restricted vehicle camping in the uplands, and oil and gas leasing subject to NSO stipulations. The area would be

closed to mineral material disposal and recommended for locatable mineral withdrawal. The SRMA would be closed to OHV use in some areas and limited to designated routes in others. The SRMA would remain closed to woodland product harvest. Impacts of this SRMA alternative on the San Juan River non-WSA lands would be the same as Alternative C except that even more visitor days would be permitted on the river, further detracting from the opportunities of solitude and primitive recreation. In addition, fewer non-WSA lands would be protected because the SRMA would be smaller than Alternative B and the non-WSA acreage overlying it would be reduced by 2,160 acres.

Dark Canyon SRMA: This 30,820-acre SRMA (a portion of the Canyon Basins SRMA under Alternative A) encompasses small portions of the Dark Canyon (1,563 acres) and Gravel and Long Canyon (220 acres) non-WSA lands with wilderness characteristics. Group size would be limited to 15 people in a private party and 15 people in a commercial party. Commercial trips would be limited to seven per week but there would be no limits on private users per day. Dispersed camping would be allowed within the canyons and mesa tops. The SRMA would be closed to private or commercial firewood cutting, which would protect the natural characteristics of the non-WSA lands with wilderness characteristics. This alternative would allow the most human use. This increased use could diminish the opportunity for solitude and conflict with primitive recreation due to interaction with other uses, either private or commercial. In addition, allowing dispersed camping throughout the area would reduce the natural characteristics of the area by creating new surface disturbances from campfire rings and crushed vegetation.

Indian Creek SRMA: This 89,271-acre SRMA (a portion of the Canyon Basins SRMA in Alternative A) includes portions of four non-WSA lands with wilderness characteristics totaling 47,390 acres: Bridger Jack Mesa (22,780 acres), Harts Point (8,970 acres), Indian Creek (12,980 acres), and Shay Mountain (960 acres). Management prescriptions would be the same as in Alternative B except that some dispersed vehicle camping would be allowed throughout the Indian Creek corridor. Dispersed vehicle camping would create new surface disturbance as vehicles pull off routes and establish new camp sites. This would reduce the natural characteristics of the non-WSA lands with wilderness characteristics where the vehicle camping occurred. Otherwise, the analysis would be the same as Alternative B.

Cedar Mesa Cultural SRMA: There are 109,700 acres in six non-WSA lands with wilderness characteristics within the Cedar Mesa Cultural SRMA. This includes 640 acres in Comb Ridge, 23,560 acres in Fish and Owl Creeks, 54,980 acres in Grand Gulch, 5,560 acres in Lime Creek, 11,290 acres in Road Canyon, and 13,670 acres in Valley of the Gods non-WSA lands with wilderness characteristics. The C-SRMA includes all of the acreage in Lime Creek and Valley of the Gods and almost all acreage in Fish and Owl Creeks, Grand Gulch, and Road Canyon non-WSAs lands with wilderness characteristics. The objective for management of this C-SRMA is to provide outstanding recreational opportunities and visitor experiences to engage in back-country and front-country recreation and rural cultural appreciation. The C-SRMA management prescription includes restrictions on numbers of visitors, types and numbers of commercial uses, and equestrian use in certain areas of the C-SRMA, as well as restrictions on camping and limits on length of stay and numbers of people. There are numerous planning- and implementation-level decisions that would be included in the management prescriptions for this C-SRMA, the most salient, and the ones most affecting wilderness characteristics being:

- Open to commercial and private firewood cutting

- Available for watershed, range, and wildlife improvements and vegetation treatments
- 25-person limit on recreation day-use permits
- Mesa Top Day Use, 12- and 25-person group size limits
- Mesa Top Overnight Camping, no designated campsites for groups less than 24, no group size limit, campsite facility development allowed
- Canyons for Day Use, 12-person private and commercial group size limit, two commercial groups allowed each day, no stock trips in canyons, elsewhere no stock limits on numbers of animals
- Canyons Overnight Camping, 12-person private group size limit and 12-person commercial group size limit; commercial trips limited to one per day per trailhead
- Trailhead allocations are 24 overnight visitors per day

This alternative provides for the greatest amount of human and stock use of all alternatives within this C-SRMA and would have the largest impact on opportunities for solitude and primitive recreation due to the numbers of people, size of groups, and commercial activities allowed. This alternative provides for the greatest probability of encountering other humans, stock animals, and evidence of human activity. Large group sizes and commercial activities, along with potential campsite facility development; private and commercial firewood cutting; and construction of watershed, range, and wildlife facilities and vegetation treatments would all reduce the natural characteristics of the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive recreation. This is because of increased human encounters and more surface-disturbing activities. A person seeking solitude would, inevitably, encounter other people, groups, and commercial outfitters and stock. Allowing private and commercial woodcutting within these areas would degrade the natural characteristics of the area by leaving cross-county vehicle tracks, tree stumps and cut limbs. The noise associated with chain saws and vehicles would temporarily impact the opportunities for solitude, as well. Impacts to naturalness would also occur in varying degrees, depending on the types of watershed, range, and wildlife facilities constructed or vegetation treatments that would be implemented in the non-WSA lands. If treatments were implemented by biological or chemical methods, or with prescribed fire, the area would have temporary visual impacts, but surface disturbance would be limited and the treatments would have more of a natural appearance. If mechanical methods were used, surface disturbance would be evident and visual imprints of humans would be apparent. During the time of the activities, the opportunities for solitude and primitive recreation would be temporarily diminished due to noise and human activities in the area.

White Canyon SRMA: Generally the same impacts as Alternative B.

None of the remaining non-WSA lands with wilderness characteristics are within SRMAs under this alternative, therefore, there would be no recreation management objectives or focus within those areas. Because these lands are not within a managed SRMA with specific recreation objectives, they would be available for other surface-disturbing uses including commercial and special recreation permit activities, new road construction, and other uses that would impact the natural characteristics and opportunities for primitive recreation and solitude that currently exist in those non-WSA lands with wilderness characteristics.

4.3.8.8.1.5. Alternative E

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Five SRMAs would be designated that include all or portions of 16 non-WSA lands with wilderness characteristics. All remaining non-WSA lands with wilderness characteristics would be managed as part of the ERMA.

San Juan River SRMA: A portion (4,120 acres) of the San Juan River non-WSA land with wilderness characteristics lies within the 10,203-acre San Juan River SRMA. The primary objective for management of this scenic area is for outstanding recreational opportunities and visitor experiences for back-country river running, camping, and cultural appreciation. The SRMA management prescription under this alternative would be the same as in Alternative B except that non-WSA lands with wilderness characteristics would be closed to OHV use. The effect of SRMA management on the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as in Alternative B except that opportunities for solitude and primitive recreation would be enhanced because the presence and noise of OHVs would be precluded.

Indian Creek SRMA: The effect of SRMA management on the wilderness characteristics of non-WSA lands with wilderness characteristics would be the same as in Alternative B, except that vehicle camping would not be allowed within the non-WSA lands with wilderness characteristics and opportunities for solitude and primitive recreation would be enhanced because the presence and noise of OHVs would be precluded.

Dark Canyon SRMA: Same impacts to wilderness characteristics of the non-WSA lands with wilderness characteristics as Alternative B.

Cedar Mesa Cultural SRMA: There are 109,700 acres in six non-WSA lands with wilderness characteristics within the Cedar Mesa Cultural SRMA. This includes 640 acres in Comb Ridge, 23,560 acres in Fish and Owl Creeks, 54,980 acres in Grand Gulch, 5,560 acres in Lime Creek, 11,290 acres in Road Canyon, and 13,670 acres in Valley of the Gods non-WSA lands with wilderness characteristics. The C-SRMA would include all of the acreage in Lime Creek and Valley of the Gods and almost all acreage in Fish and Owl Creeks, Grand Gulch, and Road Canyon non-WSA lands with wilderness characteristics. The objective for management of this C-SRMA would be to provide outstanding recreational opportunities and visitor experiences to engage in back-country and front-country recreation and rural cultural appreciation. The C-SRMA management prescription includes restrictions on numbers of visitors, types and numbers of commercial uses and users, and equestrian use in certain areas of the C-SRMA, as well as restrictions on camping, including length of stay and numbers of people. There would be numerous planning- and implementation-level decisions included in the management prescriptions for this C-SRMA, the most salient, and the ones most affecting wilderness characteristics being:

- Closed to commercial and private firewood cutting
- Allows maintenance of existing range improvements, but no new improvements would be constructed
- 25-person limit on recreation day-use permits
- Mesa Top Day Use, 10-person group size limit

- Mesa Top Overnight Camping, designated primitive campsites, with 12-person group size limit
- Canyons for Day Use, 10-person private and commercial group size limit, limit of one commercial group allowed every other day, no stock trips allowed in canyon
- Canyons Overnight Camping, 6-person private group size limit and 10-person commercial group size limit; commercial trips limited to one per day per trailhead
- Trailhead allocations are 16 overnight visitors per day

The impacts to wilderness characteristics would be the same as for Alternative B, except further protection to the wilderness characteristics would be provided by precluding construction of watershed, range, and wildlife improvements and vegetation treatments on non-WSA lands with wilderness characteristics. Surface disturbance associated with such activities would be prohibited, thereby protecting the natural characteristics

White Canyon SRMA: Same impacts to wilderness characteristics as Alternative B.

None of the remaining non-WSA lands with wilderness characteristics are within SRMAs under this alternative, therefore, there would be no recreation management objectives or focus within those areas. Because these lands are not within a managed SRMA, They would not be subject to specific recreation objectives, However, recreation management decisions that may result in substantial surface-disturbing actions would not be permitted in non-WSA lands with wilderness characteristics under this alternative.

4.3.8.8.1.6. Proposed Plan

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Three Special Recreation Management Areas (SRMAs) would be designated under the Proposed Plan that include non-WSA lands with wilderness characteristics managed to protect those characteristics.

Dark Canyon SRMA: The SRMA includes a portion (11,540 acres) of the Dark Canyon non-WSA lands with wilderness characteristics. Under the Proposed Plan, the non-WSA lands with wilderness characteristics would be managed with emphasis on protection of those characteristics. The effects of recreation management for the SRMA on the wilderness characteristics of the non-WSA lands with wilderness characteristics would be the same as described in the Dark Canyon SRMA section below, for that portion of the non-WSA lands with wilderness characteristics managed to protect those characteristics.

Cedar Mesa SRMA: Cedar Mesa SRMA also includes a portion (13,657 acres) of the Grand Gulch non-WSA lands with wilderness characteristics. Under the Proposed Plan, it would be managed with emphasis on protection of its wilderness characteristics. The effects of recreation management for the Cedar Mesa SRMA on the wilderness characteristics of the non-WSA lands with wilderness characteristics would be the same as described in the Cedar Mesa SRMA section below, for that portion of the non-WSA lands with wilderness characteristics managed to protect those characteristics.

Beef Basin SRMA: The Beef Basin SRMA includes the 11,540 acres of the Dark Canyon non-WSA lands with wilderness characteristics managed to protect those characteristics. Management would include closing the SRMA to private and commercial firewood cutting,

limiting OHV use to designated routes, and limiting group size. Improvements for range, wildlife habitat, watershed, and vegetation treatments would be allowed if consistent with management objectives, and primitive car camping areas would be designated in Ruin Park, Middle Park, House Park, and along the Beef Basin Loop Road. The SRMA has moderate potential for oil and gas production, and would be open to oil and gas leasing subject to controlled surface use or timing limitation, but the non-WSA lands with wilderness characteristics would be available for leasing only with an NSO stipulation.

The majority of management prescriptions would protect the natural characteristics in the non-WSA lands with wilderness characteristics and continue to provide opportunities for solitude and primitive recreation. Improvements for range, wildlife habitat and watershed would result in surface disturbance and minimal structures that diminish the natural characteristics of the areas, but in the long term, restore vegetation communities and wildlife populations, enhancing the natural characteristics and opportunities for primitive forms of recreation (hunting, wildlife viewing, and nature study) depending on the methods used in the SRMAs. Vegetation treatments in the Dark Canyon non-WSA lands with wilderness characteristics would only be permitted if consistent with plan objectives, protecting the natural characteristics of the non-WSA lands with wilderness characteristics. During the treatment, however, the presence and noise of people and equipment would reduce opportunities for solitude and conflict with primitive forms of recreation. When implementation of the treatment was finished, and any needed reclamation occurred, those opportunities would return.

OHV use on designated routes in the SRMAs would detract from the opportunities for solitude and conflict with primitive recreation when vehicles (and associated motorized noise) are in proximity to the non-WSA lands with wilderness characteristics. In addition, developing a car campground in Ruin Park and designating car camping sites in Dark Canyon non-WSA lands with wilderness characteristics would detract from the natural characteristics of these lands and reduce opportunities for solitude and primitive recreation in the immediate areas where car camping is occurring.

Non-WSA lands with wilderness characteristics that are managed to protect their wilderness characteristics under the Proposed Plan in Mancos Mesa (30,068 acres), Nokai Dome East (18,618 acres), and Nokai Dome West (14,988 acres) are not located in any proposed SRMA. Thus, SRMA decisions would not affect the wilderness characteristics of these non-WSA lands with wilderness characteristics. The effects of recreation management decisions identified for the ERMA (see analysis below) would be similar to those identified under Alternative E.

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Six SRMAs would be designated that include all or portions of 17 non-WSA lands with wilderness characteristics. All other non-WSA lands would be managed as part of the ERMA.

San Juan River SRMA: A portion (3,810 acres) of the San Juan River non-WSA lands with wilderness characteristics lies within the 9,859-acre San Juan River SRMA. The primary objective for management of this scenic area is for outstanding recreational opportunities and visitor experiences for back-country river running, camping, and cultural appreciation. The SRMA management prescription under this alternative allows for motorized boating, 40,000 user days per year, restricted camping areas along the river, restricted vehicle camping in the uplands and oil and gas leasing subject to NSO stipulations. The area is closed to mineral material

disposal and recommended for locatable mineral withdrawal. The SRMA would be closed to OHV use in some areas and limited to designated routes in others. The area would remain closed to woodland product harvest. The SRMA management prescription would partially protect the natural characteristics of the landscape and opportunities for solitude and primitive forms of recreation in that portion of the San Juan River non-WSA lands with wilderness characteristics included in the SRMA. Like Alternative A, motorized boating would be allowed on the river, and 40,000 user days would be permitted. This would impact the opportunity for solitude and primitive recreation by allowing this level human activity on the river, as well as noise from motorized boat engines. Like Alternative B, surface-disturbing activities associated with minerals would be precluded, protecting the natural characteristics of the non-WSA lands with wilderness characteristics. In addition, fewer non-WSA lands with wilderness characteristics would be protected because the SRMA would be smaller than Alternative B and the non-WSA lands with wilderness characteristics acreage within the SRMA would be reduced by 310 acres.

Dark Canyon SRMA: This 30,820-acre SRMA (a portion of the Canyon Basins SRMA under Alternative A) encompasses small portions of the Dark Canyon (1,563 acres) and Gravel and Long Canyon (220 acres) non-WSA lands with wilderness characteristics. Group size would be limited to 18 people in a private party and 18 people in a commercial party. Three commercial trips per week would be allowed and no more than 20 private users per day would be allowed. Camping would only be allowed in designated sites. The SRMA would be closed to private or commercial firewood cutting which would protect the natural characteristics of the non-WSA lands with wilderness characteristics. Although an increased level of human use would be allowed in this SRMA as compared to Alternative B, the rough, canyon topography enhances the potential to experience solitude and a primitive recreation experience, even with the increased level of human use. In addition, designating camping areas would also protect the SRMA from additional surface-disturbing activity, thereby protecting the natural characteristics of the non-WSA lands with wilderness characteristics.

Indian Creek SRMA: This 89,271-acre SRMA (a portion of the Canyon Basins SRMA in Alternative A) encompasses portions of four non-WSA lands with wilderness characteristics totaling 47,390 acres: Bridger Jack Mesa (22,780 acres), Harts Point (8,970 acres), Indian Creek (12,980 acres), and Shay Mountain (960 acres). The SRMA management prescription would be the same as in Alternative B except that some dispersed vehicle camping would be allowed in some areas along the Indian Creek corridor and designated to specific sites in other areas. Dispersed vehicle camping would result in new surface disturbance as vehicles pull off routes and establish new camp sites. This would degrade the naturalness of small portions of the non-WSA lands with wilderness characteristics if the camps were established there. Otherwise, the analysis would be the same as Alternative B.

Cedar Mesa SRMA: There are 122,820 acres in six non-WSA lands with wilderness characteristics that overlie the Cedar Mesa SRMA. This includes 13,760 acres in Comb Ridge, 23,560 acres in Fish and Owl Creeks, 54,980 acres in Grand Gulch, 5,560 acres in Lime Creek, 11,290 acres in Road Canyon, and 13,670 acres in Valley of the Gods non-WSA lands with wilderness characteristics. The SRMA includes all of the acreage in Lime Creek and Valley of the Gods and almost all acreage in Fish and Owl Creeks, Grand Gulch and Road Canyon non-WSA lands with wilderness characteristics. The objective for management of this SRMA is to provide outstanding recreational opportunities and visitor experiences to engage in back-country and front-country recreation and rural cultural appreciation. The management prescription would

include restrictions on numbers of visitors, types and numbers of commercial uses, and equestrian use in certain areas of the SRMA, as well as restrictions on camping and limits on length of stay and numbers of people. There would be numerous planning and implementation-level decisions included in the management prescription for this SRMA, the most salient, and the ones most affecting wilderness characteristics being:

- Open to commercial and private firewood cutting, except in the portion of the Grand Gulch non-WSA lands with wilderness characteristics being managed to protect its wilderness characteristics
- Available for construction of watershed, range, and wildlife improvements and vegetation treatments. In the Grand Gulch non-WSA lands with wilderness characteristics managed to protect its wilderness characteristics, vegetation treatment would be permitted by non-surface-disturbing methods only.
- 25-person limit on recreation day-use permits
- Mesa Top Day Use, 12-person group size limit
- Mesa Top Overnight Camping, designated primitive campsites for groups of 20 to 24 individuals, 24-person group size limit
- Canyons for Day Use, 12-person private and commercial group size limit, one commercial group allowed each day, no stock trips in canyons, elsewhere stock limited to 8 animals
- Canyons Overnight Camping, 8-person private group size limit and 12-person commercial group size limit; commercial trips limited to one per day per trailhead
- Trailhead allocations are 20 overnight visitors per day

Similar to Alternative A, these prescriptions would affect the non-WSA lands with wilderness characteristics primarily due to the limits on numbers of people, group size, and commercial activities allowed to occur in this SRMA under the Proposed Plan. The opportunities for solitude and primitive recreation would be diminished because a person seeking that experience would, inevitably, meet other people, groups, and commercial outfitters with stock. In addition, allowing private and commercial woodcutting within these areas would degrade the natural characteristics of the area by leaving cross-county vehicle tracks, tree stumps and cut limbs. The noise associated with chain saws and vehicles would temporarily impact the opportunities for solitude, as well. Impacts to natural characteristics would also occur to different degrees depending on the types of watershed, range, and wildlife facilities constructed or vegetation treatments that would be implemented in the non-WSA lands with wilderness characteristics. If treatment were conducted with biological or chemical methods, or with prescribed fire, the area would have temporary visual impacts, but surface disturbance would be limited and the treatments would have more of a natural appearance. If mechanical methods were used, surface disturbance would be evident and visual imprints of humans would be apparent. During the time of the activities, the opportunities for solitude and primitive recreation would be temporarily diminished due to the noise and human activities in the area.

In the portion of the Grand Gulch non-WSA lands with wilderness characteristics managed to protect its wilderness characteristics, no wood cutting would be permitted and vegetation treatments would be only be implemented with non-surface-disturbing methods. These limitations on these activities would preserve the natural characteristics of the non-WSA lands with wilderness characteristics. With limits on wood cutting, there would be no impacts to

opportunities for solitude or primitive recreation. The noise and presence of people and equipment during vegetation treatments, however, would temporarily diminish opportunities for solitude and primitive recreation.

White Canyon SRMA: Generally, the same impacts on the wilderness characteristics of non-WSA lands with wilderness characteristics as described under Alternative B.

None of the remaining non-WSA lands with wilderness characteristics are within SRMAs under this alternative, therefore, there would be no recreation management objectives or focus within those areas. Because these lands are not within a managed SRMA with specific recreation objectives, they would be available for other surface-disturbing uses including commercial and special recreation permit activities, new road construction, and other uses that would impact the natural characteristics and opportunities for primitive recreation and solitude that currently exist in the non-WSA lands with wilderness characteristics.

Beef Basin SRMA: Beef Basin SRMA includes 1,740 acres of the Dark Canyon and 1,180 acres of the Butler Wash non-WSA lands with wilderness characteristics. Management would include closing the SRMA to private and commercial firewood cutting, limiting OHV use to designated routes, and limiting group size. Improvements for range, wildlife habitat, watershed, and vegetation treatments would be allowed, and primitive car camping areas would be designated in Ruin Park, Middle Park, House Park, and along the Beef Basin Loop Road within the Dark Canyon non-WSA lands with wilderness characteristics. The SRMA has moderate potential for oil and gas production, and would be open to oil and gas leasing subject to controlled surface use or timing limitation.

In the SRMA, the majority of management prescriptions would protect the natural characteristics of portions of the non-WSA lands with wilderness characteristics and continue to provide opportunities for solitude and primitive recreation. Improvements for range, wildlife habitat and watershed, however, would diminish the natural characteristics of the areas, depending on the methods used in the SRMA. In the Beef Basin SRMA, vegetation treatments could be by mechanical, biological, chemical, or fire. If mechanical treatments are used within the non-WSA lands with wilderness characteristics, the natural characteristics of the areas would be compromised within the treatment area because it would leave an apparent imprint of human work on the land that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. During the time of the treatments, opportunities for solitude and primitive recreation would be foregone in and around the areas being treated due to noise and human activity associated with the vegetation manipulations. Road and well pad construction associated with oil and gas development in the SRMA would reduce the natural characteristics of the non-WSA lands with wilderness characteristics. The noise and presence of people and equipment, and the alteration of the landscape would reduce opportunities for solitude and primitive forms of recreation.

OHV use on designated routes in the SRMA would detract from the opportunities for solitude and conflict with primitive recreation when vehicles (and associated motorized noise) are in the non-WSA lands with wilderness characteristics. In addition, developing a car campground in Ruin Park and designating car camping sites in Dark Canyon non-WSA lands with wilderness characteristics would detract from the natural characteristics of these lands and reduce opportunities for solitude and primitive recreation in the immediate areas where car camping is occurring.

4.3.8.8.2. EXTENSIVE RECREATION MANAGEMENT AREAS (ERMAs)

4.3.8.8.2.1. Alternative A

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Dispersed camping would be allowed throughout the Monticello FO under this alternative and vehicle pull-offs to existing dispersed sites or to new dispersed sites would not be limited to a specified distance of disturbance off of existing routes. This would impact non-WSA lands with wilderness characteristics with existing routes, because new vehicle disturbances could ensue and the natural characteristics would be degraded by new routes, crushed vegetation, compacted soil areas, fire rings, and other human disturbances.

Special Recreation Permits (SRPs) would only be required for commercial uses. There would be no established criteria or limits on numbers of people or group size for private parties. SRPs would be considered for off-route commercial events. All non-WSA lands with wilderness characteristics are open for SRP consideration subject to site-specific NEPA analysis. SRPs could be considered throughout the non-WSA lands with wilderness characteristics within the ERMA. Impacts to natural characteristics from off-road OHV events and other unregulated recreational activities, as well as impacts to opportunities for solitude and primitive recreation would result due to noise from vehicles and large groups throughout these areas. New routes could be created in the OHV open areas that would further degrade the wilderness characteristics of the non-WSA lands with wilderness characteristics.

4.3.8.8.2.2. Alternative B

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Dispersed camping would be allowed only in previously disturbed areas off designated routes under this alternative. This would protect the natural characteristics of the non-WSA lands with wilderness characteristics by not allowing for any new surface disturbance associated with vehicle camping.

SRPs would be required for groups of more than 25 people for day use and for groups of more than 15 people for overnight groups. SRPs would also be required for OHV groups of more than 15 motorized vehicles and camping groups with more than 10 vehicles or more than 50 people. All permitted use would be on designated routes. Commercial camping would be in designated areas and commercial motorized events would be limited to two groups of 12 vehicles per route per day. Special OHV events would be limited to 350 vehicles. Providing SRPs for numbers of people, vehicles, and events at set levels allows the BLM to maintain control of activities on public lands and also allows the BLM to guide large groups and events to areas where there is the least amount of conflict with or impacts to natural resources. Still, any SRPs authorized in non-WSA lands with wilderness characteristics would have the potential to impact the natural characteristics of the areas due to surface disturbances created by group camping activities and to affect opportunities for solitude and primitive recreation, depending on where the SRP has been issued or where an event is taking place. Most of these impacts would be short-term, however, and when the event is over, or the group leaves the area, the opportunities for solitude and primitive recreation would be present. Only allowing SRP events on designated routes provides for protection of the natural characteristics of the non-WSA lands with wilderness characteristics because new surface-disturbing vehicle activities would not be permitted.

4.3.8.8.2.3. Alternative C

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, dispersed camping would be allowed throughout the Monticello FO within 150 feet of centerline off designated routes. This would impact all non-WSA lands with existing routes, because new vehicle disturbances could ensue and the natural characteristics of the areas would be affected by new routes, crushed vegetation, compacted soil areas, fire rings, and other human disturbances. However, limiting the disturbance to 150 feet concentrates use near an already disturbed linear intrusion (the route) and protects the natural characteristics of the non-WSA lands beyond the 150-foot corridor (300 feet wide total).

SRPs would be required for groups of more than 50 people for day use and for groups of more than 25 people for overnight groups. SRPs would also be required for OHV groups of more than 25 motorized vehicles, and camping groups with more than 15 vehicles or more than 50 people. All permitted use would be on designated routes. There would be no group or size limits on commercial use SRPs. Like Alternative B, providing SRPs for numbers of people, vehicles, and events that set limitations allows the BLM to maintain control of activities on public lands and also allows the BLM to guide large groups and events to areas where there is the least amount of conflict with or impacts to natural resources. However, number limits would be considerably higher under this alternative than under Alternative B, and therefore, there could be additional impacts from more people causing more surface disturbance. Any SRPs authorized in non-WSA lands with wilderness characteristics would have the potential to impact natural characteristics due to group camping activities and to affect opportunities for solitude and primitive recreation, depending on where the SRP has been issued or where an event is taking place. Most of these impacts would be short-term, however, and when the event is over, or the group leaves the area, the opportunities for solitude and primitive recreation would be present. Only allowing SRP events on designated routes provides for protection of the natural characteristics of the non-WSA lands with wilderness characteristics because new surface-disturbing vehicle activities would not be permitted.

4.3.8.8.2.4. Alternative D

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, dispersed camping would be allowed throughout the Monticello FO within 300 feet of centerline off designated routes. This would impact all non-WSA lands with wilderness characteristics with existing routes, because new vehicle disturbances would ensue and the natural characteristics of the areas would be affected by new routes, crushed vegetation, compacted soil areas, fire rings, and other human disturbances. This alternative allows for the most potential disturbance from vehicle camping and off-road use due to the width of the corridor. However, limiting the disturbance to 300 feet concentrates use near an already-disturbed linear intrusion (the route), and protects the natural characteristics of the non-WSA lands with wilderness characteristics beyond the 300-foot corridor (600 feet wide total).

SRPs would be required for groups of more than 75 people for day use and for groups of more than 50 people for overnight use. SRPs would not be required for motorized vehicles (any numbers) on designed routes. Car camping groups of more than 20 vehicles or more than 50 people would require an SRP. Special OHV events would be limited to 350 vehicles. All permitted use would be on designated routes. There would be no group or size limits on

commercial use SRPs. Authorizing SRPs that limit numbers of people, vehicles, and events would allow the BLM to maintain control of activities on public lands and guide large groups and events to areas where there is the least amount of conflict with or impacts to natural resources or other uses. This alternative, however, would allow the highest number of people, groups, and commercial activities before requiring an SRP. As a result, there could be additional impacts to non-WSA lands with wilderness characteristics from more people causing more surface disturbance. Any SRPs issued in non-WSA lands with wilderness characteristics would have the potential to impact natural characteristics due to surface disturbance created by group camping activities, and to affect opportunities for solitude and primitive recreation, depending on where the SRP has been issued or where an event is taking place. Most of these impacts would be short-term, however, and when the event is over, or the group leaves the area, the opportunities for solitude and primitive recreation would be present. Only allowing SRP events on designated routes would provide for protection of the natural characteristics of the non-WSA lands with wilderness characteristics because new surface-disturbing activities would not be permitted.

4.3.8.8.2.5. Alternative E

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

All routes in non-WSA lands with wilderness characteristics would be closed to vehicle use under this alternative; therefore, there would be no surface disturbance associated with off-road vehicle travel for camping. This would protect the natural characteristics of the non-WSA lands with wilderness characteristics because no new surface-disturbing activities would be allowed, and existing disturbance would be provided an opportunity to rehabilitate.

SRPs would be required for groups and commercial activities at the same numbers prescribed under Alternative B. However, there would be no competitive mechanized or motorized events permitted in non-WSA lands with wilderness characteristics. All motorized activities would be precluded within non-WSA lands with wilderness characteristics, thus, the loss of opportunities for solitude and primitive recreation from the noise and presence of vehicles would be prevented. Other non-motorized, non-commercial activities would still be permitted within the non-WSA lands with wilderness characteristics, however. Those uses would temporarily impact opportunities for solitude and primitive recreation, but would be short-term. When the event was over, or the group left the area, the opportunities for solitude and primitive recreation would be present.

4.3.8.8.2.6. Proposed Plan

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under the Proposed Plan, dispersed camping would be allowed throughout the Monticello FO in previously disturbed areas within 150 feet of centerline off designated routes. However, in the Dark Canyon, Mancos Mesa, Nokai Dome East, Nokai Dome West, and Grand Gulch non-WSA lands with wilderness characteristics managed to protect their wilderness characteristics under the Proposed Plan, vehicle travel would be limited to designated routes and surface disturbance resulting from off-road travel to dispersed camp sites would not occur. Thus, the natural characteristics of these non-WSA lands with wilderness characteristics would not be degraded.

SRPs would be required for groups of more than 50 people for day use and for overnight groups of more than 25 people. SRPs would also be required for OHV groups of more than 25 motorized vehicles, and camping groups with more than 15 vehicles or more than 50 people. All permitted use would be on designated routes. There would be no group or size limits on commercial use SRPs. Like Alternative B, authorizing SRPs that limit numbers of people, vehicles, and events, allows the BLM to maintain control of activities on public lands and also allows the BLM to guide large groups and events to areas where there is the least amount of conflict with or impacts to natural resources or other uses. However, use limits would be considerably higher under the Proposed Plan than under Alternative B, and therefore, there could be additional surface disturbance resulting from more people. Any SRPs provided in non-WSA lands with wilderness characteristics would have the potential to impact naturalness due to surface disturbance created by group camping activities, and to affect opportunities for solitude and primitive recreation, depending on where the SRP has been issued or where an event is taking place. Most of these impacts would be short-term, however, and when the event is over, or the group leaves the area, the opportunities for solitude and primitive recreation would be present. Only allowing SRP events on designated routes would provide for protection of the natural characteristics of the non-WSA lands with wilderness characteristics because new surface-disturbing vehicle activities would not be permitted.

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the Proposed Plan, dispersed camping would be allowed throughout the Monticello FO in previously disturbed areas within 150 feet of centerline off designated routes. While this requirement would prevent expansion of surface disturbance that would degrade the natural characteristics of non-WSA lands with wilderness characteristics, the presence and noise of motor vehicles driving on these routes to existing campsites would diminish opportunities for solitude and conflict with primitive forms of recreation on lands in proximity to the routes. However, as a person participating in primitive forms of recreation moves away from the route, deeper into the heart of the non-WSA lands with wilderness characteristics, the adverse effect of motor vehicles would diminish and eventually disappear as the separation from the noise and presence of vehicles increases.

SRPs would be required for groups of more than 50 people for day use and for overnight groups of more than 25 people. SRPs would also be required for OHV groups of more than 25 motorized vehicles, and camping groups with more than 15 vehicles or more than 50 people. All permitted use would be on designated routes. There would be no group or size limits on commercial use SRPs. Like Alternative B, providing SRPs that limit numbers of people, vehicles, and events allows the BLM to maintain control of activities on public lands and also allows the BLM to guide large groups and events to areas where there is the least amount of conflict with or impacts to natural resources. However, use limits would be considerably higher under the Proposed Plan than under Alternative B, and therefore, there could be additional surface disturbance resulting from more people. Any SRPs provided in non-WSA lands with wilderness characteristics would have the potential to impact naturalness due to surface disturbance created by group camping activities, and to affect opportunities for solitude and primitive recreation, depending on where the SRP has been issued or where an event is taking place. Most of these impacts would be short-term, however, and when the event is over, or the group leaves the area, the opportunities for solitude and primitive recreation would be present. Only allowing SRP events on designated routes would provide for protection of the natural

characteristics of the non-WSA lands with wilderness characteristics because new surface-disturbing vehicle activities would not be permitted.

4.3.8.9.1.1. Alternative ANon-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under present management, cross-country motorized use is allowed for game retrieval and antler collection in areas open for motorized travel. The Monticello FO also has the discretion to authorize cross-country travel for any commercial or organized group events. These actions would continue to degrade the natural characteristics of the non-WSA lands with wilderness characteristics by allowing new surface-disturbing activity from motorized vehicles, as well as conflict with solitude and primitive recreation experiences from the sights and sounds of vehicle travel.

Under current management, 140,600 acres in all or portions of 25 of the 29 non-WSA lands with wilderness characteristics are open to cross-country travel (see Table 4.97). Cross-country motorized travel in these non-WSA lands would result in surface disturbance to soils and vegetation that would alter the landscape and diminish the natural characteristics of these non-WSA lands with wilderness characteristics. Further, the presence and noise of motorized vehicles would degrade a visitor's opportunity for solitude and conflict with opportunities for primitive and unconfined recreation activities.

Under this alternative, OHV use would be limited to designated routes on 388,390 acres within portions of 24 non-WSA lands with wilderness characteristics. Current route inventories in the non-WSA lands with wilderness characteristics have found approximately 410 miles of existing routes in 27 of the 29 areas:

- Bridger Jack Mesa – 27.97 miles
- Butler Wash – 2.60 miles
- Cheesebox Canyon – 2.28 miles
- Comb Ridge – 5.28 miles
- Cross Canyon – 1.78 miles

- Dark Canyon – 56.55 miles
- Fish and Owl Creeks – 26.53 miles
- Fort Knocker Canyon – 2.44 miles
- Gooseneck – 2.20 miles
- Grand Gulch – 60.49 miles
- Gravel and Long Canyon – 13.73 miles
- Harmony Flat – 1.88 miles
- Harts Point – 19.08 miles
- Hatch/Lockhart/Hart – 2.99 miles
- Indian Creek – 21.20 miles
- Lime Creek – 2.52 miles
- Mancos Mesa – 27.80 miles
- Nokai Dome – 55.98 miles
- Red Rock Plateau – 8.39 miles
- Road Canyon – 11.26 miles
- San Juan River – 10.65 miles
- Shay Mountain – 2.60 miles
- Sheep Canyon – 0.10 miles
- Squaw and Papoose Canyon – 10.17 miles
- Upper Red Canyon – 18.04 miles
- Valley of the Gods – 5.42 miles
- White Canyon – 10.01 miles

Limiting OHV use would confine soil and vegetation disturbance caused by motor vehicles to existing routes, and result in no additional change to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity for visitors to find solitude, especially in proximity to the routes. Motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA lands with wilderness characteristics.

Currently, there are no routes within the 4,700-acre Hammond Canyon or the 50-acre Arch Canyon non-WSA lands with wilderness characteristics. Because no routes would be designated in these areas, surface disturbance caused by motorized travel, and the resultant impacts to the natural characteristics of the non-WSA lands with wilderness characteristics, would not be evidenced. Further, because there would be no OHV use in these areas, there would be no degradation of opportunities for solitude or conflict with primitive forms of recreation in these areas. The natural characteristics and opportunities for solitude and primitive recreation of these non-WSA lands with wilderness characteristics would be unaffected by OHV travel on designated routes. While these two non-WSA lands with wilderness characteristics currently have no routes within them, Arch Canyon and over half of Hammond Canyon remain open to cross-country OHV travel and impacts to wilderness characteristics could occur if OHV users choose to engage in cross-country use.

There are 53,370 acres in portions of nine non-WSA lands with wilderness characteristics that are closed to OHV use. The natural characteristics of these areas and the opportunities for solitude and primitive recreation would be preserved because no surface disturbance from vehicle tracks or noise from this use would occur within the closed areas.

4.3.8.9.1.2. Impacts Common to Alternatives B, C, and D

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternatives B, C, and D, vehicles would be required to stay on designated routes, with the exception of 20 acres designated open in the Indian Creek non-WSA lands with wilderness characteristics under Alternative D. Game retrieval and antler collection must be done on foot and vehicles cannot go off designated roads for such activities. The Monticello FO would not authorize cross-country travel for any commercial or organized group events. All motorized routes not designated as open would be signed as closed. These actions would continue to preserve the natural characteristics of the non-WSA lands with wilderness characteristics because no new surface-disturbing activity would be allowed from motorized vehicles.

4.3.8.9.1.3. Alternative B

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, all non-WSA lands with wilderness characteristics would be limited to designated routes or closed (see Table 4.69). There would be approximately 258 miles of routes designated in the following non-WSA lands with wilderness characteristics:

- Bridger Jack Mesa – 13.57 miles
- Butler Wash – 0.24 miles
- Cheesebox Canyon – 0.29 miles
- Comb Ridge – 1.66 miles
- Cross Canyon – 1.78 miles
- Dark Canyon – 38.60 miles
- Fish and Owl Creeks – 13.85 miles
- Fort Knocker Canyon – 0.92 miles
- Gooseneck – 2.20 miles
- Grand Gulch – 48.47 miles
- Gravel and Long Canyon – 8.20 miles
- Harmony Flat – 1.83 miles
- Harts Point – 8.61 miles
- Hatch/Lockhart/Hart – 2.99 miles
- Indian Creek – 12.81 miles
- Lime Creek – 2.13 miles
- Mancos Mesa – 11.62 miles
- Nokai Dome – 29.34 miles
- Road Canyon – 7.93 miles

- San Juan River – 6.67 miles
- Shay Mountain – 2.60 miles
- Sheep Canyon – 0.10 miles
- Squaw and Papoose Canyon – 10.17 miles
- Upper Red Canyon – 16.68 miles
- Valley of the Gods – 5.42 miles
- White Canyon – 9.23 miles

Reducing the miles of designated routes to 258 miles (by 152 miles of inventoried routes in 21 non-WSA lands with wilderness characteristics, as compared to Alternative A) would reduce the impacts to solitude and primitive recreations by limiting motorized noise within these areas. Limiting OHV use to existing routes would confine soil and vegetation disturbance caused by motor vehicles to existing routes, and result in no additional change to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity for visitors to find solitude, especially in proximity to the routes. And, motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA lands with wilderness characteristics.

The most notable areas where there would be a substantial decrease in miles of routes designated for travel would be in Bridger Jack Mesa, Dark Canyon, Fish and Owl Creeks, Grand Gulch, Harts Point, Indian Creek, Mancos Mesa, and Nokai Dome non-WSA lands with wilderness characteristics. In addition, two areas that would have designated routes under Alternative A would have none under Alternative B: Red Rock Plateau and Sheep Canyon non-WSA lands with wilderness characteristics. Because no routes would be designated in these areas, there would be no new surface disturbance caused by motorized travel that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Further, because there would be no OHV use in these areas, the opportunities for solitude and primitive forms of recreation would be unaffected by motorized travel.

There are 35,070 acres in portions of five non-WSAs with wilderness characteristics that would be closed to OHV use. The natural characteristics of these areas and the opportunities for solitude and primitive recreation would be preserved because no new surface disturbance or noise would occur from this use within those portions of the non-WSA lands with wilderness characteristics closed to motorized use.

4.3.8.9.1.4. Alternative C

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, all non-WSA lands with wilderness characteristics would be limited to designated routes or closed (see Table 4.97). In these areas, 348 miles of routes would be designated in the following non-WSA lands with wilderness characteristics:

- Bridger Jack Mesa – 24.69 miles
- Butler Wash – 1.29 miles
- Cheesebox Canyon – 2.28 miles
- Comb Ridge – 1.92 miles

- Cross Canyon – 1.78 miles
- Dark Canyon – 43.92 miles
- Fish and Owl Creeks – 20.57 miles
- Fort Knocker Canyon – 1.23 miles
- Gooseneck – 2.20 miles
- Grand Gulch – 50.09 miles
- Gravel and Long Canyon – 8.30 miles
- Harmony Flat – 1.88 miles
- Harts Point – 11.38 miles
- Hatch/Lockhart/Hart – 2.99 miles
- Indian Creek – 19.72 miles
- Lime Creek – 2.13 miles
- Mancos Mesa – 26.83 miles
- Nokai Dome – 54.10 miles
- Red Rock Plateau – 7.87 miles
- Road Canyon – 7.93 miles
- San Juan River – 9.52 miles
- Shay Mountain – 2.60 miles
- Sheep Canyon – 0.10 miles
- Squaw and Papoose Canyon – 10.17 miles
- Upper Red Canyon – 17.2 miles
- Valley of the Gods – 5.42 miles
- White Canyon – 10.07 miles

Reducing the miles of designated routes by 62 miles in 19 non-WSA lands from the inventoried routes (Alternative A) would help to reduce the impacts to solitude and primitive recreation by limiting motorized presence and noise within these areas. The most notable areas where there would be a substantial decrease in miles of routes designated are in Dark Canyon, Grand Gulch, and Harts Point non-WSA lands with wilderness characteristics. Limiting OHV use to existing routes would confine soil and vegetation disturbance caused by motor vehicles to existing routes, and result in no additional change to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity for visitors to find solitude in the non-WSA lands, especially in proximity to the routes. And, motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA lands.

There are also 29,400 acres in portions of five non-WSAs that are closed to OHV use. The naturalness of these areas and the opportunities for solitude and primitive recreation would be preserved because no surface disturbance from vehicle tracks or presence of vehicles and noise from this use within those closed portions of the non-WSA lands with wilderness characteristics would ensue.

Twenty acres in Indian Creek non-WSA lands with wilderness characteristics would remain open to cross-country vehicle use, as part of an open OHV play area designation. Cross-country motorized travel in this non-WSA would result in surface disturbance to soils and vegetation that would alter the landscape and diminish the natural characteristics of this 20-acre area of non-WSA lands with wilderness characteristics. Further, the presence and noise of motorized vehicles would degrade a visitor's opportunity for solitude and conflict with opportunities for primitive and unconfined recreation activities.

4.3.8.9.1.5. Alternative D

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, OHV use would be limited to designated routes on all 582,360 acres within the 29 non-WSA lands with wilderness characteristics, except for 20 acres in the Indian Creek non-WSA lands with wilderness characteristics which would remain open to cross-country travel as part of an OHV play area (see Table 4.97).

All inventoried routes from Alternative A would be designated open for OHV use, resulting in 410 miles of designated routes in 27 of the 29 non-WSAs:

- Bridger Jack Mesa – 27.97 miles
- Butler Wash – 2.60 miles
- Cheesebox Canyon – 2.28 miles
- Comb Ridge – 5.28 miles
- Cross Canyon – 1.78 miles
- Dark Canyon – 56.55 miles
- Fish and Owl Creeks – 26.53 miles
- Fort Knocker Canyon – 2.44 miles
- Gooseneck – 2.20 miles
- Grand Gulch – 60.49 miles
- Gravel and Long Canyon – 13.73 miles
- Harmony Flat – 1.88 miles
- Harts Point – 19.08 miles
- Hatch/Lockhart/Hart – 2.99 miles
- Indian Creek – 21.20 miles
- Lime Creek – 2.52 miles
- Mancos Mesa – 27.80 miles
- Nokai Dome – 55.98 miles
- Red Rock Plateau – 8.39 miles
- Road Canyon – 11.26 miles
- San Juan River – 10.65 miles
- Shay Mountain – 2.60 miles
- Sheep Canyon – 0.10 miles
- Squaw and Papoose Canyon – 10.17 miles

- Upper Red Canyon – 18.04 miles
- Valley of the Gods – 5.42 miles
- White Canyon – 10.01 miles

Limiting OHV use to designated routes would confine soil and vegetation disturbance caused by motor vehicles to the existing routes, and result in no additional change to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity for visitors to find solitude, especially in proximity to the routes. Motorized uses would conflict with primitive and unconfined recreation opportunities sought in areas with wilderness characteristics. There are two non-WSA lands with wilderness characteristics that have no routes: Arch Canyon (50 acres) and Hammond Canyon (4,700 acres). Because no routes would be designated in these areas, surface disturbance caused by motorized travel, and the resultant degradation of the natural characteristics of the non-WSA lands with wilderness characteristics, would not occur. Further, because there would be no presence or noise of motorized vehicles, opportunities for solitude and primitive forms of recreation would be protected.

Twenty acres in Indian Creek non-WSA lands with wilderness characteristics would remain open to cross-country vehicle use, as part of an open OHV play area designation. Cross-country motorized travel in this portion of the non-WSA lands with wilderness characteristics would result in surface disturbance to soils and vegetation that would alter the landscape and diminish the natural characteristics of this 20-acre area. Further, the presence and noise of motorized vehicles would degrade a visitor's opportunity for solitude and conflict with opportunities for primitive and unconfined recreation activities.

4.3.8.9.1.6. Alternative E

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

This alternative would designate all 582,360 acres of the 29 non-WSA lands with wilderness characteristic areas as closed to OHV use. Because these acres would be closed, no routes would be designated and surface disturbance caused by motorized travel and the resultant impacts to the natural characteristics of the non-WSA lands with wilderness characteristics would not occur. Further, because there would be no OHV use in these areas, there would be no conflicts with opportunities for solitude or primitive forms of recreation in these areas because noise and disturbance associated with OHV would be eliminated. The natural characteristics and opportunities for solitude and primitive recreation of these non-WSA lands with wilderness characteristics would be unaffected by OHV travel.

4.3.8.9.1.7. Proposed Plan

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

The five non-WSA lands with wilderness characteristics would be limited to designated routes (see Table 4.97). However, under the Proposed Plan, no routes would be designated in the non-WSA lands with wilderness characteristics managed to protect their wilderness characteristics:

- Dark Canyon
- Grand Gulch

- Mancos Mesa
- Nokai Dome East
- Nokai Dome West

Because no roads or trails would be designated in the five non-WSA lands with wilderness characteristics, there would be no surface disturbance that would degrade natural characteristics and no presence or noise of vehicles that diminish opportunities for solitude or conflict with primitive forms of recreation. This would be a substantial decrease in motorized use, compared to Alternative A).

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the Proposed Plan, all non-WSA lands with wilderness characteristics would be limited to designated routes or closed (see Table 4.97). In these areas, 173 miles of routes would be designated in the following non-WSA lands with wilderness characteristics:

- Bridger Jack Mesa – 24.69 miles
- Butler Wash – 1.29 miles
- Cheesebox Canyon – 2.28 miles
- Comb Ridge – 1.92 miles
- Cross Canyon – 1.78 miles
- Fish and Owl Creeks – 20.57 miles
- Fort Knocker Canyon – 1.23 miles
- Gooseneck – 2.20 miles
- Gravel and Long Canyon – 8.30 miles
- Harmony Flat – 1.88 miles
- Harts Point – 11.38 miles
- Hatch/Lockhart/Hart – 2.99 miles
- Indian Creek – 19.72 miles
- Lime Creek – 2.13 miles
- Red Rock Plateau – 7.87 miles
- Road Canyon – 7.93 miles
- San Juan River – 9.52 miles
- Shay Mountain – 2.60 miles
- Sheep Canyon – 0.10 miles
- Squaw and Papoose Canyon – 10.17 miles
- Upper Red Canyon – 17.2 miles
- Valley of the Gods – 5.42 miles
- White Canyon – 10.07 miles

Reducing the miles of designated routes to 173 miles (as compared to Alternative A) would reduce the impacts to solitude and primitive recreation by limiting the presence of motorized vehicles and their noise within these areas. The most notable area where there would be a substantial decrease in miles of routes traveled are in Harts Point non-WSA lands with

wilderness characteristics. Limiting OHV use to existing routes would confine soil and vegetation disturbance caused by motor vehicles to existing routes, and result in no additional disturbance and change to the natural characteristics of the non-WSA lands with wilderness characteristics. The presence and noise of vehicles using these routes, however, would reduce the opportunity for visitors to find solitude, especially in proximity to the routes. And, motorized uses would conflict with primitive and unconfined recreation opportunities sought in the non-WSA lands with wilderness characteristics.

There are also 4,598 acres in portions of four non-WSA lands with wilderness characteristics that would be closed to OHV use. The naturalness of these areas and the opportunities for solitude and primitive recreation would be protected because no surface disturbance or noise from this use would occur within those portions of the non-WSA lands with wilderness characteristics closed to motorized use.

In summary, Alternative E would provide the most protection to the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics by closing all these lands to OHV travel, followed by Alternative B. In Alternative B there would be no non-WSA lands with wilderness characteristics designated as open to cross-country OHV use. Non-WSA lands with wilderness characteristics would be protected by restricting OHV use to designated routes (258 miles) on 94% of the non-WSA lands with wilderness characteristics and closing the remainder to OHV use. Under Alternative C, 20 acres of non-WSA lands with wilderness characteristics would be designated as open to cross-country OHV use. The rest of the non-WSA lands with wilderness characteristics would be protected by restricting OHV use to designated routes (348 miles) on 95% of the non-WSA lands with wilderness characteristics and closing the remainder to OHV use. The effects of OHV decisions on non-WSA lands with wilderness characteristics under the Proposed Plan would be very similar to Alternative C. Alternative D also allows for cross-country OHV use on 20 acres of non-WSA lands with wilderness characteristics and designates all inventoried routes as open for OHV use (410 miles). No areas would be closed to OHV use. Alternative A would continue to allow for cross-country OHV use on 25% of the non-WSA lands with wilderness characteristics, limit use to designated or existing routes on 66% of the areas, and close 9% to OHV use. Alternative A and D would provide the lowest level of protection. Although Alternative A provides some protection within closed OHV areas, it contains the most acres of open OHV use. Alternative D contains no closed OHV areas and would continue to allow open OHV use on 20 acres of the non-WSA lands with wilderness characteristics.

4.3.8.9.2. MECHANIZED RECREATIONAL TRAVEL (MOUNTAIN BIKES)

4.3.8.9.2.1. Alternative A

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Areas currently open to motorized cross-country travel would continue to be open for cross-country mountain bike use. In non-WSA lands with wilderness characteristics, lands open to cross country mountain bike use under Alternative A are described under Section 4.3.8.9.1, Off-Highway Vehicle (OHV) Travel Management. Any new development of trails for mountain bikes in non-WSA lands would be in conflict with the primitive forms of trail use. If there were substantial levels of use on the trails (by foot, horse, and/or bike) in the non-WSA lands, the visitor's ability to find and experience solitude would be reduced.

4.3.8.9.2.2. Alternatives B , C, and D

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under these alternatives, mountain bikes would only be allowed on routes designated open for motorized use. Under all of the alternatives there are varying miles of routes that would be designated for OHV, and thus mountain bike travel. If there were substantial levels of use on the trails (by OHV, foot, horse, and/or bike) in the non-WSA lands with wilderness characteristics, the visitor's ability to find and experience solitude would be reduced. Change to the natural characteristics of the landscape as a result of mountain bike use is expected to be minimal, however, because the routes are already established and no new surface disturbance is expected.

4.3.8.9.2.3. Alternative E

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Non-WSA lands with wilderness characteristics would be closed to mountain bike use because no OHV routes would be designated for such use. This would protect and enhance opportunities for solitude and primitive recreation in the non-WSA lands with wilderness characteristics because fewer forms of recreation use would be allowed, and access for recreational purposes would be limited to non-mechanized users on foot or on horseback. This would potentially reduce the number of people recreating in the non-WSA lands with wilderness characteristics, enhancing opportunities for both solitude and the other primitive recreational activities.

4.3.8.9.2.4. Proposed Plan

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Under the Proposed Plan, mountain bikes would only be allowed on routes designated open for motorized use. Under all of the alternatives there are varying miles of routes that would be designated for OHV, and thus mountain bike travel. If there were substantial levels of use on the trails (by OHV, foot, horse, and/or bike) in the non-WSA lands with wilderness characteristics, the visitor's ability to find and experience solitude would be reduced. Change to the natural characteristics of the landscape as a result of mountain bike use is expected to be minimal, however, because the routes are already established and no new surface disturbance is expected.

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

The impacts would be the same as described for non-WSA lands with wilderness characteristics managed to protect their wilderness characteristics (see Section 4.3.8.9.2.4 above).

4.3.8.10. IMPACTS OF RIPARIAN DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

All non-WSA lands with wilderness characteristics contain riparian ecosystems. The objective of riparian management is to manage riparian areas for properly functioning condition and to avoid or minimize loss or degradation of riparian areas, wetlands, and associated floodplains so as to preserve and enhance natural and beneficial values and provide for fish, wildlife and special status species habitats. Decisions to implement any of these objectives would improve the natural vegetation condition of non-WSA lands with wilderness characteristics, and thus, their natural characteristics. Improved riparian and wetland condition would enhance wildlife habitat, and thus, the natural characteristics of non-WSA lands. Further, improved wildlife habitat would lead

to increases in riparian-obligate wildlife species populations and opportunities for wildlife viewing. And, improved riparian and wetland condition would improve the setting for other primitive recreational opportunities, including hiking, camping, and nature study.

Under the Proposed Plan and all alternatives, no surface disturbance would be permitted within active floodplains or within 100 m of riparian areas. This protection would prevent soil and vegetation disturbances and placement of structures that would degrade the natural characteristics of non-WSA lands with wilderness characteristics. Protection of natural characteristics would preserve the setting needed to support opportunities for primitive forms of recreation and experiences of solitude.

Inventory of riparian areas not functioning or functioning at risk would result in the identification and implementation of measures to restore these areas to properly functioning condition, which would enhance the natural characteristics of the riparian portions of non-WSA lands with wilderness characteristics. Riparian zones are critical to the life cycles of many wildlife species (fish, amphibians, mammals, and birds). They are typically scenic and desired recreation settings. Maintenance and restoration of riparian zones would maintain and enhance opportunities for primitive recreation, including hiking, wildlife viewing, camping, nature study, fishing, and other activities dependent upon water courses and riparian ecosystems.

Closing unnecessary multiple social trails in the riparian area of Fish Creek within the Fish and Owl Creeks non-WSA lands with wilderness characteristic would protect the natural characteristics of Fish Creek by preventing additional surface disturbance.

4.3.8.11. IMPACTS OF SOILS/WATERSHED DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

4.3.8.11.1. ALTERNATIVE A

4.3.8.11.1.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the No Action Alternative, where surface-disturbing actions are allowed in sensitive soil areas, there are no specific requirements for an erosion control strategy, approved survey and design, or slope restrictions for surface-disturbing activities on slopes between 21 and 40%. Depending on the type of surface-disturbing activities and the level of development or disturbance in non-WSA lands with wilderness characteristics, watershed issues associated with soil erosion could impact the naturalness characteristics of non-WSA lands with wilderness characteristics.

4.3.8.11.2. ALTERNATIVES B, C, AND D

4.3.8.11.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Where surface-disturbing actions are allowed in sensitive soil areas, specific requirements for an erosion control strategy, approved survey and design, or slope restrictions for surface-disturbing activities on steep slopes would be mandatory. Applying these requirements would help maintain natural characteristics of non-WSA lands with wilderness characteristics by mitigating potential erosion problems that could be created from permitted activities in these areas. However, even

with an approved plan to stabilize surface disturbance and prevent erosion, the disturbance and associated treatment or structure would still impact the natural characteristics to varying degrees, depending on the type and extent of the treatment or development.

4.3.8.11.3. ALTERNATIVE E

4.3.8.11.3.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

No surface-disturbing activities on sensitive soils would be permitted within non-WSA lands with wilderness characteristics, thereby maintaining their natural characteristics.

4.3.8.11.4. PROPOSED PLAN

4.3.8.11.4.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Where surface-disturbing actions are allowed in sensitive soil areas, specific requirements for an erosion control strategy, approved survey and design, or slope restrictions for surface-disturbing activities on steep slopes would be mandatory. Applying these requirements would help maintain natural characteristics of non-WSA lands with wilderness characteristics by mitigating potential erosion problems that could be created from permitted activities in these areas. However, even with an approved plan to stabilize surface disturbance and prevent erosion, the disturbance and associated treatment or structure would still impact the natural characteristics to varying degrees, depending on the type and extent of the treatment or development.

Under the Proposed Plan, portions of Dark Canyon, Mancos Mesa, Nokai Dome East, Nokai Dome West, and Grand Gulch non-WSA lands with wilderness characteristics would be managed to protect their wilderness characteristics. To achieve that objective, only minimal development and non-surface-disturbing land treatment would be permitted, minimizing or preventing impacts to the natural characteristics of these non-WSA lands with wilderness characteristics.

4.3.8.11.4.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Where surface-disturbing actions are allowed in sensitive soil areas, specific requirements for an erosion control strategy, approved survey and design, or slope restrictions for surface-disturbing activities on steep slopes would be mandatory. Applying these requirements would help maintain natural characteristics of non-WSA lands with wilderness characteristics by mitigating potential erosion problems that could be created from permitted activities in these areas. However, even with an approved plan to stabilize surface disturbance and prevent erosion, the disturbance and associated treatment or structure would still impact the natural characteristics to varying degrees, depending on the type and extent of the treatment or development.

4.3.8.12. IMPACTS OF SPECIAL DESIGNATION DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

For the purposes of this section of the analysis, “special designations” include ACECs established under each alternative, rivers recommended eligible in Alternative A and suitable for

inclusion in the National Wild and Scenic Rivers System under the Proposed Plan and four action alternatives, and wilderness study areas (WSAs) being managed to protect their wilderness characteristics under each alternative.

4.3.8.12.1. ALTERNATIVE A

4.3.8.12.1.1. Areas of Critical Environmental Concern (ACECs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Of the 10 ACECs that would continue to be designated under this alternative to protect a variety of relevant and important values, seven ACECs would include portions of non-WSA lands with wilderness characteristics. Those ACECs are the Scenic Highway Corridor, Indian Creek, Butler Wash, Dark Canyon, Shay Canyon, Lavender Mesa and Cedar Mesa. The management prescriptions for these ACECs would generally provide protection to the naturalness and opportunities for solitude and primitive recreation in all of the non-WSA lands.

The Scenic Highway Corridor ACEC includes portions of 13 non-WSA lands with wilderness characteristics totaling 38,580 acres: White Canyon (30 acres), Grand Gulch (7,935 acres), Comb Ridge (590 acres), Upper Red Canyon (915 acres), Harmony Flat (2,545 acres), Cheesebox Canyon (2,630 acres), Nokai Dome (3,140 acres), Mancos Mesa (5,260 acres), Fort Knocker Canyon (5,390 acres), Gravel and Long Canyon (6,350 acres), Road Canyon (420 acres), Fish and Owl Creeks (2,175 acres), and Valley of the God (1,200 acres) non-WSA lands with wilderness characteristics. Special conditions for managing the ACEC include: 1) reseeding with native vegetation; 2) NSO stipulation for oil and gas leasing; 3) retaining lands in public ownership; 4) managing to a VRM Class I objective; and 5) OHV use on designated roads and trails. All of these measures would help to protect and enhance the natural characteristics by eliminating new surface-disturbing activities. OHV use on designated routes would temporarily interfere with opportunities for solitude and primitive recreation when OHVs are in the area. Although the ACEC would remain available for mineral materials disposal, this is a discretionary action that must meet VRM objectives, and thus is unlikely to occur within this area. The ACEC would also remain open to firewood cutting in specified areas which would detract from the natural characteristics of the non-WSA lands with wilderness characteristics. It would also detract from the opportunities for solitude and primitive recreation when wood cutters are in the area due to chain saw noise, vehicle tracks, and evidence of surface disturbance. Although the ACEC would not be proposed for mineral withdrawal, and no recent mining activity has occurred along these highway stretches, it could be at risk of new development for uranium and vanadium extraction in the old mining districts (see Section 4.3.8.5.4, Locatable Minerals).

Indian Creek ACEC includes 3,900 acres of the Indian Creek non-WSA lands with wilderness characteristics. Special conditions for managing the ACEC include: 1) reseeding with native vegetation; 2) NSO stipulation for oil and gas leasing; 3) retaining lands in public ownership; 4) managing to a VRM Class I objective; and 5) closed to OHV use; 6) closed to mineral materials disposal; and 7) closed to commercial and personal firewood cutting. All of these measures would help to protect and enhance the natural characteristics of the non-WSA lands with wilderness characteristics, as well as protect the opportunities for solitude and primitive recreation, by eliminating new surface-disturbing activities. Although the ACEC would not be proposed for mineral withdrawal, and no recent mining activity has occurred, it could be at risk

of new development for uranium and vanadium extraction in the old mining districts (see Section 4.3.8.5.4, Locatable Minerals).

Butler Wash ACEC includes 40 acres of the Butler Wash non-WSA lands with wilderness characteristics. Special conditions for managing the ACEC include: 1) NSO stipulation for oil and gas leasing; 2) retaining lands in public ownership; 3) managing to a VRM Class I objective; and 4) closed to OHV use; 5) closed to mineral materials disposal; and 6) closed to commercial and personal firewood cutting. All of these measures would help to protect and enhance the natural characteristics, as well as protect the opportunities for solitude and primitive recreation, by eliminating new surface-disturbing activities. Although the ACEC would not be proposed for mineral withdrawal, and no recent mining activity has occurred, it could be at risk of new development for uranium and vanadium extraction in the old mining districts (see Section 4.3.8.5.4, Locatable Minerals).

Dark Canyon ACEC includes 280 acres of the Dark Canyon non-WSA lands with wilderness characteristics. Special conditions for managing the ACEC include: 1) unavailable for oil and gas leasing; 2) retaining lands in public ownership; 3) managing to a VRM Class I objective; and 4) closed to OHV use; 5) closed to mineral materials disposal; 6) closed to commercial and personal firewood cutting. All of these measures would help to protect and enhance the natural characteristics of the non-WSA lands with wilderness characteristics, as well as protect the opportunities for solitude and primitive recreation, by eliminating new surface-disturbing activities.

The Shay Canyon ACEC includes 515 acres of the Harts Point and 1,022 of the Shay Mountain non-WSA lands with wilderness characteristics. This ACEC is open for mineral leasing under special conditions, available for disposal of mineral materials, and open to mineral entry. Any of these activities, if approved within the non-WSA lands with wilderness characteristics would result in surface disturbance that would cause that portion to lose its natural characteristics. Opportunities for solitude and primitive recreation would be diminished in these non-WSA lands with wilderness characteristics due to exploration for and development of oil and gas resources, mineral material pit development, or mining, and could impact these opportunities for up to one-half mile from the ongoing activity. However, the ACEC is also protected with a VRM Class I objective, closed to private and commercial wood cutting, and limited OHV use on designated routes only. Any new development would need to meet the VRM management objective, thereby mandating extensive mitigation to any such activities. Closing the area to wood cutting would help protect the natural characteristics, as well as opportunities for solitude, by excluding the noise, tire tracks and other human activities associated with wood cutting. The occasional presence and noise of OHV use would reduce opportunities for solitude and conflict with primitive forms of recreation when vehicles were traveling the designated routes.

The Lavender Mesa ACEC includes 650 acres of the Bridger Jack Mesa non-WSA lands with wilderness characteristics. Special conditions for managing the ACEC include: 1) NSO stipulation for oil and gas leasing; 2) retaining lands in public ownership; 3) closed to OHV use; 4) closed to mineral materials disposal; 5) excluded from surface-disturbing activities; 6) excluded from land treatments or habitat improvements; and 7) closed to commercial and personal firewood cutting. All of these measures would protect, preserve, and enhance the natural characteristics of the non-WSA lands with wilderness characteristics, as well as protect the opportunities for solitude and primitive recreation, by eliminating new surface-disturbing

activities. Although the ACEC would not be proposed for mineral withdrawal, and no recent mining activity has occurred, it could be at risk of new development for uranium and vanadium extraction in the old mining districts (see Section 4.3.8.5.4, Locatable Minerals).

The Cedar Mesa ACEC overlies all or portions of six non-WSA lands with wilderness characteristics totaling 62,640 acres: all of Lime Creek (5,560 acres), the majority of Road Canyon (10,830 acres), Valley of the Gods (12,450 acres), Fish and Owl Creeks (21,870), and portions of Grand Gulch (11,680 acres), and Comb Ridge (250 acres) non-WSA lands with wilderness characteristics. Lime Creek, Road Canyon, and Valley of the Gods non-WSAs lands with wilderness characteristics lie within a special emphasis area of the ACEC and have more restrictions than the other three non-WSA lands with wilderness characteristics. The special emphasis area management includes: 1) closed to oil and gas leasing; 2) retaining lands in public ownership; 3) managing to a VRM Class I objective; and 4) closed to OHV use; 5) closed to mineral materials disposal; 6) closed commercial and personal firewood cutting, and 7) recommended segregation from mineral entry. These measures would protect the natural characteristics, as well as the opportunities for solitude and primitive recreation, by eliminating many surface-disturbing activities.

Portions of Fish and Owl Creeks, Grand Gulch, and Comb Ridge non-WSA lands with wilderness characteristics would fall within the less restrictive part of the Cedar Mesa ACEC, which allows for: 1) oil and gas leasing and development under standard stipulations; 2) disposal of mineral materials; 3) land treatments and range improvements; 4) commercial and private wood cutting; 5) OHV use on designated routes; and 6) mineral entry. These management decisions would allow for surface-disturbing activities that would create the loss of natural characteristics by placement of oil and gas wells and associated facilities, mechanical land and vegetation treatments, and wood-cutting activities. Limiting OHV activity to designated routes would help protect the natural characteristics of the areas by not allowing cross-country travel and new surface disturbance. Although the ACEC would not be proposed for mineral withdrawal, and no recent mining activity has occurred, it could be at risk of new development for uranium/vanadium extraction in the old mining districts (see Section 4.3.8.5.4, Locatable Minerals).

4.3.8.12.1.2. Wild and Scenic Rivers (WSRs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, two of the 29 non-WSA land areas are within eligible WSR segments, totaling 14.7 miles in those three areas. There are 5 miles of the eligible river segment of the Colorado River that includes the Gooseneck non-WSA lands with wilderness characteristics. And, there are 9.7 miles of the eligible river segment of the San Juan River that includes the San Juan River non-WSA lands with wilderness characteristics. Protection of river values (pending future suitability studies) would prevent uses and surface disturbances that would detract from the natural characteristics of the two non-WSA lands with wilderness characteristics within the half-mile river corridor (a quarter mile on each side of the river segment). The presence and noise of motor boat use along the San Juan River would reduce opportunities for solitude and conflict with primitive recreation in this river.

4.3.8.12.1.3. Wilderness Study Areas

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Even though Alternative A does not propose specific management to protect the wilderness characteristics of non-WSA lands with wilderness characteristics, the presence of contiguous WSAs and National Park Service lands would expand and enhance opportunities for solitude and primitive forms of recreation available in the non-WSA lands with wilderness characteristics.

4.3.8.12.2. ALTERNATIVE B

4.3.8.12.2.1. Areas of Critical Environmental Concern (ACECs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative there would be 12 ACECs designated to protect a variety of relevant and important values, of which 10 ACECs would include portions of non-WSA lands with wilderness characteristics. Those ACECs are the Indian Creek, Butler Wash, Dark Canyon, Shay Canyon, Lavender Mesa, Cedar Mesa, Lockhart Basin, San Juan River, and Valley of the Gods. The management prescriptions for these ACECs would generally provide protection to the natural characteristics and opportunities for solitude and primitive recreation in all of the non-WSA lands with wilderness characteristics.

The Indian Creek ACEC includes 3,900 acres of the Indian Creek non-WSA lands with wilderness characteristics. Prescriptions for managing the ACEC are the same as described in Alternative A, and the impacts to non-WSA lands with wilderness characteristics would be the same.

The Butler Wash ACEC includes 40 acres of the Butler Wash non-WSA lands with wilderness characteristics. Special conditions for managing the ACEC include: 1) NSO stipulation for oil and gas leasing; 2) retaining lands in public ownership; 3) managing to a VRM Class I objective; 4) OHV use limited to designated routes; 5) closed to mineral materials disposal; 6) closed to commercial and personal firewood cutting; and 7) proposed for mineral withdrawal. All of these measures would help to protect and enhance the natural characteristics, as well as protect the opportunities for solitude and primitive recreation, by eliminating new surface-disturbing activities. The occasional presence and noise of OHV use would reduce opportunities for solitude and conflict with primitive forms of recreation when vehicles were traveling the designated routes.

The Dark Canyon ACEC includes 280 acres of the Dark Canyon non-WSA lands with wilderness characteristics. Prescriptions for managing the ACEC are the same as described in Alternative A, and the impacts to non-WSA lands with wilderness characteristics would be the same.

The Shay Canyon ACEC includes 100 acres of the Shay Mountain non-WSA lands with wilderness characteristics. The prescriptions for managing this potential ACEC include: 1) NSO for oil and gas leasing; 2) OHV use limited to designated routes; 3) no surface-disturbing vegetation treatment or wildlife and watershed improvements; 4) hiking only on designated trails; 5) open to mineral entry; 6) closed to disposal of mineral materials; 7) closed to private or commercial wood cutting; and 8) managed to VRM Class II objectives. This prescription is much more restrictive than Alternative A and would protect natural characteristics from surface-

disturbing activities. The occasional presence and noise of OHV use would reduce opportunities for solitude and conflict with primitive forms of recreation when vehicles were traveling the designated routes. Although the ACEC would not be proposed for mineral withdrawal, and no recent mining activity has occurred, it could be at risk of new development for uranium/vanadium extraction in the old mining districts (see Section 4.3.8.5.4, Locatable Minerals).

The Lavender Mesa ACEC includes 650 acres of the Bridger Jack Mesa non-WSA lands with wilderness characteristics. Special conditions for managing the ACEC include: 1) NSO stipulation for oil and gas leasing; 2) retaining lands in public ownership; 3) managing to a VRM Class II objective; 4) closed to OHV use; 5) closed to mineral materials disposal; 6) excluded from surface-disturbing activities; 7) excluded from surface-disturbing land treatments or habitat improvements; and 8) closed to commercial and personal firewood cutting. Like Alternative A, all of these measures would protect and enhance the natural characteristics, as well as protect the opportunities for solitude and primitive recreation, by eliminating new surface-disturbing activities. Although the ACEC would not be proposed for mineral withdrawal, and no recent mining activity has occurred, it could be at risk of new development for uranium/vanadium extraction in the old mining districts (see Section 4.3.8.5.4, Locatable Minerals).

The Cedar Mesa ACEC includes portions of four non-WSA lands with wilderness characteristics totaling 60,055 acres: Fish and Owl Creeks (24,010 acres), Grand Gulch (26,635 acres), Road Canyon (9,160 acres) and Comb Ridge (250 acres). Management prescriptions for this ACEC include 1) open to oil and gas leasing and development under standard stipulations; 2) available for watershed, vegetation and range projects; 3) VRM Class III objectives; 4) closed to commercial and private wood cutting; and 5) OHV use permitted on designated routes. This management prescription allows for surface-disturbing activities that would create the loss of wilderness characteristics by potential placement of oil and gas wells and associated facilities and mechanical land and vegetation treatments. Limiting OHV activity to designated routes (no cross country travel) would prevent added surface disturbance and protect natural characteristics. Closing the ACEC to wood cutting would prevent impacts associated with that activity on the naturalness and opportunities for solitude and primitive recreation.

The Lockhart Basin ACEC includes portions of four non-WSA lands with wilderness characteristics totaling 21,305 acres: Indian Creek (15,820 acres), all of Gooseneck (3,570 acres), Hatch/Lockhart/Hart (1,765 acres), and Harts Point (150 acres). The management objectives for this ACEC would prescribe: 1) NSO for oil and gas leasing; 2) closed to disposal of mineral materials; 3) VRM Class I objectives; 4) prohibit surface-disturbing activities; 5) retained in public ownership; 6) proposed for mineral withdrawal; and 7) closed to commercial or private firewood cutting. The management prescription for this ACEC would protect and enhance the natural characteristics and provide opportunities for solitude and primitive recreation in the non-WSA lands with wilderness characteristics.

The San Juan River ACEC includes 2,155 acres of the San Juan River non-WSA lands with wilderness characteristics. The management prescription includes: 1) OHV use limited to designated routes; 2) closed to private and commercial firewood cutting; 3) available for watershed, range improvements and vegetation treatments; 4) managed to VRM Class I, II, and III objectives; 5) NSO for oil and gas leasing; 6) closed to mineral materials disposal; and 7) retained in public ownership. This prescription would maintain the wilderness characteristics of

the San Juan River. Depending on the methods used for the land treatments and improvements, short-term or long-term impacts to natural characteristics would occur if accomplished with surface-disturbing methods in the non-WSA lands with wilderness characteristics (see Section 4.3.17, Vegetation, for description of methods and impacts). The occasional presence and noise of OHV use would reduce opportunities for solitude and conflict with primitive forms of recreation when vehicles were traveling the designated routes.

The Valley of the Gods ACEC includes all of Lime Creek (5,560 acres), all of Valley of the Gods (13,670 acres), and a small portion of Road Canyon (1,530 acres) non-WSA lands with wilderness characteristics. The prescription for this ACEC includes: 1) unavailable for oil and gas leasing; 2) retaining lands in public ownership; 3) managing to a VRM Class I objective; 4) OHV use limited to designated routes; 5) closed to mineral materials disposal; 6) closed to commercial and personal firewood cutting in designated areas; and 7) available for vegetation treatments. Virtually all of these measures would protect the natural characteristics, as well as protect the opportunities for solitude and primitive recreation, by eliminating many surface-disturbing activities. OHV use on designated routes would temporarily interfere with opportunities for solitude and primitive recreation when OHVs are in the area. Any vegetation treatment would be required to meet VRM Class I objectives and would probably be by fire, biological, or chemical methods to meet this objective.

4.3.8.12.2.2. Wild and Scenic Rivers (WSRs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, three of the 29 non-WSA land areas are located in suitable WSR segments, totaling 15.3 miles in those three areas.

Five miles of the Colorado River segment found suitable under this alternative includes the Gooseneck non-WSA lands with wilderness characteristics. It would be managed for its recommended classification as "scenic." The river corridor would be available for oil and gas leasing with an NSO stipulation, closed to OHV use, recommended for mineral withdrawal, managed to VRM Class I objectives, and closed to motorized use. This management prescription would protect and preserve natural characteristics because no surface-disturbing activities would be allowed, and opportunities for solitude and primitive recreation as noise from motorized uses would be eliminated.

There are 9.7 miles of the suitable river segment of the San Juan River that includes with the San Juan River non-WSA lands with wilderness characteristics. This portion of the river has a recommended suitable classification of "wild," and would be managed to VRM Class I objectives, closed to oil and gas leasing, closed to OHV use, and recommended for mineral withdrawal. This management prescription would protect and preserve the natural characteristics because no surface-disturbing activities would be allowed, and opportunities for solitude and primitive recreation as noise from motorized uses would be eliminated.

There is 0.6 mile of Indian Creek suitable for inclusion in the National Wild and Scenic River System that includes the Shay Mountain non-WSA lands with wilderness characteristics. This river has a recommended suitable classification of "recreational" and would be managed under VRM Class III objectives, open to oil and gas leasing under standard lease terms, and OHV use would be limited to designated routes. Although limiting OHV activity to designated routes would help protect the natural characteristics of the non-WSA lands with wilderness

characteristics by not allowing cross-country travel, the other management prescriptions would not protect these values. Surface-disturbing activities would be permitted which would detract from the natural characteristics of the area and interrupt opportunities for solitude and primitive recreation.

4.3.8.12.2.3. Wilderness Study Areas

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Even though Alternative B does not propose specific management to protect the wilderness characteristics of non-WSA lands with wilderness characteristics, the presence of contiguous WSAs and National Park Service lands would expand and enhance opportunities for solitude and primitive forms of recreation available in the non-WSA lands with wilderness characteristics.

4.3.8.12.3. ALTERNATIVE C

4.3.8.12.3.1. Areas of Critical Environmental Concern (ACECs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative there would be seven ACECs designated to protect a variety of relevant and important values, of which five ACECs would overlie portions of non-WSA lands with wilderness characteristics. Those ACECs are Indian Creek, Shay Canyon, Lavender Mesa, San Juan River, and Valley of the Gods. The management prescriptions for these ACECs would generally provide some protection to the natural characteristics and opportunities for solitude and primitive recreation in all of the non-WSA lands.

The 3,900-acre potential Indian Creek ACEC falls within the Indian Creek non-WSA lands with wilderness characteristics. The acreage and prescriptions for managing the ACEC are the same as described in Alternative A, except OHV use would be limited to designated roads and trails. The effect of this ACEC prescription on the non-WSA lands with wilderness characteristics would be the same as for Alternative B, except that allowable motorized use would disrupt opportunities for solitude and conflict with primitive recreation activities.

The potential Shay Canyon ACEC overlies 100 acres of the Shay Mountain non-WSA lands with wilderness characteristics. The acreage and prescriptions for managing this potential ACEC would be the same as Alternative B, thus the analysis would be the same.

The potential Lavender Mesa ACEC overlies 650 acres of the Bridger Jack Mesa non-WSA lands with wilderness characteristics. The acreage and prescriptions for managing this potential ACEC would generally be the same as Alternative A, thus the analysis would be essentially the same.

The potential San Juan River ACEC overlies 2,155 acres of the San Juan River non-WSA lands with wilderness characteristics. While the acreage would be less than Alternative B, prescription for managing this potential ACEC would be the same. Thus, the analysis would be the same, on fewer ACEC acres.

The potential Valley of the Gods ACEC overlies all of Lime Creek (5,560 acres), all of Valley of the Gods (13,670 acres), and a small portion of Road Canyon (1,530 acres) non-WSA lands with wilderness characteristics. The acreage and prescriptions for managing this potential ACEC

would be the same as Alternative B, except the ACEC would not be recommended for mineral withdrawal and utility corridors would be permitted. These differences in the impact analysis with Alternative B would allow for surface disturbance and land uses that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Operations of mines and utility lines would detract from the setting needed to support opportunities for solitude and primitive recreation activities.

4.3.8.12.3.2. Wild and Scenic Rivers (WSRs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, one of the 29 non-WSA land areas intersect with a suitable WSR segment. Five miles of the Colorado River segment found suitable under this alternative intersect with the Gooseneck non-WSA lands with wilderness characteristics. As with Alternative B, it would be managed for its tentative classification as "scenic" and would be unavailable for oil and gas leasing, closed to OHV use, recommended for mineral withdrawal, managed to VRM Class I objectives, and closed to motorized use. All of these management actions would protect and preserve natural characteristics because no surface-disturbing activities would be allowed, and opportunities for solitude and primitive recreation, as noise from motorized uses would be eliminated.

4.3.8.12.3.3. Wilderness Study Areas

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Even though Alternative C does not propose specific management to protect the wilderness characteristics of non-WSA lands with wilderness characteristics, the presence of contiguous WSAs and National Park Service lands would expand and enhance opportunities for solitude and primitive forms of recreation available in the non-WSA lands with wilderness characteristics.

4.3.8.12.4. ALTERNATIVE D

4.3.8.12.4.1. Areas of Critical Environmental Concern (ACECs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternative D, no ACECs would be designated, therefore, management prescriptions to protect relevant and important values would not be applied and would not afford protection of wilderness characteristics in non-WSA lands with wilderness characteristics.

4.3.8.12.4.2. Wild and Scenic Rivers (WSRs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, no WSR segments would be found suitable. Therefore, management prescriptions to protect the suitable river segments would not be applied and would not afford protection of wilderness characteristics in non-WSA lands with wilderness characteristics.

4.3.8.12.4.3. Wilderness Study Areas

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Even though Alternative D does not propose specific management to protect the wilderness characteristics of non-WSA lands with wilderness characteristics, the presence of contiguous WSAs and National Park Service lands would expand and enhance opportunities for solitude and primitive forms of recreation available in the non-WSA lands with wilderness characteristics.

4.3.8.12.5. ALTERNATIVE E

4.3.8.12.5.1. Areas of Critical Environmental Concern (ACECs)

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Alternative E designates the same number of ACECs and includes the same number of non-WSA lands with wilderness characteristics as Alternative B. All of the non-WSA lands with wilderness characteristics that fall within the ACECs (Indian Creek, Butler Wash, Dark Canyon, Shay Canyon, Lavender Mesa, Cedar Mesa, Lockhart Basin, San Juan River, and Valley of the Gods) would be afforded protection under this alternative due to the ACEC prescriptions that include protections for wilderness characteristics. All of the lands would be closed to oil and gas leasing, closed to firewood cutting, closed to OHV use, proposed for mineral withdrawal, managed to a VRM Class I objective, and excluded from any surface-disturbing activities. The natural characteristics of the non-WSA lands with wilderness characteristics would be protected and the opportunities for solitude and primitive recreation would be preserved.

4.3.8.12.5.2. Wild and Scenic Rivers (WSRs)

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

All three suitable river segments that include non-WSA lands with wilderness characteristics described under Alternative B would be carried forward into this alternative. This would include 5 miles along the Colorado River within the Gooseneck non-WSA lands with wilderness characteristics, 9.7 miles along the San Juan River in the San Juan River non-WSA lands with wilderness characteristics, and 0.6 miles of the suitable portion of Indian Creek that includes the Shay Mountain non-WSA lands with wilderness characteristics. Management prescriptions to protect wilderness characteristics under this alternative would be equally or more restrictive to other land uses than the wild and scenic river prescriptions, limiting surface disturbances and protecting the natural characteristics of the non-WSA lands with wilderness characteristics and preserving the opportunities for solitude and primitive recreation.

4.3.8.12.5.3. Wilderness Study Areas (WSAs)

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Non-WSA lands with wilderness characteristics in Arch Canyon, Bridger Jack Mesa, Butler Wash, Cheesebox Canyon, Cross Canyon, Dark Canyon, Fish and Owl Creeks, Grand Gulch, Indian Creek, Lime Creek, Mancos Mesa, Road Canyon, and Squaw and Papoose Canyon are contiguous to wilderness study areas (many of the same name) that are managed under the BLM's IMP to protect their wilderness values. Protecting and maintaining the wilderness characteristics in the non-WSA lands would continue to safeguard their natural characteristics

and expand opportunities for solitude and primitive forms of recreation found in the adjacent WSAs. In addition, Bridger Jack Mesa, Butler Wash, Dark Canyon, Gooseneck, and Indian Creek non-WSA lands with wilderness characteristics are contiguous with lands administratively endorsed for wilderness within Canyonlands National Park. Dark Canyon non-WSA lands with wilderness characteristics are also contiguous with the Forest Service's Dark-Woodshoe Canyon Wilderness Area. There are also non-WSA lands that are contiguous to lands administratively endorsed for wilderness within the Glen Canyon National Recreation Area. These are the Grand Gulch, Dark Canyon, Nokai Dome, and Sheep Canyon non-WSA lands with wilderness characteristics. Non-WSA lands with wilderness characteristics that are contiguous to lands administratively endorsed for wilderness within Natural Bridges National Monument include Cheesebox Canyon and Harmony Flat. Similar to the WSAs, protecting the non-WSA lands with wilderness characteristics to preserve their wilderness characteristics would enhance and expand the opportunities for solitude and primitive recreation, as well as natural characteristics, in the National Park units and the Forest Service-designated wilderness area.

4.3.8.12.6. PROPOSED PLAN

4.3.8.12.6.1. Areas of Critical Environmental Concern (ACECs)

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

Management decisions for designated ACECs under the Proposed Plan would not affect the five non-WSA lands with wilderness characteristics managed to protect those characteristics.

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the Proposed Plan, there would be seven ACECs designated to protect a variety of relevant and important values, of which five ACECs would include portions of non-WSA lands with wilderness characteristics. Those ACECs are Indian Creek, Shay Canyon, Lavender Mesa, and Valley of the Gods. The management prescriptions for these ACECs would generally provide some protection to the natural characteristics and opportunities for solitude and primitive recreation in all of the non-WSA lands with wilderness characteristics.

The 3,900-acre Indian Creek ACEC falls within the Indian Creek non-WSA lands with wilderness characteristics. The prescription for managing the smaller ACEC would be the generally the same as described in Alternative A, except that OHV use would be permitted on designated roads and trails. Thus, the impacts of ACEC management on wilderness characteristics would be similar to Alternative A, except that motor vehicle use of roads and trails would diminish opportunities for solitude and conflict with primitive forms of recreation.

The Shay Canyon ACEC includes 100 acres of the Shay Mountain non-WSA lands with wilderness characteristics. The acreage and prescriptions for managing this ACEC would be the same as Alternative B, thus the impacts to wilderness characteristics would be the same.

The Lavender Mesa ACEC includes 650 acres of the Bridger Jack Mesa non-WSA lands with wilderness characteristics. The acreage and prescriptions for managing this ACEC would be the same as Alternative B, thus the impacts to wilderness characteristics would be the same.

The San Juan River ACEC includes 2,155 acres of the San Juan River non-WSA lands with wilderness characteristics. The prescription for managing this ACEC would be the same as

Alternative B for a smaller ACEC. Thus, the impacts of ACEC management on wilderness characteristics would be the same as Alternative B.

The Valley of the Gods ACEC includes all of Lime Creek (5,560 acres), all of Valley of the Gods (13,670 acres), and a small portion of Road Canyon (1,530 acres) non-WSA lands with wilderness characteristics. The acreage and prescriptions for managing this ACEC would be generally the same as Alternative B, except the ACEC would not be recommended for mineral withdrawal. Thus the impacts to wilderness characteristics would be similar, but allow for surface disturbance related to locatable mining. This disturbance could degrade the natural characteristics of the non-WSA lands with wilderness characteristics and reduce opportunities for both solitude and primitive recreation activities.

4.3.8.12.6.2. Wild and Scenic Rivers (WSRs)

Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the Proposed Plan, one of the 29 non-WSA lands with wilderness characteristics lies within suitable WSR segments. Approximately 7 miles of the Colorado River (5 miles of Segment 3 and 2 miles of Segment 2) found suitable under this alternative includes the Gooseneck non-WSA lands with wilderness characteristics, though the Gooseneck non-WSA lands with wilderness characteristics are not managed to protect their wilderness characteristics under this alternative. As with Alternative B, these two river segments would be managed for their recommended suitable classification as "scenic." Segment 2 would be managed as NSO for mineral leasing, managed by VRM Class II objectives (landscape retention), and open to motorized use on the river. Segment 3 would be unavailable for oil and gas leasing, closed to OHV use, recommended for mineral withdrawal, managed to VRM Class II objectives, and open to motorized use on the river. All of these management actions would protect the natural characteristics of the non-WSA lands with wilderness characteristics because no surface-disturbing activities would be allowed. However, the presence and noise (use) of motorized boats on the river would diminish opportunities for solitude and conflict with primitive recreation uses of the non-WSA lands adjacent to the river.

4.3.8.12.6.3. Wilderness Study Areas

Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics

The Proposed Plan would manage portions of Dark Canyon, Mancos Mesa, Nokai Dome East, Nokai Dome West, and Grand Gulch non-WSA lands with wilderness characteristics to protect their wilderness characteristics. Dark Canyon, Mancos Mesa, and Grand Gulch are contiguous to existing WSAs. Nokai Dome West is contiguous to lands administratively endorsed for wilderness in the Glen Canyon National Recreation Area. Nokai Dome East is not contiguous to any lands with identified wilderness characteristics or values. Managing these non-WSA lands with wilderness characteristics for those wilderness characteristics would expand opportunities for primitive recreation activities in large undeveloped settings from the adjacent WSAs and Park Service lands to include these areas, enhancing and expanding undeveloped landscapes, primitive recreational opportunities, and opportunities to find solitude.

In summary, the Proposed Plan and Alternatives B and E would provide the most long-term protection to the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics by designating the most acres as ACECs and by

recommending the longest stretches of waterways for protection in the National Wild and Scenic Rivers System, followed by Alternative A. Alternative C would provide some protection of the naturalness and opportunities for solitude and primitive recreation of non-WSA lands with wilderness characteristics, but recommends few ACECs and only recommends two river segment for protection in the National Wild and Scenic Rivers System. Alternative D would provide the lowest level of protection, as it would not designate ACECs or recommend suitable river segments for protection.

4.3.8.13. IMPACT OF SPECIAL STATUS SPECIES DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

Under the Proposed Plan and all alternatives, management actions would focus on maintaining, protecting, and enhancing habitats for special status species. Decisions that would help protect non-WSA lands with wilderness characteristics include applying avoidance and minimization measures for all surface-disturbing activities in special status species habitats, including using BMPs wherever possible. This would limit surface disturbance and help to maintain the natural characteristics of the non-WSA lands with wilderness characteristics where they intersect with special status species habitat. Another action common to the Proposed Plan and all alternatives would be to implement habitat manipulations where translocation and population augmentation of special status species would occur, if necessary. If surface-disturbing methods were used, this would degrade the natural characteristics of the non-WSA lands with wilderness characteristics, at least in the short term. During the time the habitat manipulation is being conducted, the opportunity for solitude and primitive recreation would be disrupted. In addition, any recovery plan actions that require construction of range improvements would introduce unnatural elements of human manipulation to the landscape, degrading the natural characteristics of the non-WSA lands with wilderness characteristics.

Mexican Spotted Owl habitat is generally associated with deep, narrow canyons that are within Hatch/Lockhart/Hart, Indian Creek, Harts Point, Shay Mountain, Dark Canyon, Fish and Owl Creeks, Gravel and Long Canyon, and Nokai Dome non-WSA lands with wilderness characteristics. Southwestern Willow Flycatcher and Yellow-billed Cuckoo habitat, as well as riverine habitat for endangered Colorado river fishes, fall within the San Juan River non-WSA lands with wilderness characteristics. Actions taken to maintain, protect, and enhance these habitats for special status species would improve the populations and would enhance the natural characteristics of the lands where these species occur in the non-WSA lands with wilderness characteristics. Further, larger and healthier populations would expand opportunities for primitive and unconfined recreation opportunities, including wildlife viewing, photography, and natural history study.

Vegetation treatments and manipulations to improve special status species habitats would be completed with fire, chemicals, biologically, or mechanically. In the long-term, vegetation treatments with fire would restore vegetation communities and display a more natural composition of grasses, forbs, shrubs, and trees. If these treatments occurred in non-WSA lands with wilderness characteristics, this objective would enhance the natural characteristics of the non-WSA lands with wilderness characteristics in the long-term, and healthy populations would enhance opportunities for primitive recreation, wildlife viewing, and wildlife studies. In the short-term, however, burning operations would result in disturbance of the landform and vegetation through fire-line construction needed to manage the fire. Further, the presence and

noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the burning operation and reclamation. When the fire and reclamation operations are complete, these opportunities would return. Soil and vegetation disturbance for fire-line construction would diminish the natural characteristics of the non-WSA lands with wilderness characteristics, but reclamation would restore the natural conditions in a relatively short period of time. Mechanical vegetation manipulation in non-WSA lands with wilderness characteristics would have long-term impacts on the natural characteristics of the non-WSA lands with wilderness characteristic and opportunities for solitude and primitive and unconfined recreation. While restoration of vegetation communities would be beneficial to the natural characteristics of non-WSA lands with wilderness characteristics, the use of chain saws, bull dozers, and brush hogs to accomplish the objective would leave an obvious imprint of human activity on the land, diminishing the natural characteristics. Also, in the short-term, the presence and noise of people and equipment would eliminate opportunities for solitude and primitive forms of recreation in proximity to the treatment area. In the long-term, a setting clearly manipulated by humans would reduce the opportunities for both solitude and primitive recreation.

4.3.8.14. IMPACTS OF VEGETATION DECISIONS ON NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

Under the Proposed Plan and all alternatives, existing vegetation treatments would be maintained, as appropriate, to allow for the desired mix of vegetation types, structural stages, and landscape/riparian/watershed function and provide for native plant, fish, and wildlife habitats. Vegetation treatments would be completed with fire, chemicals, biologically, or mechanically to achieve and maintain standards for rangeland health and desired vegetation condition. In the long-term, vegetation treatments with fire would restore vegetation communities and display a more natural composition of grasses, forbs, shrubs, and trees. If these treatments occurred in non-WSA lands with wilderness characteristics, this objective would enhance the natural characteristics of the non-WSA lands with wilderness characteristics in the long-term. Maintenance of vegetation treatment areas with fire would maintain or enhance wildlife habitat and populations of species dependent on that habitat (e.g., deer, elk, antelope, sage-grouse, and song birds). If these treatments occurred in non-WSA lands with wilderness characteristics, healthy wildlife populations would enhance opportunities for primitive recreation, wildlife viewing, and hunting. In the short-term, however, burning operations would result in disturbance of the landform and vegetation through fire-line construction needed to manage the fire. Further, the presence and noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the burning operation and reclamation. When the fire and reclamation operations are complete, these opportunities would return. Soil and vegetation disturbance for fire-line construction would diminish the natural characteristics of the non-WSA lands with wilderness characteristics, but reclamation would restore the natural conditions in a relatively short period of time.

Mechanical vegetation manipulation in non-WSA lands with wilderness characteristics would have long-term impacts on the natural characteristics and opportunities for solitude and primitive and unconfined recreation. While restoration of vegetation communities would be beneficial to the natural characteristics of non-WSA lands with wilderness characteristics, the use of chain

saws, bull dozers, and brush hogs to accomplish the objective would leave an obvious imprint of human activity on the land, diminishing the natural characteristics. Also, in the short-term, the presence and noise of people and equipment would eliminate opportunities for solitude and primitive forms of recreation in proximity to the treatment area. In the long-term, a setting clearly manipulated by humans would reduce the opportunities for both solitude and primitive recreation.

Actions that are common to the Proposed Plan and all action alternatives include prioritizing sagebrush communities for treatment within numerous areas in the Monticello FO. Non-WSA lands with wilderness characteristics that lie within these priority areas include Harts Point, Dark Canyon, and Shay Mountain. In addition, proposed greasewood treatments would occur in portions of Fish and Owl Creeks, Road Canyon, Comb Wash, Indian Creek, and Hammond Canyon. Depending on the method used to treat these areas, prescribed fire, mechanical, biological, or chemical impacts to wilderness characteristics would be varied, as described above.

The control of noxious weeds would have both beneficial and adverse impacts on the wilderness characteristics of non-WSA lands with wilderness characteristics, depending on the method of control, under the Proposed Plan and all alternatives. The use of fire, chemical, and biological treatments would control noxious weeds and insects with no apparent evidence of human intervention on the landscape. Thus there would be no noticeable impact on the natural characteristics of the non-WSA lands with wilderness characteristics. Control of non-native vegetation and restoration of native vegetation communities, however, would result in a more natural vegetation community, and thus more natural characteristics of the non-WSA lands with wilderness characteristics. The use of mechanical treatments to eradicate non-native vegetation and would leave a noticeable imprint of human work on the landscape, and degrade the natural characteristics, if the treatments were to occur in the non-WSA lands with wilderness characteristics. Depending on the vegetation community treated (grassland and shrub land vs. woodland or coniferous forest), the length of time the evidence of mechanical treatments remained on the landscape would vary before the surface and vegetation disturbances returned to a more natural or unmodified condition.

Reclaiming or restoring of up to 30,000 to 50,000 acres of vegetation treatments in FRCC III; maintaining existing land treatments; and implementing new vegetation treatments in sagebrush, pinyon-juniper, riparian, and greasewood habitats would have the same impact on the natural characteristics of the non-WSA lands with wilderness characteristics as described above. Depending on the treatment method used, the loss of natural characteristics could be substantial in the short-term, but would be beneficial to the natural characteristics of the non-WSA lands with wilderness characteristics in the long-term. If done by a surface-disturbing mechanized method, the evidence of human intervention on the land would be apparent and would remain longer.

4.3.8.15. IMPACTS OF VISUAL RESOURCE MANAGEMENT DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

4.3.8.15.1. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

There are four objectives for visual resources management (VRM Classes I–IV) that provide for various levels of landscape protection and change. The objective of Class I is to preserve the

characteristic landscape, while the objective of VRM Class IV provides for landscape modifications (see Chapter 3, Section 3.19.2). Land-use planning decisions to designate and manage areas by Class I objectives would preserve the characteristic landscape. In non-WSA lands with wilderness characteristics, this objective (VRM Class I) would preserve the natural characteristics of the area. VRM Class II objectives would retain the characteristic landscape, allowing for minor changes to the landform and vegetation. This objective would generally protect the natural characteristics of the non-WSA lands with wilderness characteristics. The objective of VRM Class III is to partially retain the existing character of the landscape, allowing for moderate changes to land and vegetation. This objective is not compatible with preserving the natural characteristics of non-WSA lands with wilderness characteristics. VRM Class IV objectives provide for major modification of the landscape, clearly incompatible with preservation of the natural characteristics of non-WSA lands with wilderness characteristics.

Under Class I and II objectives, preserving the natural characteristics of the non-WSA lands with wilderness characteristics would also preserve the undeveloped setting needed to support opportunities for solitude and primitive forms of recreation. Since VRM Class III and IV objectives would not preserve an undeveloped setting, opportunities for both solitude and primitive recreation would be diminished.

Table 4.98 shows the VRM objectives (Classes I–IV) for non-WSA wilderness areas, by alternative.

4.3.8.15.2. ALTERNATIVE A**4.3.8.15.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative A, 262,340 acres would be managed by VRM Class I and II objectives in all of six and parts of 19 non-WSA lands with wilderness characteristics, protecting the natural

characteristics of those lands in the non-WSAs lands with wilderness characteristics as described above. Conversely, 320,020 acres would be managed by Class III and IV objectives. While the focus of these VRM objectives (III and IV) is to provide for activities and uses that would change the landscape, this does not mean every acre would be developed or changed. Thus, in those non-WSA lands with wilderness characteristics with these VRM objectives, the natural characteristics could be lost. And, if the natural characteristics of these areas are lost, the opportunities for solitude and primitive recreation would be lost, as the setting needed to support these opportunities would be altered.

4.3.8.15.3. ALTERNATIVE B

4.3.8.15.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternative B, 219,267 acres would be managed by VRM Class I and II objectives in all of six and parts of 17 non-WSA lands with wilderness characteristics, protecting the natural characteristics of those lands in the non-WSAs lands with wilderness characteristics, as described above. Conversely, 363,093 acres would be managed by Class III and IV objectives. The impact of these visual objectives (III and IV) on natural characteristics, solitude, and primitive recreation would be the same as described for Alternative A.

4.3.8.15.4. ALTERNATIVE C

4.3.8.15.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternative C, 125,370 acres would be managed by VRM Class I and II objectives in all of two and parts of 18 non-WSA lands with wilderness characteristics, protecting the natural character of those lands in the non-WSAs. Also, under this alternative, 456,990 acres would be managed by VRM Class III and IV objectives. The impact of these visual objectives (III and IV) on natural characteristics, solitude, and primitive recreation would be the same as described for Alternative A.

4.3.8.15.5. ALTERNATIVE D

4.3.8.15.5.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under Alternative C, 6,350 acres would be managed by VRM Class I and II objectives in parts of four non-WSA lands with wilderness characteristics, protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics. Conversely, 576,010 acres would be managed by VRM Class III and IV objectives. The impact of these visual objectives (III and IV) on natural characteristics, solitude, and primitive recreation would be the same as described for Alternative A.

4.3.8.15.6. ALTERNATIVE E**4.3.8.15.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under Alternative D, 582,360 acres would be managed by VRM Class I objectives in all of the 29 non-WSA lands with wilderness characteristics, protecting the natural characteristics of those lands, and the settings required to support opportunities for solitude and primitive forms of recreation.

4.3.8.15.7. PROPOSED PLAN**4.3.8.15.7.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under the Proposed Plan, 88,871 acres would be managed by VRM Class II objectives in parts of five non-WSA lands with wilderness characteristics, protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics.

4.3.8.15.7.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the Proposed Plan, 106,334 acres would be managed by VRM Class I and II objectives in all of two and parts of 18 non-WSA lands with wilderness characteristics, protecting the natural characteristics of those lands in the non-WSA lands with wilderness characteristics. Also, under this alternative, 387,155 acres would be managed by VRM Class III and IV objectives. The impact of these visual objectives (III and IV) on natural characteristics, solitude, and primitive recreation would be the same as described for Alternative A.

In summary, the VRM class objectives proposed in Alternative E would provide protection of the natural characteristics of all the non-WSA lands with wilderness characteristics by applying a VRM Class I management objective to those lands. VRM objectives in Alternative A, which is the No Action Alternative, would provide protection to the natural characteristics of the 262,340 acres in all or parts of 25 non-WSA lands with wilderness characteristics by applying both VRM Class I and II management objectives to those lands. Alternative B would protect 219,267 acres in all or parts of 23 non-WSA lands with wilderness characteristics, also by applying both VRM Class I and II management objectives to those lands. Alternative C would protect 125,330 acres in all or parts of 20 non-WSA lands with wilderness characteristics with VRM Class I and II objectives. Alternative D would protect 6,350 acres in portions of four non-WSA lands with wilderness characteristics with VRM Class I and II management objectives. And, the Proposed Plan would protect 195,205 acres in all or parts of 20 non-WSA lands with wilderness characteristics with VRM Class I and II objectives.

4.3.8.16. IMPACTS OF WILDLIFE AND FISHERIES DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

Under the Proposed Plan and all alternatives, a variety of decisions would be implemented to restore, maintain, and enhance wildlife habitat and populations. Improved wildlife populations would enhance the natural characteristics of the land in all of the non-WSA lands with wilderness characteristics. Further, larger and healthier wildlife populations would expand

opportunities for primitive and unconfined recreation opportunities, including wildlife viewing, hunting, photography, and natural history study.

Within pronghorn fawning areas, which includes a small part of the eastern portion of the Harts Point non-WSA lands with wilderness characteristics (under the Proposed Plan and Alternatives B, C, and E), special condition decisions to close the habitat from May 1–June 15 to numerous surface-disturbing activities would enhance opportunities for solitude and primitive recreation on a seasonal basis. If construction of water sources to support antelope populations would be needed, this would result in more animals and the benefits described above. Construction of human-made features on the land, however, would degrade the natural, undeveloped characteristics of the non-WSA lands with wilderness characteristics. Under Alternative E, Harts Point non-WSA lands with wilderness characteristics would be managed with emphasis on protection of wilderness characteristics, and new water developments or facilities would either be precluded or constructed with mitigation to protect their wilderness characteristics.

In bighorn sheep habitat, a decision to prioritize habitat improvement projects on the "five mesa tops" would affect Upper Red Canyon, Red Rock Plateau, Gravel and Long Canyon, Cheesebox Canyon, White Canyon, and Mancos Mesa non-WSA lands with wilderness characteristics. Habitat improvement projects would include installation of guzzlers, development of springs, and vegetation manipulations. Because the five mesas are small, isolated mesa tops within a larger habitat, the animals move in and out of non-WSA lands with wilderness characteristics. Construction of water sources to support wildlife populations would result in more wildlife and the benefits to opportunities for primitive recreation as described above. Construction of human-made features on the land, however, would degrade the natural, undeveloped characteristics of the non-WSA lands with wilderness characteristics.

Under the Proposed Plan, portions of Mancos Mesa and Nokai Dome non-WSA lands with wilderness characteristics would be managed to protect wilderness characteristics. Under Alternative E, all non-WSA lands with wilderness characteristics would be managed with emphasis on protection of their wilderness characteristics. In areas managed to protect wilderness characteristics under the Proposed Plan and Alternative E, new water developments or facilities would either be precluded or constructed with mitigation within the non-WSA lands with wilderness characteristics to protect their wilderness characteristics. Each of the alternatives defines a different amount of habitat for bighorn sheep lambing and rutting areas. Non-WSA lands with wilderness characteristics that lie within portions of this habitat by alternative are as follows:

- Alternatives A (329,750 acres): Fort Knocker Canyon, White Canyon, Gravel and Long Canyon, Cheesebox Canyon, Mancos Mesa, and Upper Red Canyon
- Proposed Plan and Alternatives B and E (453,388 acres): Fort Knocker Canyon, White Canyon, Gravel and Long Canyon, Cheesebox Canyon, Mancos Mesa, Nokai Dome, Upper Red Canyon, Gooseneck, Hatch/Lockhart/Harts, Indian Creek, and Harts Point
- Alternative C (415,395/453,390 acres): Fort Knocker Canyon, White Canyon, Gravel and Long Canyon, Cheesebox Canyon, Mancos Mesa, Nokai Dome, Upper Red Canyon, Gooseneck, Hatch/Lockhart/Harts, Indian Creek, Harts Point, Dark Canyon, Red Rock Plateau, and Sheep Canyon

- Alternative D (299,009 acres): Fort Knocker Canyon, White Canyon, Gravel and Long Canyon, Cheesebox Canyon, Mancos Mesa, Upper Red Canyon, Gooseneck, Hatch/Lockhart/Harts, Indian Creek, and Harts Point

Special condition decisions to close lambing and rutting areas to numerous surface-disturbing activities from April 1–June 15 and October 15–December 15 (Proposed Plan and Alternatives C and D), and April 1–July 15 and October 15–December 31 (Alternatives A, B, and E) would enhance opportunities for solitude and primitive recreation on a seasonal basis.

Numerous non-WSA lands with wilderness characteristics overlie crucial deer winter ranges, and vegetation treatments are proposed within the crucial habitat to improve winter range. Depending on the type of treatment conducted different impacts to wilderness characteristics would ensue. Vegetation treatments would be completed with fire, chemicals, biologically, or mechanically to achieve the desired vegetation condition. In the long-term, vegetation treatments with fire would restore vegetation communities and display a more natural composition of grasses, forbs, shrubs, and trees. If these treatments occurred in non-WSA lands with wilderness characteristics, this objective would enhance the natural characteristics of the non-WSA lands with wilderness characteristics in the long-term. Maintenance of vegetation treatment areas with fire would maintain or enhance wildlife habitat and populations of species dependent on that habitat (deer and elk). If these treatments occurred in non-WSA lands with wilderness characteristics, healthy wildlife populations would enhance opportunities for primitive recreation, wildlife viewing, and hunting. In the short-term, however, burning operations would result in disturbance of the landform and vegetation through fire-line construction needed to manage the fire. Further, the presence and noise of people, vehicles, equipment, and aircraft would eliminate opportunities for solitude and primitive and unconfined recreation in proximity to the fire. The impacts on opportunities for solitude and primitive recreation would be temporary, lasting for the duration of the burning operation and reclamation. When the fire and reclamation operations are complete, these opportunities would return. Soil and vegetation disturbance for fire-line construction would diminish the natural characteristic of the non-WSA lands with wilderness characteristics, but reclamation would restore the natural conditions in a relatively short period of time. Biological and chemical treatment methods would have similar impacts as prescribed fire.

Mechanical vegetation manipulation in non-WSA lands with wilderness characteristics would have long-term impacts on the natural characteristics and opportunities for solitude and primitive and unconfined recreation. While restoration of vegetation communities would be beneficial to the natural characteristics of non-WSA lands with wilderness characteristics, the use of chain saws, bull dozers, and brush hogs to accomplish the objective would leave an obvious imprint of human activity on the land, diminishing the natural characteristics. Also, in the short-term, the presence and noise of people and equipment would eliminate opportunities for solitude and primitive forms of recreation in proximity to the treatment area. In the long-term, a setting clearly manipulated by humans would reduce the opportunities for both solitude and primitive recreation.

Under the Proposed Plan, portions of Dark Canyon and Grand Gulch non-WSA lands with wilderness characteristics would be managed to protect wilderness characteristics. Under Alternative E, all non-WSA lands with wilderness characteristics would be managed with emphasis on protection of their wilderness characteristics. In areas managed to protect wilderness characteristics under the Proposed Plan and Alternative E, vegetation treatments with

non-mechanical methods would be more compatible with protection of the natural characteristics of the landscape and providing opportunities for solitude and primitive recreation activities (see analysis above). Non-WSA lands with wilderness characteristics that lie within crucial deer winter habitat, by alternative, are as follows:

- Alternatives A and D: Harts Point, Dark Canyon, Butler Wash, Harmony Flat and Grand Gulch
- Alternatives B and E: Harts Point, Bridger Jack Mesa, Shay Mountain, Dark Canyon, Butler Wash, White Canyon, Sheep Canyon, Long Canyon, Gravel and Long Canyon, Cheesebox Canyon, Harmony Flat, Grand Gulch, Fish and Owl Canyon, Comb Ridge, Arch Canyon, Hammond Canyon
- Alternative C: Harts Point, Bridger Jack Mesa, Shay Mountain, Dark Canyon, Butler Wash, White Canyon, Cheesebox Canyon, Harmony Flat, Grand Gulch, Fish and Owl Canyon, and Comb Ridge
- Proposed Plan: Harts Point, Bridger Jack Mesa, Shay Mountain, Dark Canyon, Butler Wash, White Canyon, Cheesebox Canyon, Harmony Flat, Grand Gulch, Fish and Owl Canyon, Comb Ridge, Hammond Canyon, and Road Canyon

Special condition decisions that would close crucial deer winter range to numerous surface-disturbing activities from December 15–April 30 (Alternative A), November 1–May 15 (Alternative B and E), November 15–April 15 (Proposed Plan and Alternative C), and December 1–April 15 (Alternative D) would enhance opportunities for solitude and primitive recreation on a seasonal basis.

Numerous non-WSA lands with wilderness characteristics also lie within crucial elk habitat. Vegetation treatments would be proposed within these areas to improve winter range for deer and elk. Depending on the type of treatment conducted, different impacts to wilderness characteristics could ensue (see analysis under crucial deer winter range above).

Under the Proposed Plan, portions of Dark Canyon and Grand Gulch non-WSA lands with wilderness characteristics would be managed to protect wilderness characteristics. Under Alternative E, all non-WSA lands with wilderness characteristics would be managed with emphasis on protection of their wilderness characteristics. In areas managed to protect wilderness characteristics under the Proposed Plan and Alternative E, vegetation treatments with non-mechanical methods would be more compatible with protection of the natural characteristics of the landscape and providing opportunities for solitude and primitive recreation activities (see analysis above). Non-WSA lands with wilderness characteristics that lie within crucial elk habitat, by alternative are as follows:

- Alternatives A: None defined
- Alternatives B and E: Bridger Jack Mesa, Shay Mountain, Dark Canyon, Butler Wash, White Canyon, Gravel and Long Canyon, Cheesebox Canyon, Grand Gulch, Fish and Owl Canyon, Arch Canyon, and Hammond Canyon
- Alternative C and D: Bridger Jack Mesa, Shay Mountain, Dark Canyon, White Canyon, and Hammond Canyon
- Proposed Plan: Bridger Jack Mesa, Cheesebox Canyon, Dark Canyon, White Canyon, and Hammond Canyon

4.3.8.17. IMPACTS OF WOODLAND AND FOREST DECISIONS ON NON- WSA LANDS WITH WILDERNESS CHARACTERISTICS

Under the Proposed Plan and all alternatives permits for woodland products would continue to be sold to the public, consistent with the availability of woodland products and the protection of sensitive resource values. The Proposed Plan and each alternative prescribes areas where woodland product harvest is allowed or prohibited. Table 4.99 provides the acres of areas open or closed to woodland harvest by the Proposed Plan and alternative for non-WSA lands with wilderness characteristics.

Table 4.99. Wood-cutting Allocations in non-WSA Lands with Wilderness Characteristics

Wood-cutting Allocations in Non-WSA Lands with Wilderness Characteristics			Alternative (acres)					Proposed Plan
Name	Acres	Restriction	A	B	C	D	E

4.3.8.17.1. ALTERNATIVE A**4.3.8.17.1.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Commercial and personal wood cutting would be prohibited on 361,616 acres on all or portions of 24 non-WSA lands with wilderness characteristics. Ten non-WSAs lands with wilderness characteristics would be closed in their entirety to wood-cutting activities (Butler Wash, Comb Ridge, Gooseneck, Hatch/Hart/Lockhart, Indian Creek, Lime Creek, Mancos Mesa, Nokai Dome, San Juan River, and Valley of the Gods), thereby protecting the natural characteristics of the landscape from surface-disturbing activities associated with wood cutting. Those portions of the non-WSA lands with wilderness characteristics in the other 14 areas that are closed to wood-cutting activities would be provided the same protections. However, in the 220,744 acres that

remain open for wood cutting (and where the resource exists), natural characteristics would be compromised by surface-disturbing activities such as driving cross-country to the trees, cutting the trunks of trees, and leaving stumps and debris. Wood cutting would also diminish opportunities for solitude and primitive recreation due to the noise of vehicles and chain saws and surface disturbances associated with human activity.

4.3.8.17.2. ALTERNATIVE B

4.3.8.17.2.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Commercial and personal wood cutting would be prohibited on 387,090 acres on all or portions of 24 non-WSA lands with wilderness characteristics. Thirteen non-WSAs would be completely restricted from wood cutting activities (Butler Wash, Comb Ridge, Fish and Owl Creek, Gooseneck, Grand Gulch, Hatch/Hart/Lockhart, Indian Creek, Lime Creek, Mancos Mesa, Nokai Dome, Road Canyon, San Juan River, and Valley of the Gods), thereby protecting the natural characteristics of the landscape from surface-disturbing activities associated with wood cutting. Those portions of the non-WSA lands with wilderness characteristics in the other 11 areas that are closed to wood cutting activities would be provided the same protections. However, in the 195,270 acres that remain open for wood cutting (and where the resource exists), natural characteristics may be compromised by surface-disturbing activities such as driving cross-country to the trees, cutting the trunks of trees, and leaving stumps and debris. Wood cutting would also diminish opportunities for solitude and primitive recreation due to noise of vehicles and chain saws and surface disturbances associated with human activity.

4.3.8.17.3. ALTERNATIVE C

4.3.8.17.3.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under this alternative, commercial or personal wood cutting would be prohibited on 350,380 acres on all or portions of 24 non-WSA lands with wilderness characteristics. Similar to Alternative A, 10 non-WSAs would be completely restricted from wood-cutting activities (Butler Wash, Comb Ridge, Gooseneck, Hatch/Hart/Lockhart, Indian Creek, Lime Creek, Mancos Mesa, Nokai Dome, San Juan River, and Valley of the Gods), thereby protecting the natural character of the landscape from surface-disturbing activities associated with wood cutting. Those portions of the non-WSA lands with wilderness characteristics in the other 14 areas that are restricted from wood-cutting activities would be provided the same protections. However, in the 231,980 acres that remain open for wood cutting (and where the resource exists), natural characteristics would be compromised by surface-disturbing activities such as driving cross-country to the trees, cutting the trunks of trees and leaving stumps and debris, and by affecting the solitude and primitive recreation opportunities with mechanical chain saws and surface disturbances associated with human activity.

4.3.8.17.4. ALTERNATIVE D**4.3.8.17.4.1. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses**

Under Alternative D, commercial or personal wood cutting would be prohibited on 363,706 acres on all or portions of 24 non-WSA lands with wilderness characteristics. Similar to Alternative A, 10 non-WSA lands with wilderness characteristics would be entirely closed to wood cutting activities (Butler Wash, Comb Ridge, Gooseneck, Hatch/Hart/Lockhart, Indian Creek, Lime Creek, Mancos Mesa, Nokai Dome, San Juan River, and Valley of the Gods), thereby protecting the natural characteristics of the landscape from surface-disturbing activities associated with wood cutting. Those portions of the non-WSA lands with wilderness characteristics in the other 14 areas that are closed to wood cutting would be provided the same protections. However, in the 218,654 acres that remain open for wood cutting (and where the resource exists), natural characteristics would be compromised by surface-disturbing activities such as driving cross-country to the trees, cutting the trunks of trees, and leaving stumps and debris. Wood cutting would also diminish opportunities for solitude and primitive recreation due to noise of vehicles and chain saws and surface disturbances associated with human activity.

4.3.8.17.5. ALTERNATIVE E**4.3.8.17.5.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

All 582,360 acres of non-WSA lands with wilderness characteristics in the 29 areas within the Monticello FO would be closed to wood cutting under this alternative. Wilderness characteristics, therefore, would be protected from the surface and vegetation disturbance and noise and presence of people, vehicles, and equipment associated with wood cutting. Closing the non-WSA lands with wilderness characteristics to wood cutting would maintain the natural characteristics of the landscape and opportunities for solitude and primitive recreation.

4.3.8.17.6. PROPOSED PLAN**4.3.8.17.6.1. Non-WSA Lands with Wilderness Characteristics Managed to Protect Wilderness Characteristics**

Under the Proposed Plan, commercial or personal wood cutting would be prohibited on 88,871 acres in non-WSA lands with wilderness characteristics being managed to protect their wilderness characteristics. Similar to Alternative A, the five non-WSA lands with wilderness characteristics being managed to protect their wilderness characteristics would be closed to wood cutting activities (Dark Canyon – 11,540 acres, Mancos Mesa – 30,068 acres, Nokai Dome East – 18,618 acres, Nokai Dome West – 14,988 acres, and Grand Gulch – 13,657 acres), thereby preserving the natural characteristics of the landscape from surface-disturbing activities typically associated with wood cutting, such as driving cross-country to the trees, cutting the trunks of trees, and leaving stumps and debris. Closure to wood cutting would also maintain opportunities for solitude and primitive recreation by preventing the presence and noise of vehicles and chain saws normally used for wood cutting.

4.3.8.17.6.2. Non-WSA Lands with Wilderness Characteristics Managed for Other Resource Values and Uses

Under the Proposed Plan, commercial or personal wood cutting would be prohibited on 274,835 acres on all or portions of 24 non-WSA lands with wilderness characteristics. Similar to Alternative A, 10 non-WSA lands with wilderness characteristics would be entirely closed to wood cutting activities (Butler Wash, Comb Ridge, Gooseneck, Hatch/Hart/Lockhart, Indian Creek, Lime Creek, Mancos Mesa, Nokai Dome, San Juan River, and Valley of the Gods), thereby protecting the natural characteristics of the landscape from surface-disturbing activities associated with wood cutting. Those portions of the non-WSA lands with wilderness characteristics in the other 14 areas that are closed to wood cutting would be provided the same protections. However, in the 218,654 acres of non-WSA lands with wilderness characteristics that remain open for wood cutting, the natural characteristics would be compromised by surface-disturbing activities such as driving cross-country to the trees, cutting the trunks of trees, and leaving stumps and debris. Wood cutting would also diminish opportunities for solitude and primitive recreation due to noise of vehicles and chain saws and surface disturbances associated with human activity.

4.3.8.18. SUMMARY OF IMPACTS

See Table 2.2 for a summary of impacts to non-WSA lands with wilderness characteristics. There are 582,360 acres of non-WSA lands with wilderness characteristics in the Monticello FO.

4.3.8.18.1. ALTERNATIVE A—NO ACTION

Under Alternative A, the No Action Alternative, no actions would be prescribed to specifically protect the wilderness characteristics of the non-WSA lands with wilderness characteristics. However, 262,340 acres in all or parts of the 25 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives. These management objectives provide for preservation and retention of the landscape and would limit surface disturbances, and protect the natural characteristics of these lands. In addition, designation and management of seven ACECs and recommendations for designation of two wild and scenic rivers would prescribe measures that would protect all or portions of 22 of the non-WSA lands with wilderness characteristics. Further, 53,370 acres of non-WSA lands would be closed to OHV use, protecting the natural characteristics of the landscape and the opportunities for solitude and primitive forms of recreation.

Other actions prescribed under No Action, however, would provide for other resources values and uses that would degrade the wilderness characteristics of parts of these areas. About 470,590 acres of non-WSA lands with wilderness characteristics would be open to oil and gas leasing, subject to standard and timing and controlled surface use stipulations. Even with this amount of land available for leasing and development, only 37 wells and 355 acres of disturbance are anticipated over the next 15 years. Cross country OHV use would be permitted on 140,600 acres resulting in additional surface disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Motorized travel would be limited to 410 miles of designated routes on another 388,390 acres of non-WSA lands with wilderness characteristics. While limiting OHV use to designated routes would prevent further surface disturbance and loss of natural characteristics, the presence and noise of vehicles would diminish opportunities for solitude and conflict with primitive recreation activities. Fire wood cutting would be permitted

on 220,774 acres, resulting in surface and vegetation disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Again, the noise and presence of people, vehicles, and equipment would reduce opportunities for solitude and primitive forms of recreation.

4.3.8.18.2. ALTERNATIVE B

Under Alternative B, no actions would be prescribed to specifically protect the wilderness characteristics of the non-WSA lands with wilderness characteristics. However, 219,267 acres in all or parts of the 23 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives. These management objectives provide for preservation and retention of the landscape and would limit surface disturbances, and protect the natural characteristics of these lands. In addition, designation and management of 10 ACECs and recommendations for designation of three wild and scenic rivers would prescribe measures that would protect all or portions of 15 of the non-WSA lands with wilderness characteristics. Further, 35,070 acres of non-WSA lands would be closed to OHV use, protecting the natural characteristics of the landscape and the opportunities for solitude and primitive forms of recreation.

Other actions prescribed under Alternative B, however, would provide for other resources values and uses that would degrade the wilderness characteristics of parts of these areas. About 485,010 acres of non-WSA lands with wilderness characteristics would be open to oil and gas leasing, subject to standard and timing and controlled surface use stipulations. Even with this amount of land available for leasing and development, only 38 wells and 365 acres of disturbance are anticipated over the next 15 years. Motorized travel would be limited to 258 miles of designated routes on another 547,290 acres of non-WSA lands with wilderness characteristics. While limiting OHV use to designated routes would prevent further surface disturbance and loss of natural characteristics, the presence and noise of vehicles would diminish opportunities for solitude and conflict with primitive recreation activities. Fire wood cutting would be permitted on 195,270 acres, resulting in surface and vegetation disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Again, the noise and presence of people, vehicles, and equipment would reduce opportunities for solitude and primitive forms of recreation.

4.3.8.18.3. ALTERNATIVE C

Under Alternative C, no actions would be prescribed to specifically protect the wilderness characteristics of the non-WSA lands with wilderness characteristics. However, 125,370 acres in all or parts of the 20 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives. These management objectives provide for preservation and retention of the landscape and would limit surface disturbances, and protect the natural characteristics of these lands. In addition, designation and management of five ACECs and recommendations for designation of one wild and scenic river would prescribe measures that would protect all or portions of eight of the non-WSA lands with wilderness characteristics. Further, 29,400 acres of non-WSA lands would be closed to OHV use, protecting the natural characteristics of the landscape and the opportunities for solitude and primitive forms of recreation.

Other actions prescribed under Alternative C, however, would provide for other resources values and uses that would degrade the wilderness characteristics of parts of these areas. About 548,350 acres of non-WSA lands with wilderness characteristics would be open to oil and gas leasing, subject to standard and timing and controlled surface use stipulations. Even with this amount of land available for leasing and development, only 39 wells and 374 acres of disturbance are anticipated over the next 15 years. Motorized travel would be limited to 348 miles of designated routes on another 552,960 acres of non-WSA lands with wilderness characteristics. While limiting OHV use to designated routes would prevent further surface disturbance and loss of natural characteristics, the presence and noise of vehicles would diminish opportunities for solitude and conflict with primitive recreation activities. Fire wood cutting would be permitted on 231,980 acres, resulting in surface and vegetation disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Again, the noise and presence of people, vehicles, and equipment would reduce opportunities for solitude and primitive forms of recreation.

4.3.8.18.4. ALTERNATIVE D

Under Alternative D, no actions would be prescribed to specifically protect the wilderness characteristics of the non-WSA lands with wilderness characteristics. However, 6,350 acres in parts of the five non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives. These management objectives provide for preservation and retention of the landscape and would limit surface disturbances, and protect the natural characteristics of these lands. No ACECs would be designated and no wild and scenic rivers would be recommended, providing no additional protection to the wilderness characteristics of non-WSA lands with wilderness characteristics.

Other actions prescribed under Alternative D, however, would provide for other resources values and uses that would degrade the wilderness characteristics of parts of these areas. About 582,360 acres of non-WSA lands with wilderness characteristics would be open to oil and gas leasing, subject to standard and timing and controlled surface use stipulations. Even with this amount of land available for leasing and development, only 37 wells and 355 acres of disturbance are anticipated over the next 15 years. Motorized travel would be limited to 410 miles of designated routes on another 582,340 acres of non-WSA lands with wilderness characteristics. While limiting OHV use to designated routes would prevent further surface disturbance and loss of natural characteristics, the presence and noise of vehicles would diminish opportunities for solitude and conflict with primitive recreation activities. Fire wood cutting would be permitted on 218,654 acres, resulting in surface and vegetation disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Again, the noise and presence of people, vehicles, and equipment would reduce opportunities for solitude and primitive forms of recreation.

4.3.8.18.5. ALTERNATIVE E

Under Alternative E, all 582,360 acres in 29 non-WSA lands with wilderness characteristics would be managed to protect their wilderness characteristics. To protect these values, the non-WSA lands with wilderness characteristics would be closed to mineral leasing (though some leases currently exist), closed to OHV use, closed to mineral material disposal, closed to wood cutting, managed under VRM Class I objectives, and recommended for withdrawal from mineral

entry. There are currently 4,400 acres in parts of 10 non-WSA lands with wilderness characteristics under lease. These leases could be explored and developed, subject the terms and conditions of the leases, even if they degrade wilderness characteristics.

4.3.8.18.6. PROPOSED PLAN

Under the Proposed Plan five areas totaling 88,871 acres would be managed with emphasis on protection of their wilderness characteristics. To protect their wilderness values, the non-WSA lands with wilderness characteristics would be closed or NSO to oil and gas leasing, OHV use would be limited to designated routes, closed to fire wood cutting, closed to mineral material disposal, managed as VRM Class II, and exclusion and avoidance areas for future placement of ROWs.

Of the 29 non-WSA lands with wilderness characteristics, 195,205 acres in all or parts of the 23 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives. These management objectives provide for preservation and retention of the landscape and would limit surface disturbances, and protect the natural characteristics of these lands. In addition, designation and management of five ACECs and recommendations for designation of one wild and scenic river would prescribe measures that would protect all or portions of eight of the non-WSA lands with wilderness characteristics. Further, 4,598 acres of non-WSA lands would be closed to OHV use, protecting the natural characteristics of the landscape and the opportunities for solitude and primitive forms of recreation.

Other actions prescribed under the Proposed Plan, however, would provide for other resources values and uses that would degrade the wilderness characteristics of parts of these areas. About 460,093 acres of non-WSA lands with wilderness characteristics would be open to oil and gas leasing, subject to standard and timing and controlled surface use stipulations. Even with this amount of land available for leasing and development, only 39 wells and 374 acres of disturbance are anticipated over the next 15 years. Motorized travel would be limited to 348 miles of designated routes on another 577,762 acres of non-WSA lands with wilderness characteristics. While limiting OHV use to designated routes would prevent further surface disturbance and loss of natural characteristics, the presence and noise of vehicles would diminish opportunities for solitude and conflict with primitive recreation activities. Fire wood cutting would be permitted on 218,654 acres, resulting in surface and vegetation disturbance that would degrade the natural characteristics of the non-WSA lands with wilderness characteristics. Again, the noise and presence of people, vehicles, and equipment would reduce opportunities for solitude and primitive forms of recreation.

4.3.8.19. MITIGATION MEASURES

There are a number of actions proposed under the Proposed Plan and all alternatives that would limit surface disturbance, focus on primitive forms of recreation, and maintain or restore upland and riparian vegetation condition, all of which would maintain and enhance the wilderness characteristics of portions of non-WSA lands with wilderness characteristics. Under the Proposed Plan and alternatives, withdrawals from entry under the mining laws would prevent surface disturbance in parts of some of the non-WSA lands, protecting the natural characteristics of these areas.

Under the Proposed Plan and all alternatives, actions to prohibit surface disturbance within floodplains and within 100 m of riparian zones would protect the natural condition of riparian portions of non-WSA lands with wilderness characteristics. Protection of the natural condition of these areas would also enhance the setting needed to provide opportunities for both solitude and primitive forms of recreation. Further, managing riparian zones to achieve proper functioning condition would maintain and restore vegetation condition and water quality that would enhance the natural condition of riparian portions of the non-WSA lands with wilderness characteristics and settings that support primitive forms of recreation like floating, hiking, and wildlife viewing.

Under the Proposed Plan and alternatives, prescribed burning to restore fire-dependent and adapted vegetation communities would maintain and enhance the natural characteristics of non-WSA lands with wilderness characteristics, enhance wildlife habitat for hunting, photography, and wildlife viewing, and enhance the visual appeal by introducing variety to the landscape. Under the Proposed Plan, all or parts of 20 non-WSA lands with wilderness characteristics would be managed to VRM Class I or Class II standards. Managing areas by these VRM objectives would limit surface disturbance and maintain the natural characteristics of portions of the non-WSA lands with wilderness characteristics. Under Alternative E, all of the non-WSA lands with wilderness characteristics would be managed to VRM Class I standards, providing even more protection of the natural characteristics of these areas, than Class II objectives.

Under the Proposed Plan and alternatives, recreation management objectives for portions of proposed special recreation management areas would provide activities, settings, and experiences for primitive forms of recreation. These objectives would provide protection of the natural characteristics and opportunities for solitude and primitive forms of recreation in portions of some of the non-WSA lands with wilderness characteristics.

Management of ACECs and recommendations for wild and scenic river designation under the Proposed Plan and all alternatives would maintain and enhance wilderness characteristics in portions of the non-WSA lands with wilderness characteristics.

And, restrictions on surface disturbance on steep slopes (21%–40%), and the requirement for erosion control plans would reduce disturbances that would degrade the natural characteristics of some of the non-WSA lands with wilderness characteristics.

4.3.8.20. UNAVOIDABLE ADVERSE IMPACTS

Under the Proposed Plan and all alternatives except Alternative E, non-WSA lands with wilderness characteristics would not be recommended for withdrawal from mineral entry. Although substantial development for locatable minerals is not anticipated, mining claimants would have the right to develop mining claims. It is possible that some unavoidable adverse impacts from mining operations could occur that would impact natural characteristics and opportunities for solitude and primitive recreation.

Under Alternative E, all 582,360 acres of non-WSA lands with wilderness characteristics would be closed to oil and gas leasing. There are, however, currently 4,400 acres of lands in 10 of the non-WSA lands with wilderness characteristics currently under lease. Because the leases have been issued, they may be explored and developed according to the terms and condition of each lease. The exercise of rights under a valid lease could result in surface disturbance (i.e., access road and well pad) that would degrade the natural characteristics of the non-WSA lands with

wilderness characteristics and the opportunities for solitude and primitive recreation they provide.

Under the Proposed Plan and all of the alternatives except Alternative E, vehicles would be permitted to drive on designated road and trails in some of the non-WSA lands with wilderness characteristics. While this action would limit further surface disturbance and loss of natural characteristics, the noise and presence of vehicles would reduce opportunities to find solitude and conflict with primitive forms of recreation. While this effect may not be permanent, it would diminish visitors' experiences in varying degrees.

Under the Proposed Plan and all alternatives except Alternative E, some minor livestock, wildlife, and recreation facilities would be permitted. While construction of these facilities may not eliminate the wilderness characteristics of entire non-WSA lands with wilderness characteristics, the surface disturbance and long-term presence of a human-made structure would reduce the natural characteristics to some degree.

4.3.8.21. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Under the Proposed Plan and all alternatives, construction of oil and gas exploration access roads and well pads or mining roads and sites would produce surface disturbance that results in a long-term loss of natural characteristics and opportunities for solitude and primitive recreation in portions of the non-WSA lands with wilderness characteristics. Similarly, under the Proposed Plan and alternatives, OHV driving and woodcutting would cause long-term losses of natural characteristics and opportunities for solitude and primitive recreation.

Under the Proposed Plan and all alternatives, the use of prescribed fire to restore fire-dependent and adapted ecosystems would, in the long term, enhance vegetation condition and the natural characteristics of non-WSA lands with wilderness characteristics. A more natural landscape would improve opportunities for both solitude and primitive forms of recreation. Further, construction of riparian exclosure fences needed for restoration of riparian areas would degrade the natural characteristics of non-WSA lands with wilderness characteristics in the short term but would enhance the riparian vegetation community in the long term, providing for a more natural landscape and settings for primitive recreational activities. Upon restoration, the exclosure fences could be removed.

Protection of ACEC or recommended wild and scenic river values under the Proposed Plan and alternatives would maintain and enhance wilderness characteristics in portions of non-WSA lands with wilderness characteristics in the long term.

4.3.8.22. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

A number of land uses are proposed under the Proposed Plan and all alternatives that would result in surface disturbances that would irretrievably impact the wilderness characteristics of portions of the non-WSA land with wilderness characteristics. Under the Proposed Plan and alternatives development of oil and gas wells, above-ground pipeline and power line corridors and communication sites, forest and woodland treatments by mechanical means (bull dozers, brush hogs, and chainsaws), construction of livestock and wildlife waters and fences, construction of roads and trails, allocation of open areas and designated routes for motorized vehicle use, and allocation of areas for the harvesting of forest and woodland products (e.g., fire wood) would all result in irretrievable degradation of the natural characteristics of non-WSA

lands with wilderness characteristics. Further, implementation of these structures, land treatments, and uses would change the natural, undeveloped setting to a more developed landscape that is not conducive to primitive recreation activities and experiences of solitude. Land and vegetation disturbance, the presence of human-made structures on the land, and the noise and presence of people, equipment, and vehicles would not support an experience of solitude and would conflict with primitive recreational activities. No irreversible impacts are anticipated.

4.3.9. PALEONTOLOGICAL RESOURCES

The BLM Utah State paleontologist has classified all of the geologic units within the Monticello PA according to the Potential Fossil Yield Classification system (PFYC). The BLM is currently using this study in lieu of the current paleontological resource management classification system in the process of considering the use of the PFYC as policy. The PFYC system is described in Chapter 3 (Section 3.10, Paleontology), and the results of the PFYC classification for the Monticello PA form the basis for the analysis of impacts to paleontological resources.

For this analysis, the 46 mapped geologic units that occur within the Monticello PA were classified according to the PFYC, and the results are shown in Table 4.100. Three units are Class 1, eight are Class 2, nineteen are Class 3, fourteen are Class 4/5, and two are Class 5. Surficial exposures of Class 1 units comprise approximately 19 acres, Class 2 units encompass approximately 458,885 acres, Class 3 units are within approximately 901,335 acres, Class 4/5 are in approximately 277,556 acres, and Class 5 lie within approximately 146,960 acres.

Table 4.100. Mapped Geologic Units within the BLM Monticello PA and their PFYC Classes, in Approximate Descending Stratigraphic Order

Age	Mapped Geologic Unit(s)	PFYC Class
Quaternary (Holocene)	Landslide deposits, alluvium, sand and gravel deposits, colluvium, talus deposits, slopewash, pediment deposits, eolian deposits, dune sand, terrace gravels, surficial material	2
Quaternary (Pleistocene)	Landslide deposits, alluvium, sand and gravel deposits, colluvium, talus deposits, slopewash, pediment deposits, eolian deposits, dune sand, terrace gravels, surficial material	2
Tertiary	Abajo Mountain Intrusives	1
	Minette Intrusives	1
	Explosion Breccia	1
Cretaceous	Mancos Shale	3
	Cedar Mountain Formation	5
	Dakota Sandstone	3
	Burro Canyon Formation	4/5
	Dakota and Burro Canyon formations	4/5
Jurassic	Morrison Formation – Brushy Basin Member	5
	Morrison Formation – Westwater Canyon Member	4/5
	Morrison Formation – Salt Wash Member	4/5
	Morrison Formation – Recapture Member	4/5
	Bluff Sandstone	2
	Summerville Formation	3
	Summerville and Curtis Formations	3
	Entrada Sandstone	2
	Summerville Formation and Entrada Sandstone	3

Geologic mapping by: Hackman and Wyant, 1973 (Escalante 1° × 2° Quadrangle, scale 1:250,000); Haynes et al., 1972 (Cortez 1° × 2° Quadrangle, scale 1:250,000); Williams, 1964 (Moab 1° × 2° Quadrangle, scale 1:250,000); and Williams and Hackman, 1971 (Salina 1° × 2° Quadrangle, scale 1:250,000).

As discussed in Chapter 3, Section 3.10.4, Class 1 geologic units have no sensitivity (i.e., are not likely to contain recognizable fossil remains), thus none or negligible impacts to paleontological resources would be expected. Geologic units designated as Class 2 have a low sensitivity (not likely to contain scientifically valuable fossils), with likely negligible to minor impacts to

paleontological resources. Class 3 geologic units have moderate sensitivity (the fossil content varies in scientific significance, in abundance, and in predictable occurrence), and the risks of adverse impacts to paleontological resources within this unit would be moderate. Class 4/5 and Class 5 geologic units have been designated high-sensitivity units (highly fossiliferous geologic units that regularly and predictably produce vertebrate fossils and/or scientifically significant nonvertebrate fossils, and that are at risk of natural degradation and/or human-caused adverse impacts), and thus would have a high risk of being adversely impacted. Since the risks to paleontological resources in Class 1 and Class 2 units range from none to minor, only potential impacts to Class 3, Class 4/5, and Class 5 units are discussed in the following subsections.

4.3.9.1. TYPES OF PALEONTOLOGICAL RESOURCE IMPACTS

The loss or destruction of any identifiable fossil that could yield information important to prehistory, or that embodies the distinctive characteristics of a type of organism, environment, period of time, or geographic region, would be a significantly adverse paleontological impact. Direct adverse impacts on paleontological resources would primarily concern the potential destruction of non-renewable paleontological resources and the loss of information associated with these resources, including the unlawful or unauthorized collection of fossil remains. If potentially fossiliferous bedrock or surficial sediments were disturbed, the disturbance could result in the adverse destruction of paleontological resources and subsequent loss of information. At the site-specific project level, direct, adverse impacts can typically be reduced to a level below significance through the implementation of paleontological mitigation.

Surface disturbance may result in the exposure of fossils that would not likely have been unearthed via natural processes. If mitigation measures are implemented, these newly exposed fossils would become beneficially available for salvage, data recovery, scientific analysis, and permanent preservation at a public museum. The beneficial impacts resulting from mitigation would include advances in scientific knowledge by both permitted field researchers and paleontologists who study fossils in museum collections, contributions to public education and interpretation, and community involvement and partnerships.

In general, in those areas that are underlain by paleontologically sensitive geologic units, the greater the amount of ground disturbance, the higher the potential for adverse impacts to paleontological resources. For areas that are directly underlain by geologic units with no paleontological sensitivity, there would be no potential for impacts on paleontological resources unless sensitive geologic units that underlie the non-sensitive unit were also impacted. Impacts analyzed in this section include direct (ground-disturbance-related), indirect (operations-related), and cumulative impacts of the proposed management decisions.

4.3.9.1.1. DIRECT IMPACTS TO PALEONTOLOGICAL RESOURCES

Direct impacts would result from activities planned or authorized by the BLM, and would occur at the same time and place as the surface-disturbing activity. The potential for direct impacts on scientifically important surface and sub-surface fossils in fossiliferous sedimentary deposits is controlled by two factors: 1) the depth and lateral extent of disturbance of fossiliferous bedrock and/or surficial sediments, and 2) the depth and lateral extent of occurrence of fossiliferous bedrock and/or surficial sediments beneath the surface. Ground disturbance has the potential to adversely impact an unknown quantity of fossils that may occur on or underneath the surface in areas containing paleontologically sensitive geologic units. Without mitigation, these fossils, as

well as the paleontological data they could provide if properly salvaged and documented, could be adversely impacted, rendering them permanently unavailable for future scientific research.

4.3.9.1.2. INDIRECT IMPACTS TO PALEONTOLOGICAL RESOURCES

Indirect impacts would occur later in time or farther away in distance than direct impacts, but are still reasonably foreseeable. They would typically include those impacts that result from the continuing implementation of management decisions and associated activities, and/or the normal, ongoing operations of facilities constructed within a specific project area. For example, an indirect adverse impact on paleontological resources would be the construction of a new road that increases public access to a previously inaccessible area, and results in unauthorized fossil collecting and vandalism. Mitigation strategies could include surveys by permitted and qualified paleontologists to collect important surface fossils, transfer them to a public museum, and identify locations of fossil localities that have the potential to yield additional fossils as erosion occurs. Other mitigation strategies could include augmentation of law enforcement staff and increased patrols, and the construction of protective fencing or other barriers around known paleontological sites.

4.3.9.2. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Management decisions related to fire management could have long-term direct and indirect adverse and beneficial impacts on paleontological resources. Surface-disturbing actions such as road construction, the building of fire lines, and prescribed burns could damage or destroy surface fossils in paleontologically sensitive areas/geologic units (Class 3, 4/5, and 5). In these areas, paleontological resource impacts mitigation would reduce potential direct, adverse impacts to below the level of significance. Surface fossils would be collected by a qualified and BLM-permitted paleontologist prior to surface disturbance, and paleontological monitoring of construction-related excavations would allow the salvage and recovery of important sub-surface paleontological resources. The recovered fossils would be transferred to a public museum for permanent storage. Potential long-term, adverse indirect impacts would result from the construction of new fire roads and fire breaks, which would increase OHV access into areas that were previously less accessible or inaccessible to the public, thus increasing the potential for unauthorized fossil collecting (poaching) and vandalism. The recovery and preservation of fossils as the result of paleontological mitigation would be a beneficial impact because it would permanently preserve paleontological resources that may have otherwise never been discovered, and make them available for scientific research, education, and display.

Decisions related to paleontological resource decisions common to all alternatives and the Proposed Plan could have both short- and long-term, direct and indirect, beneficial impacts on paleontological resources. Under all alternatives and the Proposed Plan, management decisions would be designed to reduce potential adverse impacts to below the level of significance. All alternatives and the Proposed Plan would promote and facilitate scientific research by qualified and permitted paleontologists, encourage partnerships, manage access to scientifically significant fossils, reduce unauthorized use of known paleontological resources, and would provide for mitigation of adverse impacts on scientifically significant surface and sub-surface fossils where necessary to protect them and ensure their permanent storage and preservation in a public museum. Appropriate recreational use of common invertebrate and plant fossils would be encouraged, as would public education and interpretation of paleontological resources.

Paleontological Resource Use Permits administered by the BLM Utah State Office for scientific study would provide important information to the Monticello FO about the locations (both geographic and stratigraphic) and kinds of important paleontological resources in their jurisdiction. Providing Internet Web sites, local interpretive sites, and written information to the public about fossils and hobby collection would have the potential to directly and beneficially impact the resource by increasing the public's knowledge of the earth sciences and encouraging good stewardship, potentially reducing illegal collection, and increasing the likelihood that important paleontological discoveries would be reported to the BLM.

Management decisions related to air quality, cultural resources, health and safety, vegetation, riparian areas, soils and watersheds, visual resources, wildlife, and special status species would have negligible impacts on paleontological resources, and therefore will not be further analyzed. No additional impact analysis is needed because maintaining air quality by ensuring that constituent pollutants do not exceed standard threshold levels; surveying sites, protecting cultural resources, and developing interpretive sites; maintaining public health by reclaiming AML sites and managing potentially hazard materials; applying vegetation treatments to improve ecosystem health; protecting riparian resources, sensitive soils, and watersheds from surface disturbances would neither inhibit nor enhance the scientific collection and analysis of important fossils, not affect recreational collection of fossils, nor alter the ability of the BLM to protect fossil resources. Also, neither would the protection of scenic quality nor protecting wildlife habitat and federally listed and sensitive species affect the preservation, collection and/or study of paleontologic resources.

4.3.9.3. ALTERNATIVES AND PROPOSED PLAN IMPACTS

This subsection discusses the impacts of the proposed alternative and Proposed Plan resource management decisions on paleontological resources. Because the analyses of the management decisions presented in this chapter do not reflect specific projects or actions, some impacts can only be expressed qualitatively. In most cases, subsequent site-specific analyses would be required in order to implement resource management decisions. These analyses would address potential site-specific impacts on a variety of resources, including paleontological resources. More detailed or locality-specific studies and appropriate environmental documents would be prepared in compliance with NEPA and its implementing regulations as well as BLM policy as required.

Actions related to lands and realty management decisions would have long-term indirect, adverse and beneficial impacts on paleontological resources. Land acquisitions by the BLM would affect paleontological resources by increasing public access to areas that contain paleontologically sensitive geologic units and areas that contain fossil localities. Public access to these areas could result in an increased adverse risk of unauthorized collection or vandalism of paleontological resources. However, land acquisitions would also create the opportunity for the BLM to establish stewardship of paleontological resources on these newly acquired lands, which could result in associated educational benefits including interpretive opportunities and the permanent storage of scientifically significant fossils collected in public museums. Transfer of BLM lands to private ownership would have long-term, indirect, and cumulatively adverse impacts on paleontological resources by removing scientifically significant fossils from the public domain, thus rendering them permanently unavailable for scientific research and education. Commercial exploration and development, and associated access of BLM lands for energy resources would have direct and

indirect, adverse impacts on paleontological resources. Surface-disturbing activities associated with exploration and development could damage or destroy scientifically significant surface and sub-surface fossils. The ongoing operations of commercial energy facilities and associated infrastructure on BLM lands would have indirect, adverse impacts on paleontological resources by increasing access to lands that were previously inaccessible, and thus increasing the likelihood of unauthorized fossil collecting and vandalism.

Management decisions related to livestock grazing decisions could have direct and indirect adverse impacts on paleontological resources from livestock grazing in areas containing occurrences of scientifically significant surface fossils. This is because damage to or destruction of surface fossils is known to occur as a result of trampling by livestock (similar to the impacts on cultural resources from livestock grazing, see Section 4.3.2.3.1). Generally, grazing areas would be evaluated for important paleontological resources if they occur in areas containing paleontologically sensitive units (Classes 3, 4/5, and 5). See Section 4.3.6.3, Livestock Grazing Alternatives Impacts, for the range of acreages unavailable to livestock grazing.

Surface disturbance that results from mineral exploration and development (including geophysical surveys) could adversely affect paleontological resources by damaging or destroying them. Under all alternatives and the Proposed Plan, management decisions related to minerals decisions would provide for a variety of mineral exploration and development activities for oil and gas, coal, tar sand, sand and gravel, potash, and geothermal resources. Because these activities typically involve surface disturbance, adverse impacts on paleontological resources would result under all alternatives and the Proposed Plan, if mitigation was not applied. These impacts are most likely to occur in paleontologically sensitive units that are designated as Class 3, 4/5, and 5. Therefore, the PFYC classes of geologic units and surface acreage eligible for minerals exploration and development are an important consideration to paleontological resource impacts.

Management decisions related to recreation decisions would have both adverse and beneficial direct and indirect long-term impacts on paleontological resources. For example, allowing motorized vehicles into previously prohibited areas increases the likelihood that scientifically significant surface fossils could be accidentally damaged or destroyed, or intentionally vandalized. Management decisions such as implementing public education and environmental awareness programs, such as the BLM's "Tread Lightly!" and "Leave No Trace" programs would reduce illegal fossil collection, vandalism, or accidental destruction by educating the public on the need to preserve the resource. Developed recreation sites are closed to recreational fossil collection (see 43 CFR 8365.1-5[b]). This closure would thus reduce potentially adverse impacts on paleontological resources. Direct impacts on paleontological resources resulting from recreation decisions would be related to the level of surface disturbance associated with recreational development, such as the construction of recreational facilities including roads, and the degree of increased human activity in paleontologically sensitive areas/geologic units. Potential long- and short-term indirect impacts would also result from increases in levels of unauthorized collecting and associated vandalism that could accompany increased human activity. It should be noted, however, that regulated recreational use of areas tends to provide better protection to paleontological resources than does unregulated use. Collecting common invertebrate and plant fossils for personal, noncommercial use is an accepted, low-impact use of public lands, and could foster a greater overall appreciation for paleontological resources and their scientific importance. In areas containing known fossil localities, mitigation could include

surveys to collect exposed fossils and transfer them to a qualified public museum, or the installation of fencing or other barriers around the known fossil localities to protect the resources.

Under each alternative, recreation decisions would continue existing ROWs for all existing developed recreation sites and facilities, and would provide similar protective ROWs for all new recreation facilities. The primary framework for recreation management in the Monticello PA is the Special Recreation Management Area (SRMA). SRMAs are used to define components of the recreation program including OHV designations, recreation permitting, developed recreation facilities, campsite designation, tourism, and heritage tourism. All lands outside of the SRMAs are designated as part of the Extensive Recreation Management Area (ERMA), which is defined as the area where recreational opportunities and concerns do not require explicit recreation management.

Impacts related to special designations decisions could have indirect, adverse and beneficial impacts on paleontological resources. For the purpose of this analysis, Special Designations fall into two categories: Areas of Critical Environmental Concern (ACECs) and Wild and Scenic Rivers (WSRs). FLPMA defines an ACEC as an area "within the public lands where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards." ACECs differ from some other special management designations in that designation by itself does not automatically prohibit or restrict other uses in the area. The 1968 Wild and Scenic Rivers Act established legislation for a National Wild and Scenic Rivers System (NWSRS) to protect and preserve designated rivers throughout the nation in their free-flowing condition, as well as their immediate environments. The Act contains policy for managing designated rivers, and created processes for designating additional rivers into the National System. To the extent that Special Designations of BLM lands in paleontologically sensitive areas/geologic units (Class 3, 4/5, and 5) result in restricted public access and use, and prohibit surface-disturbing actions, paleontological resources would be less likely to be unlawfully collected or vandalized, or damaged or destroyed by livestock, vehicular traffic, or construction. Therefore, in this general sense, Special Designations represent a beneficial impact on paleontological resources because they lessen the probability of their permanent loss to science and education. If public access to special designations areas such as ACECs is encouraged or facilitated with trails, roads, or off-road use, and surface-disturbing actions are permitted, adverse direct and indirect impacts on paleontological resources could occur. These impacts could be reduced to below the level of significance with the implementation of paleontological mitigation measures designed to collect scientifically significant fossils prior to ground disturbance and transfer them to a public museum, or to protect resources in place with the installation of fencing or other protective barriers. Under each alternative, varying management decisions would apply to ACECs and WSRs. Decisions related to ACECs and WSRs include various levels of management prescriptions for the 12 ACECs and eligible WSRs segments managed by the Monticello FO.

Impacts related to travel decisions are generally similar to those discussed under recreation in that they include potentially adverse, direct and indirect impacts on paleontological resources associated with surface-disturbing actions, and increased public access to BLM lands resulting in a greater potential for unauthorized fossil collecting or vandalism. The construction of travel infrastructure such as roads, trails, and trailheads would be associated with construction-related

surface disturbance that could damage or destroy fossils in areas with paleontologically sensitive areas/geologic units (Class 3, 4/5, and 5). The overall increase in public access to BLM lands associated with travel decisions would increase the potential for unauthorized fossil collecting (poaching) and vandalism. As with other management decisions, the potentially adverse impacts to paleontological resources could be reduced to below the level of significance through mitigation. Mitigation in itself would be a beneficial impact because it would result in the authorized collection of fossils that may otherwise never have been discovered, along with their preservation in a public museum where they would be available for scientific research and education. Mitigation strategies would include surveys of paleontologically sensitive areas/geologic units by a qualified and permitted paleontologist in areas where surface-disturbing actions are planned, to collect surface occurrences of fossils and associated data. It would also include the installation of protective fencing or other barriers around known fossil localities. Interpretive signs and displays in paleontologically sensitive areas. Mitigation could include the encouragement of lawful collection of invertebrate and plant fossils, could foster a greater overall appreciation for paleontological resources and their scientific significance.

Decisions related to woodlands decisions would have long-term direct adverse impacts on paleontological resources due to surface-disturbing actions from OHV access, road construction, and commercial and private woodland harvesting. Additionally, the increase in public access resulting from new roads would have indirect adverse impacts on paleontological resources because it could increase the potential for unauthorized fossil collecting and vandalism. The implementation of paleontological mitigation measures in paleontologically sensitive areas/geologic units prior to and during the construction of new roads and other surface-disturbing activities related to woodlands management would reduce potential adverse direct and indirect impacts on paleontological resources to below the level of significance. Such measures provide for a qualified and BLM-permitted paleontologist to collect scientifically significant surface fossils and associated data, and transfer these resources to a public museum for permanent storage.

Under all action alternatives, woodlands decisions would include the harvesting of woodlands in 9 proposed harvesting zones. Woodlands resource management decisions would be guided by BLM Forest Health and Forest Management standards and guidelines, and the Healthy Forests Initiative.

4.3.9.3.1. IMPACTS OF LANDS AND REALTY DECISIONS ON PALEONTOLOGICAL RESOURCES

The analysis of impacts of lands and realty decisions on paleontological resources under each alternative address rights-of-ways (ROWs) for land-use authorizations including access roads, pipelines, communication sites and many other types of land uses.

4.3.9.3.1.1. Alternative A

Under Alternative A, there are no specified restrictions on the locations of land-use authorizations including access roads, pipelines, communication sites and many other types of land uses within the Monticello PA (except in WSAs). This alternative would have the highest potential for adverse impacts on paleontological resources as it could result in the greatest amount of surface disturbance associated with land-use authorizations and development activities.

4.3.9.3.1.2. Alternative B

Under Alternative B, land-use ROWs would be permitted on all lands within the Monticello PA except WSAs, eligible Wild and Scenic River segments, ACECs, all areas managed as open to minerals leasing with major constraints (such as areas under NSO leasing stipulations), designated VRM Class I, II, and III areas, migratory bird habitats and raptor nesting complexes in riparian habitats and sagebrush and aspen, and special status species habitats. Of all the proposed alternatives, Alternative B would exclude the second largest area within the Monticello PA from land-use authorizations, primarily because of VRM constraints on surface disturbances that could impact scenic quality (see Table 4.240, VRM Class Designation Acreages by Alternative). Thus, this alternative has the second lowest potential for adverse impacts on paleontological resources as it would result in the second least amount of surface disturbance associated with land-use authorizations activities. Compared to Alternative A, this alternative would have more beneficial impacts to the resource because more area would be protected from surface disturbances.

4.3.9.3.1.3. Alternative C

Under Alternative C, Land-use authorizations would be permitted on all lands within the Monticello PA except WSAs, eligible Wild and Scenic River corridors, ACECs, all areas managed as open to oil and gas leasing with major constraints (such as areas under NSO stipulations), designated VRM Class I, II, and III areas, and migratory bird habitats and raptor nesting complexes in riparian habitats and sagebrush and aspen. Alternative C exempts the third largest area of the PA from land-use authorizations, primarily because of VRM management objective constraints on surface disturbances. The impacts of this alternative, when compared to Alternative A, would be the same as Alternative B.

4.3.9.3.1.4. Alternative D

Under Alternative D, land-use authorizations permitted on all lands within the Monticello PA except WSAs, designated VRM Class I areas, threatened and endangered species habitats, and all areas managed as open to oil and gas leasing with major constraints (such as NSO areas). Alternative D exempts the fourth largest amount of BLM land from land-use authorizations (after Alternatives B, C, and E). As related to potential surface disturbance and increased access to public lands associated with land-use authorizations, potential adverse impacts on paleontological resources under Alternative D would be less than Alternative A for the same reasons as discussed under Alternative B.

4.3.9.3.1.5. Alternative E

Lands and realty management decisions under Alternative E would be the same as the impacts discussed under Alternative B, except that 582,360 acres of non-WSA lands with wilderness characteristics would be managed as exclusion areas for ROWs. This would restrict or prohibit surface disturbances and would have additional long-term, beneficial, preservation-related impacts on paleontological resources. Compared to Alternative A, this alternative would have the lowest potential for adverse impacts to the resource because it would result in the least amount of surface disturbance associated with land-use authorizations.

4.3.9.3.1.6. Proposed Plan

Lands and realty management decisions under the Proposed Plan would be the same as the impacts discussed under Alternative B, except 88,871 acres of non-WSA lands with wilderness characteristics would be managed as avoidance areas for ROWs-. The impacts of this alternative, when compared to Alternative A, would be the similar to Alternative B, but would protect more area from surface disturbances.

4.3.9.3.2. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON PALEONTOLOGICAL RESOURCES

4.3.9.3.2.1. Alternative A

Under Alternative A, no acres of Class 1 units, 1,501 acres of Class 2 units, 129,899 acres of Class 3 units, 5,151 acres of Class 4/5 units, and 724 acres of Class 5 units would be unavailable for livestock grazing. Alternative A would have the highest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it would manage the least amount of land as unavailable to livestock grazing (128,098 unavailable acres under management actions common to all alternatives), and thus would have the greatest likelihood of livestock trampling of important surface fossils.

4.3.9.3.2.2. Alternatives B and E

Alternatives B and E would manage the same number of acres as unavailable for grazing (128,098 acres under management actions common to all alternatives, with an additional 13,062 acres as unavailable to livestock grazing , including portions of Slickhorn Canyon (Perkins Brother's Allotment), Rone Bailey Mesa (Upper Mail Station Allotment), Dodge Canyon Allotment, Mule Canyon, Arch Canyon, Fish and Owl Canyons, Road Canyon, Roger Allotment, West Butler Wash Canyon, and Horsehead Canyon within the Montezuma Canyon Allotment. Under Alternatives B and E, no acres of Class 1 units, 4,034 acres of Class 2 units, 126,939 acres of Class 3 units, 7,552 acres of Class 4/5 units, and 2,053 acres of Class 5 units would be unavailable for livestock grazing. These alternatives would restrict other areas to livestock trailing only, with no grazing, and the BLM would develop seasonal restrictions, unavailable acreages, and/or forage utilization limits on grazing in riparian areas considered to be Functioning at Risk. Compared to Alternative A, this alternative would have more beneficial impacts on paleontological resources because more area would be protected from the potential impacts of livestock trampling.

Alternatives B and E would have the lowest potential for long-term adverse impacts to the resource because these alternatives would impose the most restrictions on livestock grazing, with reduced potential for adverse impacts to paleontological resources. Compared to Alternative A, these alternatives would be have less adverse impacts to the resource from livestock grazing because more area would be unavailable to livestock grazing disturbances of surface fossils. The impacts comparison of this alternative with Alternative A would be the same as discussed above for Alternative B.

4.3.9.3.2.3. Alternative C

Alternative C would have the third largest acreage managed as unavailable for livestock grazing (after Alternative E) by managing 128,098 acres as unavailable under management actions

common to all alternatives, with an additional 8,163 acres managed as unavailable. The acreages and impacts would be the same as discussed under Alternative B, except that Alternative C opens Mule Canyon below U-95 to livestock grazing. Under Alternative C, zero acres of Class 1 units, 4,031 acres of Class 2 units, 134,159 acres of Class 3 units, 7,552 acres of Class 4/5 units, and 2,053 acres of Class 5 units would be unavailable for livestock grazing. The impacts comparison with Alternative A would be the same as discussed under Alternatives B and E.

4.3.9.3.2.4. Alternative D

Alternative D livestock grazing decisions would manage the fourth most acreage as unavailable to livestock grazing (with slightly less unavailable acreages [128,098 acres as unavailable under management actions common to all alternatives, with an additional 4,010 acres managed as unavailable], when compared to Alternative A). Under Alternative D, Slickhorn Canyon (Perkins Brother's Allotment), Rone Bailey Mesa (Upper Mail Station Allotment), Mule Canyon below U-95, Arch Canyon, Fish and Owl Canyons, Road Canyon, Rogers Allotment, and portions of West Butler Wash Canyons would be unavailable for livestock grazing. Under Alternative D, zero acres of Class 1 units, 2,664 acres of Class 2 units, 130,032 acres of Class 3 units, 5,111 acres of Class 4/5 units, and 724 acres of Class 5 units would be unavailable for livestock grazing. Alternative D would have a higher potential for adverse impacts on paleontological resources in sensitive areas/geologic units due to livestock trampling than Alternatives B, C, and E, but a lower potential for adverse impacts than Alternative A.

4.3.9.3.2.5. Proposed Plan

The Proposed Plan would have the fourth largest acreage managed as unavailable for livestock grazing by managing 128,098 acres as unavailable under management actions common to all alternatives, with an additional 13,718 acres managed as unavailable. The acreages and impacts would be the same as discussed under Alternative B. Under the Proposed Plan, zero acres of Class 1 units, 10,687 acres of Class 2 units, 109,484 acres of Class 3 units, 8,370 acres of Class 4/5 units, and 5,106 acres of Class 5 units would be unavailable for livestock grazing.

4.3.9.3.3. IMPACTS OF MINERALS DECISIONS ON PALEONTOLOGICAL RESOURCES

Impacts to paleontological resources from oil and gas leasing are discussed by alternative below. Surface disturbance for mineral development other than oil and gas would be 851 acres over 15 years for all alternatives and include Uranium and Vanadium, Placer Gold, Limestone, Sand and Gravel, Building Stone, and Clay.

4.3.9.3.3.1. Alternative A

The number of acres open to oil and gas leasing under both standard and special stipulations within each Monticello PA RFD area under Alternative A and corresponding paleontological sensitivities of geologic units is shown in Table 4.101.

Table 4.101. Proposed Acreages per PFYC Classes Open to Oil and Gas Leasing Under Alternative A for Each of the RFD Areas

	Class 1	Class 2	Class 3	Class 4/5	Class 5
Blanding	19	78,268	36,241	163,403	120,136
Monument Upwarp	0	166,911	335,015	72,658	12,506
Paradox Fold and Fault	0	127,473	85,977	31,317	8,306
Total	19	372,652	457,233	267,378	140,948

Table 4.102 shows the oil and gas leasing stipulations applicable by RFD area for Alternative A.

Table 4.102 Oil and Gas Leasing Stipulations (acres) by RFD Area, Alternative A

RFD Area	Open with Standard Conditions	Open with Special Stipulations	Open with No Surface Occupancy	Closed to Oil and Gas Leasing
Blanding	270,410	127,657	9,059	15,547
Monument Upwarp	144,241	442,848	147,249	359,337
Paradox Fold and Fault	163,953	89,121	4,916	10,432

Alternative A has the second lowest potential for adverse, surface disturbance-related impacts on paleontological resources because it proposes opening the second least amount of land containing paleontologically sensitive (Class 3, 4/5, and 5) geologic units for minerals exploration and development (see Table 4.113 in Section 4.3.9.4, Summary of Impacts).

4.3.9.3.3.2. Alternative B

The number of acres open to oil and gas leasing under both standard and special stipulations within each RFD area under Alternative B and corresponding paleontological sensitivities of geologic units is provided in Table 4.103:

Table 4.103. Proposed Acreages per PFYC Classes Open to Oil and Gas Leasing Under Alternative B for Each of the RFD Areas

	Class 1	Class 2	Class 3	Class 4/5	Class 5
Blanding	19	56,593	30,408	159,113	120,217
Monument Upwarp	0	179,266	400,895	75,585	12,506
Paradox Fold and Fault	0	120,491	51,713	26,851	8,180
Total	19	356,350	483,016	261,751	140,903

Table 4.104 below shows the oil and gas leasing stipulations applicable by RFD area for Alternative B.

Table 4.104. Oil and Gas Leasing Stipulations (acres) by RFD Area, Alternative B

RFD Area	Open with Standard Conditions	Open with Special Stipulations	Open with No Surface Occupancy	Closed to Oil and Gas Leasing
Blanding	148,521	214,212	39,805	15,000
Monument Upwarp	192,290	456,604	35,826	390,014
Paradox Fold and Fault	24,359	182,876	49,473	11,597

Alternative B has the third lowest potential for surface disturbance-related adverse impacts on scientifically significant paleontological resources because it contains the third lowest number of acres of paleontologically sensitive (Class 3, 4/5, and 5) geologic units on acreage proposed for minerals exploration and development (see Table 4.113 in Section 4.3.9.4, Summary of Impacts). Compared to Alternative A, this alternative would have potentially more adverse impacts on the resource because more acreage with sensitive paleontological fossils would be open to minerals development.

4.3.9.3.3.3. Alternative C

The number of acres open to oil and gas leasing under both standard and special stipulations on BLM-administered lands within each RFD area under Alternative C and corresponding paleontological sensitivities of geologic units is provided in Table 4.105:

Table 4.105. Proposed Acreages per PFYC Classes Open to Oil and Gas Leasing Under Alternative C for Each of the RFD Areas

	Class 1	Class 2	Class 3	Class 4/5	Class 5
Blanding	19	75,907	36,770	164,025	120,300
Monument Upwarp	0	192,183	419,889	76,607	12,507
Paradox Fold and Fault	0	127,397	83,470	31,722	8,180
Total	19	395,487	540,129	272,354	140,987

Table 4.106 shows the oil and gas leasing stipulations applicable by RFD area for Alternative C.

Table 4.106. Oil and Gas Leasing Stipulations (acres) by RFD Area, Alternative C

RFD Area	Open with Standard Conditions	Open with Special Stipulations	Open with No Surface Occupancy	Closed to Oil and Gas Leasing
Blanding	254,706	142,314	8,213	16,012
Monument Upwarp	293,201	407,984	25,171	367,720
Paradox Fold and Fault	81,564	172,205	5,939	11,597

Alternative C has the fourth lowest potential for adverse impacts on scientifically significant paleontological resources because it contains the fourth lowest acreage of paleontologically sensitive (Class 3, 4/5, and 5) geologic units within areas proposed for minerals exploration and development (see Table 4.113 in Section 4.3.9.4, Summary of Impacts). Compared to Alternative A, this alternative would have potentially more adverse impacts because more acreage of sensitive resources would be open to minerals development.

4.3.9.3.3.4. Alternative D

The number of acres proposed as open to oil and gas leasing under both standard and special stipulations within the Monticello PA RFD areas under Alternative D and corresponding paleontological sensitivities of geologic units are provided in Table 4.107:

Table 4.107. Proposed Acreages per PFYC Classes Open to Oil and Gas Leasing Under Alternative D for Each of the RFD Areas

	Class 1	Class 2	Class 3	Class 4/5	Class 5
Blanding	19	75,865	37,334	163,974	120,299
Monument Upwarp	0	193,556	445,074	76,775	12,506
Paradox Fold and Fault	0	127,526	90,342	31,823	8,179
Total	19	396,957	572,750	272,572	140,984

Table 4.108 shows the oil and gas leasing stipulations applicable by RFD area for Alternative D.

Table 4.108. Oil and Gas Leasing Stipulations (acres) by RFD Area, Alternative D

RFD Area	Open with Standard Conditions	Open with Special Stipulations	Open with No Surface Occupancy	Closed to Oil and Gas Leasing
Blanding	303,258	118,675	8,936	15,506
Monument Upwarp	505,529	222,393	5,240	360,914
Paradox Fold and Fault	153,496	104,374	0	10,433

Alternative D would have the highest potential for adverse impacts on scientifically significant paleontological resources because it contains the largest amount of acreage of paleontologically sensitive (Class 3, 4/5, and 5) geologic units within acreage proposed for minerals exploration and development (see Table 4.113 in Section 4.3.9.4, Summary of Impacts). Compared to Alternative A, this alternative would have potentially more adverse impacts because more acreage of sensitive resources would be open to minerals development.

4.3.9.3.3.5. Alternative E

The number of acres open to oil and gas leasing under both standard and special stipulations within each RFD area under Alternative E and corresponding paleontological sensitivities of geologic units are provided in Table 4.109:

Table 4.109. Proposed Acreages per PFYC Classes Open to Oil and Gas Leasing Under Alternative E for Each of the RFD Areas

	Class 1	Class 2	Class 3	Class 4/5	Class 5
Blanding	19	56,076	30,255	156,724	119,658
Monument Upwarp	0	163,911	324,905	71,702	12,506
Paradox Fold and Fault	0	95,645	24,600	18,750	8,160
Total	19	315,632	379,760	247,176	140,324

Table 4.110 shows the oil and gas leasing stipulations applicable by RFD area for Alternative E.

Alternative E would have the lowest potential for adverse impacts on scientifically significant paleontological resources because it would manage the smallest acreage for minerals exploration and development in paleontologically sensitive areas/geologic units (Class 3, 4/5, and 5). Compared to Alternative A, this alternative would have potentially less adverse impacts because fewer acres of sensitive resources would be open to minerals activities and surface disturbances.

Table 4.110. Oil and Gas Leasing Stipulations (acres) by RFD Area, Alternative E

RFD Area	Open with Standard Conditions	Open with Special Stipulations	Open with No Surface Occupancy	Closed to Oil and Gas Leasing
Blanding	148,520	217,919	40,492	15,001
Monument Upwarp	170,523	433,456	35,826	454,270
Paradox Fold and Fault	24,359	172,444	46,770	24,732

4.3.9.3.3.6. Proposed Plan

The number of acres open to oil and gas leasing under both standard and special stipulations on BLM-administered lands within each RFD area under the Proposed Plan and corresponding paleontological sensitivities of geologic units is provided in Table 4.111:

Table 4.111. Proposed Acreages per PFYC Classes Open to Oil and Gas Leasing Under The Proposed Plan for Each of the RFD Areas

	Class 1	Class 2	Class 3	Class 4/5	Class 5
Blanding	19	80,301	48,437	167,527	125,649
Monument Upwarp	0	250,897	753,300	77,352	12,506
Paradox Fold and Fault	0	127,529	100,244	32,360	8,179
Total	19	458,727	901,981	277,239	146,334

Table 4.12 shows the oil and gas leasing stipulations applicable by RFD area for the Proposed Plan.

Table 4.112. Oil and Gas Leasing Stipulations (acres) by RFD Area, Proposed Plan

RFD Area	Open with Standard Conditions	Open with Special Stipulations	Open with No Surface Occupancy	Closed to Oil and Gas Leasing
Blanding	215,202	152,531	38,123	16,076
Monument Upwarp	228,783	377,588	22,001	465,683
Paradox Fold and Fault	40,228	210,475	5,984	11,626

The Proposed Plan has the fifth lowest potential for adverse impacts on scientifically significant paleontological resources because it contains the fifth lowest acreage of paleontologically sensitive (Class 3, 4/5, and 5) geologic units within areas proposed for minerals exploration and development (see Table 4.113 in Section 4.3.9.4, Summary of Impacts). Compared to Alternative A, this alternative would have potentially more adverse impacts because more acreage of sensitive resources would be open to minerals development.

4.3.9.3.4. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON PALEONTOLOGICAL RESOURCES

Management decisions related to non-WSA lands with wilderness characteristics decisions would have beneficial direct and indirect impacts on paleontological resources that occur within their boundaries. Non-WSA lands with wilderness characteristics would be managed to protect natural values; surface-disturbing activities would be prohibited. This decision would protect any paleontological resources that exist on non-WSA lands that are managed to protect their wilderness characteristics.

4.3.9.3.4.1. Alternatives A through D

No acres of non-WSA lands with wilderness characteristics would be managed to protect wilderness values. Therefore, no beneficial impact to paleontological resources would occur. The potentially adverse impacts to the resource would be the same as discussed under the other resources within this section.

4.3.9.3.4.2. Alternative E

Alternative E would manage 582,357 acres to protect non-WSA lands with wilderness characteristics. These lands would be managed as 1) closed to oil and gas leasing, 2) designated as VRM Class I (allowing a very low degree of surface impacts), 3) closed to OHV travel, and 4) ROWs would not be permitted. These restrictions would protect paleontological resources by precluding surface-disturbing activities. Compared to Alternative A this alternative would have more beneficial impacts on the resource because more area would be protected from surface and subsurface disturbances.

4.3.9.3.4.3. Proposed Plan

The Proposed Plan would manage 88,871 acres to protect non-WSA lands with wilderness characteristics. These lands would be managed as 1) closed to oil and gas leasing in Grand Gulch, Mancos Mesa, and Nokai Dome, and NSO in Dark Canyon, 2) designated as VRM Class II (allowing a low degree of surface impacts), 3) limited to designated roads and trails, and 4) ROWs avoidance areas. These restrictions would protect paleontological resources by precluding surface-disturbing activities. Compared to Alternative A this alternative would have more beneficial impacts on the resource because more area would be protected from surface and subsurface disturbances.

4.3.9.3.5. IMPACTS OF RECREATION DECISIONS ON PALEONTOLOGICAL RESOURCES

4.3.9.3.5.1. Alternative A

Alternative A would generally have the least restrictions to recreational activities within the SRMAs and the ERMA. However, since site surveys and resource mitigation would be conducted prior to surface disturbance, the impacts from recreational activities on paleontological resources would likely be minor.

4.3.9.3.5.2. Alternative B

Alternative B would generally be the second most restrictive on recreational activities within the Monticello PA SRMAs and the ERMA. To the extent that increased recreation results in greater public access and may require the installation of surface-disturbing infrastructure such as trails, and buildings, adverse impacts on important paleontological resources may result. Thus, Alternative B has the second lowest potential for adverse impacts on paleontological resources (after Alternative E) related to recreation decisions. Compared to Alternative A, this alternative would be more beneficial to the resource because more restrictions would be placed on recreational activities and facility construction.

4.3.9.3.5.3. Alternative C

Alternative C generally provides the third highest level of restrictions on recreational activities within the SRMAs and the ERMA. To the extent that increased recreation results in greater public access and may require the installation of surface-disturbing infrastructure such as roads, trails, and buildings, adverse impacts on important paleontological resources may result. Thus, Alternative C has a lower potential for adverse impacts on paleontological resources related to recreation decisions than Alternatives A.

4.3.9.3.5.4. Alternative D

Alternative D would generally provide the fourth highest level of restrictions on recreational activities within the Monticello PA SRMAs and the ERMA. The impacts would be the same as those discussed under Alternative B and C, but to a potentially greater adverse degree, from fewer restrictions on recreational activities. Alternative D would have a higher potential for adverse impacts on paleontological resources than Alternative A because of more restrictions on recreation-related surface disturbances and access than Alternative A.

4.3.9.3.5.5. Alternative E

The impacts on paleontological resources from recreation management decisions within the SRMAs, and the ERMA would be the same as discussed under Alternative B, except within lands with non-WSA wilderness characteristics, which would be managed with additional protective measures that would be beneficial to paleontological resources, as described above in Section 4.3.9.3.4. Approximately 165,831 acres of SRMAs would have inventoried wilderness characteristics, and would therefore be managed with prescriptions beneficial to paleontological resources. An additional 416,526 acres within the ERMA would also be managed under these beneficial prescriptions. Because of the large area managed to preclude surface disturbance and with reduced public access, Alternative E would be the most beneficial to paleontological resources. However, there would also be an adverse reduction of discovery and recovery of additional fossils and other resources due to reduced surface disturbance and access. Compared to Alternative A, this alternative would be more beneficial to the resource because of the increased level of protection within the non-WSA lands with wilderness characteristics.

4.3.9.3.5.6. Proposed Plan

The impacts on paleontological resources from recreation management decisions within the SRMAs and the ERMA would be the same as discussed under Alternative B, except within lands with non-WSA wilderness characteristics, which would be managed with additional protective measures that would be beneficial to paleontological resources, as described above in Section 4.3.9.3.4. Approximately 13,600 acres of SRMAs lie within non-WSA lands with wilderness characteristics, and would therefore be managed with prescriptions beneficial to paleontological resources. To the extent that increased recreation results in greater public access and may require the installation of surface-disturbing infrastructure such as roads, trails, and buildings, adverse impacts on important paleontological resources may result. Thus, the Proposed Plan has a lower potential for adverse impacts on paleontological resources related to recreation decisions than Alternatives A.

4.3.9.3.6. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON PALEONTOLOGICAL RESOURCES

4.3.9.3.6.1. Alternative A

Alternative A would generally be the least restrictive in terms of commercial and recreational access uses of lands designated as ACECs and eligible WSR segments. Under Alternative A, no acres of Class 1 geologic units, 96,932 acres of Class 2 units, 171,736 acres of Class 3 units, 141,790 acres of Class 4/5 units, and 93,985 acres of Class 5 units would lie within ACECs. Under Alternative A, 3,577 acres of ACECs would be open to minerals leasing under standard

conditions, 122,335 acres would be open under controlled surface use and timing limitations, 95,246 acres would be open with no surface occupancy, and 292,289 acres would be closed to minerals leasing. Of all the alternatives, Alternative A would permit the greatest commercial and recreational access to ACECs and WSRs, and is associated with the highest amount of potential surface disturbance. Therefore, Alternative A has the greatest potential for adverse impacts on important paleontological resources.

4.3.9.3.6.2. Alternative B

Alternative B would generally be the second most restrictive in terms of commercial and recreational access and uses of lands proposed as ACECs and eligible WSR segments (only Alternative E is more restrictive). Under Alternative B, no acres of Class 1 geologic units, 43,954 acres of Class 2 units, 439,341 acres of Class 3 units, 21,793 acres of Class 4/5 units, and 14,804 acres of Class 5 units would be designated as ACECs. Under Alternative B, 44,884 acres of ACECs would be open to minerals leasing under standard conditions, 102,825 acres would be open under controlled surface use and timing limitations, 62,698 acres would be open with no surface occupancy, and 310,651 acres would be closed to minerals leasing. Compared to Alternative A, this alternative would be more beneficial to the resource because more restrictions would be placed on access to areas with sensitive paleontological resources.

4.3.9.3.6.3. Alternative C

Under Alternative C, no acres of Class 1 geologic units, 11,141 acres of Class 2 units, 34,302 acres of Class 3 units, 15,264 acres of Class 4/5 units, and 14,804 acres of Class 5 units would be designated as ACECs. Under Alternative C, 92,115 acres of ACECs would be open to minerals leasing under standard conditions, 101,572 acres would be open under controlled surface use and timing limitations, 35,822 acres would be open with no surface occupancy, and 291,605 acres would be closed to minerals leasing. Alternative C is less restrictive than Alternatives B and E, but more restrictive than Alternatives A and D. Therefore, Alternative C would be the third most limiting in terms of commercial and recreational access to ACECs and eligible WSR segments, and is associated with the second least degree of potential surface disturbance and resulting adverse impacts on important paleontological resources. Compared to Alternative A, this alternative would be more beneficial to the resource because more restrictions would be placed on access to areas with sensitive paleontological resources.

4.3.9.3.6.4. Alternative D

Under Alternative D, no new ACECs would be designated and no river segments would be managed as eligible for WSR status. Under this alternative, 152,809 acres of existing ACECs would be open to minerals leasing under standard conditions, 71,093 acres would be open under controlled surface use and timing limitations, 9,736 acres would be open with no surface occupancy, and 287,462 acres would be closed to minerals leasing. Alternative D would be the second least restrictive in terms of commercial and recreational access and uses of lands designated as ACECs and WSRs, and thus would potentially allow the second most degree of adverse impacts to paleontological resources of the proposed alternatives because it would allow the second highest level of commercial and recreational access to ACECs and river segments within the Monticello PA. This alternative would be more restrictive than Alternative A, so Alternative D would have potentially fewer adverse impacts to the resource than Alternative A.

4.3.9.3.6.5. Alternative E

The impacts of special designation decisions on the resource would be similar to those discussed under Alternative B because the proposed ACEC acreages and miles of eligible WSR segments would be the same. Under this alternative, the proposed ACECs would encompass approximately 109,206 acres of non-WSA lands with wilderness characteristics, and would therefore be managed with prescriptions that would prevent surface disturbances to paleontological resources. Because of the larger area managed to preclude surface disturbance and with reduced public access, Alternative E would be the most beneficial to paleontological resources. However, there would also be an adverse reduction of discovery and recovery of additional fossils and other resources due to reduced surface disturbance and access. Compared to Alternative A, this alternative would be more beneficial to the resource because greater protection would be afforded the resource.

4.3.9.3.6.6. Proposed Plan

Under the Proposed Plan, no acres of Class 1 geologic units, 11,141 acres of Class 2 units, 34,302 acres of Class 3 units, 15,264 acres of Class 4/5 units, and 14,804 acres of Class 5 units would be designated as ACECs. Under the Proposed Plan, 79,224 acres of ACECs would be open to minerals leasing under standard conditions, 109,823 acres would be open under controlled surface use and timing limitations, 19,216 acres would be open with no surface occupancy, and 312,853 acres would be closed to minerals leasing. The Proposed Plan is less restrictive than Alternatives B, C, and E, but more restrictive than Alternatives A, and D. Compared to Alternative A, the Proposed Plan would be more beneficial to the resource because more restrictions would be placed on access to areas with sensitive paleontological resources.

4.3.9.3.7. IMPACTS OF TRAVEL DECISIONS ON PALEONTOLOGICAL RESOURCES

4.3.9.3.7.1. Alternative A

Under Alternative A, 611,310 acres would be open to OHV use, 540,260 acres would be open to limited use with seasonal restrictions, 570,390 acres would be limited to existing roads and trails, 218,780 acres would be limited to designated roads and trails, and 276,430 acres would be closed to OHV use. Of the proposed alternatives, Alternative A would have the highest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it opens the highest acreage of the Monticello PA to travel and access to the general public, thus increasing the potential for unauthorized fossil collection and vandalism of scientifically significant paleontological resources in sensitive areas/geologic units. The construction of new roads, routes or trails in sensitive areas/geologic units under Alternative A would also adversely impact paleontological resources if surface disturbances were not mitigated to protect the resource.

4.3.9.3.7.2. Alternative B

Under Alternative B, no acres would be open to cross-country OHV travel, 1,359,417 acres would be limited to designated routes, and 423,698 acres would be closed to OHV use. Of the proposed alternatives, Alternative B would have the second lowest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it is the second most travel restrictive (after Alternative E). This would reduce the likelihood of unauthorized fossil

collection and vandalism of scientifically significant paleontological resources resulting from increased access to public lands due to the construction of roads, routes, and trails. Compared to Alternative A, this alternative would be more beneficial to the resource because all cross-country OHV travel (and potential impacts to surface fossils from this form of travel) would be eliminated.

4.3.9.3.7.3. Alternative C

Under Alternative C, 2,311 acres would be open to cross-country OHV use, 1,362,142 acres would be limited to designated routes, approximately 3.8 miles would be limited to designated routes with seasonal restrictions, and 418,667 acres would be closed to OHV use. Alternative C would have the third lowest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it is the fourth-most travel restrictive. Alternatives B and E would have a lower potential for adverse impacts, and Alternatives A and D would have a higher potential for adverse impacts resulting from increased public access due to the construction of roads, routes, and trails.

4.3.9.3.7.4. Alternative D

Under Alternative D, 2,311 acres would be open to cross-country OHV use, 1,780,807 acres would be limited to designated routes, no acres would be limited to designated routes with seasonal restrictions, and zero acres would be closed to OHV use. Alternative D would have the second highest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it is the second least travel restrictive. Alternatives B, C, and E would have a lower potential for adverse impacts, and Alternative A would have a higher potential for adverse impacts resulting from increased public access due to the construction of roads, routes, and trails.

4.3.9.3.7.5. Alternative E

Under Alternative E, no acres would be open to cross-country OHV use, 812,683 acres would require travel along designated routes, and 970,435 acres would be closed to OHV use. Of all the alternatives, Alternative E would have the lowest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it is the most travel restrictive. These restrictions would reduce the likelihood of unauthorized fossil collection and vandalism of scientifically significant paleontological resources resulting from increased public access due to the construction of roads, routes, and trails. Compared to Alternative A, this alternative would be more beneficial to the resource because of the substantial reduction in travel opportunities, most notably on lands with non-WSA wilderness characteristics.

4.3.9.3.7.6. Proposed Plan

Under the Proposed Plan, zero acres would be open to cross-country OHV use, 1,388,191 acres would be limited to designated routes, approximately 6.9 miles would be limited to designated routes with seasonal restrictions, and 393,895 acres would be closed to OHV use. The Proposed Plan would have the third lowest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it is the third-most travel restrictive. Alternatives B and E would have a lower potential for adverse impacts, and Alternatives A and D would have a higher

potential for adverse impacts resulting from increased public access due to the construction of roads, routes, and trails.

4.3.9.3.8. IMPACTS OF WOODLANDS DECISIONS ON PALEONTOLOGICAL RESOURCES

4.3.9.3.8.1. Alternative A

Under Alternative A, no restrictions would be placed on the harvesting and use of woodlands products outside WSAs and other designated exclusion areas (see Section 4.3.20.3.1.12, Impacts of Woodlands Decisions on Woodlands). Of the proposed alternatives, Alternative A would permit the most commercial and public access within the Monticello PA for woodlands product use (1,309,894 acres would be available for harvesting within the PA), including surface disturbance associated with the harvesting and access to harvesting areas. Under Alternative A, zero acres of Class 1 units, 194,783 acres of Class 2 units, 365,088 acres of Class 3 units, 186,942 acres of Class 4/5 units, and 110,193 acres of Class 5 units would be open to woodland harvest. Alternative A would have the highest potential for adverse impacts on paleontological resources in sensitive areas/geologic units because it would result in greater surface disturbance that could damage or destroy important or valuable fossils. It would also facilitate greater commercial and public access to more areas within the PA, thus increasing the potential for unauthorized fossil collecting and vandalism.

4.3.9.3.8.2. Alternative B

Alternative B would place a high level of seasonal restrictions, limits, and closures of areas to woodlands harvesting. Under Alternative B, a total of 730,074 acres of BLM lands would be available for commercial and recreational use of woodlands products with harvesting limits and restrictions specific to each of the proposed nine harvesting zones. This alternative would potentially affect no acres of Class 1 geologic units, 96,932 acres of Class 2 units, 171,736 acres of Class 3 units, 141,790 acres of Class 4/5 units, and 93,985 acres of Class 5 units on land open to woodland harvesting. Because it would allow the second least amount of surface disturbance associated with woodlands harvesting and the least amount of commercial and public access to potentially sensitive areas/geologic units of all alternatives and the Proposed Plan, Alternative B would have the second lowest potential for adverse impacts on important paleontological resources. Compared to Alternative A, this alternative would be more beneficial to the resource because more restrictions would be placed on woodland harvesting that would provide greater protection to paleontological resources.

4.3.9.3.8.3. Alternative C

Of the proposed alternatives, Alternative C would manage woodland resources with the third highest level of seasonal restrictions, limits and closures of areas to harvesting. Under Alternative C, 841,938 acres would be available for commercial and private harvesting, with specified harvesting limits and restrictions for each of the nine woodland zones. This alternative would manage woodland resources with zero acres of Class 1 geologic units, 98,838 acres of Class 2 units, 234,757 acres of Class 3 units, 153,168 acres of Class 4/5 units, and 106,909 acres of Class 5 units on land available for harvesting. Because it would allow the second lowest amount of surface disturbance associated with woodlands products harvesting and the second lowest amount of commercial and public access to potentially sensitive areas/geologic units,

Alternative C would have a lower potential for adverse impacts on important paleontological resources than Alternatives A.

4.3.9.3.8.4. Alternative D

Of the proposed alternatives, Alternative D would have the fourth highest level seasonal restrictions, limits, and closures of areas to woodland harvesting. The acreage available for woodlands harvesting would be the same as Alternative C. However, Alternative D places fewer restrictions on woodlands harvesting than Alternative C by removing the stipulation that OHV travel be restricted to 150 feet of designated routes in most woodland zones. As it would allow the second highest amount of surface disturbance associated with woodlands products harvesting and the second highest amount of commercial and public access to potentially sensitive areas/geologic units, Alternative D would have a higher potential for adverse impacts on important paleontological resources than Alternatives B, C, and E, but a lower potential for adverse impacts to paleontological resources than Alternative A.

4.3.9.3.8.5. Alternative E

The impacts of Alternative E woodland management decisions on paleontological resources would be the same as those discussed under Alternative B because the proposed management decisions would be the same, except that 1) approximately 6,197 acres within the proposed woodland harvesting zones would impose restrictions on surface disturbance to protect lands with non-WSA wilderness characteristics (these areas fall within the White Canyon, Harts Draw, and South Cottonwood zones), and 2) 548,477 acres would be available for harvesting within the PA. The impacts on paleontological resources would be beneficial in the long-term within these areas because the underlying resources would be protected. This alternative would have the lowest potential for adverse impacts on important paleontological resources because it would manage the smallest area for woodland harvesting. Compared to Alternative A, this alternative would be more beneficial to paleontological resources because over 40% less of the Monticello PA would be available for harvesting.

4.3.9.3.8.6. Proposed Plan

The Proposed Plan would manage woodland resources with the third highest level of seasonal restrictions, limits and closures of areas to harvesting. Under the Proposed Plan, 841,938 acres would be available for commercial and private harvesting, with specified harvesting limits and restrictions for each of the nine woodland zones. This alternative would manage woodland resources with zero acres of Class 1 geologic units, 101,974 acres of Class 2 units, 234,759 acres of Class 3 units, 153,167 acres of Class 4/5 units, and 106,909 acres of Class 5 units on land available for harvesting. Because it would allow the third lowest amount of surface disturbance associated with woodlands products harvesting and the third lowest amount of commercial and public access to potentially sensitive areas/geologic units, the Proposed Plan would have a lower potential for adverse impacts on important paleontological resources than Alternatives A.

4.3.9.4. SUMMARY OF IMPACTS

In this section, the impacts of the five alternatives evaluated in this chapter are summarized. Table 4.113 summarizes the acreage available by PFYC class for mineral exploration and development.

Alternative E would have the lowest potential for adverse impacts on scientifically significant paleontological resources because it involves the least amount of acreage in paleontologically sensitive areas/geologic units (Class 3, 4/5, and 5). Alternative A would have the second lowest potential, followed by Alternative B. Alternative C would have the fourth lowest potential. Alternative D would have the highest potential for adverse impacts on scientifically significant paleontological resources.

Table 4.113. Summary of Proposed Acreages per PFYC Classes Available for Mineral Exploration and Development within the Monticello PA

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Class 1	19	19	19	19	19	19
Class 2	372,652	356,350	395,487	396,957	214,747	341,533
Class 3	457,233	483,016	540,129	572,750	168,343	481,981
Class 4/5	267,378	261,751	272,354	272,572	237,698	263,473
Class 5	140,948	140,903	140,987	140,984	138,121	140,903
Total Class 3-5	865,559	885,670	953,470	986,306	544,162	886,357
Total	1,238,230	1,242,039	1,348,976	1,383,282	758,928	1,227,909

See Section 4.3.9, Paleontological Resources, for detailed PFYC class descriptions.

4.3.9.5. MITIGATION MEASURES

As a nonrenewable resource, paleontological resources are unique. At the time fossils are discovered during paleontological surveys or mitigation monitoring of ground-disturbing activities, many have already been subjected to a variety of destructive processes. These include predation; scavenging; disarticulation of skeletal remains; transport; primary weathering; diagenesis (physical changes in rock that occur over time, such as compaction, cementation, and mineral replacement); erosion; secondary weathering; and, if discovered during monitoring, additional damage that may have occurred during the ground-disturbing action that led to fossil discovery. Unlike other resources, it is difficult to develop measurable performance standards for paleontological mitigation because 1) fossils may have been damaged by natural processes prior to their discovery during a paleontological survey or during paleontological monitoring; 2) sub-surface fossils are often further damaged by construction activities that reveal their presence to paleontological monitors, and 3) there is no way to quantify how many fossils are preserved in the sedimentary deposits underlying a given site that were not exposed during the ground-disturbing action. Therefore, the absence of fossils would not indicate failure of the mitigation measures. Paleontological mitigation seeks to discover, via survey or monitoring, as many scientifically significant fossils as possible prior to their destruction during human-caused surface disturbance. Measurable performance standards in paleontology apply to survey- and mitigation-monitoring procedures, which ensure that fossil localities are documented thoroughly and accurately, and that fossils are collected according to professional paleontological standards.

4.3.9.6. UNAVOIDABLE ADVERSE IMPACTS

With project-specific assessments and, if appropriate, paleontological mitigation, lands and realty decisions, minerals decisions, recreation decisions, woodlands decisions, livestock grazing decisions, travel decisions, and special-designations decisions under all alternatives and the Proposed Plan would reduce adverse impacts on paleontological resources resulting from surface-disturbing actions to below the level of significance. However, the increased possibility of public access to previously inaccessible lands due to new commercial and recreational activities and infrastructure will increase loss risk of paleontological resources due to unauthorized fossil collecting (poaching). The loss of these resources represents an unavoidable adverse impact. The rate, extent, intensity, and duration of loss cannot be quantified at this time due to lack of data.

4.3.9.7. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY IMPACTS

Short-term uses of BLM lands for activities involving surface disturbance or increased public access would have long-term impacts on non-renewable paleontological resources. In paleontologically sensitive areas/geologic units, surface-disturbing activities affecting paleontological resources would include mineral development (including oil and gas), trampling by livestock, and the construction of infrastructure such as roads, trails, reservoirs, buildings, and fire lines. Travel decisions involving maintenance, upgrade, and realignment of roads and OHV use would also have long-term adverse impacts on paleontological resources in sensitive areas/geologic units. Enhancing or restricting public access through Lands and Realty decisions and Special Designations would create the potential for long-term impacts, either adverse or beneficial. In most cases, implementation of paleontological mitigation measures would reduce adverse impacts to below the level of significance, and result in beneficial impacts by salvaging and preserving fossils that otherwise may have never been discovered. Such fossils would be permanently available in a public museum for scientific research, education, and public display. Accordingly, these long-term impacts would not result in a loss of the long-term productivity of this resource.

4.3.10. RECREATION

Recreational resources are defined for this impacts analysis as the natural elements (e.g., scenery, vegetation, geology, land forms, weather) within the environment that provide the physical basis for recreation. Recreational opportunities are defined as the combination of the natural elements and human-controlled conditions (e.g., roads and trails, developed sites, signs, route markers, facilities) that create the potential for recreation. Recreational expectations are those assumptions made by the recreation resource user (for example, an OHV rider, scenic driver, or hiker [see the description of user groups below]) that, having prepared for the desired recreational experience, he/she will have that desired experience (e.g., a challenging or scenic off-road trail, driving while enjoying high-quality scenery, or the natural sights and sounds of an undeveloped landscape along a hiking trail). Recreational user satisfaction can be defined as the mental state in which the resource user is able to successfully benefit from the available recreational opportunities and recognize that his/her recreational experiences meet or exceed those recreational expectations.

The following assumptions were made and considered in the analysis of impacts of the proposed RMP management decisions on recreational opportunities and experiences, and on recreation resources within the Monticello PA:

- The BLM assumed that resource users within the Monticello PA could be classified into specific user groups, each of which has its set of recreation expectations or objectives, recreational opportunities, and needs to achieve satisfying recreational experiences. We also assumed that, because each user group has its needs, opportunities, and expectations, each group also has specific recreational conditions and criteria that increase the likelihood of satisfying user experiences. The descriptions, expectations, and criteria of these groups were derived from Monticello FO resource specialist knowledge of visitor use of recreational resources and of what constitutes user group satisfaction, based on informal but long-term in-field interviews with visitors recreating throughout the PA. For the action alternatives (Alternatives B, C, D, and E) and the Proposed Plan, the Monticello FO's benefits-based recreation management (BBM) goals and objectives (see Appendix E) for the proposed SRMAs were also used in analyzing the impacts of resource decisions on user groups and on the likelihood of users having satisfying recreational experiences in these areas. The recreation user groups and assumed conditions/criteria for satisfactory recreational user experiences are:
 - **Scenic Drivers** – This would include users of passenger cars and recreational vehicles (RVs) driving for pleasure while enjoying scenic attractions.
 - ◆ This user group prefers paved access to scenic vistas, cultural sites, and interpretive stations with turnoffs and/or temporary parking.
 - ◆ High traffic volumes, crowded kiosk parking areas, impacts to visual resources from paved viewpoints, and crowded developed campsites would adversely affect this user group's recreational experience.
 - **Motorized (off-highway)** – This group would include users of off-road motorcycles, all terrain vehicles (ATVs), and four wheel drive vehicles.
 - ◆ This group prefers a range of settings, from remote, natural-appearing environments with non-paved surfaces and few human disturbances through settings that include graded, dirt roads and challenging trails to settings that could

include moderate evidence of human sights, sounds, and surface disturbances. A moderate concentration of users and the presence of human constructed structures are acceptable. Trails and facilities provided for group activities (including parking lots, trail information, trailheads, and toilet facilities) are generally beneficial for this group.

- ♦ Overcrowding and overuse of trails, particularly by slower users (e.g., hikers or mountain bikers) and other OHV users, would have an adverse impact on their experiences. Moderate numbers of hikers, bikers, or equestrians are unlikely to adversely affect their recreational experiences.
- **Mountain bikers** – Mountain bike users prefer a relatively natural or naturally appearing environment, with natural surface trails ranging from beginner to advanced where evidence of human disturbances, restrictions, and controls are present but are subtle or do not dominate the environment. Recreation facilities would be optional and would blend with the natural environment. Recreation management would encourage user dispersal. Preferred facilities include semi-primitive camping with basic facilities (i.e., parking lots, trailheads, and toilet facilities).
 - ♦ Overcrowding, noise (particularly from motorized users), dust/exhaust, and poor trail etiquette from other users can have an adverse impact on this group's recreational experiences.
- **Non-mechanized** – This group would include hikers, backpackers, and equestrians.
 - ♦ This group prefers a natural appearing environment with little evidence of disturbance, few restrictions or visitor controls, no motorized users, and few mountain bikers. Trails, signs and active management that foster dispersal of users are the typical management decisions needed for this user group.
 - ♦ Adverse recreational experiences include those listed under mountain biking, but would also include the high speeds of mountain biking and motorized users. The speed and noise of motorized users is of particular concern to equestrian users.
- **River floating** – This group would include those recreating in non-motorized boats (predominantly in canoes, kayaks, and rafts).
 - ♦ The needs of this group are similar to those of the non-mechanized user group, with a natural appearing environment that shows little evidence of human disturbances within the river corridor. Other than boat ramps and restroom facilities at put-in and take-out locations and designated primitive campsites, facilities needs are few.
 - ♦ Overcrowding, noise, and impacts to visual resources seen from the San Juan and Colorado Rivers would detract from the user experience.
- **Specialized Recreation** – This group includes rock climbers, competitive motorized trail users, and Building-Antenna-Span-Earth (BASE) jumpers.
 - ♦ This diverse group prefers locations that provide the conditions for specialized recreation. Recreation BASE jumpers prefer high cliffs with favorable wind conditions and safe landing zones. Rock climbers prefer a range of challenging routes in sufficient numbers so that crowding and waiting is minimized. Competitive motorized trail users prefer challenging routes, often with enough distance and open area to allow for speed.

- ♦ Overcrowding of a given area or site may detract from the user or group experience for either BASE jumpers or rock climbers. Conflicts with slower moving vehicles, people, or livestock would detract from the user experience for competitive motorized trail users.

While recognizing that some recreational resource users may not have expectations that include high scenic quality, recreational opportunities that are likely to provide satisfying experiences in general are related in some way to scenic quality and to visual resource management (VRM) because high quality scenery was assumed to be an important recreational expectation for all user groups. Thus, it was further assumed that those management decisions that protect visual resources/scenic quality or permit fewer surface disturbances (in areas designated as VRM Class I and II and managed under their resource objectives) would have more beneficial impacts to recreational experiences and opportunities than those management decisions that allow greater degrees of surface disturbance and less visual resource protection (those areas designated as VRM Class III and IV and managed under VRM Class III and Class IV objectives).

4.3.10.1. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Management decisions common to all of the alternatives and the Proposed Plan would include developing and/or improving campgrounds (e.g., Sand Island, Indian Creek, Comb Wash), improving developed cultural resource interpretive sites (i.e., Butler Wash Ruin, Mule Canyon Ruin, Three Kiva Pueblo), and improving the Kane Gulch Ranger Station. As discussed in Section 3.11.4.2, Resource Conflicts/Impacts, increasing recreational resource use and resource use conflicts are adversely impacting recreational resources and user experiences. Accommodating the increase in resource users through improvements to recreation facilities and sites would have long-term, direct, beneficial impacts for all user groups by potentially enhancing the recreational user experience.

As discussed above, a fundamental component of the recreational experience in the Monticello PA is scenic quality, so those management decisions that diminish or degrade scenic quality through the effects of smoke, haze, or other air pollutants would have potentially adverse short-term or long-term impacts on the recreational opportunities that include scenic quality as part of the experience. For all of the alternatives, air quality management decisions would comply with current interagency MOUs regarding smoke management. Fire management treatment (including prescribed burning) would be timed to minimize smoke impacts and mitigation would be applied in compliance with federal and state regulations to meet air quality standards and prevent deterioration of air quality within the Monticello PA airshed. All of these decisions would have long-term, direct, beneficial impacts on recreational opportunities for all recreation user groups that include scenic quality as a component of the recreational experience because smoke, haze, and other air pollutants produced within the Monticello PA would be mitigated or limited to levels that would not likely diminish or degrade scenic quality.

Management decisions common to all of the alternatives and the Proposed Plan include managing the Old Spanish National Historic Trail to beneficially protect its recreational and interpretive resource values in the long-term, with the exception that under the action alternatives (i.e., B, C, D, and E) and the Proposed Plan, SRPs would be authorized only for re-enactments and heritage tours. This would also have long-term, beneficial impacts on the resource by managing the potential impacts from recreational resource users.

None of the alternatives or the Proposed Plan propose specific areas or acreages for fire management. Fire management decision impacts to recreation resources and on all recreation user groups would be beneficial in the long-term: management decisions common to all of the alternatives and the Proposed Plan would use fuels treatments (e.g., prescribed fire) to restore ecosystems and to reduce hazards associated with fuel loading. Fire suppression would be a required consideration for all non-prescribed fires. The potential disturbances caused by these activities would be short-term, surface disturbance-related impacts on recreational activities and recreation resources that would include the closing of recreational facilities and the loss of recreational opportunities within burned areas for all user groups until recreation resources were rehabilitated or restored. Recreational scenic quality would be adversely impacted in the short-term in burned areas until vegetation re-growth. The long-term, beneficial impacts on recreation resources and user experiences would be produced by the reduced risk or likelihood of wildland fires within treated areas (and the reduced risk of loss of remote and developed recreational areas and facilities from fire). The improvement of wildlife habitat (and enhancement of recreation opportunities for wildlife viewing and hunting in the long-term) for all user groups by improving vegetation communities through fire management would have long-term, beneficial impacts to recreation. It should be noted that fuels treatments to reduce the risk of wildland fire would be similar to those used to improve vegetation communities and improve or restore ecosystem health. See Section 4.3.17.2.7, Impacts of Paleontological Resources Decisions on Vegetation, for related impacts on recreation from vegetation treatments.

Under all of the alternatives and the Proposed Plan, management decisions to identify and address hazardous materials within the Monticello PA that pose health or safety risks (e.g., AML sites, hazardous waste sites) would continue to pose potential short-term health and safety risks to all recreational users in those areas where hiking, OHV use, and target shooting are in close proximity to hazardous materials and AML sites. Once the health and safety concerns of AML sites, unauthorized waste dumps, and hazardous materials sites (e.g., lead contaminated shooting ranges) were addressed and/or the areas were reclaimed, these areas would be considered as beneficially in compliance with federal and state regulations and/or as possible recreation areas. If managed as such they would then be an additional recreation resource and potentially provide beneficial, long-term recreational opportunities to all user groups (e.g., mining interpretive sites; OHV, biking, or hiking destinations).

For impacts common to all alternatives and the Proposed Plan, season-of-use changes in grazing allotments would beneficially affect wildlife by improving the functioning condition of grazed areas and also providing improved forage for wildlife, which would indirectly benefit long-term recreational opportunities for wildlife viewing and/or hunting for all user groups.

There are no specific paleontological management decisions that are applicable to each alternative. However, the collection of invertebrate and plant fossils on BLM-administered public lands for personal, non-commercial use is an approved recreational activity. The impacts of paleontological management decisions common to all alternatives and the Proposed Plan on recreation resources would be negligible in the short-term and long-term because fossil collection is a recognized recreational activity, and current and proposed management decisions would not constrain, limit, or enhance this activity beyond those limits already mandated in BLM regulations and policy.

Management decisions for SSS under all of the alternatives and the Proposed Plan would have impacts on special recreation users and commercial recreation groups requiring SRPs. Commercial groups would be seasonally restricted from recreating within SSS habitat to protect these species during breeding seasons, which would have adverse impacts on motorized recreational opportunities for commercial users. Private, non-commercial motorized users would not be affected by these restrictions. Specialized recreation user groups (i.e., rock climbers, BASE jumpers) would be restricted from using climbing routes within areas where raptor species would be nesting, which would have adverse impacts on specialized recreation opportunities during raptor nesting season.

Under all alternatives and the Proposed Plan, travel decisions would prohibit vehicle access within the San Juan River SRMA along a river segment from Comb Wash downstream to Lime Creek, and below Mexican Hat Bridge. This would have long, term, adverse impacts on recreation-related travel because opportunities would not be available for motorized OHV recreation within this area. Under all alternatives and the Proposed Plan, non-mechanized travel would not be restricted except to protect specific resource values, preserve public safety, and maintain identified recreational opportunities. All alternatives and the Proposed Plan would identify routes and provide recreational opportunities for non-mechanized travel that are independent of motorized OHV and mountain biking routes. These management decisions would have long-term, beneficial impacts on non-mechanized recreational users because the recreational opportunities for this user group would be enhanced by relatively unrestricted access throughout the Monticello PA and by management decisions to spatially separate non-mechanized users from mountain biking and motorized OHV users. These decisions would increase the likelihood that non-mechanized users would have satisfying recreational experiences where the expectations include remoteness and a sense of solitude, an undeveloped, pristine natural environment, and natural sounds and sights.

Under all of the alternatives and the Proposed Plan, the impacts of management decisions for woodlands would be adverse in the long-term on recreation user groups whose expectations include solitude and a sense of remoteness in an undisturbed landscape. Woodland harvesting would be allowed within some SRMAs and within the ERMA, and there would be adverse impacts on non-mechanized users from intrusive noise produced by chainsaws and by motorized OHVs used to access and collect harvested wood. Adverse visual impacts on non-mechanized, mountain biking, scenic driver, specialized, and some motorized OHV groups would result from wood collecting OHV surface disturbances, trash and litter, and the remnants of cut stands of pinyon and juniper.

As the impacts for air quality, fire management, human health and safety, paleontology, SSS, and woodlands would have the same impacts on recreation under all alternatives and the Proposed Plan; the impacts of these resource decisions on recreation will not be discussed further.

4.3.10.2. IMPACTS COMMON TO ALL ACTION ALTERNATIVES AND THE PROPOSED PLAN

Management decisions common to all action alternatives (Alternatives B, C, D, and E) and the Proposed Plan would:

- Close the proposed San Juan River SRMA to woodland products use except for on-site collection of campfire wood and permitted collection of wood by Native Americans for

ceremonial purposes. This would have long-term, direct, beneficial impacts on recreation resources and recreational experiences by preserving scenic quality along the SRMA river corridor.

- Exclude backpackers from camping within one mile of Slickhorn Canyon and Grand Gulch along the San Juan River. This would have long-term, direct, beneficial impacts for river floating user groups by potentially reducing crowding by non-mechanized user groups along the river corridor. It would also have long-term, adverse impacts on non-mechanized groups by limiting recreational opportunities along the San Juan River corridor.
- Limit camping within the proposed Cedar Mesa SRMA (under Grand Gulch Plateau Mesa-Top Camping) to 14 days within any period of 28 consecutive days. This would have long-term, beneficial impacts on recreation resources and experiences within the SRMA by limiting the potential impacts from commercial and private non-mechanized users.
- Require that all garbage, refuse, and solid waste be packed out of the proposed Cedar Mesa SRMA (under Grand Gulch Plateau [In-Canyon Permitted Overnight Camping]). This would have substantially beneficial, long-term preservation-related impacts on recreation resources within this portion of the SRMA. The impacts to non-mechanized users would be negligible because packing out waste would not affect the recreational opportunities for experiencing solitude, cultural resources, and a natural environment.
- Prohibit camping within the Indian Creek riparian corridor (within the proposed Indian Creek SRMA), from Newspaper Rock to south of the Dugout Ranch, with camping outside of the riparian corridor limited to designated camping areas and campsites. As funding permits, the designated campground at Newspaper Rock would be removed and rehabilitated, with new campgrounds and parking areas constructed within the proposed SRMA. These management decisions would have long-term, beneficial impacts on recreation resources and on recreation user groups that frequent this area (i.e., scenic drivers, specialized, motorized, and non-motorized) because recreation resources would be protected and adequate recreation facilities would be constructed to enhance the recreational experience.
- Rock climbing routes in conflict with cultural sites would be closed. This management decision would have long-term, direct, adverse impacts on specialized recreational opportunities. However, it would have long-term, beneficial impacts on other user groups that consider scenic quality and regional cultural viewing and interpretation an important recreational experience.
- Woodland harvesting would be prohibited within the Indian Creek SRMA and the White Canyon SRMA, including on-site collection of firewood for campsites. This would have long-term, beneficial impacts on recreation resources by preserving recreation-related scenic resources. The impacts on all user groups would be beneficial in the long-term because the recreational experience would be enhanced by the preservation of scenic quality.
- Under all of the action alternatives and the Proposed Plan, BBM would be applied to the proposed SRMAs that include targeted outcomes to enhance personal, community, economic, and environmental goals (see Appendix E). This would have beneficial impacts on all user groups, as all SRMAs would be managed with prescriptions to increase the likelihood that resource users would have satisfying recreational experiences.

The general management decisions of the action alternatives and the Proposed Plan would apply adaptive management to protect natural and cultural resources, and maintain and enhance recreational opportunities. Wildlife water sources would be protected and camping would be

excluded within buffer zones around these areas to allow wildlife access to water. Dispersed camping within the Monticello PA would be assessed for its environmental impacts and would be seasonally closed, as conditions warrant, to protect recreational resources, and recreational OHV off-road retrieval of game would be prohibited. These management decisions would have long-term, resource protection-related, beneficial impacts on recreation resources, but there could be short-term, adverse impacts to specific recreation user groups to protect recreation resources (e.g., seasonal exclusion of non-mechanized users from dispersed camping areas to protect recreation resources, prohibitions on off-road game retrieval for motorized OHV users).

4.3.10.3. ALTERNATIVES AND PROPOSED PLAN IMPACTS

4.3.10.3.1. IMPACTS OF CULTURAL DECISIONS ON RECREATION

4.3.10.3.1.1. Alternative A

Under Alternative A, cultural management decisions that impact recreation resources are either unspecified or unrestricted within Comb Ridge, Tank Bench, and Beef Basin. Vehicle and OHV use decisions would designate these areas as either open, limited to designated routes, or closed. There are no management decisions that address dispersed camping, private and commercial group size limits, campfires, or pets. The impacts would be long-term, and substantially adverse to recreation-related cultural resources and to all recreation user groups because, as discussed in Section 3.11.4 Recreation Issues and Concerns, the current trend toward increasing recreational use within the Monticello PA is creating recreational resource use conflicts between user groups, and the potential for OHV-caused degradation of recreation resources. A lack of specific management decisions to address these concerns would perpetuate current conditions, exacerbate recreation-related cultural resource degradation, and allow resource user conflicts to intensify, resulting in a diminishing likelihood of recreation resource users having satisfactory recreational experiences.

The McLoyd Canyon-Moon House and the Grand Gulch Special Emphasis Area/National Historic District lie within WSAs, and are subject to the management decisions required to protect the resources within WSAs. Under this alternative, public access to the McLoyd Canyon-Moon House would be restricted, which would reduce and adversely impact, in the long-term, the recreational opportunities for motorized, mountain biking, and non-mechanized recreational user groups.

The Grand Gulch National Historic District would be closed to OHV use, managed to restrict recreational activities if cultural or scenic values were degraded or damaged, and managed for primitive recreational opportunities. These management decisions would have long-term, beneficial impacts on those user groups that seek solitude and dispersed and remote recreational opportunities (non-mechanized or specialized users) because the area would be managed for opportunities that they prefer, but would highly limit the recreational opportunities for mechanized user groups (scenic driver, motorized OHV, and mountain bikers).

4.3.10.3.1.2. Alternative B

Under Alternative B, cultural sites within the Monticello PA would be closed to recreational use if the Monticello FO determines that recreational activities pose a risk to cultural resources. Also, in order to protect and preserve the planning area's cultural resources, climbing aids and ropes

would be prohibited to access cultural sites/ruins except in emergencies or administrative needs. These management decisions would have long-term, beneficial, preservation-related impacts on recreation resources because cultural sites are a component of the recreational opportunities within the PA, and protecting these recreational resources would preserve cultural/interpretive-recreational opportunities.

Under this alternative, specific management plans and SRMA status would be developed for culturally sensitive areas within Cedar Mesa that could potentially limit or restrict recreational activities to protect cultural resources. This would have long-term, preservation-related beneficial impacts on recreation resources that include a cultural resource component by reducing the likelihood of recreation-related degradation of or loss of recreational opportunities.

To protect cultural resources, this alternative would create CSMA in areas known to have a high density of cultural resource sites, and/or sites that may be eligible for NRHP designation and provide recreational opportunities for cultural resource interpretation. These management areas would include Comb Ridge CSMA (30,752 acres), the Tank Bench CSMA (2,646 acres), the Beef Basin CSMA (20,302 acres), and the McLoyd Canyon-Moon House CSMA (1,607 acres). Other special management areas for cultural resources would include the current Grand Gulch National Historic District (contained with the Cedar Mesa SRMA), the Hole in the Rock Trail, and the Old Spanish National Historic Trail.

The proposed Comb Ridge CSMA would be managed for heritage tourism, OHV use would be limited to designated routes, the CSMA would be closed to dispersed camping (with camping only in designated areas), hiking would be allowed only on designated trails, and a campground would be developed in Comb Wash. These management decisions would be beneficial to recreation resources in the long-term by reducing the likelihood of recreation-related degradation or loss of recreational opportunities within the CSMA, and by enhancing the recreational experience from improved and/or expanded recreational facilities. The impacts on user groups would be variable; there would be beneficial recreational opportunities for scenic drivers, motorized, and mountain biking recreational user groups from a designated route/trail system and recreational facilities. The recreational opportunities for non-mechanized dispersed hiking, equestrian, backpacking, and specialized recreation would be few to none because of the prohibitions on dispersed camping; the low likelihood of satisfying recreational experiences that include solitude, a sense of remoteness and an undeveloped, natural environment; and the high likelihood of user conflicts between mechanized and non-mechanized user groups. Also under this alternative, recreation users would be required to obtain a permit to access Butler Wash east of Comb Ridge. The permit process would require viewing a video on low-impact recreation at Sand Island or the Kane Gulch Ranger Station. The impacts on the recreational experience caused by the additional travel time to and from these sites to watch a video would be adverse for all user groups (the Kane Gulch Station would be approximately 22 miles one-way from the entrance to Butler Wash), and there would be a potential for non-compliance with the permitting process for this area because of the perceived inconvenience, delay, and expense.

The proposed Tank Bench CSMA management decisions would have impacts on recreation resources similar to those discussed for Comb Ridge above, but to a lesser degree, as no recreational facilities are proposed for the area. The impacts on recreational user groups would be beneficial in the long-term for scenic drivers and non-motorized users (day hikers). The area is proposed as closed to OHV use, so the recreational opportunities for motorized OHV and

mountain biking recreational users would be few to none, with long-term, adverse impacts to these user groups. Closing the area to OHV recreational opportunities would have long-term, beneficial impacts to non-mechanized and specialized user groups, as resource user conflicts with motorized users would be reduced and the opportunities for solitude, quiet, and a sense of remoteness would be enhanced.

The proposed Beef Basin CSMA management decisions would have impacts on recreation resources similar to those discussed for Comb Ridge, as OHV use and hiking would be confined to designated routes, primitive car camping would be at designated sites only, and car camping facilities would be developed for primitive camping. The impacts on recreational user groups would be similar to that discussed for the Comb Ridge CSMA because this area would also be managed for heritage tourism, except that additional restrictions would be placed on specialized (rock climbing) user groups to protect rock art.

The proposed McLoyd Canyon-Moon House CSMA would have impacts on culturally related recreation resources similar to those discussed for Comb Ridge: camping would be restricted to designated areas, visitors would be prohibited from entering the Moon Room and adjoining rooms at Moon House and hiking would be allowed only on designated trails. These management decisions would have long-term, beneficial impacts on the recreation-related cultural resource by reducing the likelihood of recreation-related degradation or loss of recreational opportunities and experiences. There would be long-term, beneficial impacts on non-motorized users, and on non-mechanized users that do not require dispersed, remote recreational opportunities (i.e., day hikers) because the hiking and driving route restrictions would be more compatible with these user groups. The recreational opportunities for non-mechanized dispersed hiking and backpacking, motorized, scenic driver, and specialized recreation would be available within the surrounding Cedar Mesa SRMA with long-term, beneficial impacts on these users; however, management decisions to protect the cultural site would impose restrictions or controls on site visitation, pets, campfires, and waste management that could adversely reduce the level of satisfying recreational experiences within the CSMA.

As the proposed Grand Gulch National Historic District lies within a WSA, the restrictions on surface disturbances and activities that could potentially affect the area would be greater to preserve the wilderness characteristics of the WSA, as required by the IMP. The historic district would be closed to OHV use, with trails and camping areas designated as necessary to protect cultural resources. These management decisions would have long-term, beneficial impacts on culturally related recreation resources similar to those discussed for Comb Ridge CSMA above. The impacts on scenic drivers, motorized, mountain biking, and specialized mechanized user groups experiences would be long-term, substantial reductions in recreational opportunities. Activities associated with these activities would be prohibited within the WSA because of their potential for surface disturbances and the potential degradation of wilderness values. Non-mechanized users would benefit in the long-term because of the recreational opportunities for remote and dispersed camping, hiking, and backpacking.

Compared to Alternative A, this alternative would have more long-term, beneficial impacts on recreation resources within the proposed Comb Ridge, McLoyd Canyon-Moon House, Tank Bench and Beef Basin CSMA because recreation-related cultural resources would be protected and maintained and opportunities for education and interpretation would be preserved. Compared to Alternative A, the impacts to the proposed Grand Gulch Historic District under this alternative

would be negligible because the area would continue to receive protection under the area's WSA land status. Under this alternative, approximately 62,567 acres (including the current Grand Gulch Historic District) would be designated for protection of cultural resources. Compared to Alternative A, this alternative would have greater long-term, beneficial impacts on recreation resources because these areas would be managed for protection of their cultural/recreational resources under CSMA management plans. Compared to Alternative A, this alternative would have fewer recreational opportunities for user groups because protection-related management decisions would limit or prohibit some activities that would be allowed under Alternative A. Thus, there would be more adverse, long-term impacts to recreational opportunities under Alternative B than under Alternative A. However, unlimited use by recreation user groups under Alternative A would potentially create resource use conflicts between user groups. Alternative B, by limiting or prohibiting recreational activities in specified areas, would beneficially reduce resource use conflicts. When compared to Alternative A, Alternative B would have more certain long-term, beneficial impacts because reducing resource use conflicts would increase the likelihood that scenic driver, motorized OHV, mountain biking, and non-mechanized user groups would have satisfying recreational experiences.

4.3.10.3.1.3. Alternative C

The cultural resource management decisions on recreation resources would be similar to those discussed under Alternative B for the proposed Comb Ridge, McLoyd Canyon-Moon House, Tank Bench, and Beef Basin CSMA's because the management decisions would be similar. The Old Spanish National Historic Trail would have impacts similar to those discussed under Alternative B.

4.3.10.3.1.4. Alternative D

Under this alternative, Comb Ridge, Tank Bench and Beef Basin would not be managed as CSMA's. Comb Ridge would be managed for OHV use on designated routes. Beef Basin would prohibit climbing aids except as hiking route aids, develop a commercial campground in the Ruin Park area, and close campsites that degrade or adversely impact cultural sites. Management decisions under this alternative would be beneficial to recreation resources in the long-term, similar to those discussed under Alternative B, by reducing the likelihood of recreation-related degradation or loss of recreational opportunities within these areas, but to a lesser degree because these areas would be managed with fewer resource-protecting management decisions when compared to the other action alternatives. The impacts on user groups under this alternative would be more beneficial in the short-term because fewer restrictions and prohibitions on activities within these areas would create more opportunities for all user groups. In the long-term, the impacts on user groups would be adverse because of the potential for increased resource user conflicts and degraded recreational resources, as discussed under Alternative A. Compared to Alternative A, this alternative would have more beneficial impacts on recreation resources in the short term because of the proposed resource protection measures, but in the long-term the increased likelihood of recreation user conflicts and the likely degradation of recreation resources would have impacts similar to those discussed under Alternative A.

The impacts of management decisions under this alternative on the McLoyd Canyon-Moon House CSMA would be similar to those discussed under Alternative C because the management decisions are similar.

The impacts of management decisions on the Grand Gulch National Historic District would be similar to those discussed under Alternative C because the management decisions are similar.

4.3.10.3.1.5. Alternative E

Under this alternative, management decisions for the Beef Basin, Tank Bench, and the McLoyd Canyon-Moon House CSMA, the Old Spanish National Historic Trail, and the Grand Gulch Historic District would be similar to those discussed under Alternative B because the management decisions are similar to Alternative B. Under this alternative there are no lands with non-WSA wilderness characteristics that lie within these cultural/recreational areas (that might otherwise limit the recreation opportunities within these areas).

Within the Comb Ridge CSMA, 18,514 acres (49% of the area) would be managed to protect the wilderness values of the non-WSA lands with wilderness characteristics. The impacts on recreation resources would be beneficial in the long-term, similar to the discussion under Alternative B. Within the protected non-WSA lands with wilderness areas, the beneficial impacts to culturally related recreation resources would be enhanced by the increased restrictions on surface disturbances imposed by VRM Class I management objectives and prohibitions of OHV use. The impacts on resource user groups would be the same as discussed under Alternative B because the area's proposed recreational management decisions emphasizing heritage tourism would be the same. The impacts on recreation users from the permitting process for Butler Wash would be the same as discussed under Alternative B.

4.3.10.3.1.6. Proposed Plan

Under the Proposed Plan, the Grand Gulch National Historic District (37,388 acres), Comb Ridge and Butler Wash (30,752 acres) and McLoyd Canyon-Moon House (1,607 acres) would be managed as a recreation management zones (RMZs) within the Cedar Mesa SRMA. Tank Bench (2,646 acres) and Beef Basin (20,302 acres) would be managed as SRMAs, with emphasis on cultural resource protection. The impacts would be beneficial in the long term for all resource users because of the protective and preservation prescriptions applied to cultural resources within these recreation management areas, and from preservation of recreational opportunities for resource interpretation. The proposed Grand Gulch Historic District would have impacts similar to those discussed under Alternative B, but to a greater beneficial degree, because while the area would continue to be managed under WSA surface disturbance restrictions and because the cultural resource management decisions would be similar, additional recreational opportunities for pack animal camping would be available. The Old Spanish National Historic Trail would have impacts similar to those discussed under Alternative B.

4.3.10.3.2. IMPACTS OF LANDS AND REALTY DECISIONS ON RECREATION

There are no specific lands and realty management decisions under the alternatives and the Proposed Plan that are applicable to recreation. Management decisions common to all of the alternatives and the Proposed Plan that would potentially impact recreation resources include those proposed to protect Monticello PA resources during commercial filming projects. Management decision stipulations that require protection of habitat, soils, and cultural resources and prohibit the use of explosives or pyrotechnics or the introduction of exotic species would have short-term and long-term, beneficial impacts to recreation by preserving recreation resources. Prohibitions on pyrotechnics and explosives would have short-term, beneficial

impacts on opportunities for non-mechanized, river floating, specialized, and mountain biking user groups because the potential noise and light distractions caused by these devices would not be a source of disturbance to those who seek recreational opportunities that can provide solitude and/or minimal artificial distractions. Protection of soils, water, air, vegetation, and wildlife during filming projects would have long-term, beneficial impacts on all recreational users because maintaining recreational resources would increase the likelihood that they would have satisfactory recreational experiences.

Management decisions common to all of the action alternatives and the Proposed Plan would establish avoidance and exclusion areas for proposed ROWs. These areas would include non-WSA lands with wilderness characteristics (under Alternative E and the Proposed Plan), ACECs, WSAs, WSR segments, developed recreation sites, and special emphasis and hiking areas. The impacts on recreation would be similar to the above discussion: long-term, beneficial protection of resources from surface disturbances, which would benefit all user groups because opportunities would be maintained for satisfying recreational experiences.

4.3.10.3.3. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON RECREATION

Under all of the alternatives and the Proposed Plan, 128,098 acres would be unavailable for livestock grazing because of vegetation, wildlife, recreation, or other resource concerns. This would have long-term, beneficial impacts on all user groups, as high scenic quality and naturalness are generally common to all recreational user expectations. Cattle tend to disrupt the backcountry experience sought by hikers, mountain bikers, and backpackers because of the presence of manure along trails and at camp sites, the consumption of wildlife forage (that potentially reduces wildlife viewing opportunities), and surface disturbances that contribute to soil compaction and soil erosion and indirectly exacerbate the opportunities for exotic species establishment and spread. Proper grazing management through the livestock grazing standards and guidelines would reduce these impacts to all recreation user groups.

4.3.10.3.3.1. Alternative A

Alternative A would make 16,599 acres, which are included in the total 128,098 closed acres and discussed above, unavailable to livestock grazing within the 5 side canyons of Comb Wash (Mule (south of highway U-95), Arch, Fish, Owl, and Road canyons). The impacts on recreation resources and resource user groups in these areas would be beneficial in the long-term, for reasons as discussed above.

4.3.10.3.3.2. Alternative B

This alternative would make 13,062 additional acres unavailable for livestock grazing. Alternative B would also develop additional seasonal use restrictions and forage utilization limits on grazing in riparian areas found to be Functioning At Risk and Non-Functional, potentially closing land available for livestock grazing. These management decisions would have beneficial, long-term impacts on recreation resources and on recreational opportunities for resource users, as discussed under Alternative A.

4.3.10.3.3.3. Alternative C

Alternative C would have impacts on recreation resources and users similar to those discussed under Alternative B because the proposed management decisions would be similar (except for altered areas unavailable for grazing in Mule Canyon (south of U-95 only)). Compared to Alternative A, this alternative would have impacts similar to those discussed under Alternative B for the same reasons.

4.3.10.3.3.4. Alternative D

Alternative D would make approximately 13,062 acres within the Monticello PA unavailable for livestock grazing, with impacts on recreation resources similar to those discussed under Alternative B because the proposed management decisions would be similar. Compared to Alternative A, this alternative would have similar impacts on recreation resources, but to a slightly more beneficial degree, because the number of acres unavailable for livestock grazing would be slightly higher (a 1% increase in exclusions compared to Alternative A).

4.3.10.3.3.5. Alternative E

The impacts of this alternative on recreation would be the same as discussed under Alternative B because the proposed grazing decisions are the same.

4.3.10.3.3.6. Proposed Plan

The Proposed Plan would have impacts on recreation resources and users similar to those discussed under Alternative B because the proposed management decisions would be similar (except for additional areas unavailable for grazing in south Mule Canyon). Compared to Alternative A, the Proposed Plan would have impacts similar to those discussed under Alternative B, for the same reasons.

4.3.10.3.4. IMPACTS OF MINERALS DECISIONS ON RECREATION

4.3.10.3.4.1. Alternative A

Under Alternative A, approximately 1,238,230 acres would be available under standard stipulations and timing and controlled surface use leasing stipulations for oil and natural gas exploration and development (69% of the planning area). It should be noted, however, that the RFD predictions for minerals development are that an average total of 73 natural gas or oil wells would be drilled, with a total surface disturbance of approximately 699 acres within 15 year after approval of the proposed RMP. Under this alternative, the predicted surface disturbances on BLM-administered lands within the planning area from geophysical activities over the lifetime of the proposed RMP would be 886 acres. All of the geophysical surface disturbances would be reclaimed within 10 years. Also, locatable and salable minerals development (e.g., uranium, vanadium, and gold mining; sand, gravel, stone, limestone, and clay quarrying) would cause approximately 851 acres of surface disturbances within 15 years after approval of the proposed RMP. Thus, the expected potential disturbance from oil and natural gas exploration and development and related disturbances would be 2,436 acres or approximately 0.14% of the planning area.

The impacts on recreation resources from the drilling of approximately 73 oil or gas wells within the Monticello PA and other minerals activities would be minor because of the very small area of potential surface-disturbance impacts and the likelihood that this relatively small area would potentially impact visual/scenic quality to a minor degree. Additional long-term, beneficial motorized OHV recreational opportunities may be created along oil and gas well access roads if these roads were open for public access, but the impacts on these recreational opportunities would be minor, as the access roads would be short spur roads from existing roads within the planning area and the access roads would be reclaimed at the end of the well lifecycle. The impacts on recreational resource user groups that expect to experience naturalness, isolation, and high levels of scenic quality (non-mechanized, mountain biking, specialized, and river floating users) would be negligible to minor in the long-term because all wells located within high-scenic quality viewsheds (designated VRM Class I and Class II areas) would be required to meet visual resources objectives so that the visual intrusions are either hidden from or not noticeable to the casual viewer.

4.3.10.3.4.2. Alternative B

Under Alternative B, approximately 1,241,909 acres would be available under standard stipulations and timing and controlled surface use leasing stipulations for oil and natural gas exploration and development. The potential impacts of mineral exploration and development on recreation resources and resource user groups would be the same as discussed above under Alternative A because the RFD forecast for minerals development within the planning area would be similar. Under this alternative, the RFD predicts that an average of 66 wells would be drilled during the next fifteen years causing surface disturbances on approximately 636 acres. The predicted surface disturbances within the planning area from geophysical activities over the next fifteen years would be 794 acres, and disturbances caused by salable and locatable minerals development would be 851 acres (the same as Alternative A). The expected total disturbance under this alternative would be approximately 2,281 acres, with total reclamation of geophysical disturbances within 10 years of the activity. Compared to Alternative A, the expected potential disturbance from oil and natural gas exploration and development and geophysical activities would be the same (approximately 0.13% of the planning area). The impacts to recreation resources and users would be the same as discussed under Alternative A.

4.3.10.3.4.3. Alternative C

Under this alternative, approximately 1,348,973 acres would be available under standard stipulations and timing and controlled surface use leasing stipulations for oil and natural gas. The potential impacts on recreation resources and recreation users would be similar to those discussed above under Alternative A because the RFD predicts that an average of 74 wells would be drilled during the next fifteen years, with total surface disturbances of approximately 710 acres, 851 acres of disturbance from salable and locatable minerals development, and approximately 903 acres of surface disturbances from geophysical activities, totaling 2,464 acres (or 0.14% of the planning area). The expected potential disturbances from oil and natural gas exploration and development and other minerals activities would be similar to those discussed under Alternative A.

4.3.10.3.4.4. Alternative D

Under Alternative D, approximately 1,383,283 acres would be available under standard stipulations and timing and controlled surface use leasing stipulations for oil and natural gas. The expected potential disturbance from oil and natural gas exploration and development and geophysical activities would be similar to those discussed under Alternative A because the RFD predictions would be similar: an average of 75 wells drilled within 15 years after approval of the proposed RMP, with approximately 721 total acres of surface disturbances, 851 acres of disturbances from salable and locatable minerals development, and 924 acres of geophysical-related surface disturbances, totaling 2,496 acres (or 0.14% of the planning area). The impacts to recreation resources and user groups would be the same as discussed under Alternative A.

4.3.10.3.4.5. Alternative E

Under this alternative, approximately 582,360 acres of lands with non-WSA wilderness characteristics would be closed to minerals leasing and locatable and salable minerals disposal. This would reduce the area of potential surface disturbances from oil and gas development on lands leased under standard and timing and controlled surface use stipulations to 758,931 acres (a reduction of approximately 45% compared to Alternative A). The RFD prediction for oil, gas, and geophysical activities under this alternative would be a total of 54 wells drilled with expected surface disturbances on 519 acres, 851 acres of disturbances caused by salable and locatable minerals development, and 761 acres of disturbances caused by geophysical exploration, with a total surface disturbance of 2,131 acres. The adverse impacts on recreation from RFD-predicted activities would be similar to those discussed under Alternative A, but to a lesser degree, because more area would be protected from potential surface disturbances within those lands with non-WSA wilderness characteristics.

4.3.10.3.4.6. Proposed Plan

Under the Proposed Plan, approximately 1,224,807 acres would be available under standard stipulations and timing and controlled surface use leasing stipulations for oil and natural gas. The potential impacts on recreation resources and recreation users would be similar to those discussed above under Alternative A because the RFD predicts that an average of 72 wells would be drilled during the next fifteen years, with total surface disturbances of approximately 692 acres, 851 acres of disturbance from salable and locatable minerals development, and approximately 903 acres of surface disturbances from geophysical activities, totaling 2,446 acres (0.14% of the planning area). The expected potential disturbance from oil and natural gas exploration and development would be similar to Alternative A.

4.3.10.3.5. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON RECREATION

4.3.10.3.5.1. Alternatives A – D

Non-WSA lands with wilderness characteristics are not managed to retain their wilderness values under these alternatives. The impacts on recreation resources and user groups would be negligible because there are no management decisions that affect recreation.

4.3.10.3.5.2. Alternative E

Areas with non-WSA wilderness characteristics would be managed under Alternative E and the Proposed Plan only, with a total of 165,831 acres of non-WSA areas with wilderness characteristics that lie within Alternative E-proposed SRMAs. Recreation resources within the proposed SRMAs that contain these areas would receive increased beneficial protection from surface disturbances through management decisions to preserve the wilderness values within the non-WSA wilderness areas. These protective decisions would include closing the areas to OHV travel, managing under VRM Class I objectives to preserve high scenic quality, closing the areas to mineral materials disposal, managing as ROW exclusion areas, and prohibiting private and commercial woodland harvesting.

The impacts on primitive recreation users would be beneficial because naturalness, solitude, and outstanding opportunities for primitive recreation would be preserved and enhanced from closure/restrictions on surface-disturbing activities and other uses on a total of 582,360 acres of non-WSA lands with wilderness characteristics under Alternative E.

There could be adverse impacts to some specialized user groups because no competitive, motorized, or mountain biking events would be permitted in non-WSA lands with wilderness characteristics. Specialized recreational activities (e.g., rock climbing or BASE jumping) that would potentially degrade wilderness values could be restricted or prohibited. Prohibitions on OHV travel in these areas and on specialized activities that could degrade wilderness would have long term, adverse impacts on mechanized and specialized recreation user groups. Approximately 491,628 total acres of non-WSA lands with wilderness characteristics areas would be protected within the ERMA through the same decisions and with the same impacts on recreation resources and user groups as discussed above. Compared to Alternative A, Alternative E would be more beneficial to recreation resources and non-mechanized users because those areas protected as non-WSA wilderness characteristics areas would retain their wilderness values, and retain recreational resources for more non-mechanized recreational opportunities (where solitude, naturalness, and a sense of remoteness are desired experiences) in the long-term than under Alternative A. For mechanized users, this alternative would be more adverse than Alternative A because opportunities for OHV and mountain biking activities would be substantially reduced.

4.3.10.3.5.3. Proposed Plan

The Proposed Plan would manage a total of 13,600 acres of non-WSA lands managed for wilderness characteristics that lie within SRMAs. Recreation resources within the proposed SRMAs that contain these areas would receive increased beneficial protection from surface disturbances through management decisions to preserve the wilderness values within the non-WSA wilderness areas. These protective decisions would include managing under VRM Class II objectives to retain scenic quality, closing the areas to mineral materials disposal, limiting OHV travel to designated routes, prohibiting woodland harvesting, and managing as ROW avoidance areas. The impacts on primitive recreation users would be beneficial because naturalness, solitude, and outstanding opportunities for primitive recreation would be preserved and enhanced from closure/restrictions on surface-disturbing activities and other uses on a total of 88,871 acres of non-WSA lands with wilderness characteristics under the Proposed Plan. Compared to Alternative A, the Proposed Plan would be more beneficial to recreation resources and users because those areas protected as non-WSA wilderness characteristics areas would retain their

wilderness values, and would manage these areas for more recreational opportunities in the long-term for most user groups than under Alternative A: a broader range of mechanized and non-mechanized recreational opportunities would be available in non-WSA lands with wilderness characteristics under the Proposed Plan.

4.3.10.3.6. IMPACTS OF RECREATION DECISIONS ON RECREATION

General analysis assumptions on the impacts to recreation user groups are discussed above in Section 4.3.10. Additionally, it is assumed for analysis purposes that in order to reduce resource use conflicts and to preserve recreation resources, management decision restrictions or limitations on private and commercial recreational opportunities would have both beneficial as well as adverse impacts on recreation user groups. Restrictions on resource use would have long-term beneficial impacts on those recreational user groups that seek experiences associated with a natural, undeveloped, or pristine environment; remoteness; and solitude (in general, river floating, non-mechanized, and mountain biking groups) because restrictions would reduce the likelihood of crowding and resource use conflicts and increase the perception of solitude and remoteness, thus increasing the likelihood of satisfying recreational experiences for these groups. Related to this is the assumption that resource restrictions on commercial permits and commercial group sizes would create more long-term, beneficial recreational opportunities for private, non-commercial users for the same reasons as discussed above: less crowding within a river corridor or on a biking or hiking route would increase the perception of solitude and remoteness, which would increase the likelihood of a satisfying experience for users who seek these recreational qualities.

It is assumed that the proposed restrictions on resource use would also cause short-term, adverse access-related impacts, as users would be denied the opportunity to recreate in a given area, as well as create competition for day use and camping permits for private and commercial uses. These potential reductions in commercial use would reduce recreational opportunities for those users who would rely on a commercial outfitter or a permitted activity for their recreational experiences.

Analysis assumptions for recreation-related waste management and the use of fire pans include the following: by minimizing the amount of waste found around popular recreational areas, it is assumed that the short-term inconvenience of removing or burying waste would be outweighed by the long-term beneficial impacts to the recreational experience that include preservation of visual resources, human health benefits, and maintenance of unspoiled natural and cultural resources. The use of fire pans would have short-term and long-term beneficial impacts on recreation resource and opportunities because they would reduce the risk of recreation-caused wildland fire that could destroy recreation resources. Short-term beneficial impacts would include the safety of those recreating within an area, while the long-term beneficial impacts would include the preservation of the natural and cultural resources within the Monticello PA. A summary of the data contained within the proposed recreation management decisions (and used in the analysis), by alternative, is shown below in Tables 4.84, 4.85, and 4.86 and in Maps 36–40.

4.3.10.3.6.1. San Juan River SRMA

Alternative A

Under this alternative, recreation management decisions would continue under current conditions, and the 15,100-acre San Juan River SRMA would continue to be impacted by conditions and trends as discussed in the Chapter 3 Recreation Section 3.11.2.5.

Current management decisions for river use include restrictions on motorized use, launch limits of 40,000 user days per year, limitations on group size, and a 50% commercial use limitation of total river use. Launch limits and commercial and group limits currently allow recreational opportunities for a large number of users. However, based on the recreational expectations of the river floating user group discussed in Section 4.3.10, the permitted use of motorized boating and the large number of permitted river floaters would reduce the likelihood of a satisfactory recreational experience for those users expecting to experience isolation, a pristine and non-motorized environment, and remoteness. The large percentage of commercial use would also limit, in the short-term, the river recreational opportunities of private users because half the allocation for permitted river use would only be available to commercial users.

Table 4.114. Summary of Recreation Management Decision Analysis Data for Special Recreation Management Areas (SRMAs)

	Decision Type	Alternative A	Alternatives B and E	Alternative C	Alternative D	Proposed Plan
San Juan River SRMA						
	Launch limits (user days/year)	40,000	30,000	40,000	45,000	40,000
	Trip size (group #)	25	20	25	35	25
	Commercial (% of total trips per day)	50%	30%	40%	50%	40%
Cedar Mesa SRMA						
Mesa Top Day Use	Trip size (group #) private and commercial	No Limit	10	12	12	24
Mesa Top Camping	Trip size (group #) private and commercial	No Limit	12	24	No Limit	24
	Dispersed vs. designated camping	Dispersed	Designated only	Designated 12–24 users	Designated 24+ users	Designated 20–24 users
In Canyon Day Use, Private	People per day per trailhead	No Limit	10	12	12	12
In Canyon Day Use, Commercial	Trip size (group #) per day	12	10	12	12	12
	Groups per day per trailhead	No Limit	1	1	2	1
In Canyon Permitted	Trip size (group #)	12	10	12	12	12
Overnight Camping	Dispersed vs. designated camping	Designated only	Designated up to 4–10 users	Designated 8–12 users	Designated 8–12 users	Designated 8–12 users
Private Use	Trip size (group #) per day	12	6	8	12	8
Commercial Use	Trip size (group #) per day	12	10	12	12	12
	Groups per day per trailhead	1	1	1	1	1
Trailhead Allocations, Overnight Visitors Per Day:	Kane	26	16	20	24	20
	Bullet	22	16	20	24	20
	Government	12	16	20	24	20

Table 4.114. Summary of Recreation Management Decision Analysis Data for Special Recreation Management Areas (SRMAs)

	Decision Type	Alternative A	Alternatives B and E	Alternative C	Alternative D	Proposed Plan
	Collins	22	16	20	24	20
	Fish/Owl	26	16	20	24	20
	Road Canyon	22	16	20	24	20
	Lime Creek	22	16	20	24	20

	Slickhorn Canyons	22	16	20	24	
Dark Canyon SRMA						
	Trip size (group #) private	No limit	10	15	15	18
	Commercial	No limit	12	15	15	18
	Commercial trips per week	No limit	1	3	7	3
	Total private users per day	No limit	15	20	No limit	20

Table 4.115. Summary of Recreation Management Decision Analysis Data, Special Recreation Permits (SRPs)

Decision Type	Alternative A	Alternative B	Alternative C	Alternative D	Proposed Plan
Private Use					
Day use organized event in ERMAs	N/A	25 people	50 people	75 people	50 people
Overnight group or event in ERMA	N/A	15 people	25 people	50 people	25 people
Group OHVs on designated routes	N/A	15 OHVs	25 OHVs	No limit	25 OHVs
Mountain biking on designated routes	N/A	15	25	No limit	25
Group of riding/pack animals	N/A	10 animals	15 animals	20 animals	15 animals
Car camping	N/A	10 vehicles or 50 people	15 vehicles or 50 people	20 vehicles or 50 people	15 vehicles or 50 people
Commercial Use					
Groups size limits for commercial motorized events	Any commercial use	2 groups of 12 vehicles/day	Same as Alternative B	2 groups of 25 vehicles/day	Same as Alternative B

Table 4.115. Summary of Recreation Management Decision Analysis Data, Special Recreation Permits (SRPs)

Decision Type	Alternative A	Alternative B	Alternative C	Alternative D	Proposed Plan
Balloon festivals limits	Any commercial use	35 balloons	Same as Alternative B	Same as Alternative B	Same as Alternative B
Special OHV event limits	Any commercial use	350 total vehicles	Same as Alternative B	Same as Alternative B	Same as Alternative B
Commercial hiking in Comb and Butler Wash	Any commercial use	10 individuals	Same as Alternative B	N/A	Same as Alternative B

Table 4.116 SRMA Acreages, Under All Alternative and the Proposed Plan

SRMA	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Tank Bench	0	0	0	0	0	2,646
Beef Basin	0	0	0	0	0	20,302
San Juan River	15,100	10,203	9,859	6,365	9,859	9,859
Cedar Mesa	385,000	375,739	375,739	375,739	375,739	407,098
Dark Canyon	214,390	30,820	30,820	30,820	30,820	30,820
Indian Creek	0	89,271	89,271	89,271	89,271	89,271
White Canyon	0	2,828	2,828	2,828	2,828	2,828
Total	614,490	508,861	508,517	505,023	508,517	562,824

Under this alternative, vehicle access and camping would be restricted between Comb Wash and Lime Creek, and below Mexican Hat Bridge, which would have long-term, adverse impacts on non-river floating users by maintaining restrictions on recreation-related travel opportunities for access to and recreation within the SRMA. Other proposed management decisions would minimize resource use conflicts by designating certain reserved campsites along the river corridor, with timing stipulations that permit only one-night stays at each campsite. This would have beneficial, short-term impacts on the river recreational experience by dispersing users along the river corridor, which would reduce the perception of crowding and the impacts of human noise. Under this alternative, the permitted levels of visitation and the lack of resource protection management decisions would continue to have potentially long-term impacts to recreation resources because, as discussed in Section 3.11.2.5.1, intense river use and associated human-caused surface disturbances along the river corridor would continue to disturb riparian vegetation, create conditions for the spread of invasive species, impact special status species habitat, and degrade cultural resources.

Alternative B

Alternative B would manage the San Juan River as a 10,203-acre SRMA for the purposes of providing opportunities to engage in backcountry private and commercial river running, backcountry hiking and camping, horseback riding, and cultural site visitation. This alternative would designate and manage motorized boating within the San Juan River corridor for emergency use only. Riparian resources would be protected and launch limits would be set at 30,000 user days per year to improve the river running experience, with trip sizes limited to 20 people. Under this alternative, commercial users would also be restricted to 30% of the total river use. The impacts of these management decisions on river floating users would be beneficial in the long-term because the river floating experience would potentially be enhanced by creating conditions that reduce river use crowding and motorized noise and increase the sense of remoteness, solitude, and a pristine, natural environment. The opportunities for private users of the river would be beneficially increased in the long-term, while commercial river user recreational opportunities would be proportionally reduced. The proposed reductions in commercial river permits would also create increased competition among outfitters and those who would rely on a commercial outfitter for their recreational river opportunities within the SRMA because the opportunities for a commercially based river experience would be limited by the available permits. Under this alternative, vehicle camping restrictions would be limited to areas upstream of Comb Wash, and the bench above Sand Island would be closed to vehicle camping, and all areas within one-half mile of designated campsites would exclude vehicle camping. This would have long-term, beneficial impacts on river floating users by increasing the recreational opportunities for solitude and a sense of remoteness, but would limit the river recreational opportunities for all other user groups.

The land on the south bank of the San Juan River is owned by the Navajo Nation and camping is currently not permitted. Under this alternative, an MOU allowing camping on the south bank would be negotiated between the BLM, the NPS, and the Navajo Nation. If an MOU were agreed to, this management decision would potentially have long-term beneficial impacts on recreational opportunities for backcountry-river camping because the opportunities would be increased. The reduction in permits would have long-term, beneficial impacts on river floating recreational user groups because these conditions would increase the likelihood for a satisfactory

river floating experience in which a sense of isolation and a primitive backcountry experience is an important recreational expectation.

Under this alternative, vehicle camping would be allowed upstream of Comb Wash only, with exceptions along Lime Creek Road, the Mexican Hat Rock area, and the Mexican Hat Boat Ramp. Further restrictions under Alternative B would include closing the bench above Sand Island Recreation Area to vehicle camping and closing camping within one-half mile of designated campsites. Lime Creek Campground would be reserved for river runners only. Limiting the availability of camp sites and access along the river would potentially create a higher density of camping sites and a higher number of user impacts in areas where camping is allowed. This would potentially impact non-mechanized, specialized, and mountain biking users by degrading the overall recreational experience because the opportunities for isolation and a sense of remoteness would be marginally reduced. However, this would be offset somewhat by the designation of the Lime Creek campground (with designation contingent on project funding), which would decrease competition for campsites among river runners themselves, as well as between river runners and other recreationists. Livestock grazing restrictions and prohibitions on woodland harvesting under this alternative would have long-term, beneficial impacts on riparian resources and on the recreation resource components that lie along and within the riparian corridor, including wildlife habitat, vegetation, and scenic quality.

When compared to Alternative A, this alternative would reduce the number of annual launch limits from the current 40,000 under Alternative A to 30,000 user days per year. This 25% reduction in permitted use would increase the likelihood of satisfactory river recreational experiences where the expectation includes a sense of remoteness and solitude, and would reduce potential user conflicts and impacts on the resource by allowing river users to be more widely dispersed along the river corridor. Compared to Alternative A, Alternative B would have potentially greater long-term beneficial impacts on river floating users because it reduces the number of annual river permits, which would create more of an experience of solitude and a sense of isolation for those floating the river. However, this alternative would have more short-term, access-related recreational opportunity impacts on those potential river users who were unable to obtain permits to float the river. Compared to Alternative A, this alternative would have more beneficial preservation-related impacts on riparian resources. The long-term outcome of increasing the likelihood for satisfying private and commercial river running, backcountry, and cultural visitation recreational experiences within the proposed SRMA would include an enhanced appreciation for the area's cultural heritage, mental health maintenance from experiencing a quiet and natural environment, an improved sense of well-being from physical exercise, personal growth and development, an enhanced appreciation of the natural environment, tourist revenue from permits, and stimulation and a sense of achievement from river running challenges and risks.

Compared to Alternative A, Alternative B would reduce the size of the San Juan River SRMA to 10,203 acres (a 30% reduction in area compared to the 15,000 acres under Alternative A); however management decisions under Alternative B would seek to purchase private property and/or land development rights along the river to expand recreational areas within the SRMA boundary. This would have beneficial impacts on river recreation, if land purchases or development rights were acquired.

Alternative C

General management decisions under Alternative C would be the same as discussed under Alternative B, with similar impacts on recreation resources and resource users.

Management decisions under this alternative would allow motorized boating on the river, with impacts as discussed under Alternative A. An MOU with the Navajo Nation and the NPS would be sought under this alternative, and proposed designated camping and camping restrictions along the river corridor would have impacts as discussed under Alternative B. Commercial river use would be allowed up to 40% of the total river use, with impacts to recreational river users similar to those discussed under Alternative B. Launch limits of 40,000 user days per year would have impacts to recreation similar to those discussed under Alternative A because the management decisions are similar. The vehicle camping restrictions under this alternative would be the same as Alternative B, with similar impacts to recreation user groups. The impacts of grazing restrictions and woodland harvesting prohibition under this alternative would be the same as discussed under Alternative B because the management decisions are the same.

Compared to Alternative A, this alternative would manage the SRMA as 9,859 acres (a 33% reduction in size), with more potentially adverse impacts to recreational resources under Alternative C because the area managed for recreational resource protection would be reduced. Restrictions on grazing and woodland harvesting would have more beneficial impacts on recreation than Alternative A because recreation resources would receive more protection, and more designated campsites (assuming a successful, mutually beneficial MOU with the Navajo Nation and the NPS) would have more beneficial impacts on recreation user groups than under Alternative A. Under this alternative, the SRMA would be managed to maintain opportunities for remoteness and isolation within the bounds imposed by the permit and patrol system, which would be more beneficial to river users than Alternative A because Alternative A would not address these recreation qualities. Alternative C would have similar motorized boating and launch limit impacts as Alternative A.

Alternative D

General management decisions would be the same as discussed under Alternative B, with similar impacts on recreation resources and resource users.

Specific management decisions under this alternative would establish launch limits at 45,000 user days per year, motorized boating would be allowed, trip sizes would be limited to 35 individuals per trip, and commercial/private permit allocations would be evenly split. The impacts of these management decisions on recreational river users would be similar to those discussed under Alternative A. Management decisions to increase the number of designated campsites through an MOU with the Navajo Nation and the NPS with the purpose of reducing resource user conflicts along the river would have impacts similar to those discussed under Alternative B. Under this alternative, vehicle camping restrictions would be limited to the Sand Island area and all areas within one-half mile of designated campsites. This would have long-term, beneficial impacts on non-river floating recreation users by increasing the recreational opportunities for access to and recreation within the SRMA for scenic drivers, motorized, mountain biking, non-mechanized, and specialized recreation resource users.

Compared to Alternative A, the boundary of the SRMA under Alternative D would be reduced to 6,365 acres (a 58% reduction), thereby reducing the number of acres managed specifically for

recreational opportunities and SRMA recreation resource protection. However, while the SRMA boundary would be reduced when compared to Alternative A, those areas remaining within the proposed SRMA would receive greater resource protection than under Alternative A because more management decisions would be proposed to beneficially reduce resource use conflicts, protect recreation resources, and apply adaptive management to the SRMA for the protection of recreational resources and maintain and/or enhance recreational opportunities than would occur under Alternative A.

Alternative E

The impacts on recreation within the San Juan River SRMA would be the same as discussed under Alternative B for a portion of the SRMA (the area outside the non-WSA lands with wilderness characteristics).

Approximately 4,124 acres (40% of the proposed San Juan River SRMA) of non-WSA lands with wilderness characteristics lie within the San Juan River SRMA. Under Alternative E, the impacts to recreation for this SRMA would be that recreation resources would receive increased protection from surface disturbances through management decisions to preserve the wilderness values within the non-WSA wilderness characteristics areas. These protective decisions would include closing the areas to OHV travel, management under VRM Class I objectives to preserve high scenic quality, closure to firewood gathering, and closure to mineral leasing and mineral materials disposal.

The impacts on primitive recreation users would be beneficial because naturalness, solitude, and outstanding opportunities for primitive recreation would be preserved and enhanced from closure/restrictions on surface-disturbing activities and other uses on 4,124 acres in non-WSA lands with wilderness characteristics.

Proposed Plan

The management decisions under the Proposed Plan would be the same as discussed under Alternative C, with very similar impacts on recreation resources and resource users.

4.3.10.3.6.2. Cedar Mesa C-SRMA

Alternative A

Under Alternative A the area proposed as Cedar Mesa C-SRMA (under the action alternatives) would continue to be managed as part of the current 385,000-acre Grand Gulch Plateau SRMA. Camping would be allowed only at designated campsites, campfires would be prohibited, pets would be under human control at all times and excluded from sensitive sites, stock animal use would require a permit, and specified areas within the SRMA would be open or closed to stock animal use and subject to length of stay restrictions. Group sizes would be limited and stock animal herding would be prohibited and excluded from water sources and other sensitive sites. Stock use would be limited to existing trails. All of these management decisions would have long-term, beneficial impacts within the SRMA because these decisions would maintain the cultural and natural resource recreational opportunities within the SRMA by reducing or minimizing recreation user group impacts. Recreation user groups most likely to benefit from these management decisions would be those seeking primitive, dispersed, and remote recreational opportunities (non-mechanized hikers, equestrian, and stock animal users).

Alternatives B

The management decisions under Alternative B would establish the current Grand Gulch SRMA as the 375,739-acre Cedar Mesa Cultural SRMA (C-SRMA). The C-SRMA would be managed to provide cultural appreciation/interpretive related recreation, and backcountry to front country recreational opportunities. These opportunities would include rock art viewing, hiking, horseback riding, OHV riding, and camping. Pet and stock animal restrictions would be the same as discussed under Alternative A with additional stipulations that would exclude these animals from canyons requiring permits, which would have additional beneficial, preservation-related impacts on recreational resources. Woodland harvesting and collecting prohibitions and potential vegetation treatments and wildlife improvements within the proposed C-SRMA would also have long-term, beneficial protection-related impacts on recreation resources. There would be short-term impacts on vegetation and scenic quality from surface disturbances caused by vegetation and range treatments, as discussed under Fire Management. Under this alternative, dispersed camping would be allowed except in cultural at-risk areas, but permits would be required for a limited number of overnight camping and day hiking groups to preserve sensitive cultural resources. This would have long-term, beneficial impacts on recreation resource users by expanding the opportunities for remote, dispersed, backcountry recreational experiences by non-mechanized, mountain biking, and motorized user groups while still preserving sensitive recreational resources. The potential outcome of these recreational opportunities would be a greater likelihood for an appreciation and understanding of the natural environment and the area's cultural heritage, improved physical health and fitness from exercise, positive contributions to the local economy and increased revenues from tourist revenue, personal growth and development by confronting physical challenges in a remote setting, and maintenance of mental health from relaxation in an uncrowded, remote, and physically stimulating environment.

Compared to Alternative A, this alternative would have impacts that are more beneficial to recreational opportunities by allowing dispersed camping within the C-SRMA. There would be more long-term beneficial impacts to recreational resources under this alternative when compared to Alternative A because permitted vegetation, range, and wildlife improvements would enhance the recreational experience (e.g., improved wildlife habitat that would potentially increase the likelihood of satisfying wildlife observation experiences, a healthy mosaic of vegetation that provides a natural wilderness-like experience and better sight-seeing, etc.).

Alternative C

This alternative would have management decisions and impacts similar to those discussed under Alternative B (except for those decisions addressing pet and stock animal issues) because the management decisions are similar. Pet and stock animal-related management decisions would be similar to those discussed under Alternative A except that greater limitations would be applied to stock day use under Alternative C. Stock day use would be limited to one party per day per trailhead in all canyons requiring permits, which would have short-term, adverse, but minor, limitation-related impacts on stock use recreational opportunities for this user group, but long-term, beneficial impacts on the recreational resource through resource preservation. Also, greater limitations would be placed on pets and stock animals if resource monitoring and management determined that the presence of these animals was adversely affecting recreational resources. The impacts of this decision on recreational opportunities or resource user groups would be negligible to minor because pets are not an integral component of recreational resources or

opportunities within the C-SRMA and alternative stock trails and recreational opportunities would be available within the C-SRMA. The benefits from the recreational opportunities provided under this alternative would be similar to those discussed under Alternative B.

This alternative would have more beneficial impacts on recreation and resource users than Alternative A for reasons similar to those discussed under Alternative B because the management decisions are similar: more opportunities would be available for dispersed recreation, and more resource protection-related management decisions would be applied than under Alternative A to ensure the maintenance and preservation of recreation resources.

Alternative D

Alternative D would have management decisions and impacts similar to those proposed under Alternative C because the management decisions are the same, except for those decisions addressing pets and stock animals. Under this alternative, pets and stock would be prohibited or have limitations placed on their presence if monitoring determined they were causing adverse impacts to resources within the C-SRMA. Otherwise, stock and pet management decisions and impacts would be the same as discussed under Alternative A.

Compare to Alternative A, this alternative would have more beneficial impacts on recreational opportunities and resources for reasons similar to those discussed under Alternative B because the management decisions are similar. Pet and stock-animal management decisions would be more beneficial than Alternative A because greater limitations or prohibitions would potentially be placed on them under this alternative to protect recreation resources.

Alternative E

Under this alternative, the impacts on recreation would be the same as discussed under Alternative B, except that approximately 109,700 acres (29% of the proposed C-SRMA) would be protected from surface disturbances to preserve the wilderness values within non-WSA lands with wilderness characteristics. This would beneficially impact recreational resources within these areas through the application of greater restrictions and prohibitions on surface disturbances, including mineral leasing closure, no off-route OHV use, designation as VRM Class I, and closing these areas to firewood collection and woodland harvesting. The impacts on non-mechanized resource user groups would be the same as the discussion under Alternative B because the opportunities for remote, dispersed, backcountry experiences would remain. However, the exclusion of OHV motorized (and mountain biking) travel within the non-WSA wilderness characteristics areas would have adverse impacts on OHV recreational opportunities within these areas. In comparing this alternative with Alternative A, Alternative E would have more beneficial impacts on non-mechanized users, but more adverse impacts on mechanized users because of the restrictions placed on non-WSA lands with wilderness characteristics within the C-SRMA.

Proposed Plan

The Proposed Plan would manage Cedar Mesa as a SRMA, but would have management decisions and impacts similar to those discussed under Alternative B (except for those decisions addressing pet and stock animal issues, emphasis zones, and non-WSA lands with wilderness characteristics [see below]) because the management decisions are similar. Pet and stock animal-related management decisions would be similar to those discussed under Alternative A except

that greater limitations would be applied to stock day use under the Proposed Plan. Stock day use would be limited to one party per day per trailhead in all canyons requiring permits, which would have short-term, adverse, but minor, limitation-related impacts on stock use recreational opportunities for this user group, but long-term, beneficial impacts on the recreational resource through resource preservation. Also, greater limitations would be placed on pets and stock animals if resource monitoring and management determined that the presence of these animals was adversely affecting recreational resources. The impacts of this decision on recreational opportunities or resource user groups would be negligible to minor because pets are not an integral component of recreational resources or opportunities within the SRMA and alternative stock trails and recreational opportunities would be available within the SRMA. The benefits from the recreational opportunities provided under the Proposed Plan would be similar to those discussed under Alternative B.

Under the Proposed Plan, the 375,739-acre Cedar Mesa SRMA would include two emphasis zones: Comb Ridge (30,752 acres) and McLoyd Canyon-Moon House (1,607 acres), for a total SRMA acreage of 407,098 acres. The emphasis within these zones would be placed on cultural resource protection and recreational use, which would benefit scenic driving, OHV users, non-motorized (mountain biking), and non-mechanized users that seek cultural resource interpretive experiences.

Under the Proposed Plan, 13,600 acres (4% of the proposed Cedar Mesa SRMA) would be managed as non-WSA lands with wilderness characteristics for the preservation of wilderness values. Beneficial, minor impacts to recreation resources and user groups would result from the additional restrictions or prohibitions on surface disturbances within these areas. The impacts would be minor because the proposed SRMA under this alternative would be managed to maintain the area's cultural resources and natural environment for a range of recreational opportunities (including OHV recreational use on designated routes, and non-mechanized activities throughout these areas) as discussed under Alternative B, which would be consistent with the management prescriptions to preserve non-WSA lands with wilderness characteristics (prohibited commercial woodcutting, OHV use limited to designated routes, and ROW avoidance areas).

This alternative would have more beneficial impacts on recreation and resource users than Alternative A for reasons similar to those discussed under Alternative B because the management decisions are similar: more opportunities would be available for dispersed recreation, and more resource protection-related management decisions would be applied than under Alternative A to ensure the maintenance and preservation of recreation resources.

4.3.10.3.6.3. Grand Gulch

Alternative A

Under Alternative A, 385,000 acres would continue to be managed as the Grand Gulch Plateau SRMA through the management decisions established in the 1991 RMP. As a continuation of current management, the SRMA would be impacted by conditions and trends discussed in Section 3.11.4.2. These include the potential for increased resource use conflicts, disturbance of cultural resources within the SRMA, and trampling of vegetation and disturbance to wildlife from recreationists.

Grand Gulch/Cedar Mesa Top Day Use and Camping

Under this alternative, the Cedar Mesa mesa top would remain open to dispersed camping, no permits would be required, and there would be no limitations on the number and size of user groups. The beneficial impacts for all recreation user groups under Alternative A would be short-term because current recreational management would provide unrestricted opportunities for non-mechanized recreational groups that seek remoteness, solitude, and primitive backcountry experiences. The long-term impacts of unrestricted resource use would include recreational resource degradation across the mesa top from an increasing number of unrestricted recreational resource users. Current trends and conditions (see Section 3.11.3) indicate that this type of unrestricted recreational use is likely to result in visitor overcrowding, resource use conflicts, and resource degradation, with potentially adverse impacts on all recreation user groups.

Grand Gulch/Cedar Mesa In-Canyon Day Use

Management decisions for in-canyon day use within the Grand Gulch SRMA limit commercial and private groups sizes by setting the group size limits at 12 individuals, but they do not limit the number of parties per day along trails. Permits are required for commercial groups. As discussed above, the impacts of these management decisions would have beneficial short-term impacts on non-mechanized users because the recreational opportunities for experiencing daytime in-canyon hiking and sightseeing are essentially unrestricted. As the popularity of the area increases, as is indicated by current trends, the long-term impacts would include resource use conflict and recreational experience degrading impacts for those seeking a recreational experience that includes solitude, quiet, and uncrowded trails because there are no private or commercial restrictions on access to any of the day use canyons.

Grand Gulch/Cedar Mesa In-Canyon Camping

Under Alternative A, current management limits group sizes (see Table 4.114 above) and no overnight camping party may spend more than two consecutive nights at a campsite near Junction Ruin, Turkey Pen Ruin, Jailhouse Ruin, or the mouth of Bullet Canyon. Camping would be permitted in all established campsites only, away from any cultural resources and riparian areas. No campfires would be allowed.

In-canyon management decisions would restrict the number of people allowed to camp within the canyons, which would have protection-related beneficial impacts on both recreation-related cultural and natural resources while maintaining recreational opportunities for in-canyon isolation and a sense of solitude (recreational qualities that are sought by non-mechanized recreational user groups). Non-mechanized user groups may experience short-term impacts on the range of available in-canyon camping recreational opportunities because of the limitations placed on the number of users allowed to camp, where they may camp, and how long they may camp. In-canyon camping restrictions would have long-term preservation-related beneficial impacts on recreation resources by restricting the potential surface disturbances caused by camping to specific areas and requiring waste management and disposal at campsites. Restrictions on in-canyon length-of-stay would beneficially provide more recreational opportunity in the long-term for more non-mechanized user groups because more groups could potentially receive in-canyon camping permits during the camping season.

Alternatives B and E

Grand Gulch/Cedar Mesa-Top Day Use and Camping

Under the action alternatives (Alternatives B, C, D, and E) and the Proposed Plan, the Grand Gulch area would be managed as the Cedar Mesa SRMA to provide cultural appreciation/interpretive-related recreation and backcountry to front country recreational opportunities. These managed opportunities would include rock art viewing, hiking and backpacking, horseback riding, OHV riding, and camping.

Management decisions under Alternatives B and E would permit an unrestricted number of day use groups on the mesa top, but limit group size for commercial and private recreational use to 10 individuals per group. Camping would be permitted in designated campsites with limitations on group size (12 individuals per group) for commercial and private groups. Waste removal would be required for overnight camping, and campsites would be closed if adaptive-management monitoring detected that recreation users were adversely impacting sensitive mesa top cultural sites. The impacts of these management decisions on mesa top recreational resources would be beneficial in the long-term because cultural resources would be protected, the intensity of surface disturbances caused by non-mechanized recreational user groups would be reduced by reducing group sizes and restricting campsites, and waste removal from campsites would reduce the impacts to natural resources. The impacts on resource users would also be beneficial in the long term: limiting both day use and camping group sizes would increase the likelihood of a satisfying recreational experience by limiting the noise, overcrowding, and use conflicts associated with large groups. Waste removal would have short-term and long-term, beneficial impacts on resource users by maintaining a satisfying recreational camping experience. Limiting group size would have negligible impacts on recreational opportunities for non-mechanized recreational users because there are no limits on the number of groups permitted on the mesa top. The potential outcome of increasing the likelihood of satisfying recreational experiences through the proposed management decisions would have beneficial impacts on resource users as discussed under Alternatives B and E, Cedar Mesa SRMA.

Compared to Alternative A, these alternatives would have more beneficial impacts on mesa top day use and camping recreational opportunities because limitations on group size, waste removal requirements, the requirement for designated camping, and monitoring of cultural resources would provide more protection to recreational resources, reduce the potential for resource use conflicts, and reduce the intensity of recreation-caused surface disturbances to the recreation resource.

Grand Gulch/Cedar Mesa In-Canyon Day Use

In-canyon day use for commercial and private groups would have limitations on group size and group numbers per day (group size limits of 10 individuals for commercial and private; one commercial group every other day per trailhead, one private group per day per trailhead). In-canyon areas would be closed to commercial use, as needed to protect cultural and natural resources, and permits would be required for private and commercial groups. The impacts of these management decisions on recreational resources would be beneficial in the long-term because the intensity of recreation-caused surface disturbances within the canyons would be reduced and natural and cultural recreation resources would be protected. Under these alternatives, there would be potential impacts of 10 visitors per day per trailhead from private users, and five visitors per day per trailhead for commercial users (totaling 15 visitors per day

per trailhead). The impacts on in-canyon recreation users would be short-term, but minor on those non-mechanized users who seek in-canyon recreational opportunities but do not immediately receive an in-canyon permit because of group size and number limitations. The long-term impacts on resource users seeking an in-canyon recreational opportunity would be beneficial because group size and number limits (i.e., a reduction in the density of in-canyon recreation users) would: (1) beneficially increase the likelihood of a satisfying experience in which remoteness, isolation, and quiet are expected; and (2) reduce the likelihood of resource use conflicts between in-canyon day use groups.

Compared to Alternative A, these alternatives would have more beneficial, long-term impacts on recreation resources and on non-mechanized user groups because more resource protection-related management decisions would be applied to in-canyon day use. Alternatives B and E would have more long-term beneficial impacts on recreation resource users than Alternative A because more restrictions on group size and numbers would, in the long-term, create in-canyon group conditions that increase the likelihood for satisfying in-canyon recreational experiences.

Grand Gulch/Cedar Mesa In-Canyon Camping

The management decisions applicable to in-canyon camping would be the same as discussed under Alternative A except that designated campsites would be assigned based on group size and if stock animals are included in the group, limitations on group camping would be applied if monitoring determined that recreation activity was adversely impacting in-canyon cultural resources, limits on the size and number of private and commercial in-canyon camping groups would be applied, and requirements for waste removal would be enforced if monitoring determined that recreation-related waste was threatening public health and/or in-canyon resources. Under these alternatives, private group size would be limited to six individuals per day for each trailhead, and commercial groups would be limited to 10 individuals per day for each trailhead. Overnight camping use for the major trails in the proposed SRMA would be limited to 16 visitor days per trail. The impacts of these management decisions on recreation resources would be similar to the impacts discussion for Grand Gulch/Cedar Mesa top day use, in-canyon day use, and mesa top camping.

Compared to Alternative A, these alternatives would have impacts that are more beneficial to recreation resources and on recreation resource users for the same reasons as discussed under Grand Gulch/Cedar Mesa top day use, in-canyon day use, and mesa top camping.

Alternative C

Grand Gulch/Cedar Mesa Top Day Use and Camping

Day use management decisions and impacts would be the same as those discussed under Alternative B except there would be no group size limits, commercial or private, for groups using Kane Gulch Ranger Station, Mule Canyon Ruin, Salvation Knoll, and other sites as identified. Group size limits of 12 individuals for other private and commercial use on the mesa top would be applied, but there would be no limits on group numbers. The long-term impacts of unrestricted group size limits on recreation resources in the developed, day use areas would be negligible to minor because: (1) these sites have been managed and designed to accommodate large number of visitors and (2) adaptive management would be applied to these areas (as discussed under management decisions common to action alternatives) to ensure that resource degradation would not occur. The impacts on recreation resource users (primarily motorized

scenic drivers and non-mechanized day hikers) would be negligible because site visitation has not required a permit.

Mesa top camping management decisions and impacts would be the same as discussed under Alternative B except group size limits would be doubled (to 24 individuals) for commercial and private groups, and large groups (12–24 individuals) would be assigned designated campsites to accommodate the large group size. Increasing the group size limits under this alternative (that is, potentially doubling the number of individuals permitted to camp on the mesa top when compared to Alternative B) could have impacts on recreational opportunities to experience remoteness, isolation, and an uncrowded backcountry experience if large groups were hiking and/or camping near each other. Permitting large-group size under this alternative could also increase the likelihood of resource use conflicts (e.g., competition for shade, water, scenic view points) if several large groups are using the same trail or route, but management decisions to designate campsites for large groups would mitigate this concern. The impacts to recreation resources from permitted large groups and designating campsites for large groups would be mixed: the impacts on trailside natural resources would be more intense in the long-term because of the larger number of individuals impacting an area at the same time, but designated campsites would have long-term beneficial impacts on natural resources because it is assumed that these sites would be designed to accommodate large group sizes, thereby concentrating camping impacts within the designated area.

Compared to Alternative A, this alternative would be more beneficial for reasons discussed under Alternative B, and because even though large groups would be permitted to camp on the mesa top, management decisions would accommodate camping impacts by designating campsites that could absorb these potential impacts.

Grand Gulch/Cedar Mesa In-Canyon Day Use

The proposed management decisions and impacts for in-canyon day use under this alternative are similar to those proposed and discussed under Alternative B, except that a group size of 12 individuals per group for private and commercial use would be applied. Private and commercial use would be limited to 12 individuals per day for each trailhead, with impacts of 12 visitors per day per trailhead from private users, and 12 visitors per day per trailhead from commercial users (totaling 24 visitors per day per trailhead), a 60% increase in use compared to Alternative B. The comparison of this alternative to Alternative A would be similar to the discussion under Alternative B.

Grand Gulch/Cedar Mesa In-Canyon Camping

The proposed management decisions and impacts for in-canyon camping under this alternative would be similar to those proposed under Alternative B, except that under this alternative, private group size would be limited to eight individuals per day for each trailhead, and commercial groups would be limited to 12 individuals per day for each trailhead. Overnight camping use for the major trails in the proposed SRMA would be limited to 20 visitors per day per trail, a 25% increase in recreational use when compared to Alternative B. The comparison of this alternative to Alternative A would be similar to the discussion under Alternative B.

Alternative D

Grand Gulch/Cedar Mesa Top Day-Use and Camping

The proposed management decisions for in-canyon day use and camping under this alternative would be similar to those proposed under Alternative C, with similar impacts. The comparison of this alternative for mesa top day use to Alternative A would be similar to the discussion under Alternative C.

The proposed management decisions for mesa top camping would not establish designated campsites for large groups fewer than 24 individuals, would establish designated campsites for group sizes larger than 24 individuals, group size limits would not be set, campsite facilities would be developed as needed, and recreational activity at campsites that adversely impact cultural sites would be closed. These management decisions would have long-term impacts on recreational resources similar to those discussed under Alternative A because of the potential for resource use conflicts and overcrowding from unrestricted numbers of campers, the potential degradation of resources caused by the concentration of large camping groups at undesignated campsites, and the potential degradation of natural and cultural resources from concentrated surface disturbances caused by large camping and hiking groups. The proposed management decision to provide campsite facilities as needed to accommodate the large camping groups would have beneficial impacts on natural resources by providing for waste disposal, and it would have beneficial impacts on the recreation experience of those recreation users who expect a less primitive, less natural camping experience. However, based on the assumed recreational expectations (as described in Section 4.3.10) of non-mechanized recreational user groups, the development of mesa top campsites with toilets, fire grates, picnic tables, and other amenities would likely produce an unsatisfying recreational experience where there was an expectation of a primitive, undeveloped, natural, remote, and uncrowded backcountry experience that also provides opportunities for solitude.

The impacts on recreational users would be similar to those discussed under Alternative A.

Grand Gulch/Cedar Mesa In-Canyon Day Use

The proposed management decisions for in-canyon day use under this alternative would be similar to those proposed under Alternative C except that two commercial groups per day (with 12 individuals per group) would be permitted to access the Grand Gulch trails (totaling 24 commercial visitors per day per trail). Combined with proposed private trail use of 12 visitors per day per trail, this would have a total trail impact of 36 visitors per day per trail, an almost two and one-half times increase in permitted day trail use when compared to Alternative B and a one and one-half times increase when compared to Alternative C. The impacts would be similar to those discussed under Alternative A (e.g., resource degradation, potentially unsatisfying hiking experiences) because the number of individuals permitted to access trails under this alternative would likely create conditions that degrade, diminish, or reduce the opportunities for a sense of solitude, quiet, naturalness, and remoteness sought by this recreational user group.

Grand Gulch/Cedar Mesa In-Canyon Camping

The management decisions for this alternative would be similar to those discussed under Alternative C except that dispersed camping would be permitted for groups of seven or fewer, groups of eight to 12 and those with stock animals would be permitted to camp in designated campsites, and adaptive-management limits on visitors would be modified to protect recreational

resources. The impacts on recreational resources and on recreational users would be similar to those discussed under Alternative C because, while total overnight visitor limits would be higher (24 visitors per day per trail versus 20 for Alternative C, or a 20% increase over Alternative C), the impacts of dispersed in-canyon camping and the impacts of larger group designated camping would be similar. Compared to Alternative A, this alternative would have impacts similar to those discussed under Alternative C.

Proposed Plan

Grand Gulch/Cedar Mesa Top Day-Use and Camping

The impacts to recreation resources and users would be the same as discussed under Alternative C with one exception. The exception being that groups of 20-24 individuals would be required to camp in designated sites.

Increasing the minimum size for groups being required to camp in designated sites on the Mesa Top (an increase from 12 to 20) under this alternative could have impacts on recreational opportunities to experience remoteness, isolation, and an uncrowded backcountry experience if large groups were hiking and/or camping near each other. Permitting large-group size under this alternative could also increase the likelihood of resource use conflicts (e.g., competition for shade, water, scenic view points) if several large groups are using the same trail or route, but management decisions to designate campsites for large groups would mitigate this concern. The impacts to recreation resources from permitted large groups and designating campsites for large groups would be mixed: the impacts on trailside natural resources would be more intense in the long-term because of the larger number of individuals impacting an area at the same time, but designated campsites would have long-term beneficial impacts on natural resources because it is assumed that these sites would be designed to accommodate large group sizes, thereby concentrating camping impacts within the designated area.

Compared to Alternative A, this alternative would be more beneficial for reasons discussed under Alternative B, and because even though large groups would be permitted to camp on the mesa top, management decisions would accommodate camping impacts by designating campsites that could absorb these potential impacts.

Grand Gulch/Cedar Mesa In-Canyon Day Use

The impacts to recreation resources and users would be the same as discussed under Alternative C because the management decisions are the same.

Grand Gulch/Cedar Mesa In-Canyon Camping

The impacts to recreation resources and users would be the same as discussed under Alternative C because the management decisions are the same.

4.3.10.3.6.4. Dark Canyon SRMA

Under the action alternatives (B, C, D, and E) and the Proposed Plan, the 30,820-acre Dark Canyon SRMA would be established. Under these alternatives, the area would be managed under the BBM goals and objectives (see Appendix E) to provide recreational opportunities for backcountry, non-mechanized recreation, and cultural resource and heritage appreciation. The primary activities for which the area would be managed would include backcountry hiking and

backpacking, canyoneering, horseback riding, cultural site visiting, and wilderness therapy and education.

Alternative A

Under this alternative, Dark Canyon would continue to be managed under the stipulations of the 214,390-acre Canyon Basin SRMA management plan (which would also continue to include Indian Creek [see below]). Management decisions under this plan would include no limitations on recreation group size or group numbers, open to dispersed camping, no permits for private use, no permit fees for commercial use, dogs and vehicles allowed, fires allowed, and a minimal ranger presence within the Canyon Basin SRMA. Current conditions and trends, discussed in Section 3.11.3, describe increasing demand for both private and commercial use of the area by non-mechanized user groups for primitive backcountry hiking; increasing popularity of the area combined with unlimited, unrestricted group size; minimal monitoring of potential recreation-caused surface disturbances from unrestricted camping and potential degradation of cultural resources; the unrestricted use of campfires; and the unrestricted presence of pets within the area, which would create conditions for substantial noise and surface disturbance. In the long-term, these conditions would intensify as demand for access to the area continues to grow. The impacts on recreation resource users would be beneficial in the short-term because the recreational opportunities for non-mechanized user groups to experience remote, primitive, backcountry hiking and sightseeing and a sense of solitude and isolation would be unrestricted. However, as private and commercial demand to experience this area increases, the long-term impacts on recreation users would include the potential for overcrowding, the potential for pet noise, the potential for resource use conflicts because of overcrowding, pet waste, pet-wildlife and pet-human conflicts, the increasing potential for surface disturbances that degrade cultural and natural resources, and the resulting degradation or diminishment of recreational opportunities for a satisfying primitive, backcountry recreational experience.

Alternatives B and E

Similar management decisions for the proposed Dark Canyon SRMA under Alternatives B and E would include limits on group size (10 individuals for private use, 12 individuals for commercial use), limits on the total number of private users per day (15 individuals), the establishment of a permit and fee system, designated campsites, limits on campfire use (mesa tops only), waste management, prohibitions on pets, and prohibitions on firewood collection. Under this alternative, one commercial trip allowed per week (12 individuals), combined with a maximum 15 private users per day would have a potential maximum use of 27 individuals per day within the SRMA. These management decisions would have short-term and long-term protection-related, beneficial impacts on recreation resources within the boundaries of the SRMA because: (1) limits on group size and number of users, removal of waste, and camping within designated campsites within the SRMA would reduce the intensity and area of natural resource surface disturbances; and (2) restricting campfire use would reduce surface disturbances and reduce the risk of wildland fire within the canyon. The impacts of limiting group size and numbers could cause short-term delayed entry into the SRMA for those recreation resource users seeking opportunities for a primitive, remote backcountry experience. However, these management decisions would have long-term beneficial impacts on those non-mechanized recreation resource users seeking a primitive, remote backcountry experience that includes a pristine natural environment, a sense of solitude and remoteness, and quiet. The potential beneficial outcome of

the opportunities for backcountry recreational experiences would include physical rest and maintenance of mental health, improved physical fitness, increased tourist revenue, and an appreciation of the natural environment and the region's cultural heritage. The likelihood of a satisfying backcountry experience that includes the above attributes would be increased because: (1) limits on group size and group numbers would increase the likelihood of group dispersal within the SRMA; (2) designated camping, prohibitions on open fires, and requirement for waste removal would reduce natural resource impacts; and (3) and the prohibitions on pets would reduce pet-wildlife and pet-human conflicts and potentially reduce the level of intrusive noise.

Note that under Alternative E, approximately 2,522 acres (8% of the proposed Dark Canyon SRMA) would be managed as non-WSA lands with wilderness characteristics for the preservation of wilderness values. Beneficial, minor impacts to recreation resources and user groups would result from the additional restrictions or prohibitions on surface disturbances within these areas. The impacts would be minor because: (1) the proposed SRMA under this alternative would be managed to maintain the area's pristine environment for remote, dispersed, and primitive recreation, allowing only minor surface disturbance impacts, and (2) the size of the affected area would be relatively small in comparison to the size of the proposed SRMA, which would not likely affect the opportunities for primitive recreation within the proposed SRMA.

Compared to Alternative A, this alternative would preserve the recreation-related natural and cultural resources, have a greater potential to reduce or prevent resource use conflicts, and create the conditions and increase the likelihood for a satisfying recreational experience for non-mechanized recreational user groups.

Alternative C

The management decisions under Alternative C would be same as those discussed under Alternative B except that adaptive-management would assess and then determine if waste management was required to preserve recreation resources, pets would be allowed in-canyon but on leash and under physical control, fire pans would be permitted, and groups size and numbers would be increased. The impacts on Dark Canyon recreation resources would be similar to those discussed under Alternative B, but with a decrease in long-term beneficial impacts caused by an increase in permitted commercial groups (15 individuals per group for private and commercial use; an increase from one commercial group per week under Alternative B to three commercial groups per week under this alternative) and reduced restrictions on pets within the canyon. A total of 20 private users per day would be permitted. So, total permitted SRMA use per day could be 65 users per day (45 commercial users and 20 private users). This would potentially increase maximum users per day by almost two and one-half times when compared to Alternative B. An increase in commercial groups under this alternative would reduce the sense of in-canyon solitude and remoteness because commercially related users would potentially increase more than three times in comparison to Alternative B. The presence of pets within the canyon could create in-canyon intrusive noise and on-trail human-pet conflicts, but mandatory physical control of pets would mitigate pet-wildlife conflicts.

Compared to Alternative A, this alternative would have more beneficial resource preservation and recreation user impacts for the same reasons as discussed under Alternative B.

Alternative D

Alternative D proposes management decisions for Dark Canyon that would allow seven commercial trips per week and group size limits of 15 individuals for both commercial and private recreational groups. Dispersed camping and campfires would be permitted throughout the proposed SRMA, as would on-site collection of campfire wood and physically controlled on-leash pets in the canyon. Maximum potential commercial-type recreation within the SRMA would be limited to a total 105 individuals per day (seven groups of 15 individuals each) with no limits on the number of private groups. At least, this represents an almost four-fold increase in recreational impacts within the SRMA when compared to Alternative B. The impacts of these management decisions on recreation resources would be similar to those discussed under Alternative A because the combination of unrestricted dispersed camping, an unrestricted number of private groups, large and numerous commercial groups, unrestricted use of campfires, no designated campsites, and unrestricted collection of firewood would have substantial long-term impacts on recreation resources. As discussed under Alternative A, there would be short-term beneficial impacts on unrestricted recreational opportunities for primitive, dispersed non-mechanized backcountry recreational experiences, but these opportunities would be diminished and/or degraded, and the likelihood of a satisfying backcountry experience that includes solitude, quiet, a sense of remoteness in a pristine environment, and the potential personal benefits derived from those experiences (as discussed under Alternative B) would be adversely impacted. This would be due to overcrowding, resource user conflicts indirectly caused by overcrowding, noise, and natural and cultural resource degradation caused by the intensity of recreational use and by the intensity of surface disturbances from dispersed camping, firewood collection, and human and pet waste.

Compared to Alternative A, this alternative would have impacts similar to those discussed under Alternative A because, while Alternative A would manage the area with fewer restrictions than Alternative D, the differences between the two alternatives would be negligible.

Proposed Plan

The impacts on recreation in Dark Canyon would be the same as discussed under Alternative C except that private and commercial group size limits would be increased from 15 to 18 individuals. The impacts on Dark Canyon recreation resources would be similar to those discussed under Alternative B, but with a decrease in long-term beneficial impacts caused by an increase in permitted commercial groups (18 individuals per group for private and commercial use). A total of 20 private users per day would be permitted. So, total permitted SRMA use per day could be 74 users per day (54 commercial users and 20 private users). This would potentially increase maximum users per day by almost two and one-half times when compared to Alternative B. An increase in commercial groups under this alternative would reduce the sense of in-canyon solitude and remoteness because commercially related users would potentially increase more than three times in comparison to Alternative B.

Compared to Alternative A, this alternative would have more beneficial resource preservation and recreation user impacts for the same reasons as discussed under Alternative B.

4.3.10.3.6.5. Indian Creek SRMA

Alternative A

Under Alternative A, Indian Creek Corridor would continue to be managed under the stipulations of the 214,390-acre Canyon Basin SRMA management plan. The management decisions for this area would be the same as those discussed above under Dark Canyon, Alternative A (see Section 4.3.10.3.6.4). The impacts of these management decisions on recreation resources within Indian Creek would be short-term and long-term, based on the current conditions and trends discussed in Section 3.11.3. Briefly, these current trends and conditions include: (1) the rapidly increasing popularity of the area for specialized (rock climbing), non-mechanized (hiking), motorized OHV use, and scenic driver user groups; (2) the demand for additional recreational services and facilities to meet the needs of these diverse recreational users; (3) an increase in the size and intensity of use of dispersed camping areas; (4) intensifying resource use conflicts (between recreation user groups and between livestock grazing and recreational uses) because of its increasing popularity; (5) waste management concerns; (6) inadequate and/or unsafe vehicle parking along the Indian Creek Corridor; and (7) the current impacts of recreational activities on the area's cultural resources.

Continuing to manage Indian Creek under the above-mentioned conditions combined with proposed management decisions that permit unlimited, unrestricted group size, minimal monitoring of potential recreation-caused surface disturbances from unrestricted camping and potential degradation of cultural resources, the unrestricted use of campfires, and the unrestricted presence of pets within the area would create conditions for substantially intensifying surface disturbances to recreation-related natural and cultural resources. The proposed management decisions under this alternative would cause these impacts because the decisions neither address nor mitigate the current recreational trends and conditions that are affecting and are expected to continue to affect this area.

Under Alternative A, the current impacts on recreation resource user groups would continue to intensify because the management decisions proposed under this alternative do not address these conditions. Specifically, the management decisions under this alternative would permit increasing resource user group conflicts, permit an increase in health and safety concerns, permit the potential degradation of recreation cultural and natural resources, permit a diminishment and degradation of recreational opportunities, and create a substantial decline in satisfactory recreational experiences for all resource user groups because none of the adversely causative issues described above would be addressed under the proposed management decisions.

Alternative B

Under Alternative B (and the other action alternatives), the 89,721-acre Indian Creek SRMA would be established and managed to provide BBM-based opportunities for backcountry to front country recreation, as well as opportunities for interpretation of cultural resources and appreciation of the region's cultural heritage. Managed recreational opportunities would include rock climbing, OHV riding, backcountry hiking and backpacking, viewing rock art, camping, wilderness education, and sight-seeing.

Management decisions under Alternative B would include prohibitions on dispersed camping within the Indian Creek riparian corridor from Newspaper Rock to downstream of the Dugout Ranch, the Newspaper Rock campground would be closed and rehabilitated, designated-only

camping would be allowed along Bridger Jack Mesa bench, a new campground would be constructed, prohibitions on woodcutting and collecting with restrictions on campfires would be applied, rock climbing routes that adversely impact cultural sites would be closed, funds from camping fees would be used to develop new facilities, parking areas would be developed, adaptive monitoring of the area would be applied to ensure resource protection, and new climbing routes would be established with designs to ensure raptor protection. Management decisions under this alternative would also prohibit dispersed camping in the Indian Creek Corridor. Other specific management decisions that address the need to protect and limit impacts to the area's natural and cultural resources, limit resource user conflicts, and meet the BLM's mandate for multiple use within the proposed SRMA boundary were analyzed in the Indian Creek Corridor Plan and Environmental Assessment (EA) (BLM 2005m).

Alternative B management decisions and the management decisions contained within the Indian Creek Corridor Plan EA Decision Record would have short-term and long-term beneficial impacts on recreation resources within the proposed Indian Creek SRMA because recreation-related cultural resources and natural resources would be protected from potential degradation or disturbances caused by rock climbing, OHV use, and hiking. Intensifying visitor use and camping near Newspaper Rock would be addressed, as would waste concerns. Designated camping, prohibitions on dispersed camping and wood collection for campfires, and adaptive-management and monitoring of recreation resources within the SRMA would have short-term and long-term beneficial impacts because surface disturbances would be restricted to designated areas.

The impacts on recreational user groups that use the area would be beneficial in the short-term and long-term because building additional recreation facilities (parking lots, campgrounds, toilets, and day use picnic areas) would, respectively, reduce traffic safety concerns along the Indian Creek Corridor, relieve the demand for camping within the proposed SRMA, improve waste management conditions, and provide additional recreational opportunity areas for scenic driving users to enjoy the area. Recreation resource user groups that seek dispersed camping opportunities (e.g., rock climbers, backpackers) would be impacted by limitations that would be placed on dispersed camping (dispersed camping would not be allowed within the Indian Creek Corridor), which would reduce these opportunities and potentially diminish the recreational experiences that include dispersed camping. There would be long-term, beneficial impacts on all other recreation user groups that seek recreational opportunities in the proposed SRMA because, as the area's popularity continues to grow, the proposed management decisions would limit the number of users that are permitted to recreate and camp in the proposed SRMA, thereby reducing the potential for overcrowding and user conflicts. Management prescriptions contained within the EA, combined with the proposed management decisions under this alternative, would increase the likelihood that the current conditions and trends (as discussed under Alternative A) would be addressed, which in turn would increase the likelihood that recreational expectations would be met and that users would have satisfying recreation experiences and would maintain the range of recreational opportunities currently available in the area. The maintenance of recreational opportunities within the proposed SRMA would also increase the likelihood for beneficial experiences that include BBM objectives of challenging physical exercise and improved physical health, increased tourist revenues, education and personal development and growth, and maintenance of mental health (Table E.2.3, Appendix E).

Compared to Alternative A, this alternative would be more beneficial in the short-term and long-term because it would adequately address the resource use conflicts and recreational resource degradation concerns that are occurring within the area proposed as the Indian Creek SRMA.

Alternative C

The management decisions under this alternative would be the same as those discussed under Alternative B except that dispersed camping would be allowed within the Indian Creek Corridor (with designated, dispersed camping allowed within specific camping zones). The impacts of management decisions under this alternative would be similar to those discussed under Alternative B, but with greater surface disturbance impacts caused by dispersed camping from the expected increasing use of the area by recreation user groups. The comparison of Alternative A to this alternative would be similar to those impacts discussed under Alternative B because the management decisions and the impacts of the management decisions are similar.

Alternative D

The management decisions and impacts on recreation resources and recreation resource users would be similar under Alternative D to those discussed under Alternative C because the management decisions are similar.

The comparison of Alternative A to this alternative would be similar to those impacts discussed under Alternative B because the management decisions and the impacts of the management decisions are similar.

Alternative E

Under this alternative, the impacts on recreation resources and users would be the same as discussed under Alternative B because the management decisions are the same, except that approximately 47,393 acres (53% of the proposed SRMA) of non-WSA lands with wilderness characteristics that lie within the proposed SRMA and would be managed to preserve their wilderness values. The impacts on recreation resources would be the same as discussed under Alternative B because surface disturbances within the proposed SRMA would be limited to specific areas (i.e., parking lots, designated camping sites, hiking trails, rock climbing on designated routes, and OHV travel along designated routes) to preserve the area's recreation resources. The impacts on recreation user groups would also be similar to Alternative B for non-mechanized users because the management decisions applied to the non-WSA wilderness characteristics areas to preserve wilderness values under this alternative (e.g., no wood gathering, no OHV use, mineral leasing closures, no new road construction) would maintain opportunities for solitude and a sense of remoteness. Opportunities for motorized OHV use and mountain biking would be adversely impacted within the non-WSA lands with wilderness characteristics portion of the SRMA because these activities would be prohibited. Compared to Alternative A, this alternative would have more long term, beneficial impacts on recreation resources and users because management decisions would address current concerns and user conflict trends briefly discussed under Alternative A.

Proposed Plan

The impacts to recreation within the Indian Creek SRMA would be the same as discussed under Alternative C because the management decisions are the same.

4.3.10.3.6.6. White Canyon SRMA

Alternative A

Under this alternative, White Canyon would not be managed as an SRMA. Management decisions under this alternative would not restrict private or commercial group size, would allow open camping and campfires, and would not require permits for private groups but would require permits for commercial groups. The impacts on recreation resources could be adverse in the long-term if campfires, camping wastes, and dispersed camping caused surface disturbances along the canyon rim were to degrade recreational resources. Increasing waste disposal within the canyon, which could degrade the in-canyon recreational experience for specialized recreation users (canyon climbers, slot canyoneers) and non-mechanized users (canyon hikers), would have short-term adverse impacts on these recreation users.

Alternative B

Alternative B would create the White Canyon SRMA (2,828 acres) for the purposes of providing outstanding recreational opportunities and visitor experiences while protecting the area's natural and cultural resource values. The SRMA would be managed to provide opportunities for recreation that include backcountry hiking and backpacking, remote camping, canyoneering, cultural site visitation, and wilderness education. Management of the SRMA would include the establishment of a backcountry permit system if deemed necessary, the development of primitive campgrounds at Soldier and Grave Crossings, the use of fire pans on mesa tops, a ban on campfires in canyons, and the requirement that wastes be packed out. These management decisions would have short-term and long-term, resource preservation-related beneficial impacts in-canyon and on the canyon rim of the SRMA by reducing or mitigating surface disturbances to recreational resources. The implementation of a backcountry permit system (as necessary to protect resources) could have access-related impacts on recreational user groups in the short-term by limiting recreational opportunities, but it would also increase the likelihood for solitude, a sense of isolation, and a satisfying canyon experience by reducing the density of canyon recreation users. The beneficial outcome of managing the area under BBM goals and objectives for satisfying recreational experiences would include the likelihood for personal development and growth from physical challenges within the canyon, an appreciation for the region's cultural heritage and natural resources, improved physical health, mental health maintenance, and tourism revenue from backcountry permits (Table E.2.5, Appendix E).

Compared to Alternative A, this alternative would have more long-term beneficial impacts on the SRMA natural recreational resources and on the recreational opportunities for a satisfying in-canyon experience because the potential impacts caused by increasing use of the area would be less under this alternative than under Alternative A.

Alternative C

The management decisions and impacts under this alternative would be similar to those discussed under Alternative B because the management decisions would be similar. Compared to Alternative A, the impacts under Alternative C would be similar to those discussed under Alternative B.

Alternative D

Under Alternative D, the White Canyon SRMA would be established with management decisions that include the development of primitive canyon-rim campsites, waste management options if waste becomes a concern, and requirements for fire pans for in-canyon and canyon rim campfires. Management decisions would not include the establishment of a backcountry permit system. The impacts of these management decisions would have beneficial long-term impacts on recreation resources by providing canyon rim camping sites and requiring fire pans for campfires. These decisions would reduce or limit surface-disturbances to recreation resources. Recreation resources could be impacted in the long-term by the lack of a backcountry permit system because the intensity of in-canyon and canyon rim recreational use (with the potential for surface disturbances) would not be limited. The impacts of unlimited visitation and recreation within the SRMA could be adverse in the long-term because potential overcrowding would reduce the opportunities for a satisfying in-canyon canyoneering or hiking experiences if in-canyon recreational expectations include solitude, a sense of remoteness, and an unspoiled canyon environment. The potential beneficial outcomes of BBM management for satisfying recreational experiences (as discussed under Alternative B) would be unlikely because of the reduced opportunities for these experiences (see Table E.2.5, Appendix E). However, compared to Alternative A, this alternative would have impacts that are more beneficial on recreation resources and on recreational users because it proposes management decisions that would limit or mitigate surface disturbances caused by recreational resource use.

Alternative E

Under Alternative E, the management decisions and impacts on recreation would be the same as under Alternative B because the management decisions are the same, except that approximately 2,092 acres (74% of the proposed SRMA) would be managed as non-WSA land with wilderness characteristics for the protection of wilderness values. The impacts on recreation resources would be the same as discussed under Alternative B because the proposed SRMA management decisions under this alternative would apply the same prescriptions to protect recreational resources from surface disturbances as those applied within non-WSA wilderness characteristics areas. The impacts on recreational users would be the same as discussed under Alternative B because both alternatives would have the same levels of resource protection with the same impacts on resource users.

Proposed Plan

The management decisions and impacts under the Proposed Plan would be similar to those discussed under Alternative B because the management decisions would be similar. Compared to Alternative A, the Proposed Plan impacts would be the same as those discussed under Alternative B.

4.3.10.3.6.7. Extensive Recreation Management Area (ERMA)

Alternative A

Management decisions for managing the ERMA are not specified under this alternative. However, general management decisions under this alternative would apply adaptive management to the Monticello PA to monitor and assess resource uses to determine if more intensive management should be applied to the ERMA. If adaptive management were to

determine that an area was receiving intense use, then SRMA designation would be an option for that area, with SRMA designation assigned through the RMP amendment process. Construction of recreation facilities would be considered for areas within the ERMA, as needed, to ensure visitor health and safety, reduce user conflicts, and protect recreation resources.

All of these proposed management decisions would have long-term, beneficial impacts on ERMA recreation resources because adaptive management would ensure that changes in recreation resource use would receive an appropriate management response to protect recreation resources. The impacts on recreational resource users would also be beneficial in the long-term because ERMA adaptive management would respond appropriately to potential resource use conflicts and resource user group needs for facilities, which would maintain the likelihood for satisfactory recreational experiences for all recreation user groups.

Alternative B

Alternative B would also apply the general adaptive management decisions to the Monticello PA to monitor and assess resource uses, as discussed above under Alternative A, with the same impacts on recreation resources and resource user groups. Specific management decisions under this alternative would limit dispersed vehicle camping within the ERMA to previously disturbed areas along designated routes, limit camping to designated type camping along portions of the Bears Ears road and Deer Flat roads, and coordinate with the Glen Canyon Recreation Area on constructing a campground at Muley Point. These specific management decisions would also have long-term, beneficial impacts on recreation resources within the ERMA by limiting potential recreation-related surface disturbances from camping. The impacts on recreation user groups that seek dispersed vehicle camping opportunities would be minor in the long-term because the recreational opportunities for this type of camping within the ERMA would be reduced. The potential construction of a campground at Muley Point would be beneficial in the long-term for scenic driver groups and other recreational user groups that seek remote but developed camping sites with high scenic quality because the campground would provide additional recreational opportunities for camping and sightseeing.

Compared to Alternative A, this alternative would have impacts that are more beneficial to recreation resources by limiting vehicle camping-related surface disturbances to areas along designated routes. The impacts on dispersed vehicle camper recreation resource users would be minor because limitations on this form of camping would reduce vehicle camping recreational opportunities. The proposed construction of a campground would have impacts that are more beneficial to recreation than Alternative A because it would provide more recreational opportunities for vehicle camping with a sight-seeing and visual quality component.

Alternative C

The management decisions and impacts on recreation resources and recreation users would be the same as discussed under Alternative B except that dispersed vehicle camping would be allowed within 150 feet of centerline on roads within the ERMA, with dispersed camping encouraged within previously disturbed areas. The impacts of these management decisions would have potential long-term, adverse, but minor, impacts on recreation resources because surface disturbances from dispersed vehicle camping would potentially degrade roadside recreation resources and expand the disturbed areas. The impacts would be minor because Monticello FO monitoring and management would assess resource impacts and close and

rehabilitate roadside camping areas if the level or intensity of the activity were determined to be excessive. Adaptive management would reduce the adverse impacts of roadside vehicle camping because impact mitigation would be applied. The comparison of impacts under Alternative A to this alternative would be similar to those discussed under Alternative B because the impacts discussed under Alternative C are similar to Alternative B.

Alternative D

The management decisions and impacts on recreation resources and recreation users would be the same as discussed under Alternative C except that dispersed vehicle camping would be allowed within 300 feet of centerline on roads within the ERMA. The impacts of dispersed vehicle roadside camping would be similar to those impacts discussed under Alternative C because adaptive management mitigation would be applied to areas where surface disturbances were deemed excessive, including closing and rehabilitating disturbed roadside vehicle camping sites. The comparison of the impacts Alternative A with the impacts of this alternative would be similar to those discussed under Alternative C because the impacts of Alternative C would be similar to the Alternative D impacts.

Alternative E

Under this alternative, a total of 416,526 acres of non-WSA lands with wilderness characteristics would be managed within the ERMA. These areas would be closed to firewood gathering and woodland harvesting, closed to OHV travel and new road construction, designated as VRM Class I, and closed to mineral leasing. Surface disturbances within these areas would be minimized to preserve their wilderness characteristics, which would have long-term, beneficial impacts on recreation resources. The impacts on user groups within these areas would be the same for non-mechanized users as the discussion under Alternative B because the decisions are the same. However, the opportunities for motorized OHV travel, mountain biking, and scenic driving into these the non-WSA wilderness characteristics areas within the ERMA would be eliminated while opportunities for non-mechanized recreation and dispersed camping would remain. Compared to Alternative A, this alternative would have fewer beneficial impacts on recreation user groups because mechanized activities within non-WSA areas with wilderness characteristics in the ERMA would be prohibited.

Proposed Plan

The management decisions and impacts on recreation resources and recreation users would be the same as discussed under Alternative B except that dispersed vehicle camping would be allowed within previously disturbed areas 150 feet of centerline of roads or routes within the ERMA. The impacts of these management decisions would be minor in the long-term on recreation resources because using existing disturbed areas for dispersed vehicle camping would not degrade roadside recreation resources; however, there is the potential for vehicle campers to adversely expand the boundaries of the existing roadside disturbed areas. This potential impact would be minor because FO monitoring and management would assess resource impacts and close and rehabilitate roadside camping areas if the level or intensity of the activity were determined to be excessive. Adaptive management would reduce the adverse impacts of roadside vehicle camping because impact mitigation would be applied. Under this alternative, 75,271 acres of non-WSA lands with wilderness characteristics would be managed within the ERMA to preserve their wilderness values. These lands would be unavailable for woodland harvesting,

managed under VRM Class II objectives, and would limit OHV use to designated routes. The impacts to recreation would be beneficial in the long term for motorized, mountain biking, and non-mechanized users. Mechanized user groups would have travel opportunities within these areas along designated routes, but opportunities for also be available for solitude, remoteness, and the enjoyment of areas with high scenic quality and unspoiled landscapes. The comparison of impacts under Alternative A to this alternative would be similar to those discussed under Alternative B because the impacts discussed under Alternative C are similar to Alternative B.

4.3.10.3.6.8. Special Recreation Permits (SRPs)

Alternative A

Under this alternative, the proposed special recreation permit (SRP) management decision would require SRPs for any recreation-related commercial activity within the Monticello PA (e.g., river floating), with no specified limits on group size. Under this alternative, the issuing of SRPs would be a discretionary management decision containing standard stipulations and additional stipulations as needed to control visitor use (i.e., reduce or minimize resource use conflicts), help meet management objectives, protect cultural and natural resources, and provide for the health and safety of visitors. These SRP management decisions would have long-term, beneficial impacts on recreation resources and on recreation resource users because the special recreation permit process would review the proposed commercial activity and include stipulations to ensure that recreational resources would not be adversely impacted and that the resource use would minimize conflicts between other recreational user groups.

Alternative B

Under Alternative B, the proposed management decisions for SRPs would include those discussed under Alternative A with additional management decisions that would use SRPs to manage not only commercial activities and events but also competitive events, organized group events, vending, and special areas. Specific criteria for determining if an SRP would be required would be proposed under this alternative, including: (1) events, activities, or group sizes that involve a threshold number of individuals; (2) events with potential resource use conflicts and/or health and safety concerns; (3) events that could potentially conflict with management guidelines or prescriptions; and (4) commercial limitations on group size and time of use to protect natural and cultural resources. These SRP criteria would have impacts similar to those discussed under Alternative A because they would also ensure that natural and cultural recreation resources would be protected from special event/activity-related surface disturbances, and that recreational resource user conflicts would be minimized or prevented. Compared to Alternative A, this alternative would have more beneficial, long-term impacts on recreation resources because it proposes specific SRP permit criteria, which Alternative A does not, that could be used to more finely manage and limit the adverse impacts of large recreational private and commercial groups or events.

Alternative C

This alternative would have similar impacts as discussed under Alternative B because the management decisions are similar. The comparison of this alternative to Alternative A would be similar to the discussion under Alternative B.

Alternative D

This alternative would have similar impacts as discussed under Alternative B because the management decisions are similar. The comparison of this alternative to Alternative A would be similar to the discussion under Alternative B.

Alternative E

Alternative E would have impacts similar to those discussed under Alternative B, except that no competitive motorized or mechanized events would be permitted within non-WSA lands with wilderness characteristics. The impacts would be similar to those discussed under Alternative B, but to a lesser degree, because commercial-type specialized recreational opportunities would be reduced, with long-term, adverse impacts on this user group.

Proposed Plan

The Proposed Plan would have similar impacts as discussed under Alternative B because the management decisions are similar. The comparison of this alternative to Alternative A would be similar to the discussion under Alternative B.

4.3.10.3.7. IMPACTS OF RIPARIAN DECISIONS ON RECREATION

4.3.10.3.7.1. Alternative A

Under Alternative A, no specific management decisions would be applied to riparian areas that would affect recreational activities. However, as discussed in Section 3.12.4 Riparian Resource Demand and Forecast, current trends and conditions under this alternative would have indirect impacts on recreational opportunities in riparian areas. The current impacts on riparian resources from recreational use and exotic species encroachment from surface disturbances would continue to degrade riparian recreational resources, and would likely in time degrade scenic quality and recreational opportunities for wildlife viewing, hiking, equestrian, and other trail uses from the loss of native riparian vegetation and riparian habitat. Livestock grazing could degrade riparian areas and recreational opportunities for wildlife viewing, sightseeing, day hiking, and camping (see Section 3.12.4.1) if standards and guidelines are not followed. Consequently, mechanized and non-mechanized user group conflicts would likely intensify as increasing numbers of users compete for use of this diminishing resource, thus reducing the opportunities for and likelihood of satisfying recreational experiences in riparian areas for all users.

4.3.10.3.7.2. Alternative B

Management decisions under this alternative would limit, seasonally restrict, or make unavailable livestock grazing in selected riparian areas determined to be Functioning At Risk. Selected riparian areas Functioning At Risk would also be closed to motorized OHV and mountain biking use if riparian assessments determined that these activities were contributing to riparian degradation. Functioning At Risk riparian areas would be temporarily closed to dispersed, motorized camping until riparian proper functioning conditions were restored. These management decisions would have long-term, beneficial impacts on recreation resources by reducing or removing the causes of surface disturbance-related impacts to riparian recreational resources. These management decisions would have short-term, adverse impacts on recreational opportunities within those riparian areas determined to be Functioning At Risk (approximately

431 miles within the planning area, see Section 3.12.2) because recreational opportunities for some motorized user groups (e.g., OHV, dispersed vehicle campers) would be reduced. There would be long-term, beneficial impacts for all resource user groups because the restoration of functioning riparian areas would increase the likelihood for a satisfying recreational experience in riparian areas where the recreational expectation includes an available water source, protection from summer heat, absence of livestock, scenic quality, and wildlife viewing.

Compared to Alternative A, this alternative would have long-term impacts that are more beneficial to recreational resources and to riparian recreational use because the proposed management decisions would specifically address the causes of recreational/riparian degradation, apply site-specific adaptive management to assess the level of riparian restoration, and eventually increase the recreational opportunities in these areas to a greater degree than proposed under Alternative A.

4.3.10.3.7.3. Alternative C

Under Alternative C, the management decision impacts on riparian recreational resources would be similar to those discussed under Alternative B because the management decisions are the same. The comparison of Alternative A to this alternative would be the same as discussed under Alternative B above.

4.3.10.3.7.4. Alternative D

The management decision impacts on riparian recreational resources under this alternative would be similar to those discussed under Alternative A because the management decisions are the same.

4.3.10.3.7.5. Alternative E

Under Alternative E, the management decision impacts on riparian recreational resources would be similar to those discussed under Alternative B because the management decisions are the same: Functioning At Risk riparian areas would be closed to cross-country motorized OHV and mountain biking use, and closed to dispersed camping. Opportunities for these recreational activities would be reduced, with long-term, adverse impacts on motorized and mountain biking groups and those seeking dispersed, motorized camping.

4.3.10.3.7.6. Proposed Plan

Under the Proposed Plan, the management decision impacts on riparian recreational resources would be similar to those discussed under Alternative B because the management decisions are the same. The comparison of Alternative A to this alternative would be the same as discussed under Alternative B above.

4.3.10.3.8. IMPACTS OF SOILS/WATERSHED RESOURCES DECISIONS ON RECREATION

4.3.10.3.8.1. Alternative A

The soil and watershed management decisions under this alternative are unspecified for recreation resources and activities. The impacts on recreation would be negligible.

4.3.10.3.8.2. Alternatives B–E, and the Proposed Plan

Soils and watershed management decisions under these alternatives and under the Proposed Plan do not specifically address recreation resources and/or recreational users because the management decisions address soil productivity, soil erosion, sedimentation, and watershed health. However, these alternatives have proposed management decisions for erosion control plans for steep slopes that would include steep slope erosion control strategies, and would require BLM-approved survey and design plans for surface-disturbing activities on these slopes. These proposed decisions would have long-term, beneficial, indirect impacts on recreation resources and recreation resource users by mitigating soil erosion that could potentially degrade recreation-related scenic quality. Compared to Alternative A, these alternatives would be more beneficial to recreation resources because Alternative A does not include specific management decisions to control, prevent, or mitigate soil erosion.

4.3.10.3.9. IMPACTS OF SPECIAL DESIGNATION–ACEC DECISIONS ON RECREATION

4.3.10.3.9.1. Alkali Ridge ACEC

Alternative A

Under Alternative A, the 39,202-acre Alkali Ridge ACEC would be managed to preserve the cultural resources contained within it. Preservation-related management decisions would include surrounding buffer areas for permanent protection of all NRHP-eligible cultural resource sites. In those areas where cultural resources or their buffer areas could not be avoided, then appropriate mitigation would be applied to those cultural sites. These management decisions would have beneficial, long-term impacts on recreation-related cultural resources because the resource would be preserved or potential impacts mitigated, and sightseeing/interpretive recreational opportunities would be maintained.

The 2,340-acre Alkali Ridge National Historic Landmark would be managed under the same management decisions as discussed above, with additional protection of all cultural resources by stipulating a 100-foot avoidance area around these resources, with the same impacts as discussed above.

Alternatives B and E

Under these alternatives, the 39,196-acre Alkali Ridge ACEC would be designated as a cultural ACEC, a RMP-consistent cultural resource management plan would be written for the area, on-site collection of campfire wood collecting would be permitted, and surface-disturbing activities that would potentially impact ACEC cultural resources would be prohibited. These management decisions would have long-term, beneficial impacts as discussed above under Alternative A. The impacts on recreation user groups would be similar to the impacts discussed under Alternative A.

Under these alternatives, the 2,146-acre Alkali Ridge National Historic Landmark would be managed to preserve cultural-recreational resources by prohibiting surface-disturbing activities that could adversely affect those resources. The beneficial impacts on the resource and on recreational users would be similar to the impacts discussed under Alternative A but to a greater degree, because more limitations would be placed on activities that could potentially threaten the landmark's cultural-recreational resources.

Alternative C

The management decisions under this alternative would be similar to those discussed under Alternative A, except that an RMP-consistent cultural resource management plan would be written for the area and some limits would be placed on surface-disturbing activities (livestock grazing, woodland harvesting, and vegetation treatments) to protect cultural resources. The impacts on cultural-recreation resources and recreation user groups would be similar to those discussed under Alternative A because the management decisions are similar.

The impacts on the Alkali Ridge National Historic Landmark would be similar to those discussed under Alternative B because the proposed management decisions are similar.

Alternative D

Under Alternative D, the area would not be designated as a cultural ACEC, but an RMP-consistent cultural resource management plan would be written for the area. The impacts on cultural recreation resources would be adverse in the long-term because the management decisions under this alternative do not limit potential surface-disturbing activities that could adversely impact cultural resources, particularly livestock grazing impacts and watershed improvement projects. The impacts on sight-seeing recreation resource user groups would be adverse in the long-term because the potential degradation of cultural resources under this alternative would reduce the recreational opportunities for viewing cultural recreational resources. Compared to Alternative A, this alternative would be more adverse in the long-term for recreational resources because, until a management plan was approved for managing the area's cultural resources, this alternative provides fewer resource protection management decisions than Alternative A.

The impacts on the Alkali Ridge National Historic Landmark would be similar to those discussed under Alternative B because the proposed management decisions would be similar.

Proposed Plan

The impacts to recreation would be the same as discussed under Alternative C, except that controlled surface use leasing would be allowed within the ACEC. Management decisions that emphasize the protection of prehistoric and historic cultural resources within the ACEC from direct and indirect impacts from minerals development would ensure that these resources were permanently maintained for recreational enjoyment and interpretation. The location of minerals development infrastructure within the vicinity of known cultural sites would have a long term, adverse impact on the recreational use of cultural sites from a loss or degradation of context. However, management decisions under the Proposed Plan would emphasize maintenance of the relevant and important cultural values, so mitigation would ensure that the adverse impacts would be minimized. Compared to Alternative A, the Proposed Plan would have more beneficial impacts on recreation because more management would be applied to protect known cultural sites within the ACEC.

The impacts of management decisions on recreation within the Alkali Ridge National Historic Landmark would be the same as discussed under Alternative B because the management decisions would be similar. Geophysical exploration would be allowed under the Proposed Plan, but this activity would be short term and limited to casual use.

4.3.10.3.9.2. Bridger Jack Mesa ACEC

Alternative A

Under Alternative A, Bridger Jack Mesa ACEC (6,260 acres) lies entirely within a WSA, with management decisions that are consistent with the preservation of wilderness values, including ACEC near relict vegetation values. The impacts of this alternative's management decisions on recreation resources would continue to be beneficial in the long-term because the resource would be protected under IMP stipulations. Non-mechanized user groups would continue to benefit from opportunities for dispersed camping and hiking, backpacking, and equestrian activities within the WSA's pristine and undeveloped landscape. Motorized OHV, mountain biking, specialized, and scenic driving user groups would continue to be adversely impacted by the lack of recreational opportunities within the WSA because of IMP-imposed restrictions on surface disturbances.

Alternatives B–E, and the Proposed Plan

The impacts on recreation resources and on resource users would be the same as discussed under Alternative A because the area lies within a WSA, except that the ACEC would be slightly reduced in size and would encompass 6,225 acres. Note that under Alternatives C and D and under the Proposed Plan, Bridger Jack Mesa would not be managed as an ACEC; however, there would be affects to recreation from these decisions because the area would be managed under IMP stipulations to preserve WSA wilderness values.

4.3.10.3.9.3. Butler Wash North ACEC

Alternative A

Under Alternative A, the 17,464-acre Butler Wash ACEC lies entirely within a WSA, with management decisions that would be consistent with the preservation of wilderness values under the IMP, including ACEC scenic values. The impacts of this alternative's management decisions on recreation resources and user groups would be negligible because the area is and would continue to be protected to preserve wilderness and scenic values.

Alternatives B–E, and the Proposed Plan

The impacts on recreation resources and on resource users would be the same as discussed under Alternative A because the area lies within a WSA. Note that under Alternatives C and D and under the Proposed Plan, Butler Wash North would not be managed as an ACEC; however, there would be affects to recreation from these decisions because the area would be managed under IMP stipulations to preserve WSA wilderness values.

4.3.10.3.9.4. Cedar Mesa ACEC

Alternative A

Alternative A would continue to manage the 295,336-acre Cedar Mesa ACEC for cultural, recreational, and primitive/natural area values. Management decisions under this alternative would permit short-term impacts to recreational resources from surface disturbances that include rangeland and wildlife habitat improvements, as well as fire suppression to protect life and

property. Areas open to mineral entry and disposal of mineral materials could have long-term surface disturbance-related impacts on recreation within the ACEC by reducing the recreational opportunities for sight-seeing in areas of high scenic quality. Management decisions that limit OHV use to designated trails that limit or prevent impacts to cultural resources, manage areas for primitive or non-motorized use, and manage the scenic highway corridor would have long-term, beneficial impacts on mechanized and non-mechanized recreational resource users because the recreational opportunities for scenic driver, motorized, and non-mechanized resource users would be maintained.

Alternative B

Under Alternative B, the 306,742-acre Cedar Mesa ACEC would be managed for its cultural resources as a cultural-ACEC. Management decisions under this alternative would close the area to dispersed camping, require camping waste be packed out, and limit day use and overnight camping permits to protect cultural resources. The impacts on recreational resources would be beneficial in the long-term because the resources would be protected from surface disturbances. Short-term impacts to recreational resources would be similar to those discussed under Alternative A. The impacts on recreational resource user groups would be a long-term reduction in the recreational opportunities for motorized and non-motorized resource users because of the restrictions placed on motorized use and the prohibitions on dispersed camping. Compared to Alternative A, this alternative would have more long-term beneficial protection-related impacts on recreational resources. This alternative would also have long-term impacts that are more adverse to recreational resource users because of the reduced opportunities for motorized and non-mechanized recreational experiences within the ACEC.

Alternative C

Under this alternative, the long-term beneficial impacts to recreational resources would be similar to those discussed under Alternative B because, though the area would not be designated as a cultural-ACEC, the management decisions applied to the area through the proposed designation as a 375,739-acre SRMA would be similar. The long-term impacts to recreational users would be similar to Alternative B, but to a lesser degree because the area would be open to dispersed camping. Compared to Alternative A, this alternative would have more long-term, beneficial protection-related impacts on recreational resources, but it would also have more long-term, adverse impacts on recreational resource users because of the reduced opportunities for motorized recreational experiences.

Alternative D

The impacts of this alternative would be similar to those discussed under Alternative C because the management decisions are the same as proposed for Alternative C: the area would not be designated as a cultural ACEC, but would instead be managed under proposed designation as a 375,734-acre SRMA, with similar management decisions to those proposed under Alternative B.

Alternative E

Under this alternative, the management decisions would be similar to Alternative B, except that approximately 60,049 acres (19% of the proposed ACEC) would be managed for protection of wilderness characteristics within the proposed ACEC. The impacts to recreational resources would be similar to Alternative B, but to a greater degree, from the additional surface protection

of wilderness characteristics areas under VRM Class I management objectives that would preserve scenic quality, soils, vegetation, and cultural values for all user groups. Compared to Alternative A, this alternative would have more beneficial impacts on recreational resources and users by maintaining more area for non-mechanized opportunities.

Proposed Plan

The impacts to recreation for the Cedar Mesa area would be the same as discussed under Alternative C because the special designation management decisions would be the same: the area would not be managed as an ACEC, those portions of the area outside of the WSAs would be managed under an SRMA management plan.

4.3.10.3.9.5. Dark Canyon ACEC

Under all of the alternatives and the Proposed Plan, the area proposed as the Dark Canyon ACEC lies partially within a WSA, with management decisions that are consistent with the IMP that stipulates preservation of wilderness values. The impacts of this alternative's management decisions on recreational resources and recreational resource users would be beneficial in the long-term because the area is and would continue to be protected and managed to preserve wilderness values. Low-impact, non-mechanized recreational activities, (as discussed in Section 4.3.10.3.10) would continue to be permitted, with continued long-term, beneficial impacts to these users. That portion of Dark Canyon that does not lie within the WSA would be impacted by special designation decisions as discussed below.

Alternative A

The currently designated 61,660-acre Dark Canyon ACEC would continue to be managed as an ACEC for recreation, scenic, and natural area values. The impacts on recreation resources would be beneficial to non-mechanized users in the long term because the area would continue to be unavailable for livestock grazing and mineral leasing, excluded from woodland harvesting, closed to OHV use, and managed for minimal surface disturbances under VRM Class I objectives. These decisions would continue to provide beneficial opportunities for solitude, quiet, remoteness, and a pristine, undisturbed landscape sought by non-mechanized recreation users. The impacts to mechanized and motorized users would continue to be adverse in the long term because the opportunities for these user groups would be either highly limited or prohibited within the ACEC.

Alternative B

The management decisions under this alternative would be the same as discussed above under Alternative A because the decisions are very similar: OHV use would be prohibited within the 61,600-acre ACEC; surface-disturbing activities would be very limited or prohibited; the area would be managed as VRM I for minimal surface disturbances.

Alternative C

Under this alternative, Dark Canyon would not be managed as an ACEC. However, as discussed above, the portion that lies within a WSA would continue to be managed under IMP stipulations to preserve the area's wilderness values, with impacts on recreation as discussed under Alternative A. Under this alternative, the non-WSA portion of Dark Canyon would be managed under SRMA prescriptions that would impose limitations or prohibitions on surface disturbances

within the canyon that are similar to those described under Alternative A above. So, the impacts to recreation resources and users would be the same as discussed under that alternative.

Alternative D

This alternative would apply the same management decisions as Alternative C. The impacts to recreation would be the same as that alternative.

Alternative E

This alternative would apply the same management decisions as Alternative B. The impacts to recreation would be the same as that alternative.

Proposed Plan

The Dark Canyon ACEC would not be designated under the Proposed Plan. The impacts of the Proposed Plan decisions on recreation in Dark Canyon would be the same as discussed for Alternative C because the decisions are the same.

4.3.10.3.9.6. Hovenweep ACEC

Alternative A

Under Alternative A, the impacts on recreational resource and recreational resource users within the 1,798-acre ACEC would be similar to the analysis discussed under the Cedar Mesa ACEC for Alternative A because the management decisions applicable to recreation are similar. Mineral leasing, geophysical activities, mineral entry, and mineral disposal would have short term and long term, adverse impacts on opportunities for sightseeing, but allowed OHV use would maintain opportunities for motorized OHV and mountain biking recreation. The protection of riparian and aquatic areas, and floodplains would provide opportunities for wildlife viewing, and cultural resource protection would provide opportunities for interpretive viewing. However, the impacts to recreational users seeking opportunities for cultural resource viewing and wildlife viewing would be adverse in the long term. This is because minerals development would likely affect the cultural context of cultural resource interpretive viewing and sightseeing, and wildlife viewing would likely be adversely affected by the noise, movement, and surface disturbances associated with minerals development.

Alternatives B

Under Alternative B, the area would be designated as an ACEC and expanded to include an additional 620 acres (totaling 2,439 acres), the area would be managed under VRM Class III objectives, available for mineral leasing under standard stipulations, and available for mineral entry. The impacts to recreational users seeking opportunities for cultural resource viewing and wildlife viewing would be adverse in the long term. This is because minerals development would likely affect the cultural context of cultural resource interpretive viewing and sightseeing, and wildlife viewing would likely be adversely affected by the noise, movement, and surface disturbances associated with minerals development. Compared to Alternative A, this alternative would be more adverse for recreation because of management decisions that would allow more surface disturbances within the ACEC that would detract from the expected recreational experience associated with cultural resource viewing and interpretation.

Alternative C

The impacts on recreation under this alternative would be the same as discussed under Alternative B because the management decisions to expand the ACEC boundaries, to allow standard stipulation minerals leasing and designate the area as VRM Class III would be the same.

Alternative D

Under this alternative, the Hovenweep ACEC would not be established and management of the area would be identical with surrounding lands. The area would be available for minerals development and open to watershed and vegetation treatments that would not impact sensitive cultural sites. The impacts of management decisions on recreational resources would be short-term and long-term. Short-term impacts to recreational resources would be produced by surface disturbances from vegetation and watershed treatments that would temporarily degrade scenic quality and reduce the recreational opportunities for sight-seeing. Long-term impacts to recreational resources would be produced by the paucity of management decisions to protect the area's cultural resources from surface disturbances while permitting minerals development, livestock grazing, and campfires. The impacts on recreational resource users would be beneficial in the long-term for recreational user groups that seek opportunities for OHV and non-motorized trail use because there would be few limitations on trail development. The impacts on recreational users who seek opportunities for solitude, undisturbed and undeveloped natural landscapes, and remoteness would be adverse in the long-term because under this alternative the area would not be managed to preserve these recreational qualities. Compared to Alternative A, this alternative would have more adverse impacts because fewer resource protection-related management decisions would be specified. The impacts on recreational resource users would be similar to Alternative A.

Alternative E

The impacts of management decisions on recreation would be the same as discussed under Alternative B because the decisions are the same.

Proposed Plan

The impacts of the Proposed Plan on recreation would be similar to those discussed under Alternative A because the management decisions are similar, except that the 880 acre visual emphasis zone would be managed as VRM II under the Proposed Plan. Compared to Alternative A, the Proposed Plan would have somewhat more beneficial impacts for recreational experiences because of management for VRM Class II for part of the area and the increased emphasis on maintaining the important cultural and historical values of the area through more stringent surface management stipulations.

4.3.10.3.9.7. Indian Creek ACEC

Alternative A

Under this alternative, the 8,510-acre Indian Creek ACEC would be managed to protect visual quality. Management decisions would permit minimal surface disturbances within the area (e.g., fire suppression to protect life and property, livestock grazing, geophysical activities). The area would be closed to OHV use. Recreational activities would be restricted if adaptive management determined that scenic values were being degraded. These management decisions would have

long-term, protection-related beneficial impacts on recreational resources. The impacts on recreational user groups would be variable: there would be long-term, beneficial impacts on non-mechanized groups because the area's management would be consistent with the recreational expectations of these groups (i.e., scenic quality, a pristine environment, natural sights and sounds, solitude); the impacts on OHV and mountain biking recreational users would be adverse in the long-term because the recreational opportunities for these groups would be limited.

Alternative B

The impacts on recreation under this alternative would be similar to those discussed under Alternative A because the management decisions to preserve scenic quality would be similar.

Alternative C

This alternative would have similar impacts as Alternative A on recreational resources because the management decisions are similar. The impacts on non-mechanized recreational users would be beneficial in the long-term because dispersed camping would be permitted within the Indian Creek Corridor. The impacts on mechanized recreational users would be similar to Alternative A. Compared to Alternative A this alternative would have fewer beneficial impacts because less area would be protected for recreation-related scenic quality in the 3,908-acre ACEC (a 46% reduction when compared to Alternative A). There would also be more adverse impacts to all recreation users from the substantially reduced size of the ACEC from 8,510 acres to 3,908 acres under this alternative that would reduce the area available for recreating. The reduced size of the ACEC would likely create use conflicts between mechanized and non-mechanized user groups.

Alternative D

Under this Alternative, the Indian Creek ACEC would not be established. The area would not be managed to maintain scenic quality, but would be managed for consistency with the surrounding lands. Those areas that lie within WSAs would have recreation impacts similar to the impacts discussed under Alternative B because WSA resource protection stipulations would preserve scenic quality and non-mechanized recreational resources. Recreational resources in those areas within the Indian Creek corridor that lie outside of WSAs would not be managed for their protection, which would be an adverse long-term impact. The affects on recreational user groups would be variable: non-mechanized user groups would be adversely impacted in the long-term because management of non-WSA areas would be inconsistent with this group's recreational expectations that include an undeveloped and natural landscape, high scenic quality, natural sights and sounds, and a sense of remoteness and solitude; motorized, mountain biking, and specialized recreational user groups would be beneficially impacted in the short-term because the reduced restrictions on recreational activities within non-WSA areas would create more recreational opportunities for these users. However, the long-term impacts on all resource user groups would include an increased likelihood for resource use conflicts from expected increasing numbers of users combined with the reduced limitations on recreational resource use.. Compared to Alternative A, this alternative would be more adverse in the long-term because there would be less protection of recreational resources and an increased likelihood in the long-term for unsatisfying recreational experiences for all recreational resource users.

Alternative E

The impacts of this alternative on recreational resources and users would be the same as discussed under Alternative B because the management decisions are the same, except that approximately 3,887 acres (30% of the proposed ACEC) would be managed to preserve wilderness values within the non-WSA lands with wilderness characteristics that lie within the proposed 8,510-acre ACEC. The impacts on recreational resources and users of these areas would be the same as discussed under Alternative A because management to maintain a high level of visual quality and to preserve a pristine environment would be applied under both alternatives.

Proposed Plan

This alternative would have similar impacts as Alternative A on recreational resources and on non-mechanized recreation because the management decisions are similar. The impacts on non-mechanized recreational users would be beneficial in the long-term because dispersed camping would be permitted within the Indian Creek ACEC. The impacts on OHV and mountain biking recreational users be adverse for OHV opportunities because the ACEC would be closed to OHV use. Compared to Alternative A, this alternative would have more beneficial impacts because a greater range of recreational opportunities would be available. Lockhart Basin ACEC

Alternative A

Under this alternative Lockhart Basin would not be managed as an ACEC. However, the existing Indian Creek ACEC (designated to maintain scenic quality) and the Indian Creek WSA (managed under IMP stipulations) lie partially within the Lockhart Basin area. The current management decisions for Indian Creek ACEC in the basin would limit recreational use if adaptive management determined that visual resource values were being degraded. The area would be open for mineral leasing (subject to NSO leasing stipulations), closed to OHV use, woodland harvesting would be prohibited, and the area would continue to be managed under VRM Class I objectives. This would have long term, beneficial impacts on non-mechanized users and scenic drivers, but would continue to have adverse impacts on OHV and mountain bikers from limited opportunities. Those areas within the basin, but outside of the current ACEC and WSA boundaries are managed under VRM Class III objectives (see section 4.3.18 Visual). In these areas the impacts to resource users would be reversed: OHV and mechanized users would benefit from travel opportunities, while non-mechanized users would be adversely affected by a lack of solitude, quiet, seclusion, naturalness, and remoteness.

Alternative B

Under Alternative B Lockhart Basin would be designated as a 47,783-acre ACEC and as VRM Class I for management and preservation of scenic quality. All surface-disturbing activities would be prohibited, but the area would be open for campfires. The impacts to recreational resources and user groups would be beneficial in the long-term because management under the VRM Class I objectives would restrict surface-disturbing activities or actions that would impair visual resources and scenic quality to very low levels of impact. The impacts on user groups that seek quiet, solitude, and remoteness in undisturbed landscapes (i.e., hikers, mountain bikers, scenic drivers) would benefit in the long-term because opportunities would be available that would likely meet their expectations. There would be few opportunities for other mechanized or specialized user groups, so the impacts on these users would be adverse in the long-term from

limited recreational opportunities. Compared to Alternative A, this alternative would be more beneficial for those groups seeking quiet and solitude, with impacts to other user groups similar to those discussed under Alternative A.

Alternative C

Under this alternative, Lockhart Basin would not be designated as a scenic ACEC. The area would be designated as VRM Class II and Class III, available for livestock use, and open for mineral leasing (subject to standard and timing and controlled surface use leasing stipulations). The impacts to recreation resources would be adverse in the long-term for all recreational resource user groups in the designated VRM Class III area because visual objectives would permit surface disturbances throughout the area from recreational and non-recreational activities that would impact visual/scenic quality both from within the basin and from recreational areas that overlook the basin (see Visual Resources Section 4.3.18).

Compared to Alternative A, this alternative would be more adverse in the long-term for recreational resources and for all recreational resource users in the VRM Class III-designated area because the visual resource objectives under this alternative would permit more surface disturbance-related impacts to recreation resources that would likely diminish the quality of recreational experiences in the area.

Alternative D

The impacts under this alternative would be the same as discussed under Alternative C because the management decisions are the same.

Alternative E

Under this alternative, management decisions would be the same as those discussed under Alternative B, except that approximately 21,298 acres (45% of the proposed ACEC) with non-WSA wilderness characteristics that lie within the ACEC boundary would be protected from surface disturbances through VRM Class I designation and under minerals leasing prohibitions. The impacts on recreation would be the same as Alternative B because the management decisions under Alternative E would also protect the proposed ACEC under VRM Class I management objectives and through prohibitions on surface disturbances.

Proposed Plan

The impacts to recreation in Lockhart Basin from Proposed Plan decisions would be the same as discussed under Alternative C because the management decisions are the same.

4.3.10.3.9.8. Lavender Mesa ACEC

Alternative A

Under this alternative, the 649-acre Lavender Mesa ACEC would continue to be maintained to manage the relict vegetation on the mesa top and managed for primitive, non-motorized recreation. The management decisions would minimize surface-disturbing activities within the ACEC; would exclude OHV, pack animal, and saddle stock use; and would limit recreational activities that would potentially degrade scenic or cultural resource values. These decisions would have long-term beneficial preservation-related impacts on recreational resources because scenic quality, cultural resources, and an undisturbed environment are valued components of the

recreational experience. The impacts on scenic driver, mountain biking, motorized OHV, and most specialized recreational user groups would be negligible in the long-term because, though mountain biking and motorized OHV recreational opportunities and activities would be excluded from the ACEC, the ACEC is physically inaccessible to mechanized use. The impacts on non-mechanized recreational users and specialized recreation climbing users would be beneficial in the long-term because the management decisions would maintain the recreational opportunities and expectations that are preferred by this group: natural sights and sounds, remoteness, isolation, and a pristine, undeveloped environment.

Alternative B

The impacts of management decision on recreational users under this alternative would be similar to those discussed for Alternative A because the size of the ACEC and the management decisions are similar. Compared to Alternative A, this alternative would permit a greater degree of recreational resource degradation: recreational activities would be restricted or limited only if vegetation communities were being adversely affected.

Alternative C

The impacts of management decision on recreational users under this alternative would be similar to those discussed for Alternative A because the size of the ACEC and the management decisions are similar. Compared to Alternative A, this alternative would have long-term impacts on recreational resources as discussed under Alternative B above.

Alternative D

Under this Alternative, the ACEC would not be established and would be managed consistent with the surrounding area. Mountain biking and motorized recreation on designated routes would be permitted on the mesa top but, as noted above, the mesa top is inaccessible to these recreational activities. The impacts on recreational resources under this alternative would be potentially adverse in the long-term because there would be very few limitations or restrictions on potential surface-disturbing activities (e.g., unlimited dispersed camping; lack of waste management) and these surface disturbances would potentially degrade recreational resources. Management decisions under this alternative would also not limit surface disturbance-related resource degradation by those users who access the mesa top (climbers, non-mechanized users), which could further exacerbate surface disturbances on the mesa top. In the long-term, potential recreational resource degradation and the lack of resource protection would likely degrade the recreational experience for those accessing the mesa top. Compared to Alternative A, this alternative would have long-term impacts that are more adverse to recreation resources because management decisions would not preserve the recreational resources on Lavender Mesa.

Alternative E

Under Alternative E, the proposed 649-acre ACEC would be protected as an area with non-WSA wilderness characteristics. The impacts to recreation resources would be beneficial in the long-term because surface disturbance restrictions to preserve wilderness values on the mesa would be either prohibited or greatly limited. The impacts to resource users would be comparable to the discussion under Alternative A because the level of resource preservation and allowed recreational activities would be the same.

Proposed Plan

The impacts to recreation in Lavender Mesa (mesa top) from Proposed Plan decisions would be the same as discussed under Alternative C because the management decisions are the same.

4.3.10.3.9.9. Scenic Highway Corridor

Alternative A

Under this alternative, the current 70,017-acre Scenic Highway Corridor ACEC would be managed to preserve scenic values. Restrictions to recreational use within the ACEC would be applied within the 21,380-acre area of the ACEC that overlaps with the Cedar Mesa ACEC. Restrictions would be applied to preserve scenic quality along the corridor, with potential long term, adverse impacts on mechanized and non-mechanized recreational opportunities to prevent surface disturbances or visual intrusions within the ACEC viewshed.

Alternatives B – E, and Proposed Plan

Under the action alternatives and the Proposed Plan, the scenic highway corridor would not be designated as an ACEC, with beneficial impacts on recreational opportunities from reduced restrictions on activities along the former ACEC corridor. Compared to Alternative A, these alternatives and the Proposed Plan would have more beneficial impacts on recreation because fewer restrictions would potentially be placed on recreational activities.

4.3.10.3.9.10. Shay Canyon ACEC

Alternative A

This alternative would continue to manage the 3,561-acre Shay Canyon ACEC for conservation of cultural resources. The area would permit limited OHV use (along designated routes) and would manage the canyon for permanent protection of sensitive cultural sites, but would have no other specified limits or restrictions on recreational activities. The impacts of this alternative's management decisions on recreational resources would be minor because: (1) the area would be managed under VRM Class I objectives, so long-term degradation of scenic quality from surface disturbances would be minimal; (2) OHV-related surface disturbances would be limited; and (3) recreation-related cultural resources would be protected. The impacts on recreational resource users would also be minor because recreational opportunities for mechanized and non-mechanized groups would be available within the ACEC.

Alternative B

Under Alternative B, 119 acres would be designated as the Shay Canyon ACEC to manage the cultural resources within the canyon. The area would be closed to camping, motorized OHV and mountain biking recreational use would be limited to designated routes, hiking would be limited to designated trails, and recreation would be limited if cultural resources were adversely impacted by these activities. The impacts on recreational resources would be beneficial in the long-term because management decisions under this alternative would prohibit surface disturbances within the proposed ACEC (e.g., NSO for oil and gas development, no campfires, restricted grazing, no surface-disturbing vegetation or wildlife treatments). The impacts on recreational use within the ACEC would be adverse in the long-term because management decisions to protect cultural resources would limit the recreational opportunities for mechanized

and non-mechanized recreation within the proposed ACEC. Compared to Alternative A, this alternative would have greater long-term, adverse impacts on recreational resources and on recreational opportunities within the ACEC because it would: (1) reduce the size of the ACEC to approximately 2% of the acreage managed under Alternative A, so specific ACEC-related management prescriptions for the protection of recreational resources would be reduced; and (2) reduce the recreational opportunities within the ACEC because the 119-acre proposed ACEC would be too small to accommodate the range of recreational activities presently permitted under Alternative A.

Alternative C

The impacts of this alternative would be the same as those discussed under Alternative B because the management decisions are the same.

Alternative D

Under this alternative, the Shay Canyon ACEC would not be established but would be managed consistent with the surrounding lands. Management decisions would limit OHV use to designated trails, but management of the area under VRM Class III objectives would allow surface disturbances from other land-use activities. In the long-term, recreational resources would potentially become degraded through surface-disturbing minerals exploration and development, livestock grazing, watershed treatments, and fuels treatments. The impacts on recreational resource users would be beneficial in the short-term because opportunities would become available for a range of mechanized and non-mechanized recreational activities. In the long-term, the lack of management prescriptions to protect recreational resources would allow those resources (i.e., cultural, wildlife, vegetation, and scenic quality) to become degraded, which would reduce the likelihood of satisfying recreational experiences for all resource user groups. Compared to Alternative A, this alternative would have impacts that are more adverse because management decisions would not preserve the recreational resources or recreational opportunities within the Shay Canyon area.

Alternative E

The management decisions under this alternative would be similar to those discussed under Alternative B, except that approximately 99 acres (83% of the proposed ACEC) would be managed to protect non-WSA lands with wilderness characteristics within the proposed ACEC. The impacts would be similar to those discussed under Alternative B because management decisions that prohibit surface disturbances within the canyon would be similar, except that OHV use would be prohibited within the non-WSA lands with wilderness characteristics. The adverse impacts on recreation and user groups would be the same as Alternative B, but to a reduced degree, because mechanized activities (OHV and mountain biking activities) would not be allowed. As discussed under Alternative B, the adverse impacts to recreation would be caused by designating an area too small to accommodate the range of allowed recreational opportunities.

Proposed Plan

The impacts of this alternative would be similar to those discussed under Alternative B because the management decisions are the same.

4.3.10.3.9.11. San Juan River ACEC

Alternative A

Under this alternative, the San Juan River would not be designated as an ACEC; however, the 15,100-acre area would continue to be managed under the current prescriptions and management decisions for the San Juan River SRMA. Analyses of the impacts of those management decisions on recreation and on recreation user groups are discussed under San Juan SRMA, Alternative A above.

Alternative B

Under Alternative B, the San Juan ACEC would be managed as a 7,590-acre area for the protection of scenic, cultural, wildlife, and natural system values. Management decisions would limit surface disturbances within the proposed ACEC boundaries: vehicle access and motorized OHV and mountain biking activities would be restricted to designated routes, and trails to cultural sites would be designated, as needed, to protect resource values; recreational activities would be limited or restricted if those activities were determined to adversely impact wildlife; camping sites would be closed or restricted, as necessary, to protect resource values; and climbing aids to access cultural and raptor nesting sites would be prohibited. The management decisions under this alternative would have long-term beneficial impacts on recreational resources because recreational resource values that include scenic quality, wildlife, and cultural resource components would be preserved or managed to ensure minimal impacts.

The impacts on motorized OHV, mountain biking, non-mechanized, and specialized recreational user groups would be a long-term reduction or limitation of recreational opportunities within the proposed ACEC if recreational activities were determined to have adverse impacts on cultural, scenic, and wildlife resource values. The impacts of ACEC management decisions on river users would be minor to negligible because the recreational opportunities for this group would not likely be affected by ACEC resource use restrictions: river use would be limited by group size and group numbers under the proposed SRMA (see Section 4.3.10.3.10), with overnight camping at designated campsites.

Compared to Alternative A, this alternative would manage 50% fewer acres along the San Juan River corridor for the preservation of recreational values and place more limitations on San Juan River corridor recreational use. However, this alternative would manage the acreage within the proposed ACEC with greater restrictions on surface-disturbing activities than Alternative A, which would provide more long-term protection to those resources that would beneficially contribute to the river user's recreational experience.

Alternative C

The impacts of proposed management decisions on recreation under this alternative would be the same as discussed under Alternative B because the proposed decisions would be the same.

Alternative D

Under Alternative D, the San Juan River ACEC would not be designated. However, the management decisions under this alternative would be similar to those described under Alternative B, with similar impacts to recreational resources and user groups. Compared to

Alternative A, this alternative would have impacts that are similar to those discussed under Alternative B.

Alternative E

The impacts on recreational resources and users would be the same as discussed under Alternative B because the management decisions are the same, except that 2,155 acres (28% of the proposed ACEC) of non-WSA lands with wilderness characteristics that lie within the ACEC would prohibit any surface disturbances that could potentially degrade the existing wilderness values within these areas. The impacts of non-WSA wilderness characteristics area protection on recreational resources and users would be the same as the discussion under Alternative B because the ACEC would be managed under alternative decisions to ensure that there would be minimal impacts to visual, cultural, wildlife, and natural values within the ACEC.

Proposed Plan

Under this alternative, the 4,321-acre San Juan ACEC would be managed with the same prescriptions as discussed under Alternative B. Therefore, the impacts would be same as discussed for that alternative, but reduced in scope, because of the reduced size of the ACEC (under this alternative San Juan River segment #5 [2,768 acres] would be managed under the NWSRS).

4.3.10.3.9.12. Valley of the Gods ACEC

Alternative A

This alternative would manage the 31,387-acre Valley of the Gods (within the current Cedar Mesa ACEC) for scenic quality preservation through VRM Class I designation with surface disturbances compatible with this visual resource objective. The impacts on recreational resources would continue to be beneficial in the long-term because the VRM Class I limitations on surface disturbances would continue to preserve recreational resources (e.g., OHV use would be limited to designated routes, potential scenic quality-degrading minerals activities would require visual mitigation and/or approved plans of operation). The impacts on scenic driver, mechanized and non-mechanized recreational resource user groups would continue to be beneficial in the long-term because recreational opportunities would continue to be available for these groups, with the likelihood of satisfying scenic quality-related recreational experiences because management decisions would continue to preserve the high scenic quality of the area.

Alternative B

This alternative would manage the Valley of the Gods as a 22,863-acre ACEC for the preservation of scenic quality. The impacts on recreational resources would be similar to those discussed for Alternative A because the area would continue to be protected under VRM Class I management objectives with a similar level of potential surface disturbances to recreational resources. The impacts on recreational user groups would be similar to the discussion under Alternative A because the recreational opportunities for scenic driving, motorized OHV, mountain biking, and non-mechanized users would be similar. This alternative would provide recreation-related scenic quality protection to 73% of the area that would be protected under Alternative A. Consequently, the amount of recreational opportunities described would be proportionally less than those provided under Alternative A.

Alternative C

This alternative would have impacts similar to those discussed under Alternative B because the management decisions are the same.

Alternative D

Alternative D would not designate the 22,863-acre Valley of the Gods as an ACEC for the protection of scenic quality and the area would be managed under VRM Class III objectives. The area would be managed for a lower level of visual/scenic quality (i.e., more surface disturbances would be permitted), with potentially adverse impacts on those recreational opportunities that include a high scenic quality component. The likelihood of satisfying recreational experiences for scenic driver, mountain biking, motorized, and non-mechanized user groups within this area would be diminished in comparison with Alternative A.

Alternative E

This alternative would manage the proposed ACEC under decisions similar to Alternative B, except that approximately 20,743 acres (91% of the proposed ACEC) within the ACEC would be managed to protect non-WSA lands with wilderness characteristics. The impacts would be the same as discussed under Alternative B because management decisions to protect wilderness characteristics (designation as VRM Class I, closed to mineral leasing and minerals disposal, closed to woodland harvesting) would also be applied to the entire ACEC under that alternative.

Proposed Plan

The Proposed Plan would have impacts similar to those discussed under Alternative B because the management decisions are the same.

4.3.10.3.10. IMPACTS OF SPECIAL DESIGNATION—WILD AND SCENIC RIVERS DECISIONS ON RECREATION

4.3.10.3.10.1. Colorado River Segments

Alternative A

Under Alternative A, Segment #1 (a 2.2-mile segment) was not evaluated for eligibility under the NWSRS. However, the river segment would continue to be managed according to floodplains and riparian/aquatic areas guidelines described in the current RMP, which includes limiting OHV use to designated trails, NSO minerals leasing, and prohibitions on surface disturbances caused by mountain biking and motorized OHV equipment (except for fire management or geophysical work). The impacts on recreational resources would be beneficial in the long-term because recreation-related restrictions or limitations would continue to be imposed on the river segment to protect any ORVs that the river segment may possess. The impacts on mountain biking, motorized, river floating, and non-mechanized resource users would be beneficial in the long-term because recreational opportunities for these user groups would continue to be available under current management decisions.

Colorado River Segments #2 and #3 (5.5 and 6.5 miles, respectively) were determined to be eligible, and would be managed to preserve any ORVs that the segments might possess. The impacts on recreation resources would be beneficial in the long-term because recreation resources (e.g., scenic, wildlife, cultural resources) would be preserved. The impacts on

motorized, mountain biking, river floating, and specialized recreational user groups would be negligible in the long-term because, though river segment eligibility would continue to prohibit surface disturbances that could potentially degrade the ORVs for these river segments, recreational opportunities would continue to be available for these user groups. The impacts on non-mechanized and river floating recreational use would continue to be beneficial in the long-term because protection of the river corridor from surface disturbances along these segments would be compatible with the recreational expectations of these users, which includes a natural-appearing environment and little evidence of human surface disturbances along the river corridor. The impacts on mountain biking and motorized users would also be beneficial in the long-term because use of designated trails along the river corridor would continue.

Alternatives B and E

Under Alternatives B and E, Colorado River Segment #1 would be recommended as suitable for classification as recreational and would be managed under VRM Class III objectives. The impacts on recreational resources would be beneficial in the long-term because recreational ORVs that include cultural, wildlife, fishery, scenic, and ecological resources (see Section 3.15.2.2) would be preserved. The impacts on recreational resource users would be variable. Management decisions under these similar alternatives would have long-term beneficial impacts on specialized, mountain biking and motorized OHV users because recreational opportunities would be available along the river corridor for trail use, and surface disturbances would be managed under VRM Class III objectives (development and roads already exist on the northern side of the segment in the Moab FO [see Appendix H, Special Designations]). The impacts on non-mechanized and river floating user groups would be beneficial in the long-term because the recreational opportunities for experiencing solitude, remoteness, natural sights and sounds, and an undeveloped and pristine, natural-looking environment would be partially preserved under the Recreation category; however, the proximity of mechanized and non-mechanized users within the 352-acre, 6.2-mile segment would create the potential for resource user conflicts. Compared to Alternative A, these alternatives would permit a greater degree of surface disturbance under VRM Class III management objectives that would potentially degrade recreation resources, but would also provide more opportunities for recreational resource users.

Colorado River segment #2 would be recommended as suitable for classification as scenic and would be managed under VRM Class II objectives. The impacts would be beneficial because river ORVs would be preserved. Increased mountain biking and motorized OHV recreational opportunities would have long-term, beneficial impacts on user groups that seek those opportunities because some surface disturbances along the river corridor would be permitted. The increased recreational opportunities for solitude, isolation, and naturalness would have beneficial impacts on recreational users who seek these experiences; however, the potential exists for adverse resource use conflicts between mechanized and non-mechanized users within the relatively narrow, 880-acre, 6.8-mile river segment. Compared to Alternative A, these alternatives would have impacts that are more beneficial to recreation resources because river corridor ORVs would be protected.

Segment #3 would be recommended as suitable for classification as scenic, would be managed under VRM Class I objectives, and would be closed to OHV use. The impacts of these management decisions would be beneficial in the long-term for recreational resources because surface disturbances within the river corridor would be minimized. Under these alternatives,

there would be a long-term, adverse reduction in recreational opportunities for mountain biking and motorized OHV user groups. The impacts on non-mechanized and river floating users would be an increased likelihood of satisfying recreational experiences from the elimination of OHV travel (and reduced resource use conflicts with this activity) within the river corridor. Compared to Alternative A, this alternative would be more beneficial for non-mechanized and river floating users and more adverse for mountain biking and motorized users.

Alternative C

Under this alternative, Segment #1 would be recommended as not suitable under the NWSRS. The impacts on recreational resources and on recreational resource users would be adverse in the long-term because the river corridor would be managed under minerals timing and controlled surface use leasing stipulations that could have long-term, adverse surface disturbance-related impacts on recreational scenic quality within the river corridor from potential minerals development.

Under this alternative, the impacts on Colorado River Segment #2 would be similar to those discussed under Alternative B because the management decisions are similar. There would be long-term, adverse impacts to river floating users and on-shore non-mechanized users from resource use conflicts with permitted motorized boat use within the river corridor, which would diminish the recreational experience for those river floaters, hikers, equestrians, and backpackers who seek non-mechanized, natural sights and sounds. Compared to Alternative A, this alternative would be less beneficial for recreational users because of the increased likelihood of recreational use conflicts.

The impacts on Colorado River Segment #3 would be similar to those discussed under Alternative B because the management decisions are similar. There would be impacts to river floating users and on-shore non-mechanized users, as discussed under Segment #2 above, because motorized boat use would be allowed. Compared to Alternative A, this alternative would have impacts similar to those discussed under Alternative B. Compared to Alternative A, this alternative would have similar impacts on recreational river use.

Alternative D

Under Alternative D, the Colorado River segments #1 – #3 would be recommended as not suitable under the NWSRS, which would have long-term impacts on recreational river use as discussed for Segment #1 under Alternative C because the segments would be managed under controlled surface use mineral leasing stipulations. Compared to Alternative A, this alternative would be more adverse in the long-term on recreational river opportunities because management decisions would provide fewer protections to recreational resources, and the likelihood of recreational resource degradation and unsatisfying recreational experiences for river floaters and non-mechanized users along the river corridor would be increased.

Proposed Plan

The impacts to recreation would be the same as discussed under Alternative C, except that segment 3 of the Colorado River would be managed as VRM Class II, otherwise the management decisions are the same.

4.3.10.3.10.2. Indian Creek

Alternative A

Under this alternative Indian Creek was not evaluated for eligibility under the NWSRS, but still would be managed according to the floodplains and riparian/aquatic areas guidelines described in the current RMP. The impacts on recreational use would continue to be beneficial because recreational resources would continue to be protected under current RMP management decisions and because a range of recreational opportunities for mountain biking, motorized, and non-mechanized groups would continue to be available within the creek corridor.

Alternative B

Alternative B would manage the proposed 4.8-mile segment of Indian Creek as recommended suitable for classification as recreational. The segment would be managed as VRM Class III objectives, with OHV travel limited to designated routes. The impacts on recreational resources would be beneficial in the long-term because recreation-related ORVs (i.e., cultural resources) would be protected. The impacts on recreational resource users would also be beneficial in the long-term because more recreational opportunities for motorized OHV, mountain biking, and non-mechanized resource users would become available within the creek corridor under VRM Class III class objectives management, while continuing to protect the creek riparian and floodplain area; however, it is likely that user conflicts will develop and intensify with increased use of the area by mechanized and non-mechanized users within the narrow, 1,536-acre, 6.5-mile long river segment. Compared to Alternative A, this alternative would be more beneficial for recreation because the creek would be managed with more protection of recreational resources.

Alternative C

Alternative C would manage Indian Creek as recommended not suitable. This alternative would have long-term, adverse impacts on recreational resources because the Monticello FO eligibility study determined that the creek possesses recreation ORVs, and a non-suitability recommendation would increase the likelihood that the creek's ORVs would be degraded and diminished by surface-disturbing activities. Under this alternative, the area beyond the creek riparian and floodplain would be managed under standard stipulations and timing and controlled surface use mineral leasing stipulations, which would likely decrease the quality of recreational resource users' experience, as well as potentially resulting in long-term surface disturbance-related degraded or diminished recreational resources. Compared to Alternative A, this alternative would be less beneficial because it would manage the creek segment with fewer recreational resource protection measures.

Alternative D

Alternative D would manage Indian Creek as recommended not suitable. This alternative would have similar long-term impacts on recreational resources and users as discussed under Alternative C because the segment would be managed under standard mineral leasing stipulations.

Alternative E

Under Alternative E, the impacts on recreation would be similar those discussed under Alternative B, except that 0.6 miles of the Indian Creek river corridor would be managed under

VRM Class I objectives to preserve non-WSA lands with wilderness characteristics. Protecting the 0.6-mile segment of river would provide additional protection to recreational resources and enhance opportunities for non-mechanized users by prohibiting surface disturbances that could degrade the area's wilderness values. The impacts to motorized, mountain biking, and specialized user groups would be the same as discussed under Alternative B because these activities would still be limited to designated routes within the river corridor. Compared to Alternative A, this alternative would have more beneficial impacts to recreational resources and users, as discussed under Alternative B.

Proposed Plan

The impacts would be the same as discussed under Alternative C because the Proposed Plan would also recommend the creek segment as unsuitable.

4.3.10.3.10.3. Fable Valley

Alternative A

Under Alternative A, Fable Valley was not evaluated for eligibility under the NWSRS. The impacts on recreational resources and on non-mechanized users would continue to be beneficial because the area lies within the Dark Canyon WSA and has been and would continue to be managed under the IMP for protection of its wilderness characteristics. The impacts on recreation resources and non-mechanized recreational opportunities would continue to be beneficial in the long-term, with opportunities for satisfying hiking, backpacking, and equestrian experiences within a pristine, undeveloped landscape. The opportunities for motorized OHV, mountain biking, specialized, and scenic driving groups would continue to be adverse in the long-term because IMP-imposed stipulations would continue to prohibit mechanized use and limit surface disturbances in these areas.

Alternatives B–E, and the Proposed Plan

The action alternatives and Proposed Plan impacts would be the same as discussed under Alternative A because of the valley's stream segment location within a WSA.

4.3.10.3.10.4. Dark Canyon

Alternative A

Under Alternative A, Dark Canyon was not evaluated for eligibility under the NWSRS. The impacts on recreation would be the same as discussed under Fable Canyon above: the proposed wild stream segment lies within the Dark Canyon WSA and recreation resources have been and would continue to receive protection under the IMP.

Alternatives B, C, and E, and the Proposed Plan

Under these alternatives and the Proposed Plan, the Dark Canyon stream segment was recommended suitable for designation as wild. The segment would be managed under VRM Class I objectives, closed to OHV use, and unavailable for mineral leasing. This impacts would be beneficial to non-mechanized recreation users as opportunities for solitude, naturalness, and a sense of remoteness would be preserved. The impacts to mechanized users would be adverse, as opportunities for these activities would be prohibited or very limited. Compared to Alternative

A, the impacts would be the same because the area is currently managed for preservation of wilderness values as a WSA under IMP stipulations.

Alternative D

Management decisions under this alternative would recommend the Dark Canyon stream segment as not suitable for consideration under the NWSRS. However, the impacts of this alternative would be the same as discussed under Alternative A because the stream segment would continue to be managed under IMP stipulations to preserve wilderness values within the WSA.

4.3.10.3.10.5. San Juan River Segments

Alternative A

Under this alternative the 8.5-mile San Juan River Segment #1 was not evaluated for eligibility under the NWSRS, with impacts similar to those described under Colorado River Segment #1 for Alternative A.

Segment #2. This 10-mile segment was determined to be eligible and would be managed under VRM Class I objectives with minimal surface disturbances, OHV use limited to designated trails, and withdrawn from mineral entry. The impacts on recreational resources and users would continue to be beneficial in the long-term because recreational resources within this segment of the river corridor would be protected. The impacts on recreational user groups would be beneficial in the long-term because recreational opportunities would continue to be available to mountain biking, OHV users, river floating, and non-mechanized users.

Segments #3 – #5. The impacts for these segments (totaling 34.8 miles) would be the same as described for Segment #2 because the management decisions would be the same.

Alternatives B and E

Segment #1. Under Alternatives B and E, this segment would be recommended as suitable for recreational classification, managed under VRM Class III objectives, and subject to NSO minerals leasing within the floodplain and riparian corridor. River ORVs (i.e., historic, fish, and wildlife) would be beneficially protected in the long-term under this classification, but it should be noted that, though these similar alternatives propose to manage the segment as suitable for classification as recreational, the eligibility study conducted by the BLM Monticello FO found that "recreation and ecological values are not ORVs found in new Segment #1" because of current uses and development along this river segment (see Appendix H for a discussion of the evaluation process for segment #1). Thus, the impact on recreational resources would be negligible to minor because this segment possesses few recreation or ecological ORVs. A comparison of this alternative to Alternative A shows that the impacts to recreation would be similar because recreational resources have not been well preserved along this segment.

Segment #2. This segment would be recommended as suitable for recreational classification, managed under VRM Class III objectives, and subject to NSO leasing within the riparian areas and floodplain. The impacts of these management decisions on recreation resources would be beneficial in the long-term because recreation-related ORVs would be protected and recreational opportunities for river floating, mountain biking, motorized OHV, and non-mechanized activities would be maintained. However, increased recreational use of the segment would likely create

resource use conflicts because of proximity between mechanized and non-mechanized users within the relatively narrow, 1,600-acre, 10-mile long river segment. Compared to Alternative A, this alternative would be less beneficial because Alternative A provided a greater degree of protection to recreational resources than this alternative.

Segment #3. This 13.3-mile segment would be recommended as suitable for wild classification, managed under VRM Class I objectives, closed to OHV use, and proposed for mineral withdrawal. These impacts on recreational resources would be beneficial in the long-term because of the high degree of protection proposed for this river segment. The impacts on user groups would be variable: closing the segment to motorized OHV use would reduce the recreational opportunities for this user group; river floaters and non-mechanized users would benefit from the proposed management decisions because removing OHVs from the river corridor would likely enhance the recreational experience where solitude, a sense of remoteness, natural sights and sounds, and a pristine river corridor environment is expected. Compared to Alternative A, these alternatives would be more beneficial for non-mechanized user and less beneficial for motorized OHV users. The impacts of these alternatives on recreational resources would be similar to Alternative A.

Segment #4. This 4.2-mile segment would be recommended as suitable for recreation classification, managed under VRM Class III objectives, and subject to NSO leasing within the riparian areas and floodplain. The impacts to recreation would be similar to those discussed under Segment #2 because the management decisions are the same.

Segment #5. The impacts to recreation along this 17.3-mile segment would be similar to those discussed under Segment #3 because the management decisions are the same.

Alternative C

Segment #1. Under this alternative, Segment #1 would be recommended as not suitable for classification under the NWSRS. The impacts on recreational resources and users would be negligible because, as mentioned above under Alternative B, this river segment was not considered eligible by the Monticello FO and it did not possess sufficient ecological or recreational ORVs. Compared to Alternative A, this alternative would have similar impacts.

Segment #2. This segment would be recommended as not suitable. The impacts on recreational resources would be adverse in the long-term because the Monticello FO eligibility study determined that this segment does possess recreational ORVs, so a status of non-suitability would deny NWSRS protection to these recreation-related resource values. A lack of recreational resource protection would increase the likelihood of surface disturbance-related degradation of recreational ORVs with an associated diminishing of recreational experiences and opportunities on all recreational resource users within the river corridor. The floodplain and riparian areas along the river segment would be protected under executive orders and BLM riparian management policy, but beyond these areas, the river corridor would be open to mineral development under standard leasing stipulations. Compared to Alternative A, this alternative would be more adverse to recreation resources in the long-term because it would provide less protection to these resources.

Segment #3. The impacts to recreation would be similar to those discussed under Segment #2 because the river segment was determined to possess Wild ORVs and the management decision is the same as Segment #2 (not suitable for recommendation). A status of non-suitability would

deny NWSRS protection to the recreation-related resource values along the river segment, with adverse degradation and/or loss of recreational opportunities.

Segment #4-#5. Same as Segment #2.

Alternative D

Segment #1. Under this alternative, recreational resource within this river segment would have impacts similar to those discussed under Alternative C because the management decision is the same.

Segment #2. The impacts on recreation within this segment would be similar to those discussed under Segment #2 for Alternative C because the management decision is the same.

Segment #3-#5. Same as Segment #2, Alternative C.

Proposed Plan

Segment #1-#4. The impacts would be the same as discussed under Alternative C because the river segment recommendations are the same.

Segment #5. This 17.3-mile, 2,768-acre river segment would have the same management prescriptions as discussed under Alternative B, with the same impacts on recreation user groups and recreation resources.

4.3.10.3.10.6. Arch Canyon

Alternative A

Under Alternative A, a 6.9-mile segment of Arch Canyon was not evaluated for eligibility under the NWSRS, but would still be managed according to the floodplains and riparian/aquatic areas guidelines described in the current RMP. The impacts on recreational use would continue to be the same as those discussed under Indian Creek Alternative A because the management decisions are the same.

Alternatives B and E

Under these alternatives, the impacts would be similar to those discussed for Indian Creek Alternative B (recommended as suitable, recreational) because the management decisions are the same.

Alternative C

Under this alternative, the impacts would be similar to those discussed for Indian Creek (recommended not suitable) because the management decisions are the same, except that the area beyond the creek riparian areas and floodplain would be managed under standard mineral leasing stipulations.

Alternative D

The impacts under Alternative D would be similar to those discussed for Indian Creek (recommended not suitable) because the management decisions are the same.

Proposed Plan

The impacts would be the same as Alternative C because the river segment recommendation is the same.

4.3.10.3.10.7. White Canyon

Alternative A

Under Alternative A, White Canyon was determined to be eligible under the NWSRS, and would be managed to preserve any ORVs that the segment might possess. The impacts on recreation would be beneficial in the long-term because recreational resources would be preserved. The impacts on specialized recreation and non-mechanized recreational user groups would continue to be beneficial because recreational opportunities would continue to be available for these users.

Alternatives B – E, and Proposed Plan

Under these alternatives and the Proposed Plan, White Canyon would be managed as not suitable for classification under the NWSRS because the canyon is not a free-flowing water system. Thus, White Canyon is ineligible for inclusion under the NWSRS. The impacts on recreational resources would be negligible because the action alternatives and the Proposed Plan would designate the area as a SRMA to protect the canyon's recreational resources and continue to provide recreational opportunities for specialized and non-mechanized recreation within the canyon. Compared with Alternative A the impacts would be similar: these alternatives would provide protection to recreational resources and provide recreational opportunities for non-mechanized and specialized user groups along the canyon rim and within the canyon.

4.3.10.3.11. IMPACTS OF SPECIAL DESIGNATION—WILDERNESS DECISIONS ON RECREATION

Under all of the alternatives and the Proposed Plan, WSAs would be managed consistent with the IMP until Congress makes wilderness designations or releases the WSAs from wilderness review (see Section 3.15.3.2). The Monticello FO currently manages 13 WSAs to preserve their wilderness values under VRM Class I objectives. The impacts on recreation resources and non-mechanized recreational opportunities of managing these areas under the IMP would continue to be beneficial in the long term, with opportunities for satisfying hiking, backpacking, equestrian, and dispersed camping experiences within a pristine, undeveloped landscape. The opportunities for motorized OHV, mountain biking, specialized, and scenic driving groups would continue to be adverse in the long term, as IMP-imposed stipulations would continue to prohibit mechanized use and limit surface disturbances in these areas under all of the alternatives and under the Proposed Plan because the areas have been and would continue to be managed so that their wilderness suitability would not be impaired.

4.3.10.3.12. IMPACTS OF TRAVEL DECISIONS ON RECREATION

4.3.10.3.12.1. OHV Areas

Alternative A

Under Alternative A, 611,310 acres would be open to cross-country OHV use, and 1,329,430 acres would be limited to designated routes. Approximately 276,430 acres would be designated as closed to OHV use. Managing OHV use under current "open" designations would be

beneficial for motorized OHV users because few restrictions on cross-country OHV use would continue to provide long-term recreational opportunities for this resource user group. However, the resource degradation-related impacts to soils, water quality, scenic quality, cultural resources, wildlife, and vegetation (all of which are components of the recreational experience), and the impacts associated with OHV noise and other resource user groups would continue to impact other resource users within the 611,310 acres designated as open to OHV use because this area would continue to remain open to OHV-caused cross-country surface disturbances. The impacts of designated limited routes would continue to provide beneficial, long-term recreational/travel opportunities for motorized OHV and mountain biking user groups, with negligible impacts on recreational resources, as these routes would not increase surface disturbance impacts to recreational resources. WSAs would be closed to OHV travel except within designated "ways"; thus the impacts to recreation would provide opportunities for backcountry experiences to non-mechanized users, but would have adverse impacts on motorized OHV users from a lack of access to WSAs. However, the long-term impacts of OHV management decisions under this alternative on natural and cultural resources and on other recreational resource users would be substantially adverse because, as discussed in Sections 3.11.3 and 3.11.4, OHV use within the Monticello PA is increasing, with the likelihood that OHV-related resource use conflicts with other resources would continue to intensify in the long-term.

Alternative B

Under Alternative B, no acres would be designated as open to cross-country OHV use, with all OHV routes (1,359,417 acres) designated as limited to designated routes. Approximately 423,698 acres would be designated as closed to OHV use. Management decisions under this alternative would designate OHV travel routes for mountain bikes, single track motorized (motorcycles), or two-track motorized OHV use (four-wheelers, jeeps, ATV). Site-specific route adjustments would be permitted based on recreational opportunities, access needs, and resource constraints. The short-term and long-term impacts on recreational resources would be beneficial because: (1) the adverse impacts to natural and recreation-related (interpretive) cultural resources from cross-country OHV use would be eliminated, and (2) surface disturbance-related impacts from OHV use would be restricted to designated routes (which are, in effect, areas that have already been impacted by surface disturbances).

The impacts on motorized OHV users would be adverse in the long-term because a substantial area would not be managed for cross-country OHV travel, with the elimination of opportunities for this form of recreation. The impacts on mountain biking user groups would be beneficial in the short- and long-term because management decisions would permit the spatial separation of potentially conflicting resource users, which would reduce user conflicts and increase the likelihood of a satisfying recreational experience for all OHV route users. The impacts of this alternative on other resource users would be variable: the impacts on scenic drivers and specialized recreation users would be negligible because these user groups are not likely to have resource use conflicts with OHV users; and the impacts on river floating users would be beneficial in the long-term if non-motorized routes were designated along river corridors, otherwise noise-related impacts from motorized OHV use would have potentially adverse impacts on the recreational expectations of solitude, quiet, and remoteness for this group. Similarly, the potential impacts of this alternative on non-mechanized users (i.e., hikers, equestrians) would be an adverse reduction in recreational opportunities for solitude and a sense of backcountry remoteness from noise-related OHV use if designated OHV routes were to lie

near hiking trails. Otherwise, the elimination of cross-country OHV travel within the planning area would have long-term, beneficial impacts on non-mechanized users because of the reduced likelihood for encountering OHV noise and users, with a loss of a sense of remoteness, quiet, and solitude.

Compared to Alternative A, this alternative would have long-term impacts on those recreational opportunities associated with cross-country OHV use because these opportunities would be eliminated. This alternative would have more long-term beneficial impacts on recreational resources and on recreational user groups than Alternative A because: (1) resource use conflicts would be reduced through adaptive management of OHV route designation and use, and (2) surface disturbance-related impacts to natural and cultural resources from OHV use (which would affect all recreation user groups) would be reduced.

Alternative C

This alternative would designate 2,311 acres as open to cross-country OHV use, with 1,362,142 acres limited to designated routes for OHV use, and 418,667 acres designated as closed to OHV use. The open OHV play areas would lie within (1) the proposed Indian Creek SRMA in contiguous parcels (totaling 2,214 acres) along Indian Creek, and be managed under the SRMA plan prescriptions, and (2) on 97 acres within Butler Wash, managed under the Comb Ridge CSMA. Management decisions would also designate route-limited OHV use to access trailheads within WSAs, and approximately 3.8 miles would be designated as a limited OHV route within Arch Canyon. The impacts on recreation of OHV designations under this alternative would be similar to those discussed under Alternative B because the management decisions would be similar. Long-term surface disturbance-related impacts would occur within the 2,311 acres designated as open to cross-country OHV use, but the impacts would be relatively minor because: (1) the area of potential impacts is less than 1% of the Monticello PA, (2) the open OHV play areas would be managed under the proposed SRMA and CSMA to ensure that open OHV use would be contained, and (3) past recreational OHV use has already caused OHV-related surface disturbances in both areas.

Compared to Alternative A, this alternative would have impacts similar to those discussed under Alternative B because more than 99% of the area designated as open to OHV cross-country use under Alternative A would be limited to designated routes or closed to OHV use under this alternative. The comparative impacts on recreational resource user groups would be similar to those impacts discussed under Alternative B because the adaptive management decisions to respond to recreational user needs, conflicts, and opportunities would be the same as those discussed under Alternative B.

Alternative D

Under this alternative, 2,311 acres would be designated as open to cross-country OHV use, approximately 1,780,807 acres would be available for travel on limited designated routes, and no acreage would be designated as closed to OHV travel. The impacts of this alternative on recreation resources would be similar to those impacts discussed under Alternative C because a relatively small area would be affected by open OHV recreation. The impacts on non-mechanized and mountain biking recreational user groups would be adverse in the long-term, because no areas would be closed to motorized OHV use. This would increase the potential for resource use conflicts because of the increased likelihood for encounters between non-

mechanized, mountain biking, and motorized OHV users throughout the planning area. Under this alternative, the opportunities for unlimited, cross-country OHV recreation would be adversely impacted in the long-term when compared to Alternative A because approximately 609,000 acres (99% of the area designated as open under Alternative A) would have prohibitions on cross-country OHV travel, a substantial reduction in opportunities for this type of motorized OHV recreation. However, when compared to Alternative A, there would be increased opportunities for motorized and specialized (motorized) OHV recreation throughout the planning area for recreation along designated routes, which would have long-term, beneficial impacts to motorized OHV because no area would be closed to this recreational user group.

Alternative E

Under this alternative, management decisions would be the same as Alternative B, except all travel routes (approximately 179 miles of D-Class roads [see Section 4.3.16, Travel Management]) within lands with non-WSA wilderness characteristics would be closed to OHV use. The impacts on recreational use would be to reduce the opportunities for motorized OHV use and experiences on approximately 582,360 acres, which would have a substantially adverse impact to motorized OHV user groups. However, non-mechanized user groups would benefit from the increased opportunities for solitude, a sense of remoteness, and reduced user conflicts with mechanized groups. Compared to Alternative A, this alternative would have more beneficial impacts to non-mechanized users from increased opportunities for satisfying experiences within more areas closed to motorized users. Conversely, this alternative would have greater adverse impacts to motorized OHV and mountain biking user groups from closure of travel routes within the non-WSA wilderness characteristics areas because opportunities for motorized and mountain biking recreational experiences would be reduced.

Proposed Plan

This alternative would designate no acres as open to cross-country OHV use, with 1,388,191 acres limited to designated routes for OHV use, and 393,895 acres designated as closed to OHV use. Management decisions would also designate route-limited OHV use to access trailheads within WSAs, and the entire length of Arch Canyon (from the canyon mouth to the USFS boundary, approximately 8 miles) would be designated as a limited OHV route. The impacts on recreation of OHV designations under this alternative would be similar to those discussed under Alternative B because the management decisions would be similar.

Compared to Alternative A, this alternative would have impacts similar to those discussed under Alternative B because all of the area designated as open to OHV cross-country use under Alternative A would be limited to designated routes or closed to OHV use under this alternative. The comparative impacts on recreational resource user groups would be similar to those impacts discussed under Alternative B because the adaptive management decisions to respond to recreational user needs, conflicts, and opportunities would be the same as those discussed under Alternative B.

4.3.10.3.12.2. OHV Special Stipulation Areas

Alternative A

Management decisions for special stipulation areas would include OHV exclusions within the McLoyd Canyon-Moon House cultural site (no public travel allowed along 500 feet of BLM-

administered access road) to protect cultural resources, with impacts as discussed under Section 4.3.10.3.1.

Travel and access within Arch Canyon would be limited to designated routes to protect special status species and habitat within the canyon. The impacts on recreational resources within Arch Canyon would be beneficial in the long-term because wildlife habitat would be preserved from potential OHV-caused surface disturbances, and recreational opportunities for wildlife viewing, sight-seeing, and camping would be maintained. As recreation increases within the canyon, there is the likelihood for adverse resource use conflicts between mechanized and non-mechanized users from the proximity of these users along canyon trails and routes.

Alternatives B and E

Under these alternatives, the access route to McLoyd Canyon-Moon House would be closed to motorized use (approximately one mile of D-Class road D4798), which would reduce or eliminate the recreational opportunities for some visitors to experience the site because it would be likely that a portion of recreational users now able to visit the site would not be able to walk there. However, reducing the level and intensity of recreational sight-seeing within the site would have long-term, beneficial impacts on the recreational/cultural resource by reducing recreation-caused impacts to the site.

Arch Canyon would be closed to OHV use, access permits for non-mechanized users (i.e., hikers, equestrians) would be required, and group sizes would be limited to two groups per day of 10 individuals per group (or 20 visitors per day). Permitted groups or individuals would be allowed to camp within the canyon. The management decisions that exclude motorized OHV and mountain biking recreation groups from the canyon would have long-term, adverse impacts on these user groups by eliminating the opportunities for these user groups to experience Arch Canyon, but long term, beneficial impacts on non-mechanized users from increased opportunities for solitude, naturalness, and reduce user conflicts. The impacts to recreational resources within the canyon would be beneficial in the long-term because potential surface disturbance impacts caused by OHV use would be eliminated.

Compared to Alternative A, this alternative would reduce the recreational opportunities within Arch Canyon and McLoyd Canyon-Moon House. The impacts to recreational resources within McLoyd Canyon-Moon House and Arch Canyon under this alternative would be more beneficial in the long-term when compared to Alternative A because the access exclusions, permit limitations on group size and group number for overnight camping, and limitations on recreational use would have more preservation-related impacts on recreational resources.

Alternative C

Management decisions for the McLoyd Canyon-Moon House site would have similar impacts on recreational use and on the recreation resource as discussed under Alternative B because a portion of the route (approximately 500 feet of D-Class road D4798) would be closed to motorized traffic.

Management decisions for Arch Canyon would have similar impacts on recreational use and on recreational resources as discussed under Alternative A because the management decisions are similar: OHV use would be restricted to designated routes (totaling approximately 3.8 miles) with some portions closed to protect special status species. Under this alternative, an OHV

permit system and limits on the size of OHV groups and number of groups allowed to access the canyon would be applied (totaling 24 OHVs per day), which would have short-term impacts on those motorized recreation users seeking recreational experiences within the canyon because of limitations on OHV use in the canyon. There would be no limits on the number of non-mechanized recreational users within the canyon and no overnight camping limits for permitted OHV users and non-mechanized users, which would maintain this recreational opportunity for both user groups. As discussed under Alternative A, there is the likelihood for adverse resource user conflicts within the canyon between mechanized and non-mechanized users from the proximity of these users to each other within the canyon.

Compared to Alternative A, this alternative would have similar impacts as discussed under Alternative B for the McLoyd Canyon-Moon House cultural/recreational site.

The impacts on Arch Canyon, when compared to Alternative A, would be similar for recreational resources, but this alternative would have greater short-term impacts on motorized recreational users because of limitations caused by the maximum number of users permitted per day (24 OHVs per day) under this alternative with no specified limits on access under Alternative A.

Alternative D

Under this alternative, the management decision impacts on the McLoyd Canyon-Moon House site and on recreational users of the site would be similar to those discussed under Alternative A because motorized access to the site along D4798 would be permitted under this alternative.

The management decision impacts on recreational users in Arch Canyon would be similar to those discussed under Alternative C, but to a lesser degree, because only commercial motorized recreational users would require permits and be subject to access limitations (12 individuals per group with two groups per day). The limitations on motorized and non-mechanized camping would be similar to the discussion under Alternative A because only commercial OHV users would be subject to short-term access and camping restrictions. The impacts on recreational resources within the canyon would be similar to Alternative A because motorized users would be allowed year-round, but would be limited to designated routes.

Compared to Alternative A, the impacts of Alternative D decisions for Arch Canyon would be similar because the management decisions affecting recreational resources and recreational users would be similar: few restrictions on motorized, mountain biking, and non-motorized recreational opportunities, and preservation of wildlife habitat by limiting OHV use to designated trails.

Proposed Plan

Management decisions for the McLoyd Canyon-Moon House site would have similar impacts on recreational use and on the recreation resource as discussed under Alternative B because a portion of the route (approximately 500 feet of D-Class road D4798) would be closed to motorized traffic.

Management decisions for Arch Canyon would limit OHV travel to designated routes along the entire length of the canyon (up to the USFS boundary, approximately 8 miles), which would provide opportunities for OHV recreation within the canyon. There would be seasonal commercial and organized use restrictions along 7.5 miles of the designated route from March 1 through August 31 to protect sensitive species, which would have adverse impacts on OHV

opportunities for commercial users; this restriction would not impact private OHV users. There would be no limits on the number of non-mechanized recreational users within the canyon and no overnight camping limits for permitted OHV users and non-mechanized users, which would beneficially maintain this recreational opportunity for both user groups. However, it is likely that the proximity of non-mechanized and mechanized users would create adverse user conflicts as recreational use of the canyon increases.

Compared to Alternative A, this alternative would have similar impacts as discussed under Alternative B for the McLoyd Canyon-Moon House cultural/recreational site.

The impacts on Arch Canyon, when compared to Alternative A, would be similar for recreational resources, but this alternative would have fewer restrictions on motorized recreational users than Alternative A.

4.3.10.3.13. IMPACTS OF VEGETATION DECISIONS ON RECREATION

4.3.10.3.13.1. Alternative A

The short-term and long-term impacts of management decisions for vegetation on recreation resources and users would be similar to those discussed under Fire Management, Section 4.3.3 because the vegetation management decisions would be similar. Under this alternative, treatments would be applied to approximately 232,130 acres within vegetation communities to control exotic and invasive species and improve ecosystem health using methods similar to those for fire management, re-seeding, and restoration. Rehabilitation of disturbed areas would use techniques similar to those used for areas affected by prescribed and wildland fire.

4.3.10.3.13.2. Alternatives B and E

Under these alternatives, approximately 7,600 acres per year of a range of vegetation cover types would be treated (or approximately 114,000 acres during the next 15 years), with impacts similar to those discussed in Section 4.3.3 Fire Management. Compared to Alternative A, these similar alternatives would treat approximately 49% of the area proposed under Alternative A, with fewer short-term, adverse impacts on recreational opportunities and resources.

4.3.10.3.13.3. Alternative C

Alternative C would treat approximately 9,300 acres per year (or approximately 139,500 acres over the next 15 years) of various vegetation cover types to improve or restore ecosystem health, with impacts as discussed in Section 4.3.3 Fire Management. Compared to Alternative A, this alternative would treat approximately 60% of the area proposed under Alternative A, with impacts on recreation as discussed in Alternative B.

4.3.10.3.13.4. Alternative D

This alternative would treat approximately 11,300 acres per year (or approximately 169,500 acres over the next 15 years) of various vegetation cover types to improve or restore ecosystem health, with impacts as discussed in Section 4.3.3 Fire Management. This alternative would treat approximately 73% of the area proposed under Alternative A, with impacts as discussed in Alternative B.

4.3.10.3.13.5. Proposed Plan

The impacts of vegetation decisions under the Proposed Plan would be the same as discussed under Alternative C because the decisions are the same.

4.3.10.3.14. IMPACTS OF VISUAL RESOURCES DECISIONS ON RECREATION

4.3.10.3.14.1. Alternative A

Under Alternative A, approximately 371,575 acres would be managed for higher levels of visual resource protection under VRM Class I objectives, and 355,112 acres would be managed for visual resource protection under VRM Class II objectives, with approximately 41% of the planning area managed for high scenic quality. There would be lower levels of visual resource and scenic quality protection under VRM Class III and Class IV on 1,054,681 acres. The VRM Class I and II resource objectives would have long-term, protection-related, beneficial impacts on recreational resources and all recreational resource users because recreation-related scenic quality would be preserved or impacted to a minor degree. As discussed in Section 4.3.18, Visual Resources, the visual resource inventory conducted for the Monticello FO determined that the visual inventory classes (which are a measure of visual values [scenic quality, public concern for scenic quality]) were the same as the VRM classes assigned under the 1991 RMP.

4.3.10.3.14.2. Alternative B

Under Alternative B, 497,668 acres would be managed under VRM Class I (33% more than Alternative A), with 250,641 acres managed under VRM Class II visual quality objectives (42% of the planning area would be managed for high scenic quality). Approximately 1,034,813 acres would be managed under the visual resource objectives of VRM Class III and Class IV. Compared to the current VRM inventory and Alternative A, this alternative would manage 21,622 more acres under higher levels of VRM Class I and Class II scenic quality protection. This would have long-term, beneficial impacts on recreation resources and users because more acres would be managed to prevent or mitigate surface disturbances to visual and scenic quality under VRM Class I and Class II objectives, with associated long-term, beneficial impacts on recreation-related scenic quality. Compared to Alternative A, this alternative would be more beneficial because more acres would be protected from potential scenic quality degradation.

4.3.10.3.14.3. Alternative C

Under Alternative C, VRM Class I would be designated on 425,179 acres (14% more than Alternative A), and VRM Class II would be designated on 132,001 acres. This alternative would manage 31% of the planning area for high scenic quality. The combined acreage designated as VRM Class III and Class IV would be approximately 1,225,915 acres. Compared to the current VRM inventory/Alternative A, this alternative would reduce the area of higher levels of resource protection under VRM Class I and II by 169,507 acres (a 10% reduction) to 31% of the planning area. This would have long-term, adverse impacts on recreational resources and users because fewer acres would be managed for high-level protection of visual and scenic quality and more area would be managed for potential surface disturbance-related scenic quality degradation.

4.3.10.3.14.4. Alternative D

Under Alternative D, 390,424 acres would be managed as VRM Class I. The VRM Class II-designated area would comprise 8,838 acres, while the combined VRM Class III and Class IV areas would include 1,386,860 acres. Compared to the current VRM inventory and Alternative A, this alternative would reduce the number of acres for higher levels of visual resource protection under VRM Class I and II designation by 327,425 (a reduction of 19%), with approximately 22% of the planning area managed for high scenic quality. This would have long-term, adverse impacts on recreational resources and users because fewer acres would be managed to prevent or mitigate surface disturbances to visual and scenic quality, and would allow for more scenic quality degradation under VRM Class III and IV.

4.3.10.3.14.5. Alternative E

Alternative E would manage all non-WSA lands with wilderness characteristics under VRM Class I designation, which would result in 998,370 acres within the planning area being designated for management under this VRM class objective (269% more VRM Class I acreage than Alternative A). Approximately 111,478 acres would be managed under VRM Class II objectives, and approximately 671,828 acres would be managed under VRM Class III and IV objectives. Compared to the total VRM Class I and II acreages designated under Alternative A, this alternative would have more long-term, beneficial impacts on recreation-related visual resources because 383,161 more acres would be designated to preserve high quality scenic values under VRM Class I and II objectives (see Section 4.3.18, Visual Resources).

4.3.10.3.14.6. Proposed Plan

Under the Proposed Plan, VRM Class I would be designated on 422,989 acres (3% more than Alternative A), and VRM Class II would be designated on 228,041 acres (totaling 651,030 acres). This alternative would manage 37% of the planning area for high scenic quality under VRM Class I and II objectives. The combined acreage designated as VRM Class III and Class IV would be approximately 1,130,585 acres. Compared to the current VRM inventory/Alternative A, this alternative would reduce the area of higher levels of resource protection under VRM Class I and II by 75,657 acres (a 5% reduction). This would have long-term, adverse impacts on recreational resources and users because fewer acres would be managed for high-level protection of visual and scenic quality and more area would be managed for potential surface disturbance-related scenic quality degradation.

4.3.10.3.15. IMPACTS OF WILDLIFE RESOURCES DECISIONS ON RECREATION

4.3.10.3.15.1. Alternative A

Under Alternative A, current wildlife management decisions in the 1991 RMP would seasonally close crucial bighorn sheep, pronghorn, and deer habitat in the ERMA to OHV use to protect lambing, rutting, and winter habitat. These wildlife habitat closures would have short-term, adverse, seasonal impacts on opportunities for motorized OHV recreational opportunities because open OHV use would be prohibited in these areas.

There are no specified management decisions under any of the SRMAs that would restrict or prohibit motorized OHV use or other recreational activities because of wildlife seasonal habitat closures.

4.3.10.3.15.2. Alternatives B and E

Under these alternatives, commercial-type motorized or mountain biking tours and events would be seasonally prohibited (i.e., special recreation permits [SRPs] would not be issued) for OHV routes within pronghorn, bighorn sheep, deer, and elk crucial habitat and lambing and rutting areas (consistent with UDWR-identified crucial habitat). This would impact commercial-type OHV recreation in the short-term by decreasing the opportunities for motorized recreation along designated routes in crucial habitat areas (see Section 4.3.16, Travel Management). Compared to Alternative A, Alternatives B and E would have more restrictions on permitted and/or commercial OHV recreational opportunities within the ERMA area because 512 miles of travel routes would be seasonally closed to commercial recreational travel, with decreased opportunities for recreational access and movement through the planning area.

4.3.10.3.15.3. Alternative C

The impacts under Alternative C would be similar to those as discussed under Alternative B because the management decisions are similar, except that elk crucial habitat (in UDWR-identified habitat) would also be seasonally closed to commercial OHV use and approximately 135 miles of travel routes (26% of the routes closed under Alternative B) would be closed in the short-term to some permitted or commercial OHV use or mountain biking tours and events. Compared to Alternative A, this alternative would have more restriction-related impacts to commercial-type recreational OHV opportunities because these opportunities would be more limited.

4.3.10.3.15.4. Alternative D

The impacts on OHV recreational user groups from wildlife management decisions under this alternative would be similar to those discussed under Alternatives B, C, and E because the management decisions are similar: while commercial and private recreational OHV use would be permitted, though limited to designated routes within the ERMA seasonal wildlife restrictions would be applied to protect crucial UDWR-identified wildlife habitat.

4.3.10.3.15.5. Proposed Plan

The impacts would be the same as discussed under Alternative B (closed to permitted or commercial OHV use seasonally in UDWR-identified wildlife habitat) because the management decisions are the same.

4.3.10.4. SUMMARY OF IMPACTS

See Table 2.2 for a full summary of the impacts to recreation. In general, Alternatives B and E would be more beneficial in the long-term to non-mechanized users because under these alternatives mountain biking and motorized OHV user groups would be more restricted (through travel closures, access limitation, and/or travel access prohibitions to protect wilderness values within non-WSA areas with wilderness characteristics) than under the other alternatives. Under these alternatives, more opportunities would be available for non-mechanized users to experience

solitude and a sense of remoteness, with reduced user conflicts from mechanized users. Alternative D would have more beneficial impacts on mountain biking and motorized OHV users because this alternative proposes fewer recreation-related travel restrictions for these groups. Alternative C would balance the benefits to non-mechanized and mechanized user groups by managing for mountain biking and motorized OHV use while also providing opportunities for non-mechanized user groups.

4.3.10.5. MITIGATION MEASURES

In addition to the Management Common to All described in Chapter 2, Appendix A, and Appendix I, other measures to reduce or mitigate the impacts to recreational resources and recreational resource users would include:

- Apply fugitive dust control along scenic backways, historic trails, and heavily used travel routes to preserve recreation-related scenic quality;
- During and after prescribed burning, vegetation treatments, and fire suppression when areas are being reclaimed, encourage and educate recreational users to use alternate areas with similar recreational opportunities to permit affected recreational areas to re-vegetate;
- Educate recreational resource users regarding protection of recreation-related cultural and natural resources.

4.3.10.6. UNAVOIDABLE ADVERSE IMPACTS

Minerals exploration and development (e.g., seismic exploration along existing routes, spur road construction, well pad drilling) and OHV use would likely have short-term and long-term, unavoidable, adverse impacts on recreational user groups whose recreational expectations include solitude, naturalness, and a sense of remoteness (i.e., non-mechanized, river floating, and some specialized recreational user groups).

4.3.10.7. SHORT-TERM USE VS. LONG-TERM PRODUCTIVITY

In general, short-term uses (e.g., prescribed fire treatments, geophysical minerals activities, vegetation treatments) would have long-term impacts on recreational opportunities (productivity) where scenic quality is a component of recreational expectations. While disturbances to vegetation would be in the short-term, vegetation establishment and re-growth is typically long-term in the Monticello PA. Thus, the scenic quality contrasts from surface and vegetation disturbances would have potentially long-term impacts on recreational opportunities and experiences.

4.3.10.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

There are no unavoidable impacts that would cause irreversible, unrestorable losses of recreational resources because vegetation communities can be restored, and recreation-related cultural resources can be protected. Irretrievable impacts to recreational resources would be caused by: (1) the loss or degradation of recreation-related scenic quality from vegetation treatments, fuel reductions, or invasive weed control until vegetation re-growth; (2) the irretrievable loss of scenic recreational opportunities due to mineral development until production well sites are shutdown, the wellpads are reclaimed, and production infrastructure is removed. As discussed above in the Summary, the impacts from vegetation and surface

disturbances would have long-term, irretrievable impacts on recreational opportunities to experience scenic quality until vegetation re-growth.

4.3.11. RIPARIAN RESOURCES

Within the Monticello PA, riparian areas are typically associated with perennial, intermittent, and ephemeral streams, as well as isolated springs and other water sources. The area of potential effect for riparian resources would include all riparian areas identified in the preliminary riparian inventory for the Monticello FO. Management decisions with the potential to impact riparian resource health, the proper functioning condition (PFC) of streams, water resources necessary to riparian zone establishment and survival, or the physical environment on which riparian vegetation depends (e.g., stream stability) were evaluated in this analysis.

Analysis of impacts to the riparian resources within the Monticello PA were conducted primarily by overlaying proposed management decisions (e.g., surface disturbances due to grazing, OHV travel, camping and other recreational use, and woodland harvest) on the 28,994 acres of riparian areas in the PA, as identified in the GIS-based Utah GAP database (Lowry et al. 2005) of vegetation types. In assessing the level of surface-disturbing and vegetation-modifying impacts on riparian resources, the total acreage of surface disturbance, visitor and livestock use, and loss or degradation of riparian habitat were considered. All alternatives would include riparian management actions with the potential to affect riparian resources. Where GIS or other quantitative data were unavailable, potential impacts to riparian resources were analyzed qualitatively, based on these same criteria.

Under all alternatives, management decisions for the following resources would result in negligible impacts to riparian resources: air quality, cultural resources, health and safety, and paleontological resources. The impacts would be negligible because protecting air quality, protecting cultural resources under Section 106, maintaining safety around AML sites and reducing the risks of hazardous materials spills and spill-site cleanup, and protecting known fossil areas for scientific study and recreational collection of fossils would neither degrade nor improve the water, soil, and vegetation components of riparian resources. Accordingly, the impacts of management actions for these resource categories are not analyzed further in this section.

4.3.11.1. IMPACTS COMMON TO ALL ALTERNATIVES

4.3.11.1.1. IMPACTS OF RIPARIAN DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Impacts to riparian areas in the Monticello PA would be a result of vegetation disturbance and surface-disturbing activities within the riparian zones, and are subject to restrictions to ensure that conditions are improved or at least not degraded. The Proposed Plan and all alternatives must adhere to Standard 2 of the Utah BLM Standards for Rangeland Health, which apply to riparian resources in the Monticello PA. Standard 2 states that "[r]iparian and wetland areas [must be] in properly functioning condition (PFC). Stream channel morphology and functions are appropriate to soil type, climate, and function" (BLM 1997). The BLM would develop monitoring and management strategies and restrictions as necessary to meet or maintain PFC. Meeting or maintaining PFC would improve the physical and biological condition of those riparian zones that do not currently meet PFC standards, and would therefore constitute a beneficial impact to riparian zones in the Monticello PA.

Pipeline crossings of perennial, intermittent, and ephemeral stream channels would be constructed to withstand 100-year floods to prevent breakage and subsequent accidental contamination of runoff during high-flow events. Surface crossings would be constructed high enough to remain above stream flows at each crossing, and subsurface crossings would be buried deep enough to remain undisturbed by scour throughout passage of the peak flow. Hydraulic analysis would be completed in the design phase (by the project proponent) to eliminate potential environmental degradation associated with pipeline breaks at stream crossings to avoid repeated maintenance of such crossings. Specific recommendations regarding surface and subsurface crossings are found in Guidance for Pipeline Crossings (see Appendix F). These stipulations would minimize the chances of a pipeline break and the subsequent adverse impacts associated with the release of unrefined petroleum or other hazardous substances and or flood flow obstruction.

Under the Proposed Plan and all alternatives, oil and gas development would be managed with NSO minerals leasing stipulations in riparian areas. No new surface-disturbing activities would be allowed within active floodplains or within 100 m of riparian areas. The Monticello FO would follow BLM guidelines for managing riparian areas (see Technical Reference 1737-6: Riparian Area Management, as amended). All floodplains and riparian/wetlands would be managed in accordance with Executive Orders 11988 and 11990, Sections 303 and 404 of the Clean Water Act, and the ESA. These orders would protect riparian resources and floodplains from surface disturbance and vegetation removal.

Management of public lands by the Monticello FO would be consistent with the Colorado River Salinity Control Act and comply with Utah's state water-quality standards. Uses would be managed to minimize and mitigate damage to soils and to maintain and/or restore overall watershed health and reduce erosion, stream sedimentation, and salinization of water. These management actions would limit short- and long-term adverse impacts to riparian resources by reducing water quality degradation, salinization, and sedimentation that would impact the biological and physical structure of riparian areas.

Floodplains and riparian areas would generally be excluded from private commercial use of woodland products (but would be accessible to Native Americans for ceremonial purposes), thus limiting adverse impacts to resources due to vegetation disturbance, streambank trampling, and noxious weed spread. Habitat, range, and watershed improvements would be allowed and have been evaluated in the 1991 Vegetation EIS (BLM 1991b). Riparian areas would be excluded from surface disturbance by mechanized or motorized equipment and from structural development under all alternatives, thereby beneficially protecting riparian resources from disturbance.

The Proposed Plan and all alternatives would close social trails in Road Canyon, Fish Creek, and Mule Canyon and restrict camping within 200 feet of isolated springs and water sources to protect riparian resources by limiting trampling of vegetation, disturbance of streambanks, and noxious weed spread. Implementation of the Southwest Willow Flycatcher Recovery Plan would potentially benefit riparian resources through habitat enhancement and water management.

The Proposed Plan and all alternatives would require the control of invasive and non-native weed species, as identified in Table 3.59, and prevention of the infestation and spread of new invasive species through cooperative agreements and implementation of BLM weed-management policies and action plans. Pack stock and riding stock users on BLM-administered land would be required

to use certified weed-free feed. Use of certified weed-free seed mixes, mulch, and fill would be required in restoration/rehabilitation activities. To help control noxious weeds, power washing of equipment may be required for permitted uses. The Monticello FO would reduce tamarisk and Russian olive where appropriate using allowable vegetation treatments (refer to Section 4.3.17, Vegetation Resources, for treatment acreages). These actions would reduce adverse impacts to riparian resources from noxious weeds.

4.3.11.1.2. IMPACTS OF FIRE DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Fire management actions under all alternatives would have the same impacts on riparian resources. The impacts would generally be adverse in the short-term due to increased sedimentation and increased runoff from areas where prescribed burns are implemented. Long-term beneficial impacts would occur under all alternatives from reduction of the risk of and severity of wildland fires, and from the establishment of a more natural fire return interval. Estimated fuels reduction treatments of 5,000 to 10,000 acres per year would be designed to limit potential impacts to riparian habitat under all alternatives, which would have long-term, beneficial impacts on riparian resources.

4.3.11.1.3. IMPACTS OF LANDS AND REALTY DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Under all alternatives, land tenure adjustments (LTAs) could acquire riparian areas, and LTA criteria call for the retention of those riparian areas already in public ownership. LTAs would beneficially impact riparian resources under all action alternatives, as the resources would be protected by the stipulations placed on their use.

4.3.11.1.4. IMPACTS OF SOIL AND WATER RESOURCES DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Under all alternatives, management of all floodplains and riparian/wetland areas in accordance with Executive Orders 11988 and 11990, the Clean Water Act, the ESA, and Utah's Rangeland Health Standards would have a beneficial impact on riparian resources in the Monticello PA. Management under the terms of these directives would reduce the disturbance of riparian vegetation and soils and the introduction and establishment of weeds on floodplains. Prohibition of surface disturbances in active floodplains or within 100 m of riparian areas would also protect riparian systems under all alternatives.

4.3.11.1.5. IMPACTS OF VEGETATION DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Under all alternatives, vegetation treatment decisions would reduce the prevalence of invasive Russian olive and tamarisk throughout the Monticello PA and replace them with native willow and cottonwood stands. These actions would have a beneficial impact on riparian areas through the restoration of their native ecosystem characteristics.

4.3.11.1.6. IMPACTS OF WILDLIFE DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Wildlife management decisions would have the same impacts under all alternatives. The management of wildlife would potentially affect resources in riparian areas where elk are allowed to graze. Some loss of riparian vegetation would occur from browsing.

4.3.11.1.7. IMPACTS OF WOODLAND DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Woodland management in riparian areas would allow collection of willows and cottonwoods for Native American ceremonial purposes through a permit system. Wood-collection and harvesting practices in riparian areas would be required to maintain PFC in riparian areas, so that, although impacts to riparian productivity and health would be adverse, they would be negligible.

4.3.11.2. ALTERNATIVES IMPACTS

4.3.11.2.1. IMPACTS OF LANDS AND REALTY DECISIONS ON RIPARIAN RESOURCES

4.3.11.2.1.1. Alternative A

Right-of-way (ROW) exclusions on 120,800 acres would benefit riparian areas by limiting the possibility of surface disturbances, vegetation removal, and changes in hydrology and sedimentation that might result from an expanded road network.

4.3.11.2.1.2. The Proposed Plan and Alternatives B, C, D, and E

Avoiding issuance of ROWs in NSO areas and exclusion of ROWs in defined areas (including WSAs, non-WSA lands with wilderness characteristics, and some ACECs and WSRs C) would beneficially limit both surface disturbance and vegetation removal in riparian zones within the Monticello PA and changes in hydrology and sedimentation that might result from an expanded road network.

4.3.11.2.2. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON RIPARIAN RESOURCES

4.3.11.2.2.1. Alternative A

Proper herd management would provide long-term protection and enhancement of riparian areas through stimulation of growth of riparian vegetation. Grazing regulations would ensure proper grazing practices through implementation of seasonal closures or closure of allotments when degradation occurs. Proper grazing practices would ensure protection of riparian areas through maintenance of vegetative cover leading to riparian area health. Drought conditions, however, could worsen adversely impacted riparian plant growth and streambank stability. Proper livestock grazing would benefit riparian systems by ensuring recruitment of riparian plant species.

Impacts on riparian vegetation vary with season of use. For example, grazing riparian areas in late spring allows vegetation to grow through summer and into the fall and protect banks during critical spring runoff and late summer thunderstorms. Changes in season of use or AUMs would ensure compliance with all standards of the Utah BLM Standards for Rangeland Health,

particularly Standard 2. Compliance with Standard 2 would minimize adverse impacts to riparian areas by requiring changes in grazing management wherever monitoring shows degradation of riparian areas when PFC is not achieved.

The use of riparian exclosures within grazing allotments would protect and enhance riparian resources within the Monticello PA. The following areas would be unavailable for grazing under Alternative A: Comb Wash side canyons, including Mule Canyon below U-95, and Arch, Fish, Owl, and Road Canyons. The closure of these 2,400 riparian acres to grazing would eliminate adverse impacts to riparian resources on approximately 12% of the available riparian habitat in the planning area. The total riparian area open to grazing under Alternative A would be 17,600 acres. Table 4.117 shows the riparian acreage open to and unavailable for grazing under each alternative.

Table 4.117. Livestock Grazing in Riparian Areas, by Alternative

	Alternative A	Alternatives B C, and E; and the Proposed Plan	Alternative D
Open	17,600	17,200	18,020
Unavailable	2,400	2,800	2,380

4.3.11.2.2.2. Alternative B

Under Alternative B, the closure of riparian areas to grazing would protect riparian vegetation (as described above under Alternative A) on approximately 2,800 acres within the Monticello PA. Grazing would still be allowed on approximately 17,200 acres of riparian area. These management actions would close approximately 14% of the grazed riparian areas within the Monticello PA, compared to closure of approximately 12% of riparian areas under Alternative A (see Table 4.116).

4.3.11.2.2.3. Alternative C

Management of livestock grazing under Alternative C with respect to riparian areas would be the same as under Alternative B, and the impacts would thus be the same as well.

4.3.11.2.2.4. Alternative D

The total acreage of riparian area open for livestock grazing under Alternative D would be approximately the same as proposed under Alternative A. The closure of riparian areas to grazing would protect and enhance riparian vegetation (described above under Alternative A) on approximately 2,380 acres within the Monticello PA. Grazing would still be allowed on approximately 18,000 acres of riparian area. These management actions would close slightly less riparian area than under Alternative A (see Table 4.116).

4.3.11.2.2.5. Alternative E

The impacts to riparian resources under Alternative E would be the same as those described for Alternative B.

4.3.11.2.2.6. Proposed Plan

The impacts to riparian resources under the Proposed Plan would be the same as those described for Alternative B.

4.3.11.2.3. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS ON RIPARIAN RESOURCES

4.3.11.2.3.1. Alternatives A, B, C and D

Under Alternatives A, B, C and D, non-WSA lands with wilderness characteristics would not have any special management prescriptions to protect their wilderness values. Riparian resources within these areas would therefore be unaffected by management to protect the wilderness characteristics of non-WSA lands with wilderness characteristics.

4.3.11.2.3.2. Alternative E

Under Alternative E, riparian areas within 582,360 acres of non-WSA lands with wilderness characteristics would be beneficially protected from surface disturbance, vegetation removal, and other impacts (as described elsewhere in Section 4.3.11) by closure of this acreage to mineral leasing and entry, all OHV use, all ROWs permitting, mineral disposal, and woodland harvesting.

4.3.11.2.3.3. Proposed Plan

Under the Proposed Plan, riparian areas within 88,871 acres of non-WSA lands with wilderness characteristics would be beneficially protected from surface disturbance, vegetation removal, and other impacts (as described elsewhere in Section 4.3.11) by limiting OHV use to designated roads and trails; closure to mineral leasing in Grand Gulch, Mancos Mesa Nokai Dome West and Nokai Dome East, and NSO for mineral leasing in Dark Canyon; designation as ROW avoidance and exclusion areas; and closure of this acreage to mineral disposal, and commercial or personal woodland harvesting.

4.3.11.2.4. IMPACTS OF RECREATION DECISIONS ON RIPARIAN RESOURCES

The Proposed Plan and all alternatives would require that recreation be managed to meet Utah's Rangeland Health Standards, guided by the Standards for Public Land Health and Guidelines for Recreation Management for BLM Lands in Utah (see Appendix E for Standards and Guides). These guidelines describe the procedures that should be applied to achieve standards for rangeland health within the recreation program. Where long-term damage to riparian resources by recreational uses is observed or anticipated, the Monticello FO would limit or control activities through specialized management tools such as designated campsites, management of human and pet waste, permits, area closures, and limitations on number of users and duration of use. The FO would consider and, where appropriate, implement management methods to protect natural resources. Limitation on visitor numbers would reduce direct adverse impacts to riparian resources by limiting bank trampling and noxious weed spread. Dispersed camping where allowed may be closed seasonally or as impacts or environmental conditions warrant. This action would protect riparian resources in areas where degradation of riparian habitat is occurring.

The designation of SRMAs would have both adverse and beneficial impacts on riparian resources. Allowing visitation to SRMAs would result in impacts to riparian resources, such as trampling of streambank vegetation and the potential spread of exotic, invasive, or noxious weeds. Indirect impacts, including changes in timing and amount of runoff, would occur as a result of vegetation trampling and weed infestation. Limits on visitor use through implementation of a permit system in high-traffic areas would reduce long-term user impacts and related effects.

4.3.11.2.4.1. Alternative A

The San Juan River SRMA would be designated under Alternative A, and river trips on the San Juan would require a special use permit. Alternative A would continue management of the San Juan River SRMA under current launch limits, which allow approximately 40,000 user-days per year, private and commercial trips combined. Trip size would be limited to 25 people on private trips and 25 passengers plus 8 crewmembers on commercial trips. These levels of visitor activities would directly and indirectly impact riparian resources, as discussed above.

The Grand Gulch Plateau (Cedar Mesa) would have no user allocation limits for day use, would be open to dispersed camping, and would have no limits on in-canyon numbers of parties per day. Group size would be limited to 12 for in-canyon day and overnight use; no limits on commercial use would be instituted. Trailhead allocations would range from 22 to 26 visitors for in-canyon overnight use, except the Government trailhead, which would have a limit of 12 visitors.

There would be no limits on camping and access in the Dark Canyon SRMA, and dispersed camping would be allowed in the Indian Creek Corridor SRMA, which would be designated under Alternative A. These management prescriptions would result in more direct impacts to riparian resources from visitor use under Alternative A than under any other alternative. Backpackers in Slickhorn Canyon and Grand Gulch would not be allowed to camp within 1 mile of the river, protecting riparian resources in these areas from visitor use impacts. The designated campground would be removed from the Newspaper Rock area and rehabilitated. This action would limit direct visitor use impacts to riparian resources adjacent to this campground under all alternatives.

OHV use would potentially impact riparian resources through disturbance of riparian vegetation, streambank destruction, and a subsequent increase in sedimentation. Under Alternative A, OHV use within riparian areas would be open on 10,871 acres, closed on 3,524 acres, and limited to designated routes on 6,302 acres, providing a total of 61 miles of travel routes in the Monticello FO. The percentage of riparian area open, closed, and limited to designated routes under Alternative A would be 53%, 17%, and 30% of total riparian acreage, respectively, the largest amount of riparian area open to cross-country OHV travel or with designated routes for OHV travel under all alternatives (Table 4.118). Thus, under Alternative A there would be the highest risk for potential impacts to riparian resources.

Table 4.118. OHV Use in Riparian Areas by Alternative (Acres)

OHV Category	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Open	10,871 (53%)	0	135 (1%)	135 (1%)	0	0 (0%)
Closed	3,524 (17%)	3,977 (19%)	3,676 (18%)	0	8,779 (43%)	3,539 (17%)
Limited to Designated Routes	6,302 (30%)	16,458 (81%)	16,624 (81%)	20,300 (99%)	11,656 (57%)	16,894 (83%)
Travel routes (miles)	61	43	52	56	43	60

4.3.11.2.4.2. Alternative B

Many of the impacts of recreation management on riparian resources discussed under Alternative A apply to this and other alternatives as well. User numbers under Alternative B (and under Alternative E) would generally be lower than under Alternative A and all other action alternatives. Restrictions on camping, pets, and user-group sizes under Alternative B (and Alternative E) would also be more stringent than under other alternatives.

Alternative B would designate the San Juan River SRMA, where no motorized boating would be allowed. Launch schedules would allow approximately 30,000 user-days per year, 10,000 fewer user-days than under Alternatives A and C, and 15,000 fewer user-days than under Alternative D. Trip size would be limited to 20 people (including crew) for both private and commercial use, fewer persons than under any other alternative. These restrictions would result in approximately 30% less potential disturbance to riparian habitat than under Alternative A.

Visitor use of the Grand Gulch Plateau (Cedar Mesa) would limit group size to 10 people for day use. Primitive sites would be designated, group sizes would be limited to 12 people, and overnight visitors would be required to remove all human waste. These management actions would reduce impacts to riparian resources, whereas Alternative A would place no such limits on use of the mesa top.

In-canyon riparian resources would be protected from visitor-use impacts where use is restricted. Restrictions on use would include limits on in-canyon visitor numbers. Group size would be 2 people fewer than under Alternative A, and permits would be required for high-season use. Limits of 10 people per trailhead and one commercial trip every other day would provide more protection for riparian resources than under Alternative A, which would not designate daily visitor numbers.

In-canyon overnight use would be the same as under Alternative A, with some exceptions. Some campsites would be designated, and if human waste became a problem, a policy to carry out waste could [or might] be implemented. Private-group size would be limited to 6 people per day per trailhead, 50% less visitation than allowed under Alternative A. Total caps for trailheads would be 16 people per day, 30%–40% less visitation than under Alternative A.

Fewer commercial permits would be issued for the Dark Canyon SRMA under Alternative B than under any other alternative. Camping would be allowed only in designated sites, with no dispersed camping. Group size would be limited to 10–12 and the number of private users in the canyon per day to 15, whereas Alternative A would not have any visitor use limits. These restrictions would decrease surface disturbance, the risk of trampling of riparian vegetation, and the potential for loss of shade and increased sedimentation.

Dispersed camping would not be allowed in the Indian Creek Corridor. Camping would be allowed only in designated sites, resulting in fewer adverse impacts to riparian resources than under any other alternative.

Alternative B would designate OHV travel in riparian areas, with 3,977 acres closed, 16,458 acres limited to designated routes, no acres open to cross-country travel, and a total of 43 miles of travel routes available. Closing or limiting travel in riparian areas would protect riparian resources and limit impacts from OHV use, as discussed under Alternative A. Only Alternative E would provide a higher level of protection of riparian resources

The percentage of riparian area open, closed, and limited to designated routes under Alternative B would be approximately 0%, 19%, and 81%, respectively. Compared to Alternative A, these limits on OHV use in riparian areas would result in 10,871 fewer acres open to OHVs, 453 more acres closed, 10,156 more acres with OHVs limited to designated routes in riparian areas, and 18 fewer miles of travel routes. Alternative B (along with Alternative E) would thus have the lowest recreation-related riparian use levels and the lowest level of potential impacts of the proposed alternatives.

4.3.11.2.4.3. Alternative C

The discussion of Alternative A provided a general description of the impacts of recreation management on riparian resources. User numbers under Alternative C would be similar to those under Alternative A. However, restrictions on camping, pets, and user-group sizes under Alternative C would be more stringent than those under Alternative A.

The San Juan SRMA would be designated with management decisions similar to those under Alternative A. Launch limits would allow approximately 40,000 user-days per year, the same as under Alternative A. Trip size would be limited to 25 people, including crew on commercial trips. For commercial trips, the total would be 8 fewer than under Alternative A. These management actions would therefore result in slightly less adverse impact than would occur under Alternative A.

Visitor day use of the Grand Gulch Plateau (Cedar Mesa) would be limited to a group size of 12 people in most areas. Primitive sites would be designated, group size would be limited to 24 people, and overnight visitors would be required to remove human waste. These management actions would substantially reduce impacts to riparian resources on the mesa top over Alternative A, which would have no such limits.

In-canyon riparian resources would be protected from visitor-use impacts where use is restricted. Restrictions on use would include limits on in-canyon visitor numbers. Group size would be limited to 12, the same as under Alternative A, and a limited permit system would be implemented. Limits of 12 people per trailhead and one commercial trip per day per trailhead

would provide more protection for riparian resources than under Alternative A, which would not limit commercial use.

In-canyon overnight use would be the same as under Alternative A, with some exceptions. Some campsites would be designated for large groups (8–12 people), and if human waste should become a problem, a requirement to carry out waste might be implemented. Private group size would be limited to 8 people per day per trailhead, 33% less visitation than allowed under Alternative A. Total caps for trailheads would be 20 people per day, resulting in approximately 10% less visitation than under Alternative A.

The Dark Canyon SRMA would be designated with three commercial permits, fewer than under Alternative A. Camping would be allowed in designated sites only, with no dispersed camping. Group size would be limited to 15 people and the number of private users in the canyon to 20 per day, resulting in a reduction of surface and vegetation disturbance in comparison with Alternative A, which would not have any visitor use limits. These restrictions would decrease surface disturbance, the risk of trampling of riparian vegetation, and the potential for loss of shade and increased sedimentation.

Dispersed camping would be allowed in the Indian Creek Corridor except within certain zones where camping is limited to designated sites, resulting in fewer impacts to riparian resources than under Alternative A.

Alternative C would manage OHV travel in riparian areas, with 3,676 acres closed, 16,624 acres limited to designated routes, and 135 acres of designated open areas. Closing or limiting OHV travel in riparian areas would protect riparian resources and limit impacts from OHV use, as discussed under Alternative A. These limits on OHV use would provide a higher level of protection of riparian resources than Alternatives A and D, but less protection than Alternatives B and E.

The percentage of riparian area that would be open, closed, and limited to designated routes for OHV use under Alternative C would be approximately 1%, 18%, and 81%, respectively. These limits on OHV use in riparian areas would result in 10,736 fewer acres open to OHVs, 152 more acres closed to OHVs, and 10,322 more acres with designated route limitations for OHVs in riparian areas than under Alternative A. Designated routes in riparians would total 52 linear miles, 9 fewer miles, or approximately 15% less, than under Alternative A.

Overall, management actions for recreation under Alternative C would provide more protection of riparian resources than would Alternatives A and D, and less protection than management actions under Alternatives B and E.

4.3.11.2.4.4. Alternative D

Impacts of recreation management on riparian resources that apply to all alternatives were discussed under Alternative A. User numbers under Alternative D would generally be lower than under Alternative A and all other action alternatives.

Alternative D would designate the San Juan River SRMA, where no motorized boating would be allowed. Launch schedules would allow approximately 45,000 user-days per year, 5,000 more user days than under Alternative A. Trip size would be increased to 35 people (including crew) for both private and commercial use, more than under any other alternative, with approximately 5% more potential for disturbance to riparian habitat than under Alternative A.

Visitor use of the Grand Gulch Plateau (Cedar Mesa) would limit group size to 12 people for day use within the WSA and 25 people outside the WSA. There would be no site designation for groups under 24 and no group size limit. These management actions would have the same impacts on riparian resources as those under Alternative A, which would also impose no camping limits on the mesa top.

Grand Gulch in-canyon riparian resources would be protected from visitor-use impacts where use is restricted. Restrictions on use would be the same as under Alternative C, except that two commercial trips per trailhead would be allowed, with a slightly greater risk of adverse visitor impacts.

In-canyon overnight use would generally be the same as under Alternative A, with some exceptions. Some campsites would be designated, and if human waste should become a problem, carrying out waste might be required. Private group size would be limited to 12 people per day per trailhead, the same as under Alternative A. Total caps for trailheads would be 24 people per day, also the same as under Alternative A.

The Dark Canyon SRMA would be designated, with fewer commercial permits than under any other alternative. Dispersed camping would be allowed. Visitation would be limited to 15 users per day in the canyon. Surface and vegetation disturbance would be reduced in comparison with Alternative A, which would not have any visitor use limits. These restrictions would decrease surface disturbance, the risk of trampling of riparian vegetation, and the potential for loss of shade and increased sedimentation.

Dispersed camping would be allowed in the Indian Creek Corridor, with the same exceptions as under Alternative C. Alternative D would thus result in slightly fewer adverse visitor-related impacts than Alternative A.

Alternative D would designate OHV travel in riparian areas, with no riparian areas closed to OHV use, 20,300 acres in areas limited to designated routes, and 135 acres open to cross-country OHV travel. Closing or limiting OHV travel areas in riparian areas would protect riparian resources and limit impacts from OHV use, as discussed under Alternative A. The limits on OHV use under Alternative D would provide more protection of riparian resources than those under Alternative A, as all of the riparian area within the Monticello FO would be limited to designated routes under this alternative. Under Alternative D, approximately 10,736 fewer riparian acres would be open to OHVs in riparian areas, 3,524 fewer acres would be closed, and 13,998 more acres would be limited to designated routes than under Alternative A. A total of 56 linear miles of travel routes would be designated in riparian areas, 5 fewer miles than under Alternative A.

Alternative D would have similar use levels in designated recreation areas. Impacts to riparian areas would be similar under Alternative D and Alternative A.

4.3.11.2.4.5. Alternative E

Impacts to riparian resources under Alternative E would be the same as under Alternative B, except that restrictions on OHV use would be more stringent and fewer impacts to riparian areas from OHV use would occur. Overall, impacts under Alternative E would be less adverse than under any other alternative. Alternative E would designate OHV travel in riparian areas, with 3,977 acres closed, 16,458 acres limited to designated routes, and no acres open to cross-country

OHV travel. These limits on OHV use would provide the highest level of protection of riparian resources of any alternative.

The percentages of riparian areas open, closed, and limited to designated routes under Alternative E would be approximately 0%, 43%, and 57%, respectively. As a result, 10,871 fewer acres would be open to OHVs, 5,255 more acres would be closed, and 5,354 more acres would be limited to designated travel routes in riparian areas than under Alternative A. The total number of linear miles limited to designated routes in riparian areas would be 43, 18 fewer miles than under Alternative A.

4.3.11.2.4.6. Proposed Plan

Recreation management and its impact on riparian resources would be the same under the Proposed Plan as described under Alternative C, except for the management of OHV travel. The Proposed Plan would manage OHV travel in riparian areas, with 3,539 acres closed, 16,894 acres limited to designated routes, and 0 acres of designated open areas. Closing or limiting OHV travel in riparian areas would protect riparian resources and limit impacts from OHV use, as discussed under Alternative A. These limits on OHV use would provide a higher level of protection of riparian resources than Alternatives A and D, but less protection than Alternatives B and E.

The percentage of riparian area that would be open, closed, and limited to designated routes for OHV use under the Proposed Plan would be approximately 0%, 17%, and 83%, respectively. These limits on OHV use in riparian areas would result in 10,871 fewer acres open to OHVs, 15 more acres closed to OHVs, and 10,592 more acres with designated route limitations for OHVs in riparian areas than under Alternative A. Designated routes in riparian areas would total 60 linear miles, 1 fewer mile, or approximately 2% less, than under Alternative A.

Overall, management actions for recreation under Alternative C would provide more protection of riparian resources than would Alternatives A and D, and less protection than management actions under Alternatives B and E.

4.3.11.2.5. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON RIPARIAN RESOURCES

4.3.11.2.5.1. Alternative A

Areas designated as WSAs would restrict motorized use to existing routes. This management decision would protect riparian resources from new direct impacts from motorized use, as described under Section 4.3.10, Recreation. Under Alternative A, management of WSAs would continue to retain wilderness values, thus protecting riparian values through limitations on motorized use on a total of 2,400 acres of riparian area within the Monticello PA.

ACECs would have different management prescriptions based on resources of concern. Under Alternative A, a total of 5,700 riparian acres would have limitations on motorized use within ACECs. Motorized use would be limited to existing roads and trails within the Alkali Ridge ACEC and the Scenic Highway Corridor ACEC (900 riparian acres). Motorized use would be limited to designated roads and trails within the Cedar Mesa ACEC (partial), Hovenweep ACEC, and Shay Canyon ACEC (1,300 acres). Areas would be closed to motorized use within the Butler Wash ACEC, Cedar Mesa ACEC (partial), Dark Canyon ACEC, and Indian Creek corridor ACEC (3,600 acres). ACEC designation would not generally limit livestock use. All livestock

exclosures were analyzed in Section 4.3.6.1, Impacts Common to All Alternatives, in relation to potential riparian impacts.

Management of ACECs under Alternative A would not limit geophysical work within these areas. Geophysical work would potentially impact riparian resources through vegetation trampling and removal, habitat fragmentation, and possible noxious plant infestation. Any geophysical work within riparian areas would require site-specific NEPA analysis.

Some overlap of ACECs and WSAs would occur under all alternatives. Six ACECs would overlap with WSAs: Bridger Jack Mesa, Butler Wash, Cedar Mesa, Dark Canyon, Indian Creek Corridor, and Lockhart Basin (see Maps 87-90).

4.3.11.2.5.2. Alternative B

The designation of WSAs under Alternative B would be the same as under Alternative A and as discussed above, except that no travel would be allowed within WSAs under Alternative B. The limitation on travel would slightly reduce the risk of impacts to riparian areas from boundary road maintenance, erosion, or changes in hydrology or sediment yield from roads.

Management of ACECs under Alternative B would not preclude OHV limits to designated routes or closure of areas to OHV use. Analysis of impacts of OHV use on riparian resources appears above in Section 4.3.11.2.4, Impacts of Recreation Decisions on Riparian Resources. Surface-disturbing vegetation treatments would not be allowed in the Alkali Ridge and Shay Canyon ACECs, protecting approximately 400 more riparian acres than Alternative A, which would allow surface-disturbing vegetation treatments. Indirect impacts of surface disturbance were discussed under Section 4.3.17, Vegetation. In the Shay Canyon ACEC, Alternative B would limit livestock use on 20 more riparian acres than Alternative A. Designation of the Bridger Jack Mesa, Butler Wash, Cedar Mesa, Dark Canyon, Hovenweep, Indian Creek Corridor, Lockhart Basin, Lavender Mesa, San Juan River, and Valley of the Gods ACECs would have the same impacts as under Alternative A.

4.3.11.2.5.3. Alternative C

Under Alternative C, special designation would generally result in very similar impacts to riparian resources as under Alternative B, except that ACECs would generally be managed with slightly less protective prescriptions (such as VRM Class, mineral stipulations, livestock management, camping restrictions, and woodland harvest). Like Alternative B, Alternative C would be more protective of riparian resources than Alternative A.

4.3.11.2.5.4. Alternative D

Alternative D would manage WSAs according to the IMP, resulting in the same impacts to riparian resources as would occur under Alternative A. No ACECs would be designated under Alternative D, thus there would be no impacts to riparian resources, as discussed under Alternative A.

4.3.11.2.5.5. Alternative E

The impacts to riparian resources under Alternative E would be the same as those described under Alternative B, except that riparian areas in 109,206 acres of ACECs in non-WSA lands

with wilderness characteristics would be managed with additional limitations on woodland harvest, mineral entry, surface disturbance, and ROWs that would protect riparian areas. Because many of these activities are already prohibited in riparian areas and many ACECs, these further restrictions would have a minor beneficial impact on riparian resources.

4.3.11.2.5.6. Proposed Plan

Under the Proposed Plan, special designation would generally result in very similar impacts to riparian resources as under Alternative B, except that ACECs would generally be managed with slightly less protective prescriptions (such as VRM Class, mineral stipulations, livestock management, camping restrictions, and woodland harvest). Like Alternative B, the Proposed Plan would be more protective of riparian resources than Alternative A. Additionally, riparian areas in 25,410 acres of ACECs in non-WSA lands with wilderness characteristics would be managed with additional limitations on woodland harvest, mineral entry, surface disturbance, and ROWs that would protect riparian areas. Because many of these activities are already prohibited in riparian areas and many ACECs, these further restrictions would have a minor beneficial impact on riparian resources.

4.3.11.2.6. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON RIPARIAN RESOURCES

4.3.11.2.6.1. Alternative A

The implementation of management decisions related to special status species would generally protect and/or enhance riparian resources. Recovery plans for the Southwestern Willow Flycatcher, Colorado River fishes, Bald Eagle, and Yellow-billed Cuckoo would benefit riparian resources through habitat enhancement and potential reductions in riparian habitat degradation. Removal of tamarisk and Russian olive for restoration or enhancement of special status species habitat would generally benefit riparian resources.

All alternatives, including Alternative A, would avoid loss of cottonwood gallery riparian habitats and limit surface disturbance in riparian areas to protect Bald Eagle roosting areas. Any disturbance of riparian vegetation would be replaced with native species or ecological equivalents for all special status species. These actions would help maintain existing riparian resources.

All alternatives, including Alternative A, would also restrict surface-disturbing activities within 300 feet of suitable Southwestern Willow Flycatcher and Yellow-billed Cuckoo habitat yearlong and would require 0.25-mile buffers for permanent noise-producing facilities. These obligate riparian species preferentially use riparian areas for all life phases. Restrictions on surface disturbance would reduce potential impacts to riparian resources, as discussed under Impacts Common to All Alternatives. The eradication of tamarisk and Russian olive would cause short-term surface disturbance but would result in long-term enhancement of riparian resources. The BLM would ensure that water extraction or disposal activities do not result in changes to hydrologic regimes that would result in loss or degradation of riparian habitat. Alternative A would avoid loss of riparian habitats in designated critical habitat to protect the endangered Colorado River fishes.

4.3.11.2.6.2. Alternative B

Alternative B would propose the same management decisions and result in the same impacts as described under Alternative A. Group size for non-motorized recreation uses would be limited to 10 individuals and 2 groups per day in Arch Canyon, and a permit system would be implemented. These decisions would protect riparian resources and reduce impacts to riparian resources in Arch Canyon more than the actions taken under Alternative A, which would not limit use in Arch Canyon.

4.3.11.2.6.3. Alternative C

Alternative C would propose the same management decisions and result in the same impacts as those described under Alternative A. OHV use would be limited to the designated route to the end of the State Section (T37S, R20E, Section 16) and to the end of the route at the National Forest boundary. Group size for non-motorized recreation users would be limited to 12 individuals and 2 groups per day, and a permit system would be implemented.

4.3.11.2.6.4. Alternative D

Alternative D would result in the same management and impacts as described under Alternative A. In addition, Alternative D would protect habitat for Mexican Spotted Owl and flannelmouth sucker in Arch Canyon, where OHV use limited to designated routes would be allowed year-round. The number of commercial motorized uses would be limited to 12 people and 2 trips a day. These management actions to protect special status species would result in fewer adverse impacts to riparian resources than under Alternative A and more adverse impacts than under the other action alternatives.

4.3.11.2.6.5. Alternative E

The impacts to riparian resources under Alternative E would be the same as those described for Alternative B because the proposed management decisions would be the same.

4.3.11.2.6.6. Proposed Plan

The Proposed Plan would utilize the same management decisions and result in the same impacts as those described under Alternative A. OHV use would be limited to the designated route in Arch Canyon to the end at the National Forest boundary, a total of 8 miles one way. Organized and commercial groups are required to obtain a Special Recreation Use Permit. This permit would allow access on the designated route up to the National Forest boundary except from March 1 through August 31. During this period, access would be 7.5 miles of the designated route. Motorized access would not be allowed within 0.5 miles of the National Forest boundary.

4.3.11.2.7. IMPACTS OF VEGETATION DECISIONS ON RIPARIAN RESOURCES**4.3.11.2.7.1. Alternative A**

Alternative A would not propose any riparian vegetation treatments and would involve no vegetation management decisions that would affect riparian resources.

4.3.11.2.7.2. Alternative B

The Monticello FO would conduct vegetation treatments in riparian areas under all action alternatives. Potential impacts related to vegetation treatments include increased runoff and sedimentation due to loss of vegetative cover in the short term. Improvement of riparian condition (PFC) would occur over the long term, after treatment areas have recovered.

Under Alternative B, 500 acres of riparian vegetation treatments would be completed each year, resulting in long-term improvement of riparian condition. This would be 500 more acres of riparian treatment than under Alternative A.

4.3.11.2.7.3. Alternative C

Alternative C proposes to implement 100 acres of riparian vegetation treatments each year to restore ecosystem health and PFC of riparian areas. These decisions would result in 400 fewer acres treated in riparian areas than under Alternatives B and E, 100 more acres treated than under Alternative A, and the same acreage treated as under Alternative D. Overall, the management of vegetation resources under Alternative C would result in more beneficial impacts than under Alternative A or Alternative D, and fewer beneficial impacts than under Alternatives B and E.

4.3.11.2.7.4. Alternative D

Under Alternative D, the management of and impacts to riparian resources would be the same as under Alternative C.

4.3.11.2.7.5. Alternative E

The impacts to riparian resources under Alternative E would be the same as those described for Alternative B because the proposed management decisions would be the same.

4.3.11.2.7.6. Proposed Plan

Under the Proposed Plan, the management of and impacts to riparian resources would be the same as under Alternative C.

4.3.11.2.8. IMPACTS OF VISUAL RESOURCE DECISIONS ON RIPARIAN RESOURCES

In general, VRM designation of Class I and Class II would limit any surface disturbance and corresponding indirect adverse impacts to riparian resources from erosion and sedimentation due to vegetation clearing and/or soil disturbance. Conversely, areas that are designated as VRM Class III and Class IV would allow surface-disturbing actions, with the associated risk of sedimentation impacts to adjacent riparian areas.

4.3.11.2.8.1. Alternative A

Management decisions under Alternative A would designate as VRM Class I and Class II 12,200 acres of riparian habitat, approximately 60% of the total riparian resources within the Monticello PA. Table 4.119 compares the number of acres designated as VRM Class I and Class II for each of the alternatives.

Table 4.119. VRM Class I and Class II Designation in Riparian Areas by Alternative (Acres)

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
VRM I and II	12,200	11,200	8,600	5,300	13,704	10,835

4.3.11.2.8.2. Alternative B

Management of visual resources under Alternative B would result in reduction of surface disturbance through requirement of NSO leasing stipulations and limits on construction in areas adjacent to 11,200 acres of riparian areas within the Monticello PA. Indirect impacts to riparian resources would be reduced in these areas. Under Alternative B, 1,000 fewer riparian acres would be protected through visual resource management than under Alternative A, resulting in an increased risk of surface disturbance from human-construction on 56% of riparian areas within the Monticello PA, compared to 60% under Alternative A.

4.3.11.2.8.3. Alternative C

Management of visual resources under Alternative C would result in reduction of surface disturbance through requirement of NSO and limits on construction in areas adjacent to 8,600 acres of riparian areas within the Monticello PA. Under Alternative C, 3,600 fewer riparian acres would be protected through visual resource management than under Alternative A, resulting in an increased risk of surface disturbance from human-construction on 70% of riparian areas within the Monticello FO, compared to 60% under Alternative A.

4.3.11.2.8.4. Alternative D

Management of visual resources under Alternative D would result in reduction of surface disturbance on areas adjacent to 5,300 acres of riparian areas within the Monticello PA. Alternative D would protect 6,900 fewer riparian acres than visual resource management under Alternative A, resulting in an increase of impacts on approximately 25% of riparian areas within the Monticello PA, compared to 60% under Alternative A.

4.3.11.2.8.5. Alternative E

Impacts to riparian resources under Alternative E would be the same as those described under Alternative B, except that more area would be designated as VRM Classes I and II. Under Alternative E, 1,504 more riparian acres would be protected through visual resource management than under Alternative A, resulting in a decreased risk of surface disturbance from human-construction on 67% of riparian areas within the Monticello FO, compared to 60% under Alternative A and 56% under Alternative B.

4.3.11.2.8.6. Proposed Plan

Management of visual resources under the Proposed Plan would result in reduction of surface disturbance through requirement of NSO and limits on construction in areas adjacent to 10,835 acres of riparian areas within the Monticello PA. Under the Proposed Plan, 1,365 fewer riparian

acres would be protected through visual resource management than under Alternative A, resulting in an increased risk of surface disturbance from human-construction on 63% of riparian areas within the Monticello FO, compared to 60% under Alternative A.

4.3.11.3. SUMMARY OF IMPACTS

Resource management decisions would generally allow or limit direct and indirect adverse impacts to riparian resources. All alternatives would have similar impacts on riparian resources from fire, soils, and watershed management. The alternatives differ in their impacts in management of livestock grazing, recreation management, special designations, and visual resource management.

Proper levels of livestock grazing would not result in adverse impacts to riparian resources, as discussed above. The highest level of riparian resource protection would occur under Alternatives B and E, under which fewer riparian acres would be grazed by livestock. The Proposed Plan and Alternative C would provide more protection of riparian resources than Alternatives A and D, both of which would impose similar restrictions on livestock grazing in riparian areas.

Recreation decisions would generally impact riparian resources in areas where increased visitor use would result in riparian habitat degradation. Alternatives B and E would have the lowest levels of user numbers of the proposed alternatives. Alternative D would have the highest user numbers; followed by Alternative A. The Proposed Plan and Alternative C would provide a level of use between Alternative B and Alternative A.

Special designations would protect riparian resources in areas where management prescriptions reduce OHV use. These limits on use would result in ranking of impacts between alternatives, as described under Recreation.

Visual resource protection would generally limit surface disturbance, resulting in reduced indirect adverse impacts to riparian resources that could result from changes in watershed hydrology and stream sedimentation. Alternative E would provide the highest level of riparian resource protection from visual resource management, followed by Alternative A, Alternative B, the Proposed Plan, Alternative C, and Alternative D, in that order.

4.3.11.4. MITIGATION MEASURES

The management decisions common to all proposed alternatives, as described in Chapter 2 and in Appendixes A and I, outline the mitigation measures that would serve to avoid and/or minimize impacts to riparian resources resulting from management actions.

4.3.11.5. UNAVOIDABLE ADVERSE IMPACTS

Any pipeline crossings of stream channels could result in the temporary loss of riparian habitat. OHV use and presence of livestock in riparian areas have the potential for the loss or degradation of riparian habitat, but changes in management based on monitoring would limit these impacts.

4.3.11.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

The short-term use of vegetation treatments in specific riparian resource areas would affect the long-term productivity of the treated areas by increasing the likelihood of achieving riparian PFC

in degraded riparian habitat. Long-term productivity would be beneficially impacted, since the goals of the short-term treatments in riparian areas would be to improve ecosystem health, reduce invasive and exotic species, and restore PFC.

4.3.11.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Irretrievable loss of riparian habitat could occur due to grazing, visitor trampling, and construction-related removal of riparian habitat. However, that habitat could eventually be restored, so those impacts would not be irreversible. However, it is possible that noxious-weed infestation of disturbed riparian areas could become an irreversible impact, given the difficulties observed in the past in controlling invasive species such as tamarisk and Russian olive.

4.3.12. SOCIOECONOMIC RESOURCES

Impacts to social and economic conditions could result from the implementation of any of the alternatives. While the range of socioeconomic impacts may vary depending on the alternative implemented, some management actions would have a measurable impact on socioeconomics and are disclosed in the following analysis.

Potential economic impacts include changes in employment and income, changes in tax revenue for local, state, and federal government entities, and changes in the demand for housing and public service. Where available, quantitative data are used to analyze impacts. Where quantitative data are not available, a qualitative analysis is performed based on best available information.

Social impacts to communities cannot be measured in economic terms. These human impacts include enhancements or detractions from existing lifestyles, sense of place, community values, and unfair or unjust impacts or burdens on low income or minority populations. Accordingly, these impacts are assessed qualitatively.

Impacts to socioeconomic resources from implementation of alternatives would be considered significant if one or more of the following occurs:

- Substantial gains or losses in population/employment.
- Activities or operations substantially altering the lifestyles or quality of life of individuals utilizing or living near the Monticello FO.
- Disproportionately high and adverse environmental or human health impacts to an identified minority or low income population that appreciably exceed those to the general population around the project area.

4.3.12.1. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

4.3.12.1.1. IMPACTS TO ENVIRONMENTAL JUSTICE

Executive Order (EO) 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," requires identifying and addressing disproportionately high and adverse human health and environmental impacts of federal programs, policies, and activities on minority or low income populations. To evaluate potential environmental justice impacts, the following federal agency guidance documents were reviewed:

- EO 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," February 11, 1994, Federal Register at 7630.
- U.S. Environmental Protection Agency, "Interim Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analysis, Office of Federal Activities," September 30, 1997.
- Council on Environmental Quality, "Environmental Justice: Guidance under the National Environmental Policy Act (NEPA)," Executive Office of the President, December 1997.

The following five step method was used to evaluate potential environmental justice impacts associated with land management actions proposed by the BLM:

1. Identify potential minority or low income populations within the study area.
2. Identify a broad range of potential environmental and human health effects that could affect minority or low income populations including safety, traffic, air quality, noise, cultural resources, hazardous waste sites and hazardous materials transport, natural resources, land use, and socioeconomics.
3. Assess whether the potential impacts on minority and low income populations would be high and adverse.
4. Conduct extended outreach to minority and low income populations that would experience potential high and adverse effects.
5. Evaluate mitigation measures that would be used to minimize adverse impacts to minority and low income populations.

Census data for San Juan County, as well as Utah, were used for this analysis. These baseline data are summarized in Section 3.12.4.2. It includes:

- Total population.
- Percent of population of minority status (e.g., Black or African American, Hispanic or Latino, Asian American, American Indian or Alaskan Native, Native Hawaiian and other Pacific Islanders).
- Percent of population of low income status using annual statistical thresholds from the Bureau of Census Current Population Reports.
- Percent of population of minority status for the entire state of Utah.
- Percent of population of low income status in the entire state of Utah using annual statistical thresholds from the Bureau of Census Population Reports.

The data listed above were then used to determine whether the populations residing within the counties in the study area constitute an "environmental justice population" that meets any of the following criteria:

- At least one-half of the population is of minority status.
- At least one-half of the population is of low income status.
- The percentage of population of minority status is a least 10 percentage points higher than for the entire state of Utah.
- The percentage of population of low income status is at least 10 percentage points higher than for the entire state of Utah.

San Juan County is home to 27% of the state's Native American population and 55.7% of the county's total population; therefore Native Americans are not the minority in San Juan County. However, in Utah, 93.8% of the entire population identify themselves as white and 1.3% of the population identify themselves as Native American/Alaskan Native (GOPB 2002). Therefore, when considered state or region-wide, Native Americans are considered a minority. Despite the population data that indicates non-minority status within San Juan County, Native Americans are considered a minority group for the purposes of analyzing and ensuring environmental justice during this RMP process.

In 2003, the number of people in San Juan County living below the poverty line was higher than the state average (22.6% versus. 10%). While San Juan County poverty trends show a decrease

over time, they remain higher than the state average. In terms of race, the Native American population has the highest poverty level in the county at 48%, or 3,809 individuals.

Under each alternative, it has been determined that BLM resource management actions would not result in disproportionate effects to "environmental justice populations" defined in Executive Order 12898. Minority and low income populations do exist in the planning area, but no BLM action proposed across all alternatives or the Proposed Plan would cause disproportionate adverse impacts to these populations.

Two issues identified in Section 3.13.4.3 related to Native American concerns with BLM management decisions have been addressed to meet the group's needs and would not adversely impact their traditional practices. Under all alternatives and the Proposed Plan, wood gathering in designated areas would be allowed, with the exception of Cedar Mesa (outside of Cedar Mesa WSA) under Alternative B. Also under all alternatives and the Proposed Plan, the collection of cottonwoods and willows along riparian areas for ceremonial purposes would be permitted.

4.3.12.1.2. IMPACTS TO PILT PAYMENTS

None of the alternatives would result in significant changes in federal ownership in the planning area. Any future land exchanges or sales would be assessed to determine specific impacts, but in general, actions proposed with the PRMP/FEIS would not change payments to San Juan County made under the Payments in Lieu of Taxes (PILT) program according to established formulas.

4.3.12.1.3. IMPACTS TO POPULATION

Population changes in San Juan County that could be associated with the implementation of alternatives under consideration of this EIS would likely be linked to employment changes. Activities such as livestock grazing and mineral development within the Monticello FO that support jobs in the area are not expected to increase or decrease substantially under any of the alternatives (see impacts analysis below for further details). Therefore, it is not likely the BLM-related management decisions would result in significant changes in current population trends (see Section 3.13.4.2.1 for local population data).

4.3.12.2. ALTERNATIVES AND PROPOSED PLAN IMPACTS

The following resource management decisions would have negligible to minor impacts on woodland resources and will not be analyzed further in this section:

Air Quality

None of the decisions concerning air quality are expected to adversely affect the social or economic conditions of San Juan County.

Health and Safety

Health and safety management actions for all of the alternatives that would identify and address abandoned mine lands safety concerns, respond to hazardous waste releases, and protect public health and safety would have negligible adverse impacts to social and economic conditions of San Juan County. The health and safety management restrictions would not interfere or restrict the local economy or government revenue or the local social character of San Juan County.

Paleontology

Management actions for paleontological resources would have negligible impacts on socioeconomic resources because the recreational and scientific collection of fossils, as well as the protection of these resources, would be similar to current conditions and are the same across alternatives. Personal collection of invertebrate and plant fossils would be allowed throughout the Monticello PA. The recreational collection of vertebrate fossils, as well as of noteworthy invertebrate and plant fossils, is already prohibited within the Monticello PA. Therefore, the recreational collection of fossils from BLM-administered lands would have minimal impacts on the local economy. The permit-required scientific gathering of fossils within the planning area occurs rarely; approximately 1–2 permits are issued annually (see Section 3.10.2). The economic contributions, including sales and hotel tax revenue, from scientific collection would also be negligible under all alternatives and the Proposed Plan.

Riparian

Management decisions common to all alternatives and the Proposed Plan for riparian resources would have negligible impacts to the social and economic conditions of communities in San Juan County. The impacts would be negligible because all floodplains and riparian/wetlands would be managed in accordance with Executive Orders, the Clean Water and Endangered Species Acts, and Utah's Standards for Rangeland Health, and because there is opportunity for mineral leasing across all alternatives and the Proposed Plan outside of riparian areas. These mandates and management actions would not allow great variation in the management of the resource that would have a substantial impact on the local economy or social character of communities.

Soils and Watershed

Soils and watershed actions common to all alternatives and the Proposed Plan would have negligible impacts on socioeconomics. Approximately 76% of BLM lands available for surface-disturbing activities are overlain with medium-risk and high-risk sensitive soils. Any surface disturbance projects (i.e., minerals development) initiated on these sensitive soils would require the use of Best Management Practices and mitigation measures such as those in Appendix A and Appendix I. The large percentage of lands available for surface disturbance and the relatively small amount of wells anticipated to be developed over the next 15 years (75 wells according to the BLM's RFD) would not result in an adverse impact on potential oil and gas exploration and development locations, so there would be no economic loss to the county. Under all alternatives and the Proposed Plan developers would be able to extract oil and gas from more than three-quarters of medium- and high-risk soils and as a result generate revenues for federal and local governments.

Development on slopes greater than 20% would require a BLM-approved plan by developers and may require additional costs and time to relocate well pads and pipelines. This may result in a decrease in revenue for the developer. However, impacts to local economic conditions would be negligible given that the developers would still be permitted to produce on slopes ranging from 21%–40% and generate revenue accordingly.

Special Status Species

The impacts of special status species management actions common to all alternatives and the Proposed Plan on socioeconomics would be minor because temporary seasonal or spatial buffers

and restrictions for roosting or nesting birds and habitat enhancement to protect special status species would not specifically restrict economic growth or social well-being. Restriction on mineral development within special status species habitat could adversely impact developers during specific times of year (see Section 4.3.7.4.8, Impacts of Special Status Species Decisions on Minerals). This could slow production due to timing limitations. However, due to the large amount of acres open to oil and gas development across alternatives (more than one million acres) and the small number of wells predicted within the Monticello FO, an adverse economic impact is unlikely because drilling would commence during periods without seasonal restrictions or year-round in areas without restrictions.

Vegetation

Vegetation management actions across all alternatives and the Proposed Plan could have minor beneficial impacts to the local economy if labor, seed, and equipment maintenance come from local communities.

4.3.12.2.1. IMPACTS OF CULTURAL RESOURCES DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

Under all alternatives and the Proposed Plan, cultural resource management decisions could have potential impacts to socioeconomics. Given that San Juan County has more than 25,000 cultural sites, 60%–65% of which are on BLM lands, the area is well known for its cultural resources and draws many visitors to the area. With approximately 4,000 self-identified registered visitors to cultural resource sites in the early 2000s, public interest in cultural sites appears to be increasing. Cultural resource management for recreational use draws hikers and OHV users to the area to visit sites. Increases or decreases in access to sites and the quality of the sites have the potential to socially impact the visitor and local communities and economically impact revenues.

Cultural resource management decisions could increase or decrease recreational visits to the sites and influence the overall visitor experience. The level of impacts is related to several factors, including the importance of the sites to the Native American communities in the area (the historic cultural sites in the area serve as a connection between the landscape and the local tribes' heritage), any links between local residents and cultural resources, and the degree to which specific sites draw visitors to the area.

Potential economic impacts resulting from cultural resource management decisions could include an increase or decrease in visitor spending. Increasing access could increase visitor spending in the area in the short-term, but degradation to sites could lead to long-term adverse economic impacts, as visitors may choose not to continue to come to the area.

4.3.12.2.1.1. Alternative A

Under Alternative A, 37,433 acres of land is designated for special management related to cultural resources. All of this land is located in the Grand Gulch Special Emphasis Area/Grand Gulch National Historic District. The restrictions proposed under this alternative (see Section 4.3.2, Cultural Resources, for details) reduce the risk of damage to cultural resources. The preservation of the resources in this area would have long-term beneficial social impacts to visitors and Native American communities. However, under this alternative there are minimal restrictions on other special recreation management areas (SRMAs), so the potential for loss of cultural integrity would be greater in these areas. Access to the SRMAs is not restricted under

this alternative, so there is greater opportunity for access and recreation than if the sites were managed for special protections of cultural resources. Sites could be directly or indirectly impacted by increased visitor traffic (with resulting looting and vandalism). Other activities, such as oil and gas development, livestock grazing, and collection and harvesting of woodland resources would also create opportunities for direct and indirect, adverse impacts to cultural resources. These impacts could potentially degrade the visitor experience and therefore reduce the number of visitors to the area. Although difficult to quantify, a decrease in visitors to cultural sites could adversely impact the local economy through decreased traveler spending.

4.3.12.2.1.2. Alternative B

Under Alternative B, 98,348 acres of land would be subject to special management consideration for the purpose of protecting important cultural resource values. With a 162% increase in the amount of SRMAs and more use restrictions compared to Alternative A, this alternative provides the second greatest amount of cultural resource protection after Alternative E. Management actions under this alternative would have short- and long-term, direct and indirect, beneficial social impacts. Visitor experience would be positive over the short and long-term because sites would maintain their historic and cultural integrity. Both directly and indirectly, Native American tribes would maintain a connection and the unique sense of place developed around preservation of the cultural sites in the area.

Alternative B would enact private and commercial group size limits and a permitting system in high-density cultural resource site areas. The limitations of group sizes could theoretically reduce visitation to the area. However, long-term visitation to these sites would likely continue to increase because site integrity would be maintained, providing a higher quality experience and thus potentially encouraging more people to visit the area. This in turn, would likely have long-term positive benefits to the local economy.

4.3.12.2.1.3. Alternative C

Under Alternative C, 98,348 acres of land would be subject to special management consideration to protect cultural resource values. The acreage and location would be identical to Alternative B. Restrictions are also similar to Alternative B, with the exception of the Tank Bench SRMA, which would be open to geophysical work, locatable mineral entry, mineral disposal, and oil and gas development under standard lease terms. Minor adverse social and economic impacts could occur as a result of mineral extraction if operations detract from recreational visits to cultural sites. In addition, the potential inadvertent damage to sites as a result of mineral extraction could have an adverse impact on local tribes and their connection to their cultural heritage. However, mineral development at the implementation level would be required to comply with Section 106 of the NHPA, which would require that development avoid, minimize, or mitigate such potential impacts. Other social and economic impacts would be identical to those described for Alternative B.

4.3.12.2.1.4. Alternative D

Under Alternative D, 38,995 acres of land would be subject to special management consideration for the purpose of protecting cultural resource values. This is a 5% increase from Alternative A

and a 156% decrease in acres proposed under Alternatives B, C, and E. Impacts to social and economic conditions from cultural resource management decisions under this alternative would be similar to impacts described under Alternative A.

4.3.12.2.1.5. Alternative E

Impacts under Alternative E would be similar to those described in Alternative B, with the exception that lands in the Comb Ridge SRMA that were open to oil and gas leasing subject to NSO stipulations would be closed to oil and gas leasing under Alternative E. This would provide greater restrictions for development than under Alternative B and provide a higher quality experience and encourage more people to visit the area. This in turn, would likely have long-term positive benefits to the local economy.

4.3.12.2.1.6. Proposed Plan

Under the Proposed Plan, 98,348 acres of land would be subject to special management consideration to protect cultural resource values. The acreage and location would be identical to Alternative B. Restrictions are also similar to Alternative B, with the exception of the Tank Bench SRMA, which would be open to geophysical work, locatable mineral entry, mineral disposal, and oil and gas development under standard lease terms. Minor adverse social and economic impacts could occur as a result of mineral extraction if operations detract from recreational visits to cultural sites. In addition, the potential inadvertent damage to sites as a result of mineral extraction could have an adverse impact on local tribes and their connection to their cultural heritage. However, mineral development at the implementation level would be required to comply with Section 106 of the NHPA, which would require that development avoid, minimize, or mitigate such potential impacts. Other social and economic impacts would be identical to those described for Alternative B.

4.3.12.2.2. IMPACTS OF FIRE MANAGEMENT DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

During a normal fire year the Moab Fire District averages 100 wildfires, resulting in 10,000 to 16,000 acres each year of disturbed and potentially damaged land. The Moab Fire District encompasses the Monticello, Moab, and Price FOs. Most fire activity occurs in the eastern half of the district, although fires can occur in almost all areas of each FO. In the 25-year period between 1980 and 2005, approximately 74% of wildland fires occurring in the Moab Fire District were caused by lightning. Prior to 1995, an average of 100 fires per year burned an average of 10,000 acres per year. The past decade has shown a trend of increasing wildland fire, with an average of 130 fires each year burning an average of 16,000 acres. With specific regard to the Monticello PA, over a 10-year period an average of 2,000 acres are burned each year (personal communication between Dave Engleman, FMO Moab FO, and Laura Burch Vernon, SWCA, September 5, 2006). See Section 3.4 for further fire management details.

In the upper Snake River Plain, which has similar vegetation types as the Moab Fire District, the average cost of wildland fire treatment was estimated to be approximately \$105 per acre. The average cost for wildland fire suppression was estimated to be approximately \$140 per acre (BLM 2006a). Based on an average of 2,000 acres burned per year in within the Monticello FO, the annual cost to suppress fires would be estimated to be \$280,000. The cost of fighting fires, including supplies and labor, has the potential to impact the local economies.

Of the total expenditures for the fire management program, the following are estimates of approximate percentages spent in each category:

- 45% variable costs
- 30% fixed labor costs
- 25% other suppression costs (BLM 2006a)

Increased fire treatment and suppression activity could lead to more seasonal jobs in the region, as more firefighters would be needed during fire season. The fixed labor costs for suppression (see above) would be funneled back into the community since the firefighters are generally employed at a local level and thus contribute to the local economy. Areas of the economy that are boosted by the variable costs (50% of fire management expenditures) for treatment and suppression include fuel, food, lodging, maintenance, vehicles, administration, aviation, warehousing, and seeding. Assuming that 70% of the variable costs are spent in local communities (BLM 2006a), an estimated \$98,000 would be funneled into the local economy annually. These contributions to the local economies would be distributed throughout the four counties comprising the Moab Fire District, including San Juan, Grand, Carbon, and Emery.

Full suppression of increasingly larger fires could potentially result in adverse fiscal impacts to affected agencies and local volunteer fire departments. If future demands for firefighting services cannot be met by current staffing levels and budgets, the Monticello FO and other agencies that help fight fires on BLM lands would be adversely impacted.

It should be noted that wildfire treatment, such as actively managing lands to reduce fuel loads, is less costly to agencies than fire suppression (\$105 per acre versus \$140 per acre). Expenditures for fuels treatments in the Moab Fire District (MFD), however, are currently paid almost exclusively to out-of-area contractors, providing only marginal direct economic benefits to the local economy (personal communication between Bill Stevens, MFO, and Brian Keating, MFD fuels specialist, June 27, 2007). Actively managing BLM lands to reduce fuel loads would potentially provide economic benefits associated with the reduced risk of large-scale fires that could damage personal property (e.g., homes) and would result in lower expenditures for fire suppression treatments.

Homes and structures that are located within areas faced with wildfire threats are becoming increasingly susceptible to wildland fire, with an accompanying risk to lives and property. Communities in need of management action to reduce the threat from wildland fire on adjacent public lands are identified as WUIs. WUIs presently recognized within the Monticello PA include the communities of Blue Mountain Ranch, Natural Bridges, Bug Point, Cedar Point, Canyon Terrace, Boulder Point, Eastland, Ucolo, Summit Point, Montezuma Canyon, Bluff, Peter's Canyon, Blanding, and Monticello. Fuels treatments to reduce fuel loads in these areas would potentially have long-term beneficial impacts on these communities because of the decrease in the risk of damage to property. If there is a reduced risk of large-scale fires in WUI areas, people may be more likely to remain in these areas and individuals interested in remote locations for primary or secondary homes could be more likely to build in these areas, thus maintaining or increasing the populations of local communities.

4.3.12.2.3. IMPACTS OF LANDS AND REALTY DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

Management decisions common to Alternatives A–D and the Proposed Plan for lands and realty for access, permits, transfer, acquisition, or exchanges of lands within the PA would have negligible impacts on socioeconomics in the county. The impacts would be negligible because specific lands and realty management actions would be determined to be in the interest of the public and would accommodate the needs of local and state governments, including the needs for the economy, public purposes, and community growth.

Alternative E would prohibit land disposals and new ROWs on non-WSA lands with wilderness characteristics. The prohibition of land transfers, exchanges, or ROW authorizations on the proposed 582,357 acres are not anticipated to have major impacts on socioeconomics although infrastructure development for revenue-generating activities such as mineral development, recreation, and timber harvesting would be limited to a greater extent than under Alternatives A – D.

Under all Alternatives and the Proposed Plan existing leases with valid existing rights will be granted ROW regardless of alternative selected. Once the alternative has been implemented, new leases would not be entitled to ROW access. However, the ROW avoidance and exclusion areas tend to be closed to oil and gas leasing or No Surface Occupancy (NSO).

Applications for filming permits limited to existing highways, roads, and pullouts throughout the Monticello FO would be granted under all alternatives and the Proposed Plan without further NEPA analysis provided they meet the criteria outlined in Table 2.1, Lands and Realty–Actions Common to All. Film permits that do not meet this criteria would be analyzed through the NEPA process. Film permits have contributed minimally to the Monticello FO in recent years. In 2005, six permits were issued out of the Monticello FO totaling approximately \$1,050. The costs of the film permits were \$250 per day for moving shots and \$100 per day for still shots. In addition to the fees collected from the BLM, filming crews contribute to the local economies via sales and hotel taxes. Under all alternatives and the Proposed Plan contributions from film permits and expenditures by film crews while in the community would likely be similar to those currently experienced.

4.3.12.2.4. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

A decrease in the number of acres open to grazing has the potential to negatively impact the lifestyle of ranchers in the community. Losses in grazing opportunities could result in lost income and consequently a decline in social well-being for affected ranchers and their families. The inability of ranchers to continue with traditional practices could potentially impact overall character and the way of life for residents of San Juan County. The preservation of the agricultural way of life is very important to members of the rural communities according to comments made by San Juan County residents at a workshop held by the Sonoran Institute prior to the development of the San Juan County Social and Economic Baseline Study in 2004.

Reductions in ranching-based income would make it difficult for families to earn a living on ranching alone. Family members may have to get second jobs or work off the farm to bring in additional income. If ranchers are unable to continue operations, impacts to local communities

could include loss of business activity and/or the businesses themselves and a decline in population if individuals have to relocate to earn a living.

For the purposes of this analysis, the term "AUM" is used to indicate a change in available forage, not a change in the legally allotted grazing. Under Alternatives B, C, and D, portions of allotments would be unavailable for grazing. To get a sense of impacts to the permittees, the percentage of allotments closed was applied to the total number of AUMs under Alternative A (78,459 AUMs).

4.3.12.2.4.1. Alternative A

Under Alternative A, all livestock grazing actions would be the same as those laid out in the 1991 RMP, with the exceptions of new laws and regulatory policies that affect management of the resources under all alternatives and the Proposed Plan. The forage availability and number of AUMs would likely continue at current levels and the economic contributions to the local communities would also continue at current levels. The total area open to livestock forage would continue to be 1,633,253 acres and the number of AUMs under Alternative A would be 78,459 (see Table 4.120).

Table 4.120. Grazing Impacts by Alternative

	Acres Available for Livestock Grazing	% Difference from Alternative A	AUMs Available for Livestock Grazing	% Difference from Alternative A
Alternative A	1,633,253		78,459	
Alternative B	1,620,191	-0.70	77,856	-0.08
Alternative C	1,736,589	6.30	77,898	-0.07
Alternative D	1,629,240	-0.20	78,046	-0.05
Alternative E	1,620,191	-0.70	77,856	-0.08
Proposed Plan	1,621,515	-0.70	77,898	-0.08

This alternative would most closely maintain current livestock grazing conditions for permittees. Best professional judgment of the Monticello FO indicates that the acres open to grazing meet the demand of permittees. Income, jobs, sales, and tax revenue related to grazing within the Monticello PA would remain similar to current levels. Expenditures from ranchers contributing to the local economy (e.g., feed, grazing fees, veterinary costs, fuel, repairs, and labor) would be similar to current conditions.

4.3.12.2.4.2. Alternative B

Under Alternative B, there would be a 13,062-acre reduction (0.7% decrease) in the amount of acreage open to livestock foraging. There would be a 0.08% decrease or 603 less AUMs than Alternative A (see Table 4.120). See Section 4.3.6, Livestock Grazing, for details on closures to livestock.

It is not likely that 0.7% decrease in available forage would have an adverse, substantial, long- or short-term impact on the ranching community. Overall, the 1,620,191 acres of total forage open

under this alternative would meet the needs of grazing permittees, similar to Alternative A. It is possible that a slight decrease in forage acreage may require the supplementation of feed, which would come at a cost to the rancher. However, the slight decrease in acres open to forage is not likely to impact the social conditions related to agriculture. A 0.7% decrease in the amount of acres open to forage would not likely result in a loss of agricultural related jobs and income; therefore the quality of ranching life in and around the Monticello FO would likely be unaffected by this resource decision under this alternative.

4.3.12.2.4.3. Alternative C

Compared to the other alternatives and the Proposed Plan, Alternative C has the greatest amount of acres open for livestock grazing with a 6.3% increase compared to the No Action Alternative - Alternative A. However, the amount of AUMs available under Alternative C is similar to the No Action Alternative with only a 0.70% decrease under the action alternative. With a 6.3% increase in acres available for grazing and a nearly identical amount of AUMs under Alternative C, compared to Alternative A, impacts to social and economic conditions would be similar to current conditions.

4.3.12.2.4.4. Alternative D

With a 0.20% decrease in the number of acres open to forage and a 0.05% decrease (or 20 AUMs) in the number of AUMs under Alternative D, impacts to the social and economic conditions in San Juan County resulting from grazing would be similar to Alternative A.

4.3.12.2.4.5. Alternative E

Impacts to the social and economic conditions from grazing would be the same under Alternative E and Alternative B because the acres of forage available for livestock grazing are the same.

4.3.12.2.4.6. Proposed Plan

Impacts to the social and economic conditions from grazing would be similar to Alternative B as the amount of AUMs available are identical and the acres available for grazing increases by only 1,324 acres (0.08%) under the Proposed Plan.

4.3.12.2.5. IMPACTS OF MINERALS DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

4.3.12.2.5.1. Locatable Minerals

Uranium-Vanadium

The number of acres open to uranium and vanadium extraction is similar under all alternatives and the Proposed Plan (varying less than 8%) with more than 1,520,000 acres available to exploration and development. Therefore, potential adverse impacts (i.e., restricting the number of acres open to extraction) would be negligible under Alternatives A–E and the Proposed Plan.

Recent increases in the price of uranium have led to a substantial increase in the filing of uranium claims within the Monticello FO. Between FY 2004 and FY 2006, 1,972 mining claims were filed on BLM lands. While the exact percentage of uranium claims versus other locatable mineral claims is not known, it is likely that the majority of the claims filed were for uranium. In addition, the Mineral Potential Report indicates a high potential for the occurrence of uranium

and vanadium in historic mining areas. While the increase in the filing of mining claims does not necessarily predict future development, any extraction activities would have beneficial impacts on local economic conditions because developers would require goods and services in nearby towns.

Potential adverse effects from a dramatic increase in uranium exploration and extraction could include increased amount of stress on the local communities that have primarily identified themselves through the ranching and agriculture industries. Increases in health risks to the local communities could also have adverse impacts. Past uranium mining activities are currently suspected of increased health problems in the Monticello community. While this claim is currently under investigation by the Utah Department of Health, a resurgence of uranium mining activities could have similar adverse health impacts on the miners and members of the community. However, since BLM has no discretion regarding locatable mineral exploration and development, short of recommending areas for withdrawals, impacts resulting from this PRMP/FEIS would have negligible impacts on the resource.

Other Locatables

As in the case of uranium, the extraction of other locatables such as copper, placer gold, and limestone would not be adversely impacted regardless of the alternative selected. This is due to the large number of acres open to extraction and the small amount of mining that is likely to take place. Under all alternatives and the Proposed Plan, the number of acres open to extraction exceeds 1,520,000 and varies less than 8% between alternatives (see Section 4.3.7.3, Summary of Locatable RFD and Salable RFD, for exact acreages).

4.3.12.2.5.2. Salable Minerals

Sand, gravel, building stone, and clay have a high potential for occurrence, and extraction of these minerals would likely occur throughout the next 15 years regardless of the alternative selected. Minor—or even negligible—impacts to socioeconomics would be likely because the operations are typically small, and the number of acres open to extraction would likely be adequate to accommodate demand. Alternative E has 1,167,224 acres open to development of salable minerals, while the other four alternatives have more than 1.2 million acres available. Under all alternatives and the Proposed Plan, these acreages should be sufficient to meet demand for salable minerals (see Section 4.3.7.3, Summary of Locatable RFD and Salable RFD, for exact acreages).

4.3.12.2.5.3. Leasable Minerals

Potash and Salt

Under all alternatives and the Proposed Plan, the same minimum amount of potash and salt development would be expected. Given the large amount of acreage open for leasable mineral development (Table 4.121) it is anticipated that the number of acres open would accommodate the demand for potash and salt extraction. The expected level of development would not appreciably contribute to the economy of San Juan County.

Table 4.121. Summary of Well Potential and Acres Open to Leasing on BLM Land Per Alternative

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Potential Wells						
Acreage Open	1,238,230	1,241,910	1,348,973	1,383,283	758,930	1,227,909
% Of Total Acreage Open Compared to Alternative A	--	0.30	8.20	10.50	-38.70	-0.08
Total Number of Wells/LOP	73	66	74	75	54	72
Total Annual Well Potential	4.86	4.4	4.93	5	3.6	4.8

Oil and Gas Development

The greatest socioeconomic impacts from minerals decisions would result from changes to the oil and gas leasing program that currently exists in the planning area. Because of undefined market and non-market factors, the following analysis is based on simplified assumptions used to quantify general estimates of development costs, employment, production, and production revenue. This analysis is based on the assumptions included in Table 4.121 pertaining to the number of wells drilled per year, employment, production, and fiscal impacts.

Wells Drilled per Year

This analysis is based on an estimate of potential wells drilled annually over the next 15 years. Given the limited range in the number of wells drilled per alternative, under Alternatives A–D and the Proposed Plan, on BLM land (66–75 wells over the next 15 years), a maximum of 5 wells annually (75 wells divided by 15 years = 5) was assumed. The range between alternatives is 9 total wells, which would produce little overall variation between alternative impacts in terms of socioeconomic impacts. Alternative E proposes substantially fewer wells over the next 15 years (54 wells or 3.6 wells drilled annually), in comparison to Alternatives A–D and the Proposed Plan. Given the reduced number of wells under Alternative E, the following analysis also considers the impacts of 3 wells per year in addition to the 5 wells per year under Alternatives A – D and the Proposed Plan. See Table 4.121 for average number of wells predicted per alternative.

Although there are more acres open for development under Alternative B, compared to Alternative A the well potential is slightly lower. This is because the percentage of acres open to development within specific RFD areas is greater under Alternative A than Alternative B. For example, 98% of the Paradox Sub-basin is open to development under Alternative A and 81% is open to development under Alternative B. The percentage open to development impacts the total number of wells predicted for each RFD area throughout the next 15 years. Within the Paradox Sub-basin the total number of wells predicted is 25 and, because of the reduction in percentage open to development under Alternative B, 20 wells are predicted.

Under Alternative E there would be a 38% reduction in acres open for oil and gas leasing and a 26% percent decrease in the predicted oil and gas wells compared to the No Action Alternative. This disproportionate decline can be explained by the substantial decrease in acres open for development in the Monument Upwarp RFD area, which has a large portion of lands with wilderness characteristics and a lower overall development potential when compared to the other alternatives. In contrast to the decline in acres open for leasing, the number of wells drilled per year varies slightly between Alternative E (3.6 wells) and the No Action Alternative (4.8 wells).

Employment

The drilling and completion of an oil well requires a crew of approximately seven full-time employees (FTE). In addition to the crew members, there are several service and supply companies that contribute to well development. One oil well could involve the services of up to 25 employees from drilling to completion. Of the total number of persons involved in the well production, approximately four to five live on site. The other service employees are in the area only temporarily and typically stay in nearby hotels on a short-term basis. It is not likely that the employees related to the oil and gas exploration and completion of wells within the Monticello FO are residents of San Juan County (personal communication between Jeff Brown, Monticello FO, and Laura Burch Vernon, SWCA, on August 11, 2006).

Given the small number of wells predicted annually per alternative (five wells in Alternatives A–D and three in Alternative E) it is reasonable to assume that the same crew and service professionals (or equivalent in the amount of employees) would be responsible for all three to five wells throughout production. This suggests that the overall contribution to San Juan County employment from oil well development is minimal, regardless of alternative. It is not likely that the employment derived from the drilling and completion of wells in the area would positively impact poverty or unemployment rates in San Juan County.

The production of a single well can last up to 20 years and it is during this time that local citizens are employed by oil and gas companies. These oil and gas production jobs pay well (relative to other jobs within the county) and could employ up to 20 to 30 people throughout the life of the well. However, employment related to mining activities, including oil and gas development, only contributed 5.6% to the total employment in San Juan County in 2000 (see Section 3.13.4.2.6).

Production

While the majority of mineral development activity currently occurring within the Monticello FO is oil production (493 producing oil wells versus 15 producing gas wells, per Section 3.8.2.1.1, Table 3.16), there is a potential for the number of gas wells to increase in demand for domestic production of non-renewable resources. Therefore, this analysis will look at the production of both oil and natural gas wells. It assumes that five wells would be drilled annually under Alternatives A–D and three wells under Alternative E; these wells may be any combination of oil or gas.

According to the Energy Information Administration (EIA), in January 2007 current-day oil price was \$56.29 per 42-gallon barrel (EIA 2007). In 2004, the average yearly production per oil well in Utah was 7,141 barrels of oil. Potential annual revenue per oil well is \$401,967, assuming that 7,141 barrels are recovered ($7,141 \times 56.29$). The life of each well is estimated to be 15–20 years. The rate of production per oil well declines approximately 10% per year after the initial

year. Therefore, annual revenue per well would begin at \$401,967 and decrease 10% per year throughout the life of the well.

As of December 2006, the current natural gas price according to the EIA was \$6.65 per thousand cubic feet (MCF) for natural gas (EIA 2007). In 2004, the average yearly production per gas well in the state of Utah was 75,153 MCF (EIA 2007). For analysis purposes, potential annual revenue per natural gas well is assumed to be at the state-wide average of \$499,767 ($75,153 \times \6.65). The life of each well is estimated to be 20 years. The rate of production declines approximately 10% per year after the initial year, according to the Utah Department of Natural Resources (UDNR 2004). Therefore, the recovery value would begin at \$499,767 and decline 10% per year throughout the life of the well.

Fiscal Impacts

The drilling and completion of wells in the Monticello FO would have an impact on local and state governments resulting from services provided, tax, and other revenue received. Tax and royalty revenue would be realized for the life of the well, with diminishing returns after maximum production is reached. The severance tax and royalty revenue generated from natural resource development depends on the amount of the commodity produced. Given the uncertainty of the geology and the market, the quantification of revenue is somewhat speculative.

The severance taxes collected on mineral production are distributed within the state according to a formula published in state statutes. Severance tax revenues are distributed to a variety of state and local entities, including the state's general fund, the state highway fund, counties, cities, and towns. Local government entities within the Monticello FO will only benefit from a percentage of severance taxes collected on production within the study area. However, these entities will also benefit from severance taxes collected on mineral production occurring in other parts of the state (BLM 2003g).

In 2002 the severance tax rate for oil and gas development on Utah lands was 3% of the value up to and including the first \$13 per barrel for oil and \$1.50 per MCF of natural gas; and 5% of the value above these prices. The estimated ad valorem taxes for each mineral type are based on production and assessed values and current tax rates. Ad valorem taxes assessed on property associated with oil and gas operations generate tax revenue for the counties and with respect to this PRMP/FEIS, the greater the number of producing wells in the Monticello FO, the greater the generation of property taxes associated with oil and gas extraction assets.

Royalty revenue to the federal, state, and county governments equals approximately 12.5% of production revenue. The federal government returns 50% of the total royalties to the state where the mineral production occurs. The royalties are then distributed between the state and counties where the production takes place. Assuming the recovery value for one oil well is \$401,967 per year, royalty revenues would be \$50,246 per well at maximum production ($401,967 \times 0.125$). If the recovery value for one natural gas well were \$499,767 per year, royalty revenues would be \$62,471 per well at maximum production ($499,767 \times 0.125$).

San Juan County receives a portion of federal mineral lease monies returned to the State of Utah by the federal government through the Permanent Community Impact Fund Board (CIB). The funds received by the county for infrastructure projects would likely continue in amounts similar to recent contributions regardless of the BLM alternative selected because CIB funding is not directly correlated with production by county but rather by applicant eligibility.

4.3.12.2.5.4. Alternatives A–E and the Proposed Plan

Under Alternatives A–D and the Proposed Plan impacts from oil and gas development would be virtually the same regardless of alternative selected because the acreage open for development varies by less than 11% and the estimated total wells drilled over the next 15 years varies by nine (see Table 4.121). Alternative E allows for less development, with 19 fewer wells than Alternative A and a 38.7% reduction in acres open for development.

4.3.12.2.5.5. Alternative A

Trends related to employment would remain unchanged as long as the wells continued to be drilled and produced. Throughout the next 15 years, it is assumed the FTE required to drill and complete the well would remain at seven, and that the approximately 25 well service employees would remain unchanged. Under all alternatives and the Proposed Plan, the employees responsible for long-term production of the oil and gas wells (approximately 30–40 employees) would remain the same as current conditions. Because there are so few wells anticipated per year, hiring additional employees to drill and produce wells probably would not be necessary as the current number of employees would likely be sufficient to meet the demand. Poverty and unemployment rates would not be positively or adversely impacted. Under all alternatives and the Proposed Plan, local employment resulting from oil and gas activities would continue to have a negligible impact on the job base in San Juan County.

The annual estimated royalty revenue from five oil wells would be \$251,225. The annual estimated royalty revenue from five natural gas wells would be \$312,350 (Table 4.122). The range of economic contributions would vary depending on the combination of oil and gas wells that are producing annually.

Table 4.122. Annual Estimated Royalty Revenue from Oil and Gas Development Per Alternative

	Royalty Revenue–Oil *	Royalty Revenue–Natural Gas*
Alternatives A–D and Proposed Plan: 5 wells	\$251,225	\$312,350
Alternative E: 3 wells	\$150,735	\$187,410

*Revenue at maximum production, decreasing 10% annually.

Assuming that producing wells occur on public lands, 50% of the royalties revenues listed in Table 4.122 would go to the state, 10% of the royalties would go to the General Fund of the US Treasury, and 40% of the of royalties would go to the special purpose accounts of the reclamation fund (BLM 2005n).

Production taxes, such as severance taxes and ad valorem taxes resulting from oil and gas development would increase or decrease in proportion to the amount of production occurring within San Juan County. Overall, the contributions to the local economy from production taxes would be similar to current contributions. Annual oil and gas lease rental would also continue to contribute to the economy in a similar fashion under all alternatives and the Proposed Plan.

4.3.12.2.5.6. Alternative B

Government revenues in the form of royalties from oil and gas production under Alternative B would be similar to those under Alternative A, given that the total well potential between the alternatives is similar (73 under Alternative A and 66 under Alternative B). Although the number of wells under Alternative B is slightly lower, the number of acres open for oil and gas development is slightly greater under Alternative B by 0.3% (see Table 4.121). Employment levels would remain similar to Alternative A.

4.3.12.2.5.7. Alternative C

Government revenues in the form of royalties from oil and gas production under Alternative C would be similar to those under Alternative A, given that the total well potential between the alternatives is similar (73 under Alternative A and 74 under Alternative C). The number of acres open for oil and gas development is slightly greater under Alternative C by 8.2% (see Table 4.121). Employment levels would remain similar to Alternative A.

4.3.12.2.5.8. Alternative D

Government revenues in the form of royalties from oil and gas production under Alternative D would be similar to those under Alternative A, given that the total well potential between the alternatives is similar (73 under Alternative A and 75 under Alternative D). The number of acres open for oil and gas development is greater under Alternative D by 10.5% (see Table 4.121). Employment levels would remain similar to Alternative A.

4.3.12.2.5.9. Alternative E

Alternative E would have the greatest potential for adverse economic impacts when compared to the other alternatives. Government revenues in the form of royalties from oil and gas production under Alternative E would be less than those under Alternative A, given that the total well potential between the alternatives varies by 19 wells (73 under Alternative A and 54 under Alternative E). Compared to Alternative A, the number of acres open for oil and gas development is 38.7% less under Alternative E (see Table 4.121). Annual estimated royalty revenue generated under Alternative E would be \$100,490 less for oil and \$124,940 less for gas than Alternative A (see Table 4.122). Employment levels are unlikely to be adversely impacted by Alternative E because it is probable that the same number of employees would be required to service three wells under Alternative E as would be required to service the five wells under Alternatives A–D. Further, given that oil and gas development is not a major contributor to the local workforce and the annual reduction under Alternative E is 1.4 wells annually, it is not likely that local employment levels will be adversely impacted by Alternative E in comparison to Alternatives A–D.

An additional potential impact to state revenues is the potential loss to SITLA from not being able to lease or develop lands bordered all or in part by non-WSA lands with wilderness characteristics. The value of these lands for oil and gas leasing and/or development may be reduced if all or portions of BLM lands are closed to new oil and gas leasing. This in turn could reduce the monies collected by the state (through SITLA), including royalties and severance taxes. These impacts can be estimated using current data, and incorporating several assumptions. If one assumes that SITLA lands whose perimeter is more than fifty per cent bounded by acreage

closed to new oil and gas leasing as a result of implementing the Alternative E would be unavailable for development, and using the projections of the RFD, one can project that less than one well (0.05) would not be drilled over the next 15 years. Using data provided by the State of Utah, royalty payments to wells on SITLA lands averaged \$57,065 as of early 2008. Severance taxes averaged \$9,335 for all wells, regardless of land ownership. Multiplying these figures by the wells assumed to not be drilled, the fiscal loss to the state would total \$3,003 in royalties and \$491 in severance taxes in any year in which all 0.05 wells would have been in operation.-. This amount could increase over the next 15 years, as it is likely that some fraction of these wells would be in operation in several (or even all) years of the plan. The potential loss in jobs and income, given the assumptions of this section, could total 0.37 jobs and \$12,678 in earnings over the next 15 years.

4.3.12.2.5.10. The Proposed Plan

Government revenues in the form of royalties from oil and gas production under the Proposed Plan would be similar to those under Alternative A, given that the total well potential between the alternatives is similar (73 under Alternative A and 72 under the Proposed Plan). The number of acres open for oil and gas development is slightly less under the Proposed Plan by 0.08% (see Table 4.121). Employment levels would remain similar to Alternative A.

4.3.12.2.6. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

4.3.12.2.6.1. Alternatives A–D

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternatives A–D, resulting in no additional impacts on socioeconomics.

4.3.12.2.6.2. Alternative E

Alternative E manages 582,357 acres of non-WSA lands with wilderness characteristics to provide maximum protection for the qualities of naturalness, outstanding opportunities for primitive and unconfined recreation or solitude, and supplemental values where present. As with VRM, this resource itself is not a management tool, but relies on restrictions on other resources to achieve its management goals. The tools used include restrictions on vegetative and fuels treatments, travel management, minerals and energy, lands and realty, and recreation. These restrictions are identical to the restrictions discussed in Chapter 4 for each of these resources under Alternative D, and the socioeconomic impacts are similar for each of these resources so restricted.

As with VRM management, the restrictions on development under this alternative have the greatest potential to restrict economic opportunities for those whose livelihood depends all or in part on the restricted activities. This would be particularly true in the case of minerals development and motorized recreation. Conversely, those whose livelihood or even sense of well-being depends on values associated with wilderness characteristics and primitive recreation would receive the greatest benefit under Alternative E. As with VRM, this alternative could benefit those businesses that rely on those recreational visitors who value wilderness qualities.

It is difficult to predict whether the potential socioeconomic gains described above will outweigh the socioeconomic losses which could result from this alternative. Managing lands for wilderness characteristics may have some positive benefits to the local economy, above and beyond benefits to individual users of these areas. There is extensive literature that argues that protecting lands as wilderness provides local, regional, and even national economic benefits. An example is a recent study published by the USFS that summarizes much of the relevant research on this topic, with a special emphasis on recreation. While most published research emphasizes designated wilderness, some of these arguments may be applicable to non-WSA lands with wilderness characteristics (Bowker et al. 2005).

4.3.12.2.6.3. Proposed Plan

Under the Proposed Plan 88,871 acres of non-WSA lands would be managed for wilderness characteristics. Managing the 4 non-WSA lands with wilderness characteristics to maintain their wilderness characteristics could have potential beneficial *or* adverse impacts on socioeconomics depending on the resource impacted. However, given the small percentage of acres to be managed as non-WSA lands with wilderness characteristics (0.04%) it is not likely that impacts on resources such as minerals, livestock grazing, and recreation would have negligible impacts on socioeconomics.

As mentioned in Section 4.3.8.5, Non-WSA Lands with Wilderness Characteristics, 79% of all non-WSA lands with wilderness characteristics would remain open to mineral leasing and development under standard or conditional surface use (CSU) or timing limitations (TL) and given the low number of wells projected annually (up to 5 wells) and over the next 15 years (72 wells) based on the low RFD, it is unlikely that the restrictions would adversely impact those whose livelihood depends on mineral development in the area.

Similarly, adverse impacts to OHV users are unlikely under the Proposed Plan, as 88,825 of the 88,871 acres would be managed for OHV designated-route travel under the Proposed Plan. The impact on OHV users would be minor as OHV use would be allowed within 99% of the non-WSA lands with wilderness characteristics.

The impacts on primitive recreation users would be beneficial under the Proposed Plan, when compared to the No Action Alternative – Alternative A, because naturalness, solitude, and outstanding opportunities for primitive recreation would be preserved and enhanced from closure/restrictions on surface-disturbing activities and other uses on the 88,871 acres of non-WSA lands with wilderness characteristics. However, given the small amount of acreage of non-WSA lands with wilderness characteristics when compared to the entire planning area as well as the fact that OHV travel is permitted in 99% area, it is not likely that benefits to primitive recreation users would be minor. Those whose livelihood or even sense of well-being depends on values associated with wilderness characteristics and primitive recreation would receive a slight benefit under the Proposed Plan, but much less that under Alternative E. As with VRM, this alternative could benefit those businesses that rely on those recreational visitors who value wilderness qualities. Benefits to those businesses that rely on primitive use recreational visitors would be negligible to minor as a result of the designation.

4.3.12.2.7. IMPACTS OF RECREATION DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

Proposed recreation management decisions for the Monticello FO have the potential to impact local and regional socioeconomic conditions. The socioeconomic impacts would primarily be in the form of income and employment effects in the economies that serve the recreational user. Future recreational uses could also affect the fiscal resources and services by the BLM and other government agencies.

However, the relationship between changes in land-use decisions pertaining to recreational use and the associated social and economic impacts are difficult to quantify. Therefore, some assumptions have been made:

- Increasing recreational opportunities could positively affect visitation, which could also benefit local businesses and overall traveler spending in the region.
- Improving the recreational experience would have a positive effect on the social component of recreation, potentially increasing visitation.
- Special Recreation Management Areas (SRMAs) are intended to reduce user conflict as the BLM manages them more broadly for a specific recreational experience in comparison to focus areas. Each SRMA has been previously identified as an area where recreation issues or management concerns occur. SRMAs would still allow for other recreational uses within their boundaries but emphasize particular recreation opportunities that lie within the SRMA.
- With increased recreational use, local businesses would benefit economically. According to a state-commissioned study by D.K. Shifflet & Associates, non-resident travel within Utah has consistently been about double that of resident tourism, measured in terms of visitor-days (D.F.Shifflet & Associates 2006). For 2005, for example, the study found that non-resident visitor days accounted for 66.2% of state-wide visitor days. Not all visitors, of course, are recreational visitors (e.g., business, visiting family), nor are all recreational visitors using BLM lands. Given the lack of other data sources, this figure seems reasonable for purpose of estimating visitor spending, in that non-resident visitors typically spend more per day than resident visitors. It is likely that this figure (66.2%) is too high for some activities and too low for others.

Data on expenditures per local (defined as Utah resident) and non-local visitor day were obtained from the above source. That study estimated non-resident visitor spending state-wide at \$103 per day, with resident spending state-wide averaging \$61 per day. A large part of the difference was due to spending on lodging, implying that many resident visitors are not on overnight trips, which may be representative of the planning area.

With the trend toward increased recreation within the Monticello FO, user conflicts are likely to remain an issue regardless of the alternative selected. User groups, as defined in Section 4.3.8, Non-WSA Lands with Wilderness Characteristics, include motorized (on-road), motorized (off-road), non-motorized, non-mechanized, river floating, and specialized recreation. Increases in conflicts between user groups have the potential to adversely impact visitor experience in the area. The adverse impact to the visitor regarding their recreation experience would likely be short-term. However, long-term adverse impacts to the county's economy could be possible because users would choose to recreate in other areas where they feel they are more likely to have a positive recreational experience. This would contribute to a loss in traveler spending in the area.

4.3.12.2.7.1. Alternative A

As stated in Section 3.13.4.2.7, tourist spending has grown slowly and consistently since the 1990s. Under current management actions recreational use is projected to continue to follow existing trends. Local and regional social and economic impacts from recreation and tourism would be similar to those experienced currently. Visitation to local attractions would be anticipated to follow the existing continual growth trend.

Employment in the travel and tourism-related industries would remain around 1,083, the number of tourism-related jobs reported by the Utah Division of Travel Development in 2003. Tourism-related spending in San Juan County would total approximately \$35.5 million dollars (adjusted for inflation), as it did in 2003. Travel and tourism-related employment would continue to account for approximately 15% of San Juan County's total job base. Expenditures for leisure and hospitality services are taxed at the local and state level and are a benefit to counties. Under Alternative A, tax revenue from visitor spending (i.e. hotel, restaurant, and sales tax) would similarly contribute to the local government's fiscal resource base.

The number of activities impacted by launch limits and trip sizes within SRMAs would be least restrictive and most similar to current conditions under Alternative A. Economic contributions from these groups would also be similar since reductions in permits would not change under Alternative A.

Under the No Action Alternative, 611,310 acres would be open to OHV use and 1,329,430 acres would be designated as limited. As evidenced in the Monticello FO AMS, OHV ownership has increased substantially throughout the last five years within San Juan County and throughout the state. OHV use has increased from 1,833 riders reported in 2002 to 12,060 riders in 2005, as discussed in Section 3.11.4.1. Despite the increase in OHV uses within the Monticello FO, the majority of riders stay on existing roads. The best professional judgment from BLM Monticello FO indicates that acres currently designated as limited, and acres designated as limited across all alternatives and the Proposed Plan, are sufficient in meeting the current demand and foreseeable future demand (personal communication between Gary Torres, Monticello FO, and Laura Burch Vernon, SWCA, on Sept. 7, 2006).

This alternative would allow for OHV users to access the largest number of areas open to OHV compared to other alternatives and more than 1.3 million acres of routes designated as limited. This alternative most closely represents the current conditions for OHV access and as such it is likely that the economic contributions from the user group would be similar to current contributions. Because this alternative has the lowest number of acres designated as limited, it is possible that densities in OHV users on existing roads could increase, but an adverse impact to users and indirectly the local economies is not anticipated. Socioeconomic contributions from OHV use would remain similar to current conditions because the number of riders using the area would be similar to 2005 visitation numbers (12,060 OHV users). Contributions to the local economy from hotel taxes, retail, maintenance, and restaurant sales would continue along the current path.

Recreational users who require or prefer motorized access would enjoy the most short-term benefits under Alternative A. Individuals or groups who value solitude would have fewer places to enjoy that did not allow motorized access, potentially decreasing their recreational experience and/or social well-being. Resource degradation-related impacts to soil, water quality, cultural

resources, wildlife and scenic quality and other impacts associated with OHV use and cross-country travel would adversely impact recreational opportunities and visitation in the long-term.

4.3.12.2.7.2. Alternative B

Decreases in group and trip sizes and boat launches per day or visit within SRMAs could decrease the number of visitors to the planning area and patrons to San Juan County communities. However, decreases in visitors to the area would only occur if use within the SRMA is at capacity. For example, during the high-water season a reduction in launch limits for the San Juan River may limit the number of visitors likely to run the river and patronize local businesses. Limits to group numbers and trip sizes in SRMAs such as Grand Gulch, where permit use is not currently at capacity, would not adversely impact the local economy because visitors would not be turned away.

In recreation areas where use is at capacity, the decreases in group and trip sizes could result in lower recreation-based income and jobs and thus, adversely affect the local economy. The fiscal resources of the local county government would also be indirectly impacted by a decrease in recreational visits to the county. Expenditures for leisure and hospitality services are taxed at the local and state level and are a benefit to counties. It is possible that local government revenue from hotel, restaurant, and sales tax on goods purchased would be reduced under Alternatives B and E. However, because the proportion of total recreation expenditures versus expenditures from local residents and/or non-recreational visitors is not possible to quantify, it is generally concluded that a decrease in recreational use in the area would lead to a decrease in tax revenues for the local government.

The 25% reduction in launch limits per year on the San Juan River would equate to a 25% reduction in revenues for the BLM's fee demonstration program (if the program is operating at capacity), thus adversely impacting services to the public. It is likely that the reduction in launch limits would only prohibit river users during peak season, thus limiting the amount of revenue generated for the fee demonstration program and local retailers. The temporary reduction in launch limits could have a long-term, indirect, adverse impact on local businesses because 25% fewer people would contribute to the local economies prior to or after river trips. However, these impacts would be short-term as peak flows would likely last less than one month's time. During low-water years and non-peak seasons when river use is not at capacity, the reduction in launch limits would have a negligible impact on the local economy.

Under Alternative B, zero acres would be designated as open to OHV use, with all OHV routes (1,397,417) designated as limited. The number of acres designated as limited under Alternatives B and E are not anticipated to reduce the level of OHV travel in the planning area because the number of acres designated as limited would be greater than the No Action Alternative, which appears to meet the demand of OHV users.

Groups or individuals who value solitude and non-motorized activities would have the most places to enjoy under Alternatives B and E, perhaps enhancing the visitor experience. Alternative B is minimally responsive to the desires of individuals and groups who feel public lands should remain open to motorized vehicle access, potentially detracting from their social well-being. The potential for adverse impacts as a result of resource degradation-related OHV use would be considerably less under this alternative compared to Alternatives A, C, D, and the Proposed Plan, thus having a long-term beneficial impact on visitation to the area.

4.3.12.2.7.3. Alternative C

Under Alternative C impacts to socioeconomics from recreation would be similar to Alternative A given similar group and trip sizes and launch limits. Alternative C would provide more potential for increased visitation and economic contribution to regional economies than Alternative B.

This alternative would designate 2,311 acres as open to OHV use, with 1,362,142 acres designated as limited for OHV use. The reduction in acres open to cross-country travel would have potentially adverse social impacts on those OHV users desiring an unrestricted motorized experience. Economic contributions to the local economy could decrease as visitors desiring unrestricted access choose to stop coming to the area.

4.3.12.2.7.4. Alternative D

Impacts to socioeconomics from recreation would be greatest under Alternative D. Recreational opportunities would be greatest under this alternative, with a 29% increase in trip size and 11% increase in launch limits on the San Juan River, increased group and trip sizes throughout the planning area, and unlimited OHV group sizes on designated routes. Increasing access to recreational opportunities may increase visitation to the area and potentially increase overall tourist spending. The greater the number of visitors to the area, the greater the demand for goods and services; thus an increase in employment and spending in the tourism-based industry is likely. Under Alternative D, impacts to the local and regional economy would have long-term beneficial impacts.

Under Alternative D, 2,311 acres would be designated as open to OHV use, with 1,780,807 acres limited to designated routes. The reduction in acres open to cross-country travel would have potentially adverse social impacts on those OHV users desiring an unrestricted motorized experience. Economic contributions to the local economy could decrease as visitors desiring unrestricted access choose to stop coming to the area.

From a social perspective, impacts from recreation could have positive short-term effects because various user groups have the greatest amount of access under Alternative D. However, the long-term impacts of increased recreation use could be adverse, as crowding, user conflicts, and the degradation of the environment could detract from the visitor experience.

4.3.12.2.7.5. Alternative E

Alternative E includes management prescriptions to protect wilderness characteristics on 582,360 acres of non-WSA lands with wilderness characteristics. The overall management prescriptions associated with this alternative would have a stronger emphasis on primitive, semi-primitive, and non-motorized uses than any of the other alternatives. Fewer recreational facilities would be developed. Expenditures by individuals who either desire increased OHV access or developed recreational facilities might decline relative to the other alternatives. These expenditure reductions could cause a loss of income and jobs in the socioeconomic study area. For individuals seeking more primitive and non-motorized recreational experiences, visitation and resulting expenditures and related economic activity, as well as satisfaction, would likely be greatest under this alternative.

As discussed earlier under non-WSA lands with wilderness characteristics, some have argued that the very existence of wilderness characteristics within an area can provide economic benefits to the local economy. To the extent that managing additional lands to preserve wilderness characteristics attracts clients and employees to the planning area, there could be corresponding positive economic benefits to local communities. Local businesses that benefit from the preservation of non-WSA lands, such as Wilderness Quest, would benefit the most from Alternative E.

In a recent comprehensive study completed by the USFS National Use Visitor Monitoring Program for the Moab FO (USFS 2007), the top four activities on BLM lands in Moab mentioned by respondents were (1) hiking/walking/trail running, (2) bicycling/mountain biking, (3) driving a passenger vehicle for pleasure, and (4) viewing natural features. Taken together, this accounted for more than half the responses. Given that the driving answer was in reference to paved roads, these results strongly suggest that OHV use is not necessarily what pushes the recreation economy. The described activities all could benefit from Alternative E and all these groups could be spending in the local economies. Although this study was done for the Moab FO, it does border Monticello and arguably Moab is a better known destination for OHV enthusiasts. The study included both resident and non-resident recreationists.

Under Alternative E, impacts to socioeconomics from recreation would be similar to Alternative B, given similar group and trip sizes and launch limits. Identical to Alternative B, this alternative would result in the closure of 423,698 acres to cross-country OHV use and 1,359,417 would be designated as limited for OHV use. Whether potential economic losses resulting from restrictions on some recreationists would be offset or surpassed by economic gains from other types of recreationists cannot be predicted in this document.

4.3.12.2.7.6. Proposed Plan

Under the Proposed Plan there is a 10% decrease in the amount of acres managed as SRMAs compared to Alternative A. This slight reduction in specific areas managed for a type and range of recreational activities is not likely to have an adverse or beneficial impact when compared to Alternative A and current socioeconomic conditions. Group sizes, trailhead allocations, and launch limits within SRMAs are also similar to Alternative A. See Section 4.3.10.3 for details on SRMA management emphases.

Under the Proposed Plan there are considerably less acres designated as “Open” for cross-country motorized travel in comparison to Alternative A (0 under the Proposed Plan and 611,310 under Alternative A). The impacts of limiting the number of open-designated acres would be long-term direct and indirect, adverse *and* beneficial on recreation. Long-term, direct adverse effects would include the reduction in opportunities for OHV cross-country recreation-related travel. However, this loss would be offset by the 1,947 miles of trails proposed for OHV use in the Proposed Plan. The decrease in acres designated as “open” leads to fewer opportunities for OHV travel, as such these recreationists may reduce their visitation to the area. Reduction in OHV users could have an adverse impact on motorized-recreation-related outfitters and associated businesses.

Long-term beneficial impacts from reducing the amount of acres open for cross-country travel could be realized as a reduction in OHV-related disturbances to soil, water, and wildlife habitats

may improve long-term recreation opportunities for those who prefer non-motorized forms of recreation.

4.3.12.2.8. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

4.3.12.2.8.1. ACECs

Protecting the specific, identified relevance and importance values of ACECs limits activities that are considered incompatible with specific values and resources of concern. Specifically, mineral development and extraction would be limited as a result of ACEC designations. It is important to note the ACEC designation does not completely restrict development. Standard stipulations and controlled surface use are permitted in areas that do not compromise the values or resources of concern. Mineral development with NSO (i.e., directional drilling) is also permitted within ACECs. See Table 4.123 for total amount of acreage proposed per alternative.

Table 4.123. Proposed Total Acreage of Potential ACECs by Alternative and Percentage Difference Compared to Alternative A

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Acres	488,616	521,141	76,764	0	521,141	74,403
Percent	--	7%	-84%	--	7%	-85%

The designations of ACECs would have minor to substantial, negative impacts on minerals resource extraction and development across all alternatives and the Proposed Plan because they would exclude lands from minerals development and lower the number of locations where potential wells could be drilled. The lower number of locations could indirectly lead to a lower yield and commercial supply of oil and natural gas and fewer royalties paid to the federal government and/or the State of Utah. An approximate monetary impact would be difficult to estimate because desired future locations of development in proposed ACEC sites are unknown. However, the development area with the greatest number of wells projected to be drilled annually is the Blanding Sub-basin, with 3–13 wells drilled per year, according to the Monticello FO RFD. Therefore, if a proposed ACEC was within the Blanding Sub-basin there would be greater potential for adverse economic impacts to potential oil and gas developers and subsequently local and federal governments in comparison to the other development areas. The Paradox Fold is the development area with the second highest projected number of wells per year, with 1–6 wells. The Monument Upwarp is predicted to have 1–2 wells drilled per year, and consequently the smallest chance to be adversely impacted by the ACEC designation with respect to oil and gas development.

Under all alternatives and the Proposed Plan OHV use would be allowed in ACECs on designated routes, although the miles of Class D roads would vary slightly between alternatives (see Table 4.179). Allowing OHV access within ACEC designations may be beneficial in the long-term for socioeconomics because opportunities would remain available for recreational

access. Revenue generated in local communities by OHV users would be similar to current conditions.

Commercial-type travel (including motorized/mechanized recreational vehicle use) within the planning area would be allowed under Alternatives A, B, and E, but the impacts on travel would be negligible because no restrictions or prohibitions are specified under these alternatives.

Under Alternatives B, C and E and the Proposed Plan commercial-type motorized or mechanized tours and events would be seasonally prohibited (i.e., SRPs would not be issued) for routes within pronghorn, bighorn sheep, and elk crucial habitat and lambing and rutting areas; thus having minor short-term adverse impacts on travel. However, private motorized or mechanized use within ACECs would be allowed throughout the year and not subject to the seasonal commercial restrictions (see Section 4.3.16, Travel Management, for the proposed times when travel routes would be closed or limited to designated routes in order to protect these wildlife species). Under Alternative D there would be no private or commercial recreational travel restrictions through crucial wildlife habitat.

4.3.12.2.8.2. WSAs

The Monticello FO contains 13 WSAs totaling 386,027 acres (or approximately 21% of BLM lands). WSA designations would continue to apply across all alternatives and the Proposed Plan, including the No Action Alternative (Alternative A), and would be managed in a manner that does not impair their suitability for congressional designation (BLM 1991c). These designations are non-discretionary and, thus, are beyond the scope of this EIS's analysis.

4.3.12.2.8.3. WSR Designations

Alternatives A and D do not recommend WSR designations. Alternatives B and E recommends 92.4 BLM river miles be designated as WSRs including Segments #1–3 of the Colorado River, Indian Creek, Fable Valley, Dark Canyon, San Juan River Segments #1–5, and Arch Canyon. Alternative C recommends that 18.4 BLM river miles be designated as WSRs including Segments #2–3 of the Colorado River and Dark Canyon (see Section 4.3.14.4.3, WSRs – Alternative C). The Proposed Plan recommends 35 BLM river miles be designated as WSR including Segments 2 and 3 of the Colorado River, Dark Canyon and segment 5 of the San Juan River.

Management prescriptions for mineral activities in riparian and floodplains within WSR designations do not allow surface occupancy. Therefore, Alternatives B and E would adversely impact mineral resource extraction and development because they propose the greatest amount of river miles as WSR and lower number of locations where wells could be drilled. This lower number of locations could potentially lead to a lower yield of oil and natural gas and fewer royalties paid to the federal government and/or the State of Utah.

The designation of WSRs under Alternatives B, C, and E and the Proposed Plan could potentially lead to an increase in tourism revenue to the BLM and local communities, thus having a long-term, beneficial impact on the local economies. The designation of rivers and/or river segments could attract more people to the area who enjoy the type of recreation that often accompanies these designations (including high scenic qualities and opportunities for solitude). The increase in tourism based on river recreation could lead to increased revenue to local river running companies, increased permit revenue, and increase in tourist dollars spent within nearby

communities. The greatest potential for an increase in tourism-related revenue would occur under Alternatives B and E (same amount of river miles designated) and secondly under the Proposed Plan.

4.3.12.2.9. EFFECTS OF TRAVEL DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

Socioeconomic impacts from travel-related decisions would likely result from the recreational use of OHVs. Impacts resulting from the closure and designation of OHV routes are discussed in Section 4.3.12.2.7, Effects of Recreation Decisions on Social and Economic Conditions.

4.3.12.2.10. IMPACTS OF VISUAL RESOURCE DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

4.3.12.2.10.1. Alternatives A–E and the Proposed Plan

The demand for a range of recreation opportunities would not be limited as a result of VRM classifications, so impacts to socioeconomics from recreational visitation would be minor under all alternatives and the Proposed Plan. Opportunities for recreation with high levels of scenic quality (in VRM Class I and II designated areas) will remain throughout WSAs, ACECs, SRMAs, and along WSRs. See Section 4.3.12.2.7 for more details on recreation impacts to socioeconomics.

Under all alternatives and the Proposed Plan areas available for oil and gas leasing subject to standard or special stipulations would be managed under VRM Class III or IV objectives (depending on inventory), and areas that inventory as VRM Class II but are in areas open to leasing subject to standard or special stipulations would be managed under VRM Class III objectives, unless otherwise specified in the management prescriptions. Mineral activities in designated VRM Class I and II areas, if allowed, would be subject to at least NSO stipulations. It is difficult to accomplish oil and gas activities of any kind (directional or otherwise) under VRM Class I and II objectives. Table 4.124 illustrates the percentage and acres of land open to mineral development based on VRM classification.

Alternative D would have the least amount of lands under VRM Class I and II objectives, and thus the most acres open for oil and gas exploration and development. Beneficial impacts to socioeconomics would be greatest under this alternative because developers would have the greatest number of acres open to standard and special stipulation leasing and the greatest amount of revenue potential. Impacts to socioeconomics would be slightly less under Alternative C with 7.8% less land under VRM Class III and IV. This decrease could result in a decrease in potential revenue.

Table 4.124. VRM Class Acreages by Alternative

Class	Alternative A/ VRM Inventory	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
VRM I	371,575	497,668	425,179	390,424	998,370	422,989
VRM II	355,112	250,641	132,001	8,838	111,478	228,041
VRM III	416,806	426,350	531,920	692,741	264,369	507,583

Table 4.124. VRM Class Acreages by Alternative

Class	Alternative A/ VRM Inventory	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
VRM IV	637,875	608,463	693,995	691,119	407,459	623,002
Subtotal III and IV	1,054,681	1,034,813	1,225,915	1,383,860	671,828	1,130,585
Total*	1,781,368	1,783,122	1,783,095	1,783,122	1,781,676	1,781,615

Source: BLM 2007d.

*Acreage figures may vary by alternative due to the changes in GIS technology and variances in shapefiles.

Compared to Alternative D, revenues from oil and gas development could be adversely impacted, as 17.4% fewer land-would be open to leasing in designated VRM Class III and IV areas. Economic impacts from Alternatives B would be similar to Alternative A because there is only a 1.2% decrease in VRM Class III and IV areas under Alternative B.

When compared to Alternative A, Alternative E places the greatest restrictions on development to protect VRM with a 21% decrease in VRM Class III and IV lands. As discussed earlier, the restrictions to protect visual resources are decisions within other resources that can impact visual quality. Restrictions under this alternative to protect scenic qualities include restrictions on vegetative treatments and fuels management, travel management, minerals and energy, lands and realty, and recreation. The restrictions on development under VRM Classes I and II under this alternative have the greatest potential to restrict economic opportunities for those whose livelihood depends all or in part on the restricted activities. This would be particularly true in the case of minerals development and motorized recreation. Conversely, the scenic qualities of the planning area that attract visitation would receive the greatest degree of protection under Alternative E. This could positively impact those businesses that rely on that type of recreation visitation, including lodging, restaurants, and outfitting.

The exact number of oil and gas activities that would be restricted as a result of VRM Class I and II designation is difficult to speculate given that future proposed well locations are unknown at this time. Impacts to oil and gas development would occur in locations where drilling would have occurred absent the VRM restrictions. To the extent that VRM precludes development, there would be an adverse economic impact. Because such a large number of acres are open to development (over one million under Alternatives A–D and 671,828 under Alternative E) and the relatively small number of wells proposed over the next fifteen years (75 wells maximum), restrictions on economic opportunities would be minor to moderate depending on desired well locations.

4.3.12.2.11. IMPACTS OF WOODLANDS DECISIONS ON SOCIAL AND ECONOMIC CONDITIONS

4.3.12.2.11.1. Alternative A

In 2006 the Monticello FO issued 556 wood gathering permits. Approximately 80%–90% of the permits issued in a given year are to Navajos who live on the Navajo Reservation. The high percentage of Native American permittees is due to the fact that many use the wood for

subsistence living. The wood is used for heating their homes and other domestic needs. The Navajos harvest wood on BLM lands because wood gathering is not permitted on the reservation.

Management decisions under Alternative A would allow commercial and private woodland products harvesting within the entire planning area, except for 386,027 acres within WSAs, developed recreation areas, and other areas designated as excluded from harvesting. Accordingly, approximately 1,309,894 acres (73% of the PA) would be open to woodland harvest and the remaining 27% would be closed because of WSA-protection constraints under the IMP. There would be few restrictions on harvesting woodland resources under this alternative.

Wood gathering on Cedar Mesa would continue under the No Action Alternative. Current conditions on Cedar Mesa illustrate the damage that unpermitted wood gathering has caused in the area. Cross-travel has the potential to damage to cultural sites and impair the WSA. Under this alternative damage to the area would likely continue.

Identified as a tribal trust issue in the RMP scoping process, cottonwood and willow harvesting in riparian areas for ceremonial purposes would be allowed under all alternatives and the Proposed Plan.

4.3.12.2.11.2. Alternative B

Alternative B would allow commercial and private woodland products harvesting (with permitted off-road travel to collect wood) on a total of 730,074 acres within designated woodlands harvesting zones. This would permit woodland harvesting on approximately 41% of the planning area, with 59% of the planning area (1,055,053 acres) closed to woodland harvesting for products use. The closure of 38% more of the PA, compared to Alternative A, could have moderate social and economic impacts on the groups that depend on wood gathering in area for subsistence.

Under this alternative permitted harvesting of woodlands on a substantial portion of the planning area would be required. Restrictions on cross-country OHV use to gather wood could potential minor adverse impacts on the groups who use the vehicles gather wood in the planning area.

Cedar Mesa would be closed to wood gathering under this alternative. Impacts to individuals who gather wood in this area would be adverse because current harvesting practices in the area would cease. Private and commercial harvesting would be accessible on Montezuma Ridge, approximately 40 miles away from Cedar Mesa. This would likely result in an economic hardship for individuals who gather wood in this area because traveling to an area 40 miles away would be costly (in terms of gas for vehicle and vehicle maintenance) for a population that is highly impoverished.

4.3.12.2.11.3. Alternatives C and D

Under Alternatives C and D there would be fewer number of acres (841,938) potentially available for woodland harvesting compared to Alternative A (47% of the planning area compared to 73% under Alternative A).

Restrictions on cross-country OHV use to gather wood could have potential minor, adverse impacts on the groups who use the vehicles to gather wood in the planning area. Under

Alternatives C and D 2,311 acres would be designated as open to cross-country travel (0.1% of the planning area). The remaining acres open to OHV use would be designated as limited to existing roads.

Cedar Mesa would remain open to woodland harvesting under these alternatives. Thus, groups who use this area to gather wood for subsistence living would be able to continue to do so with restrictions on cross-country travel.

4.3.12.2.11.4. Alternative E

Under Alternative E, the impacts to socioeconomics from woodland resources would be similar to the impacts discussed under Alternative B because the management actions would be similar. However, under Alternative E 31% (548,477 acres) of the Monticello PA would be open for woodland harvesting versus 41% (730,074 acres) under Alternative B. Under Alternative E, approximately 582,357 acres of non-WSA lands with wilderness characteristics within the planning area would be protected from surface disturbances, including disturbances caused by woodland harvesting.

Because Alternative E closes the greatest amount of acreage to woodland harvest, long-term, adverse impacts to private and commercial woodland harvesting individuals and groups would be greatest. Cross-country OHV restrictions would be greatest under Alternative E, with 580,772 acres closed. Current harvesting practices would no longer be permitted on Cedar Mesa. While the resource would still be available under Alternative E, permittees would have to modify collection practices and travel longer distances to obtain wood.

4.3.12.2.11.5. Proposed Plan

Under the Proposed Plan, 837,939 acres would be open to woodland harvesting (encompassing approximately 47% of the Monticello PA). Under this alternative, approximately 4,000 acres of woodlands would be unavailable for private and commercial harvesting within non-WSA lands with wilderness characteristics. Approximately 53% of the PA (947,188 acres) would be closed to woodland harvesting. Opportunities for wood collection would be similar to Alternatives C and D.

Restrictions on cross-country OHV use to gather wood could have potential minor, adverse impacts on the groups who use the vehicles to gather wood in the planning area. Under the Proposed Plan zero acres would be designated as open to cross-country travel. The remaining acres open to OHV use would be designated as limited to existing roads.

Cedar Mesa, excluding WSA lands, would remain open to woodland harvesting under the Proposed Plan. Thus, groups who use this area to gather wood for subsistence living would be able to continue to do so with restrictions on cross-country travel.

4.3.12.3. SUMMARY OF IMPACTS

Overall, the local socioeconomic conditions would not experience substantial adverse impacts from BLM resource management decisions under Alternatives A–D or the Proposed Plan. With significantly more acres closed to surface-disturbing activities under Alternative E, the potential for revenue generating activities, such as mineral development or OHV use, would likely result in decreases in contributions to the local economy. However, tourism-based revenue from

individuals who prefer hiking, backpacking, and sight-seeing in a wilderness-like setting would potentially be greater under Alternative E. Many management decisions for resources such as air quality, fire management, health and safety, lands and realty, paleontology, soils and watersheds, special status species, and woodlands would have minor impacts on social and economic conditions. Resource management decisions for cultural resources, livestock grazing, minerals, non-WSA land with wilderness characteristics, recreation, special designations, travel, and visual resource management would have greater impact than those listed above. Population, employment, and local revenue would remain relatively unchanged with the implementation of Alternatives A–D or the Proposed Plan and may decrease slightly under Alternative E. The influence of proposed resource management decisions would not contribute to a substantial change in the economic diversity of San Juan County. See Table 2.2 for a full summary of the impacts to socioeconomic conditions.

4.3.12.4. MITIGATION MEASURES

No mitigation measures have been identified for impacts to social, economic, and environmental justice conditions.

4.3.12.5. UNAVOIDABLE ADVERSE IMPACTS

No unavoidable adverse impacts to social, economic, and environmental justice conditions resulting from resource management decisions were identified.

4.3.12.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Short-term use of resources in the planning area would have negligible impacts on the long-term social and economic health and stability in San Juan County.

4.3.12.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

There are no irreversible and irretrievable impacts to social, economic, and environmental justice conditions.

4.3.13. SOILS AND WATER RESOURCES

This section discusses impacts to soils and water resources from management actions and resource uses discussed in Chapter 2. The existing conditions of soils and water resources are described in Chapter 3.

The Proposed Plan and all of the alternatives would impact soil and water resources within the Monticello PA, because all include actions that would result in surface disturbance of some kind. Surface disturbance would impact soils and water resources to varying degrees, depending on the amount, location, and type of surface disturbance; the soil type; the time of year; and the surface hydrology. Surface-disturbing activities that currently occur and that are expected to continue include grazing, oil and gas and mineral exploration and development and associated access routes, recreation and off-highway vehicle (OHV) use, and woodland harvest and other forms of vegetation removal and treatments.

For the purposes of this broad scale analysis, the primary indicator of impacts to soils and water resources is the amount of surface disturbance caused by management decisions made for other resources, particularly surface disturbance that occurs in highly erodible, reclamation-limited, or other sensitive soils. Another important indicator of impacts to water resources is a decrease in water quality conditions in perennial streams, including levels of suspended sediments, sediment bedload, dissolved solids, nutrient loads, bacteria counts, and water temperatures. Once these parameters exceed the state water quality standards at a site, the perennial stream is listed on the 303d list, which is the final indicator of poor water quality conditions. The soil limitations with the highest potential to impact soils and water resources are wind erodibility, water erodibility, and shallow root depth. All factors were analyzed and varying degrees of risk were evaluated with regards to these limitations.

All soils in the Monticello PA are susceptible to accelerated erosion, but sensitive soils are more susceptible to impacts. Surface-disturbing activities could result in any of the following impacts under the Proposed Plan or any alternative: increased soil erosion and sedimentation, decreased soil productivity, changes to quantity and quality (e.g., salinity) of surface water and groundwater, loss of vegetation or prevention of revegetation, or introduction of noxious weeds and the attendant increases in water use (e.g., tamarisk uses large quantities of groundwater), and/or changes in soil chemistry and productivity. Analyses of impacts to soil and water resources in this section are based upon the factors contributing to site degradation and their inherent risks (Table 4.125), according to SSURGO soils mapping for the Monticello PA.

Some sites are at risk of degradation because surface layer wind and/or water erodibility factors are high. Kw refers to the relative ease of water erosion. The slope factor accounts for the tendency of steeper slopes to erode more easily. The wind erodibility group refers to the relative ease of wind transport of surface materials.

Other sites are at risk of degradation due to reclamation-limiting factors (i.e., factors that prevent soils from being fully reclaimed following surface disturbance). See Table 4.125 for a list of these factors. In reclamation-limited soils, one or more factors make site reclamation difficult in semi-arid environments, including alkalinity, droughty soils, soil rooting depth, salinity, available water capacity, and sodium adsorption. Available water capacity refers to the amount of water available for plant uptake. Salinity refers to the amount of salt within soils that can be dissolved in surface waters. The sodium adsorption ratio refers to the amount of sodium that can

be held by the soils and influence nutrient uptake. Rooting depth refers to the depth of soil, which influences how far plant roots can grow. Finally, alkalinity refers to soil pH, which generally limits plants' ability to establish when it is higher (i.e., more basic).

An important soil component often affected by surface disturbance is the biological soil crust, comprised of cyanobacteria, lichens and mosses. These crusts help to stabilize soils, reducing erosion and increasing soil productivity. Biological soil crusts have not been mapped and occur in a portion of the soils within the Monticello PA.

Table 4.125. Factors Contributing to Site Degradation and Their Inherent Risks*

Factors	High Risk	Moderate Risk	Low Risk	Restrictive Feature
Erodibility				
Kw Factor (surface layer) and Slope (sl) ¹	K ≥ .37, sl ≥ 10%; or K = .20-.36, sl > 30%	K = .20-.36, sl 10-30%; or K < .20, sl > 30%	K < .20, sl 10-30%; or sl < 10%	Water erosion hazard
Wind Erodibility Group (surface layer)	1, 2	3, 4, 4L	5-8	Wind erosion hazard
Limits on Reclamation				
Available Water Capacity (average to 40 inches; in/in) ²	< 0.05	0.05-0.10	0.10 <	Droughty soils
Salinity ³ (mmhos/cm; surface layer)	16 <	8-16	< 8	Excess salt
Sodium Adsorption Ratio ⁴ (surface layer)	13 <	4-13	< 4	Excess sodium
Depth to Bedrock or Hardpan (inches)	< 10	10-20	20 <	Rooting depth
Alkalinity (pH of surface layer)	9.0 ≤	7.8-8.9	< 7.8	Excess alkalinity

* Draft parameters developed by the BLM's National Science and Technology Center, SSURGO soils mapping.

¹ K Factor of surface layer adjusted for the effect of rock fragments. Slope is the maximum value for the range of slope of a soil component within a map unit.

² Maximum value for the range of available water capacity for the soil layer; inches of water per inches of soil.

³ Maximum value for the range in soil salinity.

⁴ Maximum value for the range in sodium adsorption ratio.

Throughout this analysis, highly erodible soils, reclamation-limited soils, and biological soil crusts are collectively referred to as sensitive soils. Biological soil crusts are discussed only qualitatively and are not included in the tables. However, any of the other soil parameters may overlap in any area, and so acreages presented in this analysis are not additive. For example, a particular acreage may have soils with shallow rooting depth as well as high wind erodibility. Acreages are also only approximate, due to limitations in soil mapping techniques and the planning area-wide scale of analysis.

Decisions regarding the management of resources other than soil and water in the Monticello PA may affect soil and water resources either directly or indirectly. Those impacts may be beneficial or adverse, and are described below. Management decisions regarding air quality, lands and realty, paleontology, socioeconomics, or wildlife resources would result in negligible impacts to soils and water resources. The impacts would be negligible because protecting air quality,

making lands and realty decisions, allowing recreational fossil collection and scientific study of fossils, improving the local and regional economy, and maintaining habitat for non-listed wildlife species would not have surface-disturbance impacts on sensitive soils and soil crusts. Therefore, impacts from these management decisions were not analyzed.

4.3.13.1. ASSUMPTIONS

For the purposes of this programmatic-level analysis, the acreages disclosed in Table 4.126 to 4.130 are assumed to be evenly distributed across the smallest nominal geographic area represented in each table. The limitations of this type of broad-scale analysis are best seen in cases when surface disturbance is concentrated in areas that are highly sensitive. Site-specific National Environmental Policy Act (NEPA) analysis of impacts to soils and water resources would be required before individual project implementation for projects proposed in sensitive soils. Refer to Table 4.125 for factors that determine inherent risk of site degradation. Areas where surface disturbance would occur in critical watersheds, priority sub-basins, 100-year floodplains, within 100 m of a natural spring, and public water reserves would need to be analyzed on a site-specific basis.

The analysis of cultural resource decisions on soils and water resources was based upon acreage of watershed treatment allowed or not allowed due to the presence or absence of cultural resources. Watershed treatments would generally provide long-term beneficial impacts to soils and water resources. Restrictions on dogs and human waste disposal associated with cultural resource decisions were also considered, where dogs and human waste would adversely impact soils and water resources. The analysis of the impacts of fire management decisions on soils and water resources was based upon the acres of treatment by soil type. Due to the lack of specific areas designated for treatment each year under the PRMP/FEIS, the actual acreage of treatment in areas with soil limitations is difficult to quantify; therefore, a qualitative assessment of long-term impacts was made. Individual fire management projects will be analyzed at the implementation level with site-specific NEPA.

Under all alternatives and the Proposed Plan, all BLM-administered lands in the Monticello PA would be placed in one of the following oil and gas leasing stipulations categories developed in the RMP: standard lease terms (SLT), timing limitations (TL), controlled surface use (CSU), no surface occupancy (NSO), and unavailable for oil and gas leasing. Impacts related to these categories and conditions would depend upon surface disturbance in areas with soil limitations. Generally, where areas are closed to disposal of mineral materials or NSO, there would be no surface disturbance and thus negligible or no adverse impacts to soils and water resources. Areas open to mineral use under standard lease terms or timing limitations would potentially have short-term adverse impacts to soils and water resources where surface disturbance would occur in limited soils. However, under all alternatives, the relative amount of potential mineral-related soil disturbance and groundwater withdrawal in the planning area is minimal and, consequently, would likely have negligible impacts to soils and water resources. Refer to Tables 4.1 – 4.3 for the estimated acreages of surface disturbance related to mineral development.

All alternatives would be subject to limits on surface disturbance related to paleontological resources. Recreational collectors may collect and retain reasonable amounts of common invertebrate and plant fossils for personal, non-commercial use. Surface disturbance must be negligible, and mechanized tools may not be used; therefore, the adverse impacts to soils and water resources from paleontological management decisions would be negligible.

Analysis of impacts of vegetation treatments was based upon total acres of treatment and a qualitative assessment of how that treatment would impact watershed condition. Total acres of treatment by water and/or wind erodibility risk and reclamation potential are included. Direct impacts to soils and water resources in critical watersheds, priority sub-basins, 100-year floodplains, or within 100 m of a spring would require finer scale watershed hydrology data. Qualitative analysis of soils and watershed resource impacts was completed where these resources would be impacted.

4.3.13.2. IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

4.3.13.2.1. IMPACTS FROM SOILS AND WATER DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

The BLM would manage soils and water resources to maintain watershed health and provide favorable conditions for water flow and maintain stable and efficient stream channels as required to provide for fish and wildlife habitat, recreation, and livestock use. All floodplains and riparian/wetlands would be managed in accordance with Executive Orders 11988 and 11990, sections 303 and 404 of the Clean Water Act, and the Endangered Species Act. Maintenance of satisfactory watershed conditions would be required as indicated by maintenance of riparian proper functioning condition (PFC) and Utah's Rangeland Health Standards and Guidelines for Grazing and Recreation. Impacts Common to All Alternatives for riparian PFC were analyzed in Section 4.3.11.1, Riparian Resources. These management decisions would result in beneficial impacts to soils and water resources by protecting and restoring watershed health, healthy soils and good water quality conditions.

Surface-disturbing activities that are currently occurring and are expected to continue include grazing, oil and gas exploration, development and production, recreation and OHV use, and woodland harvest/vegetation removal. As a result of surface-disturbing activities in areas having soils prone to wind erosion, water erosion, or with limitations on reclamation, impacts common to all alternatives include soil erosion, sedimentation, and impacts to surface and ground water quantity and quality. Surface disturbance can result in loss of vegetation or prevention of revegetation, increased soil erosion and sedimentation, and increased salinity in surface waters. Erosion control practices for slopes greater than 20% would be the same for all alternatives, as per Utah's Non-Point Source Management Plan (UDEQ 2000b). Careful planning of development to minimize impacts to soil and water is important in protecting water quality and soil productivity. Part of this planning includes compliance with the Utah BLM Standards for Rangeland Health (Appendix D). All alternatives must adhere to Rangeland Health Standards 1 and 4:

- Upland soils [must] exhibit permeability and infiltration rates that sustain or improve site productivity, considering the soil type, climate, and landform.
- BLM will apply and comply with water quality standards established by the State of Utah (R317.2) and the federal clean water and safe drinking water acts. Activities on BLM lands will fully support the designated beneficial uses described in the Utah Water Quality Standards (R317.2) for surface and groundwater.

Surface-disturbing actions would require site-specific NEPA analysis. Actions that would not comply with standards 1 and 4 in the short-term would require mitigation in the form of

reclamation and rehabilitation. This mitigation would reduce accelerated erosion; ensure water quality, soil productivity, and sustainability; and would result in a relative beneficial impact to soil and water resources.

The BLM would manage public lands consistent with the Colorado River Salinity Control Act, comply with Utah's state water quality standards, and collaborate with San Juan County and local municipalities on management of municipal watersheds to meet local needs. Maintenance or improvement of soil quality and long-term soil productivity would be achieved through the implementation of Standards for Rangeland Health and other soil protection measures. Uses would be managed to minimize and mitigate damage to soils. Modification of BMPs and vegetation would be managed to meet water quality standards and maintain watershed function in Montezuma Creek, Indian Creek (Forest Service boundary to Newspaper Rock), Johnson Creek (and tributaries from confluence with Recapture Creek to headwaters), and Recapture Reservoir to achieve water quality standards and watershed function. Watershed function would be assessed using Utah's Rangeland Health Standards, riparian PFC, and state water quality standards. These actions would result in the maintenance and restoration of overall watershed health, including reduction of erosion, stream sedimentation, and salinization of water.

Any surface-disturbing activity located in reclamation-limited soils (shown as high-risk in Table 4.125) will be subject to site-specific NEPA analysis and will incorporate mitigating measures to minimize accelerated soil erosion and improve soil stability.

4.3.13.2.2. IMPACTS OF FIRE MANAGEMENT DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Fire management under all alternatives would follow the guidelines in Utah Land-use plan Amendment for Fire and Fuels Management (LUP Amendment), and is incorporated by reference into the PRMP/FEIS (BLM 2005g). The document can be found at www.ut.blm.gov/fireplanning/index.htm. The impacts of fire management on soil and water resources would be adverse in the short-term due to increased sedimentation and increased runoff from areas where vegetation is removed from prescribed burns or other fuel reduction treatments. Long-term beneficial impacts would occur under all alternatives due to the potential reduction of fire severity and impacts, as well as improving the ability to control fire in and around treated areas. Please refer to the environmental assessment of the LUP Amendment (BLM 2005g) for analysis of impacts to soils and water resources related to plan implementation.

Under all alternatives, estimated fuels reduction treatments of 5,000 to 10,000 acres per year would be targeted subject to budgetary constraints. Fuels reduction treatments would be designed to limit potential short-term adverse impacts to areas with soil limitations and limit changes in surface hydrology under all alternatives. The return of a more natural fire return interval would result in long-term beneficial impacts to soils and water resources through reduced fire severity, which would lower the potential for long-term loss of vegetative cover and resulting stream sedimentation and changes in surface hydrology due to increased runoff. The actual location of treatment areas will be determined based on need and individual treatments will be analyzed with site-specific NEPA.

4.3.13.2.3. IMPACTS OF HEALTH AND SAFETY DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

The management of hazardous materials under all alternatives would affect soils and water resources in the short-term, where Abandoned Mine Lands (AMLs) are rehabilitated. Water-quality-based AML program priority watersheds have been identified by the state based on (a) one or more water laws or regulations; (b) threat to public health or safety; and (c) threat to the environment. The rehabilitation of watersheds impacted by AMLs would result in long-term beneficial impacts on soils and water resources by reducing the detrimental impacts of AML water drainage. The impacts of these decisions would be the same under all alternatives; therefore, no impacts analysis was completed by alternative.

4.3.13.2.4. IMPACTS OF RECREATION DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Managing recreation to meet Utah's Rangeland Health Standards would ensure that standards for rangeland health are met within the recreation program, thereby beneficially impacting soil productivity. Limiting or controlling activities through specialized management tools, where long-term damage to soils or water resources by recreational uses is observed or anticipated, would reduce the area of existing long-term impacts to soils and water resources in the Monticello PA. Long-term impacts would also be reduced through revisions to recreation management plans and management framework plans when they prove to be inadequate to maintain public land health.

OHV access for game retrieval would follow all area and route designations. (There would be no off-road retrieval). The public would be notified of these restrictions in the Federal Register. These limits on OHVs would reduce long-term adverse impacts that would otherwise result from motorized recreation.

Under the Proposed Plan and all alternatives, dispersed camping, while allowed where not specifically restricted, may be closed seasonally or as impacts or environmental conditions warrant. The BLM would emphasize "Leave No Trace" camping and travel techniques throughout the Monticello PA. BLM would consider and, where appropriate, implement management methods to protect soils and water resources.

4.3.13.2.5. IMPACTS OF WILDLIFE AND FISHERIES DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Wildlife and fisheries decisions under the Proposed Plan and all of the alternatives would prioritize the maintenance and/or improvement of lowland riparian, wetlands, and low and high desert scrub communities, which are the four most important and used habitat types by migratory birds in the Monticello PA. It is likely that the maintenance and/or improvement of these habitats would have indirect benefits to soils and water resources by ensuring the ecological functions of these systems. Beneficial impacts to soils and water resources due to wildlife and fisheries management would correspond to improvement of vegetative conditions and was evaluated in Sections 4.3.17, Vegetation Resources, and 4.3.11, Riparian Resources.

4.3.13.2.6. IMPACTS OF WOODLANDS DECISIONS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Floodplains and riparian/aquatic areas would be excluded from woodland product use except for limited on-site collection of driftwood for campfires, and uses for Native American ceremonial purposes as determined on site-specific basis. Cottonwood and willow harvest would be allowed in areas with proper functioning condition for Native American ceremonial uses only, which would minimize potential adverse increases in surface water temperature due to loss of vegetation cover immediately adjacent to streams. Harvest would be administered under a permit system, where restrictions on harvest would be implemented as necessary to achieve or maintain PFC, and maintain or improve Threatened or Endangered Species/Special Status Species (TES/SSS) habitat. These actions would limit adverse impacts to soils and water resources resulting from vegetation disturbance in riparian areas.

4.3.13.3. ALTERNATIVES IMPACTS

4.3.13.3.1. IMPACTS OF CULTURAL RESOURCE DECISIONS ON SOILS AND WATER

4.3.13.3.1.1. Alternative A

Management actions under Alternative A would not designate any CSMA's. This alternative would not place limitations on watershed treatments, so soils may be subject to surface-disturbing treatments but would not experience the potential long-term beneficial impacts of those treatments. The disposal of human and pet waste would not be controlled within any CSMA's under Alternative A. Potential impacts including e-coli contamination of water and small amounts of soil disturbance with subsequent sedimentation would continue to occur. Cultural resource management under Alternative A would not limit vegetative treatments, so some soils would be subject to surface-disturbing treatments. Long-term adverse impacts from cultural resource decisions would be partially mitigated by the closure of the Grand Gulch Special Emphasis Area and Grand Gulch National Historic District to surface-disturbing activities.

4.3.13.3.1.2. Alternative B

Cultural Resource decision impacts on soil and water resources would be identical to those under Alternative A with the following exceptions:

- 1) Alternative B would designate Comb Ridge (38,012 acres) and Tank Bench (2,600 acres) as CSMA's, and has prescriptions for Grand Gulch National Historic District (37,400 acres). These designations/prescriptions would prohibit surface-disturbing vegetation treatments in these areas. This would prevent potential short-term increases in erosion and subsequent potential for sedimentation in perennial watercourses. However, these limitations would also result in some potential long-term increases in erosion and/or sedimentation in areas where the restrictions prevent effective fuels management or post-fire rehabilitation. Limits on vegetative treatment would also reduce long-term improvement of soil productivity and stability that can result from vegetation management.
- 2) In the Comb Ridge, Tank Bench, Beef Basin (20,300 acres), McLoyd Canyon-Moon House (1,600 acres) CSMA's, and Grand Gulch NHD, human waste would be packed out, thus reducing the potential adverse impacts to soils and water resources from e-coli

contamination. McLoyd Canyon-Moon House CSMA and Grand Gulch NHD would not allow pack animals or pets, further limiting adverse impacts to soils and water resources from streambank trampling and animal waste.

In summary, Alternative B would place limits on watershed treatments within 40,700 acres. These limits on watershed treatments would reduce the potential for increased erosion and sedimentation in the short-term, but would also prevent potential long-term benefits to watershed health in comparison with Alternative A. However, human waste, pets, and livestock would be managed with greater restrictions in CSMA's under Alternative B than under any other alternative, resulting in the lowest level of adverse impacts to soils and water resources from these sources.

4.3.13.3.1.3. Alternative C

Alternative C would allow surface-disturbing land treatments in Comb Ridge, Tank Bench, Beef Basin, and Grand Gulch (non-motorized only) (refer to Section 4.3.17, Vegetation Resources). This would have short- and long-term impacts identical to those described under Alternative A. Additionally, under Alternative C, groups larger than 20 would be required to pack out human waste in the Beef Basin CSMA. All human waste would be required to be packed out of the McLoyd Canyon-Moon House CSMA. Qualitative analysis of impacts related to these limits was discussed under Alternative A. These limits would generally reduce adverse impacts to soils and water resources, as compared to Alternative A.

Overall, Alternative C would limit the beneficial impacts of watershed treatments less than Alternative A. Human waste disposal and group size would be controlled more than under Alternative A, with corresponding benefits to soils and water resources.

4.3.13.3.1.4. Alternative D

Alternative D proposes to manage McLoyd Canyon-Moon House (1,607 acres) as a CSMA, where visitors would be required to pack out human waste resulting in lower adverse impacts to water resources in this area than under Alternative A. Grand Gulch National Historic District (37,388 acres) would be managed with the same prescriptions as under Alternative C. Comb Ridge, Tank Bench, and Beef Basin would not be managed as CSMA's, and would therefore be at greater risk of adverse impacts to soil and water resources due to improper human waste disposal.

Overall, Alternative D would provide the fewest beneficial impacts to soils and water resources due to cultural resources decisions, as compared to the other action alternatives. Alternative D would provide more protection of soils and water resources than Alternative A, which would not designate any CSMA's.

4.3.13.3.1.5. Alternative E

Cultural resource decision impacts on soil and water resources would be identical to Alternative B, except that Alternative E would close the Comb Ridge CSMA (38,012 acres) and Beef Basin CSMA (20,300 acres) to oil and gas leasing, surface-disturbing vegetation treatments, and cross-country OHV use. These prescriptions would provide greater protection for soils and water resources than any other alternative.

4.3.13.3.1.6. Proposed Plan

Cultural resource decision impacts on soil and water resources under the Proposed Plan would be the same as those described under Alternative C except that Comb Ridge would become a recreation management zone within the Cedar Mesa SRMA, Tank Bench CSMA would become Tank Bench SRMA, Beef Basin CSMA would become Beef Basin SRMA, and McLoyd Canyon-Moon House (1,607 acres) would become a recreation management zone.

4.3.13.3.2. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON SOILS AND WATER

Livestock grazing management decisions would affect soils and water resources when AUMs for livestock and/or wildlife are adjusted in response to evidence from monitoring that water quality or soil degradation is imminent or occurring. Depending on season of use and duration, reducing AUMs could have a short-term, direct, and potentially beneficial impact, as it could increase the area of ground cover left after the grazing season. Changes in ground cover, including biological soil crusts, would have direct, long-term impacts to water quality and soil productivity.

With respect to livestock grazing, the alternatives vary between areas proposed as unavailable for livestock grazing. Impacts on vegetation (and subsequently, on water and soils) vary depending on the season of use in relation to vegetation growing seasons. For example, proper grazing in areas with the potential for periods of high runoff (generally due to spring runoff and late summer thunderstorms) would reduce or minimize the adverse impacts of these events: banks that retain their vegetation (due to properly managed livestock grazing) would likely be protected from erosion caused by high flows.

4.3.13.3.2.1. Alternative A

Livestock grazing would be monitored for compliance with all rangeland standards (Appendix D). Where monitoring shows site degradation, adaptive management of livestock use through changes in seasons of use and closure of areas not meeting rangeland standards would reduce adverse impacts to soils and water resources.

Alternative A would have long-term indirect beneficial impacts to soil and water resources in the Comb Wash side canyons (Mule Canyon below U-95, Arch, Fish, Owl, and Road). These areas would continue to be unavailable for livestock grazing and this rest from grazing would allow maintenance and/or improvement of vegetation subsequently restoring soil productivity. The impacts of livestock grazing on soil and water resources on other allotments within the Monticello PA would continue to be managed in accordance with Utah Rangeland Health Standards. The areas unavailable for livestock grazing under Alternative A would protect approximately 3,000 acres of wind erodible soil, 5,600 acres of water erodible soils, and 14,600 acres of soil with poor reclamation potential from adverse impacts due to grazing. Livestock grazing would continue to occur on approximately 94,500 acres of wind erodible soils, 16,300 acres of water erodible soils, and 328,700 acres of soil with poor reclamation potential. Refer to Table 4.126 for comparison with other alternatives.

Table 4.126. Livestock Grazing in Soils with Limitations

Alternative(s)	Limitation	Open	Unavailable
Alternative A	Wind	94,500	3,000
	Water	16,300	5,600
	Reclamation Limited	328,700	14,600
Alternatives B and E	Wind	94,200	3,300
	Water	16,300	5,600
	Reclamation Limited	326,000	17,300
Alternative C and the Proposed Plan	Wind	94,200	3,300
	Water	16,300	5,600
	Reclamation Limited	326,000	17,300
Alternative D	Wind	94,500	3,000
	Water	16,300	5,600
	Reclamation Limited	328,500	14,800

4.3.13.3.2.2. Alternative B

Under Alternative B, the BLM would develop seasonal restrictions, closures, and/or forage utilization limits on grazing in all riparian areas and especially those Functioning at Risk. These actions and closures of areas to grazing would reduce adverse impacts to soils and water resources similarly to Alternative A. The total area with limited soils open to livestock grazing under Alternative B would be very slightly less than under Alternative A. Refer to Table 4.126 for comparison of alternative impacts. For a qualitative description of the impacts of removal of grazing from riparian areas, see Section 4.3.11.2.2, Impacts of Livestock Grazing Decisions on Riparian Resources, for Alternative A.

4.3.13.3.2.3. Alternative C

Alternative C would have the same closure areas and management of livestock grazing, and therefore the same impacts, as Alternative B. The one exception would be Mule Canyon, only part of which would be made unavailable for grazing under Alternative C. Therefore, Alternative C would have very slightly more impacts on soils and watersheds than Alternatives B and A. However, the acreage of limited soils open to livestock grazing is nearly identical under all alternatives.

4.3.13.3.2.4. Alternative D

Alternative D would make the same areas unavailable to grazing as Alternative B, with the exception of the Horsehead Canyon within the Montezuma Canyon allotment, Dodge Canyon allotment, and Mule Canyon allotment north of U-95, all of which would be open to livestock grazing under Alternative D. There would be no seasonal restrictions, closures, and/or forage utilization limits on grazing in riparian areas classified as Functioning at Risk, so fewer reductions in adverse impacts would occur as compared to Alternative B. This alternative would

have very similar impacts to sensitive soils as would occur under Alternative A (see Table 4.126).

4.3.13.3.2.5. Alternative E

Under Alternative E, the total area with limited soils open and unavailable for livestock grazing would be the same as under Alternative B, with the same impacts to soils and water resources.

4.3.13.3.2.6. Proposed Plan

Under the Proposed Plan, the total area with limited soils open and unavailable for livestock grazing would be the same as under Alternative C, with the same impacts to soils and water resources.

4.3.13.3.3. IMPACTS OF MINERAL DECISIONS ON SOILS AND WATER

Impacts related to mineral development would occur where sensitive soils were impacted through surface disturbance. These impacts include loss of vegetative cover and associated accelerated soil erosion, sedimentation of surface waters, and a loss of soil productivity.

4.3.13.3.3.1. Alternative A

Refer to Table 4.127 below for a comparison of limited soil acreage open and closed under Alternative A and the action alternatives. Alternative A would result in more adverse impacts to soils and water resources as compared to the Proposed Plan and the action alternatives, which have fewer acres of limited soils open to mineral development. A total of 77,600 acres of wind erodible; 15,000 acres of water erodible; and 217,300 acres of reclamation-limited soils would be open to surface-disturbing mineral leasing under Alternative A. A total of 23,500 acres of wind erodible; 12,800 acres of water erodible; and 85,000 acres of reclamation limited soils would be closed to surface-disturbing mineral leasing. It should be noted that Table 4.127 indicates areas open for surface-disturbing leasing; it does describe the actual predicted disturbance from mineral development.

Geophysical exploration would also be allowed under Alternative A, and would potentially adversely impact soils and water resources in areas with limited soils in the short term. Table 4.128 outlines estimated potential surface disturbance due to oil and gas leasing and geophysical exploration over the next 15 years (15 years). This surface disturbance would have potential long-term adverse impacts on soils and water resources where disturbance occurs in sensitive soils. Under Alternative A, the total potential surface disturbance due to oil and gas leasing and geophysical exploration would be 665, 189, and 731 acres in the Blanding Sub-basin, Monument Upwarp, and Paradox Fold and Fault Belt respectively. These acreages would represent less than 1% of the total Monticello PA and disturbance would impact a very small percentage of the limited soils open to surface disturbance (see Table 4.127).

4.3.13.3.3.2. Alternative B

Under Alternative B, the following acreages of sensitive soils would be open for mineral leasing: 74,000 acres of highly wind erodible soils; 15,100 acres of highly water erodible soils; 276,930 acres of reclamation sensitive soils. This would be approximately 3,600 less wind erodible; 100 more water erodible; and 59,630 less reclamation sensitive acres open to mineral leasing than

under Alternative A. A total of 3,300 more wind erodible; 200 less water erodible; and 37,500 less reclamation sensitive soils would be closed, as compared to Alternative A (see Table 4.127). The total estimated surface disturbance from oil and gas development and exploration would be lower under Alternative B (1,430 acres) than under Alternative A (1,585 acres), as shown in Table 4.128. An additional 851 acres of surface disturbance would occur over 15 years under Alternative B due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres). This disturbance would occur under the Proposed Plan and all of the action alternatives, but is not expected under Alternative A (No Action).

Table 4.127. Acreage of Limited Soils Open and Closed to Surface-disturbing Mineral Leasing by Alternative

		Alternative A			Alternative B			Alternative C		
		Wind	Water	Reclamation Limited	Wind	Water	Reclamation Limited	Wind	Water	Reclamation Limited

4.3.13.3.3. Alternative C

Under Alternative C, the following approximate acreages of sensitive soils would be open to surface-disturbing activities related to mineral leasing: 83,476 acres of highly wind erodible soils; 16,443 acres of highly water erodible soils; and 311,700 acres of reclamation sensitive soils. This would result in potential for surface disturbance on approximately 5,876 more wind erodible acres; 1,443 more water erodible acres; and 94,400 more reclamation limited soils than under Alternative A. Approximately 17,700 wind erodible acres; 17,600 water erodible acres; and 65,900 reclamation-limited acres would be closed to mineral leasing. The 1,613 acres of total estimated surface disturbance would be greater than the 1,585 acres estimated under Alternative A (see Table 4.128). An additional 851 acres of surface disturbance would occur over 15 years under Alternative C due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres). This disturbance would occur under the Proposed Plan and all of the action alternatives, but is not expected under Alternative A (No Action).

4.3.13.3.4. Alternative D

Under Alternative D, the following acreages of sensitive soils would be open to potential surface-disturbing activities related to mineral leasing: 84,700 acres of highly wind erodible soils; 17,000 acres of highly water erodible soils; and 314,800 acres of reclamation sensitive soils. This would result in potential adverse impacts on 7,100 more wind erodible acres; 2,000 more water erodible acres; and 97,500 more reclamation-limited soils than under Alternative A. A total of 1,900 wind erodible acres; 10,700 water erodible acres; and 62,700 reclamation-limited acres would be closed to mineral leasing. An estimated total of 1,645 acres of soil disturbance due to minerals development and exploration would be greater than under Alternative A (1,585 acres) and the other action alternatives (see Table 4.128). An additional 851 acres of surface disturbance would occur over 15 years under Alternative D due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres). This disturbance would occur under the Proposed Plan and all of the action alternatives, but is not expected under Alternative A (No Action).

4.3.13.3.5. Alternative E

Under Alternative E, the following acreages of sensitive soils would be open for mineral leasing: 29,732 acres of highly wind erodible soils; 7,878 acres of highly water erodible soils; and 196,031 acres of reclamation sensitive soils. This would be approximately 47,868 less wind erodible; 7,122 less water erodible; and 21,269 less reclamation sensitive acres open to mineral leasing than under Alternative A. A total of 47,769 more wind erodible; 7,028 more water erodible; and 96,491 more reclamation sensitive soils would be closed, as compared to Alternative A. The 1,109 acres of estimated surface disturbance due to mineral development and exploration would be lower than under any alternative, including the 1,585 acres expected under Alternative A (see Table 4.128). An additional 851 acres of surface disturbance would occur over 15 years under Alternative E due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres),

and clay (18 acres). This disturbance would occur under the Proposed Plan and all of the action alternatives, but is not expected under Alternative A (No Action).

4.3.13.3.3.6. Proposed Plan

Under the Proposed Plan, the following approximate acreages of sensitive soils would be open to surface-disturbing activities related to mineral leasing: 72,573 acres of highly wind erodible soils; 14,570 acres of highly water erodible soils; and 274,712 acres of reclamation sensitive soils. This would result in potential for surface disturbance on approximately 5,027 less wind erodible acres; 460 less water erodible acres; and 57,412 more reclamation limited soils than under Alternative A. Approximately 28,416 wind erodible acres; 13,034 water erodible acres; and 102,812 reclamation-limited acres would be closed to mineral leasing. The 1,613 acres of total estimated surface disturbance would be greater than the 1,585 acres estimated under Alternative A (see Table 4.128). An additional 851 acres of surface disturbance would occur over 15 years under the Proposed Plan due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres). This disturbance would also occur under all of the action alternatives, but is not expected under Alternative A (No Action).

4.3.13.3.4. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON SOILS AND WATER

4.3.13.3.4.1. Alternatives A–D

There would be no direct impacts from non-WSA lands with wilderness characteristics decisions on soils and water under these alternatives, since no lands would be managed to preserve wilderness characteristics. Because these areas would not receive protective management, they may be open to adverse impacts to soils and water resources, such as additional development, ROWs, and surface-disturbing activities.

4.3.13.3.4.2. Alternative E

Under Alternative E, a total of 582,360 acres of non-WSA lands with wilderness characteristics would be managed to maintain their wilderness characteristics. These areas would be closed to OHV use, which would reduce soil disturbance, erosion, and associated impacts to water quality. Lands with wilderness characteristics would also be closed to mineral leasing and disposals and would prohibit new road construction or ROWs, which would also reduce impacts to soils and water resources. Finally, lands with wilderness characteristics would be closed to woodland harvest, thereby eliminating associated surface disturbance and associated impacts to soils and water resources. Therefore, Alternative E would have beneficial impacts to soils and water resources over approximately 582,360 more acres than any other alternative, including Alternative A.

4.3.13.3.4.3. Proposed Plan

Under the Proposed Plan, a total of 88,871 acres of non-WSA lands with wilderness characteristics would be managed to maintain their wilderness characteristics. These areas would limit OHV use to designated routes, which would reduce soil disturbance, erosion, and associated impacts to water quality. Lands with wilderness characteristics would also be NSO or

closed to mineral leasing and disposals and would be avoidance or exclusion areas of ROWs, which would also reduce impacts to soils and water resources. Therefore, the Proposed Plan would have beneficial impacts to soils and water resources over approximately 88,871 more acres than the alternatives (including Alternative A), except for Alternative E.

4.3.13.3.5. IMPACTS OF RECREATION DECISIONS ON SOILS AND WATER

Recreation management decisions would potentially affect sensitive soils and water quality in critical watersheds and priority sub-basins under the Proposed Plan and all alternatives. The disturbance of sensitive soils (reclamation limited, highly erodible, or biological crusts) through surface disturbance and loss of vegetative cover in areas open to OHV use would increase the risk of stream sedimentation and resultant decreases in water quality. Disturbance levels would be relative to amount of surface disturbance and proximity to water resources. Limiting OHV use to designated routes would minimize adverse impacts to soils and water. Vegetation disturbance in riparian areas and highly erodible areas from OHV use or visitor use would increase the risk of water quality degradation and loss of soil productivity due to accelerated wind and water erosion and vegetation removal.

Vegetation disturbance leading to increased surface runoff and alteration of erosional and depositional processes would occur in areas with high visitor use. Recreation permit systems would continue to manage visitor use in areas with sensitive soils or in riparian areas. Analysis of visitor use was completed under Section 4.3.11.2.4, Impacts of Recreation Decisions on Riparian Resources. Impacts to soils and water resources from visitor use would be at the same relative levels as riparian impacts.

4.3.13.3.5.1. Alternative A

Recreation management decisions under Alternative A would allow OHV use in sensitive soils with potential to disturb 36,400 acres of wind erodible, 5,700 acres of water erodible, and 179,700 acres of reclamation-limited soils. OHV use could potentially result in short-term surface disturbance resulting in streambank destruction, vegetation damage, and sedimentation of surface waters. OHV trails could also lead to increased incidence of water erosion due to gullying resulting in sedimentation of streams. A total of 64,600 acres of wind erodible, 22,000 acres of water erodible, and 199,100 acres of reclamation limited soils would be limited to designated routes or closed to OHV use, thus reducing adverse impacts on soils and water resources in closed or travel limited areas. Refer to Table 4.129 for comparison between alternatives.

Table 4.129. OHV Use in Reclamation-Limited Soils by Alternative

		Alternative A			Alternative B			Alternative C		
		Wind	Water	Reclamation limited	Wind	Water	Reclamation limited	Wind	Water	Reclamation limited
All RFD areas	open	36,400	5,700	179,700	0	0	0	200	0	300
	closed or limited	64,600	22,000	199,100	101,000	27,700	376,100	100,800	27,700	375,800
		Alternative D			Alternative E			Proposed Plan		
		Wind	Water	Reclamation limited	Wind	Water	Reclamation limited	Wind	Water	Reclamation limited
All RFD areas	open	300	0	300	0	0	0	0	0	73
	closed or limited	100,700	27,700	375,800	101,000	27,700	376,100	100,936	27,703	375,978

4.3.13.3.5.2. Alternative B

OHV use under Alternative B would be the lowest of any alternative, along with Alternative E (see Table 4.129). No areas would be open to cross-country OHV use within the Monticello PA. This would result in 36,400 less wind erodible acres; 5,700 less water erodible; and 179,700 less reclamation sensitive acres where OHV use would occur on designated routes than under Alternative A.

Several SRMAs would be designated under Alternative B, which would result in management restrictions that would impact soils and water resources. Within the San Juan River SRMA, launch schedules would allow approximately 30,000 user/days per year, which is 10,000 fewer user days than Alternative A and Alternative C, and 15,000 fewer user days than Alternative D. Trip size would be limited to 20 people (including crew) for both private and commercial use, which is fewer than any other alternative. These management actions would reduce adverse impacts due to visitor use more than any other alternative (except Alternative E, which would have the same management). Camping permits would be less than any other alternative in the Grand Gulch Plateau (Cedar Mesa) In-Canyon Camping Area, resulting in the greatest amount of soil and water resources protection of any alternative. Levels of camping are shown in the Alternatives Matrix. The Dark Canyon SRMA would allow fewer commercial permits than under any alternative. Camping in designated sites would be allowed and dispersed camping would not be allowed. Group size would be limited to 10–12 with 15 private users per day in the canyon. Alternative A would not have any user limits within the Dark Canyon SRMA. Limits on group size and number of commercial permits would reduce bank trampling, human waste (e-coli), and noxious weed spread in regulated areas. These actions would result in a reduction of surface and vegetation disturbance due to human use, thus having the highest level of protection for soils and water resources of any alternative. Dispersed camping would not be allowed in the Indian Creek Corridor. Camping would only be allowed in designated sites resulting in fewer impacts to riparian resources than any alternative.

4.3.13.3.5.3. Alternative C

Under Alternative C very few areas would be open to OHV use within the Monticello PA. This would result in 36,200 less wind erodible acres; 5,700 less water erodible acres; and 179,400 less reclamation sensitive acres subject to impacts from OHV use than under Alternative A. Areas closed to OHV use and limited to designated routes would be nearly the same as under Alternative B (see Section 4.3.13.2.4). By reducing OHV use to designated trails and closing some areas to OHV use, Alternative C would have the similar levels of impact to sensitive soils as Alternative B, and far fewer than Alternative A (see Table 4.129).

The San Juan SRMA would be designated with similar management as under Alternative A. Launch limits would allow approximately 40,000 user/days per year, which is the same as under Alternative A. Alternative C would allow fewer user days than Alternative D and more user days than Alternatives B and E. Trip size would be limited to 25 people (including crew) total for both private and commercial trips, which is fewer than Alternative A and Alternative D, and more than Alternatives B and E. Refer to discussion in Alternative A for impacts related to soil and vegetation disturbance from visitor use.

The camping numbers in Grand Gulch Plateau (Cedar Mesa) In-Canyon Camping Area would be more than Alternatives B and E and less than Alternative A and Alternative D, as reflected in the Alternatives Matrix. Camping in designated sites would be allowed in the Dark Canyon SRMA. Group size would be limited to 15 with up to 20 private users per day. These limits would protect soils and water resources from adverse impacts due to visitor use more than Alternative A and Alternative D (which would not designate camping limits) and less than Alternatives B and E. Dispersed camping would be allowed in the Indian Creek Corridor except for within the following designated dispersed camping zones that have been established: Bridger Jack Mesa, Indian Creek Falls, and Creek Pasture. Camping within these zones would be limited to designated sites. These limits on camping would protect soils and water resources more than Alternative A and Alternative D and less than Alternative B.

Overall, Alternative C would provide more protection of soils and water resources due to management actions for recreation than Alternative A and Alternative D and less protection than under Alternatives B and E.

4.3.13.3.5.4. Alternative D

Under Alternative D, 300 acres of wind erodible and 300 acres of reclamation limited soils would be open to OHV use within the Monticello PA. This would be 36,100 less wind erodible acres; 5,700 less water erodible; and 179,400 less reclamation-limited acres open to OHV use than under Alternative A. There would be no areas closed to OHV use under Alternative D, but nearly all OHV use would be limited to designated routes (see Section 4.3.13.2.4). By reducing OHV use to designated trails, Alternative D would have the similar levels of use within sensitive soils as Alternative B, and far fewer than Alternative A (see Table 4.129).

Alternative D would allow approximately 45,000 user/days per year, private and commercial trips combined within the San Juan SRMA, which would result in a higher level of use than under any other alternative. Trip size would be increased to a maximum of 35 people per trip for both private and commercial use, which would be more people per trip than any other alternative. Camping permit numbers in the Grand Gulch Plateau (Cedar Mesa) In-Canyon Camping Area would be greater than Alternatives B, C, and E and fewer than under Alternative A, as reflected in the Alternatives Matrix. Dispersed camping would be allowed in the Dark Canyon SRMA, resulting in the same impacts as under Alternative A. The group size would be the same as Alternative C, with no limits on private user numbers. Dispersed camping would be allowed throughout the Indian Creek corridor, which would provide the lowest amount of protection of soils and water resources of any alternative.

Overall, Alternative D would provide the lowest level of protection for soils and water resources due to recreation decisions than any action alternative but a higher level of protection than under Alternative A.

4.3.13.3.5.5. Alternative E

Under Alternative E, the impacts of recreation decisions on soils and water resources would be the same as under Alternative B, except that no OHV travel would be allowed within non-WSA lands with wilderness characteristics (582,360 acres). By reducing OHV use to designated routes and closing the highest overall acreage to OHV use of any alternative (958,410 acres),

Alternative E would have the lowest use levels, and consequently, the lowest OHV-related soils impacts within designated recreation areas, of any alternative.

4.3.13.3.5.6. Proposed Plan

Under the Proposed Plan, the impacts of recreation decisions on soils and water resources would be the same as under Alternative C, except that OHV travel would be limited to designated routes within non-WSA lands with wilderness characteristics (88,871 acres). By reducing OHV use to designated routes the Proposed Plan would have the second lowest use levels, and consequently, the second lowest OHV-related soils impacts within designated recreation areas, as compared to the alternatives.

4.3.13.3.6. IMPACTS OF RIPARIAN DECISIONS ON SOILS AND WATER

4.3.13.3.6.1. Alternative A

Alternative A would limit surface disturbance in riparian areas, and would thereby limit adverse impacts to soils and water resources, since riparian areas naturally filter surface runoff and attenuate floods. Reduction of floods would limit the amount of erosion and sedimentation of water bodies.

All floodplains and riparian/wetlands are managed in accordance with Executive Orders 11988 and 11990, sections 303 and 404 of the Clean Water Act, and the Endangered Species Act, thus protecting riparian areas from impacts related to surface disturbance. These protections would indirectly reduce adverse impacts to soils and water resources by reducing sedimentation and salinization of water.

Under Alternative A, oil and gas development would be No Surface Occupancy (NSO) in riparian areas. The Monticello PA would follow Utah's Standards for Rangeland Health and Guidelines for Grazing and Recreation Management to achieve riparian PFC. No new surface-disturbing activities would be allowed within active floodplains or within 100 m of riparian areas. These actions would protect soils and water resources from adverse impacts due to surface disturbance.

4.3.13.3.6.2. Alternative B

Impacts under Alternative B would be the same as under Alternative A except that selected areas would be closed to motorized use and livestock trailing, which would result in minor beneficial reductions in impacts to soils and water resources.

4.3.13.3.6.3. Alternative C

Under Alternative C, the impacts of riparian decisions would be the same as under Alternative B.

4.3.13.3.6.4. Alternative D

Under Alternative D, the impacts of riparian decisions would be the same as under Alternative A.

4.3.13.3.6.5. Alternative E

Under Alternative E, the impacts of riparian decisions would be the same as under Alternative B.

4.3.13.3.6.6. Proposed Plan

Under the Proposed Plan, the impacts of riparian decisions would be the same as under Alternative B.

4.3.13.3.7. IMPACTS OF SOILS AND WATER DECISIONS ON SOILS AND WATER

In addition to those impacts common to all alternatives described in Section 4.3.13.2, soils and water decisions specific to each alternative would also affect soils and water resources.

4.3.13.3.7.1. Alternative A

There would be no additional impacts under Alternative A.

4.3.13.3.7.2. Alternative B

Under Alternative B, soil erosion and subsequent stream sedimentation would be beneficially reduced by stipulations requiring that erosion control plans be developed for surface-disturbing activities on slopes greater than 20%. These measures would reduce erosion and sedimentation relative to Alternative A.

4.3.13.3.7.3. Alternative C

Under Alternative C, soil erosion and subsequent stream sedimentation would be beneficially reduced by stipulations requiring that erosion control plans be developed for surface-disturbing activities on slopes greater than 20%, and that surface disturbance be limited on slopes greater than 40%. These measures would reduce erosion and sedimentation relative to Alternatives A and B.

4.3.13.3.7.4. Alternative D

Under Alternative D, soil erosion and subsequent stream sedimentation would be beneficially reduced by stipulations requiring that erosion control plans be developed for surface-disturbing activities on slopes greater than 40%. These measures would reduce erosion and sedimentation relative to Alternatives A.

4.3.13.3.7.5. Alternative E

Impacts under Alternative E would be the same as under Alternative B, except that additional restrictions on surface-disturbing activities would apply within non-WSA lands with wilderness characteristics. Therefore, impacts to soils and water resources would be less adverse under Alternative E than under any other alternative.

4.3.13.3.7.6. Proposed Plan

Under the Proposed Plan, the impacts of soils and water resources decisions would be the same as under Alternative C.

4.3.13.3.8. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON SOILS AND WATER

Special Designations would generally reduce adverse impacts to floodplains, soils, and water resources through limits on surface disturbance within Areas of Critical Environmental Concern (ACECs) and river segments designated as Wild and Scenic under the National Wild and Scenic River System (NWSRS). Short-term adverse impacts to soils and water resources would occur in areas where vegetation treatments are allowed within special designations. Allowing vegetation treatments would result in increased sedimentation in the short-term, but would provide long-term beneficial impacts on soils and water resources by improving vegetation cover and health.

Under the Proposed Plan and all alternatives, ACEC designation would generally require areas with surface disturbance to be reclaimed using BMP's after project completion. This would reduce any long-term adverse impacts to soils and water resources. The total acreage of limited soils in ACECs by alternative is shown in Table 4.130 below. Short-term adverse impacts would still occur due to any surface-disturbing activities in these areas, but effective reclamation would prevent these impacts from being long-term. Additionally, OHV use would generally be limited to designated trails or prohibited, thus reducing adverse impacts as discussed under Section 4.3.13.2.4, Impacts of Recreation Decisions Common to All Alternatives.

Table 4.130. ACEC Special Designations in Limited Soils, by Alternative

	Alternative A			Alternatives B			Alternative C		
	Wind	Water	Reclamation limited	Wind	Water	Reclamation limited	Wind	Water	Reclamation limited
ACECs	9,400	12,200	91,400	9,200	11,200	100,000	300	600	14,100
	Alternative D			Alternatives E			Proposed Plan		
	Wind	Water	Reclamation limited	Wind	Water	Reclamation limited	Wind	Water	Reclamation limited
ACECs	0	0	0	9,200	11,200	100,000	300	600	14,100

4.3.13.3.8.1. Alternative A

A total of 9,400 acres of wind erodible soils; 12,200 acres of water erodible soils; and 91,400 acres of reclamation-limited soils would be within designated ACECs under Alternative A (see Table 4.130). These designations would generally reduce impacts to soils and water resources due to surface disturbance, as described above.

The designation of river segments as Wild and Scenic would not be evaluated under Alternative A. River segments determined eligible for designation in the 1991 RMP would retain protections

from surface disturbance, thus limiting adverse impacts. River segments not evaluated in the 1991 RMP would not be protected from surface disturbance and its impacts.

4.3.13.3.8.2. Alternative B

Designation of ACECs and Wild and Scenic river segments proposed under Alternative B would limit surface disturbance on 9,200 acres of wind erodible; 11,185 acres of water erodible; and 100,000 acres of reclamation limited soils. This would result in protection of 200 fewer acres of wind erodible; 1,000 fewer acres of water erodible; and 8,600 more acres of reclamation limited soils, as compared to the Alternative A. However, the management prescriptions of special designations under Alternative B are generally slightly more protective than under Alternative A.

Management of Wild and Scenic Rivers under Alternative B would recommend Dark Canyon (2,048 acres) and San Juan River Wild Segments #3 and #5 (4,896 acres) as Wild under the WSR system. These designations would limit surface disturbance within the river corridors at these locations. These actions would provide more long-term protection of soils and water resources than Alternative A, which would not designate any Wild river segments.

The designations proposed under Alternative B would result in the protection of more acres of reclamation limited soils and biological soil crusts than Alternative A.

4.3.13.3.8.3. Alternative C

Designation of ACECs and Wild and Scenic river segments proposed under Alternative C would limit surface disturbance on 300 acres of wind erodible; 600 acres of water erodible; and 14,100 acres of reclamation limited soils. These designations would result in less protection for soils and water resources than under Alternative A (see Table 4.130).

Management of Wild and Scenic Rivers under Alternative C would recommend Dark Canyon (2,048 acres) as Wild under the WSR system, as well as sections of the Colorado River that were already determined to be eligible. This designation would limit surface disturbance within the river corridor. These limits on surface disturbance would provide more long-term protection of soils and water resources than Alternative A, which would not designate any Wild river segments.

The designations proposed under Alternative C would result in the protection of fewer acres of reclamation limited soils and biological soil crusts than Alternative A.

4.3.13.3.8.4. Alternative D

There would be no special designations under Alternative D. No reduction in adverse impacts would occur under this alternative, resulting in the lowest level of protection from adverse impacts.

4.3.13.3.8.5. Alternative E

Under Alternative E, the impacts of special designations decisions on soils and water resources would be the same as under Alternative B.

4.3.13.3.8.6. Proposed Plan

Under the Proposed Plan, the impacts of special designations decisions on soil and water resources would be the same as under Alternative C.

4.3.13.3.9. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON SOILS AND WATER

The management of special status species under all alternatives would generally be positive where soils are indirectly protected from disturbance due to protections for TES. Where treatments are limited due to the presence of TES, impacts could be beneficial or adverse.

4.3.13.3.9.1. Alternative A

Under Alternative A, the BLM would conduct inventories and monitoring studies in order to determine special status plant and animal species locations, potential habitat, population dynamics, and existing and potential threats. Beneficial impacts would occur where riparian areas and waterways would be protected through implementation of current and future sensitive species Conservation Agreements. These agreements include the Colorado River cutthroat trout Conservation Agreement and Strategy and Conservation Agreement for the roundtail chub, bluehead sucker, and flannelmouth sucker.

Specific actions to improve habitat for some TES would likely result in beneficial impacts on soils and water resources due to improvement of natural water filtration and increased water holding capacity of natural vegetation. Limits on surface disturbance would reduce adverse impacts due to loss of vegetation and its natural water filtration and flood attenuation properties. The protections of Bald eagle winter roosting sites, including avoidance of disturbance to or loss of large cottonwood gallery riparian habitats, would reduce adverse impacts to soils and water resources by maintaining the natural filtration of these areas. Where riparian gallery habitats are lost, adverse impacts to soils and water resources would be due to increased runoff and lack of filtration of surface waters. Bald Eagle protection would also require avoidance of surface disturbance in riparian areas, with the same impacts as discussed above. The protections for Mexican Spotted Owls (MSO) would require any activity that includes water production would be managed to ensure maintenance or enhancement of riparian habitat, thus reducing adverse impacts to soils and water resources.

Any BLM lands that contains riparian habitat within the range of Southwestern Willow Flycatcher or Yellow-billed Cuckoos would be managed to avoid development and/or implement use restrictions. The BLM would ensure that water extraction or disposal practices do not result in change of hydrologic regime that would result in loss or degradation of riparian habitat. Revegetation of temporarily disturbed areas within riparian areas and adjacent uplands would be done with native species or ecological equivalents. These actions or limits on disturbance would reduce the adverse impacts of disturbance to soils and water resources as discussed above. Avoidance of development and/or use restrictions within BLM areas, watersheds, or tributaries to Designated Critical Habitat for the Colorado River fish (bonytail, humpback chub, Colorado pikeminnow, and razorback sucker) would also result in reduction of adverse impacts to soils and water resources. Finally, limits on water depletions to protect special status fish would also result in reduction of adverse impacts such as reduced spring flood magnitudes or less frequent floodplain inundation.

4.3.13.3.9.2. Alternative B

Under Alternative B, the impacts of special status species decisions would be the same as under Alternative A, except that there would be minor additional protective measures within Gunnison Sage-grouse and Mexican Spotted Owl habitat that would also benefit soils and watersheds, such as prohibitions on road construction within 2 miles of active strutting grounds. These additional measures would have a minor impact on soils, but would have a greater benefit than under Alternative A.

4.3.13.3.9.3. Alternative C

Under Alternative C, the impacts of special status species decisions would be the same as under Alternative A, except that there would be minor additional protective measures within Gunnison Sage-grouse and Mexican Spotted Owl habitat that would also benefit soils and watersheds, such as NSO leasing stipulations and prohibitions on road construction within 0.6 miles of active strutting grounds. These additional measures would have a minor impact on soils, but would have a greater benefit than under Alternatives A and D. They would have a less beneficial impact than Alternatives B and E.

4.3.13.3.9.4. Alternative D

Under Alternative D, the impacts of special status species decisions would be the same as under Alternative A, except that there would be negligible, additional protective measures within Gunnison Sage-grouse and Mexican Spotted Owl habitat that would also benefit soils and watershed, such as prohibitions on road construction within 0.25 miles of active strutting grounds. These additional measures would have a negligible beneficial impact on soils.

4.3.13.3.9.5. Alternative E

Under Alternative E, the impacts of special status species decisions would be the same as under Alternative B.

4.3.13.3.9.6. Proposed Plan

Under the Proposed Plan, the impacts of special status species decisions would be the same as under Alternative C

4.3.13.3.10. IMPACTS OF VEGETATION DECISIONS ON SOILS AND WATER

Vegetation treatments would potentially impact soils and water resources through changes in vegetation type and canopy cover, and the resulting shifts in water runoff and erosion. Vegetation treatments would potentially increase surface water temperature due to lost vegetation cover adjacent to streams, which would be an adverse impact on water resources. Surface-disturbing vegetation treatments could also result in increased erosion and stream sedimentation. Analysis of beneficial impacts of vegetation treatments was based upon total acres of treatment that improves watershed condition.

4.3.13.3.10.1. Alternative A

Under Alternative A, existing vegetation treatment would continue on 232,100 acres.

4.3.13.3.10.2. Alternative B

Under Alternative B, the impacts from vegetation management decisions would be similar to those described under Alternative A. Alternative B would result in approximately 7,600 acres of vegetation treatments per year, or a total of 114,000 acres over 15 years. This is approximately 118,100 fewer acres of vegetation treatments than Alternative A, and would therefore result in fewer short-term adverse impacts and fewer long-term beneficial impacts to soils and water resources.

4.3.13.3.10.3. Alternative C

Under Alternative C, the impacts from vegetation management decisions would be similar to those described under Alternative B. Alternative C would result in approximately 9,300 acres of vegetation treatments per year, or a total of 139,500 acres over 15 years. This is approximately 92,600 fewer acres of vegetation treatments than Alternative A, and would therefore result in fewer short-term adverse impacts and fewer long-term beneficial impacts to soils and water resources.

4.3.13.3.10.4. Alternative D

The impacts from vegetation management decisions under Alternative D would be similar to those described under Alternative B. Alternative D would result in approximately 11,300 acres of vegetation treatments per year, or a total of 169,500 acres over 15 years. This is approximately 62,600 fewer acres of vegetation treatments than Alternative A, and would therefore result in fewer short-term adverse impacts and fewer long-term beneficial impacts to soils and water resources.

4.3.13.3.10.5. Alternative E

Under Alternative E, the impacts of vegetation management decisions on soils and water resources would be the same as under Alternative B except that no new land treatments would be allowed in non-WSA lands with wilderness characteristics.

4.3.13.3.10.6. Proposed Plan

Under the Proposed Plan, the impacts of vegetation management decisions on soils and water resources would be the same as under Alternative C.

4.3.13.3.11. IMPACTS OF VISUAL RESOURCE DECISIONS ON SOILS AND WATER

The designation of VRM classes would result in indirect impacts to soil and water resources depending on the type of surface-disturbing activity that these classes would allow. For example, VRM Class I would stipulate NSO and would limit potentially adverse surface-disturbing activities in order to protect scenic quality, whereas VRM Class II would stipulate that management activities not alter landforms, but would not necessarily limit surface-disturbing activities. For the purpose of this analysis, the potential impacts of VRM designation are evaluated based on the acreage of each limited soil type that would be protected by being within areas designated as VRM Class I and II. These acreages, by alternative, are listed in Table 4.131.

4.3.13.3.11.1. Alternative A

Under Alternative A, approximately 36,050 acres of wind erodible, 16,015 acres of water erodible, and 140,071 acres of reclamation limited soils would be designated as VRM Class I and II. Approximately 64,840 acres wind erodible, 11,512 water erodible, and 235,592 acres reclamation limited soils would be designated as VRM Class III and IV, and therefore would be at greater risk of adverse impacts due to surface disturbances.

4.3.13.3.11.2. Alternative B

Visual resource management under Alternative B would designate 34,539 acres of wind erodible; 16,331 acres of water erodible; and 135,232 acres of reclamation limited soils as VRM Class I and II. This would result in the protection of 1,511 fewer wind erodible acres; 316 more water erodible acres; and 4,839 fewer reclamation-limited acres than under Alternative A.

4.3.13.3.11.3. Alternative C

Visual resource management under Alternative C would designate 28,622 acres of wind erodible; 12,879 acres of water erodible; and 105,081 acres of reclamation limited soils as VRM Class I and II. This would be 7,428 fewer wind erodible acres; 3,136 fewer water erodible acres; and 34,990 fewer reclamation-limited acres designated as VRM Class I and II than under Alternative A.

4.3.13.3.11.4. Alternative D

Visual resource management under Alternative D would designate approximately 16,584 acres of wind erodible; 10,746 acres of water erodible; and 60,502 acres of reclamation limited soils as VRM Class I and II. This would be 19,466 fewer wind erodible acres; 5,269 fewer water erodible acres; and 79,569 fewer reclamation-limited acres designated as VRM Class I and II than under Alternative A (see Section 4.3.18, Visual Resources, for a qualitative description of the impacts of VRM).

4.3.13.3.11.5. Alternative E

Visual resource management under Alternative E would designate 72,796 acres of wind erodible; 21,164 acres of water erodible; and 199,099 acres of reclamation limited soils as VRM Class I and II. This would result in the protection of 36,746 more wind erodible acres; 5,149 more water erodible acres; and 59,028 more reclamation-limited acres than under Alternative A.

4.3.13.3.11.6. Proposed Plan

Visual resource management under the Proposed Plan would designate 38,135 acres of wind erodible; 14,085 acres of water erodible; and 124,767 acres of reclamation limited soils as VRM Class I and II. This would be 2,085 more wind erodible acres; 1,930 fewer water erodible acres; and 15,304 fewer reclamation-limited acres designated as VRM Class I and II than under Alternative A.

Table 4.131. VRM Designation - Limited Soils by Alternative

	Alternative A			Alternative B			Alternative C		
	Wind	Water	Reclamation	Wind	Water	Reclamation	Wind	Water	Reclamation
VRM I and II (acres)	36,050	16,015	140,071	34,539	16,331	135,232	28,622	12,879	105,081
VRM III and IV (acres)	64,840	11,512	235,592	66,390	11,362	240,503	72,304	14,813	270,630
	Alternative D			Alternative E			Proposed Plan		
	Wind	Water	Reclamation	Wind	Water	Reclamation	Wind	Water	Reclamation
VRM I and II (acres)	16,584	10,746	60,502	72,796	21,164	199,099	38,135	14,085	124,767
VRM III and IV (acres)	84,590	16,952	315,186	28,118	6,529	176,631	62,770	13,605	250,934

4.3.13.3.12. IMPACTS OF WOODLANDS DECISIONS ON SOILS AND WATER

Potential impacts to soils and water resources from woodlands decisions may result from an increased risk of excessive vegetation removal, surface disturbance, soil compaction, and hydrological changes in areas open to woodland harvest. This risk would be due to the potential for surface disturbance from motorized vehicles and foot traffic during wood gatherings, as well as the loss of woody shrub and forest vegetation from areas, particularly those areas with sensitive and/or highly erodible soils.

4.3.13.3.12.1. Alternative A

Under Alternative A, a total of 1,309,894 acres of the Monticello PA would be open to woodland harvest. Therefore, Alternative A would result in the highest risk of impacts to soils and water resources (Table 4.132), as described above.

Table 4.132. Acres of Soils Available for Woodland Harvesting, By Alternative

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Available for Woodland Harvesting (Acres)	1,309,894	730,074	841,938	841,938	548,477	837,939

4.3.13.3.12.2. Alternative B

Under Alternative B, a total of 730,074 acres would be open to woodland harvest, or 579,820 fewer acres than under Alternative A. Therefore, Alternative B would result in a lower risk of adverse impacts to soils and water resources, as described above.

4.3.13.3.12.3. Alternatives C and D

Under Alternatives C and D, a total of 841,938 acres would be open to woodland harvest, or 467,956 fewer acres than under Alternative A. Therefore, Alternatives C and D would result in a lower risk of adverse impacts to soils and water resources, as described above.

4.3.13.3.12.4. Alternative E

Under Alternative E, a total of 548,477 acres would be open to woodland harvest, or 761,417 fewer acres than under Alternative A. Therefore, Alternative E would result in a lower risk of adverse impacts to soils and water resources, as described above.

4.3.13.3.12.5. Proposed Plan

Under the Proposed Plan, a total of 837,939 acres would be open to woodland harvest, or 471,955 fewer acres than under Alternative A. Therefore, the Proposed Plan would result in a lower risk of adverse impacts to soils and water resources, as described above.

4.3.13.4. MITIGATION MEASURES

Any activity with potential for surface disturbance would be required to follow stipulations as outlined in Appendix A and Appendix I. These surface stipulations would protect soils and water resources by requiring Best Management Practices (BMPs) for all activities in limited soils or on slopes greater than 20%. The use of BMPs would limit adverse impacts to soils and water resources.

4.3.13.5. UNAVOIDABLE ADVERSE IMPACTS

Unavoidable adverse impacts would include short-term, increased erosion and sedimentation and short-term nutrient release to surface waters due to prescribed burning and vegetation treatments; increases in surface water temperature due to vegetation cover lost because of vegetation treatment and woodland harvesting immediately adjacent to streams; and loss of soils productivity and water quality degradation due to surface disturbances caused by proposed oil and gas exploration, development, and production.

4.3.13.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Livestock grazing would provide a short-term economic benefit for the livestock industry that would not affect the long-term soil productivity of soils and water if Rangeland Standards and Guides are met as detailed in Chapter 2 Management Common to All. Similarly, minerals development, recreation, and OHV use would provide a short-term economic benefit to the tourism industry and would not affect long-term soil productivity and water quality if appropriate applicant committed measures and Chapter 2's Management Common to All is effectively implemented. However, where surface-disturbing activities in reclamation-limited soils cannot be mitigated successfully or reclaimed, some long-term loss of soil productivity could result.

4.3.13.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Drilling of oil and gas wells would result in a long-term loss of that soil productivity within wellpad, wellpad infrastructure, and access roads during the productive life of the well. Areas dedicated to cross country or concentrated OHV use may not be able to be completely restored due to erosion, and some small irretrievable losses of soil may occur. None of the adverse impacts would be irreversible because soils and water productivity could be restored in the long-term.

4.3.14. SPECIAL DESIGNATIONS

Impacts from the various alternatives related to values associated with Areas of Critical Environmental Concern (ACECs), Wild and Scenic Rivers (WSRs), and Wilderness Study Areas (WSAs) are described in this section.

In general, management of specially designated areas is focused on allowing those uses and activities that are considered compatible with the specific, special resources of concern, while restricting those uses and activities that would impact those identified value(s). In the case of ACECs, the management focuses on protecting specific, identified relevant and important values, resources, and natural systems, or managing natural hazards.

For river segments that are eligible/suitable for congressional designation into the national system, the management focuses on protecting the specific, identified, outstandingly remarkable values, the free-flowing nature of the river, and tentative classifications for eligible river segments.

For WSAs, the management focuses on maintaining the wilderness setting, characteristics and experience, and meeting the non-impairment standard of the Interim Management Policy and Guidelines for Lands Under Wilderness Review (IMP – BLM, 1995). Accordingly, this impact analysis will determine how each alternative impacts the relevant and important values for ACECs, the outstandingly remarkable values and tentative classifications for eligible Wild and Scenic Rivers, and the wilderness setting, characteristics and experience in WSAs. WSAs will be managed under the IMP the Proposed Plan and all alternatives. The only decisions being considered for WSAs are OHV area designations, travel routes, and VRM objectives (classes).

4.3.14.1. ACECs – IMPACTS COMMON TO THE PROPOSED PLAN AND ALL ALTERNATIVES

Impacts common to the Proposed Plan and all alternatives would be caused by implementation of resource program policies such as best management practices, cultural mandates, and appropriate fire management response. Those that would protect the relevant and important values will not be discussed further. In addition, except for Alternative A, No Action, OHV use would be limited to designated routes unless otherwise specified. This would protect the relevant and important values of the ACECs by eliminating surface disturbance from cross-country OHV travel. Limiting OHV use to designated routes throughout the planning area would also likely result in a shift in riding in motorized recreation as OHV riders throughout the field office adjust their riding habits to comply with the new restrictions. This shift would likely result in fewer instances of inadvertent, casual, or deliberate illegal riding off designated routes, and would consequently also decrease the risk of impacts to resources within the ACEC.

Any section(s) of a proposed or existing ACEC that falls within a WSA would be managed under the IMP, which strictly regulates surface disturbance and impacts that would alter the naturalness and opportunities for primitive recreation and solitude of the area. One of the practical effects of interim management is permitted activities in WSAs (except grandfathered and valid existing rights) are limited to temporary uses that create no new surface disturbance, nor involve permanent placement of structures. Prescriptions for lands that lie in both (overlap) ACECs and WSAs must comply with the prescription (IMP or ACEC) that is most restrictive. Since the IMP imposes special management conditions to protect wilderness characteristics, it is assumed that there would be no impacts to the relevant and important values in the overlap areas and that

ACEC management would be duplicative in most instances. Table 4.133 lists the percent of ACECs that overlap with WSAs. Maps 87–90 show the areas where ACECs would overlap with WSAs under each alternative.

4.3.14.2. ACECs – ALTERNATIVES IMPACTS

In order for an area to be designated as an ACEC, it must meet the criteria of "relevance" and "importance" and require special management to protect the relevant and important values, resources, natural systems, or hazards (generally referred to as values) as described in 43 CFR 1610.7-2 and BLM Manual Section 1613.11-.12. This analysis focuses on impacts to these values. These impacts are described in detail under Alternative A (No Action). The subsequent impacts analysis for the action alternatives (B, C, D, and E) and the Proposed Plan discloses their level of impact in comparison to Alternative A.

ACECs are areas that are subject to special management to protect relevant and important values. While standard management includes compliance with policy, laws, and mandates, special management typically includes restrictive prescriptions such as closures to mineral development, limits on livestock grazing or restrictions on woodland product harvest, VRM Class I management, and packing out human waste. Some of the decisions to be made in this plan would have no adverse impacts on existing or potential ACECs, eligible river segments, or WSAs regardless of the alternative chosen. Only decisions that may affect the values of these areas are analyzed further.

Table 4.133. ACECs by Alternative, with Percent of Each that is WSA

ACECs	Alternative A		Alternatives B and E		Alternative C		Alternative D		Proposed Plan	
	Acres ^a	% WSA	Acres	% WSA	Acres	% WSA	Acres	% WSA	Acres	% WSA

^a GIS technology has changed since the last RMP. Acres listed under this alternative may be slightly different even though the polygon is the same size under other alternatives.

^b Includes Pine and Step Canyons 21,280 acres of the Scenic Highway Corridor ACEC

^c Does not include 21,380 acres that overlaps with the Cedar Mesa ACEC.

^d Acreage included in Cedar Mesa ACEC (31,387 acres).

4.3.14.2.1. ALKALI RIDGE ACEC⁶

Alkali Ridge is proposed as an ACEC under Alternatives A, B, C, and E and the Proposed Plan to provide special management attention to protect the area's relevant and important cultural and historic values. The area would not be designated as an ACEC under Alternative D.

4.3.14.2.1.1. Alternative A

Under Alternative A, Alkali Ridge ACEC (39,202 acres) would be managed as open to most resource uses including mineral development, woodland harvest, livestock and OHV use, and land treatments. Cultural resources would be avoided by a sufficient margin as to allow permanent protection. This ACEC would also encompass the Alkali Ridge National Historic Landmark (2,340 acres), which would have identical management prescriptions under this alternative, including the requirement that cultural resources be avoided by 100 feet. It should be noted that agency responsibilities to a National Historic Landmark are higher than to National Register listed or eligible properties (see 36CFR65.2(c)(2): Federal agencies must take actions to minimize impacts to such a resource, in consultation with the Advisory Council). Active leasing within a landmark where data recovery might be required would likely be construed as an increased threat. In the remainder of the ACEC, all cultural properties eligible for the National Register of Historic Places would be surrounded by an avoidance area sufficient enough to allow permanent protection.

In general, direct impacts to cultural resources under this alternative would be avoided through adherence to the Section 106 process and avoidance of sites through relocation of surface-disturbing activities. However, cultural resource districts, landscapes, and some traditional cultural properties (TCPs) would not be afforded the same beneficial protection due to the fact

⁶ In order to reduce redundancy, when similar impacts occur in different ACECs, a detailed explanation of impacts will be given in the first ACEC presented. Subsequent analysis will summarize the impacts and the reader can assume that the detailed information of impacts from the previous ACEC also applies.

that these types of resources often cover vast geographic areas and have multiple individual sites which may be affected by the physical and auditory disturbances created by construction and operation of mineral development infrastructure and other surface-disturbing activities. Physical and auditory disturbances are especially critical to TCPs where viewsheds and soundscapes are the primary components. These impacts can render the TCP non-functional for the related Native American Tribe or other cultural group (BLM 2004).

Although livestock grazing would be managed under the Standards for Rangeland Health there is potential for direct impacts to cultural resources from trampling and loss of vegetation in areas with livestock grazing, especially in riparian areas or other areas where cattle tend to congregate. Trampling can dislodge and fracture cultural artifacts and destroy site integrity. Loss of vegetation exposes cultural resources making them more susceptible to looting and degradation from exposure (Roney 1977). Most of the adverse effects to the sites in the Monticello FO have occurred from past livestock grazing and trailing activities (personal communication between Nancy Shearin, Monticello FO and Deb Reber, SWCA, 2006). Future disturbance will only add to the site degradation.

Indirect negative impacts to cultural resources may also occur from recreational activities that are not targeted under Section 106. Increasing visitation from hikers, cyclists, and OHV users to more remote areas would increase the risk of intentional and inadvertent damage to cultural resources. Loss of ground cover may churn up archaeological deposits and destroy historical context. Archaeological materials exposed by natural or human-induced erosion would then become vulnerable to unauthorized collection (VanderHoek 2005). The risk would be greater from OHV use due to their ability to travel over greater distances and access more remote locations. Under Alternative A, OHV use is limited to existing trails in the proposed ACEC. Limiting motorized travel to existing routes would prevent off-road use and further surface disturbance that would damage cultural resources.

Alternative A allows for private and commercial use of woodland products. There is potential for negative indirect impacts to cultural resources from this activity. Impacts consist primarily of unintended damage to cultural sites by driving vehicles off designated roads for the cutting and loading of wood and the subsequent use of the resultant "trail" (tire tracks) by OHV riders (BLM 2004).

Allowing surface-disturbing vegetation treatments would have adverse and/or beneficial long-term effects. Adverse effects would be possible if cultural surveys (especially in areas of dense vegetation cover) do not reveal cultural resources and treatments inadvertently destroy them. Vegetation treatment projects also could impact sites where Native Americans collect plants that are culturally significant. (CA. State Board of Forestry and Fire Protection 2006) In addition, if locations of cultural resources are known and surrounding areas are treated, the demarcation between the treatment and non-treatment areas makes cultural resources more visible and therefore more subject to damage and looting. Conversely, beneficial impacts to cultural resources would occur from the reduction in fuels loading and may protect sites from wildfire in addition to offering positive benefits to other resource programs.

Under Alternative A, the area would be open for mineral leasing with Standard stipulations. The entire ACEC falls within the Blanding Sub-Basin RFD area that has a high potential for mineral development. Approximately 41 wells are predicted to be developed in the area totaling 394 acres of surface disturbance. (See minerals discussion for specifics). Although surveys would

have to be conducted prior to development, identified sites would have to be avoided, and mitigation measures employed there is a risk of impacts to the integrity of the landscape as discussed in the second paragraph of Alternative A.

4.3.14.2.1.2. Alternative B

Alternative B (39,196 acres) would be generally the same as Alternative A, except that this alternative would close the area to harvest of woodland product and surface-disturbing vegetation treatments. Alternative B would restrict livestock use if cultural resources are being impacted and manage the area as VRM Class IV rather than VRM Class III.

There would be a beneficial long-term effect from closing the area to woodland product use because it would eliminate any chances of secondary impacts from cross-country travel to collect wood. (See discussion of impacts from OHV use under Alternative A) This proactive decision would offer a greater degree of protection to cultural resources than Alternative A.

Unlike the other alternatives, Alternatives B specifically states that livestock use would be restricted if cultural resources are being damaged. There is no difference between this alternative and the Proposed Plan or other alternatives from a management perspective, as this restriction would be implemented regardless of whether or not it is stated in the PRMP/FEIS. However it does forewarn the permittee and may give the resource specialist more leverage to implement the restriction for site-specific proposals because it would be based on recent analysis and decisions.

Alternative B would limit OHV use to designated roads and trails in the entire ACEC rather than existing roads and trails under Alternative A. This would have essentially the same effects on ACEC values as Alternative A.

Alternative B does not allow for surface-disturbing vegetation treatments and treatment must avoid cultural sites by a sufficient margin as to have no impact. This decision provides the highest degree of protection to cultural resources because it does not allow for surface disturbance, thereby eliminating any possibility of damage from surface-disturbing activities.

The final difference between Alternative B and Alternative A is the change to VRM management Class III from VRM Class IV. VRM Class IV would allow for major modifications to the landscape in comparison to VRM III that would allow moderate changes. However, this shift of VRM management objective is unlikely to have a substantial effect on cultural resources and associated values as both classes allow for development and associated surface disturbance.

Under this alternative, the ACEC would also include Alkali Ridge National Historic Landmark which would be managed with the same prescriptions as the ACEC with the following exceptions: 1) it would be managed as NSO for oil and gas leasing rather than timing and controlled surface use; 2) campfires would not be allowed; 3) it would be closed to geophysical work and the disposal of mineral materials; and 4) it would be recommended for withdrawal from locatable mineral entry. These actions would have direct beneficial long-term effects to cultural resources because they would eliminate any chance of inadvertent disturbance to cultural sites from mineral development and recreational use, thereby reducing potential risk to the integrity of the sites on a landscape level.

4.3.14.2.1.3. Alternative C

Alternative C proposes the same management prescription as Alternative A except for prescriptions involving woodland harvest, vegetation treatments, visual resources management, and mineral leasing stipulations. Woodland harvest would be allowed but off-road travel to conduct that harvest would be allowed in chained areas only. Since surveys are required prior to chaining activities, cultural resources would typically have been identified and avoided before subsequent woodland harvest occurs. However, indirect OHV impacts could result as described in Alternative A.

Alternative C also differs from Alternative A in that they allow for woodland product use. However, that use would be confined to specific areas within Alkali Ridge if cultural resources are being damaged. This adaptive management strategy offers beneficial protection, including the closure of areas if there is evidence of damage. This is more restrictive than Alternative A and less restrictive than Alternative B.

Alternative C allows for vegetation treatments with non-surface-disturbing methods being preferred. If surface-disturbing treatments were approved, access routes would have to be reclaimed to prevent future use. This decision would prevent adverse impacts from OHV use as routes would be reclaimed thereby eliminating access. It also allows for noxious weed treatments that use the minimum amount of surface disturbance necessary.

Alternative C would manage landscapes by VRM Class IV objectives, rather than Class III under Alternative A. The objective of Class IV provides for landscape change, and would allow for surface disturbance and landscape change. However, future actions would not move forward without adherence to the Section 106 process and the protections afforded to cultural resources by laws, regulations, and policies.

Alternative C would provide for oil and gas leasing subject to Standard stipulations (6,032 acres), timing limitations and controlled surface use (31,018 acres) and no surface occupancy (2,146 acres). The ACEC falls within the Blanding Sub-Basin RFD area that has a high potential for mineral development. Standard stipulations and controlled surface use would permit oil and gas exploration and development with mitigation for resource values and uses of concern. Approximately 41 wells are predicted to be developed in the RFD area totaling 394 acres of surface disturbance. (See minerals discussion for specifics). Under controlled surface use, cultural resource surveys would be conducted prior to surface disturbance, identified sites would be avoided, and mitigation measures would be implemented, protecting the relevant and important cultural resource values of the ACEC. Even with mitigation, however, there would be a risk of impacts to the integrity of the landscape as discussed under Alternative A.

Alkali Ridge National Historic Landmark would be managed the same as it is under Alternative B except the area would be open to geophysical exploration that meets the definition of "casual use." Impacts would be similar to Alternative B with a slightly greater risk of minor surface disturbance from geophysical exploration.

4.3.14.2.1.4. Alternative D

Under Alternative D, the area would not be designated as an ACEC and would be managed as open to all uses. The area would be available for woodland harvest, watershed improvements,

and livestock use. It would be managed as available for mineral development and as VRM Class IV.

The impacts for this alternative would be similar to Alternative A.

4.3.14.2.1.5. Alternative E

The impacts under Alternative E (39,196 acres) would be the same as those under Alternative B because the management decisions would be the same.

4.3.14.2.1.6. Proposed Plan

The impacts under the Proposed Plan would be the same as described for Alternative C above, except that the ACEC would be available for mineral leasing with timing limitations and controlled surface use (37,050 acres) and no surface occupancy (2,146 acres). The effect of oil and gas leasing and development on the relevant and important cultural and historic values would be the same as described under Alternative C. The ACEC would also be managed as VRM III instead of VRM IV which would have impacts similar to Alternative A.

4.3.14.2.2. BRIDGER JACK MESA ACEC

Bridger Jack Mesa is proposed as an ACEC (Mesa top only) under Alternatives A (6,260 acres), B (6,225 acres), and E (6,225 acres) to protect the relevant and important relict vegetation values. It would not be designated as an ACEC under the Proposed Plan and Alternatives C and D. The entire proposed ACEC falls within the Bridger Jack Mesa WSA.

4.3.14.2.2.1. Alternative A

Under Alternative A the area would be designated as an ACEC and managed to exclude almost all surface-disturbing activities including mineral development. By curtailing virtually all surface-disturbing activities this alternative would offer direct long-term protection to the relevant and important relict vegetation. It should be noted that since the area is overlapped by Bridger Jack WSA and managed under the IMP it would be managed so as to prevent impairment to the wilderness values (Map 87). Management under the IMP's non-impairment standard would also provide long-term protection of the ACEC values.

Recreational use would be allowed but would be limited if vegetative resources are being damaged. Due to the inaccessibility of the area, recreation use is anticipated to be low. OHV and mountain bike use would not be allowed. Therefore, recreational activities would consist mainly of light foot traffic and would result in little disturbance to the vegetation.

4.3.14.2.2.2. Alternatives B and E

Alternatives B and E would designate a slightly smaller ACEC, 6,224 acres, with the same management prescriptions as Alternative A. The modification of the ACEC boundary under this alternative would exclude the non-vegetated spires. Impacts would be the same as described under Alternative A.

4.3.14.2.2.3. Alternatives C and D

Alternatives C and D propose to drop the current ACEC designation and manage the area with prescriptions of the surrounding area with the only special management being exclusion from livestock and saddle stock grazing and woodland product use. As with Alternatives A, B, and E, it would be managed under the IMP, so vegetation values would be protected regardless of whether or not it is an ACEC. As mentioned under Alternative A the area is mostly inaccessible, so the exclusions of livestock grazing and woodland product use don't appear to be necessary to protect the resource.

4.3.14.2.2.4. Proposed Plan

Under the Proposed Plan, Bridger Jack Mesa would not be managed as an ACEC. Management of the WSA under the non-impairment standard of the IMP, however, would protect the relevant and important relict vegetation values of the ACEC. In addition, under the Proposed Plan, the area would be closed to livestock grazing, including grazing by pack and saddle stock. As described under Alternatives C above, the area is mostly inaccessible to livestock, so this action would have little protective effect on the relict vegetation. The area would also be closed to harvest of woodland products, except collection of wood for campfires. Again, given the inaccessibility of the area, this action would have little protective effect on the ACEC values.

4.3.14.2.3. BUTLER WASH NORTH ACEC

Butler Wash North is proposed as an ACEC to protect the areas scenic values under Alternatives A (17,464 acres) and B and E (17,365 acres). The area would not be designated as an ACEC under Alternatives C and D or the Proposed Plan. The entire proposed ACEC would lie within the Butler Wash WSA.

4.3.14.2.3.1. Alternative A

Under Alternative A the area would be closed to mineral leasing, as part of the WSA. Since the area would be managed as VRM Class I, the visual objective would be to retain a unmodified (natural) landscape. As per BLM Manual 8410 the objectives would be to preserve the existing character of the landscape and the level of change should be very low and should not attract attention. Geophysical work would be allowed if conducted by non-surface-disturbing methods. Thus, direct negative impacts from geophysical work on the scenic quality are not anticipated.

As a result of the decision to close the area to use of woodlands products there would be no harvest of pinyon or juniper, thereby providing beneficial impacts to visual resources by retaining the natural character of the landscape. The ACEC would be closed to OHV use.

Livestock grazing would be allowed and would be managed under the Standards and Guidelines for grazing management. One of the guidelines states that when establishing grazing practices and rangeland improvements, the quality of the outdoor recreation experience would be considered. Aesthetic and scenic values, water, campsites and opportunities for solitude are among those considerations. For that reason there would be negligible effects from this activity on the scenic quality.

Since the entire area falls within a WSA, management prescriptions between the alternatives would have to conform to the IMP. Designating the area as an ACEC would reinforce protection of the scenic quality of the area.

4.3.14.2.3.2. Alternatives B and E

Alternatives B and E propose almost an identical management prescription as Alternative A except the BLM would seek to acquire state inholdings and would impose limitations on livestock grazing if scenic resources are being impacted. Acquiring state inholdings would have a major beneficial impact to the ACEC values because the state is not obligated to follow the IMP on their inholdings within WSAs, so development is possible within those areas. Any development involving surface disturbance would have a negative impact on the scenic values. If the BLM acquires those inholdings they would be managed in accordance with the IMP thereby protecting the scenic values of the ACEC.

4.3.14.2.3.3. Alternatives C and D

Alternatives C and D would not designate Butler Wash ACEC and management would default to the IMP. Management under the IMP would limit surface disturbances that would diminish the scenic values of the area. These alternatives would not pursue acquisition of state inholdings, and development on state sections that could impact the scenic values of the ACEC.

4.3.14.2.3.4. Proposed Plan

The Proposed Plan would not designate Butler Wash ACEC. However, management of the area as part of the Butler Wash WSA under the IMP would protect the relevant and important scenic ACEC values. In addition to the IMP, Butler Wash North would be retained in public ownership; be unavailable for private or commercial use of woodland products, though limited on-site collection of dead wood for campfires would be permitted; be available for livestock use, but may be limited if cultural resources are impacted; closed to OHV use; and be managed by VRM Class I objectives. These actions would also limit surface disturbances that would degrade the relevant and important scenic values of Butler Wash North.

4.3.14.2.4. CEDAR MESA ACEC

Cedar Mesa is currently managed as an ACEC under Alternative A to protect its relevant and important cultural and scenic values, and the designation would continue under Alternatives B and E. Under Alternative A, the ACEC (295,336 acres) would include Valley of the Gods. Under Alternatives B and E the ACEC (306,742 acres) would not include Valley of the Gods as it is proposed as a separate ACEC under these alternatives. Cedar Mesa would not be designated as an ACEC under Alternatives C and D or the Proposed Plan. The area would be managed as a Cultural Special Recreation Management Area (C-SRMA) under Alternatives C and D, and an SRMA under the Proposed Plan. (See the Recreation section for a discussion of impacts from this decision). Grand Gulch, Road Canyon, Fish Creek Canyon, and Mule Canyon WSAs overlie the proposed Cedar Mesa ACEC comprising 209,619 acres or 71% of the proposed ACEC under Alternative A and 68% under Alternatives B and E. The existing ACEC configuration includes Valley of the Gods (22,863 acres), which is proposed as a separate ACEC under Alternatives B, C, and E and the Proposed Plan.

The WSAs would be managed under the IMP and the Grand Gulch Special Emphasis area management prescriptions are discussed in the next section.

The remaining acres would be managed as outlined in the alternatives matrix and the impacts from those decisions are discussed below. Those elements of the ACEC prescription that are consistent with IMP direction would also apply to the WSA area.

4.3.14.2.4.1. Alternative A

Under Alternative A, the 295,336 acre area would be available for land treatments and wildlife habitat and range improvements. These actions would maintain and enhance vegetation and forage important to wildlife and their habitat, but also result in surface disturbance and modification of the landscape or scenic values. Over the long-term following reclamation (natural or actions taken by people), vegetation treatments would introduce variety to the vegetation community, enhancing its scenic appeal. Prior to vegetation treatments, the treatment area would be surveyed for cultural resources, and necessary mitigation measure implemented to protect cultural resources.

With this alternative, the area would open to woodland product harvest in designated areas. On-site collection of dead fuel wood would be allowed throughout the entire area. The harvesting of woodland product could be detrimental to the values of the ACEC depending on the area involved and the amount of wood harvested. Firewood cutting would remove some degree of vegetation, changing that element of the landscape. Depending on the amount or degree of removal, harvest of fuelwood could result in a noticeable change to the landscape – the scenery. Since cutting areas would be designated, those areas could be designed to reduce change to the landscape, and would be surveyed for the presence of cultural resources prior to cutting to mitigate any disturbance or harm to cultural sites.

Under Alternative A the area would be open for mineral leasing with Standard stipulations, and NSO stipulations in areas managed for primitive recreation settings. NSO stipulations would protect the scenery of the landscape in those primitive recreation settings. Leasing with standard stipulations would allow construction of roads and well pads and placement of structures that would alter the scenery of the ACEC. However, the entire ACEC falls within the Monument Upwarp RFD which has low potential for mineral development (See Minerals discussion for specifics). Only nine wells are projected to be developed in the Monument Upwarp over the next 15 years, totaling 69 acres of surface disturbance. There would also be surface disturbance created by geophysical work totaling 120 acres within the Monument Upwarp. This would be reclaimed within ten years. The ACEC is also open to the disposal of mineral materials and mineral entry. Depending on the location of these activities, there would be a risk of compromising the scenic values of the ACEC because of surface disturbance caused by mining activities and mineral development. The surface disturbance resulting from these development activities would be mitigated with the requirement for revegetation. Only that disturbance that would be successfully reclaimed within 5 years after project completion would be permitted. Depending on the soil and vegetation type in the project area this could preclude some development and would benefit the values of the ACEC. With all surface disturbance and development activities, cultural surveys would be conducted prior to implementation of the project to identify any cultural resources and prescribe needed mitigation measures, thus protecting cultural sites.

In the areas where the Scenic Highway Corridor overlaps (21,280 acres) the ACEC special conditions for the Corridor take precedence. The Corridor would be managed as open to most uses including mineral entry but it would also be managed as NSO for minerals and as VRM I. These two actions would rule out any occurrences of visible surface disturbance and would consequently protect the values of the ACEC in this area of overlap.

Special protective management prescriptions close the Grand Gulch Special Emphasis Area to the following uses: mineral leasing, geophysical work, disposal of mineral materials, woodland product harvest, and ORV use. In addition a withdrawal from mineral entry would be requested and the area would be managed as VRM I. All of these actions would benefit the area by preventing surface disturbance and protecting the cultural and scenic resource values of the ACEC.

4.3.14.2.4.2. Alternative B

Alternative B's management prescriptions diverge from Alternative A in the aspects of recreational use, livestock use, and woodland product harvest.

Under Alternative B the area would be available for livestock use, but with special conditions to protect at risk cultural resources. The special conditions mostly involve fencing to keep livestock from impacting sites with features at risk such as standing walls or large middens. Restrictions would be in conformance with the grazing permit renewal stipulations specific to protecting cultural resources at risk from livestock impacts within each allotment. Thus, there would be variations in protective measures for each allotment depending on site density and type. (personal communication between Nancy Shearin, Monticello FO and Deb Reber, SWCA on August 24, 2006) This prescription would offer beneficial direct protections to the cultural values of the ACEC by preventing damage from livestock trampling.

Recreation use under Alternative B would be managed in the following way: 1) the area would be closed to dispersed camping; 2) overnight campers would be required to pack out human waste; 3) recreation permits for both day and overnight use would be limited as necessary to prevent cultural site damage from over visitation and 4) campfires would be limited to mesa tops and would be closed if there are impacts to cultural sites. All of these actions would provide beneficial direct and indirect impacts to the cultural and scenic ACEC values. Closing the area to dispersed camping and limiting visitation would decrease surface disturbance, limit social trails, and may reduce vandalism, pot hunting, and surface collections.

Alternative B provides for additional protections to the ACEC values by requiring that human waste be packed out. This decision would maintain site-specific aesthetic values (i.e., campsites, canyons), water quality, and improve health and safety concerns. For much of Cedar Mesa there is concentrated use in narrow corridors. These small areas cannot isolate and naturally process large amounts of human waste. Research has shown that buried feces, and the microbes in it, persist for many months when buried. The volume of waste generated along the trail, combined with a climate that is not conducive to composting, make "digestion" of waste unlikely.

Closing the area to private and commercial use of woodland products would have direct beneficial impacts to the relevant and important values of the ACEC. This decision would diminish impacts to cultural sites by eliminating unintended damage from driving vehicles off designated roads for the cutting and loading of wood and the subsequent use of the resultant

"trail" (tire tracks) by OHV riders. This decision would also prohibit the harvesting of pinyon-juniper, reducing alteration to the vegetation component of the landscape and its scenic quality.

Impacts to the Grand Gulch Special Emphasis Area would be the same as Alternative A.

4.3.14.2.4.3. Alternatives C and D and the Proposed Plan

Under Alternatives C and D and the Proposed Plan, the area would not be designated as an ACEC. However, it would be managed as a Cultural Special Recreation Management Area – C-SRMA under Alternatives C and D and an SRMA under the Proposed Plan (see Section 4.3.10, Recreation). No special management prescription would be implemented to protect the relevant and important cultural and scenic values. As a C-SRMA or SRMA, the management focus would be on providing outstanding recreational opportunities while protecting natural and cultural resource values. Further, large portions of the proposed ACEC are located in the Grand Gulch, Road Canyon, Fish Creek Canyon, and Mule Canyon WSAs. Management of the WSAs under the IMP to protect their wilderness characteristics would prevent surface disturbances and protect the relevant and important scenic and cultural resource ACEC values. Fuelwood harvest would be permitted in parts of the C-SRMA and SRMA. Removal of some degree of vegetation cover would alter the vegetation component of the landscape and thus the scenery of the ACEC. However, fuelwood harvest would not be permitted without survey and mitigation to protect cultural resources. The WSA portions of the proposed ACEC would be closed to oil and gas leasing and OHV use, and managed by VRM Class I objectives to preserve the characteristic landscape. All of these measures would continue to protect most of the ACEC values.

4.3.14.2.4.4. Alternative E

The impacts under Alternative E would be the same as those described under Alternative B, except that approximately 60,049 acres (20% of the proposed Cedar Mesa ACEC) would be managed with emphasis on protection of the natural characteristics and opportunities for solitude and primitive recreation within non-WSA lands with wilderness characteristics. This management would protect the relevant and important scenery and cultural resource values of the ACEC by limiting surface disturbance. These areas would be managed as VRM Class I, closed to mineral leasing, managed as exclusion areas for ROWs, closed to new road construction, closed to woodland harvesting and gathering, and closed to OHV travel.

The impacts to the Grand Gulch Special Emphasis Area would be the same as Alternative A.

4.3.14.2.5. DARK CANYON ACEC

Dark Canyon is an existing ACEC (61,660 acres) and Alternatives A, B, and E (61,660 acres) would continue ACEC management to protect the scenic and wildlife values. The ACEC would not be designated as an ACEC under Alternatives C and D or the Proposed Plan. Dark Canyon WSA overlaps the entire proposed ACEC (Maps 87 and 88).

4.3.14.2.5.1. Alternative A

Alternatives A proposes to exclude most surface-disturbing activities including woodland product use, OHV use, livestock use, oil and gas development, and mineral material disposal. The area would also be managed under VRM Class I objectives to preserve the characteristics landscape. Excluding surface-disturbing activities would have beneficial impacts to the relevant

and important values because the natural character of the landscape would be retained thereby protecting scenic values. These management prescriptions would also offer benefits to wildlife by eliminating noise from construction projects, preventing habitat fragmentation, retaining soil structure and preventing vegetation loss. VRM I management would have similar beneficial impacts because the level of change to the characteristic landscape must be very low and not attract attention consequently eliminating most surface-disturbing activities.

Besides the benefits of reducing surface disturbance, closing the area to OHV use would benefit wildlife by eliminating noise disturbances. Scientific literature indicates some wildlife species may be affected by excessive noise and disturbance. Displacement during winter depletes energy reserves needed for survival and reproduction by mammals and birds. On the other hand, some species (especially deer) adapt to the noise disturbance over time and may no longer be displaced by the activity (USFS 2005).

Under Alternative A, area recreation use would be limited if cultural or resources or scenic values are being damaged. Although this decision would be beneficial in the long term, there is risk of short term direct and indirect negative impacts to the area from increased recreation use as limitations on use would only be applied after there is evidence of damage. Scenic values could be compromised by localized surface disturbance. Vegetation around the perimeter of campsites could be destroyed as more and larger groups occupy the sites. There is potential for cutting of greenwood because of lack of dead and downed wood for campfires and an increased risk of human induced wildfire. Water quality could be diminished by an increase in human and pet waste. Negative impacts to wildlife could occur from the presence and noise of visitors during sensitive breeding and foraging periods.

A withdrawal for mineral entry would prevent mining related surface disturbance, with the same beneficial impacts to wildlife and scenery as noted above.

4.3.14.2.5.2. Alternatives B and E

Alternatives B and E would have similar effects on relevant and important scenic and wildlife values as Alternative A. Under these alternatives, however, campfires would only be allowed on mesa tops (not in the canyons) and there would be a requirement to pack out human waste. Packing out human waste would maintain site-specific aesthetic values, water quality, and improve health and safety concerns. This would indirectly benefit wildlife as they rely on healthy water systems. Packing out waste would offer some benefits to the scenic values by reducing the risk of erosional forces revealing human waste and paper by-products. Restricting campfire use to mesa tops would have minor beneficial impacts to the scenic values by reducing the risk of wildfire and eliminating unsightly campfire rings, ash, and debris. Reducing the risk of wildfire would have long-term beneficial impacts on wildlife because habitat would be preserved.

4.3.14.2.5.3. Alternatives C and D

Alternatives C and E would similar impacts to ACEC values as described for Alternatives B and E because the ACEC would remain within the Dark Canyon WSA and managed under the IMP to protect it wilderness characteristics. The protective prescription of the IMP would prevent surface disturbance, protecting the relevant and important scenic and wildlife value, as described for Alternatives B and E.

4.3.14.2.5.4. Proposed Plan

Under the Proposed Plan, Dark Canyon would not be managed as an ACEC. It would, however, be managed as part of Dark Canyon WSA, under the IMP, with the same protective effects on ACEC values as described for the other alternatives. As a part of the WSA and a special recreation management area, however, Dark Canyon would be closed to private and commercial firewood cutting, closed to livestock use (except Fable Valley), closed to motorized and mechanized use, recommended for mineral withdrawal, and closed to oil and gas leasing. Recreation use would be limited if scenic and wildlife values were threatened. These actions would prevent or limit surface disturbance and protect wildlife habitat, resulting in protection of the relevant and important scenic and wildlife ACEC values.

4.3.14.2.6. HOVENWEEP ACEC

Hovenweep is an existing ACEC (1,798 acres) and Alternatives A, B, C, and E and the Proposed Plan would continue ACEC management to provide special management attention to protect the area's relevant and important cultural and habitat management values. The size of the ACEC would be increased from 1,798 acres under Alternative A to 2,418 acres under Alternatives B, C, and E and the Proposed Plan. The additional 620 acres is contiguous with the existing ACEC and is east of Hovenweep National Monument. The area would not be designated as an ACEC under Alternative D.

4.3.14.2.6.1. Alternative A

Under Alternative A, No Action, Hovenweep ACEC would be managed as open to most uses except for the disposal of mineral materials and woodland product use. These uses would result in surface disturbances that could harm the cultural resources and habitat values of the ACEC without mitigation measures. Needed mitigation measure, however, would be implemented and protect the ACEC values

Mineral leasing would be subject to timing and controlled surface use on 918 acres (51.0%), which includes the ten acres of Cajon Pond Habitat, and no surface occupancy on 880 acres (49%) for the Visual Protective Zone. Surface uses would be precluded in Cajon Pond during the shorebird and waterfowl courtship and nesting season (March 1-June 30). The proposed ACEC is in the Blanding Sub-basin, the RFD area that has high potential for mineral development. Those portions that are managed with timing and controlled surface use would be subject to impacts from surface disturbance (see Alkali Ridge ACEC impacts discussion). The NSO stipulations for the Visual Protection Zone would offer indirect beneficial protection to values of the ACEC by eliminating surface disturbance.

Mineral entry would be allowed with an approved plan of operation.⁷ This would have negative effects on the values of the ACEC if approved. Although impacts to cultural sites would be mitigated there is still a risk of loss of site integrity and damage to cultural resources from relocation. Depending on the location of the mine, there could be degradation to visual quality in the Visual Protective Zone and Hovenweep National Monument.

⁷ There is no historical knowledge of the evolution of these seemingly opposite management decisions other than mineral withdrawals require congressional approval which can be extremely labor intensive and time consuming to obtain.

4.3.14.2.6.2. Alternatives B and E

Under Alternatives B and E, an additional acquired 620 acres contiguous to the eastern border of the current ACEC and Hovenweep National Monument would be added to the ACEC. Alternatives B and E would be managed the same as Alternative A except under these alternatives, no new routes would be designated within the ACEC and surface-disturbing land treatments would not be allowed. One other key difference between these alternatives and Alternative A is that Alternatives B and E would manage the area as open to oil and gas leasing with Standard stipulations. The fact that oil and gas leasing would be managed under standard stipulations could negate the positive aspects of the other two decisions, which preclude surface disturbance. Allowing surface disturbance of up to 9.6 acres per well would have a detrimental effect on the visual, cultural, and wildlife resources. The visual protection zone and Cajon pond would be open for development. This could degrade the scenic quality of the surrounding areas including Hovenweep National Monument and may impact wildlife species utilizing the pond as habitat. In addition to surface disturbance, indirect adverse effects include noise and habitat fragmentation.

4.3.14.2.6.3. Alternative C

Alternative C is similar to Alternative A except that it would allow for watershed improvements and vegetative treatments as long as cultural sites are not impacted and the emphasis would be on non-surface-disturbing treatments. This allows for more protection of cultural sites while still allowing the flexibility to conduct treatments when needed to prevent noxious weed infestations and to improve wildlife habitat.

As with Alternatives B and E, Alternative C would also manage oil and gas leasing with Standard stipulations. Impacts would be the same as noted in Alternatives B and E.

4.3.14.2.6.4. Alternative D

Alternative D would not designate the ACEC and would manage the area with similar prescriptions of the surrounding area. This equates to essentially the same management as Alternative C except the area would be managed as VRM Class IV. This would allow for the level of change to the landscape to be high rather than moderate. This difference would have a negligible on the impacts to the ACEC values. Consequently, impacts from Alternative D would be similar to Alternative C.

4.3.14.2.6.5. Proposed Plan

The Proposed Plan is similar to Alternative A, except that it would allow for watershed improvements and vegetative treatments as long as cultural sites are not impacted and the emphasis would be on non-surface-disturbing treatments. This allows for more protection of cultural sites while still allowing the flexibility to conduct treatments when needed to prevent noxious weed infestations and to improve wildlife habitat. In addition, the visual emphasis zone would be managed as VRM II and NSO which would have beneficial impacts to the ACEC by reducing surface disturbance.

The Proposed Plan would manage oil and gas leasing with timing limitations and controlled surface use (1,538 acres), and NSO (880 acres) stipulations. Development on that portion of the ACEC available for leasing with timing limitations and controlled surface use would result in

surface disturbance and impacts to relevant and important cultural resource and habitat values as noted in Alternative B. However, compliance with Section 106 of the National Historic Preservation Act would mitigate adverse effect on cultural sites and values.

4.3.14.2.7. INDIAN CREEK ACEC

Indian Creek is managed as an ACEC under Alternatives A, B, C, and E and the Proposed Plan to provide special management attention to protect the area's relevant and important scenic values. The area would not be designated as an ACEC under Alternative D. The size of the proposed ACEC varies between alternatives. Under Alternative A it would be 8,510 acres with 6,130 acres (47%) overlapping the Indian Creek WSA (Map 87). Under Alternatives B and E, the ACEC would be 8,510 acres with 4,602 acres (54%) overlapping the Indian Creek WSA (Map 88) and under Alternative C it would be 3,908 acres with the WSA completely excluded (Map 89). The WSA would be managed to protect its wilderness characteristics under the IMP, protecting the scenic quality of the ACEC.

4.3.14.2.7.1. Alternative A

Under Alternative A the area would be managed as closed to the disposal of mineral materials, woodland product harvest, and OHV use. Closures to all of these activities would benefit the scenic quality by preventing surface disturbance and landscape change.

Surface-disturbing activities such as mineral leasing, geophysical work and mineral entry would be allowed but they would be subject to a VRM Class I management standard which would either preclude the project entirely or only allow it if it meets the visual quality standards for the area. (As an example, mineral infrastructure may be located in a deep gully or other area that is topographically invisible from a typical viewpoint.) Restricting or concealing these activities would preserve the characteristics landscape (landform and vegetation) in visible areas thereby protecting the scenic quality.

Recreation use would be curtailed if scenic values were damaged. As mentioned in Section 4.3.10, Recreation, use would be allowed until there is evidence of damage the landscape – the scenery. The evidence could be as minor as footprints in biological soil crusts to something more significant such as a social trail in sensitive soils.

The area would be available for livestock use. This would have negligible impacts on the scenic quality, as grazing doesn't result in noticeable changes to the landform or vegetation.

Another management prescription that would preserve and enhance the scenic qualities would be the requirement that revegetation be done with native species only. This would help retain the natural characteristics of the area and eliminate unnatural breaks of differing vegetation types.

4.3.14.2.7.2. Alternative B

Alternative B would be the same as Alternative A with the following exception. First, the BLM would request a mineral withdrawal for the area, which means it would be closed to mineral entry. This affords protection to the scenic values of the ACEC by preventing mining-related surface-disturbing activities that alter and degrade the scenic quality of the landscape. Second, the ACEC would be available for oil and gas leasing subject to a NSO stipulation, without exceptions. Third, the ACEC would be closed to fuelwood cutting, and collection for campfires.

These additional measures would further limit landscape change from surface disturbance and protect the relevant and important scenic values of the ACEC.

4.3.14.2.7.3. Alternative C

Alternative C is the same as Alternative B, except it allows for some dispersed camping but only outside of specified zones and OHV use would be limited to designated roads and trails. The difference in the amount of damage to scenic resources between the two alternatives would be negligible.

4.3.14.2.7.4. Alternative D

Alternative D would not designate the area as an ACEC and would allow all uses including dispersed camping. The area would be managed as VRM III, allowing moderate, but not landscape dominating change. The area that would be NSO under Alternatives A, B, and C would be managed as available to mineral leasing with timing and controlled surface use. OHV use would be limited to designated roads and trails. Allowing for surface-disturbing activities and construction of mineral infrastructure would alter the area's scenic qualities and the nature of the landscape.

4.3.14.2.7.5. Alternative E

The impacts under Alternative E would be the same as those under Alternative B, except approximately 3,887 acres (30% of the proposed ACEC) would be managed to maintain the wilderness characteristics of non-WSA lands with wilderness characteristics. Protection of wilderness characteristics would include closure to mineral leasing and VRM Class I management objectives. These actions would provide long-term, protection of the relevant and important scenic values because protection of non-WSA lands with wilderness characteristics values would prevent surface disturbance that would diminish the scenic quality of the ACEC.

4.3.14.2.7.6. Proposed Plan

The Proposed Plan would be the same as Alternative B, except that 3,908 acres would be designated as an ACEC. The difference between the two alternatives would not noticeably change the impacts to the scenic values of the ACEC. In that portion of the proposed ACEC that would not be designated and managed as an ACEC under the Proposed Plan, much of it would be managed as part of the Indian Creek WSA. Management of the WSA under the IMP would prohibit uses that would result in surface disturbances that degrade wilderness values. That protection would also protect the relevant and important scenic ACEC values.

4.3.14.2.8. LOCKHART BASIN ACEC

Lockhart Basin is proposed as an ACEC (47,783 acres) under Alternatives B and E to provide special management attention to protect the area's relevant and important scenic values. There is currently no existing ACEC for Lockhart Basin. A portion of the potential ACEC includes the existing Indian Creek ACEC. The area would not be designated as an ACEC under Alternatives C and D or the Proposed Plan.

4.3.14.2.8.1. Alternative A

Under Alternative A the portion of the potential ACEC Lockhart Basin ACEC includes the existing Indian Creek ACEC (8,642 acres) and would be managed by VRM Class I objectives. The remaining 39,141 acres would be managed as VRM II. Although the area would be open to most uses, including mineral leasing, geophysical exploration, mineral material development, and mining entry, the limitations of the VRM Class I and Class II objectives would limit most surface disturbance and would preserve the scenic values of the ACEC. There would be some risk of change to the landscape under VRM II but as noted in VRM class objectives, landscape changes should not attract the attention of the casual observer.

4.3.14.2.8.2. Alternative B

Alternative B and Alternative E are the only alternatives proposing that Lockhart Basin be designated as an ACEC to protect its scenic values. Alternative B would preclude surface-disturbing activities, manage the area under VRM Class I landscape objectives, and propose the area for withdrawal from mineral entry. Precluding surface-disturbing activities and managing the area as VRM I would offer a high degree of protection of the visual resources thereby protecting the ACEC's relevant and important scenic values.

4.3.14.2.8.3. Alternatives C and D

Alternatives C and D would not designate an ACEC and would allow most uses except woodland product harvest. Mineral leasing would be subject to timing limitations and controlled surface use but only in the bighorn sheep area. The rest of the area would be open with Standard stipulations. The area would be managed as VRM Class II and Class III. These visual objectives would mitigate and reduce changes to the landscape, but not prevent changes to the scenic values of the area, as oil and gas development would be allowed and the wells along with the associated infrastructure would degrade the visual quality from select viewpoints.

4.3.14.2.8.4. Alternative E

The impacts under Alternative E would be the same as those under Alternative B, except that approximately 21,298 acres (45% of the proposed ACEC) would be managed to protect the wilderness characteristics of non-WSA lands with wilderness characteristics. This management prescription would limit surface disturbance and provide additional protection for the ACEC's relevant and important scenic values by closing these acres to mineral leasing and geophysical exploration (by eliminating exemptions for geophysical exploration when VRM Class I criteria could be met), and by managing landscape change with VRM Class I objectives.

4.3.14.2.8.5. Proposed Plan

The Proposed Plan would not designate the ACEC and would allow most uses except woodland product harvest. Mineral leasing would be subject to timing limitations and controlled surface use in the bighorn sheep area. The rest of the area would be open for leasing with Standard stipulations. The area would be managed as VRM Class II and Class III. While these measures would not prevent alteration of landscape (scenic values), mitigation measures would be implemented to reduce the view of authorized surface disturbances, such as oil and gas development and the associated infrastructure.

4.3.14.2.9. LAVENDER MESA ACEC

Lavender Mesa is an existing ACEC (649 acres) and the designation would continue under Alternatives A, B, C, and E and the Proposed Plan to protect the area's relevant and import relict vegetation values. The area would not be designated as an ACEC under Alternative D.

4.3.14.2.9.1. Alternative A

Alternative A would prohibit OHV use, disposal of mineral materials, use of woodland products, grazing, land treatments (including vegetation treatments), wildlife habitat improvements, watershed control structures, and surface disturbance. Recreational use would be allowed but access is difficult. This alternative provides long-term protection to the ACEC values by precluding virtually all surface disturbance, thereby protecting the relict vegetation. There could be minor adverse impacts from hikers and climbers trampling vegetation or camping on the relict vegetation but recreational use can be curtailed under this alternative if there are any signs of damage to relict vegetation. Some mineral development would also be allowed but only on the slopes of the mesa as the mesa tops are NSO. This too would protect the relict vegetation on the mesa tops.

4.3.14.2.9.2. Alternative B

The Alternative B management prescription would be the same as Alternative A, except under Alternative B there would be allowances to conduct non-surface-disturbing vegetative treatments to control invasive species and for rehabilitation of disturbed surfaces. Alternative B would also prohibit campfires, limit recreation if vegetative resources are being impacted, and manage landscape change by VRM Class II objectives.

These prescriptions would offer a slightly higher degree of protection to the relict vegetation than Alternative A because controlling invasive species would benefit the native plants. Given that invasive plants draw excessive amounts of water from the soil, displace native plants, and are practically unusable for food, cover, or nesting substrate by native wildlife (BLM Undated) they are a major threat to native species. Implementing this prescription would reduce the risk of invasive species gaining a foothold in the area consequently protecting and allowing for an increase in relict vegetation.

Prohibiting campfires would also provide a higher level of protection to the relict vegetation values in comparison to Alternative A by eliminating the possibility of damage from campfires, campfire rings, or the possibility of human induced wildfires.

VRM Class II objectives would limit surface disturbances that would harm the relict vegetation community.

4.3.14.2.9.3. Alternative C

Impacts from Alternative C are essentially the same as described above for Alternative B.

4.3.14.2.9.4. Alternative D

Under this alternative, the ACEC would not be designated, offering no special protection to the relevant and important relict vegetation community. The lands would be managed the same as the surrounding area - VRM Class III, OHVs limited to designated routes, and closed to

firewood cutting. However, since the mesa top is inaccessible to vehicles and livestock, little change to the plant community is expected.

4.3.14.2.9.5. Alternative E

The impacts under Alternative E would be the same as those under Alternative B, except that additional protections of the relevant and important relict vegetation would occur due to management focused on maintaining the wilderness characteristics of non-WSA lands with wilderness characteristics. This alternative would provide more protection for relict vegetation of the entire 649-acre ACEC. Closing the ACEC to oil and gas leasing and locatable mineral entry, as well as managing the landscape for VRM Class I objectives, would limit surface disturbance, protecting the relict vegetation community.

4.3.14.2.9.6. Proposed Plan

Impacts of the ACEC prescription of the Proposed Plan would be essentially the same as described for Alternative B.

4.3.14.2.10. SHAY CANYON ACEC

Shay Canyon is an existing ACEC (3,561 acres) and Alternatives A, B, C, and E and the Proposed Plan would continue ACEC management to provide special management attention to protect the area's relevant and important cultural values. The size of the ACEC would be reduced to 119 acres under Alternatives B, C, and E and the Proposed Plan to only include the area with the highest site density. It would not be designated under Alternative D.

4.3.14.2.10.1. Alternative A

Under Alternative A the area managed as an ACEC would be 3,561 acres and would include the Newspaper Rock art panel, the riparian corridor of Indian Creek and the core of Shay Canyon.

Alternative A would allow for grazing, campfires, and camping within the ACEC. All of these activities would increase the risk of minor localized surface disturbance to the cultural and paleontological sites from trampling and exposure. There is also potential for looting and vandalism from campers who may discover previously unexposed sites.

Under Alternative A the area would be managed as VRM Class I. This management prescription would virtually eliminate the risk of damage from major surface-disturbing activities within the 3,561 acres because the objective of this management class is to preserve the characteristics landscape. Consequently, even though mineral development (including mineral material disposal, mining entry, and mineral leasing) would be allowed under Alternative A, it is virtually precluded by the overriding requirements of VRM Class I. There is some risk of localized surface disturbance from geophysical work but it too must comply with VRM Class I objectives and would not impact the values of the ACEC.

This alternative would allow for vegetation treatments and watershed and habitat improvements. The requirement that revegetation must be successfully established within 5 years after project completion supplements these prescriptions and assures that although there may be some temporary surface disturbance no irreparable harm would occur from these activities within the ACEC. The area would be closed to woodland product harvest and this would further protect

cultural resources by eliminating the chance of negative impacts from vehicles driving off designated roads for cutting and loading wood.

OHV use would be limited to designated roads and trails. This limitation would prevent additional surface disturbance that would potentially harm cultural and paleontological sites.

4.3.14.2.10.2. Alternatives B and C and the Proposed Plan

The size of the ACEC would be reduced to 119 acres under Alternative B and the Proposed Plan, and the management prescriptions for that smaller area would be more restrictive than under Alternative A. No surface disturbance would be allowed for vegetation, watershed, or wildlife treatments/improvements. The area would be closed to the disposal of mineral materials, woodland product harvest, and camping. Livestock use would be restricted to trailing only and hiking would be limited to designated trails (except for side canyons). Mineral leasing would be managed as NSO. All of these prescriptions would protect the ACEC values by reducing the possibility of surface-disturbing activities that could damage cultural sites. The VRM II prescription under this alternative would complement these prescriptions by only allowing minimal change to the landscape. OHV use would be limited to designated roads and trails. This limitation would prevent additional surface disturbance that would potentially harm cultural and paleontological sites.

The remainder of the proposed ACEC, however, would not be designated under the Proposed Plan or these alternatives but would be managed in a manner similar to Alternative A. Lands outside the ACEC would be managed as VRM Class II rather than VRM Class I. This would be less restrictive than Alternative A. However, since several other prescriptions limit surface disturbance, the risk of adverse impacts would be minimal. Any action proposed would be implemented only following compliance with Section 106 of the National Historic Preservation Act, protect the cultural resource values of the lands not designated and managed as an ACEC.

4.3.14.2.10.3. Alternative D

Under Alternative D the area would not be designated as an ACEC and as with Alternative A grazing, vegetation treatments, campfires and camping would be allowed. As noted under Alternative A these activities would increase the risk of surface disturbance to the cultural and paleontological sites from trampling, vandalism, and exposure. In addition mineral development including mineral material disposal would be allowed under Alternative D. There could be adverse impacts if surveys missed sites or cultural resources were damaged during relocation but in an area of this size the risk would be low. With this alternative the area would be managed as VRM Class III rather than VRM Class II as it is under Alternatives A, B, and C and the Proposed Plan. This would allow for a higher level of surface disturbance and would increase the potential for impacts to cultural sites.

4.3.14.2.10.4. Alternative E

The impacts under Alternative E would be the same as those under Alternative B, except that there would be additional protections to the relevant and important cultural values from the management prescriptions for non-WSA lands with wilderness characteristics. Under this alternative, the prescription for protective management of 99 acres of non-WSA lands with wilderness characteristics (83% of the proposed ACEC) would provide additional protection for

cultural resources by closing the ACEC to oil and gas leasing, geophysical exploration, and mineral entry; managing the ACEC under VRM Class I objectives; and closing the ACEC to OHV use. These actions prescribed to protect the wilderness characteristics of the non-WSA lands with wilderness characteristics would limit surface disturbance that could harm cultural and paleontological resources.

4.3.14.2.11. SAN JUAN RIVER ACEC

The San Juan River is proposed as an ACEC under Alternatives B (7,590 acres), C (4,321 acres), and E (7,590 acres) and the Proposed Plan (4,321 acres) to protect the area's relevant and important wildlife values, scenery, cultural resources, and natural systems. The area would not be designated under Alternatives A or D but would be managed as the San Juan River Special Recreation Management Areas (SRMA). It should be noted that the area south of the river corridor is under the jurisdiction of the Navajo Nation, and these prescriptions would not apply.

4.3.14.2.11.1. Alternative A

Under Alternative A the area would not be designated as an ACEC but would be managed as a special recreation management area (SRMA) of 15,100 acres. See the Recreation Section 4.3.10 for a description of impacts from SRMA decisions under this alternative.

Oil and gas leasing would be managed with timing and controlled surface use stipulations within the areas managed for semi-primitive, motorized recreation objectives (ROS – SPM) and NSO within areas managed for primitive objectives (ROS – P) (see Map 35). The remaining area would be managed with Standard oil and gas leasing stipulations. The ROS-P area corresponds with the eligible segment proposed as a Wild and Scenic River and would be protected from development within a quarter-mile of centerline. This would have beneficial impacts to the relevant and important values. Areas outside of this corridor would be managed with Timing and Controlled Surface Use and Standard stipulations. The values of these areas would be negatively impacted if mineral development were to occur because of surface disturbances, visual intrusions, and disruptions to wildlife and wildlife habitat.

Grazing is allowed under this alternative and could cause direct short-term negative impacts to the riparian areas. Springs and tributary streams are especially susceptible as livestock tend to congregate/loiter in these areas. Cattle grazing in riparian areas affects nutrients, fecal bacteria, sediments, stream banks, and vegetation in the riparian ecosystem, with associated effects on water quality. Livestock grazing in riparian areas can cause non-point source water pollution. (Mosley et al. 2005) Although grazing is managed under the Standards for Rangeland Health and permittees generally follow its mandates, it is difficult to apply these standards to free-roaming cattle on a day-to-day basis. Consequently there can be occasional impacts in these areas. Livestock grazing may also cause long-term direct impacts to cultural resources. (See Alkali Ridge ACEC Alternative A).

Under this alternative, the area would be recommended for withdrawal from mineral entry. This would directly benefit the values of the ACEC by precluding surface disturbance. This decision would help to preserve the pristine nature of the river corridor and would enhance the recreational experience. Sedimentation and pollution from surface disturbance would be reduced thereby improving or maintaining water quality and wildlife habitat. The visual integrity of the area would be preserved.

The river corridor would be managed as VRM Class I, Class II, and Class III. In those areas that would be managed as VRM Class I or Class II, the values of the ACEC would be protected because surface disturbance would not occur in VRM Class I areas and would be limited in VRM Class II areas. However those areas that would be managed as VRM Class III would be subject to moderate levels of surface-disturbing activities that would adversely impact the values of the ACEC.

4.3.14.2.11.2. Alternative B

This alternative differs from Alternative A because the entire area would be managed as NSO for mineral leasing and the VRM categories would shift from a higher percentage of VRM Class I to a higher percentage of VRM Class II and Class III. In addition the entire area would be closed to mineral materials disposal rather than just the ROS-P areas, and livestock grazing seasons of use would be shortened by two weeks to one month depending on the allotment.

Managing the entire area as NSO for mineral leasing would have beneficial impacts to the values of the ACEC by preventing surface disturbance. Shifting from a higher percentage of VRM Class I to VRM Class II and Class III could have some impacts to the values of the ACEC because some level of surface disturbance may be allowed under VRM Class II and would certainly be allowed under VRM Class III. Even though the disturbances may meet the visual standards there would still be the risk of impacts to the wildlife, cultural, and natural systems values because of sedimentation, noise, and inadvertent damages to cultural sites from development.

Closing the entire area to minerals materials disposal would further protect the values of the ACEC by eliminating surface disturbance and impacts from mining activities such as and noise from construction and operations.

Shortening the seasons of use for livestock grazing would benefit the values of the ACEC by reducing forage and habitat conflicts with wildlife and reducing the risk of impacts to riparian areas as noted in Alternative A.

Range, wildlife, and watershed improvement projects, including vegetation treatments would benefit wildlife by enhancing habitat. These projects would provide opportunities to restore native vegetation communities, benefiting the natural systems of the ACEC. Vegetation treatment would also add variety to the vegetation component of the landscape, enhancing the scenic appeal of the areas (e.g., restoring riparian communities, adding openings of shrubs and grasses to pinyon-juniper stands). While these projects may not directly benefit cultural resources, they would be designed, mitigated, and implemented to prevent harm or disturbance to cultural sites.

4.3.14.2.11.3. Alternative C and the Proposed Plan

Alternative C would be the same as Alternative B. The Proposed Plan would be the same as Alternative B, except for a smaller ACEC (4,321 acres). Under the Proposed Plan, 3,269 acres would not be designated and managed as an ACEC. The relevant and important wildlife, scenic, and cultural resource values and natural system values would be protected, however. Those lands not managed for their ACEC values would be located in a segment of the San Juan River recommended suitable for wild and scenic river designation. Management to protect river values

would also protect the relevant and important values of the lands in the ACEC not designated under the Proposed Plan .

4.3.14.2.11.4. Alternative D

The area would not be designated as an ACEC under this alternative. The area would be managed with the same prescriptions, as Alternative B except that the entire area would be managed as VRM Class II and Class III, livestock use would be allowed from October 1-May 31, and the area would not be recommended for mineral withdrawal.

Managing the area as VRM Class II would offer beneficial protections to the values of the ACEC by precluding most surface use and retaining the visual integrity of the landscape. VRM Class III objectives would allow more moderate changes to the landscape, affecting the scenic quality of the lands. Livestock seasons of use would be similar to Alternative A. Please see the discussion under that alternative for possible impacts. Since the area would not be recommended for withdrawal there would be a risk of impacts to the values of the ACEC from mineral entry. The riparian corridor would be managed as NSO for oil and gas development, and there would only be impacts if an exception was applied, or the development area was outside of the riparian corridor.

4.3.14.2.11.5. Alternative E

The impacts under Alternative E would be the same as those under Alternative B, except that approximately 2,155 acres (28% of the proposed ACEC) of non-WSA lands with wilderness characteristics would be managed with further resource protections in order to preserve their wilderness values. This management decision would further protect the relevant and important (wildlife, scenic, cultural values, and natural systems) values of the ACEC by closing the non-WSA lands with wilderness characteristics to mineral leasing and mining entry, managing the area under VRM Class I objectives, excluding ROWs, prohibiting new roads, and closing the area to woodland harvesting and OHV travel.

4.3.14.2.12. SCENIC HIGHWAY ACEC

There are several Scenic Byways or Backways including: Indian Creek Corridor Scenic Byway, Bicentennial Trail of the Ancients, Monument Valley to Bluff Scenic Backway, Lockhart Basin Road Scenic Backway, Abajo Loop Road Scenic Backway, and Trail of the Ancients Scenic Backway. Management of lands adjacent to Scenic Byways and Backways could affect the visitor's experience while driving along the Byways, depending on the activities allowed.

Generally, surface-disturbing activities could have an adverse impact to the visitor experience that might be driving by on their way to a destination or visiting the Cedar Mesa area. VRM Classes I and II limit surface disturbance and tend to protect the scenic values and are therefore a benefit to the Scenic Byways and Backways. Protection such as NSO, closed to leasing, ROW avoidance and exclusion areas, and special designations such as WSAs, ACECs, and WSRs could all benefit the Scenic Byways by restricting or minimizing surface disturbance. Standard terms and conditions allow for moving oil and gas operations up to 200 m and could delay activities for up to 60 days which could be used to mitigate some impacts. Impacts from dust clouds (from filming, mineral development or exploration) could be allowed in most of these areas and would adversely impact visitor experiences; however, the impact would be short term.

Alternatives B and E tend to be more restrictive regarding surface-disturbing activities. Alternative E is the most restrictive protecting 582,360 acres for non-WSA lands with wilderness characteristics by closing the area to surface-disturbing activities, OHV use, and recommending the areas for mineral withdrawal.

WSAs are managed the same for all alternatives and the Proposed Plan and restrict activities that might adversely impact the Scenic Byways and Backways. Alternative A would manage the ACEC as NSO and VRM Class I. This generally would restrict surface-disturbing activities on the entire 79,017 acres of the Scenic Highway Corridor ACEC.

4.3.14.2.12.1. Alternative A

Under Alternative A the area proposed for designation as an ACEC is 79,017 acres, although 21,380 acres overlap with Cedar Mesa ACEC. Thus outside the Cedar Mesa ACEC, the Scenic Highway ACEC is 57,637 acres. Further, there are 9,930 acres that overlap with WSAs and are protected by the IMP (Map 87). The 9,930 acres would continue to be protected under all alternatives.

Alternative A would allow for mineral leasing with NSO, open to mineral entry with an approved plan of operation, excluded from land treatments, and managed as VRM Class I. VRM Class I, would eliminate the risk of damage from major surface-disturbing activities within the 57,737 acres because of the restrictive nature of this management class. Consequently, even though mineral development (including minerals disposal, entry and leasing) would be allowed under Alternative A, it is restricted by the overriding requirements of VRM Class I. There is some risk of localized surface disturbance from geophysical work but it would be minor and would not impact the values of the ACEC.

4.3.14.2.12.2. Alternatives B, C, and D and the Proposed Plan

Under these alternatives and the Proposed Plan, the area would not be managed as an ACEC. Under Alternative B, however, due to the overlap of 21,380 acres with the Cedar Mesa ACEC, protection of scenic values would still occur. As stated above, under all alternatives and the Proposed Plan, those lands that overlap with WSAs would be protected by the IMP (Maps 88–90). No appreciable impacts to the scenic values of those lands would occur.

4.3.14.2.12.3. Alternative E

Impacts would be the same as Alternative B except for those non-WSA lands with wilderness characteristics that lie within the ACEC corridor. Non-WSA lands with wilderness characteristics would be closed to leasing, closed to OHV travel, recommended for withdrawal from mineral entry, and managed by VRM Class I objectives. These restrictive measures would limit surface disturbance and reduce impacts so as to be negligible for any lands that overlap between the Scenic Highway ACEC and non-WSA lands with wilderness characteristics.

4.3.14.2.13. VALLEY OF THE GODS ACEC

Valley of the Gods is an existing special emphasis area within the Cedar Mesa ACEC. Under Alternatives B, C, and E and the Proposed Plan, 22,863 acres (including the special emphasis area) would be managed as a stand-alone ACEC to provide special management attention to

protect the area's relevant and important scenic values. The area would not be designated as an ACEC under Alternative D.

4.3.14.2.13.1. Alternative A

Under Alternative A, the 31,387-acres special emphasis area would be managed as NSO for mineral leasing and it would be open to the disposal of mineral materials, mineral entry, and geophysical work. Since the area would also be managed as VRM I this would preclude most development and resultant surface disturbance, except in areas where that disturbance would not be visible. This would have beneficial impacts on the scenic values of the ACEC by protecting the area from visible surface disturbance. With Alternative A, the area would be open to woodlands harvest but this would not impact the values of the ACEC because there are very few woodland resources in the area. In addition the area is open to livestock and OHV use limited to designated trails. These prescriptions would have minor impacts to the scenic values from localized surface disturbance but would not impact the larger landscape. A withdrawal from mineral entry would not be pursued under this alternative, but again with a VRM Class I management objectives, visible surface disturbance would be precluded.

4.3.14.2.13.2. Alternatives B and C

Under Alternatives B and C, the size of the ACEC would be reduced to 22,863 acres, 8,524 acres less than the Special Emphasis Area under Alternative A. These alternative differ from Alternative A because the area would be closed to the disposal of mineral materials, mineral leasing, and woodland product harvest, and a withdrawal from mineral entry would be pursued. These actions would limit surface disturbance in the entire ACEC, protecting scenic values, even areas unseen from primary viewpoints. These actions would also provide additional protection to other resource values because it would limit surface disturbance, again, even in areas that are not visible to the average traveler. Under Alternatives B and C, vegetation treatments would be allowed. These treatments would be required to comply with VRM Class I objectives, protecting the scenic value of the ACEC. Vegetation treatments may also introduce variety to the vegetation component of the landscape, and enhance the visual appeal of an area. One other difference from Alternative A is that campfires would not be allowed. This would offer temporary beneficial protections to the scenic values of the ACEC by preventing haze.

4.3.14.2.13.3. Alternative D

Under Alternative D, the area would not be designated as an ACEC. The area would be managed as open to minerals leasing, mineral entry, and mineral material disposal, with a VRM Class III landscape objective. Since this area has high development potential for limestone and sand and gravel and moderate development potential for oil and gas, some development could occur. This would introduce modification of the landform and vegetation and introduce human-made structures, negatively affecting the relevant and important scenic values of this eligible ACEC. However, depending of the type and the location of development, it may be possible to screen from key observation points, although it would not be required under VRM III. The area would be available for campfire use under this alternative and this would cause temporary impacts to the scenic values from haze.

4.3.14.2.13.4. Alternative E

The impacts under Alternative E would be the same as those under Alternatives B and C, except that approximately 20,743 acres of the ACEC (91%) would be managed with further resource protections in order to maintain those non-WSA lands with wilderness characteristics that lie within the ACEC boundaries. This management would further protect the relevant and important scenic values of the ACEC by limiting surface disturbance through closure to mineral leasing and mining entry, management under VRM Class I objectives, exclusion of ROWs and new roads, closure of the area to woodland harvesting and wood gathering, and closure of the area to OHV travel.

4.3.14.2.13.5. Proposed Plan

The impacts of the Proposed Plan would be the same as Alternative B, except that mineral withdrawal would not be recommended, and the ACEC would be open to mineral leasing subject to no surface occupancy. However, under the Proposed Plan, land uses would be required to comply with VRM Class I management objectives, and visible surface disturbance would be precluded, protecting the relevant and important scenic ACEC values.

4.3.14.3. WILD AND SCENIC RIVERS – IMPACTS COMMON TO ALL ALTERNATIVE AND THE PROPOSED PLAN

In all action alternatives (B, C, D and E) and the Proposed Plan, where eligible rivers would be determined suitable, the BLM would manage these segments to protect or enhance the outstandingly remarkable values, tentative classification, and free-flowing nature of these rivers with specific protection allocations within the river corridor (1/4 mile of the high water mark on each side of the river). The extent of BLM's authority is limited to those portions of the segment where BLM manages the shoreline, or other lands within the corridor, and is subject to valid existing rights. Further discussion is presented in Appendix H, Special Designations including the suitability determination.

The free-flowing character of eligible river segments would be protected to the extent that modifications such as stream impoundments, channelization, and/or rip rapping would not be permitted along BLM shorelines. However, depending upon the alternative, values may be at risk from potential mineral development, OHV activity, or other surface-disturbing activities. Also, the protection is limited because there are no federal reserved water rights established for in-stream flow purposes because of eligibility or suitability determinations. In addition, unless BLM land is somehow involved in a proposed action, BLM has no control of potential modifications of the shoreline or other development (including development related to the perfection of water rights) on non-public lands. Because of these factors, there would be no effect on the Colorado River Compact from protective management of eligible/suitable segments. BLM's management authority only extends to public lands within the river corridor, and there are no water rights associated with suitability determinations. A suitability determination also has no effect on existing water compacts. Table 4.134 outlines the segments of rivers that would be determined suitable by alternative.

4.3.14.4. WILD AND SCENIC RIVERS – ALTERNATIVES IMPACTS

Shown in Table 4.134 is a summary of management prescriptions by alternative. In all cases where the recommendation is "suitable wild" the lands are recommended for withdrawal from mineral entry.

Table 4.134. River Segments that Would be Determined Suitable and Total River Miles (RM), by Alternative

River/ River Segment	Alternative A	Alternatives B and E	Alternative C	Alternative D	Proposed Plan
Colorado River					
Segment #1- Recreational	0	2.2	0	0	0

4.3.14.4.1. ALTERNATIVE A

Under Alternative A, a suitability determination would not be made, but those river segments that were determined eligible in the 1991 San Juan RMP would remain eligible with this alternative. Where BLM manages the shoreline or other lands within the river corridors they would be managed to maintain the free-flowing nature, outstandingly remarkable values, and tentative classification. The segments determined to be eligible were Colorado River Segments #2 and #3 and San Juan River Segments #2 (portion), #3, #4, and #5. Because the eligible river corridors would be subject to the existing land-use plan as far as resource allocations are concerned, they may be subject to case-by-case actions. These would be addressed through the NEPA process with mitigation applied. If any proposed land uses would affect the eligibility of a river segment, it is BLM policy to deny the action until suitability can be considered. Although a suitability determination would not be made in Alternative A (No Action), all eligible rivers would continue to be managed to protect the outstandingly remarkable values (ORVs) in a case-by-case manner. The protective measures identified for the Colorado and San Juan River segments would continue.

The San Juan River (Segments #1 and #2), Arch Canyon, Fable Valley, Indian Creek would be managed as open to minerals leasing under Standard stipulations or timing and controlled surface use. The San Juan River (Segments #3, #4, and #5), Fable Valley, and Dark Canyon would be managed as NSO or closed to mineral leasing. All segments except for the Colorado River and Dark Canyon would be open to mineral entry and the Colorado, Indian Creek, and San Juan River Segments (#1 and #2) are open to minerals material disposal. Generally, riparian corridors would be managed as NSO under BLM's riparian policy and therefore, regardless of the leasing category these areas would be protected from development. However there is an exception to allow for development in riparian areas if there are no other practical alternatives. In addition, on smaller rivers, in areas where the 0.25-mile WSR corridor extends beyond the riparian corridor there would not be NSO protection. In these instances, where mineral leasing (with Standard stipulations or timing and controlled surface use), mining entry, or mineral material disposal would be allowed, the outstandingly remarkable values of these rivers may be at risk from surface disturbance, habitat fragmentation, loss of visual integrity, and noise from construction and operation of mineral development infrastructure.

With this alternative, Dark Canyon and the San Juan River would be managed as SRMAs. This would enhance this segment's recreational values, and would not affect the other outstandingly remarkable values. It would not affect the free-flowing nature of the river, and would be in keeping with the tentative classification of scenic, recreational, or wild.

Arch Canyon, Colorado River (Segment #2), and the San Juan River (Segments #1 and #2) are in an open OHV category. Temporary impacts to outstandingly remarkable values could occur from surface disturbance and noise. All the remaining eligible river segments would be in a limited or closed OHV category. River corridors would largely be protected from disturbance related to OHV activity.

4.3.14.4.2. ALTERNATIVE B

With Alternative B, 92.4 river miles involving the following eligible river segments – Colorado River (Segments #1, #2, and #3), Arch Canyon, Fable Valley, Indian Creek, Dark Canyon, and the San Juan River (Segments #1 through #5) would be determined suitable for designation into the National Wild and Scenic River System (see Table 4.135). Overall, because of the increased acreage identified and managed as suitable, and because other resource allocations such as OHV use limited to designated routes, and closure to mineral entry in all wild segments, this alternative would provide greater protection to outstandingly remarkable values than would the No Action Alternative.

The San Juan River (Segments #1, #2, and #4), Colorado River (Segment #1), Indian Creek and Arch Canyon would be managed as open to minerals leasing under Standard stipulations or timing and controlled surface use, though floodplains and the riparian zones would be NSO. The San Juan River (Segments #3 and #5), Fable Valley, and Dark Canyon would be managed as NSO or closed to mineral leasing. All segments would be open to mineral materials disposal and the Colorado River (Segments #1 and #2), the San Juan (Segments #1, #2, and #4), Arch Canyon, and Fable Valley would be open to mineral entry. The risks to the ORVs in these segments are as noted above in Alternative A.

With Alternative B the Colorado River (Segment #3), Dark Canyon, Fable Valley, and the San Juan River (Segment #3 and #5) would be managed as VRM Class I and the Colorado River (Segment #2) would be managed as VRM Class II. These segments would have direct beneficial protection to the scenic values and indirect benefits to other resource values because the VRM objectives would limit surface disturbance. Unless other management prescriptions would limit surface disturbance in these areas, the remaining segments would be at risk for adverse impacts to the ORVs from surface-disturbing activities.

With this alternative, the San Juan River and Dark Canyon would be managed as SRMAs. This would emphasize these segments' recreational values, and would not affect the other outstandingly remarkable values. It would not affect the free-flowing nature of the river, and would be in keeping with the tentative scenic classification.

All eligible and suitable river segments would be in a limited or closed OHV category, with most of the segments limited. River corridors would largely be protected from disturbance related to OHV activity. No loss of outstandingly remarkable values from OHV use would be anticipated during the next 15 years.

4.3.14.4.3. ALTERNATIVE C

With Alternative C, 18.4 river miles involving the eligible Colorado River Segments #2 and #3 and Dark Canyon Segment would be determined suitable for designation into the National Wild and Scenic River System (see Table 4.135). This alternative would be more protective to the ORVs than Alternatives A and D but less so than Alternatives B and E.

The San Juan River (Segments #1, #2 and #4), Colorado River (Segment #1), Indian Creek and Arch Canyon would be managed as open to minerals leasing under Standard stipulations or timing and controlled surface use. The San Juan River Segments #3 and #5, Fable Valley, and Dark Canyon would be managed as NSO or closed to mineral leasing. All segments would be open to mineral materials disposal. With Alternative C, mineral withdrawals would be pursued

on the San Juan Segments #3 and #5 and Dark Canyon to restrict mineral-related disturbance and would therefore protect the outstandingly remarkable values and tentative classification of the river segments from mineral entry. The risks to the ORVs in the segments open to minerals leasing under Standard stipulations and timing and controlled surface use are as noted above in Alternative A.

With Alternative C, Colorado River (Segment #1) and Dark Canyon would be managed as VRM Class I and Colorado River (Segment #2) and Fable Valley would be managed as VRM Class II. These segments would have beneficial direct protection to scenic and other resource values because the objectives limit surface disturbance. Unless there would be other management prescriptions that would limit surface disturbance in these areas the remaining segments would be at risk for adverse impacts to the ORVs.

With this alternative, Dark Canyon and the San Juan River would be managed as SRMAs. This would emphasize these segments' recreational values, and would not affect the other outstandingly remarkable values. It would not affect the free-flowing nature of the river, and would be in keeping with the tentative classification of scenic.

All eligible and suitable river segments would be in a limited or closed OHV category, with most of the segments limited. River corridors would largely be protected from surface disturbance related to OHV activity. No loss of outstandingly remarkable values from OHV use would be anticipated during the next 15 years.

4.3.14.4.4. ALTERNATIVE D

No segments would be recommended suitable for designation under this alternative. This alternative would offer the least protections to the WSRs in comparison to Alternatives A, B, C and E and the Proposed Plan.

The San Juan River (Segments #1, #2, and #4), Colorado River (Segments #1, #2, and #3), Indian Creek, and Arch Canyon would be managed as open to minerals leasing under Standard stipulations or timing and controlled surface use. The San Juan River (Segments #3, #5), Fable Valley, and Dark Canyon would be managed as NSO or closed to mineral leasing. All segments would be open to mineral materials disposal. No mineral withdrawals would be pursued with this alternative.

Fable Valley and Dark Canyon would be managed as VRM Class I and the San Juan River would be managed as VRM Class II. These segments would provide direct protection to scenic and other resource values because these landscape objectives limit most surface-disturbing activities. The remaining segments would be managed as VRM Class III. Unless there would be other management prescriptions that would limit surface disturbance in these areas the remaining segments would be at risk for adverse impacts to the ORVs from surface disturbance, habitat fragmentation, loss of visual integrity, and noise from construction and operation of mineral development infrastructure.

With this alternative, Dark Canyon and the San Juan River would be managed as SRMAs. This would emphasize this segment's recreational values, and would not affect the other outstandingly remarkable values. It would not affect the free-flowing nature of the river, and would be in keeping with the tentative classification of scenic.

All eligible river segments would be in a limited or closed OHV category, with most of the segments limited. River corridors would largely be protected from disturbance related to OHV activity. No loss of outstandingly remarkable values from OHV use would be anticipated during the next 15 years.

4.3.14.4.5. ALTERNATIVE E

The impacts under Alternative E would be the same as those under Alternative B, except that Colorado River Segment #3, San Juan River Segment #3, and Fable Valley would be closed to oil and gas leasing, and Colorado River Segment #3 and San Juan Segment #3 would be managed lands to maintain the wilderness characteristics of non-WSA land with wilderness characteristics where they exist along those segments. Because of these additional management prescriptions, this alternative would offer the greatest protection to WSRs in comparison to Alternatives A, B, C, and D and the Proposed Plan.

4.3.14.4.6. PROPOSED PLAN

Under the Proposed Plan, 35.7 river miles involving the eligible Colorado River Segments #2 and #3, San Juan River Segment # 5, and Dark Canyon would be determined suitable for designation into the National Wild and Scenic River System (see Table 4.135). This alternative would be more protective to the ORVs than Alternatives A, C, and D but less so than Alternatives B and E.

The San Juan River (Segments #1, #2 and #4), Colorado River (Segment #1), Indian Creek and Arch Canyon would be managed as open to minerals leasing under Standard stipulations or timing and controlled surface use. The San Juan Segments #3, Fable Valley, and Dark Canyon Rivers would be managed as NSO or closed to mineral leasing. All segments would be open to mineral materials disposal. Mineral withdrawals would be pursued on the Colorado River Segment #3, the San Juan River Segments #5, and Dark Canyon to restrict mineral-related disturbance and would therefore protect the outstandingly remarkable values and tentative classification of the river segments from mineral entry. The risks to the ORVs in the segments open to minerals leasing under Standard stipulations and timing and controlled surface use are as noted above in Alternative A.

Under the Proposed Plan, San Juan River Segment # 5 and Dark Canyon would be managed as VRM I and the Colorado River Segments #2 and #3 would be managed as VRM II. These segments would have beneficial direct protection to scenic and other resource values because these landscape objectives would limit surface disturbance. Unless there would be other management prescriptions that would limit surface disturbance in these areas the remaining segments would be at risk for adverse impacts to the ORVs.

With the Proposed Plan, Dark Canyon would be managed as SRMAs. This would emphasize these segments' recreational values, and would not affect the other outstandingly remarkable values. It would not affect the free-flowing nature of the river, and would be in keeping with the tentative classification of scenic.

All eligible and suitable river segments would be in a limited or closed OHV category, with most of the segments limited. River corridors would largely be protected from disturbance related to OHV activity. No loss of outstandingly remarkable values from OHV use would be anticipated during the next 15 years.

4.3.14.5. IMPACTS TO WILDERNESS AND WILDERNESS STUDY AREAS (WSAs)

WSAs are managed under the Interim Management Policy (IMP), which directs the BLM to manage the area so as not to impair their suitability for preservation as wilderness. This applies to all uses and activities except those specifically exempted from this standard by FLPMA (such as grandfathered uses) (BLM 1995). Because of this protective management requirement, there would be no impacts to WSAs from implementation of this plan except in areas with valid existing rights. In those areas the impacts would be similar to those described in Section 4.3.8, Non-WSA Lands with Wilderness Characteristics. Table 4.136 shows the acreages of WSAs in the Monticello FO.

Table 4.136. Acreages of WSAs in the Monticello FO

WSA	Acreage ¹
Bridger Jack Mesa	6,301
Butler Wash	22,043
Cheese Box Canyon	14,826
Cross Canyon	945
Dark Canyon ISA Complex	67,822
Fish Creek Canyon	46,089
Grand Gulch ISA Complex	105,181
Indian Creek	6,884
Mancos Mesa	50,876
Mule Canyon	5,977
Road Canyon	52,372
South Needles	159
Squaw and Papoose Canyon	6,552
Total	386,027

¹ Acreages are GIS calculations and may not reflect acreages presented in BLM statewide Wilderness Study Report.

All WSAs would be managed as VRM Class I. This management objective would preserve the natural landscape. Protection of the natural landscape would protect the setting required to provide for opportunities for solitude and needed to support primitive recreation activities. OHV travel in WSAs would be limited to designated routes. This would protect the natural character of the landscape of the WSAs, but allow for temporary, short-term impacts to opportunities for solitude and primitive forms of recreation in the WSA where motorized travel would be permitted.

4.3.14.6. SUMMARY OF IMPACTS

Alternatives B and E would manage the largest area (521,241 acres) of the Monticello PA as ACECs, followed by Alternative A (504,947 acres), and Alternative C (76,764 acres) and the Proposed Plan (73,495 acres). No ACECs would be designated under Alternative D. Although

Alternative A would designate a comparable number of areas as ACECs, its management prescriptions would generally not be as protective of the relevant and important ACEC values as Alternatives B, C, and E and the Proposed Plan. Therefore, Alternative E, which has the most acres designated and the most protective management prescriptions, would be the most protective of relevant and important ACEC values, followed by Alternatives B and C, the Proposed Plan and Alternative A, respectively. Alternative D would not provide any beneficial impacts to the ACEC values. Alternatives B and E best prevent irreparable damage to the relevant and important values, resources, natural systems and natural hazards. Alternative D does the least to prevent irreparable damage to the relevant and important values, resources, natural systems or natural hazards. However, to some degree because WSAs overlap many of the ACECs in Alternative A, protection is generally in place (Map 87).

In all action alternatives (Alternatives B, C, D, and E) and the Proposed Plan, where eligible rivers would be recommended suitable, the BLM would manage these segments to protect or enhance the outstandingly remarkable values, tentative classification, and free-flowing nature of these rivers with specific protective allocations within the river corridor (1/4 mile of the high water mark on each side of the river) to the extent of its authority, which is limited to those portions of the segment where BLM manages the shoreline or other lands within the corridor, and is subject to valid existing rights. Under Alternative A, a suitability determination would not be made, but those river segments that were determined eligible in the 1991 San Juan RMP would remain eligible with this alternative. Where BLM manages the shoreline or other lands within the river corridors, the rivers would be managed to maintain the free-flowing condition, outstandingly remarkable values, and tentative classification. Under Alternatives B and E, 92.4 miles of river would be recommended as suitable; with the greatest beneficial impacts to wild and scenic rivers. Management prescriptions under Alternative E would be slightly more protective than those under Alternative B. The Proposed Plan would recommend 35.7 miles of river as suitable. Alternative D recommends 18.4 miles suitable for designation. Alternative D would not find any segments suitable.

The management of WSAs would be the same under all alternatives. WSAs would be managed under the Interim Management Plan (IMP), which directs the BLM to manage the area so as not to impair their suitability for preservation as wilderness.

4.3.14.7. MITIGATION MEASURES

No mitigation measures would be required under any of the alternatives or the Proposed Plan.

4.3.14.8. UNAVOIDABLE ADVERSE IMPACTS

Unavoidable adverse impacts would occur from surface disturbance resulting from mineral development and OHV activity, where they are permitted under any alternative or the Proposed Plan.

4.3.14.9. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Any loss of relevant and important ACEC values and outstanding remarkable wild and scenic river values, from surface disturbances created by other resource uses, would persist throughout the next 15 years, and would constitute a long-term loss of these values as a result of short-term uses.

4.3.14.10. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Any loss of relevant and important ACEC values or outstanding remarkable wild and scenic river values due to mineral development, OHV activity, or other surface disturbances would be irretrievable, lasting until the affected area was fully reclaimed, either naturally or with human intervention.

4.3.15. SPECIAL STATUS SPECIES

This section discusses impacts to special status species from management decisions of other resources and resource uses described in Chapter 2. Existing conditions concerning special status species are described in Chapter 3.

Because of the large number of special status species that may occur in the Monticello PA, including Threatened, Endangered, and Sensitive species, it was determined that, in some cases, the most effective way to disclose impacts at the programmatic level would be to analyze the impacts to the habitat cover type used by those species. Accordingly, for the purposes of analysis, the special status species described in Chapter 3, Section 3.16 are grouped by habitat type, as shown in Table 4.137 below. Impacts to federally listed species are also analyzed by habitat type. Quantitative information is provided for the following species: Mexican Spotted Owl (MSO), Gunnison Sage-grouse, Southwestern Willow Flycatcher (SWFL), Bald Eagle, and Colorado River fish (humpback chub, Colorado pikeminnow, razorback sucker, and bonytail).

4.3.15.1. ANALYSIS ASSUMPTIONS

The habitats associated with these species are representative of the habitats of the other special status species (see Table 4.137). All habitat impacts analyzed in this section are approximations based on assumptions regarding the potential locations of facilities, vegetation treatments, grazing, and other impacts from management decisions. Representations of the available habitat (and critical habitat where designated) for these representative species within the Monticello PA can be found in Map 93 (Colorado fish species and MSO), Map 92 (Bald Eagle), and Map 91 (SWFL). Acreage calculations used for analysis for SWFL and Yellow-billed Cuckoo habitat were made using riparian vegetation acreages. Because both species utilize micro-habitats within riparian habitat, all habitat acreage calculations are likely over-estimations for these species. The Bald Eagle habitat acres used in this document include a 1-mile-wide buffer on all streams and rivers in the Monticello PA, all BLM mule deer winter range and a .05-mile buffer on Highways SR-191, SR-95, SR-275, and SR-211 (personal communication between Deb Reber and Susan Martin, SWCA, and Tammy Wallace, BLM, September 22, 2006). Acres of habitat for the MSO and the 4 endangered Colorado River fish species used in this document are taken from the GIS habitat layer for these species provided by the USFWS and BLM. Acres of Gunnison Sage-grouse habitat used in the following analyses were taken from the DWR habitat GIS layer. All references to the Colorado River fishes are specifically referring to the federally endangered bonytail (*Gila elegans*), Colorado pikeminnow (*Ptychocheilus lucius*), humpback chub (*Gila cypha*), and razorback sucker (*Xyrauchen texanus*). These 4 species are managed similarly, and impacts can typically be analyzed as a group.

The black-footed ferret is not known to occur in the Monticello PA. However, the possibility exists that at some point in time the introduction of experimental non-essential populations of ferrets may be considered. Because there are no specific plans or time frames for re-introductions, potential re-introductions are not analyzed and potential impacts to black-footed ferrets are not analyzed.

In all of the following subsections, management decisions discussed for each of the alternatives and the Proposed Plan are in addition to those discussed under Management Common to All Alternatives and the Proposed Plan in Table 2.1 of Chapter 2. The Proposed Plan and alternatives

have the potential for adverse impacts on special status species through decisions for resource management such as travel, recreational use of the land, vegetation treatments, and oil or gas development.

For most resource decisions for which there is limited variation in impacts by habitat type, impacts are discussed by the Proposed Plan and alternative in order to give an overall description of the impacts resulting from the management action.

Air quality management does not directly result in additional emissions or air quality degradation. Potential impacts to air quality from actions, such as the construction of access roads to oil and gas development sites, would be analyzed as part of the energy and minerals program in the environmental analysis prepared for that action. Appropriate Section 7 consultation with USFWS would be conducted as a part of the environmental process. Therefore, any potential impacts to air quality would result from implementing aspects of the energy and minerals program. Given the objectives and goals of the air quality program and the support function for maintenance of appropriate air quality standards, implementation of the air quality program would not impact any of the listed threatened or endangered plant, fish, and animal species analyzed in this report and would not impact any of the designated critical habitat of the threatened or endangered fish and animal species analyzed in this report within the Monticello PA.

The alternatives have the potential for both adverse and beneficial impacts on special status species through management actions such as travel management, recreational use of the land, vegetation treatments, and oil or gas development. Wherever possible, this document quantifies the amount and types of habitats that would be directly disturbed or reclaimed due to such actions. However, it is often difficult to quantify the loss or improvement of quality or condition of a habitat. Subtle increases or decreases in weeds, shrubs, forbs, water availability, undisturbed areas, or birthing or wintering grounds can greatly affect the distribution, health, and survival of a diversity of sensitive plant and animal species. The degree to which these impacts could occur varies by alternative, with alternatives that increase the amount of surface disturbance within special status species' habitats generally having greater potential adverse impacts on these species. Attempts are made to address potential impacts within each action analysis, but the discussions are often qualitative due to the difficulty in measuring such changes.

Additional assumptions for this chapter include the following: (1) implementation of all of the alternatives would be in accordance with existing laws, regulations, and standard management guidelines; (2) actions associated with emergency or public safety would be performed at the discretion of the Authorized Officer; (3) though impacts resulting from implementation of any of the alternatives may extend beyond Monticello PA boundaries, they will be analyzed to their logical conclusion even if they extend beyond Monticello PA boundaries (an example of this would be analyzing impacts to aquatic species, including downstream impacts beyond the Monticello PA boundaries); and that, (4) public land users will comply with the decisions and allocations contained in the alternatives.

Table 4.137. Grouping of Special Status Species by Habitat Type

Habitat	BLM Special Status Species	Federally Listed Species	Designated Critical Habitat
Desert Shrub	Wildlife: Gunnison's prairie dog, desert night lizard, ferruginous hawk, short-eared owl, Brewer's sparrow, loggerhead shrike, pinyon jay, sage sparrow Plants: Cronquist milkvetch, Cutler milkweed, Copper Canyon milkvetch, Skull Valley spring-parsley, Hole-in-the-Rock prairie clover, spineless hedgehog cactus, Cataract Canyon gilia, Paradox breadroot, Howell scorpionweed, Bluff phacelia, Mancos shadscale, Jane's globemallow	Wildlife: None Plants: None	Wildlife: None Plants: None
Sagebrush and Perennial Grassland	Wildlife: Brewer's sparrow, loggerhead shrike, pinyon jay, sage sparrow, Virginia's warbler, Gunnison's prairie dog, ferruginous hawk, short-eared owl, desert night lizard, Gunnison Sage-grouse, Mogollon vole, kit fox, silky pocket mouse, burrowing owl, Swainson's hawk, prairie falcon Plants: Chatterley's onion, Copper Canyon milkvetch, spineless hedgehog cactus, redroot buckwheat	Wildlife: Black-footed ferret (<i>Mustela nigripes</i>) (E) ⁸ Plants: None	No critical habitat rules have been published for the black-footed ferret. Plants: None
Pinyon-Juniper Woodland	Wildlife: gray vireo, pinyon jay, Virginia's warbler Plants: Chatterley's onion, spineless hedgehog cactus, redroot buckwheat, Paradox breadroot, Howell scorpionweed	Wildlife: None Plants: None	Wildlife: None Plants: None
Conifer and Mountain Shrub	Wildlife: Yavapai mountain snail, Gunnison's prairie dog, Lewis's woodpecker, northern goshawk, three-toed woodpecker, broad-tailed hummingbird, black-throated gray warbler Plants: spineless hedgehog cactus	Wildlife: None Plants: None	Wildlife: None Plants: None

⁸The black-footed ferret does not occur in the MPA, but is included here due to its potential to occur in association with prairie dog habitat. See Sections 4.3.15.1 Analysis Assumptions and 4.3.15.2.9 Impacts Common to All Alternatives for further discussion.

Table 4.137. Grouping of Special Status Species by Habitat Type

Habitat	BLM Special Status Species	Federally Listed Species	Designated Critical Habitat
Riparian and Wetland	Wildlife: American white pelican, bobolink, peregrine falcon, Arizona toad, smooth greensnake, bluehead sucker, roundtail chub, flannelmouth sucker, western Yellow-billed Cuckoo (C), Bald Eagle Plants: alcove bog orchid	Wildlife: SWFL (E), bonytail (E), Colorado pikeminnow (E), humpback chub (E), razorback sucker (E) Plants: None	Colorado River fishes: Designated critical habitat includes portions of the Colorado River and the Green River downstream from the Yampa River, along the San Juan River from Shiprock, NM to the inflow of Lake Powell; and the 100-year floodplain. Plants: None
Caves and Rock Crevices (Seeps)	Wildlife: Allen's big-eared bat, big free-tailed bat, fringed myotis, spotted bat, Townsend's big-eared bat Plants: pinnate spring-parsley, Nevada willowherb, alcove rock-daisy, kachina daisy	Wildlife: California condor (E; Experimental) Plants: Navajo sedge (T)	California condor: Potential nesting habitat occurs within the Monticello PA; however, any individuals in Utah are part of an experimental, non-essential population. Navajo sedge: Potential population in San Juan County occurs on Navajo land.
Rocky Slopes and Canyons	Wildlife: common chuckwalla Plants: Nevada willowherb, Canyonlands lomatium, western hophornbeam	Wildlife: MSO (T) Plants: None	MSO: Designated critical habitat consists of 8.65 million acres in AZ, CO, NM, and UT. In UT, critical habitat has been designated in portions of San Juan County within the Monticello PA. Plants: None

(C) = candidate for federal listing
 (T) = federally listed as threatened
 (E) = federally listed as endangered

4.3.15.2. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Under all alternatives, the BLM would comply with management plans and conservation agreements for special status species as detailed in Chapter 2. Additionally, all special status species-related measures outlined in the BLM's Oil and Gas Stipulations (Appendix C), Conservation Measures and Best Management Practices for Federally Listed Species (Appendix K), and Best Management Practices and Recommended Buffers and Nesting Periods for Raptors (Appendix M) would be followed. Further, the BLM is required to use methods and procedures necessary to improve the condition of special status species and their habitats to the degree such that their special status recognition is no longer warranted (BLM 2001c). There would be no specific individual protections provided for the majority of special status species listed in Table 4.137, including the black-footed ferret, which has no special protective measures in place because there are no known populations in the Monticello PA. Many of these species, however, would be indirectly protected by the restrictions and buffers in place for Gunnison Sage-grouse, MSO, SWFL, Yellow-billed Cuckoo, Bald Eagle, Navajo sedge, California condor, the endangered Colorado River fishes, and migratory birds (discussed in Section 4.3.19, Wildlife and Fisheries). These special status species protections are discussed in the following sections.

4.3.15.3. ALTERNATIVES AND PROPOSED PLAN IMPACTS

4.3.15.3.1. IMPACTS OF CULTURAL RESOURCE DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.1.1. Alternative A

Under Alternative A, the potential direct adverse impacts of cultural resource decisions on special status species include disturbance of individual wildlife and plant species. Wildlife could be disturbed by cultural resource site visitors, and plant species could be trampled or uprooted by visitors in cultural areas with high visitation. The potential indirect adverse impacts of cultural resource decisions on special status species include habitat disturbance and/or alteration caused by surface disturbance. This includes potential introduction and the spread of weedy, non-native plant species. Under Alternative A, Tank Bench and Beef Basin would not be managed as CSMAs and would be managed according to the 1991 San Juan RMP prescriptions. Human disturbance, including noise and vegetation trampling, in special status species habitat would be reduced due to the closure of the Grand Gulch Special Emphasis Area/Grand Gulch National Historic District to private and/or commercial use of woodland products, mineral leasing, OHV use, and mechanized or mechanical surface disturbance, including vegetation treatments. This would have beneficial impacts on special status species by decreasing the amount of surface disturbance caused by foot/vehicle traffic, tree removal, and oil and gas development in the area. Long-term adverse impacts would occur on special status species by not allowing mechanized or mechanical vegetation treatments that are designed to improved habitat for wildlife.

4.3.15.3.1.2. Alternative B

Under Alternative B, the qualitative impacts of cultural resource decisions on special status species would be the same as those discussed under Alternative A. Under this alternative, Comb Ridge, Tank Bench, Beef Basin, and McLoyd Canyon-Moon House would be managed as CSMAs. The Comb Ridge Management Zone (MZ) within the Cedar Mesa SRMA (30,752 acres) would be closed to woodland product collection, closed to oil and gas surface occupancy

and mineral entry, and would only be available for non-surface-disturbing vegetation treatments. Camping would be limited to designated campgrounds and hiking and OHV use would be limited to designated trails. The Tank Bench CSMA (2,646 acres) would have the same surface disturbance restrictions as the Comb Ridge MZ with the Cedar Mesa SRMA, but would be closed to OHV use, campfires, and domestic pets and pack animals. The Beef Basin CSMA (20,302 acres) and the McLoyd Canyon-Moon House CSMA (1,607 acres) would have the same surface disturbance restrictions as the Comb Ridge MZ within the Cedar Mesa SRMA with the exception of mineral leasing, which would be allowed subject to standard terms. Under all alternatives and the Proposed Plan, the Grand Gulch National Historic District (37,388 acres) would be closed to all surface disturbances, with the exception of designated trails and camping areas.

There would be a considerable difference in impacts between Alternative B and Alternative A due to the designation of CSMA and associated restrictions on surface-disturbing activities. Adverse impacts to special status species from surface-disturbing activities and other human disturbances under Alternative B would be considerably reduced from Alternative A due to restrictions on surface disturbances and use within the designated CSMA and the 37,388 acres Grand Gulch National Historic District.

4.3.15.3.1.3. Alternative C

Under Alternative C, the qualitative impacts of cultural resource decisions on special status species would be the same as those discussed under Alternative B. The Comb Ridge MZ within the Cedar Mesa SRMA would be managed the same as under Alternative B, except that woodland product collection and surface-disturbing vegetation treatments would be allowed. The Tank Bench CSMA would be managed the same as under Alternative B, except for the following: it would be open to oil and gas leasing and mineral entry under standard lease terms, hiking would be allowed off trails, and surface-disturbing land activities would be permitted. The Beef Basin CSMA would be managed the same as under Alternative B, except that campfires would be allowed, and groups larger than 20 people would be required to camp in designated areas. The McLoyd Canyon-Moon House CSMA would be managed the same as under Alternative B, except that access to the interior corridor would be limited to 4 people at any one time. The Grand Gulch National Historic District would be managed the same as under Alternative B, but would allow non-motorized vegetation treatments.

There would be a considerable difference in impacts between Alternative C and Alternative A due to the designation of CSMA and associated restrictions on surface-disturbing activities. Adverse impacts to special status species from surface-disturbing activities and other human disturbances under Alternative C would be less than under Alternative A.

4.3.15.3.1.4. Alternative D

Under Alternative D, no CSMA would be proposed for designation. Visitors would be allowed in greater numbers and more area would be open to woodland product harvest under this alternative. In addition, Tank Bench (2,646 acres) would be open to mineral material disposal and geophysical work. These management decisions would have adverse impacts on special status species as described in the other alternatives.

This alternative would have fewer adverse impacts on special status species than would Alternative A because visitor use numbers would be imposed for Butler Wash east of Comb Ridge and for McLoyd Canyon-Moon House, and woodland product harvest would not be allowed in Beef Basin. However, there would be more adverse impacts to special status species under Alternative D than under Alternative B and the Proposed Plan because of the decisions to allow for more visitors, woodland product harvest, and mineral development.

4.3.15.3.1.5. Alternative E

Under Alternative E, impacts of cultural decisions on special status species would be the same as those described under Alternative B with the exception that OHV use would be closed in non-WSA lands with wilderness characteristics and vegetation disturbances would be restricted to protect wilderness characteristics in these areas. This would result in long-term, beneficial impacts to special status species habitat, as well as adverse impacts from restrictions on vegetation treatments to improve vegetation communities and control the spread of invasive species. The Comb Ridge MZ within the Cedar Mesa SRMA and Beef Basin CSMA would allow maintenance for existing improvements to wildlife habitat, but no new improvements would be allowed. This would limit direct impacts associated with surface-disturbing improvements. However, it would also reduce long-term, indirect, beneficial impacts from vegetation and wildlife habitat improvements. Due to the designation of CSMA and protections in place for non-WSA lands with wilderness characteristics, Alternative E would have considerably fewer direct adverse impacts than Alternative A.

4.3.15.3.1.6. Proposed Plan

Under the Proposed Plan, the qualitative impacts of cultural resource decisions on special status species would be the same as those discussed under Alternatives B and C. The Comb Ridge recreation management zone of the Cedar Mesa SRMA would be managed the same as under Alternatives B and C, except that woodland product collection and surface-disturbing vegetation treatments would be allowed. The Tank Bench SRMA would be managed the same as under Alternatives B and C, except for the following: it would be open to oil and gas leasing and mineral entry under standard lease terms, hiking would be allowed off trails, and surface-disturbing land activities would be permitted. The Beef Basin and the McLoyd Canyon-Moon House recreation management zones within the Cedar Mesa SRMA would be managed the same as under Alternatives B and C. The Grand Gulch National Historic District would be managed as a recreation management zone within the Cedar Mesa SRMA, and would allow non-motorized vegetation treatments.

There would be a considerable difference in impacts between the Proposed Plan and Alternative A due to the designation of the recreation management zones, SRMAs and associated restrictions on surface-disturbing activities. Adverse impacts to special status species from surface-disturbing activities and human disturbances under the Proposed Plan would be less than under Alternative A.

4.3.15.3.2. IMPACTS OF FIRE MANAGEMENT DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.2.1. Impacts Common to the Proposed Plan and All Alternatives

The impacts of fire management on special status species would be the same under all alternatives and the Proposed Plan, with all decisions guided by the Utah Land-use plan Amendment (LUP Amendment) for Fire and Fuels Management (Appendix A). Adherence with the LUP Amendment (which mandates the maintenance of existing healthy ecosystems and the protection of threatened, endangered, and special status species) would have beneficial impacts on special status species habitat in the Monticello PA, and would ensure that healthy ecosystems are not adversely impacted by fire management and fuels reduction. Wildland fire use would not be authorized in areas that are known to be highly susceptible to post-fire cheatgrass or other weed invasion, important terrestrial and aquatic habitats, and non-fire adapted vegetation communities unless reasonable Resource Protection Measures (RPMs) were in place. These RPMs would have beneficial impacts on special status species habitat by reducing the spread of weeds and preserving native plant species, thereby maintaining suitable wildlife forage, cover, and habitat.

Fuels management decisions include fuels-reduction treatments on 5,000 to 10,000 acres annually. These fuels-reduction treatments include: mechanical and manual treatments, prescribed fire, chemical or biological vegetation control, and aerial/ground seeding. These fuels management decisions would likely have a beneficial long-term impact on special status species habitat by helping to restore the natural fire regime, which would improve habitat health (Lewis and Harshbarger 1976), forage, nesting opportunities, and cover. Restoring the natural fire regime would also reduce the chance of wildland fire, and the subsequent loss of major ecosystem components. In the short-term, vegetation treatments could result in trampling or removal of forage and/or habitat, and human-caused wildlife disturbance including increased erosion, sedimentation, and surface runoff.

Wildland fire use may be authorized in special status species habitats, and this could adversely impact special status species by burning or cutting of vegetative cover, reduction of the overall quantity or quality of habitat or forage, or mortality of individuals due to fire, trampling, or crushing. Indirect impacts to special status species and their habitats could include increased exposure to predators due to reduced vegetation cover, increased soil erosion, or other impacts to habitat quality. In the long-term, after appropriate rehabilitation wildland fire would benefit special status species habitat in an area by removing competition from weedy natives and invasive species. Once the competition was removed, a diverse native community would have the potential to establish itself in the area (Monsen 2004), which would mean more available forage and cover for special status wildlife species and available habitat for special status plant species (Stevens 2004).

Wildland fire use would not be authorized in the following areas unless reasonable Resource Protection Measures were in place: 1) areas that are known to be highly susceptible to post-fire cheatgrass or other weed invasion, 2) important terrestrial and aquatic habitats, and 3) non-fire-adapted vegetation communities (see Chapter 2 Table 2.1, Summary Table of Alternatives and the Proposed Plan).

Desert Shrub Habitat

Under all alternatives and the Proposed Plan, wildland fire use or fuels management actions and associated surface-disturbing treatments would not be authorized in desert shrub habitats, which are known to be highly susceptible to post-fire cheatgrass or other weed invasion, unless reasonable Resource Protection Measures were in place. Resource Protection Measures would result in beneficial impacts because fire management activities that promote weed invasion could adversely impact special status plant species through direct impacts to individuals and competition from weed species. These also indirectly impact special status wildlife through short- and long-term changes in vegetation composition and structure and weed-induced destabilization of biological soil crusts.

Sagebrush and Perennial Grassland and Pinyon-Juniper Woodland

The LUP indicates that the majority of fuels management treatments would occur in pinyon-juniper woodland and sagebrush habitats. Impacts would be analyzed with site-specific NEPA once it is determined where individual treatments would occur. Under all alternatives and the Proposed Plan, fuels management actions would include surface-disturbing treatments on 5,000–10,000 acres annually within the Monticello PA.

Impacts to special status species would include trampling or removal of vegetation and associated disturbance to sensitive wildlife species from fire and human presence. In the long-term, however, vegetation treatments would potentially benefit special status species habitat by removing competition from weedy natives and invasive species.

Riparian and Wetland Habitats

Direct adverse impacts from fire management decisions would include aquatic habitat degradation and modification, including sedimentation and salinization resulting from soil erosion and stream bank destabilization, changes in water chemistry, changes in flow pattern, and possible water withdrawals (USFWS 2002a; BLM 2005c; Trombulak and Frissell 2000). Indirect beneficial impacts of fire management on special status species and their habitats include the reduction of catastrophic wildland fires that cause habitat modification, soil erosion, stream sedimentation, and water quality degradation. Indirect adverse impacts of fire management in riparian areas include the potential for alteration of plant community structure, species composition, and a relative abundance of species. Fire is an imminent threat to special status species riparian habitats, because native riparian plants are neither fire-adapted nor fire-regenerated; therefore, fires in riparian habitats can cause catastrophic, immediate, and drastic changes in riparian plant density and species composition (USFWS 2002a). Under all alternatives and the Proposed Plan, wildland fire and fuels management decisions would not be authorized in potential special status species riparian habitats (see Section 4.3.15.1).

All Other Special Status Species Habitats in the Monticello PA

Under all other habitat types, wildland fire use would not be authorized unless reasonable Resource Protection Measures were in place if the habitat is deemed susceptible to post-fire cheatgrass or other weed invasion, important as terrestrial and aquatic habitat for special status species, or a non-fire-adapted vegetation community.

4.3.15.3.3. IMPACTS OF HEALTH AND SAFETY DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.3.1. Impacts Common to All Alternatives and the Proposed Plan

Under all alternatives and the Proposed Plan, abandoned mine lands (AMLs) would be prioritized for area reclamation and mitigation. Site-specific NEPA analysis would be completed on all potential AML projects, thereby preventing adverse impacts to special status species. BLM would identify and clean up unauthorized dumping and shooting areas in the PA as required to comply with applicable state, local, and federal regulations. These would include areas such as the unauthorized shooting range west of Blanding, dumps near Hovenweep, the Monticello Airport, and Piute Knoll.

Riparian and Wetland Habitats

Hazardous waste contamination from AML sites could directly or indirectly impact special status species in the short and long-term. Special status fish and amphibian species may be particularly vulnerable to adverse impacts to water quality, which could result in mortality of individuals, reduced forage or prey availability, or impacts to other habitat qualities. Any impacts to water quality could indirectly impact sensitive wildlife species that utilize affected riparian or wetland habitats through exposure to contaminants or impacts to prey availability or habitat quality. Health and safety management decisions could negatively impact the endangered Colorado River fishes due to impacts to the primary constituent elements for their designated critical habitat. Actions associated with health and safety management decisions could also negatively impact SWFL and other riparian species due to surface disturbance impacts resulting in water quality degradation, and increased human activities during mine reclamations and spill clean up.

Under all alternatives and the Proposed Plan, some abandoned mine lands sites would be prioritized due to hazardous waste contamination and water quality issues. The top criteria used to prioritize water-quality-based AML programs include threats to the environment (see special status section of Table 2.2, Summary of Impacts), which takes into account habitat quality for all special status fish species.) These actions are conducted under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) authority and follow CERCLA processes. These reclamations would help to mitigate for the adverse impacts of poor water quality on special status fish species because the threat of groundwater contamination would be removed. Long-term water quality monitoring would be required.

Caves and Rock Crevices

In addition to naturally occurring caves and rock crevices, abandoned mining structures are often used as roosting habitat by bats, including sensitive bat species. Of the 18 bat species in Utah, 14 species regularly occur in abandoned mines. One state special status species (Townsend's big-eared bat) has been found exclusively in abandoned mines (Grandison 2004). Of the special status bat species occurring in the Monticello PA (see Table 4.137), three are known to use caves as winter, day, or night roosts (Oliver 2000). There are also three sensitive plant species that grow in rock crevices and on steep slopes that could be impacted by activities associated with health and safety decisions in the Monticello PA. Completely sealing off AML entrances could have direct adverse impacts to roosting individuals and populations, which could include the reduction of suitable roosting habitats. Under all alternatives and the Proposed Plan, potential mitigations to avoid and/or minimize impacts to special status bat species would include pre-construction surveys and the installation of bat compatible mine gates and cupolas, which allow

bats to pass through but prohibit human entrance. Use of mitigation structures and monitoring would lessen adverse impacts of mine closures on bats.

Under the Proposed Plan, hazardous materials management activities could negatively impact MSO and other cliff dwelling sensitive birds due to disturbance associated with the presence of humans and equipment.

All Other Special Status Species Habitats in the Monticello PA

Under all alternatives and the Proposed Plan, impacts to all other special status species from abandoned mine reclamation would be negligible because they do not occur in areas that would be impacted by these activities. There is potential for negative impacts on species in all other habitat types resulting from the clean up of existing dumping and shooting areas. These impacts are likely to be negligible because the disturbed areas are unlikely to meet the habitat requirements of sensitive species.

4.3.15.3.4. IMPACTS OF LANDS AND REALTY DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.4.1. Impacts Common to All Alternatives and the Proposed Plan

Lands and realty decisions that could potentially impact special status species include access, easements, leases and permits, utility/transportation systems, exchanges, disposals, and withdrawals. Under all alternatives and the Proposed Plan, WSAs would be exclusion areas for ROWs. Withdrawals and excluded areas would preserve and protect special status environmental resources and areas. Similarly, the acquisition and retention of any special status species habitat, quality riparian areas, and key productive ecosystems would have beneficial impacts on special status species.

All areas not identified as avoidance or exclusion would be available for ROWs and could be subject to multiple-use terms on a case-by-case basis (BLM 2004a). The use of ROWs for utility and communication infrastructure could have direct, long-term adverse impacts on special status plant and wildlife species habitat due to surface disturbance for utility lines, communication sites, solar and wind energy sites, pipeline installation, trampling by workers and vehicles during construction activities, as well as impacts to special status bird or bat species and migration routes from wind turbines and construction of maintenance access roads. Additionally, noise and human presence associated with infrastructure installation could have adverse impacts on special status wildlife species in the Monticello PA. The installation of power poles may increase raptor predation on Gunnison's prairie dog and Gunnison Sage-grouse by providing hunting perches. Although this would be an adverse impact on these prey species, it would also provide a beneficial impact on raptor species in the planning area (see Section 4.3.19, Wildlife, for details).

Under all alternatives and the Proposed Plan, applications for filming permits would have to meet the criteria that they do not impact special status species or their habitat. Accordingly, implementation of these minimum-impact criteria would prevent adverse impacts to special status species from filming.

4.3.15.3.4.2. Alternative A

Under Alternative A, lands available for ROWs would be divided into four categories; lands with designated transportation and utility corridors, lands outside designated transportation and utility

corridors, lands to be avoided, and lands to be excluded. Exclusion (120,800 total acres) and avoidance (253,790 total acres) areas under Alternative A would benefit special status species habitat in these areas by limiting the possibility of surface disturbances and vegetation removal that might result from an expanded ROW network.

In areas where ROWs would be authorized, there could be long-term direct, adverse impacts on special status species habitat where installation would occur. These impacts would result from vegetation crushing and removal associated with construction and habitat fragmentation. Short-term direct impacts could result from noise disturbances. Long-term indirect adverse impacts could result from the potential introduction of invasive plant species by construction equipment and building personnel. This alternative has the greatest amount of acreage open to ROW authorization and, therefore the greatest potential for impacts to special status species.

4.3.15.3.4.3. Alternative B

Alternative B would consider proposals for ROWs in the Monticello PA except in exclusion areas (416,612 acres) and avoidance areas (125,105 acres). This would limit both surface disturbance and vegetation removal in these areas which could be beneficial for special status species in these areas. Impacts to special status species from surface-disturbing activities and human disturbances under Alternative B would be less than under Alternative A.

4.3.15.3.4.4. Alternative C

Alternative C would consider proposals for ROWs in the Monticello PA except in exclusion areas (395,329 acres) and avoidance areas (39,323 acres). This would limit both surface disturbance and vegetation removal in these areas which could be beneficial for special status species in these areas. Impacts to special status species from surface-disturbing activities and human disturbances under Alternative C would be less than under Alternative A.

4.3.15.3.4.5. Alternative D

Alternative D would consider proposals for ROWs in the Monticello PA except in exclusion areas (386,853 acres) and avoidance areas (14,175 acres). This would limit both surface disturbance and vegetation removal in these areas which could be beneficial for special status species in these areas. Impacts to special status species from surface-disturbing activities and human disturbances under Alternative D would be less than under Alternative A.

4.3.15.3.4.6. Alternative E

Alternative E would consider proposals for ROWs in the Monticello PA except in exclusion areas (974,463 acres) and avoidance areas (53,915 acres). This would limit both surface disturbance and vegetation removal in these areas which could be beneficial for special status species in these areas. Impacts to special status species from surface-disturbing activities and human disturbances under Alternative E would be less than under Alternative A.

4.3.15.3.4.7. Proposed Plan

The Proposed Plan would consider proposals for ROWs in the Monticello PA except in exclusion areas (416,115 acres) and avoidance areas (133,293 acres). This would limit both surface disturbance and vegetation removal in these areas which could be beneficial for special

status species in these areas. Impacts to special status species from surface-disturbing activities and human disturbances under the Proposed Plan would be less than under Alternative A.

4.3.15.3.5. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.5.1. Impacts Common to All Alternatives and the Proposed Plan

Grazing would continue to be unavailable on 134,520 acres in the areas identified in the Summary Table of Alternatives and the Proposed Plan (Table 2.1), and Table 4.181 in Section 4.3.17, Vegetation, shows the acres unavailable for livestock grazing by vegetation type.

Livestock grazing allotments occupy approximately 99% of all lands within the Monticello PA. Detrimental impacts from grazing could include loss of biodiversity, lowering of population densities, disruption of some ecosystem functions, changes to community organization, and changes to the physical characteristics of both terrestrial and aquatic habitats (Chaneton and Lavado 1996; Fleischner 1994; Olf and Ritchie 1998). Within grazing allotments, special status species may be impacted by trampling, reduced forage or cover vegetation, reduced quality of riparian and wetland habitats, and other impacts to habitat quality or quantity.

Under all alternatives and the Proposed Plan, livestock grazing would be managed according to the Guidelines for Grazing Management to achieve the Standards for Rangeland Health (BLM 1997). By adhering to these standards, the impacts from livestock grazing on special status species are expected to be minimal. Grazing use would be unavailable on approximately 137,440 acres in the Monticello PA whereby adverse impacts to special status species by livestock would be reduced or eliminated. These closures could eliminate potential direct impacts from livestock grazing on special status species and associated habitat. Potential indirect, beneficial impacts could include increased habitat for special status species.

Under all alternatives and the Proposed Plan, grazing would be modified when monitoring indicates that objectives are not being met or resources are being adversely impacted. This would mitigate the adverse impacts of surface disturbance on riparian habitat associated with livestock grazing in the Monticello PA.

Livestock grazing would be permitted, with potentially adverse, indirect impacts from grazing in riparian habitat. A reduction in surface disturbance enables native vegetation to establish faster in riparian habitat.

Vegetation treatments including the use of mechanized or motorized equipment would be allowed in riparian areas. These treatments would have both beneficial and adverse impacts on vegetation in riparian habitat. Long-term beneficial impacts would include reduction of weed populations and creation of favorable conditions for establishment of native species. This, in turn, would improve riparian habitat for special status wildlife species. Short-term adverse impacts would include crushing and inadvertent removal of special status plant species during the treatment process. There could also be temporary adverse impacts on special status fish species habitat due to increased overland flow associated with soil compaction on soils adjacent to riparian areas (see Section 4.3.6, Livestock Grazing).

The SWFL Recovery Plan would be implemented in all suitable habitat areas. This would have beneficial impacts on any species within SWFL habitat because of the goals of the recovery plans, which are, 1) increase and improve occupied, suitable, and potential breeding habitat; 2)

increase meta-population stability; 3) improve demographic parameters; 4) minimize threats to wintering and migration habitat; 5) survey and monitor; 6) conduct research; 7) provide public education and outreach; 8) assure implementation of laws, policies, and agreements that benefit the flycatcher; 9) track recovery progress (USFWS 2002e).

The Utah's Standards for Rangeland Health and Guidelines for Grazing (Appendix G) and Recreation Guidelines (Appendix E) would be followed to achieve proper riparian functioning. Overall, the BLM would avoid degradation of habitats that could result in the loss of riparian vegetation, which would have beneficial impacts to special status species by preventing riparian habitat alteration.

4.3.15.3.5.2. Alternative A

Under Alternative A, 128,098 acres would be unavailable for livestock grazing (those areas shown in Table 4.51). Table 4.138, below, shows the number of acres of habitat for select special status species unavailable for grazing under each alternative.

Species	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Bald Eagle	4,835	7,898	7,898	4,835	7,898	7,898
Federally Listed Fish	0	0	0	0	0	0
MSO	71,178	73,010	73,010	71,178	73,010	73,010
SWFL	2,381	2,816	2,816	2,394	2,816	2,816
Gunnison Sage-grouse	0	0	0	0	0	0

Riparian and Rocky Slopes and Canyons

Under Alternative A, approximately 2% of the total 250,264 acres of Bald Eagle habitat, 10% of the total 22,896 acres of SWFL habitat, and 19% of the total 378,518 acres of MSO habitat in the Monticello PA would be unavailable for livestock grazing.

Adverse impacts of livestock on special status riparian species could include loss of riparian habitat as a result of grazing of palatable native plant species. Once disturbed, these areas could become more susceptible to invasion by noxious and introduced weeds, which tend to be low value forage and cover species for special status wildlife (Popolizio et al. 1994, Sarr et al. 1996, Belsky et al. 1999).

Under Alternative A, none of the total 1,690 acres of designated critical fish habitat in the Monticello PA would be unavailable for livestock grazing. Potential adverse impacts on special status fish species and their habitat would include direct, adverse impacts of livestock presence in streams and indirect, adverse impacts of increased stream sedimentation resulting from overland flow associated with riparian soil compaction. Cattle hooves compact the soil on stream-bank slopes, which results in less rainwater infiltration into soils and more overland

flows. The result is large, short-lived flows rather than small, perennial flows (Trimble and Mendel 1995).

Sagebrush, Desert Shrub, Conifer, and Pinyon-Juniper Woodland

Under Alternative A, none of the Gunnison Sage-grouse habitat in the Monticello PA would be unavailable for livestock grazing, which could have direct and indirect adverse impacts on Gunnison Sage-grouse individuals and their habitat. Livestock grazing, when properly grazed, would not necessarily have adverse impacts on the native plant populations in an area. However, when improper grazing occurs, adverse impacts on native vegetation could be possible in some areas (Sparrow et al. 2003; Young and Evans 1973). The invasion and establishment of weedy species in arid environments is common following surface disturbance. Most native plant species are slow-growing, and generally cannot compete with invasive plants in disturbed areas (Stevens 2004). Under all alternatives and the Proposed Plan, using standards and guides, grazing could be reduced in those areas where the native vegetation appears to be stressed. This would mitigate the adverse impacts of surface disturbance on these special status plant and wildlife habitats associated with livestock grazing in the Monticello PA. Table 4.181 in Section 4.3.17, Vegetation, shows the number of acres unavailable for grazing in each habitat for each alternative.

4.3.15.3.5.3. Alternative B

Under Alternative B, 141,160 acres would be unavailable for livestock grazing (those areas shown in Table 4.51 with additional unavailable acreages shown in Table 4.52). In addition, seasonal restrictions, closures, and/or forage utilization limits would be imposed on grazing in riparian areas determined to be Functioning at Risk. This would help mitigate the potential adverse impacts of livestock grazing in special status species habitats, as discussed in Alternative A.

Riparian and Canyons

Under this alternative, 3% of total Bald Eagle habitat would be unavailable for livestock grazing, which would be 1% more than under Alternative A; 19% of total MSO habitat would be unavailable for livestock grazing (same as Alternative A); 12% of SWFL habitat would be unavailable for livestock grazing (2% more than under Alternative A). These proposed grazing restrictions would have more beneficial impacts on special status species than Alternative A because more potential habitat would be protected from grazing-related surface disturbances to vegetation. There would be no critical fish habitat unavailable for grazing under this alternative.

Sagebrush, Desert Shrub, Conifer, and Pinyon-Juniper Woodland

Under Alternative B, none of the Gunnison Sage-grouse habitat in the Monticello PA would be unavailable for livestock grazing, which would have the same level of direct and indirect adverse impacts on Gunnison Sage-grouse individuals and their habitat as under Alternative A. The additional acres of federally listed species habitat closed to livestock grazing under this alternative would decrease the magnitude of the adverse impacts associated with livestock grazing decisions more than under Alternative A or D.

4.3.15.3.5.4. Alternative C

Under Alternative C, 139,832 acres would be unavailable for livestock grazing (those areas shown in Table 4.51 with additional unavailable acreages shown in Table 4.54). Under Alternative C, the impacts of livestock grazing decisions on special status species would be the same as under Alternative B because the management decisions are the same, except for management of Mule Canyon, which would be made unavailable for grazing south of U-95, (North and South Forks north of U-95 would be open).

4.3.15.3.5.5. Alternative D

Under Alternative D, 132,111 acres would be unavailable for livestock grazing (the number of unavailable acres shown in Table 4.51, with additional unavailable acres shown in Table 4.55). The same number of acres of federally listed wildlife species habitat would be closed to grazing under this alternative as under Alternative A. These closures would reduce the magnitude of the adverse impacts associated with livestock grazing in the Monticello PA, when compared to Alternative A.

4.3.15.3.5.6. Alternative E

Under Alternative E, 141,160 acres would be unavailable for livestock grazing. Under Alternative E, the impacts of livestock grazing decisions on special status species would be the same as under Alternative B because the management decisions are the same, except for management of wilderness values protection within non-WSA lands with wilderness characteristics. Livestock grazing with the non-WSA wilderness characteristics lands would not be affected by the decision to protect wilderness values in these areas.

4.3.15.3.5.7. Proposed Plan

Under the Proposed Plan, 139,832 acres would be unavailable for livestock grazing. The impacts would be similar to Alternative B because the only difference between Alternative B and the Proposed Plan is 656 additional acres would be unavailable for livestock grazing.

4.3.15.3.6. IMPACTS OF MINERAL DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.6.1. Alternative A

In Tables 4.147–4.149 in Section 4.3.17, Vegetation, acres of each special status species habitat type in each leasing category are shown for each of the three RFD areas. Acreage figures under the standard stipulations (standard conditions) and timing and controlled surface use (special conditions) stipulations reflect the total BLM-administered areas within the Monticello PA open to surface-disturbing activities. The impacts of surface-disturbing oil and gas activities on native vegetation (special status species habitat) are discussed in Section 4.3.17.2.5, Impacts of Minerals Decisions on Vegetation. These are not estimates of the total area disturbed within the Monticello PA, but a comparison by alternative of the amount of area open to potential development within BLM-administered areas within the Monticello PA. All acreages provided in this document are approximations. Tables 4.108–4.111 include acres of select federally listed and BLM special status species habitat under each of the minerals leasing stipulations.

Desert Shrub, Sagebrush, Perennial Grassland, Pinyon-Juniper Woodland, and Conifer/Mountain Shrub

Potential direct, adverse impacts of oil and gas development on special status species include placement of facilities or roads within either occupied habitat or potential habitat necessary for recovery, resulting in an overall reduction in suitable and potentially suitable habitat and an increase in habitat fragmentation (see Table 4.259). Additionally, noise associated with construction and operation activities could potentially disturb special status wildlife species. Protective measures would be implemented to mitigate these impacts (see Appendix A). Further mitigation measures include native vegetation protection and restoration requirements discussed in Section 4.3.17.4, which would benefit potentially suitable special status wildlife habitat and special status plant individuals and habitat.

Riparian

Oil and gas development would have both direct and indirect adverse impacts on riparian species. Although the riparian zone is listed as NSO, this stipulation could be waived if necessary for transmission lines, roads, and surface occupancy (Appendix A). Development of oil and gas wells requires approximately 2.4 acre feet of water for well drilling and extraction per well, which could adversely affect riparian habitat. Each contracting company would identify its own water source and disposal methods for waste products. One of the main factors in the listing of the Colorado River fishes was the cumulative impact of water depletion within the Colorado River system and their associated critical habitat. Because the Colorado and San Juan Rivers are designated as critical habitat for the 4 federally listed fish species, any water withdrawal would constitute a significant impact on these species. New depletions from these rivers or changes in the amount of water returned to the rivers would constitute an additional impact on the Colorado River fishes. Although required conservation measures (Appendix A) would help mitigate the adverse impacts of minerals development on water quality, the mineral development, including road construction, outlined for each alternative and the Proposed Plan could result in indirect, adverse impacts to water quality due to sedimentation associated with soil compaction in areas adjacent to riparian areas and subsequent overland flow (Trimble and Mendel 1995).

Other special status species dependent on riparian habitat for survival could be adversely impacted by oil and gas development activities. These impacts include a potential reduction on available prey species (fish) for special status bird species. Under Alternative A, 24% of SWFL habitat, 16% of Bald Eagle habitat, and none of Colorado River fish habitat would be categorized as closed or NSO to minerals leasing.

Rocky Slopes and Canyons

Oil and gas maintenance activities would be allowed year-round in lands managed with standard stipulations and special conditions. The potential exists for the MSO to occupy the rocky slope/canyon habitat in the Monticello PA. Under Alternative A, 31% of MSO habitat would be closed or NSO to minerals leasing. Direct, adverse impacts include short-term disturbance of individual owls and other special status species resulting from construction and operation noise, and a long-term reduction in habitat from the installation of mineral development infrastructure. These impacts, however, would be partially mitigated by riparian habitat restoration requirements and seasonal disturbance restrictions. Impacts to owls and habitat would be avoided or minimized through the implementation of the conservation measures in Appendix A. This

would include survey requirements for temporary activities during the owl breeding season (March 1–August 31) in potentially suitable or known owl habitat. No permanent disturbing actions would be allowed within 0.5 miles of areas where MSO surveys discover nesting individuals.

Table 4.139. Acres of Special Status Species Habitat designated as Closed or NSO by Alternative and Proposed Plan

Species	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
MSO	117,424	166,131	116,648	112,101	300,489	129,969
Gunnison Sage-grouse	0	0	0	119	0	0
Colorado River fish	0	1,670	1,670	1,397	1,668	1,413
SWFL	5,390	11,167	6,603	10,985	11,670	10,105
Bald Eagle	39,127	28,335	25,290	22,360	75,694	27,655

Table 4.139 provides acres of special status species habitat located in areas of the Monticello PA designated as closed or NSO to minerals leasing for each alternative and the Proposed Plan. The acres in Table 4.139 are carried forward from the 1991 RMP, which include acres from both locatable mineral entry and oil and gas RFD areas. Tables 4.140–4.154 provide acres of special status species habitat by RFD area acres only; therefore, they are not comparable. At the time of this analysis, spatially explicit habitat information is only available for these eight federally listed and BLM special status species.

The number of acres of TES species habitat within each of the RFD areas by mineral leasing category are listed in Tables 4.109 through 4.111. Section 4.3.17, Vegetation, provides acreage estimates of actual surface disturbance in each RFD for each alternative and the Proposed Plan. Site-specific NEPA will take place for each oil and gas development once actual well locations are known.

Table 4.140. Acres of Special Status Species Habitat in the Blanding Sub-basin Under Alternative A

Special Status Species	Surface Use with Standard Conditions (acres)	Surface Use Limited by Special Conditions (acres)	NSO and Closed to Mineral Entry (acres)	NSO and Open to Mineral Entry (acres)	Closed to Leasing and Mineral Entry (acres)
MSO	0	0	0	0	0
Gunnison Sage-grouse	122	0	0	0	0
Colorado River fish	423	0	190	0	0
SWFL	6,949	2,266	532	83	410

Table 4.140. Acres of Special Status Species Habitat in the Blanding Sub-basin Under Alternative A

Special Status Species	Surface Use with Standard Conditions (acres)	Surface Use Limited by Special Conditions (acres)	NSO and Closed to Mineral Entry (acres)	NSO and Open to Mineral Entry (acres)	Closed to Leasing and Mineral Entry (acres)
Bald Eagle	23,772	84,111	3,537	2,506	0

Table 4.141. Acres of Special Status Species Habitat in the Monument Upwarp Under Alternative A

Special Status Species	Surface Use with Standard Conditions (acres)	Surface Use Limited by Special Conditions (acres)	NSO and Closed to Mineral Entry (acres)	NSO and Open to Mineral Entry (acres)	Closed to Leasing and Mineral Entry (acres)
MSO	75,225	76,570	0	2,173	99,903
Gunnison Sage-grouse	0	0	0	0	0
Colorado River fish	17	0	262	0	0
SWFL	1,386	1,377	357	964	2,433
Bald Eagle	7,598	31,506	4,759	16,204	7,731

Table 4.142. Acres of Special Status Species Habitat in the Paradox Fold and Fault Under Alternative A

Special Status Species	Surface Use with Standard Conditions (acres)	Surface Use Limited by Special Conditions (acres)	NSO and Closed to Mineral Entry (acres)	NSO and Open to Mineral Entry (acres)	Closed to Leasing and Mineral Entry (acres)
MSO	76,108	33,381	0	4,916	10,432
Gunnison Sage-grouse	4,424	0	0	0	0
Colorado River fish	37	236	0	0	0
SWFL	2,145	1,185	0	294	317
Bald Eagle	14,326	46,379	0	1,723	2,667

4.3.15.3.6.2. Alternative B

Under Alternative B, the qualitative impacts on special status plant and animal species would be the same as described under Alternative A. See Tables 4.152–4.154 in Section 4.3.17, Vegetation for the acres of each vegetation type in each leasing category in each of the RFD areas.

Under Alternative B, 49% of SWFL habitat in the Monticello PA would be categorized as NSO or closed, which is 25% more than under Alternative A. Under Alternative B, 11% of Bald Eagle habitat in the Monticello PA would be categorized as NSO or closed, which is 5% less than under Alternative A. Under Alternative B, 99% of Colorado River fish habitat in the Monticello PA would be categorized as NSO or closed, which is 99% more than under Alternative A. This would protect other special status riparian plant and animal species, including the Yellow-billed Cuckoo. Under Alternative B, 44% of MSO habitat in the Monticello PA would be categorized as NSO or closed, which is 13% more than under Alternative A. This would protect MSO as well as other special status species in this cliff, desert shrub and sagebrush habitat. No Gunnison Sage-grouse habitat would be closed to mineral entry. Overall, Alternative B would have fewer adverse impacts on special status species than Alternative A because more acres of habitat would be closed or NSO to oil and gas leasing. Tables 4.112 to 4.114 list the number of acres of TES habitat within each of the RFD areas.

Table 4.143. Acres of Special Status Species Habitat in the Blanding Sub-basin Under Alternative B

Special Status Species	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
MSO	0	0	0	0	0	0

4.3.15.3.6.3. Alternative C

Under Alternative C, the qualitative affects on special status plant and animal species would be the same as described under Alternative A.

Under Alternative C, 29% of SWFL habitat in the Monticello PA would be categorized as NSO or closed, which is 5% more than under Alternative A. Under Alternative C, 10% of Bald Eagle habitat in the Monticello PA would be categorized as NSO or closed, which is 6% less than under Alternative A. Under Alternative C, 99% of Colorado River fish habitat in the Monticello PA would be categorized as NSO or closed, which is 99% more than under Alternative A. Under Alternative C, 31% of MSO habitat in the Monticello PA would be categorized as NSO or closed, which is the same as under Alternative A. This would protect MSO as well as other special status species in this cliff, desert shrub, and sagebrush habitat. No Gunnison Sage-grouse habitat would be closed or NSO to mineral entry. Overall, Alternative C would have fewer adverse impacts on special status species than Alternative A because more acres of habitat would be closed or NSO to oil and gas leasing. Tables 4.115–4.117 list the number of acres of MSO, Colorado River fishes, and sage-grouse habitat within each of the RFD areas. Spatially explicit protected habitat information is only available for these six special status species.

Table 4.146. Acres of Special Status Species Habitat in the Blanding Sub-basin Under Alternative C

Special Status Species	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
MSO	0	0	0	0	0	0

Bald Eagle	8,514	13,362	1,882	35,909	1,913	3,593

4.3.15.3.6.4. Alternative D

Under Alternative D, the qualitative impacts on special status plant and animal species would be the same as described under Alternative A.

Under Alternative D, 48% of SWFL habitat in the Monticello PA would be categorized as NSO or closed, which is 24% more than under Alternative A. Under Alternative D, 9% of Bald Eagle habitat in the Monticello PA would be categorized as NSO or closed, which is 7% less than under Alternative A. Under Alternative D, 83% of Colorado River fish habitat in the Monticello PA would be categorized as NSO or closed, which is 83% more than under Alternative A. Alternative D is the only alternative to classify any sage-grouse habitat (119 acres) as NSO or closed to minerals development. This would provide more protection for sage-grouse and other special status sagebrush plant and animal species than Alternative A. Under Alternative D, 30% of MSO habitat in the Monticello PA would be categorized as NSO or closed, which is 1% less than Alternative A. This would provide less protection to MSO as well as other special status species in this cliff, desert shrub, and sagebrush habitat. Overall, Alternative D would have fewer adverse impacts on special status species than Alternative A because more acres of habitat would

be closed or NSO to oil and gas leasing. Tables 4.118–4.120 list the number of acres of MSO, Colorado River fishes, and sage-grouse habitat within each of the RFD areas. Spatially explicit protected habitat information is only available for these seven special status species.

Table 4.149. Acres of Special Status Species Habitat in the Blanding Sub-basin Under Alternative D

Special Status Species	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
MSO	0	0	0	0	0	0
Gunnison Sage-Grouse	3	0	0	0	119	0
Colorado River fish	19	0	0	0	1,004	0
SWFL	409	0	0	2,158	6,596	1,136

Colorado River fish	0	0	0	273	0	0
SWFL	1,812	1	0	1,819	0	317
Bald Eagle	15,954	0	0	46,550	0	2,667

4.3.15.3.6.5. Alternative E

Under Alternative E, the qualitative impacts on special status plant and animal species would be the same as described under Alternative A. See Tables 4.164–4.166 in Section 4.3.17, Vegetation for acres of each vegetation type in each leasing category in each of the RFD areas.

Under Alternative E, 56% of SWFL habitat in the Monticello PA would be categorized as NSO or closed, which is 32% more than under Alternative A. Under Alternative E, 31% of Bald Eagle habitat in the Monticello PA would be categorized as NSO or closed, which is 15% more than under Alternative A. Under Alternative E, 99% of Colorado River fish habitat in the Monticello PA would be categorized as NSO or closed, which is 99% more than under Alternative A. This would protect other special status riparian plant and animal species including the Yellow-billed Cuckoo. No Gunnison Sage-grouse habitat would be closed or NSO to mineral entry. Under Alternative E, 79% of MSO habitat in the Monticello PA would be categorized as NSO or closed, which is 48% more than under Alternative A. This would protect MSO as well as other special status species in this cliff, desert shrub, and sagebrush habitat. Overall, Alternative E would have fewer adverse impacts on special status species than Alternative A because more acres of habitat would be closed or NSO to oil and gas leasing. Tables 4.121–4.123 list the number of acres of TES habitat within each of the RFD areas.

Table 4.152. Acres of Special Status Species Habitat in the Blanding Sub-basin Under Alternative E

Special Status Species	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No surface Occupancy	Closed

4.3.15.3.6.6. Proposed Plan

Under the Proposed Plan, the qualitative affects on special status plant and animal species would be the same as described under Alternative A.

Under the Proposed Plan, 48% of SWFL habitat in the Monticello PA would be categorized as NSO or closed, which is 24% more than under Alternative A. Under the Proposed Plan, 10% of Bald Eagle habitat in the Monticello PA would be categorized as NSO or closed, which is 6% less than under Alternative A. Under the Proposed Plan, 84% of Colorado River fish habitat in the Monticello PA would be categorized as NSO or closed, which is 84% more than under Alternative A. Under the Proposed Plan, 34% of MSO habitat in the Monticello PA would be categorized as NSO or closed, which is 3 % more than under Alternative A. This would protect MSO as well as other special status species in this cliff, desert shrub, and sagebrush habitat. No Gunnison Sage-grouse habitat would be closed or NSO to mineral entry. Overall, the Proposed Plan would have fewer adverse impacts on special status species than Alternative A because more acres of habitat would be closed or NSO to oil and gas leasing. Tables 4.115–4.117 list the number of acres of MSO, Colorado River fishes, and sage-grouse habitat within each of the RFD areas. Spatially explicit protected habitat information is only available for these six special status species.

Table 4.155. Acres of Special Status Species Habitat in the Blanding Sub-basin Under the Proposed Plan

Special Status Species	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
MSO	0	0	0	0	0	0

4.3.15.3.7. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON SPECIAL STATUS SPECIES

Management decisions regarding non-WSA lands with wilderness characteristics would generally reduce adverse impacts to the special status species and habitat within their boundaries. Impacts to special status species vary among alternatives based on the acreage managed for wilderness characteristics and the oil and gas leasing stipulations assigned within them.

4.3.15.3.7.1. Impacts Common to All Alternatives and the Proposed Plan

There are no impacts common to all alternatives and the Proposed Plan for lands with wilderness characteristics.

4.3.15.3.7.2. Alternatives A, B, C, and D

Under Alternatives A, B, C, and D, no areas within the Monticello PA would be managed as non-WSA areas with wilderness characteristics.

4.3.15.3.7.3. Alternative E

Under Alternative E, approximately 582,360 acres of non-WSA lands wilderness characteristics would be managed to preserve their wilderness values. Proposed decisions to protect wilderness values would include managing the areas under VRM I objectives, closing the area to oil and gas leasing and locatable mineral development, closing the areas to off-route OHV use and new road construction, designating the areas as ROW exclusion areas, and closing the areas to woodland harvest and wood gathering. Fire suppression on non-WSA lands with wilderness characteristics would be through light on the land techniques. These proposed decisions would have long-term beneficial impacts on special status species in all of the habitat types by reducing the potential for surface disturbances, noise, and alteration of habitat.

4.3.15.3.7.4. Proposed Plan

Under the Proposed Plan, 88,871 acres would be managed for their wilderness characteristics. These areas would include Dark Canyon (11,540 acres), Grand Gulch (13,657 acres), Mancos Mesa (30,068 acres), and Nokai Dome East (18,618 acres) and Nokai Dome West (14,988 acres). Proposed decisions to protect wilderness values would include: 1) managing the areas under VRM II objectives; 2) closing most units to oil and gas leasing and establishing the Dark Canyon unit as NSO; 3) limiting OHV use to designated roads/trails; 4) establishing units as ROW avoidance areas; 5) maintaining existing improvements within units; 6) unavailable for private and commercial wood harvest; 7) available for non-ground disturbing treatments; 8) not proposed for mineral withdrawal; 9) available for mineral materials disposal if the oil and gas leasing category is standard or timing/controlled surface use, otherwise closed to mineral materials disposal; 10) unavailable for coal leasing; and 11) unavailable for geothermal leasing. Fire suppression on non-WSA lands with wilderness characteristics would be through light on the land techniques. These proposed decisions would have long-term beneficial impacts on special status species in all of the habitat types by reducing the potential for surface disturbances, noise, and habitat alteration.

4.3.15.3.8. IMPACTS OF PALEONTOLOGY DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.8.1. Impacts Common to All Alternatives and the Proposed Plan

Management actions associated with paleontological resources program include survey and inventory, development of interpretive sites, establishment of temporary campgrounds, and construction of fences and erosion stabilization structures. Hand tools, power tools, and heavy machinery are used during these actions. Impacts to special status species may result from surface disturbance, foot traffic, soil erosion and compaction, and human presence. These actions can also result in increased potential for weed invasion or other changes to habitat structure and composition. Paleontological resource excavation or preservation actions are typically less than one acre in size and disturbances are generally isolated and short-term. Under all management alternatives and the Proposed Plan, the collection of vertebrate fossils and associated activities would be limited to qualified individuals and would thereby limit surface-disturbing activities to permitted activities.

Piñon-Juniper Woodland and Desert Shrub Habitats

Under the Proposed Plan and other management alternatives, implementation of the paleontological resource management program is likely to adversely affect Jones' cycladenia due to the potential for surface disturbance associated with discovery activities within known or potential piñon-juniper woodland and desert shrub habitats. Paleontological activities could negatively impact MSO and other sensitive species in this habitat due to paleontology related actions such as digging, fencing, and excavations that could alter the habitats utilized by MSO prey and disrupt foraging behaviors.

Conifer and Mountain Shrub Habitat

Under the Proposed Plan, paleontological activities could negatively impact MSO and other sensitive species in conifer and mountain shrub habitat due to paleontology related actions such as digging, fencing, and excavations that could prey habitat and disrupt foraging behaviors.

Riparian, Wetland and Stream Habitat

Under the Proposed Plan, paleontological activities could negatively impact SWFL and other riparian birds due to actions such as digging, fencing, excavations, or establishment of temporary camp sites in riparian habitats. Associated human activities may disrupt nesting and foraging behaviors and result in reduced reproductive success. Paleontological activities may also negatively impact endangered Colorado River fishes due to potential for water quality degradation and aquatic habitat modification during paleontologic activities.

All Other Special Status Species Habitats in the Monticello PA

The impacts of paleontological resource management decisions on all other special status species habitats are expected to be negligible. Potential impacts are discussed in Section 4.3.15.2. Impacts Common to All Alternatives and the Proposed Plan.

4.3.15.3.8.2. Alternative A

Under this alternative, the only impacts on sensitive species and their habitat would be those discussed in the previous section.

4.3.15.3.8.3. Alternatives B and E

Under these alternatives, on-site evaluation of surface-disturbing activities for all Category 3, 4/5, and 5 areas, and avoidance of impacts to paleontological resources are stipulated. In addition to the impacts common to all alternatives and the Proposed Plan, sensitive species in all habitat types would potentially be impacted by the surface disturbance and human presence associated with the on-site evaluations stipulated under these alternatives. In the long-term, any sensitive species habitat located in areas with paleontological resources would benefit from the impact avoidance requirement in these areas. These alternatives would result in fewer long-term, adverse impacts on sensitive species and their habitat than Alternative A.

4.3.15.3.8.4. Alternatives C, D, and the Proposed Plan

Under these alternatives, on-site evaluation of surface-disturbing activities for all Category 5 areas would be required and impacts to paleontological resources would be minimized to the degree practicable. The site evaluation would consider the type of surface disturbance proposed

and mitigation will be developed based on site-specific information. In addition to the impacts common to all alternatives and the Proposed Plan, sensitive species in all habitat types would potentially be impacted by the surface disturbance and human presence associated with the on-site evaluations stipulated under these alternatives. These alternatives would result in fewer long-term, adverse impacts on sensitive species and their habitat than Alternative A.

4.3.15.3.9. IMPACTS OF RECREATION DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.9.1. Impacts Common to All Alternatives and the Proposed Plan

Impacts to special status species from recreation include direct impacts from use of mechanized and non-mechanized vehicles, ground disturbance from trail development, trampling of individuals, habitat fragmentation, and increased access to secluded fragile habitats and species. Increased visitor use of recreational areas may also adversely impact special status species through increased noise and human presence. Indirect adverse impacts to riparian areas from recreation could include alternation of plant community structure and species composition, reduction in the relative abundance of species, and changes to stream channel morphology, all of which may contribute to habitat degradation. Management of recreational areas that includes measures to reduce surface disturbance and resource degradation would also reduce these adverse impacts on special status species.

The adverse impacts of recreation decisions would be partially mitigated by the required reclamation of disturbed areas to meet the Utah Standards for Public Land Health and Guidelines for Recreation Management (Appendix E) and protective measures outlined for federally listed species in Appendix Q. OHV use and dispersed camping are emphasized here due to the higher use levels of these activities in the Monticello PA, and the potential for direct adverse impacts to sensitive species and their habitats from these activities throughout the Monticello PA.

Under all alternatives and the Proposed Plan, riparian areas would be managed as NSO for oil and gas leasing. They would, however, be open to mineral entry and disposal of mineral materials, but not in active floodplains or within 100 m of riparian areas. Woodland product collection would be prohibited. These restrictions would decrease the intensity the impacts of surface disturbance on riparian habitat in the Monticello PA.

4.3.15.3.9.2. Alternative A

Under Alternative A, the San Juan River SRMA would restrict visitor use by issuing a limited number of river permits each year. Also, the Indian Creek SRMA would limit some camping to designated sites, which would reduce the surface disturbance associated with dispersed camping. These restrictions would reduce the adverse impacts of visitor traffic on special status species. There would, however, be adverse surface disturbance associated with the potential trampling and crushing of special status plant species by humans, horses, and vehicles. The surface disturbance associated with foot and vehicle traffic could also lead to the introduction of invasive plant species, with long-term adverse impacts on special status plant and animal habitats as discussed in previous sections. Additional impacts on special status species and their habitat would include direct and indirect disturbance of individual wildlife species by human visitors. Wildlife species, birds in particular, are directly impacted by vehicle traffic and other anthropogenic noise. Traffic noise has been shown to directly interfere with bird vocal communication, which affects territorial behavior and mating success (Reijnen and Foppen,

1994). The San Juan River SRMA (10,203 acres) would allow 40,000 user/days per year, and vehicle camping would not be restricted. These stipulations would allow potential surface and noise disturbances, which would have long-term adverse impacts on special status species in the SRMA, as discussed in previous sections. The acreage of each vegetation type included in the SRMA is listed for each alternative in Table 4.209 in Section 4.3.17, Vegetation.

The Cedar Mesa SRMA (385,000 acres) with the Grand Gulch Plateau SRMA would require pets to be leashed, camping only at campsites, and a total of 196 overnight visitors per day. This would reduce the adverse impacts of surface and noise disturbance associated with visitors. In Table 4.206 in Section 4.3.17 Vegetation, the acreage of each vegetation type included in the SRMA is listed in that table.

Under Alternative A, the Dark Canyon SRMA (214,390 acres) and the Indian Creek SRMA (0 acres) are managed as part of a larger Canyon Basins SRMA. There would be no limit on group size, camping location, or vehicle use. This could result in short- and long-term adverse impacts on special status species from surface and noise disturbances. In Tables 4.168 and 4.169 in Section 4.3.17, Vegetation, the acreage of each vegetation type included in the SRMA is listed for each alternative and the Proposed Plan.

The White Canyon SRMA would have no limit on group size, camping location, or vehicle use. This could result in short- and long-term adverse impacts on special status species due to surface and noise disturbance. In Table 4.206 in Section 4.3.17, Vegetation, the acreage of each vegetation type included in the SRMA is listed. Table 4.158 includes acres of federally listed species habitat in each of the SRMAs under Alternative A. Gunnison Sage-grouse is not included in the table because none of the SRMAs overlap with Gunnison Sage-grouse habitat.

Table 4.158. Acres of Federally Listed Species Habitat in each of the SRMAs Under Alternative A

SRMA	Bald Eagle	Federally Listed Fish	MSO	SWFL
Canyon Basins SRMA	59,799	0	245,465	2,931
Cedar Mesa SRMA	8,928	0	21,268	5,768
Dark Canyon	0	0	0	0
Grand Gulch Plateau	0	0	0	0
Indian Creek	0	0	0	0
San Juan River SRMA	12,642	825	0	4,346
White Canyon	0	0	0	0

Under this alternative, 33% of Bald Eagle habitat, 70% of MSO habitat, 57% of SWFL habitat, 49% of the federally listed fish habitat, and none of the Gunnison Sage-grouse habitat would lie within the boundaries of proposed SRMAs.

4.3.15.3.9.3. Alternatives B and E

Under Alternatives B and E, the impacts of recreation management decisions on special status species would include those outlined below, as well as those discussed in Impacts Common to All Alternatives and the Proposed Plan.

The San Juan River SRMA would allow 30,000 user/days per year, which would be 25% fewer visitors allowed per year than under Alternative A. Vehicle camping would be restricted to designated areas. These management decisions would result in less surface and noise disturbances to habitat than Alternative A, but there would still be long-term, adverse impacts on special status species in the SRMA as discussed in previous sections.

The Cedar Mesa Cultural SRMA (375,739 acres) would be available for livestock use and vegetation treatments, pets would be allowed on leash, dispersed camping would be allowed, and a total of 144 overnight visitors per day would be permitted. This represents a 27% reduction in visitors permitted than under Alternative A. Under Alternatives B and E, the Dark Canyon SRMA (30,820 acres) would have a 15-private visitor per day limit and camping would be allowed in designated areas only. This would be a reduction in permitted visitation when compared with Alternative A, which would allow unlimited visitation. Permitted visitation could result in short and long-term, adverse affects on special status species from surface and noise disturbance, but to a lesser degree than under Alternative A.

In the Indian Creek SRMA, dispersed camping would not be allowed. This alternative would result in short and long-term, adverse impacts on special status species due to surface and noise disturbance associated with visitors, but to a lesser extent than under Alternative A because of the camping restrictions.

The White Canyon SRMA (89,271 acres) would limit use through a permit system. This could still result in short and long-term, adverse affects on special status species due to surface and noise disturbance, but to a lesser degree than under Alternative A. Table 4.159 includes acres of federally listed species habitat in each of the SRMAs under Alternatives B and E. Gunnison Sage-grouse is not included in the table because none of the proposed SRMAs overlap with Gunnison Sage-grouse habitat.

Table 4.159. Alternatives B and E-Acres of Federally Listed Species Habitat in each of the SRMAs

SRMA	Bald Eagle	Federally Listed Fish	MSO	SWFL
Canyon Basins SRMA	0	0	0	0
Cedar Mesa C-SRMA	0	0	0	0
Dark Canyon	846	0	30,820	351
Grand Gulch Plateau	7,737	0	17,330	4,061
Indian Creek	19,243	0	83,203	2,195
San Juan River SRMA	11,217	793	0	3,556
White Canyon	571	0	0	17

Under this alternative, 16% of Bald Eagle habitat in the Monticello PA would be included within proposed SRMAs (17% less than under Alternative A). Forty-seven percent of federally listed fish habitat would be included within SRMA boundaries (2% less than under Alternative A; 35% of MSO habitat would lie within SRMAs, (35% less than under Alternative A); and 44% of SWFL habitat would be included in SRMAs (13% less than under Alternative A).

Overall, this alternative would be likely to have less adverse impacts on special status species in SRMAs than Alternative A because of the increased protection afforded species within the proposed SRMAs.

4.3.15.3.9.4. Alternative C

Under Alternative C, the impacts of recreation management decisions on special status species would include following impacts in addition to those discussed in Impacts Common to All Alternatives.

The San Juan River SRMA (9,859 acres) would allow 40,000 user/days per year, which is the same number of users permitted under Alternative A. Unlike Alternative A, camping would be restricted to designated areas under this alternative. These stipulations would allow for less surface and noise disturbance than Alternative A, but there would still be some long-term, adverse impacts on special status species in the SRMA as discussed in previous sections.

Under Alternative C, the Cedar Mesa Cultural SRMA would be managed the same as under Alternative B with the following exceptions: woodland harvesting would be allowed, and a total of 180 overnight visitors per day would be permitted. Under this alternative, 8% fewer visitors would be allowed per day than under Alternative A which would reduce adverse impacts, however, there could be an increased level of surface disturbance related to woodland gathering and harvesting and/or noise-related disturbance compared with Alternatives A and B. Under Alternative C, the Dark Canyon SRMA management decisions would limit visitation to 20 private visitors per day, and camping would be allowed in designated areas only. This would result in short and long-term adverse impacts on special status species due to surface disturbances, but to a lesser extent than under Alternative A.

In the Indian Creek SRMA, dispersed camping would not be allowed except in designated dispersed camping zones. This alternative would result in short and long-term, adverse impacts on special status species due to surface and noise disturbance associated with visitors, but to a lesser extent than under Alternative A because of the camping restrictions.

Under Alternative C, the impacts in on special status species in the White Canyon SRMA would be the same as under Alternative B.

The same number of acres of federally listed species habitat would be included in SRMAs under this alternative as under Alternative B; therefore, there would be the same impacts on federally listed species and their habitat under this alternative.

4.3.15.3.9.5. Alternative D

Under Alternative D, the impacts of recreation management decisions on special status species resources would include the following impacts, in addition to those discussed previously in Impacts Common to All Alternatives and the Proposed Plan.

The San Juan River SRMA would allow 40,000 user/days per year, and vehicle camping would be restricted to designated areas in specified portions of the SRMA. These stipulations would potentially result in a similar level of surface disturbance as Alternative A, which would include long-term adverse impacts on special status species and their habitat in the SRMA, as discussed in previous sections.

Under Alternative D, the Cedar Mesa Cultural SRMA would be managed the same as under the Proposed Plan with the exception that a total of 216 overnight visitors per day would be permitted. This could result in an increased level of surface and noise disturbance compared with Alternatives A, B, and the Proposed Plan. Under Alternative D, the Dark Canyon SRMA would have no limit on the number of private visitors per day, and dispersed camping would be allowed in some areas. This would result in short- and long-term adverse impacts on special status species and their habitat due to surface and noise disturbance, but to a lesser extent than under Alternative A.

Under Alternative D, the impacts on special status species and their habitat in the Indian Creek SRMA would be the same as under Alternative A. Under Alternative D, the impacts on special status species and their habitat in the White Canyon SRMA would be the same as under Alternative A. Table 4.160 includes acres of federally listed species habitat in each of the SRMAs under Alternative D. Gunnison Sage-grouse is not included in the table because none of the SRMAs overlap with Gunnison Sage-grouse habitat.

Table 4.160. Acres of Federally Listed Species Habitat in each of the SRMAs Under Alternative D

SRMA	Bald Eagle	Federally Listed Fish	MSO	SWFL
Canyon Basins SRMA	0	0	0	0
Cedar Mesa C-SRMA	0	0	0	0
Dark Canyon	846	0	30,820	351
Grand Gulch Plateau	7,737	0	17,330	4,061
Indian Creek	19,243	0	83,203	2,195
San Juan River SRMA	7,767	544	0	2,711
White Canyon	571	0	0	17

Under this alternative, 16% of Bald Eagle habitat in the Monticello PA would be included in an SRMA, which is 17% less than under Alternative A. Thirty-two percent of federally listed fish habitat would be included within proposed SRMA boundaries (17% less than under Alternative A). Thirty-five percent of MSO habitat would be included in an SRMA (35% less than under Alternative A), and 41% of SWFL habitat would be included within the SRMAs (16% less than under Alternative A). Overall, this alternative is likely to have more adverse impacts on special status species within the proposed SRMAs than Alternative A because of the increased number of permitted visitors in some of the SRMAs and the reduction in habitat protection within the SRMAs.

4.3.15.3.9.6. Proposed Plan

Under the Proposed Plan, the impacts of recreation management decisions on special status species would include following impacts in addition to those discussed in Impacts Common to All Alternatives and the Proposed Plan.

The San Juan River SRMA (9,859 acres) would include the same number of acres and be managed the same as under Alternative C.

Under the Proposed Plan, the Cedar Mesa SRMA would be managed the same as under Alternative B with the following exceptions: woodland harvesting would be allowed, stock would be limited to 8 animals, group size would be expanded to 24, and campfires would be allowed on mesa tops. The Cedar Mesa SRMA would include 407,098 acres, which is approximately 6 % larger than under Alternative A. Under the Proposed Plan, 8% fewer visitors would be allowed per day than under Alternative A which would reduce adverse impacts, however, there could be an increased level of surface disturbance related to woodland gathering and harvesting and/or noise-related disturbance compared with Alternative A. The Grand Gulch Plateau would be managed as described for Alternative C.

Under the Proposed Plan, the Dark Canyon SRMA, Indian Creek SRMA, and White Canyon SRMA would be managed as described for Alternative C, except group size limitations for the Dark Canyon SRMA would be 18 people.

Under the Proposed Plan, ERMAs would be managed as described for Alternative C.

4.3.15.3.10. IMPACTS OF RIPARIAN DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.10.1. Impacts Common to All Alternatives and the Proposed Plan

BLM would follow Utah's Standards for Rangeland Health and Guidelines for Grazing and Recreation Management (BLM 1997) to achieve riparian PFC, oil and gas leasing would be NSO in riparian areas, and no new surface-disturbing activities would be allowed within active floodplains or within 100 m of riparian areas unless it can be shown that: a) there are no practical alternatives or, b) all long-term impacts can be fully mitigated or, c) the activity will benefit and enhance the riparian area. In addition, a few trails would be closed to protect riparian resources. These requirements would help mitigate the adverse impacts of surface-disturbing activities on special status species in riparian habitat. Floodplains and riparian/aquatic areas would be subject to fire suppression to protect riparian habitat. This could have short-term, adverse impacts on riparian species as a result of human presence and vegetation trampling associated with fire suppression activities. No camping would be allowed within 200 feet of isolated springs or water sources. This would help protect special status species habitat in these areas by reducing human presence and habitat modification. Hydraulic analysis would be completed in the design phase by the project proponent to eliminate potential environmental degradation associated with pipeline breaks at stream crossings to avoid repeated maintenance of such crossings. Specific recommendations regarding surface and subsurface crossings are found in Guidance for Pipeline Crossings (see Appendix F). These requirements would help mitigate the adverse impacts of stream degradation including sedimentation, removal of bank vegetation (resulting in increased stream temperature), and water contamination on special status fish species.

4.3.15.3.10.2. Alternatives A and D

Under Alternatives A and D, impacts would be the same as discussed under Impacts Common to All Alternatives.

4.3.15.3.10.3. Alternatives B, C, and the Proposed Plan

Under Alternatives B, C, and the Proposed Plan the impacts of riparian management decisions on special status species and their habitat would include the impacts outlined below, in addition to those discussed in Section 4.3.15.2, Impacts Common to All Alternatives and the Proposed Plan.

OHV routes in selected riparian areas would be closed in riparian areas determined to be Functioning at Risk if site-specific analysis shows that OHV use is contributing to the degradation. Riparian areas considered "Functioning at Risk" would be closed to dispersed motorized camping until PFC is restored. In addition, some riparian areas would be unavailable for livestock grazing, while others would be subject to seasonal restrictions and forage utilization limits. These restrictions would lessen the number of acres of special status species habitat subject to the adverse impacts of surface disturbance in special status riparian areas. It would also reduce the adverse impacts of human presence and noise associated with OHV use in special status riparian habitat. Alternatives B, C and the Proposed Plan would be more beneficial to special status species and their habitat than Alternative A.

4.3.15.3.10.4. Alternative E

Under Alternative E, the impacts of riparian management decisions on special status species and their habitat would be the same as for Alternative B except non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, as unavailable for OHV use, as ROW exclusion areas, as unavailable for disposal of mineral materials, as unavailable for private and commercial woodland harvest, as VRM Class I, and as proposed for withdrawal from mineral entry. This alternative would be more beneficial to special status species and their habitat than Alternative A.

4.3.15.3.11. IMPACTS OF SOILS AND WATERSHED DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.11.1. Impacts Common to All Alternatives and the Proposed Plan

Under all alternatives and the Proposed Plan, soils and watershed decisions would comply with Utah's Standards for Rangeland Health and Guidelines for Grazing (Appendix G) and Recreation (Appendix E). In addition, all floodplains and riparian/wetlands would be managed in accordance with Executive Orders 11988 and 11990, sections 303 and 404 of the Clean Water Act, the Colorado River Salinity Control Act, and the Endangered Species Act, which would protect the quality of stream water and federally listed species habitat. Also, uses in the Monticello PA would be managed to minimize and mitigate damage to soils, and activities located in areas with special status soils would be subject to site-specific NEPA. These restrictions would decrease the number of acres in the Monticello PA subject to the adverse impacts on special status species and habitat associated with surface-disturbing activities. This includes the indirect impacts of potential stream water contamination associated with increased sedimentation from runoff associated with disturbed areas.

4.3.15.3.11.2. Alternative A

Under Alternative A, impacts would be the same as Impacts Common to All Alternatives.

4.3.15.3.11.3. Alternatives B and D

Under Alternatives B and D, the impacts of soils and watershed management decisions on special status species and their habitat would include the following impacts in addition to those discussed in Alternative A. If surface-disturbing activities cannot be avoided on slopes between 21 and 40%, a plan including an erosion-control strategy and a BLM-approved survey and design would be required. This would provide protection for special status plant and animal species on 218,296 acres of land in the Monticello PA. Therefore, the actions associated with these alternatives would have less adverse impact on special status species and their habitat than Alternative A. Table 4.161 provides the total number of acres of each vegetation type in the Monticello PA with slopes greater than 40%. Special status species in pinyon-juniper woodland habitat would benefit from the large number of acres protected from surface-disturbing activities due to slope use restrictions.

Table 4.161. Acres of Each Vegetation Type by Slope Steepness Category

Vegetation Type	Acres of slopes >40%	Acres of slopes 21-40%
Conifer/Mountain Shrub	1,323	2,662
Desert Shrub	6,391	27,473
Invasive Plants and Weeds	43	213
Pinyon-Juniper Woodland	77,332	180,954
Riparian/Wetland	683	1,461
Sagebrush/ Perennial Grassland	1,684	5,533
Total	87,456	218,296

4.3.15.3.11.4. Alternative C and the Proposed Plan

Under Alternative C and the Proposed Plan, the impacts of soils and watershed management decisions on special status species and their habitat would include the following impacts in addition to those discussed in Alternative B. For slopes greater than 40%, no surface disturbance would be allowed unless it is determined that it would cause undue or unnecessary degradation to pursue other placement alternatives, and an erosion plan would be required. Avoid surface disturbance on slopes greater than 40% would eliminate the adverse impacts associated with surface disturbance on special status species utilizing or inhabiting slopes greater than 40%. Alternative C and the Proposed Plan would be more beneficial to special status species and their habitat than Alternative A.

4.3.15.3.11.5. Alternative E

Under Alternative E, impacts of soils and watershed decisions on special status species would be the same as those described under Alternative B except for non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, as unavailable for OHV use, as ROW exclusion areas, as unavailable for disposal of mineral materials and woodland

harvest, and would be managed as VRM Class I, and as proposed for withdrawal from mineral entry. Therefore, the actions associated with the Proposed Plan would have less adverse impact on special status plant and animal species and their habitat than Alternatives A.

4.3.15.3.12. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.12.1. Impacts Common to All Alternatives and the Proposed Plan

Special Designation areas, such as ACECs, WSAs, and WSRs would generally reduce long-term impacts to special status species that occur within their boundaries. Impacts to special status species vary among the Proposed Plan and alternatives based on the acreage of these specially designated areas, and the oil and gas leasing stipulations assigned within them. ACECs are designated to protect identified relevant and important values such as cultural resources, scenic qualities, and natural systems. ACEC designation would reduce impacts to special status species and habitats by limiting human activity and surface disturbances, preserving habitat, and limiting noise.

WSAs are established in order to provide for the protection of wilderness character and for the use and enjoyment of visitors in a manner that leaves it unimpaired for future use. By definition, no surface disturbance, permanent new development, or ROW would be allowed in the WSAs; the lands would be closed to oil, gas, and mineral leasing. Under all alternatives and the Proposed Plan, where ACECs overlap WSAs (see Maps 87–90 WSA management would take precedence. This land would be managed according to the IMP.

Under all alternatives and the Proposed Plan, any river segments found suitable for designation as a WSR would be recommended to Congress. Once identified—but prior to their official designation by Congress—these river segments would be managed to protect their free-flowing condition and outstandingly remarkable values. These qualities would be maintained within 1/4 mile on each side of the river. The BLM would not seek water rights in these segments, and OHV travel would be limited to designated routes.

A comparative analysis of the management (specifically relating to oil and gas leasing stipulations) of the ACECs under the Proposed Plan and each alternative would be the best representative of potential impacts of Special Designation decisions on special status species. Impacts of surface-disturbing oil and gas activities on special status species and their habitats include direct and indirect human-caused disturbance (i.e., vehicular traffic, trampling of vegetation, noise, and human presence) of individual species and their habitats. Further discussion of the qualitative impacts of surface-disturbing oil and gas activities on native vegetation (special status species habitat) can be found in Section 4.3.17, Vegetation.

Within the Monticello PA, there are 12 proposed ACECs and 12 reviewed WSR segments. Not every proposed ACEC or WSR segment would be designated under each alternative (Table 4.162 and Table 4.163). Other than stipulating that WSAs would be managed according to IMP and as VRM Class I there are no blanket management prescriptions within proposed ACECs, so the impacts to special status species resources from ACEC designations would vary depending on the management stipulations for each area under each alternative and the Proposed Plan.

Table 4.162. Proposed ACEC Acreage under the Proposed Plan and Each Alternative

ACEC	Alternatives					Proposed Pan
	A	B	C	D	E	
Alkali Ridge	39,202	39,196	39,196	0	39,196	39,196
Bridger Jack Mesa	6,260	6,225	0	0	6,225	0
Butler Wash North	17,464	17,365	0	0	17,365	0
Cedar Mesa	295,336*	306,742	0	0	306,742	0
Dark Canyon	61,660	61,660	0	0	61,660	0
Hovenweep	1,798	2,439	2,439	0	2,439	2,439
Indian Creek	8,510	8,510	3,905	0	8,510	3,905
Lockhart Basin	N/A**	47,783	0	0	47,783	0
Lavender Mesa	649	649	649	0	649	649
Shay Canyon	3,561	119	119	0	119	119
San Juan River	0***	7,590	7,590	0	7,590	4,321
Valley of the Gods	0****	22,863	22,863	0	22,863	22,863
Total	492,077	521,142	76,761	0	521,142	73,492

*Acreage includes Cedar Mesa ACEC (295,336) and Pine and Step Canyons (23,653).

**Lockhart Basin is not currently an ACEC. A portion of the potential Lockhart Basin ACEC area includes the existing Indian Creek ACEC accompanied by current management prescriptions for this area.

***The proposed San Juan River ACEC would continue to be managed under SRMA status under Alternative A.

****Under Alternative A, the Valley of the Gods is a Special Emphasis Area for Scenic Value within the Cedar Mesa ACEC.

Table 4.163. Miles of WSR Segment Recommended for Designation by Alternative

WSR Segment	Alternatives					Proposed Plan
	A	B	C	D	E	
Colorado River Segment 1 (Recreational)	0	2.2	0	0	2.2	0
Colorado River Segment 2 (Scenic)	0	5.5	5.5	0	5.5	5.5
Colorado River Segment 3 (Scenic)	0	6.5	6.5	0	6.5	6.5
Indian Creek (Recreational)	0	4.8	0	0	4.8	0
Fable Valley (Scenic)	0	6.8	0	0	6.8	0
Dark Canyon (Wild)	0	6.4	6.4	0	6.4	6.4
San Juan River Segment 1 (Recreational)	0	8.5	0	0	8.5	0
San Juan River Segment 2 (Recreational)	0	10	0	0	10	0
San Juan River Segment 3 (Wild)	0	13.3	0	0	13.3	00
San Juan River Segment 4 (Recreational)	0	4.2	0	0	4.2	0

Table 4.163. Miles of WSR Segment Recommended for Designation by Alternative

WSR Segment	Alternatives					Proposed Plan
	A	B	C	D	E	
San Juan River Segment 5 (Wild)	0	17.3	0	0	17.3	17.3
Arch Canyon (Recreational)	0	6.9	0	0	6.9	0
Total	0	92.4	18.4	0	92.4	35.7

4.3.15.3.12.2. Alternative A

Ten of the 12 proposed ACECs would continue to be managed as ACECs under Alternative A (approximately 492,077 acres in total). This includes Valley of the Gods, which would be a Special Emphasis Area for scenic value within the Cedar Mesa ACEC as well as Pine and Step Canyons, which would be managed with the same prescriptions as Cedar Mesa ACEC. The proposed Lockhart Basin ACEC is not currently an existing ACEC but a portion of it includes the Indian Creek ACEC (8,510 acres). This portion would continue to be managed as an ACEC and is included in the total acreage above.

Under Alternative A, none of the river segments reviewed for WSR status would be recommended as suitable for WSR status. This is fewer than all other Alternatives B, C, E, and the Proposed Plan.

4.3.15.3.12.3. Alternatives B and E

Under Alternatives B and E, all 12 of the proposed ACECs (approximately 521,142 acres in total) would be designated and managed as ACECs. Alternatives B and E would designate 29,065 (or 6%) more acres as ACECs than under Alternative A and 446,663 (or 86%) more acres than under the Proposed Plan, which would indirectly benefit special status species by providing protections from surface disturbance.

Under Alternatives B and E, all 12 of the river segments reviewed for WSR status would be recommended as suitable for WSR status (92.4 miles in total). Management prescriptions vary from river segment to river segment (see Table 2.1 for specific prescriptions by segment) but this variation does not represent a notable difference between alternatives and the Proposed Plan in terms of the impacts of WSR designation since Alternatives B and E recommend more river segments for WSR status than all other alternatives and the Proposed Plan.

4.3.15.3.12.4. Alternative C

Under Alternative C, seven of the proposed ACECs (approximately 76,764 acres in total) would be recognized and managed as ACECs. Alternative C would designate approximately 415,313 (or 84%) fewer land as ACECs than Alternative A, decreasing protections from surface disturbance compared to Alternative A.

Three of the 12 river segments reviewed for WSR status would be designated as suitable for WSR status under Alternative C (18.4 miles in total). The remaining segments would not be

recommended as suitable for WSR status. Alternative C would include 3 more WSR recommended river segments than Alternative A.

4.3.15.3.12.5. Alternative D

Under Alternative D, none of the 12 proposed ACECs would be designated. This is 492,077 fewer acres than under Alternative A, and 74,429 fewer acres than under the Proposed Plan. Fewer acres would be closed to surface-disturbing activities under Alternative D than under all other alternatives and the Proposed Plan.

Under Alternative D, none of the river segments reviewed for WSR status would be recommended as suitable for WSR status. This is fewer than all other alternatives and the Proposed Plan.

4.3.15.3.12.6. Proposed Plan

Under the Proposed Plan, seven of the proposed ACECs (approximately 74,429 acres in total) would be recognized and managed as ACECs. The Proposed Plan would designate approximately 417,648 fewer acres or 85% less land as ACECs than Alternative A, limiting protections from surface disturbance compared to Alternative A.

Four of the 12 river segments reviewed for WSR status would be designated as suitable for WSR status under the Proposed Plan (35.7 miles in total). The remaining segments would not be recommended as suitable for WSR status. The Proposed Plan would include 3 more WSR recommended river segments compared to Alternative A.

4.3.15.3.13. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON SPECIAL STATUS SPECIES

Navajo Sedge

Site-specific plant inventories would be required prior to any proposed surface-disturbing projects in suitable Navajo sedge habitat. Activities that would be avoided in suitable habitat include road construction, land disposal and approval of ROW corridors, and grazing activities (trailing, salting, watering, and herding). All motorized travel would be limited to designated routes in suitable Navajo sedge habitat. The use of herbicide and chemical treatments would be restricted. These avoidance measures and restrictions would help to mitigate the adverse impacts of habitat degradation and fragmentation for the Navajo sedge.

Black-footed Ferret

No critical habitat rules have been published for the black-footed ferret. There are no special protective measures in place because there are no known populations in the Monticello PA. However, the 1988 Recovery Plan states, “direct reduction in the area occupied by prairie dogs has been shown to reduce the number of black-footed ferrets linearly” (USFWS 1988). Therefore, it can be assumed that critical habitat for the black-footed ferret coincides with prairie dog habitat (including areas of short vegetation and bare ground), and that impacts described in this chapter for prairie dogs would be the same for the black-footed ferret.

Gunnison Sage-grouse

Major threats to the Gunnison Sage-grouse include roads, fences, and power poles that fragment habitat and provide perches and viewing areas for sage-grouse predators, including raptors,

leading to increased sage-grouse mortality (Connelly et al. 2000, Crawford et al. 2004). Additional threats to Gunnison Sage-grouse include reduction in native vegetation distribution and human disturbance during breeding and nesting season. The BLM's Guidance for the Management of Sagebrush Plant Communities for Sage-grouse Conservation, BLM's National Sage-grouse Habitat Conservation Strategy (BLM 2004d) and Gunnison Sage-grouse Rangeland Conservation Plan (BLM 2005l) would be implemented in suitable habitat in the Monticello PA. An additional 320 acres of suitable Gunnison Sage-grouse habitat would be managed as a conservation easement to protect and enhance their habitat. Adherence to these plans would have beneficial impacts on Gunnison Sage-grouse and other special status sagebrush species in the Monticello PA because of the habitat protections and restrictions on human disturbance specified in these plans.

Mexican Spotted Owl (MSO)

There would be no ground-disturbing activities allowed within a 0.5-mile radius of known MSO nests, with the 0.5-mile protective radii designated as Protected Activity Centers (PACs). These would be protected as outlined in the MSO Recovery Plan (USFWS 1995). Because healthy, native vegetation is a key component of suitable habitat (food source and shelter for owl prey species), these restrictions would have long-term beneficial impacts on MSOs and other special status species in the MSO nest buffer zones. MSO Designated Critical Habitat and suitable habitat would be avoided or use restrictions would be implemented. Suitable habitat restrictions would include staying on designated routes or revegetating access routes created by a project: actions that would help mitigate the adverse impacts of any surface disturbance associated with road construction in MSO prey habitat.

In addition, surveys would be required for temporary activities taking place within 0.5 miles of suitable MSO habitat during breeding season (March 1–August 31). For all permanent actions, two years of surveys would be required prior to commencement of the activity. If MSOs were found during the surveys, no disturbing actions or permanent structures would be allowed within 0.5 miles of any identified nest sites or PACs. Additionally, noise emissions would be reduced below 45 dBA at 0.5 miles from suitable habitat. This would help reduce the stress of noise on MSOs during the breeding season. Various studies have shown that human presence and noise disturbance leads to a significant reduction in prey handling and delivery by females, impacts that would reduce nest success (Frid 2002; Swarthout and Steidl 2003). These requirements would mitigate the adverse impacts of human disturbance on MSOs during breeding season.

Bald Eagle

Bald eagles would be protected as outlined in the Bald Eagle Protection Act of 1940 (16 U.S.C. 668-668d, 54 Stat. 250, as amended). Activities on BLM lands that contain nesting or winter roosting habitat for the Bald Eagle would be avoided or restricted, depending on the duration and timing of the activity. Bald eagles would be managed according to the Best Management Practices for Raptors and their Associated Habitats in Utah (BLM 2006c). These management requirements would include restrictions and avoidance measures, including required surveys prior to activity, possible monitoring during the activity, implementation of seasonal and spatial buffers during the breeding season (January 1–August 31), and avoidance of disturbance in riparian areas unless impracticable. No future ground-disturbing activities would be authorized within a 0.5-mile radius of known Bald Eagle nest sites year-round. Deviations may be allowed only after appropriate levels of consultation and coordination with the USFWS. In addition, no

permanent above-ground structures would be allowed within a 0.50-mile radius of a winter roost site if the structure would result in the habitat becoming unsuitable for future winter roosting by Bald Eagles.

As discussed in the MSO section, these requirements would help to mitigate the adverse impacts of human disturbance on Bald Eagles during breeding and roosting seasons.

Southwestern Willow Flycatcher (SWFL) and Yellow-billed Cuckoo

In SWFL and Yellow-billed Cuckoo riparian habitat, there would be no surface-disturbing activities within 300 feet of riparian areas, restrictions that would have long-term beneficial impacts on riparian special status species and their habitat within those buffer zones by eliminating ground disturbance and preventing habitat degradation. In addition, native species revegetation of disturbed riparian and adjacent upland areas would be required upon completion of an activity. Surveys would be required for activities taking place within suitable riparian habitat (see Map 65). Construction and other disruptive activities would not be permitted within a 0.25 mile buffer of occupied breeding habitat from May 1 through August 15. No permanent loud-noise-emitting facilities would be permitted within 0.25 miles of riparian habitat. In addition, SWFL would be protected as outlined in the SWFL Recovery Plan (USFWS 2002e). These requirements would help to mitigate the adverse impacts of human disturbances on special status bird species during breeding, nesting, and roosting seasons.

California Condor

California condors and their habitat would be protected as outlined in the Recovery Plan for the California condor (USFWS 1996). If California condors are found to nest in the Monticello PA, there would be no roads or permanent structures allowed within 1 mile of the nest. In addition, no surface-disturbing activities or special use permit groups would be allowed within 1 mile of the nest during breeding season. These requirements would help to mitigate the adverse impacts of human disturbance on nesting California condors. Adverse impacts would be similar to those discussed for the MSO.

Endangered Colorado River Fishes

The humpback chub, Colorado pikeminnow, razorback sucker, and bonytail chub would all be protected as outlined in their respective recovery plans (USFWS 2002a; USFWS 2002b; USFWS 2002c; USFWS 2002d). All water depletions from any portion of the Upper Colorado River drainage basin above Lake Powell have been determined to adversely affect or modify the critical habitat of the 4 resident endangered fish species and must be reported to the BLM (USFWS 1987). Any new depletion would require formal Section 7 consultation with the USFWS and would require implementation of the Conservation Measures dictated in the Programmatic Biological Opinion for depletions to the Colorado River system (USFWS 1987).

Surveys and monitoring would be required for activities taking place within designated critical habitat. Loss or degradation of riparian habitats would be avoided. The Utah Oil and Gas Pipeline Crossing Guidance would be implemented for all activities occurring near riparian areas (Appendix F). These requirements would help mitigate the adverse impacts of disturbance on special status fish species within the Monticello PA because of the associated reductions in human impacts such as grazing and surface-disturbing activities on fish habitat (Lentsch and Converse 1997).

4.3.15.3.13.1. Alternative A

Under Alternative A, the impacts of special status species management decisions on special status species would include those discussed in the Impacts Common to All Alternatives and the Proposed Plan section.

4.3.15.3.13.2. Alternatives B and E

Under Alternatives B and E, the impacts of special status species management decisions on special status species and habitat would include the impacts outlined below in addition to those discussed in the Impacts Common to All Alternatives and the Proposed Plan section.

For the Gunnison Sage-grouse, year-round crucial habitat would be designated on 4,524 acres of BLM land in the Monticello PA. This crucial habitat is 3% of estimated sagebrush habitat in the Monticello PA. In sage-grouse lek habitat (defined as the 2-mile radius of an active strutting ground), there would be no surface-disturbing geophysical activities, with the exception of seasonal grazing (closed from March 20 to May 15), allowed. These restrictions would help mitigate the adverse impacts of surface disturbance on vegetation resources in lek habitat. Within six miles of lek habitat, sagebrush treatments, oil and gas leasing with standard stipulations, and seasonal grazing would be allowed. The construction of fences, power lines, wind-power turbines, or other tall structures would not be permitted. This would help reduce the predation of sage-grouse by raptors and the collision of sage-grouse with fences. The allowance of sagebrush treatments would help mitigate the adverse impacts of surface-disturbing activities on special status species and habitat within the 6-mile buffer of the center of the lek. Because of these restrictions, there would be fewer adverse impacts on Gunnison Sage-grouse and other sagebrush special status species associated with these alternatives than with Alternative A.

Under this alternative, the habitat in Arch Canyon for MSO and the flannelmouth sucker would be closed to OHV use, and group size would be limited to 10 individuals and 2 groups per day. These restrictions would help mitigate the impacts of noise disturbance on MSO and other cliff-dwelling special status species in the closure area. The OHV closures would provide the opportunity for the reestablishment of riparian vegetation on closed OHV routes, and reduce the runoff, stream sedimentation, and erosion associated with OHV use that could adversely impact special status fish species habitat.

4.3.15.3.13.3. Alternative C

Under Alternative C, the impacts of special status species management decisions on special status species and habitat would be the same as those discussed in Alternative B except that disturbance would not be allowed within a 0.6-mile radius from the center of a lek. The potential disturbance associated with grazing in and around sage-grouse leks associated with this change in designation would result in this alternative having more adverse impacts on vegetation resources than Alternative B. The construction of fences, power lines, or other tall structures would be avoided. This could help reduce the predation of sage-grouse by raptors. Because of these restrictions, there would be fewer adverse impacts on special status plant and animal species in sagebrush habitat associated with this alternative than with Alternative A.

Under this alternative, portions of the habitat in Arch Canyon for MSO and the flannelmouth sucker would be closed to OHV use, and group size would be limited to 12 vehicles and 2 groups

per day. This would provide more protection for cliff-dwelling wildlife species and special status fish than the management activities proposed under Alternative A.

4.3.15.3.13.4. Alternative D

Under Alternative D, the impacts of special status species management decisions on special status species in sagebrush habitat would include the impacts outlined below, in addition to those discussed in Section 4.3.15.2, Impacts Common to All Alternatives and the Proposed Plan.

For Gunnison Sage-grouse, year-round crucial habitat would be designated on 2,877 acres of BLM land in the Monticello PA. In lek habitat (defined as a 0.25-mile radius of an active strutting ground), there would be no surface-disturbing activities allowed, with the exception of seasonal grazing. These restrictions would help mitigate the adverse impacts of seasonal grazing on special status species and sagebrush vegetation communities in lek habitat. Within 6 miles of the lek center, sagebrush treatments, fence construction, and oil and gas leasing with standard stipulations and seasonal grazing would be allowed. The allowance of sagebrush treatments would help mitigate the adverse impacts of surface-disturbing activities on special status species and habitat within the 6-mile buffer of the lek center.

Under this alternative, the habitat in Arch Canyon for MSO and the flannelmouth sucker would be open to OHV use on designated trails year-round, and commercial motorized group size would be limited to 12 vehicles and 2 trips per day. This would provide more protection for cliff-dwelling wildlife species and special status fish than the management activities proposed under Alternative A.

4.3.15.3.13.5. Proposed Plan

Under the Proposed Plan, the impacts of special status species management decisions on special status species and habitat would include the impacts outlined below in addition to those discussed in the Impacts Common to All Alternatives and the Proposed Plan section.

For the Gunnison Sage-grouse, year-round crucial habitat would be designated on 4,524 acres of BLM land in the Monticello PA. This crucial habitat is 3% of estimated sagebrush habitat in the Monticello PA. In sage-grouse lek habitat (defined as the 2-mile radius of an active strutting ground), there would be no surface-disturbing geophysical activities, and all permitted activities would be avoided from March 20 to May 15. These restrictions would help mitigate the adverse impacts of surface disturbance on vegetation resources in lek habitat. Within four miles of lek habitat, sagebrush treatments, oil and gas leasing with standard stipulations, and limited grazing would be allowed. The construction of fences, power lines, wind-power turbines, or other tall structures would not be permitted. This would help reduce the predation of sage-grouse by raptors and the collision of sage-grouse with fences. The allowance of sagebrush treatments would help mitigate the adverse impacts of surface-disturbing activities on special status species and habitat within the 4-mile buffer of the center of the lek. Because of these restrictions, there would be fewer adverse impacts on Gunnison Sage-grouse and other sagebrush special status species associated with the Proposed Plan than with Alternative A.

Under this alternative, the habitat in Arch Canyon for MSO and the flannelmouth sucker would be open to OHV use limited to designated routes. This restriction would help mitigate the impacts of noise disturbance on MSO and other cliff-dwelling special status species in the closure area. The OHV limitations would provide the opportunity for the reestablishment of

riparian vegetation on closed OHV routes, and reduce the runoff, stream sedimentation, and erosion associated with OHV use that could adversely impact special status fish species habitat.

4.3.15.3.14. IMPACTS OF TRAVEL DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.14.1. Impacts Common to All Alternatives and the Proposed Plan

Under all alternatives and the Proposed Plan for travel management, any new trail designations would consider special status species habitat, which could reduce the adverse impacts of surface and noise disturbance on special status plant and animal species. In addition, National Scenic Byways and Backways would be designated in the Monticello PA. These roads already exist, so there is not likely to be an appreciable impact on special status plant and animal species and their habitat resulting from these designations.

A number of trails would be managed for non-mechanized travel under all alternatives and the Proposed Plan (see Chapter 2 Table 2.1, Summary Table of Alternatives and the Proposed Plan, for the list). Because these trails are already established and in use, there is not likely to be a noticeable increase in disturbances of special status species and habitat resulting from trail maintenance. There would also be trails and/or areas open to OHV use under all alternatives and the Proposed Plan. OHV use can physically damage the vegetation in special status species habitat and cause noise disturbance, which could have direct, adverse impacts on special status species, especially birds and big game, in the Monticello PA (Reijnen and Foppen 1995, Gelbard and Belnap 2003). The surface disturbance associated with OHV use can have direct and indirect adverse impacts on individual plants and animals as well as their habitat.

4.3.15.3.14.2. Alternative A

Under Alternative A, there are a total of 611,310 acres open to OHV use which is more than under any of the other alternatives or the Proposed Plan. Under this alternative, there are 540,260 acres with seasonal restrictions on OHV use off of existing trails to protect bighorn sheep lambing and rutting areas. There are an additional 789,170 acres where OHV use is limited to existing trails. These restrictions would indirectly benefit special status wildlife species using the restricted areas. The number of acres of each habitat type classified as closed or limited OHV use by alternative is located in Tables 4.184–4.186 in Section 4.3.17, Vegetation.

This alternative has 276,430 acres closed to OHV use. These closures would decrease the adverse impacts of this alternative on special status species and their habitat in these protected areas by eliminating surface and noise disturbance associated with OHV use. A reduction in miles of available OHV trails would lead to a reduction in habitat fragmentation for special status wildlife species. A list of closed areas is located in the Summary Table of Alternatives and the Proposed Plan. Closed areas include some ACECs and vegetation study areas. Table 4.164 provides acres of special status species habitat that are open to OHV use, closed to OHV use, or limited to designated trails under this alternative.

Table 4.164. Acres of Special Status Species Habitat by OHV Usage Status Under Alternative A

OHV Status	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
Closed	16,275	371	101,801	3,568	0
Limited	184,785	311	122,529	6,335	0
Open	50,134	483	154,610	13,473	4,593

Under this alternative, 7% of Bald Eagle habitat, 27% of MSO habitat, 16% of SWFL habitat, 22% of the federally listed fish habitat, and none of Gunnison Sage-grouse habitat would be closed to OHV use.

4.3.15.3.14.3. Alternatives B and E

Under Alternatives B and E, the impacts of travel management decisions on special status species would include the following impacts in addition to those discussed in Alternative A. No acres would be open to cross-country OHV travel under these alternatives, which is 100% less than under Alternative A. Under Alternative B, there would be 1,359,417 acres with OHV use limited to designated routes; Alternative E would designate 812,679 acres for limited to designated OHV routes. Compared to Alternative A, there would be a substantial increase in OHV restrictions under these two alternatives because Alternative A would propose 789,170 acres for OHV travel along designated and existing routes.

Alternative B would close 423,698 acres to OHV use, which would be 147,268 acres (1.5 times more acreage) than under Alternative A. Alternative E would close 970,436 acres to OHV use (694,006 acres or 3.5 times more acreage than Alternative A). These closures would decrease the adverse impacts of these alternatives on special status species and their habitat in these protected areas by eliminating noise and surface disturbance associated with OHV use. A list of closed areas is located in the Summary of Alternatives and the Proposed Plan, Table 2.1. Designated OHV Closed areas include vegetation study areas, some SRMAs, and some WSAs. This action would protect more acres of ecologically important special status species habitat from the surface disturbance and weed spread associated with OHV use than Alternative A. Table 4.165 provides acres of special status species habitat that would be open to OHV use, closed to OHV use, or limited to designated routes under this alternative.

Table 4.165. Acres of Special Status Species Habitat by OHV Usage Status Under Alternatives B and E

OHV Status	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
Closed	15,347	117	116,645	4,020	4,593
Limited	235,163	1,018	262,107	18,949	0
Open	0	0	0	0	0

Under these alternatives, 6% of Bald Eagle habitat in the Monticello PA would be closed to OHV use, which is 1% less than under Alternative A. Seven percent of federally listed fish habitat would be closed, which is 15% less than under Alternative A. Thirty-one percent of MSO habitat would be closed to OHV use, which is 4% more than under Alternative A. Eighteen percent of SWFL habitat would be closed, which is 2% more than under Alternative A. One hundred percent of Gunnison Sage-grouse habitat would be closed, which is 100% more than under Alternative A.

There are fewer acres of special status species habitat subject to adverse surface-disturbing impacts, which contribute to habitat fragmentation, under this alternative than under Alternative A.

4.3.15.3.14.4. Alternative C

Under Alternative C, the impacts of travel management decisions on special status species and their habitat would include the following impacts in addition to those discussed in Alternative A. There are a total of 2,311 acres open to OHV use under this alternative, which is 608,999 acres (99%) less than under Alternative A. Note that the proposed open OHV area would be in an existing OHV play area, already disturbed and impacted by previous and current use (see Section 4.3.10.3.12, Impacts of Travel Decisions on Recreation), so the impacts to special status species would be minor. There would be 1,362,142 acres within which OHV use would be limited to designated routes. This would be a 58% increase in acreage, when compared to Alternative A.

This alternative would close 418,667 acres to OHV use, which is 142,237 acres (1.5 times more acreage) than Alternative A. These closures would decrease the adverse impacts of this alternative on native vegetation in these protected areas by eliminating surface disturbance associated with OHV use. A list of closed areas is located in the Summary Table of Alternatives, Table 2.1. Closed areas include vegetation study areas, some SRMAs, some CSMAs, and some WSAs. This action helps protect more acres of ecologically important special status species habitat from the surface disturbance and weed spread associated with OHV use than Alternative A. Table 4.166 below provides acreage of special status species habitat that is open to OHV use, closed to OHV use, or limited to designated trails under this alternative.

Table 4.166. Acres of Special Status Species Habitat by OHV Usage Status Under Alternative C

OHV Status	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
Closed	13,567	124	112,737	3,719	0
Limited	235,388	1,011	263,801	19,114	4,593
Open	1,555	0	2,214	135	0

Under this alternative, 5% of Bald Eagle habitat in the Monticello PA would be closed to OHV use, which is 2% less than under Alternative A. Seven percent of federally listed fish habitat would be closed, which is 15% less than under Alternative A. Thirty percent of MSO habitat would be closed to OHV use, which is 3% more than under Alternative A. Sixteen percent of SWFL habitat would be closed, which is the same as under Alternative A. None of the Gunnison Sage-grouse habitat would be closed, which is the same as under Alternative A. There are fewer

acres of special status species habitat subject to adverse surface-disturbing impacts under this alternative than under Alternative A.

4.3.15.3.14.5. Alternative D

Under Alternative D, the impacts of travel management decisions on special status species and their habitat would include the impacts outlined below, in addition to those discussed in Alternative A.

There are a total of 2,311 acres open to OHV use under this alternative (the same as discussed under the Proposed Plan), which is 608,999 acres (99%) less than under Alternative A. Approximately 1,780,807 acres of the Monticello PA would limit OHV travel to designated routes. This would be an increase of 991,637 acres or over 2 times more acreage than under Alternative A.

Under this alternative, no acres within the Monticello PA would be closed to OHV use, which is 276,430 acres (100%) less than under Alternative A. Table 4.167 below provides acres of special status species habitat that are open to OHV use, closed to OHV use, or limited to designated trails under this alternative.

Table 4.167. Acres of Special Status Species Habitat by OHV Usage Status Under Alternative D

OHV Status	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
Closed	0	0	0	0	0
Limited	248,955	1,105	376,538	22,834	4,593
Open	1,555	0	2,214	135	0

Under this alternative, there would be no special status species habitat closed to OHV use, which is 34% less acreage than under Alternative A. The elimination of OHV closed areas under this alternative would have greater adverse impacts on special status species than the impacts under Alternative A.

4.3.15.3.14.6. Proposed Plan

Under the Proposed Plan, the impacts of travel management decisions on special status species and their habitat would include the following impacts in addition to those discussed in Alternative A. There are a total of zero acres open to OHV use under this alternative, which is 590,225 acres (more than 99%) less than under Alternative A. There would be 1,388,191 acres within which OHV use would be limited to designated routes. This would be a 57% increase in acreage, when compared to Alternative A. Under the Proposed Plan the Arch Canyon route would be opened for the entire length of the canyon to the USFS boundary. This would potentially have long-term adverse impacts (related to noise and human presence) on MSO since Arch Canyon is identified as containing suitable MSO nesting habitat.

The Proposed Plan would close 393,895 acres to OHV use, which is 105,974 acres (38% more acreage) than Alternative A. These closures would decrease the adverse impacts of this alternative on native vegetation in these protected areas by eliminating surface disturbance

associated with OHV use. A list of closed areas is located in the Summary Table of Alternatives and the Proposed Plan, Table 2.1. Closed areas include vegetation study areas, some SRMAs, and some WSAs. This action helps protect more acres of ecologically important special status species habitat from the surface disturbance and weed spread associated with OHV use than Alternative A. Table 4.168 below provides acreage of special status species habitat that is open to OHV use, closed to OHV use, or limited to designated trails under the Proposed Plan.

Table 4.168. Acres of Special Status Species Habitat by OHV Usage Status Under the Proposed Plan

OHV Status	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
Closed	13,505	124	112,737	3,719	0
Limited	232,752	1,011	265,780	19,114	4,593
Open	96	0	0	135	0

Under the Proposed Plan, 5% of Bald Eagle habitat in the Monticello PA would be closed to OHV use, which is 2% less than under Alternative A. Seven percent of federally listed fish habitat would be closed, which is 15% less than under Alternative A. Thirty percent of MSO habitat would be closed to OHV use, which is 3% more than under Alternative A. Eighteen percent of SWFL habitat would be closed, which is 2% more than under Alternative A. None of the Gunnison Sage-grouse habitat would be closed, which is the same as under Alternative A. There are fewer acres of special status species habitat subject to adverse surface-disturbing impacts under the Proposed Plan than under Alternative A.

4.3.15.3.15. IMPACTS OF VEGETATION DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.15.1. Impacts Common to All Alternatives and the Proposed Plan

Under all alternatives and the Proposed Plan, vegetation-related seed gathering and plant collection would be allowed in all areas meeting Utah's Rangeland Health Standards and Grazing Guidelines (BLM 1997). This could have short-term, direct adverse impacts on special status species and their habitat due to trampling and human disturbance during collection activities. Sagebrush habitat would be managed as described in the National Sage-grouse Habitat Conservation Strategy (BLM 2004d). A list of sagebrush communities prioritized for treatment is located in the Summary Table of Alternatives and the Proposed Plan, Table 2.1. These restoration treatments would have long-term beneficial impacts on special status species in native sagebrush communities by providing them with improved habitat (Monsen 2004). The spread of noxious, invasive, and non-native weed species would be controlled through implementation of BLM weed management policies and action plans. In addition, restoration activities and stock animal feed would be required to use certified weed-free seed mixes, mulch, and feed. Actions taken to help slow/stop the spread of weeds in the Monticello PA would help reduce the adverse impacts of surface disturbance associated with stock use, oil and gas development, and other activities that result in the adverse impacts associated with alteration of special status species habitat. Those non-native, exotic, and invasive species of management concern for the Monticello PA are included in Table 3.59.

4.3.15.3.15.2. Alternative A

Under Alternative A, 15,475 acres of land treatments per year would be continued. This treatment decision would be greater than under any of the other alternatives. Impacts are discussed in the Impacts Common to All Alternatives and the Proposed Plan section. Vegetation treatments for each alternative by vegetation type are provided in Table 4.230 in Section 4.3.17, Vegetation.

4.3.15.3.15.3. Alternative B

Under Alternative B, there would be 7,600 acres of vegetation treatments per year, which is about 51% fewer acres of treatment per year than under Alternative A. In general, these treatment decisions would likely have more beneficial impacts on special status species and habitat than Alternative A because of the increased likelihood of successful vegetation treatments due to the concentration of efforts in specified vegetation communities.

4.3.15.3.15.4. Alternative C

Under Alternative C, the impacts of vegetation management decisions on special status species would include the impacts outlined below, in addition to those discussed in Impacts Common to All Alternatives and the Proposed Plan.

There would be 9,300 acres of vegetation treatments under this alternative, which is 30% fewer acres of treatment than under Alternative A. There would be fewer, short-term adverse impacts associated with this alternative than Alternative A because fewer acres would be open to trampling and surface disturbance associated with vegetation treatments.

4.3.15.3.15.5. Alternative D

Under Alternative D, the impacts of vegetation management decisions on special status species would include the impacts outlined below, in addition to those discussed in Impacts Common to All Alternatives and the Proposed Plan.

There would be 11,300 acres of vegetation treatments under this alternative, which is 27% fewer acres of treatment than under Alternative A. There would be fewer, short-term adverse impacts associated with this alternative than Alternative A because fewer acres are open to trampling and disturbance associated with vegetation treatments. There are more long-term beneficial impacts for special status species and habitat under this alternative than under Alternative B or the Proposed Plan because a greater number of acres would receive vegetation treatments.

4.3.15.3.15.6. Alternative E

There would be 7,600 acres of vegetation treatments under this alternative, which is 51% fewer acres of treatment than under Alternative A. Under Alternative E, the impacts to species would be the same as discussed under B, except that approximately 582,357 acres within the planning area would have restrictions on vegetation treatments in order to preserve non-WSA wilderness characteristics. These areas would be managed under VRM Class I objectives, which would limit the degree of treatment-related surface disturbances. The impacts of limiting vegetation treatments would be beneficial in the short- and long-term based on the reduced potential for trampling of species habitat, and the reduced potential for invasive species establishment and

spread from treatment-related surface disturbances. Compared to Alternative A, this alternative would have more beneficial long-term impacts on special status species because more potential habitat would be protected within the non-WSA wilderness characteristics areas.

4.3.15.3.15.7. Proposed Plan

Under the Proposed Plan, the impacts of vegetation management decisions on vegetation resources would include the following impacts in addition to those discussed in Impacts Common to All Alternatives and the Proposed Plan. There would be 9,300 acres of vegetation treatments per year under this alternative, which is 30% fewer acres of treatment per year than under Alternative A. The short-term, adverse impacts of trampling and crushing vegetation associated with treatment would be substantially reduced compared to Alternative A. There are fewer long-term beneficial impacts to special status species and habitat under this alternative than under Alternative A because fewer acres would receive vegetation treatments.

4.3.15.3.16. IMPACTS OF VISUAL RESOURCE DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.16.1. Impacts Common to All Alternatives and the Proposed Plan

Under all alternatives and the Proposed Plan, lands within the Monticello PA would be designated and managed as VRM Classes I through IV (see Chapter 3, Section 3.19, Visual Resources). All WSAs and eligible/designated WSR segments would be managed as VRM Class I or II. Very limited and minor impacts to scenic quality would be allowed in areas designated as VRM Class I or II. Vegetation treatments, with short-term impacts on visual quality, and other similar surface-disturbing activities designed to enhance native vegetation, would be allowed in VRM Class I or II areas. These limitations on surface disturbances as well as allowed habitat enhancement would mitigate the adverse impacts of management activities in special status species habitat.

In areas designated as VRM Class III or IV, visual objectives would allow moderate or major changes to the visual landscape. Most types of surface-disturbing activities and human visitation would be allowed in VRM Class III or IV areas. These types of disturbance could have short- and long-term adverse impacts on special status species and their associated habitat in the Monticello PA.

4.3.15.3.16.2. Alternative A

Alternative A would have the third largest area (726,687 acres) subject to VRM Class I or II resource objective restrictions. It would have the third largest area (1,054,681 acres) subject to VRM Class III or IV resource objectives restrictions (see Map 66 for Alternative A VRM class designations). Because very limited and limited changes to scenic quality would be allowed in areas designated as VRM Class I or II, this alternative would have the third most acres protected from activities that could adversely affect special status plant and wildlife individuals and their suitable habitat.

The number of acres of each habitat type in each of the VRM classes is located in Tables 4.190–4.193 in Section 4.3.17, Vegetation. Table 4.169 contains the number of acres of federally listed species habitat located in each VRM class under this alternative.

Table 4.169. Acres of Federally Listed Species Habitat by VRM Class Under Alternative A

VRM Class	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
I	34,773	435	95,389	4,823	0
II	50,266	592	121,354	9,148	44
III	92,278	0	69,586	6,135	21
IV	72,852	0	91,570	2,729	4,528

Under this alternative, 34% of Bald Eagle habitat, 57% of MSO habitat, 61% of SWFL habitat, 100% of the federally listed fish habitat, and 1% of Gunnison Sage-grouse habitat would be in areas managed as VRM I or II.

4.3.15.3.16.3. Alternative B

Under Alternative B, the impacts of visual resource management decisions on special status species and habitat would include the impacts outlined below, as well as those discussed in Impacts Common to All Alternatives and the Proposed Plan.

Some ACECs would also be managed under VRM Class I or II objectives. This alternative would have the second largest area (748,309 acres) subject to VRM I or II restrictions on impacts to scenic quality. It would have the second smallest area (1,034,813 acres) subject to VRM III or IV restrictions (see Map 67 for Alternative B VRM designations). Because very limited and limited management activities would be allowed in areas designated as VRM I or II, this alternative would have the second highest number of acres protected from activities that could adversely affect special status plant and wildlife individuals and their suitable habitat. Table 4.170 contains the number of acres of federally listed species habitat located in each VRM class under this alternative.

Table 4.170. Acres of Federally Listed Species Habitat by VRM Class Under Alternative B

VRM Class	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
I	20,385	612	165,817	5,978	0
II	58,908	273	67,740	6,811	44
III	98,276	221	63,607	7,463	21
IV	72,695	0	81,374	2,645	4,528

Under this alternative, 32% of Bald Eagle habitat in the Monticello PA would be in areas managed under VRM Class I or II objectives (2% less than under Alternative A); 80% of federally listed fish habitat would be included in VRM Class I or II designated areas (20% less than under Alternative A); 62% of MSO habitat would be included in be in areas managed under VRM Class I or II objectives (5% more than under Alternative A); and 56% of SWFL habitat would be included in VRM Class I or II designated areas (5% less than under Alternative A).

One percent of Gunnison Sage-grouse habitat would lie within areas managed under VRM I or II objectives, which would be the same as Alternative A. Overall, this alternative would be slightly less beneficial to these federally listed species and their habitat than Alternative A because fewer acres of potential habitat would lie within the more-protective VRM Class I and II designated areas.

4.3.15.3.16.4. Alternative C

Under Alternative C, the impacts of visual resource management decisions on special status species and habitat would include those discussed in Management Common to All, with additional impacts from specified ACECs managed as VRM Class I or II. Alternative C would have the fourth largest area (557,180 acres) subject to VRM Class I or II restrictions. It would have the second largest area (1,225,915 acres) subject to VRM III or IV restrictions (see Map 68 for VRM designations under Alternative C). Because VRM Class I and II objectives would limit surface-disturbance-related impacts to existing scenic quality, this alternative would have the fourth largest number of acres protected from activities that could adversely affect special status plant and wildlife individuals and their suitable habitat. Table 4.171 contains the number of acres of federally listed species habitat located in each VRM class under this alternative.

Table 4.171. Acres of Federally Listed Species Habitat by VRM Class Under Alternative C

VRM Class	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
I	19,609	538	121,198	4,381	0
II	32,928	342	51,846	5,527	0
III	81,207	225	124,146	8,894	65
IV	116,519	0	81,328	4,095	4,528

Under this alternative, 21% of Bald Eagle habitat in the Monticello PA would be in areas managed under VRM Class I or II objectives, which is 13% less than under Alternative A. Eighty percent of federally listed fish habitat would be included in VRM Class I or II designated areas under this alternative (20% less than under Alternative A). Forty-six percent of MSO habitat would be included in be in areas managed under VRM Class I or II objectives (11% less than under Alternative A). Forty-three percent of SWFL habitat would be included in VRM Class I or II designated areas (18% less than under Alternative A). None of the Gunnison Sage-grouse habitat would be managed under VRM I or II objectives (1% less than under Alternative A). Overall, this alternative would be less beneficial to these federally listed species and their habitat than Alternative A because fewer acres of habitat would be subject to disturbance restrictions associated with VRM Class I and II objectives.

4.3.15.3.16.5. Alternative D

Under Alternative D, the impacts of visual resource management decisions on special status species and habitat would include those discussed in Impacts Common to All Alternatives and the Proposed Plan. This alternative would have the smallest area (399,261 acres) subject to VRM Class I and II objective restrictions. It would have the largest area (1,383,860 acres) designated

as VRM Class III or IV, with the most area managed to allow moderate to major surface disturbance impacts to visual resources and species habitat (see Map 69 for Alternative D VRM designations). This alternative would have the fewest acres protected (under VRM Class I and II objectives) from activities that could adversely affect special status plant and wildlife individuals and their suitable habitat.

Table 4.172 contains the number of acres of federally listed species habitat located in each VRM class under this alternative.

Table 4.172. Acres of Federally Listed Species Habitat by VRM Class Under Alternative D

VRM Class	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
I	10,686	0	115,708	3,159	0
II	10,501	823	0	3,593	0
III	114,650	236	181,364	12,381	65
IV	114,557	0	81,342	3,722	4,528

Under this alternative, 8% of Bald Eagle habitat in the Monticello PA would be in areas managed as VRM Class I or II (1% more than under Alternative A). Seventy-four percent of federally listed fish habitat would be included in VRM I or II under this alternative, (26% less than under Alternative A). Thirty-one percent of MSO habitat would be included in be in areas managed as VRM I or II (26% less than under Alternative A). Thirty percent of SWFL habitat would be included in VRM I or II (31% less than under Alternative A). None of the Gunnison Sage-grouse habitat would be managed as VRM I or II (1% less than under Alternative A). Overall, this alternative would be less beneficial to these federally listed species and their habitat than Alternatives A, B, or the Proposed Plan because fewer acres of habitat would be subject to disturbance restrictions associated with VRM I and II.

4.3.15.3.16.6. Alternative E

Under Alternative E, approximately 582,357 acres of non-WSA lands with wilderness characteristics would be managed to preserve their wilderness values. Management would include designating these areas as VRM I and limiting surface disturbances to those allowed under this class objective. Table 4.173 shows the acres of special status species habitat by VRM class for Alternative E.

Table 4.173. Acres of Federally Listed Species Habitat by VRM Class Under Alternative E

VRM Class	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
I	68,396	612	300,524	9,500	0
II	43,420	272	23,529	4,204	44
III	74,634	221	26,728	4,618	21
IV	59,737	0	27,523	2,081	4,528

Alternative E would have the most acreage managed under VRM Class I and II objectives (1,109,848), and the least area managed under VRM Class III and IV objectives (671,828 acres). This would have the greatest beneficial impact on special status species when compared to Alternative A and the other action alternatives or the Proposed Plan, because of the likelihood for habitat preservation through restrictions on surface disturbances. Approximately 45% of Bald Eagle habitat would lie within VRM Class I and II designated areas, an increase of 11% when compared to Alternative A. Also managed as VRM Class I and II would be approximately 80% of listed fish species habitat (a decrease of 20% compared to Alternative A), 86% of MSO habitat (a 29% increase compared to Alternative A), 67% of SWFL habitat (a 6% increase compared to Alternative A), and 1% of sage-grouse habitat (identical to Alternative A).

4.3.15.3.16.7. Proposed Plan

Under the Proposed Plan, the impacts of visual resource management decisions on special status species and habitat would include those discussed in Management Common to All, with additional impacts from specified ACECs managed as VRM Class I or II. The Proposed Plan would have the fourth largest area (651,030 acres) subject to VRM Class I or II restrictions. It would have the second largest area (1,130,585 acres) subject to VRM III or IV restrictions (see Map 71 for VRM designations under the Proposed Plan). Because VRM Class I and II objectives would limit surface-disturbance-related impacts to existing scenic quality, the Proposed Plan would have the fourth largest number of acres protected from activities that could adversely affect special status plant and wildlife individuals and their suitable habitat. Table 4.174 contains the number of acres of federally listed species habitat located in each VRM class under the Proposed Plan.

Table 4.174. Acres of Federally Listed Species Habitat by VRM Class Under the Proposed Plan

VRM Class	Bald Eagle	Federally Listed Fish	MSO	SWFL	Gunnison Sage-grouse
I	17,732	339	118,906	4,381	0
II	34,484	545	71,400	5,527	0
III	102,525	221	116,543	8,894	62
IV	91,448	0	71,435	4,095	4,449

Under the Proposed Plan, 19% of Bald Eagle habitat in the Monticello PA would be in areas managed under VRM Class I or II objectives, which is 15% less than under Alternative A. Fifty-two percent of federally listed fish habitat would be included in VRM Class I or II designated areas under this alternative (48% less than under Alternative A). Fifty percent of MSO habitat would be included in be in areas managed under VRM Class I or II objectives (7% less than under Alternative A). Forty-three percent of SWFL habitat would be included in VRM Class I or II designated areas (18% less than under Alternative A). None of the Gunnison Sage-grouse habitat would be managed under VRM I or II objectives (1% less than under Alternative A). Overall, the Proposed Plan would be less beneficial to these federally listed species and their habitat than Alternative A because fewer acres of habitat would be subject to disturbance restrictions associated with VRM Class I and II objectives.

4.3.15.3.17. IMPACTS OF WILDLIFE AND FISHERIES DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.17.1. Impacts Common to All Alternatives and the Proposed Plan

In occupied priority migratory bird habitat, surface disturbance would be avoided from May 1 through July 30. Occupied priority migratory bird habitat will be determined with the use of Utah Partners in Flight Avian Conservation Strategy, Intermountain West Joint Venture Bird Habitat Conservation Areas, and other migratory bird conservation plans. In addition, maintenance/improvement of lowland riparian, wetlands, and low and high desert scrub communities would be prioritized in the Monticello PA. These three requirements would benefit both migratory bird and special status species in these habitats by maintaining and improving habitat necessary for survival.

Reintroduction of native fish and wildlife species into historic or suitable ranges would continue where it is determined to be appropriate. This could help to reestablish special status species, including the Colorado River endangered fish species, in their historical habitat. This would have beneficial impacts on these species in the Monticello PA.

Bighorn sheep habitat on the 5 mesa tops (56,740 acres) would be prioritized for improvement because of potential loss of habitat caused by surface disturbance in these areas. On-site mitigation would be required for projects that disturb or remove forage and browse species used by desert bighorn sheep. These requirements would help mitigate the adverse impacts of surface-disturbing activities on special status species in sagebrush and desert shrub habitat used by bighorn sheep. Listed under each alternative and the Proposed Plan are seasonal wildlife protection areas for big game species. The special conditions common to all alternatives and the Proposed Plan include no use of pyrotechnics, shooting during permitted filming, no use of low-flying aircraft, and minimal surface-disturbing activities (see Appendix P for minimal impact criteria during filming). Exceptions to special conditions for the seasonal wildlife protection areas could be granted by the Monticello FO Manager if it can be shown that legal rights would be curtailed, animals are not present in the specific project location, or the activity can be conducted so as not to adversely affect wildlife species. In addition, maintenance and operation activities for mineral production as well as hunting would be allowed during seasonal restrictions. These special conditions would protect and benefit special status species that utilize these areas during the seasonal protection. There would be less noise and direct disturbance from humans to special status species.

There would be 17,300 acres allotted as wildlife habitat on slopes of Peter's Canyon and East Canyon, which would have beneficial impacts on special status species in this area by reducing forage competition and direct impacts from livestock.

4.3.15.3.17.2. Alternative A

Under Alternative A, seasonal protection would be in place on 329,750 acres from April 1 through July 15 for bighorn sheep lambing, and again from October 15 through December 31 for rutting. There would be 12,960 acres of crucial pronghorn habitat closed to certain surface-disturbing activities from May 15 through June 15 for fawning. There would be 197,550 acres of crucial deer winter habitat closed to certain surface-disturbing activities from December 15 through April 30 (see Chapter 2 Summary Table of Alternatives and the Proposed Plan 2.1 for a list of activities). These closures would also protect special status wildlife species on 279,786 acres of habitat. Alternative A provides a total of 184 days of protection for bighorn sheep, 32 days for pronghorn, 137 days for deer, and no protection for elk (see Table 4.243). These restrictions would protect special status species and their associated habitat from direct human disturbance, noise, and surface-disturbing activities during those seasonal protection times.

Table 4.175 contains the number of acres of special status species habitat located in areas with big game seasonal restrictions under each of the management alternatives and the Proposed Plan.

Table 4.175. Acres of Special Status Species Habitat Located in Areas with Big Game Seasonal Restrictions

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Bald Eagle	188,801	218,868	165,997	195,283	218,868	188,021
Critical Fish	0	286	13	273	286	286
MSO	59,171	325,172	154,998	142,051	325,172	249,206
Gunnison Sage-grouse *	0/0	2,778/4,884	2,456/4,884	0/3,197	2,778/4,884	2,337/4,884
SWFL	1,679	10,937	3,340	4,030	10,937	7,174

*The number following the dash is the total acres of designated sage-grouse habitat for each alternative. The total acres of habitat does not change by alternative for the other special status species listed in the table.

4.3.15.3.17.3. Alternatives B and E

Under Alternatives B and E, the impacts of wildlife and fisheries management decisions on special status species resources would include those discussed in Management Common to All Alternatives and the Proposed Plan, as well as the restrictions in place for wildlife habitat during parts of the year (see Table 4.236). Seasonal wildlife protection areas would have special conditions for all land-use activities with the exception of woodland harvest. Seasonal protection would be in place on 453,388 acres from April 1 through July 15 for bighorn sheep lambing, and again from October 15 through December 31 for rutting. There would be 29,365 acres of crucial pronghorn habitat closed to certain surface-disturbing activities from May 1 through June 15 for

fawning. In addition, spring grazing (April 15–June 15) would be eliminated in allotments within pronghorn habitat. There would be 785,921 acres of crucial deer winter habitat closed to certain surface-disturbing activities from November 1 through May 15. The final restriction would be on 191,173 acres of elk habitat from November 1 through May 15. These closures would also protect special status wildlife species on 558,041 acres of habitat (99% more than under Alternative A). These special conditions include no oil and gas leasing activities, no geophysical work, and no permitted or commercial OHV use.

Alternatives B and E also provide for longer seasonal wildlife protection, which would benefit special status species by providing for a longer period of reduced human disturbances from noise and surface-disturbing activities. Seasonal protection would be the same for bighorn sheep, and it would last 15 days longer for pronghorn fawning areas and 60 days longer for deer winter range areas than in Alternative A. There is no protection for elk habitat in Alternative A, versus 196 days of special conditions in Alternatives B and E (see Table 4.243).

4.3.15.3.17.4. Alternative C

Under Alternative C, the impacts of wildlife and fisheries management decisions on special status species and associated habitat would include those discussed in Management Common to All Alternatives, as well as the restrictions in place for wildlife habitat during parts of the year (see Table 4.237). Seasonal wildlife protection areas would have the same special conditions as under Alternative A, with the exception of OHV restrictions. Under this alternative, the number of OHV users may be limited. In addition, there would be 326,898 acres subject to special wildlife conditions, which is 17% more than under Alternative A. Alternative C provides for different lengths of time for seasonal restrictions. Seasonal protection would be 30 days fewer for bighorn sheep, 15 days more for pronghorn, 15 days more for deer, and 150 days more for elk than Alternative A (see Table 4.243). Because of these differences, this alternative would be less likely to adversely affect special status species and associated habitat in the wildlife protection areas of the Monticello PA than Alternative A.

4.3.15.3.17.5. Alternative D

Under Alternative D, the impacts of wildlife and fisheries management decisions on special status species and associated habitat would include those discussed in Management Common to All Alternatives and the Proposed Plan, as well as the restrictions in place for wildlife habitat during parts of the year (see Table 4.238). Seasonal wildlife protection areas would have the same special conditions as under Alternative A, with the exception of OHV restrictions. Under this alternative, OHV use would only be allowed on designated routes. Additionally, there 265,244 acres would be subject to special wildlife conditions, (5% less than under Alternative A). Seasonal protection would be 45 days fewer for bighorn sheep, 15 days more for pronghorn, the same for deer, and 136 days longer for elk than Alternative A (see Table 4.243). Because of limitation of OHV use to designated trails, this alternative would be less likely to adversely affect special status species and habitat in the wildlife protection areas of the Monticello PA than Alternative A.

4.3.15.3.17.6. Proposed Plan

Under the Proposed Plan, the impacts of wildlife and fisheries management decisions on special status species and associated habitat would include those discussed in Management Common to

All Alternatives and the Proposed Plan, as well as the restrictions in place for wildlife habitat during parts of the year (see Table 4.239). Seasonal wildlife protection areas would have the same special conditions as under Alternative B, which provide more protection to special status species in wildlife habitat than the special conditions included in Alternative A. Under the Proposed Plan, the number of OHV users may be limited. In addition, there would be 963,332 acres subject to special wildlife conditions, which is 56% more than under Alternative A. The Proposed Plan provides for shorter lengths of time for seasonal restrictions than Alternative B. Seasonal protection would not be provided for pronghorn antelope grazing, which is the same as under Alternative A. Deer and elk winter range would include fewer seasonally protected acres protected for fewer days as part of the Proposed Plan than under Alternative B. There would be more acres of deer and elk winter range protected for a longer period of time as part of the Proposed Plan than under Alternative A.

Because of these differences, this alternative would be less likely to adversely affect special status species and associated habitat in the wildlife protection areas of the Monticello PA than Alternative A.

4.3.15.3.18. IMPACTS OF WOODLANDS DECISIONS ON SPECIAL STATUS SPECIES

4.3.15.3.18.1. Impacts Common to All Alternatives and the Proposed Plan

Impacts to special status species from woodland management activities include removal of trees used by these species as cover, roosting, or breeding sites; direct impacts to individuals from trampling or crushing during harvesting; and indirect impacts due to changes in vegetation structure, which could be beneficial or adverse depending on the species. Woodland harvest resulting in reduced probability of wildfire would likely reduce potentially adverse impacts to special status species that occupy woodland habitats.

Indirect adverse impacts of wood gathering include off-road driving, trampling, and removal of native vegetation, which result in special status species habitat degradation that can include reductions in prey species, forage species, and cover.

Sensitive wildlife species in pinyon-juniper woodland habitat would face short- and long-term adverse impacts from surface and noise disturbance associated with woodland harvest.

All WSAs, Arch Canyon, Alkali Ridge NHL, Grand Gulch NHD (mesa-top), Beef Basin, Fable Valley, Comb Ridge SRMA (south of Highway 95), San Juan SRMA, developed recreation sites, areas unavailable for livestock grazing, wildlife enclosures, cultural sites, Indian Creek Corridor, McLoyd Canyon-Moon House, Grand Gulch Plateau SRMA (in-canyon), Grand Gulch NHD (in canyon), floodplains, and riparian/aquatic areas would be excluded from woodland harvesting. This decision would provide beneficial impacts to special status species by protecting habitat from harvesting related surface disturbances and loss of vegetation cover.

4.3.15.3.18.2. Alternative A

Impacts to special status species from woodland management activities include removal of trees used by these species as cover, roosting, or breeding sites; direct impacts to individuals from trampling or crushing during harvesting; and indirect impacts due to changes in vegetation structure, which could be beneficial or adverse depending on the species. Woodland harvest

resulting in reduced probability of wildfire would likely reduce potentially adverse impacts to special status species that occupy woodland habitats.

Indirect adverse impacts of wood gathering include off-road driving, trampling, and removal of native vegetation, which result in special status species habitat degradation that can include reductions in prey species, forage species, and cover.

Under Alternative A, 1,309,894 acres (73% of the planning area) would be open to woodland harvest and wood gathering. In the area open to harvesting, there would be 793,757 acres of pinyon-juniper vegetation available for woodland harvesting. Of the five alternatives and the Proposed Plan, this would have the largest area open to woodland harvest and wood gathering, and therefore the greatest potential risk of disturbance to special status species utilizing the pinyon-juniper woodland habitat (see Table 4.137).

4.3.15.3.18.3. Alternative B

Under Alternative B, 730,075 acres would be open to woodland harvest and wood gathering. This would be 579,820 fewer acres (56% less) than Alternative A. In the area open to harvesting, there would be 504,666 acres of pinyon-juniper vegetation available for woodland harvesting (37% fewer acres than under Alternative A).

In addition, limitations on off-road travel and wood product use in the deer and elk winter range from November 1 through May 15 would do more to mitigate the short-term adverse impacts of woodland product collection and harvest on special status species and habitat than Alternative A. This alternative would have fewer short- and long-term beneficial impacts on special status species and habitat than Alternative A.

4.3.15.3.18.4. Alternative C

Under Alternative C, 841,938 acres would be available for harvesting and the impacts of woodlands management decisions on special status species and habitat would include those discussed in Alternative A. In the area open to harvesting, there would be 597,086 acres of pinyon-juniper vegetation available for woodland harvesting (25% fewer acres than under Alternative A). This alternative would have fewer short- and long-term adverse impacts on special status species and habitat than Alternative A.

4.3.15.3.18.5. Alternative D

Under Alternative D, 841,938 acres would be available for woodland harvesting and the impacts of woodlands management decisions on special status species and habitat would include those discussed in Alternative A. In the area open to harvesting, there would be 597,086 acres of pinyon-juniper vegetation available for woodland harvesting (25% fewer acres than under Alternative A). This alternative would have fewer short- and long-term adverse impacts on special status species and habitat than Alternative A.

4.3.15.3.18.6. Alternative E

Under Alternative E, the impacts of woodlands management decisions on special status species and habitat would be the same as Alternative B, except that 582,360 acres of non-WSA lands with wilderness characteristics would also be closed to woodland harvesting, thereby giving

additional long-term beneficial, surface-disturbance-related protection to special status species and their potential habitat. Under this alternative, 608,476 acres would be open to and available for woodland harvesting (54% fewer acres than under Alternative A). In the area open to harvesting, there would be 73,428 acres of pinyon-juniper vegetation available for woodland harvesting (91% fewer acres than under Alternative A). This alternative would have fewer short- and long-term adverse impacts on special status species and habitat than Alternative A.

4.3.15.3.18.7. Proposed Plan

Under the Proposed Plan, 837,939 acres (36% fewer acres than under Alternative A) would be available for woodland harvesting and the impacts of woodlands management decisions on special status species and habitat would include those discussed in Alternative A. In the area open to harvesting, there would be 597,086 acres of pinyon-juniper vegetation available for woodland harvesting (25% fewer acres than under Alternative A). The Proposed Plan would have fewer short- and long-term adverse impacts on special status species and habitat than Alternative A.

4.3.15.4. MITIGATION MEASURES

The Best Management Practices described in the Management Common to All section in Chapter 2 and Appendixes A and I would serve to avoid and/or minimize impacts to special status species and habitat in the Monticello PA.

4.3.15.5. UNAVOIDABLE ADVERSE IMPACTS

There will be unavoidable adverse impacts to special status species and habitat in the Monticello PA resulting from surface-disturbing activities, recreation, and resource development activities associated with the resource management decisions detailed in the PRMP/FEIS. Potentially adverse impacts include reductions in native forage due to trampling and grazing by wildlife and livestock; trampling and weed introduction by human visitors (motorized and non-motorized); permanent alteration of special status species habitat due to clearing activities such as oil-well pad installation and woodland harvest; and noise disturbance of special status species individuals associated with human presence.

4.3.15.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

As discussed throughout this section, some of the short-term multiple uses of the Monticello PA are likely to impact or reduce special status species and/or their habitat. These uses include oil and gas development, ROW authorizations, livestock grazing, camping, off-road vehicle travel, and woodland harvest. These impacts, however, provide economic benefits, and will be partially mitigated by the actions discussed in the Management Common to All sections for each management decision. Implementation of conservation measures, as well as adherence to BLM requirements and the ESA, would prevent these short-term resource uses from significantly impacting the long-term productivity of special status species habitat in the planning area.

4.3.15.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Irretrievable impacts associated with surface-disturbing activities proposed throughout the planning area include the loss of special status species habitat value from mineral development, fire treatments, or grazing. These resource values would be lost until successful

restoration/rehabilitation takes place. Management Common to All Alternatives and the Proposed Plan detailed in the Summary Table of Alternatives and the Proposed Plan (Table 2.1 in Chapter 2) requires reclamation of disturbed areas following completion of management actions (i.e., well-pad deconstruction and reseeding and weed eradication in overgrazed areas). Implementation of this reclamation/rehabilitation would prevent these impacts from being irreversible. Some decisions would have irretrievable impacts to special status species, which include loss of habitat from the placement of permanent structures, such as campgrounds and facilities.

4.3.16. TRAVEL MANAGEMENT

As the popularity of travel within the Monticello PA increases and greater numbers of on-road and off-road vehicles and visitors use the road and trail system within the PA, travel management issues are becoming an increasing concern (see the discussion of OHV resource use conflicts in Section 3.11.4.3 and 3.11.4.5, Recreation). These concerns include (and are not limited to) engine noise, air pollution from exhaust emissions, impacts to erodible soils, the potential for travel-related stream sedimentation and non-point source water pollution, potential impacts to federally listed and sensitive wildlife species habitats, and potential impacts to historic and prehistoric archaeological sites.

Two assumptions were used in the analysis of impacts to travel within the Monticello PA:

- Areas designated as open to cross-country OHV use, and areas managed as limited to Designated Routes and Trails would be beneficial to OHV travel, as these areas would allow access within the Monticello PA;
- Areas designated as closed to on and off-road vehicles would be adverse to mechanized travel because of the reduced opportunities for travel access. The number of acres designated as open, limited to designated routes, or closed to OHV travel and the miles of designated routes along B-Class and D-Class roads [see below] were the indicators for analyzing the impacts to travel. (See Table 4.179 at the end of the section for a summary of travel data used in the analysis of impacts.) No assumptions were made for non-mechanized travel (i.e., equestrian, hiking, backpacking) because, as discussed in Section 4.3.16.2.11.2., Non-Mechanized Travel, none of the proposed alternatives and the Proposed Plan would restrict these forms of travel within the PA except where necessary to protect specific resource values, and to maintain public health and safety.

Road classes are discussed and considered in the analysis of impacts to travel. The road classifications relevant to the analysis are as follows:

- Class B roads are those that are regularly maintained by the State of Utah within the Monticello FO planning area, with road surfaces that can be natural, paved, or gravel;
- Class C roads are roads within town or city municipal boundaries (e.g., Monticello, Blanding, Bluff);
- Class D roads are those with natural surfaces only, not on a regular maintenance schedule (though they may be maintained), and not funded for maintenance by the State of Utah (BLM 2005j).

4.3.16.1. IMPACTS COMMON TO ALL ACTION ALTERNATIVES

After approval of the proposed RMP, management decisions under the action alternatives (Alternatives B, C, D, and E) and under the Proposed Plan would continue to analyze the impacts of limited to designated travel routes for all vehicles within the planning area, including mountain biking and motorized OHV routes, through adaptive management at the activity planning level. This would be beneficial to travel management in the long-term because travel-related resource-use conflicts would be identified and resolved through potential modification of these designated limited routes.

Through travel resource management, if the AO determines that OHV travel use would cause or have the potential to cause resource degradation, travel along the route would be prohibited or limited. This would be adverse to travel in the long-term because access opportunities within the planning area would be reduced.

4.3.16.2. ALTERNATIVES AND PROPOSED PLAN IMPACTS

The following resources would have negligible to minor impacts on travel, and will not be analyzed further in this section:

Health and Safety

Health and safety management decisions for all the alternatives and the Proposed Plan that would identify and address abandoned minelands safety concerns, respond to hazardous waste releases, and protect public health and safety would have negligible impacts on travel management because these management decisions would not close routes or delay, restrict, or otherwise interfere with travel opportunities within the Monticello PA.

Livestock Grazing

Grazing management decisions for all alternatives and for the Proposed Plan would have negligible impacts on travel because grazing restrictions and exclusions, and authorized grazing use within the planning area would not prevent or limit travel.

Paleontology

Management decisions for paleontological resources would have negligible impacts on travel because the collection of fossils for personal, commercial, and scientific use, and the protection of these resources would not affect travel opportunities.

Soils and Watershed

Soils and watershed management decisions common to all of the alternatives and to the Proposed Plan would have negligible impacts on travel because none of the soil management decisions to protect sensitive soils, prevent soil erosion, and protect watershed resources would restrict access, prohibit travel, or affect travel opportunities.

Visual Resources

The proposed VRM management decision impacts on travel would be negligible because VRM designations and visual resource objectives within the planning area for all the alternatives would be consistent with other land management decisions, including travel. There are no specific VRM management decisions that would restrict or prohibit travel or access within the Monticello PA, beyond those required by law (e.g., IMP-related restrictions on motorized travel within VRM Class I-managed WSAs).

4.3.16.2.1. IMPACTS OF AIR QUALITY DECISIONS ON TRAVEL

Air quality management decisions common to all of the alternatives would require compliance with Utah air conservation regulations (R307-5-7) prohibiting the use, maintenance, or construction of roads without fugitive dust-abatement measures. BLM policy requires monitoring and managing exhaust emissions to prevent deterioration of air quality within PSD Class I airsheds (e.g., Canyonlands, Arches, and Capitol Reef National Parks). The impacts on

travel within the PA would be minor and short-term along unpaved travel routes (D-Class roads) that require road-surfacing-related, dust-abatement measures, because travelers could experience some travel delays or re-routing around the affected road sections during maintenance.

4.3.16.2.2. IMPACTS OF CULTURAL RESOURCES DECISIONS ON TRAVEL

Under all of the alternatives and the Proposed Plan, management decisions for the Comb Ridge and Beef Basin would allow either open OHV cross-country travel (Alternative A only) or limited OHV travel along designated routes. This would be beneficial in the long-term to travel by allowing access to or within these CSMA/SRMAs.

Management decisions under all of the alternatives and the Proposed Plan for the Grand Gulch National Historic District would designate the area as closed to OHV use, which would have adverse, long-term impacts on travel because opportunities for OHV travel into the area would be prohibited. It should be noted that this area lies within a WSA and, as stipulated under the IMP; mechanized travel (other than along existing "ways") is prohibited within WSAs.

4.3.16.2.2.1. Alternative A

Under Alternative A, travel would be prohibited along a 500-foot segment of a spur road (D-Class road) that allows access to the McLoyd Canyon-Moon House. This would have long-term, adverse impacts on travel for those wishing to drive to the hiking access trailhead for this cultural site, as it would reduce the travel access opportunities for those visitors who either cannot walk or choose not to walk along the spur road to this site.

4.3.16.2.2.2. Alternatives B and E

Under these similar alternatives, the Tank Bench CSMA would be closed to OHV use, with impacts as discussed for the Grand Gulch National Historic District above. Compared to Alternative A, these two action alternatives would have more adverse impacts on travel opportunities because Alternative A would not impose travel restrictions in the area (the management decisions are unspecified).

Management decisions under these alternatives would close the D-Class access road to the McLoyd Canyon-Moon House CSMA (hiking to the Moon House site would be limited to the designated trail), with impacts as described under Alternative A.

4.3.16.2.2.3. Alternative C

The impacts of management decisions for the Tank Bench CSMA would be the same as discussed under Alternatives B and E.

Management decisions impacts on travel for the McLoyd Canyon-Moon House CSMA would be the same as discussed under Alternative B.

4.3.16.2.2.4. Alternative D

Under Alternative D, travel within the Tank Bench area would be managed under the same decisions as the surrounding areas, which would be beneficial for travel in the long-term because travel along designated routes would be allowed. Compared to Alternative A, the beneficial impacts on travel would be similar, but to a lesser degree, because this action alternative would

limit travel to designated routes within the Tank Bench area while travel opportunities under Alternative A would be unspecified (and unlimited).

Travel management decisions under this alternative for the McLoyd Canyon-Moon House CSMA would permit travel along the D-Class road to the Moon House site, with long-term, beneficial impacts on travel because access opportunities would be available. Compared to Alternative A, this action alternative would be more beneficial to travel in the long-term because site access would be available, whereas under Alternative A, directly accessing the site by motorized vehicles would not be allowed.

4.3.16.2.2.5. Proposed Plan

Under the Proposed Plan, the management decisions for the Tank Bench SRMA would be the same as discussed under Alternatives B and E (access to the site limited to the designated trail), with the same impacts comparison to Alternative A.

Management decisions on travel for the McLoyd Canyon-Moon House Management Zone would be the same as discussed under Alternative B.

4.3.16.2.3. IMPACTS OF FIRE MANAGEMENT DECISIONS ON TRAVEL

Fire management decisions under the alternatives and the Proposed Plan would have negligible long-term impacts on travel because prescribed fire treatments, fuels treatments, fire prevention and mitigation, and wildland fire suppression would not prevent or impede travel within the Monticello PA. There could be short-term, minor, adverse impacts on travel if prescribed burns or wildland fires crossed travel routes that required temporary road or trail closure, or temporary re-routing around the fire management or suppression area to protect public safety.

4.3.16.2.4. IMPACTS OF LAND AND REALTY DECISIONS ON TRAVEL

Under management decisions common to all of the alternatives and the Proposed Plan, land and realty decisions would have negligible impacts on travel from granting filming permits for cinematography within the planning area because permit stipulations would require that these activities would not significantly restrict public access along routes. The granting of ROWs access within the planning area for oil and gas leases could have minor, beneficial impacts on travel in the long-term by establishing routes for access in the planning area along spur roads to oil and gas well sites. The ROW impacts would be minor because 1) only production sites would have maintained access to well sites (exploration sites and access roads would be reclaimed), and 2) the RFD predictions for oil and natural gas well drilling throughout the planning area after approval of the Proposed Plan ranges from a relatively small 54 to 76 wells.

4.3.16.2.5. IMPACTS OF MINERALS DECISIONS ON TRAVEL

The impacts of mineral resource management decisions on travel would be similar to those discussed above for Lands and Realty decisions because the decisions are similar. The granting of ROWs and the construction of minerals-related access roads would be permitted under all of the alternatives, but the predicted level of mineral resource development would result in a relatively small number and short length of additional spur-type access roads when compared with the existing and/or designated routes in the planning area. Accordingly, minerals decisions would have beneficial but minor impacts on opportunities for travel within the planning area.

4.3.16.2.6. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON TRAVEL

Alternatives A, B, C, and D would not manage non-WSA lands with wilderness characteristics to preserve their wilderness values. There would be no impacts to travel under these alternatives.

Alternative E would manage non-WSA areas with wilderness characteristics for protection of their wilderness values. Travel management decisions would prohibit all OHV travel within the approximately 582,360 acres of lands inventoried as having non-WSA wilderness characteristics by designating existing routes through these areas as closed to OHV use (see Section 4.3.8.9.1, Off-Highway Vehicle (OHV) Travel Management, for OHV management and acreage closures). The impacts to travel would be substantial under this alternative, as mechanized travel opportunities would not be available within and through those areas (along approximately 179 miles of D-Class routes within non-WSA wilderness characteristics lands) where designated routes have been proposed under the Monticello Travel Plan. Compared to Alternative A, this alternative would have more adverse impacts on travel opportunities because 582,360 acres and 179 miles of OHV routes would be closed to OHV travel opportunities that would not be closed under Alternative A.

The Proposed Plan would manage 88,871 acres of non-WSA lands with wilderness characteristics for the protection of their wilderness values. Management prescriptions would limit OHV travel within these areas to designated routes. However, a substantial portion of these lands (88,825 acres) would be managed for OHV designated-route travel under the PA travel plan and the remaining area (44 acres) would be managed as closed to OHV travel under other resource management prescriptions. The impacts on travel within these areas would be minor because OHV travel along designated routes would be allowed within 99% of these non-WSA lands with wilderness characteristics. Compared to Alternative A, the Proposed Plan would have more adverse impacts on mechanized travel because fewer acres within the PA would be available for open, cross-country OHV travel access.

4.3.16.2.7. IMPACTS OF RECREATION DECISIONS ON TRAVEL

Recreational management decisions common to all of the alternatives and the Proposed Plan would ensure that the Monticello FO coordinate and develop procedures, protocols, and permits with other federal agencies to provide reasonable access for non-recreational use of OHVs for search-and-rescue, military, emergency, and other non-specified uses. This would be beneficial in the long-term by developing plans and establishing routes for efficient travel within the planning area by federal, non-BLM personnel.

4.3.16.2.7.1. Alternative A

Under Alternative A, vehicle access would not be allowed within the San Juan River SRMA between Comb Wash and Lime Creek (as stipulated in the current RMP), which would be adverse in the long-term for travel because opportunities would not be available for recreational access along this stretch of the river.

Commercial-type travel (including motorized/mechanized recreational vehicle use) within the planning area would require an SRP, but the impacts on travel would be negligible because no restrictions or prohibitions are specified under this alternative.

4.3.16.2.7.2. Alternatives B and E

Under Alternatives B and E, vehicle access would not be allowed from Comb Wash to Lime Creek within the San Juan River SRMA, with adverse long-term impacts on travel, because of the reduced opportunities for travel and access to the river. Compared to Alternative A, these alternatives would have the same impacts to travel because Alternative A would also not allow vehicle access along this stretch of the river.

Commercial-type motorized or mechanized tours and events would be seasonally prohibited (i.e., SRPs would not be issued) for routes within pronghorn, bighorn sheep, deer, and elk crucial habitat, and lambing and rutting areas. Table 4.176 below shows the proposed times when travel routes for all alternatives and the Proposed Plan would be closed or limited to designated routes in order to protect these wildlife species.

Table 4.176. Proposed Travel Closing or Travel Limitation Periods in Wildlife Areas

	Alternative A	Alternatives B and E	Alternative C	Alternative D	Proposed Plan
Bighorn Sheep	1 Apr– 5 Jul 15 Oct–31 Dec	1 Apr– 5 Jul 15 Oct–31 Dec	1 Apr–15 Jun 15 Oct–15 Dec	15 Apr–15 May 1 Nov–15 Dec	1 Apr–15 Jun 15 Oct–15 Dec
Pronghorn	15 May–15 Jun	15 Apr–30 Jun	1 May–15 Jun	15 May–15 Jun	1 May–15 Jun
Elk	Unspecified (no identified crucial habitat)	1 Nov–15 May	15 Nov–15 Apr	15 Dec–31 Mar	15 Nov–15 Apr
Deer	15 Dec–30 Apr	1 Nov–15 May	15 Nov–15 April	15 Dec–31 Mar	15 Nov–15 April
Affected Roads in Wildlife Habitat	Zero miles of travel routes seasonally closed to private, permitted, or commercial OHV travel.	512 miles of travel routes seasonally closed to permitted or commercial OHV travel, but open to private use.	135 miles of travel routes seasonally closed to permitted or commercial OHV travel, but open to private use.	Zero miles of travel routes seasonally closed to private, permitted, or commercial travel.	135 miles of travel routes seasonally closed to permitted or commercial OHV travel, but open to private use.

This would have short-term, adverse impacts on specific recreational travel-related activities during these times because the opportunities for permitted or commercial OHV travel and/or motorized events into or through crucial habitat would be prohibited along 512 miles of travel routes in order to protect wildlife species. The impacts on private motorized OHV and mountain biking travel opportunities would be negligible because no wildlife restrictions would be applicable. Compared to Alternative A, these alternatives would have more adverse impacts on travel because 512 miles of travel routes would be seasonally closed to some forms of commercial travel, with decreased opportunities for access and movement through the planning area.

Note that while the recreation management decisions under Alternative E would be very similar to those discussed under Alternative B, Alternative E would manage approximately 582,360 total acres for the protection of non-WSA lands with wilderness characteristics within the proposed SRMAs and the ERMA. The impacts on travel under this alternative would be more adverse to

recreation-related travel opportunities, as discussed in Section 4.3.16.2.6, because travel opportunities for OHVs along D-Class routes within lands with non-WSA wilderness characteristics would be prohibited.

4.3.16.2.7.3. Alternative C

Impacts on travel along the San Juan River from Comb Wash to Lime Creek would be the same as discussed under Alternative B because the management decisions are the same.

Under this alternative, there would be short-term, adverse impacts on travel from seasonal limitations in crucial pronghorn, deer, elk, and bighorn sheep habitat through closing approximately 135 miles of travel routes (26% of the routes closed under Alternative B) to some permitted or commercial OHV use or mechanized tours and events. Compared to Alternative A, this alternative would have more adverse impacts on travel because commercial-type recreational travel opportunities would be reduced.

4.3.16.2.7.4. Alternative D

Impacts on travel along the San Juan River from Comb Wash to Lime Creek would be the same as discussed under Alternatives B.

The impacts on travel from restricting OHV use to designated routes in crucial pronghorn, deer, elk, and bighorn sheep habitat would be negligible because private and commercial recreational travel restrictions would not impede or prevent travel through crucial wildlife habitat (no recreation-related roads would be seasonally closed to travel in crucial wildlife habitat). The impacts would be similar to those discussed for Alternative A.

4.3.16.2.7.5. Proposed Plan

The impacts of recreation decisions on travel under the Proposed Plan would be the same as discussed under Alternative C for commercial access into wildlife areas because the management decisions are the same. The prohibitions on access along the San Juan River would be the same as discussed under Alternative B.

4.3.16.2.8. IMPACTS OF RIPARIAN MANAGEMENT DECISIONS ON TRAVEL

4.3.16.2.8.1. Alternative A

The impacts on travel from riparian management decisions would be negligible under Alternative A. Management decisions under the current RMP would maintain water quality in streams to meet state and federal requirements, and preserve and restore riparian natural functioning conditions, but these decisions would not specifically restrict or prohibit travel within or through riparian areas.

4.3.16.2.8.2. Alternatives B and E

These alternatives would apply the same management decisions to riparian areas, resulting in short-term, adverse impacts on travel opportunities from potential temporary closures of Functioning at Risk riparian areas to dispersed motorized use. These areas would be closed until riparian Proper Functioning Condition (PFC) is restored. Management decisions under these alternatives would have long-term, adverse impacts on travel from closing selected riparian areas

to vehicle traffic if site-specific analysis determines that OHV use is causing riparian degradation. At this programmatic-level of analysis, the size of the at-risk riparian areas that would be closed to travel, and the length of time that they would be closed (and thus reduce the opportunities for travel) are unknown. The impacts on travel from riparian management decisions would be analyzed under NEPA at the site-specific level during project development and implementation. Compared to Alternative A, these alternatives would be more adverse to travel in the short- and long-term because roads and travel routes within riparian areas could potentially be closed to travel opportunities in order to protect riparian resources.

4.3.16.2.8.3. Alternative C

The impacts would be the same as discussed under Alternative B because the management decisions are the same.

4.3.16.2.8.4. Alternative D

The impacts under Alternative D would be the same as discussed under Alternative A because the management decisions are the same.

4.3.16.2.8.5. Proposed Plan

The impacts would be the same as discussed under Alternative B because the management decisions are the same.

4.3.16.2.9. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON TRAVEL

Management decisions related to impacts to travel access and restrictions within ACECs, WSAs, and along recommended eligible Wild and Scenic River segments are analyzed under Sections 4.3.16.2.7 (Impacts of Recreation Decisions), 4.3.16.2.8 (Impacts of Riparian Decisions) and 4.3.16.2.11 (Impacts of Travel Management Decisions) for OHV and other motorized vehicle use.

4.3.16.2.10. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON TRAVEL

Management decisions related to impacts to travel access and restrictions within special status species habitat are analyzed under Sections 4.3.16.2.7 (Recreation) and 4.3.16.2.8 (Riparian).

4.3.16.2.11. IMPACTS OF TRAVEL MANAGEMENT DECISIONS ON TRAVEL

4.3.16.2.11.1. OHV Travel

Alternative A

Under Alternative A, OHV travel would be managed under open, limited to designated routes, and closed travel designations. As shown in Table 4.177 below, current OHV designations under Alternative A would manage 611,310 acres as open for cross-country travel (see Map 58). The limited to designated route category of OHV travel would be managed with 540,260 acres designated as limited use with season restrictions to protect important wildlife habitat; 570,390 acres would be managed as limited to existing roads and trails to protect cultural, scenic, and recreational values; and 218,780 acres would be managed as limited to designated roads and trails to protect resource values within ACECs, SRMAs, developed recreation sites, and

riparian/floodplain areas. Approximately 276,430 acres would be managed as closed to OHV travel to protect vegetation study areas, and ACEC resource values.

Table 4.177 OHV Acreage Designations by Alternative

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Open	611,310	0	2,311	2,311	0	0
Limited – Seasonal Restrictions (miles)	540,260	-	3.8 ¹	-	-	8 ¹
Limited – Existing Roads and Trails	570,390	-	-	-	-	-
Limited – Designated Roads and Trails	218,780	1,359,417	1,362,142	1,780,807	812,679	1,388,191
Closed	276,430	423,698	418,667	0	970,436	393,895
Total²	2,217,170³	1,783,115	1,783,120	1,783,118	1,783,115	1,782,086

¹This mileage number applies to Arch Canyon.

²Acreage figures may vary by alternative due to the changes in GIS technology and variances in shapefiles.

³Acres are not additive under this alternative because of overlap between limited use categories.

The impacts to travel under the open OHV category would be beneficial in the long-term because these areas would not impede or restrict OHV travel, continuing to allow unlimited, cross-country OHV travel in the designated open areas. Limited OHV use along designated roads and trails would also have beneficial impacts on OHV travel because travel along these routes would be unimpeded. Limited OHV use with seasonal restrictions would have short-term, adverse impacts on travel opportunities by prohibiting travel along these designated routes during specified times of the year. Areas designated as closed to OHV use would continue to adversely affect motorized OHV travel opportunities.

Alternative B

Alternative B would not designate any acreage under the open OHV travel category. Limited to Designated Route OHV use would be allowed on 1,359,417 acres, with 423,698 acres designated as closed to OHV travel (Map 59). The impacts on OHV travel would be adverse along routes designated as closed to travel because travel and access opportunities within these portions of the planning area would be prohibited. Compared to Alternative A, this alternative would be more adverse in the long-term on travel because 1) more area would be designated as closed to OHV travel (more than 53% more area), and 2) no area would be designated as open to cross-country OHV travel, with long-term, adverse impacts on this form of travel from the elimination of the 611,310 acres of open cross-country OHV travel opportunities allowed under Alternative A.

Arch Canyon would be closed to OHV use to protect special status species within the canyon (e.g., the Mexican Spotted Owl and flannelmouth sucker). The impacts to travel in the long-term would be adverse because opportunities for motorized OHV travel within the canyon would be eliminated. Compared to Alternative A, this alternative would be more adverse because Alternative A would not prohibit travel within the canyon.

Alternative C

This alternative would have impacts similar to those discussed under Alternatives B and E, except that a very small area would be designated as open to cross-country OHV travel opportunities (2,214 acres near Indian Creek within the Indian Creek SRMA, and 97 acres in Butler Wash [within the Cedar Mesa C-SRMA]) (Map 60). The comparison of OHV travel under this alternative with Alternative A would be similar to the comparison under Alternatives B and E because the areas designated as limited and closed are similar: there would be a 5,031-acre difference for the closed category between Alternatives B/E and Alternative C, and a 2,725-acre difference under the limited OHV use category.

Under Alternative C, OHV use would be limited to designated routes within Arch Canyon, with some long-term adverse impacts on travel opportunities through partial closure of the canyon to OHV travel. The impacts on travel under this alternative, when compared to Alternative A, would be similar.-Alternative D

Similar to Alternative C, Alternative D would designate a small 2,311-acre area as open to cross-country OHV travel, but none of the planning area would be designated as closed to OHV travel access along designated routes (Map 61). Under this alternative, the travel opportunities for open unlimited, cross-country OHV travel would be adversely impacted in the long-term, when compared to Alternative A, as approximately 609,000 acres (99% of the area designated as open under Alternative A) would have prohibitions on cross-country OHV travel, with a substantial reduction in opportunities for this form of travel. The opportunities for travel along designated routes and trails would not be restricted, except for the seasonal restrictions on commercially permitted mechanized tours or events as discussed above under Section 4.3.16.2.7. Compared to Alternative A, this alternative would have more beneficial impacts on OHV travel because 276,430 fewer acres would be designated as closed to OHV travel, which would increase the OHV-related travel opportunities within the planning area along designated routes. This alternative would also have more adverse impacts to travel, when compared to Alternative A, from the loss of practically all of the opportunities for cross-country OHV travel.

Under this alternative, OHV use within Arch Canyon would be limited to the designated route along the D-class road that allows access to the canyon. The impacts on travel opportunities within the canyon would be minor because canyon travel opportunities would not be restricted along the designated route. The impacts on travel under this alternative, when compared to Alternative A, would be similar.

Alternative E

Alternative E travel decisions would designate no acres as open to cross-country OHV travel and travel within Arch Canyon would be the same as Alternative B, with impacts as discussed under that alternative. Approximately 970,436 acres would be closed to OHV travel (582,360 acres and 179 miles of routes within non-WSA lands with wilderness characteristics, and the remainder throughout the Monticello PA) (Map 62). As discussed above in Section 4.3.16.2.6, the impacts of closing more than 54% of the Monticello PA to OHV travel would have substantially adverse impacts on mechanized travel opportunities. The impacts on non-mechanized travel would be negligible, as these forms of travel (hiking, backpacking, and equestrian) would not be affected by route closures except where public safety and resource protection would be a concern. The designation of 812,679 acres as limited to designated routes would have impacts on travel

opportunities, as discussed under Alternative B, but to a lesser degree because fewer acres would be designated for travel under this OHV use category.

Compared to Alternative A, this alternative would have substantially more adverse impacts on travel opportunities because: 1) 611,310 acres (100% of the area designated under Alternative A) would be closed to cross-country OHV travel, and 2) 694,006 more acres would be closed to OHV travel opportunities (with a total acreage closure of 970,436 acres or over 3.5 times more acres than designated under Alternative A) under this alternative than under Alternative A.

4.3.16.2.11.2. Proposed Plan

The Proposed Plan would have impacts similar to those discussed under Alternatives B and E. The comparison of OHV travel under the Proposed Plan with Alternative A would be similar to the comparison under Alternatives B and E because the areas designated as limited and closed would be similar: there would be a 29,803-acre difference for the OHV closed category between Alternative B and the Proposed Plan, and a 28,677-acre difference under the limited OHV use category.

Under the Proposed Plan, OHV use would be limited to designated routes within Arch Canyon, with some long-term beneficial impacts on travel opportunities through allowed OHV travel along the entire length of the canyon from its mouth to the USFS boundary. Seasonal restrictions would be applied to commercial OHV groups from March 1 through August 31 to protect sensitive species, but this would not apply to private OHV users. The impacts would be adverse for commercial users from restrictions on travel opportunities, but there would be no impact so private use travel opportunities. The impacts to OHV travel would be similar to Alternative A because there would be opportunities for travel along the full length of the canyon.

4.3.16.2.11.3. Non-Mechanized Travel (Hiking, Backpacking, Equestrian)

Management decisions for all alternatives and the Proposed Plan would provide opportunities for non-mechanized travel on all routes open to mechanized uses, and would manage routes that exclude motorized OHV and mountain bikers to reduce user conflicts, and provide travel opportunities independent of motorized OHV and mountain biking routes. Management would not restrict non-mechanized travel within the Monticello PA, except in areas where specific resource values would need protection or for public health and safety reasons. All of the alternatives and the Proposed Plan would have long-term beneficial impacts to non-mechanized travel because travel opportunities would only be limited for the reasons just mentioned, if the health and safety of the traveler would be put at risk, or where natural and cultural resources have been degraded and need to be rehabilitated or preserved.

4.3.16.2.11.4. Road Travel

Alternative A

Under Alternative A, no D-Class roads would be closed because of resource use conflicts, restrictions to authorized users only, proposed management decisions, purpose and need review, or crucial wildlife habitat. As shown in Table 4.178, 890 miles of B-Class roads would be open within the planning area, with approximately 2,179 miles of D-Class roads open within the planning area. The impacts on travel under this alternative would be negligible because travel

opportunities to access the Monticello PA would not be prohibited or restricted along these roads.

Table 4.178. B-Class and D-Class Roads in the Monticello Planning Area (Miles)

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Open B-Class Roads	890	875	873	873	875	873
Open D-Class Roads	2,179	1,521	1,947	2,205	1,342	1,947
Closed D-Class Roads	0	780	316	45	959	316

Source: BLM 2006d.

¹The D-Class closed roads include those routes seasonally closed to protect wildlife crucial habitat (see Section 4.3.16.2).

Alternative B

Under these alternatives, 15 miles of B-Class roads (fewer than 2%) would not be designated, with 780 miles of D-Class roads (34% of the total number of D-Class roads) proposed for closing because of resource use conflicts, restrictions to authorized users only, proposed management decisions under this alternative, purpose and need review, or crucial wildlife habitat needs. Of the proposed 780 miles of D-Class closures, 258 miles would be closed because of crucial deer habitat needs, 155 miles because of resource designations under this alternative, 75 miles because of crucial elk habitat needs, 136 miles because of crucial bighorn sheep habitat needs, 34 miles because of authorized use only along designated roads, and 30 miles because of purpose and need review of road use. Other reasons for closure would include 47 miles because of riparian vegetation conflicts and 6 miles due to law enforcement conflicts. (See the Monticello Travel Plan [Appendix N] for a description of the route designation process.) The remainder of the proposed closures would be for cultural resource, seasonal, and other wildlife habitat and vegetation conflicts. These proposed road closures would have long-term adverse impacts on travel because of the reduction in planning area travel and access opportunities. Compared to Alternative A, these alternatives would be more adverse to travel because 780 more miles (34% more D-Class routes) would be closed to travel than under Alternative A, which would not close any D-Class roads.

Alternative C

Alternative C would propose to not designate 17 miles of B-Class roads in the travel plan (fewer than 2%), and close 316 miles of D-Class roads (14% of the total number of D-Class roads under this alternative) within the planning area. Of the proposed 316 miles of road closures, the majority of closures would be for the following reasons: 109 miles for crucial deer habitat needs; 38 miles for WSA intrusions/resource designations under this alternative; 58 miles for resource designations; 33 miles for road purpose and need review; 17 miles for authorized use only along specified roads; and 31 miles for bighorn sheep habitat needs. The impacts of these proposed closures would be similar to those discussed under Alternative B because the affects on travel

opportunities would be similar. However, the degree of impact on travel would be roughly half of that disclosed under Alternative B because road closures under this alternative would be 46% of those proposed under Alternative B. Compared to Alternative A, this alternative would have more adverse impacts on travel for the same reasons as discussed under Alternative B.

Alternative D

Alternative D would propose to not designate 17 miles of B-Class roads in the travel plan (the same as under Alternative C) and close 45 miles of D-Class roads. The proposed D-Class closures would be because of WSA intrusions. The impacts of these road closures on travel under this alternative would be minor because 1) the total number of road closures is small, compared to the total miles of B- and D-Class road within the planning area (2% of B-Class roads, 2% of D-Class roads), and 2) the D-Class road closures within WSAs would be for reasons required under the IMP to limit trails and routes to those existing prior to the time that the WSA was established (i.e., to eliminate unauthorized routes within the WSA). Compared to Alternative A, this alternative would be more beneficial to travel along D-Class roads because 26 more miles of D-Class roads would be open for travel than under Alternative A. This would provide more opportunities for planning area travel and access along these roads. The impacts on B-Class roads would be the same as discussed under Alternative B.

Alternative E

Travel decisions for Alternative E would be the same as those discussed under Alternative B, except that the 582,360 acres within non-WSA lands with wilderness characteristics would be closed to OHV travel. Closing these areas would not affect travel opportunities along B-Class routes because these are state-administered and maintained routes, beyond the jurisdiction of BLM land management; however, 179 miles along D-Class roads would be closed to OHV travel opportunities within non-WSA lands with wilderness characteristics. Compared to Alternative A, this alternative would have more adverse impacts on D-Class OHV travel because fewer OHV travel opportunities would be available under Alternative E.

Proposed Plan

The Proposed Plan would not designate 17 miles of B-Class roads (fewer than 2%) in the travel plan, and close 316 miles of D-Class roads (14% of the total number of D-Class roads under this alternative) within the planning area. Of the proposed 316 miles of road closures, the majority of closures would be for the following reasons: 109 miles for crucial deer habitat needs; 38 miles for WSA intrusions/resource designations under this alternative; 58 miles for resource designations; 33 miles for road purpose and need review; 17 miles for authorized use only along specified roads; and 31 miles for bighorn sheep habitat needs. The impacts of these proposed closures would be similar to those discussed under Alternative B because the affects on travel opportunities would be similar. However, the degree of impact on travel would be roughly half of that disclosed under Alternative B because road closures under this alternative would be 46% of those proposed under Alternative B. Compared to Alternative A, this alternative would have more adverse impacts on travel for the same reasons as discussed under Alternative B. Note that while 88,871 acres of non-WSA lands with wilderness characteristics would be managed under this alternative, the impacts to travel would be negligible because management decisions for these areas would allow travel access along designated roads and trails within these areas.

4.3.16.2.11.5. Scenic Byways and Backways

Under all of the alternatives and the Proposed Plan, scenic byways would be maintained along the Indian Creek Corridor, along the Bicentennial–Trail of the Ancients National Scenic Byway, and along Monument Valley. Scenic backways would be maintained along the Lockhart Basin Road, the Trail of the Ancients (Backway), Elk Ridge Road, and the Abajo Loop Road. These management decisions would have long-term, beneficial impacts on travel by providing scenic-quality-related travel opportunities within the PA.

4.3.16.2.12. IMPACTS OF VEGETATION DECISIONS ON TRAVEL

The impacts of vegetation treatments for ecosystem restoration, fire management, and exotic vegetation control on travel are similar to those discussed under Section 4.3.16.2.3, Impacts of Fire Management Decisions on Travel, because the treatments and resultant impacts of the alternatives and the Proposed Plan would be similar.

4.3.16.2.13. IMPACTS OF WILDLIFE AND FISHERIES DECISIONS ON TRAVEL

4.3.16.2.13.1. Alternative A

Under Alternative A, management decisions for the protection of bighorn sheep, pronghorn, and deer would have impacts similar to those discussed in Section 4.3.10, Recreation, i.e., the impacts would be negligible to minor on travel. No restrictions or limitations would be placed on travel except cross-country OHV travel within bighorn sheep crucial habitat (personal communication between Tammy Wallace, Monticello FO, and Thomas Sharp, SWCA, 2006).

4.3.16.2.13.2. Alternatives B and E

Under these alternatives, permitted and commercial OHV travel would be prohibited within bighorn sheep, pronghorn, deer, and elk crucial habitat. The impacts would be short-term, but adverse, on travel opportunities for these activities, as approximately 512 miles of routes would be seasonally closed to protect wildlife. It should be noted that private motorized OHV and mountain biking travel along designated routes would be permitted within these areas, so there would be negligible impacts on opportunities for private travel. Compared to Alternative A, these alternatives would be more adverse to commercial and permitted types of travel because of the prohibitions on OHV access into crucial wildlife habitat.

4.3.16.2.13.3. Alternative C

The impacts of crucial wildlife habitat restrictions on travel would be similar to those discussed under Alternatives B and E, but to a lesser degree, as some travel limitations would be placed on the extent and duration of commercial and permitted OHV use within crucial wildlife habitat. Approximately 135 miles of travel routes would be closed to protect wildlife species under this alternative (26% of the acres closed to travel under Alternatives B and E), which would reduce travel opportunities. It should be noted for Alternatives B and E, that private OHV/mechanized travel along designated routes would be permitted within these areas, so the impacts on opportunities for this type of travel would be negligible. Compared to Alternative A, this alternative would be more adverse to travel because more roads would be closed, and thus the opportunities for travel would be reduced.

4.3.16.2.13.4. Alternative D

The impacts of crucial wildlife habitat restrictions on travel would be similar to those discussed under Alternative A because the management decisions would be similar.

4.3.16.2.13.5. Proposed Plan

The impacts of wildlife and fisheries decisions on travel would be the same as discussed under Alternative B because the decisions are the same.

4.3.16.2.14. IMPACTS OF WOODLANDS DECISIONS ON TRAVEL**4.3.16.2.14.1. Alternative A**

Alternative A woodlands decisions would have negligible impacts on travel because there are no specific management decisions that would reduce or limit travel access opportunities within the Monticello PA.

4.3.16.2.14.2. Alternative B

Alternative B would have short-term, adverse impacts on travel by managing the East Canyon, Harts Draw, Salt Creek Mesa, Dark Canyon, White Canyon, South Cottonwood, and Montezuma Watershed woodland zones with seasonal, commercial-travel restrictions on woodland harvesting access to elk, deer, pronghorn, and bighorn sheep in UDWR-designated crucial habitat in order to protect these wildlife species, as discussed under Section 4.3.10, Recreation, and Section 4.3.19, Wildlife (and shown in Table 4.176 above). Compared to Alternative A, the short-term restrictions and route closures on travel under Alternative B would be more adverse because travel would be seasonally restricted or prohibited in these zones.

4.3.16.2.14.3. Alternative C

The impacts to travel under Alternative C would be similar to Alternative B because woodland decisions under this alternative would impose travel restrictions and close areas to protect site-specific cultural and other sensitive resources. Private and/or commercial woodland harvesting activities would be permitted to travel off-road to harvest and collect wood, but would be limited or prohibited, as necessary, to protect resources.

4.3.16.2.14.4. Alternative D

The impacts on travel under this alternative would be similar to Alternative B because while there would be no OHV woodland harvesting decisions that would restrict or prohibit travel access to harvest and collect wood, site-specific travel restrictions in harvesting areas would be imposed to protect cultural and other sensitive resources.

4.3.16.2.14.5. Alternative E

Under Alternative E, all lands with non-WSA wilderness characteristics within the proposed woodland harvesting zones would be managed to protect wilderness values. Woodland decisions to protect these characteristics would include closure to OHV use, scenic quality management under VRM I objectives, and prohibitions on firewood gathering and woodland harvesting. These management decisions would have short-term and long-term adverse impacts on OHV

travel, as 1) OHV travel (including OHV travel to harvest and collect wood) would not be allowed within the approximately 582,360 acres of lands with non-WSA wilderness characteristics, and 2) the same short-term seasonal restrictions applied to protect wildlife within woodland harvesting zones (as discussed under Alternative B) would restrict travel opportunities. Compared to Alternative A, this alternative would have more adverse impacts on OHV travel because more acreage would be closed to travel or seasonally restrict travel opportunities.

4.3.16.2.14.6. Proposed Plan

The impacts to travel under the Proposed Plan would be similar to Alternative B because crucial wildlife habitat would be protected through seasonal travel restriction. Travel restrictions would also be applied under this alternative to protect site-specific cultural and other sensitive resources, but private and/or commercial woodland harvesting activities would be permitted to travel off-road to harvest and collect wood. Under this alternative, 88,871 acres of non-WSA lands with wilderness characteristics would be managed to protect their wilderness values (as discussed above under Alternative E), including prohibitions on private and commercial woodland harvesting. However, the impacts on travel opportunities would be minor because OHV travel would still be allowed along designated routes and trails within these areas.

4.3.16.3. SUMMARY OF TRAVEL ANALYSIS DATA

The following table (Table 4.179) summarizes acres of OHV designations, miles of proposed travel routes, and proposed travel restrictions under each alternative, the purpose of which is to provide the reader with a concise description of the data used in this impacts analysis.

Table 4.179. Travel Data Summary Table

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Open B-Class Roads	890 miles	875 miles	873 miles	873 miles	875 miles	873 miles
Open D-Class Roads	2,179 miles	1,521 miles	1,947 miles	2,205 miles	1,342 miles	1,947 miles
Closed D-Class Roads	0 miles	780 miles	316 miles	45 miles	959 miles	316 miles
OHV Open	611,310 acres	0 acres	2,311	2,311 acres	0 acres	0 acres
OHV Limited – Seasonal Restrictions	540,260 acres	-	3.8 miles (in Arch Canyon)	-	-	8 miles (in Arch Canyon)
OHV Limited – Existing Roads and Trails	570,390 acres	-	-	-	-	-
OHV Limited – Designated Roads and Trails	218,780 acres	1,359,417 acres	1,362,142 acres	1,780,807 acres	812,679 acres	1,388,191 acres
OHV Closed	276,430 acres	423,698 acres	418,667 acres	0 acres	970,436 acres	393,895 acres

Table 4.179. Travel Data Summary Table

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Bighorn Sheep Travel Restrictions	Closed to OHV cross-country travel from 1 Apr–15 Jul 15 Oct–31 Dec	1 Apr–15 Jul 15 Oct–31 Dec	1 Apr–15 Jun 15 Oct–15 Dec	15 Apr-15 May 1 Nov-15 Dec	1 Apr–15 Jul 15 Oct–31 Dec	1 Apr–15 Jun 15 Oct–15 Dec
Pronghorn Travel Restrictions	15 May-15 Jun	15 Apr–30 June	1 May–15 Jun	15 May-15 Jun	15 Apr–30 June	1 May–15 Jun
Elk Travel Restrictions	Unspecified (no identified crucial habitat)	1 Nov–15 May	15 Nov–15 Apr	15 Dec-31 Mar	1 Nov–15 May	15 Nov–15 Apr
Deer Travel Restrictions	15 Dec-30 Apr	1 Nov– 15 May	15 Nov–15 Apr	15 Dec-31 Mar	1 Nov– 15 May	15 Nov–15 Apr
Affected Roads in Wildlife Habitat	Zero miles of travel routes closed to private, permitted, or commercial OHV travel.	512 miles of travel routes closed to permitted or commercial OHV travel, but open to private use.	135 miles of travel routes closed to permitted or commercial OHV travel, but open to private use.	Zero miles of travel routes closed to private, permitted, or commercial OHV travel.	512 miles of travel routes closed to permitted or commercial OHV travel, but open to private use.	135 miles of travel routes closed to permitted or commercial OHV travel, but open to private use.

4.3.16.4. SUMMARY OF IMPACTS ON TRAVEL

See Table 2.2 of Chapter 2 for a summary of impacts to travel.

4.3.16.5. MITIGATION

There are no mitigation measures to reduce the impacts to access or increase the opportunities for travel within the planning area, except as discussed in Section 4.3.1, Air Quality and Climate for dust abatement.

4.3.16.6. UNAVOIDABLE ADVERSE IMPACTS

Unavoidable adverse impacts to travel would be caused by temporary seasonal road or route closures in crucial fawning, lambing, and crucial winter habitat for wildlife along routes where vehicles could impact deer, elk, bighorn sheep, pronghorn, and special status wildlife species.

4.3.16.7. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Short-term use of resources in the planning area would have no impact on the long-term productivity of travel.

4.3.16.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

All route or road closures described above are irretrievable in that the use of that travel resource would be irretrievably lost until the routes are reopened. However, none of these closures are irreversible in that it is possible to reopen any of these closed areas or routes subject to additional analysis.

4.3.17. VEGETATION RESOURCES

The following resources are not discussed in this section because their management decisions would have negligible impacts on vegetation resources: Air Quality, Health and Safety, Non-WSA lands with wilderness characteristics, and Socioeconomics.

4.3.17.1. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Sagebrush habitat would be managed as required by the BLM Special Status Species Management – Manual 6840 (BLM 2001c), which requires the BLM to use the methods and procedures necessary to improve the condition of special status species and their habitats to the point where special status recognition is no longer warranted. In addition, BLM's National Sage-grouse Habitat Conservation Strategy 1.3.1 guidance (BLM 2004d) would be followed to ensure land-use plans and plan amendments adequately address sage-grouse habitat conservation needs. Harts Draw, Beef Basin, Black Mesa, Alkali, Mustang, Cedar Point, Shay Mesa, and all areas with Gunnison Sage-grouse habitat would be prioritized for treatment. These management actions would have beneficial impacts on native plant species in sagebrush vegetation communities because improved sage-grouse habitat necessitates the maintenance of large areas of native sagebrush communities (Crawford et al. 2004).

The Monticello FO would incorporate vegetation treatments from the Utah Record of Decision (ROD) for Vegetation Treatment on BLM Lands in Thirteen Western States EIS (BLM 1991b as amended). Restoration treatments would include biological, chemical, manual, mechanical, and prescribed burning. These treatments would have long-term, beneficial impacts on all native vegetation communities by reducing competition from noxious weeds and exotic, invasive plant species (BLM 1991b).

The spread of noxious, invasive, and non-native weed species would be controlled by implementing the principles in BLM weed management policies and action plans (see Table 3.59 Invasive and Noxious Weeds of San Juan County). In addition, restoration activities and stock animal feed would be required to use certified weed-free seed mixes, mulch, and feed. Restoration treatments to help slow and/or halt the spread of weed species in the Monticello PA would reduce the adverse impacts of surface disturbances associated with improper livestock management, minerals development, motorized OHV travel in designated open areas, and other activities that result in disturbances to native vegetation. Greasewood would be treated in Comb Wash, Butler Wash, Montezuma, East Canyon, Indian Creek, South and North Cottonwood Wash, and Cross Canyon to improve ground cover, biodiversity, and water quality. This could have short-term, adverse impacts on native vegetation in the treatment areas from surface disturbances and loss of productivity, but would have long-term, beneficial impacts on the treated, native vegetation community as a whole by removing undesirable, non-native plant species, thereby allowing the establishment of a diverse, native vegetation community.

Under all alternatives and the Proposed Plan, seed gathering and plant collection would be allowed in all areas meeting Utah's Rangeland Health Standards. This could have short-term, direct, adverse impacts on native vegetation due to pedestrian trampling, as well as minor potential for loss in reproductive success due to seed/plant removal.

4.3.17.2. ALTERNATIVES AND PROPOSED PLAN IMPACTS**4.3.17.2.1. IMPACTS OF CULTURAL RESOURCE DECISIONS ON VEGETATION****4.3.17.2.1.1. Alternative A**

Under Alternative A, there would be no designated Cultural Special Management Areas (CSMAs) and the cultural areas identified in Table 4.33 would be managed according to 1991 RMP Prescriptions. Butler Wash East of Comb Ridge would be managed with no allocation limit and no size limit on private or commercial groups, with camping, OHV use, dogs, fires and grazing permitted within the area. Under this alternative, potential direct adverse impacts from increased trampling of native vegetation by visitors to cultural sites would be reduced or eliminated. However, there would be adverse impacts associated with surface-disturbing vegetation treatments, and direct disturbance to vegetation and introduction of noxious and invasive weed species from recreationists, vehicles, and livestock. The level of cultural resource protection (that indirectly results in vegetation resource protection) varies by alternative. Because the extent and location of these surface disturbances are not known at this time, the quantitative differences in vegetation impacts between alternatives and the Proposed Plan cannot be determined.

Under all alternatives and the Proposed Plan, adverse impacts of cultural resource decisions on vegetation would be reduced due to the closure of the Grand Gulch National Historic District (37,388 acres) to private and/or commercial use for woodland products, mineral leasing, OHV use, and mechanized or mechanical surface disturbance (including vegetation treatments). This would decrease the number of native trees removed from this area. It would also decrease the amount of surface disturbance caused by foot/vehicle traffic in the area. Under Alternative A, the only surface disturbance restrictions would be in the Grand Gulch National Historic District. See Table 4.180 for the acreages of each vegetation type within the Grand Gulch National Historic District.

Table 4.180. Acreage of Vegetation Type by Cultural Area

Vegetation Type	Comb Ridge	Tank Bench	Beef Basin	McLoyd Canyon-Moon House	Grand Gulch National Historic District
Conifer/mountain shrub	15,884	0	20	0	13
Desert shrub	0	858	181	0	7,154
Invasive species and weeds	4	0	0	0	24
Pinyon-juniper woodland	17,576	1,564	15,796	1,408	26,902
Riparian and wetland	3,378	225	17	3	860
Sagebrush and perennial grassland	1,147	0	4,285	196	2,434
Total Vegetated Acres	37,989	2,647	20,299	1,607	37,387

¹ Acres of each vegetation type were determined using the Southwest ReGAP terrestrial ecological classification system (USGS 2004). Because vegetation types may overlap or be overestimated in the SWReGAP coverages, total acres of vegetation may exceed the total acres of the area being analyzed.

4.3.17.2.1.2. Alternative B

Under Alternative B, the qualitative impacts of cultural resource decisions on vegetation resources would be the same as those discussed under Alternative A. Under this alternative, Comb Ridge Tank Bench Beef Basin and McLoyd Canyon-Moon House would be managed as CSMA. The Comb Ridge CSMA (38,012 acres) would be closed to woodland product collection, closed to oil and gas surface occupancy and mineral entry, and would only be available for non-surface-disturbing vegetation treatments. Camping would be limited to designated campgrounds and hiking and OHV use would be limited to designated trails. The Tank Bench CSMA (2,646 acres) would have the same surface disturbance restrictions as the Comb Ridge CSMA, but would be closed to OHV use. The Beef Basin (20,302 acres) and the McLoyd Canyon-Moon House CSMA (1,607 acres) would have the same surface disturbance restrictions as Comb Ridge CSMA with the exception of mineral leasing, which would be allowed subject to standard terms. Under all alternatives and the Proposed Plan, the Grand Gulch National Historic District (37,388 acres) would be closed to all surface disturbances, with the exception of designated trails and camping areas.

There would be a considerable difference in impacts between Alternative B and the No Action Alternative due to the designation of four CSMA and associated restrictions on surface-disturbing activities. Adverse impacts to vegetation from surface disturbance under Alternative B would be considerably reduced from Alternative A due to restrictions on surface disturbances within 62,567 acres of designated CSMA and the 37,388 acres Grand Gulch National Historic District.

4.3.17.2.1.3. Alternative C

Under Alternative C, the qualitative impacts of cultural resource decisions on vegetation resources would be the same as those discussed under Alternative B. The Comb Ridge CSMA would be managed the same as under Alternative B, except that woodland product collection and surface-disturbing vegetation treatments would be allowed. The Tank Bench CSMA would be managed the same as under Alternative B, except for the following: it would be open to oil and gas leasing and mineral entry under standard lease terms, hiking would be allowed off trails, and surface-disturbing land activities would be permitted. The Beef Basin CSMA and the McLoyd Canyon-Moon House CSMA would be managed the same as under Alternative B, but would allow non-motorized vegetation treatments.

There would be a considerable difference in impacts between Alternative C and the No Action Alternative due to the designation of four CSMA and associated restrictions on surface-disturbing activities. Adverse impacts to vegetation from surface disturbance under Alternative C would be greater than under Alternative B due to more acres of native vegetation in the CSMA subject to adverse impacts from surface disturbance. Adverse impacts under Alternative C would be less than under Alternative A.

4.3.17.2.1.4. Alternative D

Under Alternative D, the qualitative impacts of cultural resource decisions on vegetation resources would be similar to those discussed under Alternative A, as Comb Ridge, Tank Bench, and Beef Basin would not be managed as CSMA, but would be managed with similar management prescriptions as under Alternative C. These areas would be available for livestock

use, surface-disturbing vegetation treatments, and OHV use on designated routes. Tank Bench would be open to locatable mineral entry and disposal of mineral materials and geophysical work, campfires, and private and commercial use of woodland products. Beef Basin would be managed as closed to private or commercial use of woodland products. McLoyd Canyon-Moon House would be managed the same as under Alternative C, with the following exceptions: 24 visitors and two commercial groups would be allowed each day. The Grand Gulch National Historic District would be managed the same as under Alternative C; however, if the WSA is released by Congress, it would be open to oil and gas leasing with no surface occupancy and casual geophysical exploration.

Alternative D would have similar impacts as Alternative A due to the designation of only one CSMA and the Grand Gulch National Historic District, and allowances for surface disturbances associated with livestock grazing, vegetation treatments, OHV use, and mineral entry in the other cultural areas. Adverse impacts to vegetation from surface disturbance under Alternative D would be greater than under Alternatives B and C due to more acres of native vegetation subject to adverse impacts from surface disturbance.

4.3.17.2.1.5. Alternative E

Under Alternative E, impacts of cultural decisions on vegetation resources would be the same as those described under Alternative B with the exception that OHV use would be closed in non-WSA lands with wilderness characteristics and vegetation disturbances would be restricted to protect wilderness characteristics in these areas. This would result in long-term, beneficial impacts to vegetation, as well as adverse impacts from restrictions on vegetation treatments to improve vegetation communities and control the spread of invasive species. The Comb Ridge and Beef Basin CSMA would allow maintenance for existing improvements to wildlife habitat, but no new improvements would be allowed. This would limit direct impacts associated with surface-disturbing improvements. However, it would also reduce long-term, indirect, beneficial impacts from vegetation and wildlife habitat improvements. Due to the designation of four CSMA and protections in place for non-WSA lands with wilderness characteristics, Alternative E would have considerably fewer direct adverse impacts than Alternative A. This alternative would also have fewer direct adverse impacts and indirect beneficial impacts to vegetation than any of the other management alternatives and the Proposed Plan.

4.3.17.2.1.6. Proposed Plan

Under the Proposed Plan, the qualitative impacts of cultural resource decisions on vegetation resources would be the same as those discussed under Alternatives B and C. The Comb Ridge recreation management zone of the Cedar Mesa SRMA would be managed the same as under Alternatives B and C, except that woodland product collection and surface-disturbing vegetation treatments would be allowed. The Tank Bench SRMA would be managed the same as under Alternatives B and C, except for the following: it would be open to oil and gas leasing and mineral entry under standard lease terms, hiking would be allowed off trails, and surface-disturbing land activities would be permitted. The Beef Basin SRMA and McLoyd Canyon-Moon House recreation management zone would be managed the same as under Alternatives B and C. The Grand Gulch National Historic District would be managed the same as under Alternatives B and C, but would allow non-motorized vegetation treatments.

There would be a considerable difference in impacts between the Proposed Plan and the No Action Alternative due to the designation of two SRMAs and two recreation management zones and associated restrictions on surface-disturbing activities. Adverse impacts to vegetation from surface disturbance under the Proposed Plan would be greater than under Alternatives B and C due to more acres of native vegetation in the SRMAs subject to adverse impacts from surface disturbance. Adverse impacts under the Proposed Plan would be less than under Alternative A.

4.3.17.2.2. IMPACTS OF FIRE MANAGEMENT DECISIONS ON VEGETATION

4.3.17.2.2.1. Alternative A

Under Alternative A, the Reasonable and Prudent Measures and Terms and Conditions identified in consultation with the USFWS for the Utah Land-use plan Amendment for Fire and Fuels Management would be implemented in fire-related actions (see Appendix B). Maintenance of existing healthy ecosystems is one of the criteria for establishing fire management priorities and would have beneficial impacts on vegetation resources in the Monticello FO. Wildland fire use would not be authorized in the following areas unless reasonable Resource Protection Measures were in place: areas that are known to be highly susceptible to post-fire cheatgrass or other weed invasion, important terrestrial and aquatic habitats, and non-fire adapted vegetation communities. These measures would have beneficial impacts on vegetation by reducing the spread of weeds and exotic, invasive species into native vegetation communities.

Under all alternatives and the Proposed Plan, fuels management actions would include surface-disturbing treatments on 5,000 to 10,000 acres annually. These actions include: mechanical and manual treatments, prescribed fire, chemical or biological vegetation control, and aerial/ground seeding. These treatments would have long-term beneficial and short-term adverse impacts on vegetation communities in treated areas. Fuels treatments that thin vegetation and reduce or eliminate weeds benefit native vegetation communities by allowing greater growth potential and also by removing competition from weedy native and invasive species. Once competition from weedy or non-native species is removed, a diverse native community has the potential to establish itself in the area (Stevens and Monsen 2004). Adverse impacts associated with fuels management actions include trampling and crushing of vegetation, and thinning or removal of rare or ecologically desirable species. Fuels management actions potentially result in a short-term, adverse reduction in native species diversity. However, in the long-term fuels treatments allow native and desirable non-native species to become established and promote more varied species composition and habitat structure (e.g., forests with multiple age classes and canopy openings for groundcover establishment).

4.3.17.2.2.2. Alternatives B, C, D, E, and the Proposed Plan

Under Alternatives B, C, D, E, and the Proposed Plan the impacts of fire management decisions on vegetation resources would be the same as those discussed under Alternative A.

4.3.17.2.3. IMPACTS OF LANDS AND REALTY DECISIONS ON VEGETATION

Lands and realty decisions include the following issues: access, easements, leases and permits, utility/transportation systems, exchanges, disposals, and withdrawals. The Monticello FO AMS Chapter 7 contains a complete list of common realty issues the Monticello FO can expect. Lands and realty decisions common to the Proposed Plan and the alternatives pertain to filming permits,

Recreation and Public Purpose and other authorizations for disposal, access, easements, land tenure adjustments, and land disposals.

Applications for filming permits for work on existing roads include the following criteria for approval: project would not impact sensitive species habitat, would not involve the use of exotic species, and would not adversely impact relict environments or riparian areas. Applications for filming permits for work in WSAs, WSR corridors, NRHP Eligible Sites, and Native American Sacred Sites would include the following additional criteria for approval: no significant livestock use and a maximum of 15 vehicles and 75 people in the sensitive area. Trampling and vegetation removal associated with filming operations could result in short- and long-term adverse impacts on vegetation resources. Adverse impacts would be reduced by these required avoidance and/or minimization criteria for sensitive habitats, and by restrictions on the use of exotic species.

Under the Proposed Plan and the alternatives approximately 6,581 acres would be identified for disposal. These data are not available in a spatially explicit format; therefore, acres of impacts by TES species habitats are not available for this analysis. Nevertheless, land disposal decisions could result in impacts to all vegetation types. On the other hand, the acquisition and retention of any TES species habitat, quality riparian areas, and key productive ecosystems would protect vegetation resources.

4.3.17.2.3.1. Alternative A

Mineral withdrawals (132,380 total acres) and exclusion (120,800 total acres) and avoidance (253,790 total acres) areas under Alternative A would help preserve and protect sensitive environmental resources and areas.

The Monticello FO AMS Chapter 7 contains a list of ACECs and SRMAs closed to ROWs in the Monticello FO. These closures would benefit vegetation in these areas. However, all areas not identified as avoidance or exclusion will be available for ROWs and could be subject to multiple-use terms on a case-by-case basis (BLM 2005c). ROW corridors are presently used for electric transmission facilities, pipelines 10 inches and larger, communication lines, federal and state highways, and major county road systems. The permanent installation of utility and communication infrastructure in ROWs could have direct, long-term, adverse impacts on native vegetation due to vegetation removal and trampling by workers and vehicles during construction activities.

4.3.17.2.3.2. Alternative B

Under Alternative B, the impacts of lands and realty decisions on vegetation resources would include the qualitative impacts discussed in Alternative A and at the beginning of this section, with the withdrawal of an additional 119,330 acres from locatable mineral entry (an increase of approximately 90% over Alternative A).

Under this alternative lands would be considered available for ROWs except for exclusion areas (approximately 416,612 total acres) and avoidance areas (approximately 125,105 total acres). Exclusion areas under Alternative B would include approximately 245% more land than under Alternative A. Avoidance areas, on the other hand, would include approximately 51% less land than under Alternative A. Overall, this alternative would have fewer adverse impacts on vegetation than Alternative A by withdrawing more land from locatable mineral entry and

excluding more land from ROWs (though less land would be ROW avoidance area than under Alternative A).

4.3.17.2.3.3. Alternative C

Under Alternative C, the impacts of lands and realty decisions on vegetation resources would be the same as under Alternatives A and B, except there would be 10,468 fewer acres withdrawn from locatable mineral entry (approximately 8% less than under Alternative A). Exclusion and avoidance areas for ROWs would consist of 395,329 acres and 39,323 acres, respectively. Under Alternative C exclusion areas would be 227% greater than under Alternative A while avoidance areas would be 85% smaller than under Alternative A. Overall, Alternative C would have more adverse impacts on vegetation than Alternative A due to the lesser acreage of land withdrawn from locatable mineral entry and the lesser acreage established as avoidance for ROWs (though more acreage would be ROW exclusion area under Alternative C than under Alternative A).

4.3.17.2.3.4. Alternative D

Under Alternative D, the impacts of lands and realty decisions on vegetation resources would be the same as under Alternatives A, B, and C, except there would be 86,249 fewer acres withdrawn from locatable mineral entry (approximately 65% less than under Alternative A). Exclusion and avoidance areas for ROWs would consist of 386,853 acres and 14,175 acres, respectively. Under Alternative D exclusion areas would be 220% greater than under Alternative A while avoidance areas would be 94% smaller than under Alternative A. Overall, Alternative D would have more adverse impacts on vegetation than Alternative A due to the lesser acreage of land withdrawn from locatable mineral entry and the lesser acreage established as avoidance for ROWs (though more acreage would be ROW exclusion area under Alternative D than under Alternative A).

4.3.17.2.3.5. Alternative E

Under Alternative E, the impacts of lands and realty decisions on vegetation resources would be the same as the impacts discussed under Alternative B except that under Alternative E 53,915 acres would be ROW avoidance areas (79% less than under Alternative A) and 974,463 acres would be ROW exclusion areas (707% greater than under Alternative A). Also, 834,070 acres would be withdrawn from locatable mineral entry (530% more than under Alternative A). Alternative E would have fewer adverse impacts on vegetation than the other alternatives and the Proposed Plan because fewer surface disturbances would be allowed due to protection of non-WSA lands with wilderness characteristics.

4.3.17.2.3.6. Proposed Plan

Under the Proposed Plan, the impacts of lands and realty decisions on vegetation resources would be the same as under Alternatives A, B, C, D, and E except there would be 81,715 fewer acres (approximately 62% less than under Alternative A) withdrawn from locatable mineral entry. Exclusion areas for ROWs would consist of 416,115 acres (244% more than under Alternative A) while avoidance areas for ROWs would consist of 133,293 acres (47% less than under Alternative A). Overall, the Proposed Plan would have greater adverse impacts on vegetation than Alternative A due to the lesser acreage of land withdrawn from locatable mineral entry and the lesser acreage established as ROW avoidance areas (though more acreage would be ROW exclusion area under the Proposed Plan than under Alternative A).

4.3.17.2.4. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON VEGETATION

Under the Proposed Plan and all alternatives livestock grazing would be managed according to the Guidelines for Grazing Management to achieve the Standards for Rangeland Health (Appendix D). Furthermore, grazing would continue to be excluded from 128,098 acres in areas identified in the Summary Table of Alternatives and the Proposed Plan (Table 2.1). The allotments and their seasons of use would be the same as in the San Juan RMP (BLM 1991) with the exceptions listed in the Summary Table of Alternatives and the Proposed Plan. Included in these 128,098 acres are approximately 15,720 acres excluded from livestock use for wildlife objectives (i.e., managed for wildlife use) on parts of the slopes of Peter's Canyon and East Canyon, which would help maintain native vegetation in those areas. In total, approximately 8% of the Monticello FO planning area would be unavailable for livestock grazing under the Proposed Plan and all alternatives (Map 12). Because the intensity and exact location of grazing activities are not known at this time, the quantitative differences in vegetation will instead be analyzed by comparing the acres of each vegetation type unavailable for grazing under the Proposed Plan and each alternative (Table 4.181). Under the Proposed Plan and all action alternatives new allotments would be added in South Vega, Upper Mail Station, and Big Westwater. In areas where utilization levels have not been established the targeted level of use would be 50% to meet the objectives of this plan.

There is the potential for direct and indirect adverse impacts on vegetation resources associated with grazing-related surface disturbance in 92% of the Monticello PA. Livestock grazing, when done at proper levels, would not have adverse impacts on the native plant species in an area. However, when improper grazing practices occur at higher levels than the native vegetation can support, adverse impacts to native vegetation are inevitable. In all vegetation types in the Monticello PA, if native vegetation is grazed beyond the point of natural regeneration, non-native, weedy species such as cheatgrass are better able to colonize an area and inhibit the future restoration of native species (Sparrow et al. 2003, Young and Evans 1973). Under all alternatives and the Proposed Plan, adaptive management would be applied to livestock grazing in areas where the native vegetation appears to be overburdened, in order to mitigate adverse impacts to vegetation.

4.3.17.2.4.1. Alternative A

The impacts of livestock grazing decisions on vegetation under Alternative A would be the same as the impacts described above for the Proposed Plan and all alternatives because the decisions would be the same.

Table 4.181. Acreage of Each Vegetation Type Unavailable for Grazing for the Proposed Plan and Alternatives

Vegetation Type	Alternative A	Alternatives B and E	Alternative C	Alternative D	Proposed Plan
Conifer/mountain shrub	785	800	800	785	785
Desert shrub	8,411	8,967	8,992	8,420	8,420
Invasive species and weeds	99	99	99	99	99

Table 4.181. Acreage of Each Vegetation Type Unavailable for Grazing for the Proposed Plan and Alternatives

Vegetation Type	Alternative A	Alternatives B and E	Alternative C	Alternative D	Proposed Plan
Pinyon-juniper woodland	121,317	129,641	129,641	121,504	121,504
Riparian/wetland	2,380	2,816	2,816	2,394	2,394
Sagebrush/perennial grass	5,362	5,434	5,434	5,362	5,362
Total	138,354	147,757	147,782	138,564	138,564

4.3.17.2.4.2. Alternatives B and E

Under Alternatives B and E, the impacts of livestock grazing decisions on vegetation resources would be the same as those discussed above, except that additional areas would be made unavailable to grazing. Additional closures would consist of Slickhorn Canyon (Perkins Brother's Allotment), Rone Bailey Mesa (Upper Mail Station Allotment), Dodge Canyon Allotment, Mule Canyon (including North and South Forks north of U-95), Rogers Allotment, Portions of West Butler Wash Canyons, and Horsehead Canyon within the Montezuma Canyon allotment (Map 13). These closures would generally have a beneficial impact on native vegetation through full plant development and growth without livestock grazing pressures. In the long-term, Alternatives B and E would likely have fewer potential adverse impacts on native vegetation in the Monticello FO than Alternative A because of the closure of 13,062 additional acres to livestock grazing. Under Alternatives B and E, 6.6% more acres of the desert shrub vegetation type, 6.9% more pinyon-juniper woodland, 18.3% more riparian/wetland, and 1.3% more sagebrush/perennial grassland would be closed to grazing than under Alternative A, with more potentially beneficial impacts as discussed above.

4.3.17.2.4.3. Alternative C

Under Alternative C, the impacts of livestock grazing decisions on vegetation resources would be the same as discussed for Alternatives B and E, with the exception that Mule Canyon south of U-95 would be unavailable for grazing, and the North and South Forks north of U-95 would be open (Map 14). As discussed above, these closures would generally have a beneficial impact on native vegetation through full plant development and growth without livestock grazing pressures. In the long-term, Alternative C would have fewer potential adverse impacts on native vegetation in the Monticello FO than Alternative A due to the closure of 11,738 additional acres to livestock grazing. Under Alternative C, 6.9% more acres of the desert shrub vegetation type, 6.9% more pinyon-juniper woodland, 18.3% more riparian/wetland, and 1.3% more sagebrush/perennial grassland would be closed to grazing than under Alternative A, with only slightly greater acres of desert shrub.

4.3.17.2.4.4. Alternative D

Under Alternative D, the impacts of livestock grazing decisions on vegetation resources would include those discussed under Alternative A, with the additional closures of Slickhorn Canyon

(Perkins Brother's Allotment), Rone Bailey Mesa (Upper Mail Station Allotment), Rogers Allotment, and portions of West Butler Wash Canyons (Map 15). Due to the closure of 4,013 additional acres to livestock grazing, Alternative D is likely to have slightly less potential adverse impacts on native vegetation in the long-term than Alternative A. Under Alternative D, 0.1% more acres of the desert shrub vegetation type, 0.2% more pinyon-juniper woodland, and 0.6% more riparian/wetland would be closed to grazing than under Alternative A.

4.3.17.2.4.5. Proposed Plan

Under the Proposed Plan, the impacts of livestock grazing decisions on vegetation resources would be the same as discussed above. Specific locations where closures would occur and where restrictions would be in place are listed in the Summary Table of the Proposed Plan and All Alternative (Table 2.1). As discussed above, closures would generally have a beneficial impact on native vegetation through full plant development and growth without livestock grazing pressures. In the long-term, the Proposed Plan would have fewer potential adverse impacts on native vegetation in the Monticello FO than Alternative A due to the closure of 11,738 additional acres to livestock grazing. Under the Proposed Plan, 0.1% more acres of the desert shrub vegetation type, 0.2% more pinyon-juniper woodland, and 0.6% more riparian/wetland would be closed to grazing than under Alternative A.

4.3.17.2.5. IMPACTS OF MINERALS DECISIONS ON VEGETATION

In Tables 4.147–4.149, the number of acres of each vegetation type in each leasing category is shown for each of the RFD areas. Acreage figures under the Standard Stipulations and Timing and Controlled Surface Use reflect the total BLM administered areas within the Monticello PA open to surface-disturbing activities. These are not estimates of the total area disturbed within the Monticello PA, but a comparison by alternative and the Proposed Plan of the amount of area open to potential development within BLM administered areas within the Monticello PA. All acreages provided in the vegetation sections are approximations. The remaining discussion of impacts of minerals decisions on vegetation pertains primarily to oil and gas leasing, mineral material disposal, mineral entry, and geophysical activity. The discussion of impacts due to oil and gas leasing and geophysical activity includes surface disturbance approximations due to these activities. Surface disturbances for other mineral activities would also occur; under the Proposed Plan and all alternatives there would be approximately 851 acres of surface disturbance total for 15 years as a result of uranium and vanadium activities (300 acres), placer gold activities (10 acres), limestone activities (50 acres), sand and gravel activities (360 acres), building stone activities (113 acres), and clay activities (18 acres). This disturbance would have adverse impacts (as described below) on vegetation resources.

Table 4.182. Alternative A—Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulation In the Blanding Sub-basin RFD Area

Vegetation Type	Surface Use with Standard Conditions (acres)	Surface Use Limited by Special Conditions (acres)	NSO and Closed to Mineral Entry (acres)	NSO and Open to Mineral Entry (acres)	Closed to Leasing and Mineral Entry (acres)
Conifer/mountain shrub	549	11	0	1	0
Desert shrub	81,663	17,530	2,167	1,120	5,744
Invasive species and weeds	584	224	0	31	2
Pinyon-juniper woodland	146,689	87,504	2,204	2,526	9,284
Riparian/wetland	6,949	2,266	532	83	410
Sagebrush/perennial grass	31,096	18,454	3	311	97
Total	267,530	125,989	4,906	4,072	15,537

Table 4.183. Alternative A—Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulation In the Monument Upwarmp RFD Area

Vegetation Type	Surface use with Standard Conditions (acres)	Surface use Limited by Special Conditions (acres)	NSO and Closed to Mineral Entry (acres)	NSO and Open to Mineral Entry (acres)	Closed to Leasing and Mineral Entry (acres)
Conifer/mountain shrub	5,002	3,008	0	76	1,008
Desert shrub	21,459	120,633	2,179	53,429	52,554
Invasive species and weeds	30	545		250	228
Pinyon-juniper woodland	101,907	286,930	2,506	78,949	275,201
Riparian/wetland	1,386	1,377	357	964	2,433
Sagebrush/perennial grass	12,997	25,681	0	7,595	27,847
Total	142,781	438,174	5,042	141,263	359,271

Table 4.184. Alternative A—Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulations In the Paradox Fault and Fold Belt RFD Area

Vegetation Type	Surface use with Standard Conditions (acres)	Surface Use Limited by Special Conditions (acres)	NSO and Closed to Mineral Entry (acres)	NSO and Open to Mineral Entry (acres)	Closed to leasing and Mineral Entry (acres)
Conifer/mountain shrub	1,088	37	0	9	14
Desert shrub	45,187	12,159	0	2,098	3,839
Invasive species and weeds	1,366	170	0	1	0
Pinyon-juniper woodland	90,093	54,756	0	2,340	6,191
Riparian/wetland	2,145	1,185	0	294	317
Sagebrush/perennial grass	21,091	20,506	0	174	71
Total	160,970	88,813	0	4,916	10,432

4.3.17.2.5.1. Alternative A

Potential direct adverse impacts from oil and gas production and mineral materials entry and disposal would occur as various forms of surface disturbance. Of the three oil and gas RFD areas within the Monticello FO (see Map 57), vegetation in the Blanding Sub-basin RFD area is expected to be the most impacted by minerals decisions, because it has the highest predicted levels of oil and gas well development (42 wells total for 15 years). In addition, there are nine wells expected in the Monument Upwarp area and 25 wells expected in the Paradox fault and fold belt over the life of the Monticello FO RMP. On average, a well pad disturbs 9.6 acres, so oil and gas development would result in the direct removal of native vegetation from approximately 701 acres (73 wells total) in the Monticello FO total for 15 years. Site-specific analysis will be necessary to determine the vegetation types impacted by oil and gas development.

In addition to the 1,399,454 acres managed for oil and gas leasing in the Monticello FO, there are 530,000 acres of managed coal resources in the San Juan Coal Field, 10,000 acres of tar sand resources in the White Canyon Special Tar Sand Area, two Known Potash Leasing Areas of unspecified size, and 16,320 acres in the Warm Springs canyon geothermal area. Site-specific analysis will be necessary to determine the vegetation types impacted by coal, tar sand, and potash development.

Surface disturbance associated with well, pipeline, and road construction would result in both short- and long-term adverse impacts on vegetation, beyond the life of the well. In the short-term, loss of vegetation associated with surface disturbance would increase the potential for invasion of undesirable plant species, including noxious weeds (Piemeisel 1951). Surface disturbance would also have long-term impacts on vegetation resources. Following completion of oil and gas activities, native seeding and weed management would occur at each site. Initial establishment of sagebrush and other native species following seeding is estimated to take three to four years. Successful establishment is dependent on the exclusion or reduction of livestock and control of weedy annuals on the restoration site during this time (Monsen and Stevens 2004). Revegetation is especially difficult in desert shrub vegetation because soils are shallow and highly saline and moisture availability is relatively low (Stevens and Monsen 2004). Introduction of undesirable plant species, notably cheatgrass, is likely in the sagebrush/perennial grass types due to the species' ability to out-compete native plant species in disturbed areas and to thrive in arid conditions (Morrow and Stahlman 1984, Piemeisel 1951).

Adverse impacts of minerals decisions on vegetation resources would be partially mitigated by the implementation of Management Common to All Alternatives and the Proposed Plan outlined in Table 2.1. This management would include no surface occupancy (NSO) in riparian vegetation, required revegetation of oil and gas well sites upon project completion, and land management that meets or moves towards meeting Utah's Standards for Rangeland Health (Appendix D).

Under this alternative, there would be 41 wells drilled in the Blanding Sub-basin total for 15 years. This would result in approximately 394 acres of surface disturbance. This disturbance could occur in any of the vegetation types except for riparian.

Under this alternative, there would be 7 wells drilled in the Monument Upwarp total for 15 years. This would result in approximately 69 acres of surface disturbance. This disturbance could occur in any of the vegetation types except for riparian.

Under this alternative, there would be 25 wells drilled in the Paradox Fault and Fold Belt total for 15 years. This would result in approximately 236 acres of surface disturbance. This disturbance could occur in any of the vegetation types except for riparian.

Weed Dispersal Associated with Roads

Under the Proposed Plan and all alternatives, new roads would be created to access oil and gas wells in the three RFD areas. In addition, traffic on existing roads is likely to increase due to construction and operation of new and existing oil and gas facilities in the Monticello FO. The number of acres of roadside vegetation that may be invaded by weeds introduced during road construction and traffic was calculated using data from the literature (Gelbard and Belnap 2003). The minimum number of miles of road required to connect future well pads to existing roads was calculated. This number was then converted to meters and multiplied by 100 m, which is the width of potential weed infestation due to road disturbance. The resulting number of acres of roadside vegetation subject to the introduction and/or spread of noxious weeds and invasive species is provided in Table 4.185.

Table 4.185. Acres of Roadside Vegetation Subject to Weed Invasion

Vegetation Type	Alternative A	Alternatives B and E	Alternative C	Alternative D	Proposed Plan
Conifer/mountain shrub	1,010	0	977	1,014	977
Desert shrub	34,272	29,069	32,768	35,056	32,768
Invasive species and weeds	459	428	463	468	463
Pinyon-juniper woodland	59,451	46,126	55,156	59,682	55,156
Riparian/wetland	2,384	1,898	2,252	2,541	2,252
Sagebrush/perennial grass	24,182	19,465	21,689	24,254	21,689
Total	121,758	96,986	113,305	123,015	113,305

Lands Available for Mineral Material Disposal

Under Alternative A, 584,270 acres of land in the Monticello FO are available for disposal of mineral materials subject to standard terms and conditions, or approximately 33% of the 1,784,724 acres in the Monticello FO. There are currently 821,070 acres (approximately 46% of Monticello FO lands) subject to special conditions under Alternative A. Currently, there are 373,850 acres (approximately 21% of Monticello FO lands) closed to disposal of mineral materials.

Lands Available for Mineral Entry

Under Alternative A, 1,652,743 acres of land in the Monticello FO are open to mineral entry, or approximately 93% of the 1,784,724 acres in the Monticello FO. This area is potentially subject to the impacts described above. There are currently 132,380 acres (approximately 7% of Monticello FO lands) withdrawn from mineral entry. These acres would not be subject to the risks of surface disturbance associated with open pit mining activities.

Geophysical Activity

Under all alternatives and the Proposed Plan, geophysical activity would be permitted in the Monticello FO. Under Alternative A, approximately 886 acres of vegetation would be temporarily impacted by geophysical exploration. Impacts associated with exploration on existing roads would include crushing of individual plants and the potential spread of invasive and weedy plant species along existing roadways in the Monticello FO. There would be short-term, negative impacts associated with removal and/or displacement of native vegetation. Areas disturbed by geophysical activity would be completely reclaimed within 10 years. It is not known exactly where the geophysical activity would take place; therefore, the acreage of disturbance by vegetation type is not available. Site-specific NEPA analysis will take place on a project-by-project basis to quantify the impacts by vegetation type. Table 4.186 presents the predicted acres of surface disturbance associated with geophysical exploration by RFD area.

Table 4.186. Acres of Surface Disturbance Associated with Geophysical Exploration by RFD Area

RFD Area	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Blanding	271	249	271	271	250	266
Monument	120	137	143	149	123	125
Paradox	495	408	489	504	385	489
Total	886	794	904	924	758	880

4.3.17.2.5.2. Alternative B

Under Alternative B, the qualitative impacts of minerals decisions on vegetation resources would be the same as those discussed under Alternative A because the impacts from minerals development would be the same. The major differences in impacts between this alternative and the No Action Alternative would be 1,367,015 acres available for management of oil and gas leasing (2.3% fewer acres than under Alternative A), and 365,170 acres available for mineral material disposal with standard stipulations (38% fewer acres than under Alternative A). Acres available for oil and gas leasing by vegetation type in each of the RFD areas are shown in Tables 4.152–4.154. The acres and location of predicted surface disturbance are similar for each alternative and the Proposed Plan.

Under this alternative, there would be 38 wells drilled in the Blanding Sub-basin total for 15 years. This would result in approximately 364.8 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 3 (7%) fewer wells and 28.8 (7%) fewer acres of disturbance than would occur under Alternative A.

Table 4.187. Alternative B—Acreage of Each Vegetation Type by Oil and Gas Leasing Category in the Blanding Sub-basin RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	519	0	0	43	0	0
Desert shrub	70,846	0	752	13,817	16,843	5,019
Invasive species and weeds	367	0	32	432	4	2
Pinyon-juniper woodland	59,056	71	2,660	159,258	17,518	9,579
Riparian/wetland	2,997	0	0	2,444	4,573	284
Sagebrush/perennial grass	14,142	21	141	35,133	402	96
Total	147,927	92	3,585	211,127	39,340	14,980

Table 4.188. Alternative B—Acreage of Each Vegetation Type by Oil and Gas Leasing Category in the Monument Upwarp RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	4,879	2	0	3,030	56	1,126
Desert shrub	85,051	315	9,617	75,456	5,224	74,623
Invasive species and weeds	94	0	7	671	53	227
Pinyon-juniper woodland	92,198	10,721	9,373	325,073	25,242	282,993

Table 4.188. Alternative B—Acreage of Each Vegetation Type by Oil and Gas Leasing Category in the Monument Upward RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Riparian/wetland	680	27	75	1,727	1,318	2,836
Sagebrush/perennial grass	8,285	579	270	33,259	3,760	27,967
Total	191,187	11,644	19,342	439,216	35,653	389,772

Table 4.189. Alternative B—Acreage of Each Vegetation Type by Oil and Gas Leasing Category in the Paradox Fault and Fold Belt RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	611	73	0	438	11	14
Desert shrub	1,954	24,693	1	6,600	25,955	4,080
Invasive species and weeds	495	16	0	868	125	0
Pinyon-juniper woodland	14,092	24,454	29	86,580	21,365	6,708
Riparian/wetland	96	1,286	7	405	1,686	470
Sagebrush/perennial grass	6,863	4,534	0	30,037	295	71
Total	24,111	55,056	37	124,928	49,437	11,343

Under this alternative, there would be 8 wells drilled in the Monument Upwarp total for 15 years. This would result in approximately 76.8 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 1 (14%) more well and 9.6 (147%) more acres of disturbance than would occur under Alternative A.

Under this alternative, there would be 20 wells drilled in the Paradox Fault and Fold Belt total for 15 years, resulting in approximately 192.0 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 5 (20%) fewer wells and 48 (20%) fewer acres of disturbance than would occur under Alternative A. Across the three RFD areas, there would be 7 (9.6%) fewer wells and 67.2 (9.6%) fewer acres of disturbance under Alternative B than would occur under Alternative A.

Weed Dispersal Associated with Roads

Under Alternative B, there would be fewer acres of all vegetation types subject to invasion by noxious weeds and invasive species than under Alternative A due to a reduction in new roads for oil and gas activity. Alternative B would have fewer negative impacts to vegetation than Alternative A, because there would be fewer acres subject to disturbance and potential weed infestation. Table 4.190 provides the percent difference in acres of roadside vegetation subject to weed infestation between Alternatives A and B by vegetation type.

Table 4.190. Percent Difference in Acres of Roadside Vegetation Subject to Weed Infestation

Vegetation Type	Percent Difference Compared with Alternative A
Conifer and mountain shrub	15% less
Desert shrub	15% less
Invasive species and noxious weeds	7% less
Pinyon-juniper woodland	12% less
Riparian and wetland	10% less
Sagebrush and perennial grassland	20% less
Total	20% less

Lands Available for Mineral Material Disposal

Under Alternative B, 365,168 acres of land in the Monticello FO would be available for disposal of mineral materials subject to standard terms and conditions. That is 219,102 acres (37%) fewer than are currently subject to standard terms and conditions for mineral materials disposal under Alternative A.

There would be 876,736 acres subject to special conditions. That is 55,666 acres (7%) more than are currently subject to special conditions for disposal of mineral materials under Alternative A.

There would be 542,402 acres closed to disposal of mineral materials. That is 168,552 acres (45%) more than would be closed to disposal under Alternative A.

Lands Available for Mineral Entry

Under Alternative B, 1,533,413 acres of land in the Monticello FO would be open to mineral entry. That is 7% fewer acres than would be open under Alternative A.

There would be 251,710 acres recommended to be withdrawn from mineral entry. That is 119,330 acres (90%) more than would be withdrawn from mineral entry under Alternative A.

Geophysical Activity

Under Alternative B, the qualitative impacts of geophysical activity on vegetation resources would be the same as those discussed under Alternative A. There would be approximately 794 acres of surface disturbance associated with geophysical exploration under this alternative. This is approximately 10% fewer acres of disturbance than would be expected under Alternative A, which could result in slightly reduced impacts overall due to the decreased acreage open to exploration.

4.3.17.2.5.3. Alternative C

Under Alternative C, the qualitative impacts of minerals decisions on vegetation resources would be the same as those discussed under Alternative A. The major difference in impacts between this alternative and the No Action Alternative is the reduction in acres available for management of oil and gas leasing and mineral material disposal with standard stipulations. Acres available for oil and gas leasing by vegetation type in each of the RFD areas are provided in Tables 4.156–4.158.

Under both Alternatives A and C, there would be 41 wells drilled in the Blanding Sub-basin total for 15 years. This would result in approximately 394 acres of surface disturbance, which could occur in any of the vegetation types except for riparian.

Under this alternative, there would be 9 wells drilled in the Monument Upwarp total for 15 years. This would result in approximately 86 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 2 (29%) more wells and 19.2 (29%) more acres of disturbance than would occur under Alternative A.

Table 4.191. Alternative C–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Blanding Sub-basin RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	544	0	0	18	0	0
Desert shrub	90,330	6	1,341	7,571	2,227	5,803
Invasive species and weeds	490	0	32	313	0	2
Pinyon-juniper woodland	128,580	72	3,041	103,630	3,132	9,686

Total	252,531	101	4,734	135,946	7,744	15,996

Table 4.192. Alternative C–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Monument Upwarp RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	7,101	43	15	808	0	1,126
Desert shrub	87,707	166	12,831	73,966	21,811	53,806
Invasive species and weeds	94	0	14	671	46	227
Pinyon-juniper woodland	179,233	4,434	35,318	242,232	2,773	281,611
Riparian/wetland	1,711	27	293	1,571	306	2,755

Table 4.192. Alternative C–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Monument Upwarp RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Sagebrush/perennial grass	14,465	134	3,536	27,971	61	27,954
Total	290,311	4,804	52,007	347,219	24,997	367,479

Table 4.193. Alternative C–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Paradox Fault and Fold Belt RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	995	61	13	54	11	14
Desert shrub	12,655	20,392	18,312	4,804	3,040	4,080
Invasive species and weeds	1,148	16	86	245	8	0
Pinyon-juniper woodland	52,674	20,348	21,710	49,591	2,197	6,708
Riparian/wetland	636	1,073	1,112	154	505	470
Sagebrush/perennial grass	11,807	4,233	349	25,200	141	71
Total	79,915	46,123	41,582	80,048	5,902	11,343

Under this alternative, there would be 24 wells drilled in the Paradox Fault and Fold Belt total for 15 years. This would result in approximately 230 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 1 (4%) fewer wells and 9.6 (4%) fewer acres of disturbance than would occur under Alternative A. Across the three RFD areas, there would be 1 (1.4%) more well and 9.6 (1.4%) more acres of disturbance under Alternative C than would occur under Alternative A.

Weed Dispersal Associated with Roads

Under Alternative C, there would be fewer acres of all vegetation types subject to invasion by noxious weeds and invasive species than under Alternative A due to a reduction in new roads for oil and gas activity. Alternative C would have fewer negative impacts to vegetation than Alternative A because there would be fewer acres subject to disturbance and potential weed infestation. Table 4.194 provides the percent difference in acres of roadside vegetation subject to weed infestation between Alternatives A and C by vegetation type.

Table 4.194. Percent Difference in Acres of Roadside Vegetation Subject to Weed Infestation

Vegetation Type	Percent Difference Compared with Alternative A
Conifer and mountain shrub	3% less
Desert shrub	4% less
Invasive species and noxious weeds	1% more
Pinyon-juniper woodland	7% less
Riparian and wetland	6% more
Sagebrush and perennial grassland	10% more
Total	7% less

Lands Available for Mineral Material Disposal

Under Alternative C, 624,734 acres of land in the Monticello FO would be available for disposal of mineral materials subject to standard terms and conditions. That is 40,464 acres (7%) more than are currently subject to standard terms and conditions for mineral materials disposal under Alternative A.

There would be 724,234 acres subject to special conditions. That is 96,836 fewer acres (12%) than are currently subject to special conditions for disposal of mineral materials under Alternative A.

There would be 435,338 acres closed to disposal of mineral materials. That is 61,488 acres (16%) more than currently closed to disposal under Alternative A.

Lands Available for Mineral Entry

Under Alternative C, 1,663,221 acres of land in the Monticello FO would be open to mineral entry. That is 10,478 fewer acres (less than 1%) than are currently open under Alternative A.

There would be 121,912 acres recommended to be withdrawn from mineral entry. That is 10,468 acres (8%) less than are currently withdrawn from mineral entry under Alternative A.

Geophysical Activity

Under Alternative C, the qualitative impacts of geophysical activity on vegetation resources would be the same as those discussed under Alternative A. There would be approximately 904 acres of surface disturbance associated with geophysical exploration under this alternative. This is approximately 2% more acres of disturbance than would be expected under Alternative A, which would result in a slightly greater impacts overall, due to the increased acreage open to exploration.

4.3.17.2.5.4. Alternative D

Under Alternative D, the qualitative impacts of minerals decisions on vegetation resources would be the same as those discussed under Alternative A. The major difference in impacts between this alternative and the No Action Alternative is a reduction in acres available for management of oil and gas leasing and mineral materials disposal with standard stipulations. Acres available for oil and gas leasing by vegetation type in each of the RFD areas are provided in Tables 4.160–4.162.

Under Alternatives A, C, and D, there would be 41 wells drilled in the Blanding Sub-basin total for 15 years. This would result in approximately 393.6 acres of surface disturbance, which could occur in any of the vegetation types except for riparian.

Under Alternatives C and D, there would be 9 wells drilled in the Monument Upwarp total for 15 years. This would result in approximately 86.4 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 2 (29%) more wells and 19.2 (29%) more acres of disturbance than would occur under Alternative A.

Under Alternatives A and D, there would be 25 wells drilled in the Paradox Fault and Fold Belt total for 15 years. This would result in approximately 240.0 acres of surface disturbance. This disturbance could occur in any of the vegetation types except for riparian. Across the three RFD areas, there would be 2 (29%) more wells and 19.2 (29%) more acres of disturbance than under Alternative A, and more wells and disturbance than would occur under any of the other management alternatives and the Proposed Plan.

Table 4.195. Alternative D–Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulations In the Blanding Sub-basin RFD Area

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	0	0	0	0	555	7
Desert shrub	5,721	0	0	1,726	94,363	5,468
Invasive species and weeds	2	0	0	0	604	231
Pinyon-juniper woodland	9,271	0	0	3,614	165,414	69,842
Riparian/wetland	409	0	0	2,158	6,596	1,136
Sagebrush/perennial grass	96	0	0	247	32,585	17,008
Total	15,499	0	0	7,745	300,117	93,692

Table 4.196. Alternative D–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Monument Upwarp RFD

Conifer/mountain shrub	7,597	0	0	459	0	1,037
Desert shrub	145,976	0	0	49,886	1,895	52,530
Invasive species and weeds	606	0	0	220	0	227
Pinyon-juniper woodland	312,464	0	0	153,795	2,550	276,791
Riparian/wetland	3,354	0	0	371	504	2,432

Table 4.196. Alternative D–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Monument Upwarp RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Sagebrush/perennial grass	30,300	0	0	15,990	0	27,830
Total	500,297	0	0	220,721	4,949	360,847

Table 4.197. Alternative D–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Paradox Fault and Fold Belt RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	1,105	24	0	5	0	14
Desert shrub	35,128	0	0	24,315	0	3,840
Invasive species and weeds	1,245	2	0	256	0	0
Pinyon-juniper woodland	90,119	440	0	56,476	0	6,191
Riparian/wetland	1,812	1	0	1,819	0	317
Sagebrush/perennial grass	21,233	2,096	0	18,401	0	71
Total	150,642	2,563	0	101,272	0	10,433

Weed Dispersal Associated with Roads

Under Alternative D, there would be more acres subject to disturbance and potential invasion by noxious weeds and invasive species than under Alternative A due to an increase in new roads for oil and gas activity. Alternative D would have greater negative impacts to vegetation than Alternative A because there would be more acres subject to disturbance and potential weed infestation. Table 4.198 provides the percent difference in acres of roadside vegetation subject to weed infestation between Alternatives A and D by vegetation type.

Table 4.198. Percent Difference in Acres of Roadside Vegetation Subject to Weed Infestation

Vegetation Type	Percent Difference Compared with Alternative A
Conifer and mountain shrub	0%
Desert shrub	2% more
Invasive species and noxious weeds	2% more
Pinyon-juniper woodland	0%
Riparian and wetland	7% more
Sagebrush and perennial grassland	0%
Total	1% more

Lands Available for Mineral Material Disposal

Under Alternative D, 962,283 acres of land in the Monticello FO would be available for disposal of mineral materials subject to standard terms and conditions. That is 378,013 acres (65%) more than are currently subject to standard terms and conditions for mineral materials disposal under Alternative A.

Under this alternative, there would be 420,998 acres subject to special conditions. This is 400,072 fewer acres (49%) than would be subject to special conditions for disposal of mineral materials under Alternative A.

Under this alternative, there would be 401,027 acres closed to disposal of mineral materials. That is 27,177 acres (7%) more than would be closed to disposal under Alternative A.

Lands Available for Mineral Entry

Under Alternative D, 1,738,992 acres of land in the Monticello FO would be open to mineral entry. That is 86,249 acres (5%) more than would be open to mineral entry under Alternative A.

Under Alternative D, it would be recommended that 46,131 acres be withdrawn from mineral entry. That is 86,249 fewer acres (65%) than would be withdrawn under Alternative A.

Geophysical Activity

Under Alternative D, the qualitative impacts of geophysical activity on vegetation resources would be the same as those discussed under Alternative A. There would be approximately 924 acres of surface disturbance associated with geophysical exploration under this alternative. This

is approximately 38 acres (4%) more disturbance than would occur under Alternative A, which would result in a slightly greater impact overall due to the increased acreage open to exploration.

4.3.17.2.5.5. Alternative E

Under Alternative E, the qualitative impacts of minerals decisions on vegetation resources would be the same as those discussed under Alternative A. The major difference in impacts between this alternative and the No Action Alternative would be the reduction in acres available for management of oil and gas leasing and mineral materials disposal due to minerals leasing restrictions within the 582,357 acres of non-WSA lands with wilderness characteristics. These lands would be closed to minerals leasing and mineral materials disposal, closed to off-route OHV use, closed to new road construction to protect non-WSA lands with wilderness characteristics, and surface disturbance impacts would be limited to VRM Class objectives. These restrictions on minerals-related surface disturbance would have long-term, beneficial impacts on vegetation resources within the planning area. Nevertheless, RFD predictions of oil and gas development within the planning area under Alternative E would be approximately 74% of the RFD-predicted level of development under Alternative A (see below). Acres available for oil and gas leasing by vegetation type in each of the RFD areas are provided in Tables 4.164–4.166. The acres and location of predicted surface disturbance is similar for each alternative and the Proposed Plan.

Under this alternative, there would be 36 wells drilled in the Blanding Sub-basin total for 15 years. This would result in approximately 345 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 5 (12%) fewer wells and 48.6 (12%) fewer acres of disturbance than would occur under Alternative A.

Under this alternative, there would be 3 wells drilled in the Monument Upwarp total for 15 years. This would result in approximately 30 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 4 (57%) fewer wells and 37.2 (55%) fewer acres of disturbance than would occur under Alternative A.

Table 4.199. Alternative E–Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulations In the Blanding Sub-basin RFD Area

Vegetation Type	Standard Lease Terms	Controlled Surface use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	519	0	0	43	0	0
Desert shrub	59,650	0	752	13,813	9,744	23,319
Invasive species and weeds	366	0	32	432	1	6
Pinyon-juniper woodland	52,377	71	2,660	159,248	7,097	26,688
Riparian/wetland	2,935	0	0	2,444	3,140	1,780
Sagebrush/perennial grass	13,816	21	141	35,133	312	512
Total	129,663	92	3,585	211,113	20,294	52,305

Table 4.200. Alternative E–Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulation In the Monument Upwarp RFD Area

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	4,652	2	0	1,680	43	2,716
Desert shrub	18,125	302	2,021	31,560	1,272	197,006
Invasive species and weeds	5	0	1	86	9	951
Pinyon-juniper woodland	32,825	914	2,783	135,607	4,923	568,548
Riparian/wetland	327	1	39	787	694	4,814

Table 4.200. Alternative E–Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulation In the Monument Upwarp RFD Area

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Sagebrush/perennial grass	4,428	323	119	14,532	850	53,867
Total	60,362	1,542	4,963	184,252	7,791	827,902

Table 4.201. Alternative E–Acreage of Each Vegetation Type by Oil and Gas Leasing Stipulation In the Paradox Fault and Fold Belt RFD Area

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	611	53	0	425	0	59
Desert shrub	1,787	11,068	0	5,942	12,225	32,261
Invasive species and weeds	495	9	0	868	89	42
Pinyon-juniper woodland	11,570	8,071	13	69,380	11,598	52,625
Riparian/wetland	33	982	2	278	487	2,167
Sagebrush/perennial grass	6,841	3,116	0	29,038	123	2,682
Total	21,337	23,299	15	105,931	24,522	89,836

Under this alternative, there would be 15 wells drilled in the Paradox Fault and Fold Belt total for 15 years. This would result in approximately 143 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is 10 (40%) fewer wells and 97 (40%) fewer acres of disturbance than would occur under Alternative A. Compared to the Alternative A RFD areas, this represents a 26% reduction in expected oil and gas development total for 15 years and the lowest level of disturbance that would occur under any of the management alternatives and the Proposed Plan.

Lands Available for Mineral Materials Disposal

Under this alternative, areas with non-WSA lands with wilderness characteristics would be closed to disposal of mineral materials, which would encompass approximately 1,025,378 acres (58% of the planning area). Under Alternative E, 37% more acreage would be closed to disposal than under Alternative A.

Lands Available for Mineral Entry

Under Alternative E, 951,053 acres of land in the Monticello FO would be open to mineral entry. That is 42% fewer acres than are currently open under Alternative A. There would be 834,070 acres recommended to be withdrawn from mineral entry, which is 701,690 acres (530%) more than would be withdrawn from mineral entry under Alternative A. Non-WSA lands with wilderness characteristics (582,360 of the 834,070 acres noted above) would be recommended for withdrawal from mineral entry.

Geophysical Activity

Non-WSA lands with wilderness characteristics would be closed for geophysical exploration.

Under Alternative E, the qualitative impacts of geophysical activity on vegetation resources would be the same as those discussed under Alternative A. There would be approximately 591 acres of surface disturbance associated with geophysical exploration under this alternative. That is approximately 33% fewer acres of disturbance than would be expected under Alternative A, which could result in reduced impacts to vegetation resources from the decreased acreage open to this form of minerals exploration.

4.3.17.2.5.6. Proposed Plan

Under the Proposed Plan, the qualitative impacts of minerals decisions on vegetation resources would be the same as those discussed under Alternative A. The major difference in impacts between the Proposed Plan and Alternative A is the reduction in acres available for management of oil and gas leasing and mineral material disposal with standard stipulations. Acres available for oil and gas leasing by vegetation type in each of the RFD areas are provided in Tables 4.156–4.158.

Under the Proposed Plan, there would be 42 wells drilled in the Blanding Sub-basin total for 15 years. This would result in approximately 383 acres of surface disturbance, which could occur in any of the vegetation types except for riparian.

Under the Proposed Plan, there would be 9 wells drilled in the Monument Upwarp total for 15 years. This would result in approximately 72 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is the same number of wells as under Alternative A but 3 (4%) more acres of disturbance than would occur under Alternative A.

Table 4.202. Proposed Plan–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Blanding Sub-basin RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	500	0	0	61	0	0
Desert shrub	78,344	5	511	7,490	15,909	5,019
Invasive species and weeds	488	0	32	311	4	2
Pinyon-juniper woodland	112,428	72	2,606	107,612	15,844	9,579
Riparian/wetland	3,816	0	0	1,850	4,349	284
Sagebrush/perennial grass	26,540	21	141	22,735	402	96
Total	222,116	98	3,290	140,059	36,508	14,980

Table 4.203. Proposed Plan–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Monument Upwarp RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	1,898	43	2	5,408	609	1,133
Desert shrub	72,562	1,072	11,208	66,164	1,998	97,282
Invasive species and weeds	93	46	7	617	0	290
Pinyon-juniper woodland	141,638	5,162	20,511	231,200	16,055	331,034
Riparian/wetland	1,089	68	182	1,039	1,167	3,118

Table 4.203. Proposed Plan–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Monument Upwarp RFD

Vegetation Type	Standard Lease Terms	Controlled Surface Use	Controlled Surface Use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Sagebrush/perennial grass	11,489	163	927	28,437	1,247	31,857
Total	228,769	6,554	32,837	332,865	21,076	464,714

Table 4.204. Proposed Plan–Acreage of Each Vegetation Type by Oil and Gas Leasing Category In the Paradox Fault and Fold Belt RFD

Vegetation Type	Standard Lease terms	Controlled Surface Use	Controlled Surface use and Timing Limitations	Timing Limitations	No Surface Occupancy	Closed
Conifer/mountain shrub	260	61	13	789	11	14
Desert shrub	3,807	20,392	26,502	5,462	3,040	4,080
Invasive species and weeds	424	16	117	939	8	0
Pinyon-juniper woodland	26,101	20,348	24,331	73,541	2,197	6,708
Riparian/wetland	364	1,073	1,378	160	505	470
Sagebrush/perennial grass	8,841	4,233	490	28,025	141	71
Total	39,797	46,123	52,831	108,916	5,902	11,343

Under the Proposed Plan, there would be 25 wells drilled in the Paradox Fault and Fold Belt total for 15 years. This would result in approximately 233 acres of surface disturbance, which could occur in any of the vegetation types except for riparian. This is the same number of wells as under Alternative A but 3 (1%) fewer acres of disturbance than would occur under Alternative A. Across the three RFD areas, the number of wells would be the same between the Proposed Plan and Alternative A but there would be 11 (2%) fewer acres of disturbance under the Proposed Plan than under Alternative A.

Weed Dispersal Associated with Roads

Under the Proposed Plan, there would be fewer acres of all vegetation types subject to invasion by noxious weeds and invasive species than under Alternative A due to a reduction in new roads for oil and gas activity. The Proposed Plan would have fewer negative impacts to vegetation than Alternative A because there would be fewer acres subject to disturbance and potential weed infestation. Table 4.205 provides the percent difference in acres of roadside vegetation subject to weed infestation between Alternative A and the Proposed Plan by vegetation type.

Table 4.205. Percent Difference in Acres of Roadside Vegetation Subject to Weed Infestation

Vegetation Type	Percent Difference Compared with Alternative A
Conifer and mountain shrub	3% less
Desert shrub	4% less
Invasive species and noxious weeds	1% more
Pinyon-juniper woodland	7% less
Riparian and wetland	6% more
Sagebrush and perennial grassland	10% more
Total	7% less

Lands Available for Mineral Material Disposal

Lands available for mineral material disposal would be the same under the Proposed Plan as under Alternative C.

Lands Available for Mineral Entry

Under the Proposed Plan, 1,734,458 acres of land in the Monticello FO would be open to mineral entry. That is 81,715 more acres (5%) than are currently open under Alternative A.

There would be 50,665 acres recommended to be withdrawn from mineral entry. That is 81,715 acres (62%) less than are currently withdrawn from mineral entry under Alternative A.

Geophysical Activity

Under the Proposed Plan, the qualitative impacts of geophysical activity on vegetation resources would be the same as those discussed under Alternative A. There would be approximately 904 acres of surface disturbance associated with geophysical exploration under the Proposed Plan. This is approximately 2% more acres of disturbance than would be expected under Alternative

A, which would result in a slightly greater impacts overall, due to the increased acreage open to exploration.

4.3.17.2.6. IMPACTS OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS DECISIONS ON VEGETATION

4.3.17.2.6.1. Alternatives A, B, C, and D

Under Alternatives A, B, C, and D, the Monticello FO would not manage the planning area for the preservation of non-WSA lands with wilderness characteristics.

4.3.17.2.6.2. Alternative E

Under Alternative E, approximately 582,357 acres of non-WSA lands with wilderness characteristics would be managed to preserve their wilderness values. The impacts on vegetation resources would be beneficial in the long-term because surface disturbance related impacts to vegetation communities would be limited. There would be short-term and long-term indirect impacts to vegetation resources from preservation of non-WSA lands with wilderness characteristics because of prohibitions on vegetation treatments, fire treatments, and woodland harvesting that would maintain the risks of wildland fire and the spread of invasive species.

4.3.17.2.6.3. Proposed Plan

Under the Proposed Plan, 88,871 acres would be managed for their wilderness characteristics. These areas would include Dark Canyon (11,540 acres), Grand Gulch (13,657 acres), Mancos Mesa (30,068 acres), and Nokai Dome East (18,618 acres) and Nokai Dome West (14,988 acres). Proposed decisions to protect wilderness values would include: 1) managing the areas under VRM II objectives; 2) closing most units to oil and gas leasing and establishing the Dark Canyon unit as NSO; 3) limiting OHV use to designated roads/trails; 4) establishing units as ROW avoidance areas; 5) maintaining existing improvements within units; 6) unavailable for private and commercial wood harvest, except for onsite collection for campfires; 7) available for non-ground disturbing treatments; 8) not proposed for mineral withdrawal; 9) closed to mineral materials disposal; and 10) unavailable for coal and geothermal leasing. These proposed decisions would have long-term beneficial impacts on vegetation by reducing the potential for surface disturbances and alteration of habitat. However, because of prohibitions on vegetation treatments, fire treatments, and woodland harvesting the risk of wildland fire and the spread of invasive species would be maintained in these areas.

4.3.17.2.7. IMPACTS OF PALEONTOLOGICAL RESOURCES DECISIONS ON VEGETATION

4.3.17.2.7.1. Alternative A

Under Alternative A, paleontology decisions that could impact vegetation resources include increased visitor use associated with fossil collection, which could have short-term adverse impacts on vegetation due to trampling. It is BLM policy that only non-mechanized tools are allowed for use by fossil hunters and that any surface disturbances caused by fossil collecting activities have negligible impacts on planning area resources. These requirements would minimize the adverse impacts on vegetation caused by paleontology-related surface disturbances.

4.3.17.2.7.2. Alternatives B, C, D, and E and the Proposed Plan

Because the BLM's fossil collecting policy and resource protection stipulations would be applicable to the Proposed Plan and all of the proposed alternatives, the impacts of paleontology management decisions on vegetation resources under the Proposed Plan and action alternatives would be the same as those discussed under Alternative A.

4.3.17.2.8. IMPACTS OF RECREATION DECISIONS ON VEGETATION

Under the Proposed Plan and all alternatives, all developed recreation sites would be recommended for withdrawal from mineral entry, closed to disposal of mineral materials, and open for oil and gas leasing subject to NSO. In addition, grazing would be unavailable in developed sites and collection of woodland products would not be allowed. These requirements would decrease the intensity of long-term impacts on vegetation in the project area by decreasing the amount of surface disturbance in the SRMAs compared to other areas in the Monticello FO. There would, however, still be surface disturbance associated with trampling and crushing of vegetation by humans, horses, and vehicles. In addition, there is potential for introduction of weed seeds by visitors bringing clothing and equipment to the area from around the country. This disturbance could lead to the introduction of invasive plant species as discussed in previous sections. The adverse impacts of recreation decisions would be partially mitigated by the required reclamation of disturbed areas to meet Utah's Rangeland Health Standards (Appendix D).

4.3.17.2.8.1. Alternative A

Under Alternative A the impacts of recreation management decisions on vegetation resources would include the following impacts in addition to the qualitative impacts discussed at the beginning of this section.

Under Alternative A, the Cedar Mesa SRMA (385,000 acres) would require pets to be leashed, camping only at campsites, and a maximum of 196 overnight visitors per day. This would reduce adverse impacts from surface disturbance associated with visitors. The White Canyon would not be identified as an SRMA under Alternative A and would have no limit on group size, camping location, or vehicle use. This could result in short- and long-term, adverse impacts to vegetation from surface disturbance. Table 4.206 lists the acreage of each vegetation type included in the Cedar Mesa SRMA and White Canyon SRMA.

Table 4.206. Acreage of Each Vegetation Type in the Cedar Mesa and White Canyon SRMAs Under the Proposed Plan and All Alternatives

Vegetation Type	Cedar Mesa SRMA ¹	White Canyon SRMA ²
Conifer/mountain shrub	213	0
Desert shrub	105,904	289
Invasive species and weeds	111	1
Pinyon-juniper woodland	230,453	2,521
Riparian/wetland	4,061	17

Table 4.206. Acreage of Each Vegetation Type in the Cedar Mesa and White Canyon SRMAs Under the Proposed Plan and All Alternatives

Vegetation Type	Cedar Mesa SRMA ¹	White Canyon SRMA ²
Sagebrush/perennial grassland	32,482	0
Total	373,224	2,828

¹Cedar Mesa SRMA would be 385,000 total acres under Alternative A and 407,098 acres under the Proposed Plan.

²White Canyon would not be identified as an SRMA under Alternative A. Under all other alternatives and the Proposed Plan White Canyon SRMA would be 2,828 acres.

Under Alternative A, the Dark Canyon SRMA (30,820 acres) and the Indian Creek SRMA (89,271 acres) would be managed as part of a larger Canyon Basins SRMA (214,390 acres). There would be no limit on group size or vehicle use, but camping would be prohibited within the Indian Creek riparian corridor and limited to designated sites outside the corridor. These restrictions would lessen the adverse impacts of visitor traffic on native vegetation as explained in the above sections. However, this management would result in short- and long-term, adverse impacts to vegetation from surface disturbance. The size of the Dark Canyon and Indian Creek SRMAs would not differ under Alternatives B, C, D, E, and the Proposed Plan. In Tables 4.168 and 4.169, the acreage of each vegetation type included in each SRMA is listed for each alternative and the Proposed Plan.

Under Alternative A, the San Juan River SRMA (15,100 acres) would allow 40,000 user days per year and vehicle camping would not be restricted. These stipulations allow for surface disturbance, which could have long-term, adverse impacts on vegetation in the SRMA as discussed in previous sections. In Table 4.207, the total acreage of each type of vegetation for the San Juan River SRMA is listed for each alternative and the Proposed Plan.

Table 4.207. Acreage of Each Vegetation Type in the Dark Canyon SRMA for the Proposed Plan and All Alternatives

Vegetation Type	Alternative A (Canyon Basins SRMA)	Alternatives B and E	Alternative C and Proposed Plan	Alternative D

Total	10,378	9,505	9,161	5,897

4.3.17.2.8.2. Alternative B

Under Alternative B, the impacts of recreation management decisions on vegetation resources would include following impacts in addition to the qualitative impacts discussed above.

Under Alternative B, the San Juan River SRMA would include 12.5% less of the desert shrub vegetation type, 0.4% less pinyon-juniper woodland, and 15.6% less riparian/wetland vegetation than under Alternative A. There would be 30,000 user days permitted per year, which is 25% fewer visitors allowed per year than under Alternative A. Vehicle camping would be restricted to designated areas. These stipulations would allow for less surface disturbance than Alternative A, but there would still be long-term, adverse impacts on vegetation in the SRMA, as discussed in previous sections.

The Cedar Mesa Cultural SRMA would be available for livestock use and vegetation treatments, pets would not be allowed in canyons requiring permits, hiking and overnight camping permits

would be limited to 25 visitors per day, and the area would be managed as VRM III and IV. These actions would result in a decreased level of surface disturbance compared with Alternative A, depending on the level of disturbance resulting from livestock use and vegetation treatments. Under Alternative B, the Dark Canyon SRMA would limit group sizes to 10 and 12 people (private and commercial, respectively), would allow 15 private visitors per day, camping would be allowed in designated areas only, and collection of woodland products, including deadwood for campfires, would be prohibited. Visitor use would result in short- and long-term, adverse impacts on vegetation due to surface disturbance, but to a lesser extent than under Alternative A.

Dispersed camping would not be allowed in the Indian Creek riparian corridor and would be limited to designated sites elsewhere. This would result in short- and long-term, adverse impacts on vegetation from surface disturbance associated with visitors, but to a lesser extent than under Alternative A because of limited visitor and camping permits and other restrictions.

The White Canyon SRMA would limit use through a backcountry permit system. This would result in short- and long-term, adverse impacts on vegetation due to surface disturbance, but to a lesser degree than under Alternative A due to resource protection measures.

4.3.17.2.8.3. Alternative C and Proposed Plan

Under Alternative C and the Proposed Plan, the impacts of recreation management decisions on vegetation resources would include the following impacts in addition to the qualitative impacts discussed above.

Under Alternative C and the Proposed Plan, the San Juan River SRMA (see Table 4.209) would include 17.5% less of the desert shrub vegetation type, 3.8% less pinyon-juniper woodland, and 16.4% less riparian/wetland vegetation than under Alternative A. There would be 40,000 user days per year permitted, which is the same level of visitation allowed under Alternative A. Vehicle camping would be restricted to designated areas. These stipulations would allow for less surface disturbance than Alternative A, but there would still be long-term, adverse impacts on vegetation in the SRMA as discussed in previous sections.

Under Alternative C, the Cedar Mesa SRMA would be managed the same as under Alternative B with the following exceptions: commercial and private use of woodland products would be allowed and campfires would only be allowed on mesa tops. This would result in an increased level of surface disturbance compared with Alternatives A and B, depending on the level of disturbance resulting from livestock use and vegetation treatments.

Under the Proposed Plan the Cedar Mesa SRMA would be 407,098 acres and include two management zones (Comb Ridge, at 30,752 acres, and McLoyd-Moonhouse at 1,607 acres). Management prescriptions for this area under the Proposed Plan would be similar to Alternatives A and B with similar impacts.

Under Alternative C and the Proposed Plan, the Dark Canyon SRMA would be managed the same as Alternative B, except that group size would be limited to 18 people and 20 private visitors per day, which is 25% more than would be permitted under Alternative B. Camping would be allowed in designated areas only if and where necessary, and leashed pets would be allowed. This would result in reduced short- and long-term, adverse impacts on vegetation due to surface disturbance compared to Alternative A, but greater impacts than under Alternative B.

Under Alternative C and the Proposed Plan, in the Indian Creek SRMA, dispersed camping would be allowed in the Indian Creek Corridor and in designated dispersed camping zones (see Summary Table of Alternatives). Because of these camping restrictions, this alternative would have fewer short- and long-term, adverse impacts on vegetation due to surface disturbance associated with visitors than under Alternative A.

Under Alternative C and the Proposed Plan, the impacts on vegetation in the White Canyon SRMA would be the same as under Alternative B.

The Proposed Plan would differ from Alternative C in that it would include two additional SRMAs—Tank Bench (2,646 acres) and Beef Basin (20,302 acres). Providing focused recreation management in these areas would generally reduce adverse impacts to vegetation in these areas.

4.3.17.2.8.4. Alternative D

Under Alternative D, the impacts of recreation management decisions on vegetation resources would include the following impacts in addition to the qualitative impacts discussed above.

Under Alternative D, the San Juan River SRMA would include 55.8% less of the desert shrub vegetation type, 37.0% less pinyon-juniper woodland, and 34.6% less riparian/wetland vegetation than under Alternative A. There would be 45,000 user days per year permitted, which is an increase of 5,000 user days from Alternative A. Vehicle camping would not be restricted within the SRMA except for the bench above Sand Island Recreation Area, which would be closed to camping, and camping would be closed within one-half mile of designated campsites area wide. These stipulations would allow for a slightly reduced amount of surface disturbance as would occur under Alternative A, including long-term, adverse impacts on vegetation in the SRMA as discussed in previous sections.

Under Alternative D, the Cedar Mesa Cultural SRMA would be managed the same as under Alternative C with the following exception: a total of 216 overnight visitors per day would be permitted, which is 20 (10%) more overnight visitors than under Alternative A. This could result in an increased level of surface disturbance compared with Alternatives A, B, and C, depending on the level of disturbance resulting from livestock use and vegetation treatments.

Under Alternative D, the Dark Canyon SRMA would have no limit on the number of private visitors per day and dispersed camping would be allowed in some areas. This would result in short- and long-term, adverse impacts on vegetation due to surface disturbance, but to a lesser extent than under Alternative A.

Under Alternative D, management of the Indian Creek SRMA would be the same as under Alternative C. The White Canyon SRMA would be managed the same as under Alternative C, except that campfires would be allowed and there would be no permit system. There would be fewer short- and long-term, adverse impacts on vegetation due to surface disturbance than under Alternative A.

4.3.17.2.8.5. Alternative E

Under Alternative E, the impacts of recreation management decisions on native vegetation would include the following impacts in addition to those discussed under Alternative B.

Non-WSA lands with wilderness characteristics within proposed SRMAs would be closed to mineral leasing, closed to new road construction, managed under VRM I objectives, closed to woodland harvesting, closed to OHV use, closed to disposal of mineral materials, and proposed for withdrawal from mineral entry. Lands without wilderness characteristics would be managed as VRM III and IV. These stipulations would result in less surface disturbance than under the other four alternatives and the Proposed Plan, but there would still be potential for long-term, adverse impacts on native vegetation within the SRMAs as discussed in previous sections.

In the Cedar Mesa SRMA, there would be special conditions on livestock use on non-WSA lands with wilderness characteristics. In addition, no new vegetation treatments or wildlife habitat improvements would be allowed in non-WSA lands with wilderness characteristics. Finally, non-WSA lands with wilderness characteristics would be managed as VRM Class I. These additional protections would result in less surface disturbance in this SRMA compared with the other four alternatives and the Proposed Plan.

Vegetation resources within all of the proposed SRMAs would be impacted by the above mentioned stipulations to protect non-WSA lands with wilderness characteristics. The non-WSA lands with wilderness characteristics affected within each SRMA would be: San Juan SRMA (4,124 acres or 40% of the SRMA); Cedar Mesa SRMA (109,700 acres or 29% of the SRMA); Dark Canyon (2,522 acres or 8% of the SRMA); Indian Creek SRMA (47,393 acres or 53% of the SRMA); and White Canyon SRMA (2,092 acres or 74% of the SRMA).

Overall, Alternative E would have fewer adverse impacts on native vegetation in SRMAs than Alternative A, the other action alternatives, and the Proposed Plan because of increased protections to limit surface disturbances in non-WSA lands with wilderness characteristics.

4.3.17.2.9. IMPACTS OF RIPARIAN DECISIONS ON VEGETATION

4.3.17.2.9.1. Alternatives A and D

Under Alternatives A and D, riparian areas would be managed as NSO for oil and gas leasing. They would, however, be open to mineral entry and disposal of mineral materials, but not in active floodplains or within 100 m of riparian areas. Woodland product collection would be prohibited in riparian communities, except for ceremonial use by Native Americans. In addition, riparian areas would be grazed according to the Guidelines for Grazing Management to achieve the Standards for Rangeland Health, which require proper riparian functioning condition (Appendix D). The BLM would avoid degradation of habitats that could result in the loss of riparian vegetation. The reduction in surface disturbance associated with these restrictions would help decrease the establishment of noxious weeds and invasive plant species in riparian areas in the Monticello FO. Because livestock grazing would be allowed, there may be indirect, potentially adverse impacts from surface disturbance of riparian soils and vegetation associated with cattle hooves and improper grazing practices, in which case livestock grazing practices would be modified to allow the riparian system to meet and/or move towards meeting Proper Function Conditions (PFC) (Dobson 1973, Kauffman et al. 1983). Reduced surface disturbance in riparian vegetation allows the establishment of native vegetation, which facilitates proper riparian functioning. Vegetation treatments, including the use of mechanized or motorized equipment, would be allowed in riparian areas. These treatments would have both beneficial and adverse impacts on vegetation in riparian areas. Beneficial impacts would include reduction

of weed populations and the restoration of diverse native vegetation. Adverse impacts would include crushing and inadvertent removal of native vegetation during the treatment process.

4.3.17.2.9.2. Alternatives B and C and the Proposed Plan

Under Alternatives B and C and the Proposed Plan the impacts of riparian management decisions on vegetation resources would include the following impacts in addition to those discussed in Alternative A. OHV routes in selected riparian areas would be closed in Functioning At Risk riparian areas if site-specific analysis indicates that OHV use is contributing to riparian degradation. Some riparian areas would be unavailable for livestock grazing, while others would be subject to seasonal restrictions and forage utilization limits if they are found to be Functioning At Risk. These restrictions would reduce the number of acres of native vegetation subject to potentially adverse impacts from surface disturbance in sensitive riparian areas. The Proposed Plan and these alternatives would be more beneficial to vegetation resources when compared to Alternative A.

4.3.17.2.9.3. Alternative E

Under Alternative E, the impacts of riparian management decisions on vegetation resources would include the following impacts in addition to those discussed under Alternatives B and C and the Proposed Plan. Non-WSA lands with wilderness characteristics would be managed as closed to mineral leasing, closed to OHV use, proposed for withdrawal from mineral entry, ROW exclusion areas, closed to private and commercial woodland harvest, and managed as VRM I. These restrictions would reduce the number of acres of native vegetation subject to potentially adverse impacts from surface disturbance in sensitive riparian areas. Alternative E would be more beneficial to vegetation resources when compared to any of the management alternatives and the Proposed Plan.

4.3.17.2.10. IMPACTS OF SOILS AND WATERSHED DECISIONS ON VEGETATION

4.3.17.2.10.1. Alternative A

Under Alternative A, soils and watershed decisions would comply with maintenance of riparian preferred future condition and Guidelines for Grazing Management to achieve the Standards for Rangeland Health. In addition, activities in the Monticello FO would be managed to minimize and mitigate damage to soils, and activities located in areas with sensitive soils (i.e., saline, gypsiferous, or highly erodible) would be subject to site-specific NEPA (see Table 4.126 and 4.127 in Section 4.3.13, Soils and Water Resources). These restrictions would decrease the number of acres in the Monticello FO subject to adverse impacts on vegetation resources associated with surface-disturbing activities. There would not be any slope restrictions on allowable disturbance under this alternative.

4.3.17.2.10.2. Alternatives B and E

Under Alternatives B and E, the impacts of soils and watershed management decisions on vegetation resources would include the following in addition to impacts discussed under Alternative A. Surface-disturbing activities would not be permitted on slopes greater than 40%. This would exclude 87,456 acres (approximately 5%) of land in the Monticello FO from potential development, which would eliminate adverse impacts from surface disturbance on

vegetation growing on slopes greater than 40%. As a result, actions associated with this alternative would have fewer adverse impacts on vegetation resources than Alternative A. If surface-disturbing activities cannot be avoided on slopes between 21% and 40%, a plan including an erosion control strategy and a BLM-approved survey and design would be required. The acres of each vegetation type located in areas where the slopes are greater than 40% or 21% to 40% are provided in Table 4.210.

Table 4.210. Acres of Each Vegetation Type by Slope Steepness Category

Vegetation Type	Acres of slopes >40%	Acres of slopes 21%–40%
Conifer/mountain shrub	1,323	2,662
Desert shrub	6,391	27,473
Invasive species and weeds	43	213
Pinyon-juniper woodland	77,332	180,954
Riparian/wetland	683	1,461
Sagebrush/perennial grassland	1,684	5,533
Total	87,456	218,296

4.3.17.2.10.3. Alternative C and the Proposed Plan

Under Alternative C and the Proposed Plan, the impacts of soils and watershed management decisions on vegetation resources would include the following impacts in addition to those discussed under Alternative A. Surface-disturbing activities would not be permitted on slopes greater than 40% unless it is determined that it would cause undue or unnecessary degradation to pursue other placement alternatives. Therefore, surface disturbance allowed under this alternative could cause direct and indirect adverse impacts on native vegetation on up to 87,456 acres of steep slopes in the Monticello FO. If surface-disturbing activities cannot be avoided on slopes between 21% and 40%, a plan including an erosion control strategy and a BLM-approved survey and design would be required. Therefore, the actions associated with this alternative would have fewer adverse impacts on vegetation resources than Alternatives A and D, but greater adverse impacts than Alternative B.

4.3.17.2.10.4. Alternative D

Under Alternative D, the impacts of soils and watershed management decisions on vegetation resources would require a plan including an erosion control strategy and a BLM-approved survey and design for development of land with slopes greater than 40%. The required erosion and design plan would help mitigate the adverse impacts of surface disturbance on vegetation resources located in and downslope of steep development areas. Therefore, this alternative would have fewer adverse impacts on vegetation resources than Alternative A, but greater adverse impacts than Alternatives B and C.

4.3.17.2.11. IMPACTS OF SPECIAL DESIGNATIONS DECISIONS ON VEGETATION

Under the Proposed Plan and all alternatives, Wilderness Study Areas (WSAs) would be managed according to the Interim Management Policy and Guidelines for Lands Under Wilderness Review. All WSAs would be managed under VRM Class I objectives, which would indirectly minimize the adverse impacts of surface-disturbing activities on vegetation resources by preserving high scenic quality and prohibiting surface disturbances and structures that would degrade VRM I scenic quality (see Section 4.3.18, Visual Resources).

4.3.17.2.11.1. Alternative AAlkali Ridge (39,202 acres)

Under Alternative A, this ACEC would be open for mineral leasing with special conditions, open for geophysical work, available for mineral materials disposal, and open to mineral entry. It would also be available for woodland product collection, surface-disturbing land treatments, range and wildlife habitat improvements, livestock grazing, and OHV use on existing roads and trails. The allowance of these surface-disturbing activities in the ACEC would have both beneficial and adverse impacts on vegetation resources. Land and vegetation treatments would have adverse impacts on vegetation in the short-term due to trampling or removal of individual plants. In the long-term, however, these treatments would help to reestablish native vegetation communities in the ACEC. As discussed in Section 4.3.17.1, Impacts Common to All Alternatives and the Proposed Plan, other surface-disturbing activities allowed in the ACEC would have adverse impacts on vegetation resources. The acres of each vegetation type in Alkali Ridge by alternative and the Proposed Plan are presented in Table 4.211.

Table 4.211. Acreage of Each Vegetation Type in Alkali Ridge by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	1	1	1	N/A
Desert shrub	864	864	864	N/A
Invasive species and weeds	24	24	24	N/A
Pinyon-juniper woodland	31,766	31,760	31,760	N/A
Riparian/wetland	357	357	357	N/A
Sagebrush/perennial grass	5,153	5,153	5,153	N/A
Total	38,165	38,159	38,159	N/A

Bridger Jack Mesa (6,260 acres)

Bridger Jack Mesa ACEC, which is managed for near relict vegetation value, would be closed to mineral leasing, mineral disposal, livestock grazing, OHV use, woodland product collection, and land and vegetation treatments. However, the ACEC would be available for geophysical work and open to locatable mineral entry. The restricted surface-disturbing activities listed above would help to mitigate adverse impacts from authorized surface disturbance. The acres of each

vegetation type in Bridger Jack Mesa by alternative and the Proposed Plan are presented in Table 4.212.

Table 4.212. Acreage of Each Vegetation Type in Bridger Jack Mesa by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	134	133	N/A	N/A
Desert shrub	9	8	N/A	N/A
Invasive species and weeds	0	0	N/A	N/A
Pinyon-juniper woodland	5,969	5,934	N/A	N/A
Riparian/wetland	3	3	N/A	N/A
Sagebrush/perennial grass	147	71	N/A	N/A
Total	6,262¹	6,149	N/A	N/A

¹ Acres of each vegetation type were determined using the Southwest ReGAP terrestrial ecological classification system (USGS 2004). Because vegetation types may overlap or be overestimated in the SWReGAP coverages, total acres of vegetation may exceed the total acres of the area being analyzed.

Butler Wash North (17,464 acres)

This ACEC would be managed with similar restrictions to Bridger Jack Mesa. However, since Butler Wash North is within a WSA surface-disturbing vegetation treatments, otherwise allowed, would be prohibited. The acres of each vegetation type in Butler Wash North by alternative and the Proposed Plan are presented in Table 4.213.

Table 4.213. Acreage of Each Vegetation Type in Butler Wash North by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	46	46	N/A	N/A
Desert shrub	61	61	N/A	N/A
Invasive species and weeds	0	0	N/A	N/A
Pinyon-juniper woodland	16,602	16,506	N/A	N/A
Riparian/wetland	30	28	N/A	N/A
Sagebrush/perennial grass	725	725	N/A	N/A
Total	17,464¹	17,366	N/A	N/A

¹ Acres of each vegetation type were determined using the Southwest ReGAP terrestrial ecological classification system (USGS 2004). Because vegetation types may overlap or be overestimated in the SWReGAP coverages, total acres of vegetation may exceed the total acres of the area being analyzed.

Cedar Mesa (295,337 acres)

This ACEC would be managed with the same restrictions as Alkali Ridge; therefore, impacts would be the same. The acres of each vegetation type in Cedar Mesa by alternative and the Proposed Plan are presented in Table 4.214.

Table 4.214. Acreage of Each Vegetation Type in Cedar Mesa by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	211	212	N/A	N/A
Desert shrub	79,672	55,874	N/A	N/A
Invasive species and weeds	95	109	N/A	N/A
Pinyon-juniper woodland	183,115	212,775	N/A	N/A
Riparian/wetland	3,615	3,588	N/A	N/A
Sagebrush/perennial grass	26,949	31,679	N/A	N/A
Total	293,657	304,237	N/A	N/A

Dark Canyon (61,660 acres)

This ACEC would be managed with similar restrictions to Bridger Jack Mesa except that the area would be subject to conditional fire suppression, with motorized suppression methods used only if necessary to protect life or property. Therefore, there would be a minimal difference in surface disturbance impacts between Dark Canyon and Bridger Jack Mesa ACEC. The acres of each vegetation type in Dark Canyon by alternative and the Proposed Plan are presented in Table 4.215.

Table 4.215. Acreage of Each Vegetation Type in Dark Canyon by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	543	543	N/A	N/A
Desert shrub	1,892	1,892	N/A	N/A
Invasive species and weeds	9	9	N/A	N/A
Pinyon-juniper woodland	56,966	56,966	N/A	N/A
Riparian/wetland	354	354	N/A	N/A
Sagebrush/perennial grass	1,896	1,896	N/A	N/A
Total	61,660¹	61,660¹	N/A	N/A

¹ Acres of each vegetation type were determined using the Southwest ReGAP terrestrial ecological classification system (USGS 2004). Because vegetation types may overlap or be overestimated in the SWReGAP coverages, total acres of vegetation may exceed the total acres of the area being analyzed.

Hovenweep (1,796 acres)

Hovenweep ACEC would be open for mineral leasing (NSO in the visual emphasis zone, special conditions elsewhere), geophysical work, mineral entry, livestock grazing, OHV use on roads and trails, and vegetation treatments in most areas. It would be closed to mineral materials disposal and vegetation treatments in the 880 acre visual protective zone. The surface-disturbing activities allowed in this ACEC would have adverse impacts on vegetation resources as discussed in Section 4.3.17.1, Impacts Common to All Alternatives and the Proposed Plan. Restrictions on mineral materials disposal and vegetation treatments would have beneficial impacts on vegetation resources in this ACEC, and would help mitigate adverse impacts from authorized surface-disturbing activities. The acres of each vegetation type in Hovenweep by alternative and the Proposed Plan are presented in Table 4.216.

Table 4.216. Acreage of Each Vegetation Type in Hovenweep by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	0	0	0	N/A
Desert shrub	305	392	392	N/A
Invasive species and weeds	2	2	2	N/A
Pinyon-juniper woodland	486	813	813	N/A
Riparian/wetland	4	4	4	N/A
Sagebrush/perennial grass	998	1,198	1,198	N/A
Total	1,795	2,409	2,409	N/A

Indian Creek (8,510 acres)

This ACEC would be managed with the same restrictions as Bridger Jack Mesa except that livestock use would be allowed and mineral leasing would be subject to NSO restrictions. Therefore, surface disturbance impacts on vegetation resources would be greater than in the Bridger Jack Mesa ACEC. The acres of each vegetation type in Indian Creek by alternative and the Proposed Plan are presented in Table 4.217.

Table 4.217. Acreage of Each Vegetation Type in Indian Creek by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	0	0	0	N/A
Desert shrub	4,710	4,710	2,289	N/A
Invasive species and weeds	0	0	0	N/A
Pinyon-juniper woodland	3,222	3,222	1,317	N/A
Riparian/wetland	577	577	298	N/A

Total	649	649	649	N/A

Shay Canyon (3,561 acres)

This ACEC would be managed with the same restrictions as Alkali Ridge with one exception: woodland product collection would not be allowed. This would reduce the adverse impacts of permitting surface-disturbing activities in the ACEC. The acres of each vegetation type in Shay Canyon by alternative and the Proposed Plan are presented in Table 4.220.

Table 4.220. Acreage of Each Vegetation Type in Shay Canyon by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	11	0	0	N/A
Desert shrub	1	0	0	N/A
Invasive species and weeds	0	0	0	N/A
Pinyon-juniper woodland	3,057	98	98	N/A
Riparian/wetland	247	20	20	N/A
Sagebrush/perennial grass	245	2	2	N/A
Total	3,561	120	120	N/A

San Juan River (0 acres)

Under Alternative A, this area is managed as an SRMA. The acres of each vegetation type in San Juan River by alternative and the Proposed Plan are presented in Table 4.221.

Table 4.221. Acreage of Each Vegetation Type in San Juan River by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	N/A	0	0	N/A
Desert shrub	N/A	1,650	971	N/A
Invasive species and weeds	N/A	0	0	N/A
Pinyon-juniper woodland	N/A	2,604	1,562	N/A
Riparian/wetland	N/A	1,640	1,380	N/A
Sagebrush/perennial grass	N/A	3	3	N/A

Table 4.221. Acreage of Each Vegetation Type in San Juan River by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Total	N/A	5,897	3,916	N/A

Valley of the Gods (0 acres)

This area is managed as special emphasis area for scenic value within the Cedar Mesa ACEC under Alternative A. The acres of each vegetation type in Valley of the Gods by alternative and the Proposed Plan are presented in Table 4.222.

Table 4.222. Acreage of Each Vegetation Type in Valley of the Gods by Proposed Plan and Alternative

Vegetation Type	Alternative A	Alternatives B and E	Alternative C and Proposed Plan	Alternative D
Conifer/mountain shrub	N/A	0	0	N/A
Desert shrub	N/A	21,383	21,383	N/A
Invasive species and weeds	N/A	0	0	N/A
Pinyon-juniper woodland	N/A	1,395	1,395	N/A
Riparian/wetland	N/A	81	81	N/A
Sagebrush/perennial grass	N/A	0	0	N/A
Total	N/A	22,859	22,859	N/A

4.3.17.2.11.2. Alternative BAlkali Ridge (39,196 acres)

Under Alternative B, this ACEC would be 4 acres (0.01%) smaller than under Alternative A. It would be open for mineral leasing with standard stipulations and livestock grazing, but it would not be open to woodland product collection or surface-disturbing land treatments. The adverse impacts of this alternative on vegetation resources would be less than those under Alternative A because of the reduction in allowable surface-disturbing activities.

Bridger Jack Mesa (6,219 acres)

Under Alternative B, this ACEC would be 41 acres (0.7%) smaller than under Alternative A. As a result, the impacts of management decisions pertaining to surface disturbance would be approximately the same as those discussed for Alternative A.

Butler Wash North (17,365 acres)

Under Alternative B, this ACEC would be 98 acres (0.7%) smaller than under Alternative A. There would be 1 less acre of desert shrub vegetation, 94 fewer acres of pinyon-juniper

woodland vegetation, and 2 fewer acres of riparian vegetation than under Alternative A. Because the acreage is slightly reduced between Alternatives A and B, the impacts of management decisions pertaining to surface disturbance would be slightly greater than those discussed for Alternative A.

Cedar Mesa (306,743 acres)

Under Alternative B, this ACEC would be 11,406 acres (3.9%) larger than under Alternative A. There would be 1 additional acre of conifer/mountain shrub vegetation, 23,799 fewer acres of desert shrub vegetation, 14 additional acres of invasive species and weeds vegetation, 26,660 additional acres of pinyon-juniper woodland vegetation, and 4,731 additional acres of riparian vegetation than under Alternative A. This ACEC would be managed with the same restrictions as under Alternative A with the following exceptions: it would be closed to dispersed camping and collection of woodland products. These surface disturbance restrictions, plus the increased size of the ACEC under this alternative, would decrease the magnitude and extent of adverse impacts on vegetation resources compared to Alternative A. One exception would be the loss of 23,799 acres of desert shrub vegetation, which would lead to an increased risk of surface-disturbing, adverse impacts on native vegetation in this vegetation type compared to Alternative A.

Dark Canyon (61,659 acres)

This ACEC would be the same size and be managed with the same restrictions as under Alternative A with the following exceptions: vegetation treatments with minimal surface disturbance would be allowed. The allowance of vegetation treatments would have beneficial impacts on native vegetation in the ACEC.

Hovenweep (2,412 acres)

Under this alternative, this ACEC would be 616 acres (34%) larger than under Alternative A. There would be 87 more acres of desert shrub vegetation, 327 more acres of pinyon-juniper woodland vegetation, and 200 more acres of riparian vegetation than under Alternative A. This ACEC would be managed with the same restrictions as under Alternative A except that vegetation treatments would not be allowed. This would reduce beneficial impacts on native vegetation by failing to improve vegetation resources in the ACEC. The larger size of the ACEC, however, would provide protection for more acres of native vegetation than under Alternative A. Overall, this alternative would have fewer negative impacts on vegetation resources than Alternative A.

Indian Creek (8,510 acres)

Under Alternative B, this ACEC would be approximately the same size as under Alternative A. The ACEC would be managed with the same restrictions as under Alternative A except that dispersed camping would not be allowed. This would help mitigate adverse impacts of camping on native vegetation in the ACEC. Overall, this Alternative would have fewer negative impacts on vegetation resources in Indian Creek than Alternative A because of the decreased level of surface disturbance associated with the prohibition of dispersed camping.

Lockhart Basin (47,783 acres)

This ACEC would be open for mineral leasing with NSO, geophysical work, and livestock grazing. It would be closed to mineral disposal and woodland product collection. These

restrictions on surface-disturbing activities would reduce adverse impacts on vegetation resources in this ACEC. Because this area would not be designated as an ACEC under Alternative A, Alternative B would have fewer adverse impacts on vegetation resources because of restrictions to surface-disturbing activities with ACEC designation.

Lavender Mesa (649 acres)

Under Alternative B, this ACEC would be the same size and managed with the same restrictions as under Alternative A except that vegetation treatments with minimal surface disturbance would be allowed. Overall, the allowance of vegetation treatments would have beneficial impacts on native vegetation in the ACEC because treatments would reduce the cover of weedy species and restore native plant species diversity.

Shay Canyon (119 acres)

Under Alternative B, this ACEC would be 3,442 acres (97%) smaller than under Alternative A. There would be 11 fewer acres of conifer/mountain shrub habitat, 1 less acre of desert shrub habitat, 2,959 fewer acres of pinyon-juniper woodland vegetation, 227 fewer acres of riparian vegetation, and 243 fewer acres of sagebrush/perennial grassland vegetation than under Alternative A. This ACEC would be managed with the same restrictions as under Alternative A with the following exceptions: no surface-disturbing vegetation treatments, NSO oil and gas management, grazing on trails only, and closed to mineral materials disposal. These restrictions on surface-disturbing activities would reduce adverse impacts on vegetation resources and would help mitigate adverse impacts from authorized surface-disturbing activities. Overall, this alternative would adversely impact more acres of vegetation resources in Shay Canyon than would occur under Alternative A.

San Juan River (7,590 acres)

Under this alternative, the San Juan River area would be managed as an ACEC and would be open for mineral leasing with NSO, seasonal livestock use, vegetation treatments, and OHV use on roads and trails. The surface-disturbing activities allowed in the ACEC would have adverse impacts on vegetation resources as discussed under Alternative A. San Juan River would be closed to mineral disposal, mineral entry, and woodland product collection. Restrictions on surface disturbance would reduce adverse impacts on vegetation resources and would help mitigate adverse impacts from authorized surface-disturbing activities. Although this ACEC would be smaller than the San Juan River SRMA proposed under Alternative A, there would be fewer adverse impacts on vegetation resources resulting from increased restrictions on surface-disturbing activities associated with ACEC designation.

Valley of the Gods (22,863 acres)

Under this alternative, the Valley of the Gods area would be managed as an ACEC. It would be managed as VRM I, closed for mineral leasing and disposal of mineral materials, available for livestock use and vegetation treatments, and closed to woodland product use. These surface-disturbing activities would have adverse impacts on vegetation resources as discussed under Alternative A. Restrictions on surface disturbance would reduce adverse impacts on vegetation resources and would help mitigate adverse impacts from authorized surface-disturbing activities. Although this ACEC would be smaller than the special emphasis area within the Cedar Mesa ACEC proposed under Alternative A, there would be fewer adverse impacts on vegetation

resources resulting from increased restrictions on surface-disturbing activities under this alternative.

Summary

Overall, there would be fewer adverse impacts on vegetation resources in ACECs under Alternative B than under Alternative A. This is because of the increase in the number of acres designated as ACECs and a reduction in allowable surface-disturbing activities.

4.3.17.2.11.3. Alternative C

Alkali Ridge, Hovenweep, Indian Creek, Shay Canyon, and Valley of the Gods

Under this alternative, these ACECs would be the same size as under Alternative B and the impacts of management decisions pertaining to surface disturbance would be the same as those discussed for Alternative B.

Bridger Jack Mesa, Butler Wash North, Dark Canyon, and Lockhart Basin

Under Alternative C, these areas would not be managed as ACECs. Therefore, the management decisions under Alternatives A and B would have fewer adverse impacts on fewer acres of native vegetation than under this alternative.

Cedar Mesa (306,742 acres)

Under Alternative C, this area would not be managed as an ACEC. Cedar Mesa would be managed as a C-SRMA, which provides fewer protective measures for soil and vegetation. Therefore, the management decisions under Alternatives A and B would have fewer adverse impacts on fewer acres of native vegetation than under this alternative.

Lavender Mesa (649 acres)

Under this alternative, these ACECs would be the same size as under Alternative A, and would be managed with the same restrictions. Therefore, impacts under this alternative would be the same as those discussed in Alternative A.

San Juan River (7,590 acres)

Under Alternative C, the San Juan River ACEC would be the same as under Alternative B. Impacts of management decisions pertaining to surface disturbance would be the same as those discussed for Alternative B.

Summary

Overall, there would be greater adverse impacts on vegetation resources in the ACECs and other areas under Alternative C than under Alternative A. This is because of the decrease in the number of acres designated as ACECs and the increase in allowable surface-disturbing activities compared to Alternative A.

4.3.17.2.11.4. Alternative D

Alkali Ridge, Bridger Jack Mesa, Butler Wash North, Cedar Mesa, Dark Canyon, Hovenweep, Indian Creek, Lockhart Basin, Lavender Mesa, Shay Canyon, San Juan River, and Valley of the Gods

Under this alternative, these areas would not be managed as ACECs. Therefore, management decisions under Alternatives A, B, and C would have fewer adverse impacts on fewer acres of native vegetation than under Alternative D.

Overall, there would be greater adverse impacts on vegetation resources in ACECs and other areas under this alternative than under Alternative A. This is because of the decrease in the number of acres designated as ACECs and the increase in allowable surface-disturbing activities compared to Alternative A.

4.3.17.2.11.5. Alternative E

Under Alternative E, the impacts of special designations management decisions on native vegetation would be the same those discussed under Alternative B with the following exceptions. Non-WSA lands with wilderness characteristics would be managed to preserve their wilderness values. Preservation stipulations would include management under VRM I objectives, no minerals leasing, no off-route OHV travel, no new road construction, no mineral materials disposal, and no firewood gathering or harvesting. These stipulations would have additional long-term, beneficial impacts on vegetation resources by restricting surface disturbances to a greater degree than those discussed under Alternative B. The areas of vegetation resources within the proposed ACECs that would be beneficially affected include: 0.1% of Bridger Jack Mesa, 0.2% of Butler Wash, 20% of Cedar Mesa, 0.5% of Dark Canyon, 46% of Indian Creek, 100% of Lavender Mesa, 45% of Lockhart Basin, 28% of San Juan River, 83% of Shay Canyon, and 91% of the Valley of the Gods.

Management of these non-WSA lands with wilderness characteristics would decrease surface disturbance within the above ACECs, which would provide more beneficial protection to vegetation resources when compared to Alternative A, the other action alternatives, and the Proposed Plan.

4.3.17.2.11.6. Proposed Plan

Alkali Ridge, Hovenweep, Indian Creek, Shay Canyon, and Valley of the Gods
