Under the Proposed Plan, these ACECs would be the same size as under Alternative B. The impacts of management decisions pertaining to surface disturbance would be similar to those discussed for Alternative B with minor modifications described in the Summary Table of Alternatives and the Proposed Plan (Table 2.1).

Bridger Jack Mesa, Butler Wash North, Dark Canyon, and Lockhart Basin

Under the Proposed Plan, these areas would not be managed as ACECs. Therefore, the management decisions under Alternatives A and B would have fewer adverse impacts on fewer acres of native vegetation than under the Proposed Plan.

Cedar Mesa (375,739 acres)

Under the Proposed Plan, this area would not be managed as an ACEC. Cedar Mesa would be managed as an SRMA, which provides fewer protective measures for soil and vegetation. Therefore, the management decisions under Alternatives A and B would have fewer adverse impacts on fewer acres of native vegetation than under the Proposed Plan.

Lavender Mesa (649 acres)

Under the Proposed Plan, this ACEC would be the same size as under Alternative A and it would be managed with similar protective restrictions. Therefore, impacts to vegetation would be the same as Alternative A.

San Juan River (4,321 acres)

Under the Proposed Plan, the San Juan River ACEC would be 3,269 acres (43%) smaller than under Alternatives B and E. Impacts of management decisions pertaining to surface disturbance would be similar to those discussed for Alternative B but decreased given the lesser acreage of the ACEC.

Summary

Overall, there would be greater adverse impacts on vegetation resources in the ACECs and other areas under the Proposed Plan than under Alternative A. This is because of the decrease in the number of acres designated as ACECs and the increase in allowable surface-disturbing activities compared to Alternative A.

4.3.17.2.12. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON VEGETATION**4.3.17.2.12.1. Alternative A**

Compliance with the Endangered Species Act and BLM Manual 6840 requires avoiding and/or minimizing surface-disturbing activities in Threatened and Endangered species habitat. In addition, both the BLM's Guidance for the Management of Sagebrush Plant Communities for Sage-grouse Conservation and BLM's National Sage-grouse Habitat Conservation Strategy would be implemented in suitable habitat in the Monticello FO (4,546 acres of sagebrush vegetation). An additional 320 acres of suitable Gunnison Sage-grouse habitat would be managed as a conservation easement to protect and enhance their habitat. Adherence to these plans would have beneficial impacts on vegetation resources in the Monticello FO.

There would be no ground disturbing activities allowed within a 0.5 mile radius of known Bald Eagle or Mexican Spotted Owl (MSO) nests, which would have long-term beneficial impacts on sagebrush vegetation in those buffer zones. MSO Protected Activity Centers (PACs) would be protected as outlined in the MSO Recovery Plan (USFWS 1995). MSO Designated Critical Habitat and suitable habitat would be avoided or use restrictions would be implemented. Within suitable habitat, these would include staying on designated routes or revegetating access routes created by a project, which would help mitigate the adverse impacts of surface disturbance associated with road construction and/or use on vegetation.

In Southwestern Willow Flycatcher, Yellow-billed Cuckoo, and endangered Colorado River fishes riparian habitat, there would be no surface-disturbing activities within 300 feet of riparian habitat, which would have long-term beneficial impacts on riparian vegetation in those buffer

zones. If oil and gas operations require stream crossing, Utah Oil and Gas Pipeline Crossing Guidance would be followed to help mitigate negative impacts on vegetation and wildlife associated with pipeline crossing (Appendix F).

If California condors nest in the Monticello FO, there would be no surface-disturbing activities allowed within 1 mile of the nest, which would have long-term beneficial impacts on vegetation in those buffer zones.

4.3.17.2.12.2. Alternative B

Under Alternative B, the impacts of special status species management decisions on vegetation resources would include the following management in addition to that discussed under Alternative A. For Gunnison Sage-grouse, year-round critical habitat would be designated on 4,524 acres of the sagebrush vegetation on BLM land in the Monticello FO (see Map 74). In lek habitat (2.0 mile radius of an active strutting ground), there would be no surface-disturbing activities allowed, with the exception of seasonal grazing. These restrictions would help mitigate the adverse impacts of seasonal grazing on vegetation resources in lek habitat. Within 6 miles of lek habitat, sagebrush treatments, oil and gas leasing with standard stipulations, and year-round grazing would be allowed (except seasonally in Sage Flat, Upper East Canyon, Sage-grouse, and Dry Farm). Sagebrush treatments would mitigate the adverse impacts of surface-disturbing activities on vegetation resources within the 6 mile lek habitat buffer.

Under this alternative, MSO and flannelmouth sucker habitat in Arch Canyon would be closed to OHV use and have a maximum group size of 10 people per day. These restrictions would reduce the surface disturbance in Arch Canyon associated with human visitation more than under Alternative A.

4.3.17.2.12.3. Alternative C

Under Alternative C, the impacts of special status species management decisions on vegetation resources would be the same as those discussed under Alternative B, except lek habitat would be defined as within 0.60 miles of an active strutting ground. Grazing would be permitted year-round. Construction of power lines would be permitted within year-round Gunnison Sage-grouse habitat. The potential increase in grazing in and around sage-grouse leks and other potential surface-disturbing activities within year-round habitats would result in greater adverse impacts on vegetation resources than under Alternative B but fewer impacts than under Alternative A.

Under this alternative, MSO and flannelmouth sucker habitat in Arch Canyon would have OHV use limited to designated routes to the end of the State Section (closed from there to the end of the National Forest boundary), and have a maximum group size of 12 people per day. These restrictions would reduce surface disturbance in Arch Canyon associated with human visitation more than under Alternative A.

4.3.17.2.12.4. Alternative D

Under Alternative D, special status species management decisions on vegetation resources would include the following impacts in addition to those discussed in Alternative A. For Gunnison Sage-grouse, year-round critical habitat would be designated on 2,877 acres of BLM land in the Monticello FO (see Map 76). In lek habitat (within 0.25 miles of an active strutting ground), there would be no surface-disturbing activities allowed, with the exception of seasonal grazing.

These restrictions would help mitigate the adverse impacts of seasonal grazing on vegetation resources in lek habitat. Within 6 miles of lek habitat, sagebrush treatments, fence construction, oil and gas leasing with standard stipulations, and year-round grazing would be allowed (except seasonally in Sage Flat, Upper East Canyon, Sage-grouse, and Dry Farm). Sagebrush treatments would help mitigate the adverse impacts of surface-disturbing activities on vegetation resources within the 6 mile lek habitat buffer. The reduced area of protected habitats and allowances for surface-disturbing activities would result in greater adverse impacts on vegetation resources under Alternative D than would occur under any of the other alternatives and the Proposed Plan.

Under this alternative, MSO and flannelmouth sucker habitat in Arch Canyon would have OHV use limited to designated routes and have a maximum group size of 12 people per day. These restrictions would reduce surface disturbance in Arch Canyon associated with human visitation more than under Alternative A but less than Alternatives B and C.

4.3.17.2.12.5. Alternative E

Under Alternative E, the impacts of special status species management decisions on vegetation resources would be the same as discussed under Alternative B with the following additions. Non-WSA lands with wilderness characteristics would be managed as closed to mineral leasing, closed to OHV use, proposed for withdrawal from mineral entry, ROW exclusion area, closed to disposal of mineral materials, closed to private and commercial woodland harvest, and managed as VRM I. Management of these non-WSA lands with wilderness characteristics would decrease surface disturbance to vegetation within these areas, and would thereby provide more beneficial protection to vegetation resources than any of the other management alternatives and the Proposed Plan.

4.3.17.2.12.6. Proposed Plan

Under the Proposed Plan, the impacts of special status species management decisions on vegetation resources would be the same as those discussed under Alternative B, except that within 0.6 miles of active sage-grouse strutting grounds oil and gas leasing would be subject to no surface occupancy restrictions. Furthermore, the construction of power lines, wind power turbines, or other above ground structures would be avoided rather than prohibited within 4 miles of active Gunnison Sage-grouse strutting grounds from May 16 to March 19. Overall, special status species decisions in the Proposed Plan would result in fewer impacts to vegetation than under Alternative A due to greater restrictions placed on surface-disturbing activities.

Under the Proposed Plan, MSO and flannelmouth sucker habitat in Arch Canyon would have OHV use limited to designated routes up to the National Forest boundary. There would not be any group size limits on non-mechanized, non-motorized group size. These decisions are the same as Alternative A and therefore the impacts would be the same.

4.3.17.2.13. IMPACTS OF TRAVEL DECISIONS ON VEGETATION

4.3.17.2.13.1. Alternative A

Under Alternative A, any new trail designations would consider sensitive species habitat, which would reduce surface-disturbing activities in critical native vegetation. In addition, National Scenic Byways and Backways would be designated in the Monticello FO. These roads already

exist, so there is not likely to be an appreciable impact on vegetation resources resulting from these designations.

A number of trails would be managed for non-mechanized travel (see Summary Table of Alternatives and the Proposed Plan – Table 2.1). Because these trails are already established, there is not likely to be an appreciable impact on vegetation resources resulting from trail maintenance. There would also be trails and areas open to OHV use under all alternatives and the Proposed Plan. OHV use can cause an increased level of surface disturbance because of the weight of the machines and speed of travel. This surface disturbance would have short- and long-term direct and indirect impacts on vegetation resources in the Monticello FO, as discussed in previous sections.

Under Alternative A, the impact of travel management decisions on vegetation resources would include the following additional impacts: There are a total of 611,310 acres open to OHV use under this alternative, which is more than under any of the other alternatives and the Proposed Plan. Further, 540,260 acres would be limited to designated routes subject to seasonal restrictions, 570,390 acres would be limited to existing roads and trails, and 218,780 would be limited to designated roads and trails (1,329,430 total acres).

This alternative would have 276,430 acres closed to OHV use, which is more than Alternative D, but less than Alternatives B, C, and E and the Proposed Plan. These closures would reduce adverse impacts on native vegetation in these protected areas by eliminating surface disturbance associated with OHV use. A list of closed areas is located in the Summary Table of Alternatives and the Proposed Plan. Closed areas include some ACECs and vegetation study areas. This action helps protect ecologically important vegetation communities from surface disturbance and weed introduction associated with OHV use. In Tables 4.184–4.186, the acreage closed to OHV, acreage of limited OHV use, and acres open to OHV use are listed by vegetation type for each alternative and the Proposed Plan.

Table 4.223. Acreage of Closed OHV Use for All Alternatives and the Proposed Plan

Vegetation Type	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Conifer/mountain shrub	856	1,074	1,074	0	0	1,061
Desert shrub	53,097	69,957	67,238	0	251,680	64,276
Invasive species and weeds	159	236	235	0	0	228
Pinyon-juniper woodland	218,188	317,500	315,524	0	648,062	296,553
Riparian/wetland	3,524	3,977	3,676	0	8,779	3,539
Sagebrush/perennial grass	12,256	30,838	30,802	0	57,050	28,122
Total	288,080¹	423,582	418,549	0	965,571	393,779

¹ Acres of each vegetation type were determined using the Southwest ReGAP terrestrial ecological classification system (USGS 2004). Because vegetation types may overlap or be overestimated in the SWReGAP coverages, total acres of vegetation may exceed the total acres of the area being analyzed. Furthermore, acreage numbers of each OHV use category that appear under Alternative A in the Summary Table of Alternatives and the Proposed Plan were based on the 1991 San Juan RMP. Acreage numbers for calculations were based on GIS coverages generated between approval of the 1991 San Juan RMP and the completion of this document.

Table 4.224. Acreage of Limited OHV Use for All Alternatives and the Proposed Plan

Vegetation Type	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Conifer/mountain shrub	3,236	9,728	9,728	10,802	8,029	9,740
Desert shrub	218,564	350,720	351,592	418,829	168,996	356,351
Invasive species and weeds	1,284	3,154	3,154	3,390	0	3,161
Pinyon-juniper woodland	572,435	828,766	830,534	1,145,957	498,214	849,664
Riparian/wetland	6,302	16,458	16,623	20,300	11,656	16,894
Sagebrush/perennial grass	88,073	134,739	134,770	165,571	108,526	137,439
Total	889,894¹	1,343,565	1,346,401	1,764,849	795,421	1,373,249

¹ Acres of each vegetation type were determined using the Southwest ReGAP terrestrial ecological classification system (USGS 2004). Because vegetation types may overlap or be overestimated in the SWReGAP coverages, total acres of vegetation may exceed the total acres of the area being analyzed. Furthermore, acreage numbers of each OHV use category that appear under Alternative A in the Summary Table of Alternatives and the Proposed Plan were based on the 1991 San Juan RMP. Acreage numbers for calculations were based on GIS coverages generated between approval of the 1991 San Juan RMP and the completion of this document.

Table 4.225. Acres Open to OHV Use for All Alternatives and the Proposed Plan

Vegetation Type	Alternative A	Alternatives B and E	Alternatives C and D	Proposed Plan
Conifer/mountain shrub	6,709	0	0	0
Desert shrub	150,188	0	1,847	0
Invasive species and weeds	1,986	0	0	0
Pinyon-juniper woodland	356,773	0	321	0
Riparian/wetland	10,870	0	135	0
Sagebrush/perennial grass	65,782	0	6	0
Total	592,308	0	2,309	0

4.3.17.2.13.2. Alternative B

Under Alternatives B and E, the impacts of travel management decisions on vegetation resources would include the following in addition to the qualitative impacts discussed in Alternative A. There are no acres open to OHV use under these alternatives, which is 100% less (611,310 acres) than under Alternative A.

In total, there are 600,377 more acres of OHV use limited to designated routes under Alternative B than under Alternative A. Under Alternative B, 201% more conifer/mountain shrub vegetation, 60% more desert shrub, 146% more invasive weed vegetation, 45% more pinyon-juniper woodland, 161% more riparian/wetland vegetation, and 53% more sagebrush/perennial grassland vegetation would have OHV use limited to designated routes.

Alternative B would close 423,698 acres to OHV use, which is 147,268 acres (53%) more than under Alternative A. Alternative E would close 970,436 acres to OHV use, which is 694,006 acres (251%) more than under Alternative A. Table 4.226 provides the percent difference in acres closed to OHV use in each vegetation type between Alternatives A and B and Alternatives A and E.

Table 4.226. Percent Difference Acres Closed to OHV Use between Alternative A and Alternative B

Vegetation Type	Percent difference of Alternative B Compared with Alternative A
Conifer and mountain shrub	25%
Desert shrub	32%
Invasive species and noxious weeds	48%
Pinyon-juniper woodland	46%
Riparian and wetland	13%
Sagebrush and perennial grassland	152%

These closures and limitations would decrease the adverse impacts of this alternative on native vegetation by reducing surface disturbance associated with OHV use. A list of closed areas is located in the Summary Table of Alternatives. Closed areas include vegetation study areas, some SRMAs, some CSMAAs, and some WSAs. These closures would protect more acres of ecologically important vegetation communities from the surface disturbance and weed spread associated with OHV use than Alternative A. The impacts of management decisions under these alternatives are comparable to the impacts of Alternative C. There are fewer acres of native vegetation subject to adverse surface-disturbing impacts under these alternatives than under Alternative D.

4.3.17.2.13.3. Alternative C

Under Alternative C, the impacts of travel management decisions on vegetation resources would include the following impacts in addition to the qualitative impacts discussed in Alternative A. There are a total of 2,311 acres open to OHV use under this alternative, which is 608,999 acres less than under Alternative A. Under Alternative C, approximately 99% to 100% less of each vegetation type would be open to OHV use than under Alternative A.

In total, there are 603,102 more acres of OHV use limited to designated routes under Alternative C than under Alternative A. When quantified by vegetation type, this difference breaks down as follows: 201% more conifer/mountain shrub vegetation, 61% more desert shrub, 146% more invasive weed vegetation, 45% more pinyon-juniper woodland, 164% more riparian/wetland and 53% more sagebrush/perennial grassland vegetation would have OHV use limited to designated routes.

This alternative would have 418,667 acres closed to OHV use, which is 142,237 acres (51%) more than under Alternative A. Table 4.227 provides the percent difference in acres closed to OHV use in each vegetation type between Alternative A and C.

Table 4.227. Percent Difference Acres Closed to OHV Use between Alternatives A and C

Vegetation Type	Percent Difference Compared with Alternative A
Conifer and mountain shrub	25%
Desert shrub	27%
Invasive species and noxious weeds	48%
Pinyon-juniper woodland	45%
Riparian and wetland	4%
Sagebrush and perennial grassland	151%

These closures would decrease the adverse impacts of this alternative on native vegetation by eliminating surface disturbance associated with OHV use. A list of closed areas is located in the Summary Table of Alternatives and the Proposed Plan. Closed areas include vegetation study areas, some SRMAs, and some WSAs. These closures would protect more acres of ecologically important vegetation communities from the surface disturbance and weed introduction associated

with OHV use than Alternative A. Impacts under this alternative are comparable to impacts under Alternatives B and E. There are fewer acres of native vegetation subject to adverse surface-disturbing impacts under this alternative than under Alternative D. Under Alternative C there would be 7 ways that would continue to provide motorized access to existing trailheads.

4.3.17.2.13.4. Alternative D

Under Alternative D, the impacts of travel management decisions on vegetation resources would include the following in addition to the qualitative impacts discussed in Alternative A. There are a total of 2,311 acres open to OHV use under this alternative, which is 608,999 acres less than under Alternative A.

In total, there are 1,021,767 more acres of OHV use limited to designated routes under Alternative D than under Alternative A. When quantified by vegetation type, this difference breaks down as follows: 234% more conifer/mountain shrub vegetation, 92% more desert shrub vegetation, 164% more invasive weed vegetation, 100% more pinyon-juniper woodland, 222% more riparian/wetland vegetation, and 88% more sagebrush/perennial grassland vegetation would have OHV use limited to designated routes.

This alternative has no acres closed to OHV use, which is 276,430 acres less than under Alternative A. Because of the lack of closures, adverse impacts associated with this alternative would be greater than under Alternatives A, B, C, D, and E and the Proposed Plan.

4.3.17.2.13.5. Alternative E

Under Alternative E, the impacts of travel management decisions on vegetation resources would include the following in addition to the qualitative impacts discussed in Alternative A. There are no acres open to OHV use under this alternative, which is 100% less (611,310 acres) than under Alternative A.

In total, there are 53,639 more acres of OHV use limited to designated routes under Alternative E than under Alternative A. Under Alternative E 100% less conifer/mountain shrub vegetation, 374% more desert shrub, 100% less invasive weed vegetation, 197% more pinyon-juniper woodland, 149% more riparian/wetland vegetation, and 365% more sagebrush/perennial grassland vegetation would have OHV use limited to designated routes.

Alternative E would close 970,436 acres to OHV use, which is 694,006 acres (251%) more than under Alternative A. Table 4.228 provides the percent difference in acres closed to OHV use in each vegetation type between Alternatives A and E.

Table 4.228. Percent Difference Acres Closed to OHV Use between Alternative A and Alternative E

Vegetation Type	Percent difference of Alternative E Compared with Alternative A
Conifer and mountain shrub	-100%
Desert shrub	374%
Invasive species and noxious weeds	-100%
Pinyon-juniper woodland	197%

**Table 4.228. Percent Difference Acres Closed to OHV Use
between Alternative A and Alternative E**

Vegetation Type	Percent difference of Alternative E Compared with Alternative A
Riparian and wetland	149%
Sagebrush and perennial grassland	365%

These closures and limitations would decrease the adverse impacts of this alternative on native vegetation by reducing surface disturbance associated with OHV use. A list of closed areas is located in the Summary Table of Alternatives and the Proposed Plan. Closed areas include vegetation study areas, some SRMAs, some CSMAs, WSAs, and non-WSAs with wilderness characteristics. These closures would protect more acres of ecologically important vegetation communities from the surface disturbance and weed spread associated with OHV use than Alternative A.

4.3.17.2.13.6. Proposed Plan

Under the Proposed Plan, the impacts of travel management decisions on vegetation resources would include the following impacts in addition to the qualitative impacts discussed above. There are no acres open to OHV use under the Proposed Plan, which is 100% less (611,310 acres) than under Alternative A.

In total, there would be 605,316 more acres of OHV use limited to designated routes under the Proposed Plan than under Alternative A. When quantified by vegetation type, this difference breaks down as follows: 201% more conifer/mountain shrub vegetation, 63% more desert shrub, 146% more invasive weed vegetation, 48% more pinyon-juniper woodland, 168% more riparian/wetland and 56% more sagebrush/perennial grassland vegetation would have OHV use limited to designated routes.

The Proposed Plan would have 393,895 acres closed to OHV use, which is 117,465 acres (42%) more than under Alternative A. Table 4.229 provides the percent difference in acres closed to OHV use in each vegetation type between Alternative A and the Proposed Plan. The Proposed Plan would establish 4 or fewer ways that would continue to provide motorized access to existing trailheads.

**Table 4.229. Percent Difference Acres Closed to OHV Use
between Alternative A and the Proposed Plan**

Vegetation Type	Percent Difference Compared with Alternative A
Conifer and mountain shrub	24%
Desert shrub	21%
Invasive species and noxious weeds	43%
Pinyon-juniper woodland	36%

Table 4.229. Percent Difference Acres Closed to OHV Use between Alternative A and the Proposed Plan

Vegetation Type	Percent Difference Compared with Alternative A
Riparian and wetland	<1%
Sagebrush and perennial grassland	129%

4.3.17.2.14. IMPACTS OF VEGETATION DECISIONS ON VEGETATION**4.3.17.2.14.1. Alternative A**

Under Alternative A, the impacts of vegetation management decisions on vegetation resources would be the same as those discussed in Section 4.3.17.1 Impacts Common to All Alternatives and the Proposed Plan. There would be 232,130 acres open to vegetation treatments each year under this alternative. This is significantly greater than under any of the other alternatives and the Proposed Plan. Due to the cost of vegetation treatments, it is likely that only a small portion of this area would be treated in a given year. The numbers of acres of vegetation treatments in each vegetation type for each alternative and the Proposed Plan are provided in Table 4.230.

Table 4.230. Acres of Vegetation Treatment per Year by Vegetation Type for Each Alternative and the Proposed Plan

Vegetation Type	Alternative A	Alternative B	Alternative C and the Proposed Plan	Alternative D	Alternative E
Sagebrush		1,000	1,500	2,000	1,000
Weed treatments		3,000	3,000	3,000	3,000
Pinyon-juniper woodland		2,000	3,000	4,000	2,000
Riparian		500	100	100	500
Greasewood		100	200	200	100
Unspecified	15,475	1,000	1,500	2,000	1,000
Total	15,475	7,600	9,300	11,300	7,600

4.3.17.2.14.2. Alternative B

Under Alternative B, the impacts of vegetation management decisions on vegetation resources would include the following impacts in addition to those discussed in Section 4.3.17.1 Impacts Common to All Alternatives and the Proposed Plan. There would be 7,600 acres of vegetation treatments per year under this alternative, including an estimated 1,000 acres/year of existing unspecified land treatments, which is 51% fewer acres of treatment per year than under Alternative A. This alternative would have fewer long-term, beneficial impacts on vegetation resources than Alternative A due to considerably fewer acres of vegetation treatments. The adverse impacts of trampling and crushing of vegetation associated with treatment would be substantially reduced under this alternative compared with Alternative A.

4.3.17.2.14.3. Alternative C and the Proposed Plan

Under Alternative C and the Proposed Plan, the impacts of vegetation management decisions on vegetation resources would include the following impacts in addition to those discussed in Section 4.3.17.1 Impacts Common to All Alternatives and the Proposed Plan. There would be 9,300 acres of vegetation treatments per year under Alternative C and the Proposed Plan, including an estimated 1,500 acres/year of existing unspecified land treatments, which is 40% fewer acres of treatment per year than under Alternative A. Compared to Alternative B, there would be 500 additional acres of sagebrush treatment, 1,000 additional acres of pinyon-juniper woodland treatment, 400 fewer acres of riparian vegetation treatment, and 100 additional acres of greasewood (desert shrub) vegetation treatment (see Table 4.230). Overall, Alternative C and the Proposed Plan would provide greater long-term beneficial impacts for sagebrush, pinyon-juniper woodland, and greasewood vegetation types than Alternative B. Alternative C and the Proposed Plan would provide fewer long-term beneficial impacts for riparian vegetation than under Alternative B and for all vegetation types under Alternative A. However, Alternative C and the Proposed Plan would limit potentially severe short-term adverse impacts associated with vegetation treatments.

4.3.17.2.14.4. Alternative D

Under Alternative D, the impacts of vegetation management decisions on vegetation resources would include the following impacts in addition to those discussed in Section 4.3.17.1 Impacts Common to All Alternatives and the Proposed Plan. There would be 11,300 acres of vegetation treatments per year under this alternative, including an estimated 2,000 acres/year of existing unspecified land treatments, which is 27% fewer acres of treatment per year than under Alternative A. Compared to Alternative B, there would be 1,000 additional acres of sagebrush treatment, 2,000 additional acres of pinyon-juniper woodland treatment, 400 fewer acres of riparian treatment, and 100 additional acres of greasewood (desert shrub) treatment under this alternative (see Table 4.230). Overall, this alternative would provide greater long-term beneficial impacts for sagebrush, pinyon-juniper woodland, and greasewood (desert shrub) vegetation than Alternatives B and E, as well as for sagebrush and pinyon-juniper woodland vegetation than Alternative C. It would provide fewer long-term beneficial impacts for riparian habitat than would occur under Alternative B. This alternative would have fewer potentially severe short-term adverse impacts associated with vegetation treatments than would occur under Alternative A.

4.3.17.2.14.5. Alternative E

Under Alternative E, the impacts of vegetation management decisions on vegetation resources would be the same as discussed under Alternative B with the following additions. Non-WSA lands with wilderness characteristics would be managed to decrease surface disturbance to vegetation within these areas, and would thereby provide more beneficial protection to vegetation resources than any of the other management alternatives and the Proposed Plan.

4.3.17.2.15. IMPACTS OF VISUAL RESOURCE DECISIONS ON VEGETATION

Under all alternatives and the Proposed Plan lands in the Monticello FO would be managed as one of four visual resource management classes (see VRM Section 3.19). All WSAs and Wild and Scenic River segments would be managed as VRM I or II. Very limited and limited

management activities, respectively, would be allowed in areas designated as VRM Classes I or II. Short-term vegetation treatments and other surface-disturbing activities designed to enhance native vegetation would be allowed in VRM Class I or II areas. These types of disturbances could have minor, short-term, adverse impacts on native vegetation in the Monticello FO.

In areas designated as VRM Classes III or IV, changes to the landscape could be moderate or major, respectively. Most types of vegetation treatments and other surface-disturbing activities would be allowed in VRM Class III or IV areas. These types of disturbances could have long-term adverse impacts on native vegetation in the Monticello PA, but long-term benefits in restoration of native and other desired vegetation communities. Alternative A, the No Action Alternative, also describes the acreages assessed under the Monticello FO VRM inventory, which represents the level of scenic quality within the planning area.

4.3.17.2.15.1. Alternative A

Under Alternative A the qualitative impacts of visual resource decisions on vegetation would consist of those discussed above for each area under each VRM class. Of the five alternatives and the Proposed Plan, Alternative A would have the smallest area subject to VRM Class I, but the largest area subject to VRM Class II restrictions (see Map 66 for VRM locations). Tables 4.190–4.193 show the acres of each vegetation type in VRM Classes I, II, III, and IV for the Proposed Plan and each alternative.

Table 4.231. Acreage of Each Vegetation Type in VRM Class I by Alternative and the Proposed Plan

Vegetation Type	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Conifer/Mountain shrub	767	1,156	1,144	14	2,778	1,133
Desert shrub	97,493	115,751	88,711	62,131	266,378	88,411
Invasive species and weeds	187	360	230	229	1,088	230

4.3.17.2.15.2. Alternative B

Under Alternative B, the impacts of visual resource management decisions on vegetation resources would be more beneficial than under Alternative A in the long-term, as more vegetation acreage would be managed as VRM I and protected from surface disturbances in order to preserve scenic qualities. Alternative B would protect more vegetation resources than the Proposed Plan and any of the other alternatives except Alternative E, which would manage nearly twice as many acres as VRM Class I (see Table 4.231).

4.3.17.2.15.3. Alternative C

Under Alternative C, the impacts of visual resource management decisions on vegetation resources would include the qualitative impacts discussed above, as well as the following additions: some ACECs would also be managed as VRM Class I or II. Of the five alternatives and the Proposed Plan, Alternative C would have the second smallest area subject to both VRM Class I and II restrictions. It would have the second largest area subject to VRM Class III restrictions, and the largest area subject to class IV restrictions (see Map 68 for VRM locations). Because more acres would be classified as VRM I, this alternative would do more to reduce negative impacts on vegetation resources than Alternative A, and would have greater impacts than Alternatives B and E.

4.3.17.2.15.4. Alternative D

Under Alternative D, the impacts of visual resource management decisions on vegetation resources would include the qualitative impacts discussed above. Of the five alternatives and the Proposed Plan, Alternative D would have the second smallest area subject to VRM Class I restrictions and the smallest area subject to VRM Class II restrictions. It would have the largest area subject to VRM Class III restrictions and the second largest area subject to class IV restrictions (see Map 69 for VRM locations). Because more acres would be classified as VRM I, this alternative would do more to reduce negative impacts on vegetation resources than Alternative A.

4.3.17.2.15.5. Alternative E

Under Alternative E, approximately 582,357 additional acres would be managed as VRM I to protect non-WSA lands with wilderness characteristics. As shown in Table 4.191, 996,889 acres of vegetation resources would receive protection from surface disturbances under this alternative (56% of the planning area or 270% more VRM I area than under Alternative A). Compared to Alternative A, this alternative would have greater beneficial impacts because more area would be protected from the adverse impacts of minerals development, access road construction, OHV use, and woodland harvesting; however, these areas would also be protected from vegetation treatments and fire treatments, which would have adverse impacts on vegetation resources because of increased risks of wildland fire from fuel loading and invasive species encroachment. Overall, this alternative would have greater direct beneficial impacts from protection of non-WSA lands and greater indirect adverse impacts from exclusion of vegetation treatments than any of the alternatives and the Proposed Plan.

4.3.17.2.15.6. Proposed Plan

Under the Proposed Plan, the impacts of visual resource management decisions on vegetation resources would include the qualitative impacts discussed above. The Proposed Plan would designate 52,396 more acres (14% more) as VRM Class I than Alternative A. On the other hand, the Proposed Plan would designate 122,903 fewer acres (35% less) as VRM Class II than Alternative A. VRM Class III restrictions under the Proposed Plan would apply to 88,145 more acres (21% more) than under Alternative A, while VRM Class IV restrictions would apply to 15,110 fewer acres (2% less) (see Map 71 for VRM locations). Because more acres would be classified as VRM I and II (73,035 more total acres, or 7% more, under VRM Classes I and II combined under the Proposed Plan), the Proposed Plan would do more to reduce negative impacts on vegetation resources than Alternative A.

4.3.17.2.16. IMPACTS OF WILDLIFE AND FISHERIES DECISIONS ON VEGETATION**4.3.17.2.16.1. Alternative A**

In occupied priority migratory bird habitat, no surface disturbance would be allowed from May 1–July 30. Maintenance and improvement of lowland riparian habitats, wetlands, and low and high desert scrub communities would be prioritized in the Monticello FO. In addition, the spread of invasive plant species would be prevented in these four vegetation types. These three requirements would benefit both migratory birds and native vegetation communities. These actions would have long-term beneficial impacts on native vegetation in lowland riparian, wetland, and desert scrub communities in the Monticello FO.

Bighorn sheep habitat on the five mesa tops (56,740 acres) would be prioritized for habitat improvement because of potential loss of habitat caused by surface disturbance in these areas. On-site mitigation would be required for projects that disturb or remove forage and browse species used by desert bighorn sheep. These requirements would help mitigate the adverse impacts of surface-disturbing activities on vegetation resources critical to bighorn sheep survival.

There would be 17,300 acres allotted as wildlife habitat on slopes of Peter's Canyon and East Canyon under all alternatives and the Proposed Plan.

Under Alternative A, specific restrictions would be in place for wildlife habitat during parts of the year. This alternative would have the least amount of wildlife habitat subject to special wildlife conditions of any of the management alternatives and the Proposed Plan.

Tables 4.194–4.197 provide acreage comparisons of wildlife habitat subject to special conditions in each vegetation type for the Proposed Plan and each alternative.

Table 4.235. Alternative A—Acres of Wildlife Habitat by Vegetation Type Subject to Special Conditions

Vegetation Type	Bighorn Sheep	Pronghorn	Deer	Elk
Conifer/mountain shrub	356	0	226	0
Desert shrub	66,103	2,548	6,041	0
Invasive species and weeds	346	0	387	0
Pinyon-juniper woodland	168,890	2,880	139,178	0

Table 4.235. Alternative A—Acres of Wildlife Habitat by Vegetation Type Subject to Special Conditions

Vegetation Type	Bighorn Sheep	Pronghorn	Deer	Elk
Riparian/wetland	435	0	1,244	0
Sagebrush/perennial grass	11,808	8,526	33,013	0
Total	247,938	13,954	180,089	0

4.3.17.2.16.2. Alternatives B and E

Under Alternatives B and E, the impacts of wildlife and fisheries management decisions on vegetation resources would include those discussed in Alternative A, as well as the restrictions in place for wildlife habitat during parts of the year. Seasonal wildlife protection areas would have special conditions for all land-use activities with the exception of woodland harvest. These special conditions include: no oil and gas leasing activities, no geophysical work, and no OHV use. These seasonal wildlife protection area designations, however, can be overturned by the Field Manager if it can be shown that legal rights would be curtailed, animals are not present in the specific project location, or the activity can be conducted so as not to adversely affect wildlife species. In addition, maintenance and operation activities for mineral production and hunting would be allowed during seasonal restrictions. Therefore, these restrictions would offer only minor mitigation potential for the adverse impacts of surface-disturbing activities on vegetation resources allowed in wildlife habitat. Under these alternatives, there would be 205,070 (83%) more acres subject to bighorn sheep special wildlife conditions, 15,401 (110%) more acres of protected pronghorn habitat, 594,165 (330%) more acres of protected deer habitat, and 184,248 more acres of elk habitat subject to special conditions than under Alternative A (see Table 4.236).

Table 4.236. Alternatives B and E—Acres of Wildlife Habitat by Vegetation Type Subject to Special Conditions

Vegetation Type	Bighorn Sheep	Pronghorn	Deer	Elk
Conifer/mountain shrub	211	1	4,379	9,168
Desert shrub	139,069	4,359	32,058	1,882
Invasive species and weeds	996	17	1,377	702
Pinyon-juniper	289,494	10,434	636,489	155,866
Riparian/wetland	3,627	14	7,011	1,380
Sagebrush/perennial grass	19,611	14,530	92,940	15,250
Total	453,008	29,355	774,254	184,248

4.3.17.2.16.3. Alternative C

Under Alternative C, the impacts of wildlife and fisheries management decisions on vegetation resources would include those discussed in Alternative A, as well as the restrictions in place for wildlife habitat during parts of the year. Seasonal wildlife protection areas would have the same

special conditions as under Alternative A, with the exception of OHV restrictions in which the number of OHV users may be limited. Under this alternative, there would be 52,218 (21%) more acres subject to bighorn sheep special wildlife conditions, 15,401 (110%) more acres of protected pronghorn habitat, 80,242 (45%) more protected deer habitat, and 93,104 more acres of elk habitat subject to special conditions than under Alternative A (see Table 4.237). Because of these differences, this alternative would provide greater protection for vegetation resources in the wildlife protection areas of the Monticello FO than Alternative A, but would be more likely to adversely affect vegetation resources than Alternatives B and E.

Table 4.237. Alternative C—Acres of Wildlife Habitat by Vegetation Type Subject to Special Conditions

Vegetation Type	Bighorn Sheep	Pronghorn	Deer	Elk
Conifer/mountain shrub	125	1	825	6,915
Desert shrub	95,466	4,359	6,085	774
Invasive species and weeds	777	17	452	693
Pinyon-juniper woodland	186,181	10,434	206,807	74,103
Riparian/wetland	1,427	14	1,581	319
Sagebrush/perennial grass	16,180	14,530	44,581	10,300
Total	300,156	29,355	260,331	93,104

4.3.17.2.16.4. Alternative D

Under Alternative D, the impacts of wildlife and fisheries management decisions on vegetation resources would include those discussed in Alternative A, as well as the restrictions in place for wildlife habitat during parts of the year. Seasonal wildlife protection areas would have the same special conditions as under Alternative A with the exception of OHV restrictions. Under this alternative, OHV use would only be allowed on designated routes. Additionally, there would be 65,179 (26%) fewer acres subject to bighorn sheep special wildlife conditions, the same number of acres of protected pronghorn habitat, 30,826 (17%) fewer acres of protected deer habitat, and 60,103 more acres of elk habitat subject to special conditions than under Alternative A (see Table 4.238). Because of these differences, this alternative would be more likely to adversely affect vegetation resources in the wildlife protection areas of the Monticello FO than Alternatives B, C, and E, but less likely to adversely impact vegetation resources than Alternative A.

Table 4.238. Alternative D—Acres of Wildlife Habitat by Vegetation Type Subject to Special Conditions

Vegetation Type	Bighorn sheep	Pronghorn	Deer	Elk
Conifer/mountain shrub	111	0	185	6,155
Desert shrub	54,511	2,548	3,711	116
Invasive species and weeds	256	0	358	0
Pinyon-juniper	117,798	2,880	114,742	47,845
Riparian/wetland	895	0	1,092	313

Table 4.238. Alternative D—Acres of Wildlife Habitat by Vegetation Type Subject to Special Conditions

Vegetation Type	Bighorn sheep	Pronghorn	Deer	Elk
Sagebrush/perennial grass	9,188	8,526	29,175	5,674
Total	182,759	13,954	149,263	60,103

4.3.17.2.16.5. Proposed Plan

Under the Proposed Plan, the impacts of wildlife and fisheries management decisions on vegetation resources would include those discussed in Alternative A, as well as the restrictions in place for wildlife habitat during parts of the year. Seasonal wildlife protection areas would have the same special conditions as under Alternative A, with the exception of OHV restrictions in which the number of OHV users may be limited. Under the Proposed Plan, there would be 205,071 (83%) more acres subject to bighorn sheep special wildlife conditions, 15,401 (110%) more acres of protected pronghorn habitat, 195,803 (109%) more protected deer habitat, and 93,104 more acres of elk habitat subject to special conditions than under Alternative A (see Table 4.237). Because of these differences, the Proposed Plan would provide greater protection for vegetation resources in the wildlife protection areas of the Monticello FO than Alternative A, but would be more likely to adversely affect vegetation resources than Alternatives B and E.

Table 4.239. Proposed Plan—Acres of Wildlife Habitat by Vegetation Type Subject to Special Conditions

Vegetation Type	Bighorn Sheep	Pronghorn	Deer	Elk
Conifer/mountain shrub	211	1	5,533	6,915
Desert shrub	139,070	4,359	10,917	774
Invasive species and weeds	996	17	586	693
Pinyon-juniper woodland	289,494	10,434	298,273	74,103
Riparian/wetland	3,627	14	3,335	319
Sagebrush/perennial grass	19,611	14,530	57,248	10,300
Total	453,009	29,355	375,892	93,104

4.3.17.2.17. IMPACTS OF WOODLANDS DECISIONS ON VEGETATION**4.3.17.2.17.1. Alternative A**

The Healthy Forest Initiative and the Healthy Forest Restoration Act of 2003 would be implemented under all alternatives and the Proposed Plan. In addition, numerous sites would be excluded from wood product use except for limited on-site collection of deadwood for campfires (see Summary Table of Alternatives). These actions would help mitigate the adverse impacts of woodland product use on vegetation resources in areas of the Monticello FO open to wood harvesting. Short-term, adverse impacts include trampling and removal of native trees. Long-term, indirect impacts include the potential introduction of weedy, non-native species during

wood harvesting operations. Under this alternative, all 1,147,407 acres of the FO would be open to woodland harvest.

4.3.17.2.17.2. Alternative B

Under Alternative B, the impacts of woodlands management decisions on vegetation resources would include those discussed in Alternative A. There would be 504,666 acres of pinyon-juniper woodland vegetation open to woodland product harvest, which is 56% fewer acres open to harvest than under Alternative A. In addition, limitations on off-road travel and seasonal restrictions on wood collection would help mitigate the adverse impacts of woodland product collection and harvest on vegetation resources.

4.3.17.2.17.3. Alternatives C and D and the Proposed Plan

Under Alternatives C and D and the Proposed Plan, the impacts of woodlands management decisions on vegetation resources would include those discussed in Alternative A. There would be 597,086 acres of pinyon-juniper woodland vegetation open to woodland product harvest, which is 48% fewer acres open to harvest than under Alternative A. There would not be any seasonal restrictions on wood collection, as would occur under Alternative B. The Proposed Plan would differ from Alternatives C and D in that OHV use would be limited to designated routes.

4.3.17.2.17.4. Alternative E

Under Alternative E, the impacts of woodlands management decisions on vegetation resources would be the same as those outlined under Alternative B with the following differences: Under this alternative, non-WSA lands with wilderness characteristics would not be available for woodland product use. This would close all pinyon-juniper woodland areas with non-WSA wilderness characteristics to surface-disturbing activities associated with woodland harvest. Compared to Alternative A, this alternative would have fewer adverse impacts to native vegetation resources because more area would be protected.

4.3.17.3. SUMMARY OF IMPACTS

Table 2.2 of Chapter 2 contains a summary of impacts of management decisions on vegetation resources.

4.3.17.4. MITIGATION MEASURES

The protective measures for vegetation described in the management common to all sections in Chapter 2 and Appendices A and I would serve to avoid and/or minimize impacts to native vegetation resources in the Monticello FO.

4.3.17.5. UNAVOIDABLE ADVERSE IMPACTS

There will be unavoidable adverse impacts to vegetation resources in the Monticello FO resulting from surface-disturbing activities associated with the resource management decisions detailed in the PRMP/FEIS. Adverse impacts include temporary damage to individual native plants due to trampling and grazing by wildlife and livestock, trampling and weed introduction by human visitors (motorized and non-motorized) and vegetation treatment crews, and

permanent removal of native plants due to clearing activities such as oil well pad installation and woodland harvest.

4.3.17.6. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Impacts to vegetation occurring in the Monticello FO's arid to semi-arid climate could affect long-term productivity due to the limited annual growth of many of the plants found in this ecosystem. Recovery periods of up to 50 years may be required to return desert vegetation communities to their original vegetation cover and species composition following disturbance (Guo 2004). A period of 75 to 100 years may be required for reestablishment of mature pinyon-juniper woodlands. The recovery of cryptobiotic soil communities and associated vegetation is extremely slow (up to 250 years) following soil disturbance (BLM 2001b). Changes in other vegetation community compositions, and the resulting productivity and forage value, may also take decades.

As discussed throughout this section, some of the short-term multiple uses of the Monticello FO would adversely impact the short- and long-term productivity of native vegetation. These uses include oil and gas development, improper livestock grazing, camping, off-road vehicle travel, and woodland harvest. These activities, however, provide economic benefits, and would be partially mitigated by the protective measures discussed in the Management Common to All Alternatives and the Proposed Action sections for each management decision. Effective implementation of these protective measures would prevent these uses from substantially impacting the long-term productivity of vegetation resources in the planning area.

4.3.17.7. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

The protective measures detailed in the Summary Table of Alternatives and the Proposed Plan and Chapter 2 require that disturbed areas be reclaimed following completion of the management action (i.e., well pad deconstruction, reseeding, and weed eradication in disturbed areas). Because vegetation resources would be restored or rehabilitated after proposed disturbance and/or development, there would be no anticipated irreversible impacts on native vegetation resources associated with the management decisions proposed for the Monticello FO. There would, however, be irretrievable impacts associated with surface-disturbing activities proposed throughout the planning area. Native vegetation removed or disturbed when roads or trails are cut, oil pads installed, or other surface disturbance is implemented, is an irretrievable loss until successful restoration takes place. The acreage of this irretrievable disturbance would be identical to that described above for unavoidable adverse impacts.

4.3.18. VISUAL RESOURCES

The assumptions for analyzing the impacts to visual resources are 1) that the greater the size and/or severity of surface disturbance and/or degree of air quality degradation, the greater the impact there would be to scenic quality, and 2) that all Monticello PA resources with management decisions that would permit surface disturbances or degrade air quality would have adverse impacts on visual resources to some degree. Surface disturbances would introduce new, potentially noticeable, visual elements onto the landscape or intensify existing visual elements that would alter the line, form, color, and/or texture that characterize the existing landscape. Changes in air quality, either from smoke, dust, or other pollutants, could potentially reduce or degrade scenic quality by obscuring distant views in the short-term or long term.

Visual Resource Management (VRM) class designations are defined in Section 3.19.2. While reviewing the analysis of impacts, it should be noted that under VRM Class I visual resource objectives, landscape scenic quality would be maintained in its pristine, undeveloped, and natural state, permitting very minor changes to the landscape that should not be noticeable. Visual objectives under VRM Class II would also retain scenic quality within the natural landscape, but would allow minor man-made changes to the landscape, though these changes should not be noticeable to the casual viewer. The VRM Class III objectives would allow a moderate degree of man-made change to the landscape that would be visible, but the changes and contrasts with the natural should not dominate the natural landscape. Under VRM Class IV, major modifications of the natural landscape would be permitted and allowed to dominate the natural landscape. So, based on the above range of allowed changes to scenic quality, the visual resources analysis of impacts assumes that areas designated for management under VRM Class I objectives would receive the highest level of visual resource protection, that areas designated and managed under VRM Class II objectives would receive a high level of visual resources protection, and that VRM Class III and IV-designated areas would receive less visual resources protection. Thus, the analysis logically assumes that areas managed under VRM Classes III and IV would allow more surface-disturbing impacts and potentially have greater adverse impacts on visual resources than those areas managed under VRM Class I and II objectives.

The BLM's VRM class objectives (see Section 3.19.2 and above) were used in analyzing surface disturbance and air quality impacts on visual resources. These objectives provide a consistent basis for determining how much a particular action would affect scenic quality, as well as determining the level of disturbance an area could support while still meeting designated visual resource objectives.

Before VRM classes were designated under the proposed RMP, a visual resource inventory was conducted to assess current scenic quality and viewer sensitivity to views within the Monticello PA. This inventory process assists the Monticello FO in considering visual values in the RMP process. The inventory does not provide management direction and would not be used to limit or constrain surface-disturbing activities within the planning area. For the Monticello PA, the acreage results of the visual resource inventory are the same as the VRM class designation acreages under the current RMP (i.e., Alternative A). That is, there have been no substantial changes in viewer sensitivity or scenic quality since VRM class designations were assigned during the 1991 RMP process.

The determination and assignment of VRM class designations are based on the management decisions made during the RMP process. Once the RMP is completed and the VRM class designations are approved, the VRM class objectives are applicable to all land management actions; that is, once a VRM class designation has been assigned to an area, resource management and planning decisions that could impact visual quality are required to consider and to comply with the designated VRM class objectives of that area. Thus, analyses of the impacts of management decisions for other resources on visual resources were not discussed in this visual resources section because all potential impacts to visual resources that would be produced by the RMP management decisions would be required to comply with the designated and approved VRM class objectives.

It should be noted that, during the RMP process, other proposed land management objectives and management decisions affect the assignment of VRM class designations. For example, WSAs would be managed as VRM Class I in order to maintain their pristine and undeveloped landscapes, and their suitability for designation by Congress as wilderness; areas considered eligible for recommendation under the NWSRS would be managed as VRM Class I, II, or III depending on the resources considered for protection (wild, scenic, or recreation, respectively); areas with high mineral resources potential may be designated as VRM Class III or IV to allow surface-disturbing minerals exploration and development. Therefore, the VRM class designations that are proposed under the PRMP/FEIS are the result of a synthesis and balance of other proposed resource and land management actions (e.g., livestock grazing, minerals, recreation, special designations) with the visual resource inventory of scenic quality, visual resource values, and viewer sensitivity within the Monticello PA.

In this analysis of impacts of proposed management decisions on visual resources, a "macro" and "micro" approach was taken to analyze impacts to visual resources. At the macro scale, the acres of proposed VRM classes under the action alternatives were compared to Alternative A to determine the increase or decrease of acres proposed for protection of scenic quality under VRM Classes I and II. At the micro scale of analysis, representative visually sensitive areas with high scenic quality were selected within the Monticello PA and were analyzed for the impacts of the proposed management decisions on visual resources and scenic quality. These were areas where the proposed alternatives varied in their VRM class designations, and they are Lockhart Basin, Indian Creek, and Valley of the Gods. The analytical methodology of determining the impacts to these areas was a comparison of the area's visual resource inventory class (Alternative A) with the proposed VRM class designation for the area under each action alternative (Alternatives B–E) and the Proposed Plan.

Table 4.240 below shows the proposed VRM acreages managed under each VRM class designation for each of the alternatives, and the combined acreages of VRM Classes III and IV.

Table 4.240. VRM Class Designation Acreages by Alternative

VRM Class	Alternative A (Visual Resource Inventory)	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
VRM Class I	371,575	497,668	425,179	390,424	998,370	422,989
VRM Class II	355,112	250,641	132,001	8,838	111,478	228,041
VRM Class III	416,806	426,350	531,920	692,741	264,369	507,583
VRM Class IV	637,875	608,463	693,995	691,119	407,459	623,002
Subtotal Classes I and II	726,687	748,309	557,180	399,262	1,109,848	651,030

*Acreage figures may vary by alternative due to the changes in GIS technology and variances in GIS shapefiles.

4.3.18.1. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Under all alternatives and the Proposed Plan, VRM class objectives would be applicable to all land management decisions within the Monticello PA. Specifically, all designated VRM Class I areas would apply NSO leasing stipulations or would be closed to leasing, and Controlled Surface Use leasing stipulations would include requirements to meet VRM Class II objectives. All WSAs would be managed under VRM Class I objectives. These specific management actions would be generally beneficial because they would maintain and/or protect scenic quality to the extent allowable under the designated VRM class objectives.

4.3.18.2. ALTERNATIVES AND PROPOSED PLAN IMPACTS**4.3.18.2.1. ALTERNATIVE A**

As mentioned above, the Monticello FO visual resource inventory resulted in visual inventory classes that are the same as the current VRM class designations under Alternative A. Under this alternative, 371,575 acres (21% of the planning area) would be designated for the highest level of visual resource protection under VRM Class I, 355,112 (20% of the planning area) would be designated for a high level of protection under VRM Class II, and 1,054,681 acres (the remaining 59% of the area) would be designated for lower levels of visual resource protection under VRM Classes III and IV objectives.

4.3.18.2.2. ALTERNATIVE B

Alternative B would designate 497,668 acres for management under VRM Class I objectives (28% of the planning area would be managed for pristine, very high quality natural landscapes), 250,641 acres would be designated for management under VRM Class II objectives (14% of the

planning area would be managed for high-quality, natural landscapes). Approximately 1,034,813 acres (the remaining 58% of the planning area) would be designated for management under VRM Class III and Class IV objectives that would permit moderate to major changes to the landscape. Compared to Alternative A, this alternative would designate 126,093 more acres as VRM Class I, 104,471 fewer acres as VRM Class II (a decrease of 6%), and 19,868 fewer acres as VRM Class III and IV (a decrease of 1%). This would have more direct, beneficial, long-term impacts on scenic resources and fewer potentially adverse surface-disturbance-related impacts on the resource than Alternative A because 7% more acreage under VRM Class I objectives would be managed for higher levels of visual resource protection and preservation than indicated by the visual resource inventory. Also, this alternative would designate fewer acres for management under VRM Class III and IV objectives, a 1% reduction in acreage managed for visual resource modification than indicated by the visual resource inventory.

4.3.18.2.3. ALTERNATIVE C

Under Alternative C, 425,179 acres would be managed under VRM Class I objectives to maintain 24% of the planning area as undeveloped, pristine landscape, and 132,001 acres would be designated and managed under VRM Class II objectives (with 7% of the Monticello PA managed for high-quality landscapes). Visual resource designation and management under VRM Classes III and IV objectives would encompass 1,225,915 acres (69% of the PA where moderate to high levels of visual resource impacts would be allowed). Compared to the Alternative A, this alternative would manage 53,604 more acres for the highest level of visual resource preservation under VRM Class I than indicated by the visual resource inventory (an increase of 3%), and 223,111 fewer acres of high-visual quality protection under VRM Class II objectives (a decrease of 13%). Management under VRM Class III and VRM Class IV objectives for this alternative would increase the number of acres under these management classes by 171,234 (a 10% increase, when compared to the visual resource inventory). This would result in greater adverse impacts to visual resources than Alternative A because, while there would be long-term, beneficial impacts on visual resources by managing more acres at the highest level of resource protection under VRM Class I than indicated by the visual resource inventory, fewer acres within the planning area would be managed to preserve high-quality scenic landscapes under VRM Class II and more acres within the Monticello PA would be managed to permit surface disturbances, development, and man-made alterations of the existing landscape under VRM Class III and VRM Class IV than indicated by the visual resource inventory.

4.3.18.2.4. ALTERNATIVE D

Alternative D would manage 390,424 acres under VRM Class I objectives (22% of the Monticello PA) and 8,838 acres under VRM Class II objectives (0.5% of the planning area), and 1,383,860 acres (the remaining 77.5% of the planning area) under VRM Classes III and IV objectives. Compared to Alternative A, Alternative D would manage 18,849 more acres (an increase of 1%) under VRM Class I objectives for preservation of pristine, very high quality visual resources, but 346,274 fewer acres would be managed under VRM Class II objectives (a reduction in acreage of 19.5% for landscapes inventoried as having high scenic quality). This alternative would manage 329,179 more acres under VRM Class III and IV objectives (an increase of 18.5%) than indicated by the visual resource inventory. Under this alternative, there would be long-term, adverse impacts to visual resources because more acres would be managed at lower levels of visual resource and scenic quality protection and fewer acres within the PA

would be managed at the higher levels of visual resource protection and preservation under this alternative than under Alternative A.

4.3.18.2.5. ALTERNATIVE E

Under Alternative E, approximately 998,370 acres would be designated and managed under VRM Class I objectives in order to preserve scenic quality and visual resources, including 582,360 acres of non-WSA lands with wilderness characteristics. So, 56% of the PA would be managed as VRM Class I (an increase in VRM Class I-managed acreage of 268% when compared to Alternative A). Approximately 111,478 acres would be designated and managed under VRM Class II objectives (a decrease of 69% when compared to Alternative A). This alternative would manage a combined acreage of 671,828 under VRM Classes III and IV objectives (a 36% decrease when compared to Alternative A). Under Alternative E, over 62% of the planning area would receive the highest levels of visual resource protection under VRM Class I and II objectives. Compared to Alternative A, this alternative would have more beneficial, long-term, preservation-related impacts to scenic quality than Alternative A because more acres within the PA would be protected to preserve scenic quality.

4.3.18.2.6. PROPOSED PLAN

Under the Proposed Plan, 422,989 acres would be managed under VRM Class I objectives to maintain 24% of the planning area as undeveloped, pristine landscape, and 228,041 acres would be managed under VRM Class II objectives (with 13% of the Monticello PA managed for high-quality landscapes). Visual resource management under VRM Class III and IV objectives would total 1,130,585 acres (with 63% of the planning area managed for moderate to high levels of visual resource impacts). Compared to the Alternative A, the Proposed Plan would manage 51,414 more acres for the highest level of visual resource preservation under VRM Class I than indicated by the visual resource inventory (an increase of 3 %), and 127,071 fewer acres of high-visual quality protection under VRM Class II objectives (a decrease of 7%). Management under VRM Class III and VRM Class IV objectives for the Proposed Plan would increase the number of acres under these management classes by 75,904 (a 4% increase, when compared to the visual resource inventory under Alternative A). This would result in greater adverse impacts to visual resources than Alternative A because, while there would be long-term, beneficial impacts on visual resources by managing more acres at the highest level of resource protection under VRM Class I than indicated by the visual resource inventory, fewer acres within the planning area would be managed to preserve high-quality scenic landscapes under VRM Class II. Also, more acres within the Monticello PA would be managed to permit surface disturbances, development, and man-made alterations of the existing landscape under VRM Class III and VRM Class IV than indicated by the visual resource inventory under Alternative A.

4.3.18.3. VISUALLY SENSITIVE AREAS

4.3.18.3.1. LOCKHART BASIN

The area proposed as the Lockhart Basin ACEC was visually inventoried as VRM Class II and is currently designated as VRM Class III, with an objective of partially retaining the existing character of the landscape, permitting a moderate level of change to the landscape that does not

dominate the view of the casual observer. Portions of the basin lie within the 8,642-acre Indian Creek ACEC (managed under VRM Class I objectives for scenic values).

Management decisions under Alternative A would have visual resource-related impacts on the area because surface-disturbing activities and viewscape changes would be allowed. Under this alternative, the RFD of mineral resources, based on geophysical surveys of the Paradox Fold and Fault Belt that includes Lockhart Basin, predicts that an average of 25 natural gas exploration wells could be drilled within the belt during a 15-year period after approval of the RMP. If natural gas exploration and/or other mineral resource development projects were conducted within Lockhart Basin, then the VRM objectives that permit moderate levels of change to the landscape would have long-term, adverse impacts to visual resources from surface disturbance and visual resource degradation for those viewing Lockhart Basin within the Monticello PA. The impacts would include short-term surface-disturbance-related impacts to visual resources caused by drilling rigs, seismic exploration lines, and natural gas or oil exploration well pads. Long-term impacts would include increased visual contrasts caused by soil and vegetation surface disturbances, and visual contrasts from pipelines, well pad access roads, exploration and/or production well pads, natural gas extraction and compression infrastructure and facilities, and minerals-related vehicle traffic.

When viewed from the points of view looking down into the basin (from Island in the Sky in Canyonlands National Park, from Dead Horse Point in Dead Horse Point State Park, and from the Canyon Rims SRMA in the Moab FO planning area), the potentially adverse short-term and long-term impacts to visual resources from minerals-related surface disturbances would be the same as when viewed from within the Basin, but to a greater degree. The impacts to scenic quality would be greater because of: 1) the likelihood that standard BLM visual resource impacts mitigation and minerals BMPs (e.g., camouflaged and/or low profile structures, edge feathering, topographically hidden disturbances or visual intrusions, reclamation of well drilling pads and roads) would not be effective when viewed from above the Basin; 2) the angle of view looking down into the Basin would likely show more adverse, surface-disturbance impacts and visual contrasts than when viewed from ground-level within the Basin; and 3) the high level of scenic quality within Lockhart Basin (as determined by the visual resource inventory), when viewed from the surrounding elevated points of view, would likely heighten the potential surface-disturbance-related contrasts created by minerals development.

Under Alternatives B and E, Lockhart Basin would be managed as a 47,783-acre ACEC for protection of scenic values under VRM Class I designation, with the objective of preserving the existing character of the landscape. A very low level of visual change would be permitted under this VRM management objective, and the level of change would be to a degree that would not attract casual viewer attention. The impacts on scenic quality under these alternatives would be beneficial in the long-term because surface-disturbing activities, visual intrusions, and potential visual contrasts would be greatly restricted or prohibited. Any proposed natural gas well drilling and minerals resource development within the Paradox Fold and Fault Belt area would likely not impact the Lockhart Basin because of the VRM restrictions placed on potential changes to the existing scenic quality of the area. From points of view within the Basin and above the Basin, the impacts on visual resources would be negligible to minor. Compared to Alternative A, these similar alternatives would be more beneficial to visual resources within Lockhart Basin because of the increased protection of visual resources (comparable to visual resource inventory Class I even though the area was visually inventoried as having a Class II level of scenic quality).

It should be noted that under Alternative E, approximately 21,298 acres of area managed under VRM Class I objectives as non-WSA lands with wilderness characteristics would lie within the proposed ACEC boundary, but because the area would be protected as VRM Class I under Special Designation Area management decisions for both alternatives, the impacts to visual resources would be the same.

Management decisions under Alternative C and the Proposed Plan would not designate Lockhart Basin as an ACEC for protection of scenic values. This alternative would designate the area that abuts the Moab FO planning area as VRM Class II (10,573 acres or approximately 22% of the basin) and the rest of the basin as VRM Class III. The VRM Class II management objectives would retain the existing character of the landscape, permitting a low level of change to the landscape that should not attract the attention of the casual observer. The impacts on visual resources in the area managed under VRM II would be beneficial in the short-term and long-term because visual resource objectives would maintain scenic quality at levels consistent with the area's inventoried scenic quality and viewer sensitivity. The impacts to visual resources in the area designated as VRM Class III would be similar to those described under Alternative A.

Under Alternative C and the Proposed Plan, the area would be open for mineral leasing, subject to Standard and Timing and Controlled Surface Use lease stipulations. An estimated 24 natural gas exploration wells could be drilled within the Paradox Fold and Fault Belt within 15 years after approval of the RMP. If natural gas exploration and/or development activities were conducted within Lockhart Basin, then there would be the likelihood of short-term and long-term surface-disturbance and visual intrusion-related impacts to visual resources within the designated VRM Class III areas of the basin the same as those described under Alternative A. The designated VRM Class II areas would require more impacts mitigation in order to meet the VRM Class II objectives, so the impacts to visual resources would be minor. For those viewing the Basin from within the Monticello PA and at points looking down into the basin, the impacts within the designated VRM Class III area would be the same as those discussed under Alternative A because the VRM objectives would be the same. For viewers looking into the designated VRM Class II area of the Basin from the Monticello PA perspective, there would be minor impacts to visual resources from minerals-related surface disturbances because a small degree of visual contrasts and visual degradation would be permitted. For those viewers looking down into the Basin from elevated points of view within the VRM Class II area, the short-term and long-term, adverse impacts to scenic quality (as discussed under Alternative A) would be reduced because of the reduced level of permitted disturbances to scenic quality, but the impacts would be visible to the viewers for the same reasons as discussed under Alternative A: the angle of view would more clearly expose surface disturbances and contrasts, and mitigation would not likely be effective at reducing visual contrasts and intrusions. Compared to Alternative A, Alternative C and the Proposed Plan would be similarly adverse to visual resources in the VRM Class III area because the proposed VRM Class III objectives would allow scenic quality within the Basin to be degraded to a greater level than indicated by the visual inventory's VRM Class II rating. The area designated as VRM Class II would be more beneficial to visual resources because it would be managed for greater scenic quality protection, consistent with the visual resource inventory.

Alternative D would not designate Lockhart Basin as an ACEC. The area would be designated as VRM Class III, with the same impacts as those discussed under Alternative A because the management decisions are similar. Under this alternative, the area would be open for mineral leasing, subject to Standard and Timing and Controlled Surface Use lease stipulations. An

estimated 25 natural gas exploration wells could be drilled within the Paradox Fold and Fault Belt within 15 years after approval of the RMP, with short-term and long-term impacts on visual resources as discussed under Alternative A.

4.3.18.3.2. INDIAN CREEK

Under Alternative A, the Indian Creek ACEC was visually inventoried and is currently designated as VRM Class I, with visual resource impacts similar to those discussed under Lockhart Basin Alternative B: the visual resource class objectives of preserving the existing character (and high scenic quality) of the landscape would limit impacts to visual resources to a very low level. Alternatives B, C, and E and the Proposed Plan would also manage the proposed ACEC as VRM I, with negligible impacts to visual resources, comparable to Alternative A. Alternatives A, B and E would manage the ACEC within 8,510 acres; Alternative C and the Proposed Plan would manage the area as a 3,908-acre ACEC. Note that for Alternative E, approximately 3,887 acres designated as non-WSA lands with wilderness characteristics would be managed under VRM Class I objectives; however, the impacts to visual resources would not change as the proposed ACEC would be managed under VRM Class I management objectives through Alternative E special designation management decisions.

Management decisions under Alternative D would not designate Indian Creek as an ACEC. The area would be designated as VRM Class III, allowing moderate changes to the characteristic landscape from activities that attract attention but do not dominate the landscape, and with the objective of partially retaining the landscape's existing character. Portions of the area would be open to mineral leasing under Timing stipulations, with minerals RFD in the Paradox Fold and Fault Belt the same as discussed under Alternative D for Lockhart Basin. The potential short-term and long-term impacts to visual resources would be similar to those discussed under Lockhart Basin, except that there would be no distinction between points of view looking down versus across the area of disturbance.

Compared to Alternative A, there would be more adverse, long-term impacts to visual resources under Alternative D within the Indian Creek area because a 1) a higher degree of surface disturbances and visual contrasts would be allowed under VRM Class III management objectives, and 2) the proposed VRM Class III objectives would permit scenic quality to be degraded to a greater level than indicated by the visual resource inventory Class I level for the area.

4.3.18.3.3. VALLEY OF THE GODS

Under Alternative A, the 31,387-acre Valley of the Gods was visually inventoried and is designated as VRM Class I, with surface disturbance impacts required to be compatible with the very low degree of visual resource change allowed under this class objective. Valley of the Gods is currently designated as a special emphasis area for scenic values within the Cedar Mesa ACEC. The valley lies within the Monument Upward mineral resources survey area, and the predicted RFD average number of natural gas exploration wells within this survey area for this alternative during a 15-year period after approval of the proposed RMP would be 9 wells. Visual resource values are high in this area, and the Open minerals leasing category would require NSO stipulations. Any exceptions to these stipulations would require that visual mitigation measures reduce impacts to meet the current VRM I Class objectives. Thus, the impacts to visual resource values under this alternative would be negligible.

The impacts under Alternatives B, C, and E, and the Proposed Plan would be the same as those discussed for Alternative A because the VRM Class I objectives would also be applied under these alternatives and under the Proposed Plan: the valley would be designated as the 22,863-acre Valley of the Gods Scenic ACEC.

As noted above for Lockhart Basin regarding lands with non-WSA wilderness characteristics, the Valley of the Gods under Alternative E would contain approximately 20,743 acres of non-WSA lands with wilderness characteristics. However, as previously discussed, Special Designation Area management decisions would apply VRM Class I objectives to the area under Alternative E, so management of these VRM Class I non-WSA lands with wilderness characteristics would not affect visual resource management because VRM Class I objectives would be applied to all of the proposed ACEC.

Under Alternative D, the Valley of the Gods area would not be designated as an ACEC and the VRM Class III designation and management objectives would be applied, as described under Lockhart Basin Alternatives C and D above. Under this alternative, the area would be open to mineral leasing with standard stipulations; however, as discussed above, the average predicted RFD of mineral resources would be 9 natural gas exploration wells within the Monument Upwarp minerals survey area after approval of the proposed RMP. If mineral resource development was conducted within the Valley of the Gods area, the short-term and long-term impacts from mineral development would be similar to those discussed for Lockhart Basin Alternatives C and D, with the exception that there would be no distinction between points of view looking down versus across the area of disturbance.

4.3.18.4. SUMMARY OF IMPACTS

The visual resources analysis assumed that VRM Class I and II areas would receive the highest level of visual resources protection, and that VRM Class III and IV areas would receive less visual resources protection. So, VRM Classes III and IV would allow more surface-disturbing impacts and potentially have greater adverse impacts on visual resources than those areas managed under VRM Classes I and II. Table 2.2 of Chapter 2 shows the impacts to visual resources in terms of acreages affected for each alternative.

The impacts to visual resources within selected visually sensitive areas within the Monticello PA would be as follows.

4.3.18.4.1. LOCKHART BASIN

Under Alternative A the visual impacts from potential surface disturbances and visual intrusions would be moderately adverse in the long-term when viewed within and from areas surrounding the basin because of the current VRM Class III designation and management objectives for the area that would permit visible surface disturbances to and degradation of visual resources that have been inventoried as having VRM Class II scenic quality. Alternatives B and E would permit minor to negligible changes to visual quality under proposed VRM Class I designation and management objectives, thus retaining the existing scenic quality when viewed from within and from surrounding points of view. Alternatives C and D and the Proposed Plan would manage the area under VRM Class II and Class III objectives, which would allow moderate change to the characteristic landscape, with permitted changes to visual resources from potential oil and gas activities. The impacts to visual quality under Alternatives C and D and the Proposed Plan would

be the most adverse, when compared to Alternatives A, B, and E by allowing substantial visual quality degradation within an area of high scenic quality.

4.3.18.4.2. INDIAN CREEK

Under Alternative A, the visual resource class objectives of preserving the existing character (and high scenic quality) of the landscape would limit impacts to visual resources to a very low level. Alternatives B, C, and E and the Proposed Plan would also designate the proposed ACEC as VRM Class I, with negligible to very minor impacts to visual resources, comparable to Alternative A. Alternative D would designate the area as VRM Class III Class, with management objectives that would allow moderate changes to the characteristic landscape, with a greater degree of permitted degradation of visual resources than the other alternatives and the Proposed Plan.

4.3.18.4.3. VALLEY OF THE GODS

Under Alternative A, this highly scenic ACEC was visually inventoried and is designated as VRM Class I, with surface disturbance impacts required to be compatible with the very low degree of permitted visual resource change. Alternatives B, C, and E and the Proposed Plan would have impacts similar to those for Alternative A because the VRM Class I designation and resource objectives would be applied under these alternatives and the Proposed Plan. Alternative D would not designate the area as an ACEC and VRM Class III designation and class objectives would be applied, with permitted impacts to and potential degradation of the area's visual resources.

4.3.18.5. MITIGATION MEASURES

Based on visual resource mitigation techniques described in BLM Manual H-8431-1, mitigation to minimize visual impacts resulting from facility development would include (but are not limited to):

- modifying facility design to reduce profile or height;
- applying appropriate coloring to facilities and structures as camouflage;
- planning and placement of roads and facilities to take advantage of local landscape features to hide these man-made features; and
- using local topography to hide surface-disturbing impacts or reduce visual contrasts.

All surface-disturbing activities would be subject to the VRM class objectives of the area where surface-disturbing activities would be proposed. The VRM visual contrast rating system would be used to assess the potential site-specific impacts of project surface disturbances, and to guide facility placement and facility design to mitigate the impacts to visual resources.

4.3.18.6. UNAVOIDABLE ADVERSE IMPACTS

Woodland harvesting, vegetation treatments for control of exotic species and fire management, the development of energy and communication sites, cross-country (open) OHV travel, and minerals resources exploration and development would likely cause short-term and long-term, unavoidable, adverse impacts on visual resources that would not be completely mitigated by camouflage coloring, facility placement or design, topographic screening of construction-related

surface disturbance impacts or structures, or other site-specific visual resources mitigation techniques.

4.3.18.7. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

Disturbance due to vegetation treatments for fire management, facility/campground construction, range improvements, mineral development and exotic species control would have short-term impacts on visual resources. However, some of these activities, such as vegetation treatments, exotic species control, and fire management would also have long-term, beneficial impacts on visual resources and scenic quality by reducing the potential for visual quality degradation from wildland fire, or by producing variations in vegetation communities that would create a more diverse (and a potentially more visually interesting) landscape. Accordingly, these short-term resource uses would not result in a loss in the long-term productivity of visual resources in the planning area.

The short-term impacts of exploratory well pad and associated access road construction would also likely cause a long-term loss or degradation of scenic quality in those areas where vegetation re-growth and establishment is slow or difficult. Additionally, the bulk of this development and its associated impacts to visual resources would be visible in the long term. However, the relatively small amount of predicted oil and gas drilling is unlikely to result in a loss of the long-term productivity of visual resources in the Monticello PA.

4.3.18.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

Irreversible impacts to visual resources would be produced if visual resource-related cultural resources, such as pictographs, petroglyphs, and prehistoric and historic structures were damaged or destroyed by other resource use activities (e.g., minerals exploration and development, recreation, OHV cross-country travel, fire management). However, substantial impacts of this type are unlikely due to the protection afforded these resources by Section 106 of the National Historic Preservation Act. Irretrievable impacts to visual resources would also be produced by surface disturbances such as mineral development, access road construction, facility construction, fire management, and vegetation treatments. This irretrievable loss would be most apparent in those areas of particular visual sensitivity noted above and under those alternatives that propose lower visual protections for those areas. The visual resources impacted by such developments would be irretrievably lost until those areas are rehabilitated or restored. However, because they can be restored, these impacts would not be irreversible.

4.3.19. WILDLIFE AND FISHERIES

This chapter provides the scientific and analytic basis for the comparisons of alternatives and the Proposed Plan. The probable consequences of each alternative and the Proposed Plan on wildlife resources are discussed in this section, beginning with impacts common to all alternatives and the Proposed Plan and proceeding to a discussion of the Proposed Plan's and each alternative's impact on wildlife and fisheries resources. All acreages and percentages reported in this Wildlife and Fisheries section are approximations.

Table 4.241 summarizes where wildlife species are found in the Monticello PA by habitat type. These representative species were chosen for their high public interest, such as deer and elk, or because they represent an important ecological group, such as neotropical birds. The Wildlife and Fisheries section in Chapter 3 (Section 3.20) explains the connection between specific habitat types and associated wildlife in more detail. The quantitative analyses in this section reflect impacts by habitat type, since the wildlife species in the PA are too numerous to analyze for individual species.

Table 4.241. Grouping of Wildlife Species by Native Habitat Type

Vegetation/ Habitat Type	Wildlife Associations
Aquatic*	Amphibians, fish.
Cliff/Rock*	Raptors, desert bighorn sheep, reptiles.
Conifer/Mountain shrub	Mule deer, elk, mountain lion, black bear (primarily old growth), neotropical birds, upland game birds, reptiles.
Desert scrub	Pronghorn, desert bighorn sheep, elk (winter), raptors, neotropical birds, upland game birds, reptiles.
Pinyon-juniper	Mule deer, elk, pronghorn, mountain lion, neotropical birds, upland game birds, reptiles.
Riparian/Wetland*	Mule deer, elk, mountain lion, neotropical birds, upland game birds, amphibian and fish species, reptiles.
Sagebrush/Perennial grass	Mule deer, elk, mountain lion, neotropical birds, upland game birds, reptiles.

* Aquatic and Cliff / Rock habitats are not generally discussed in subsequent analyses. Most impacts to wildlife species are terrestrially based, and there are only a few acres of cliff/rock habitat in the Monticello PA.

4.3.19.1. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Under all alternatives and the Proposed Plan, the BLM would continue to cooperate with the UDWR to benefit native and naturalized fish and wildlife species in the long term by introducing, transplanting, augmenting, or reintroducing the species to historic or suitable ranges. Wildlife would benefit from guzzler installation and/or spring development in areas lacking proper water distribution or natural water sources. Habitat objectives would be considered in all reclamation activities, and priority given to meeting Standards for Healthy Rangelands (BLM 1997). The BLM would continue to allot 17,300 acres to wildlife, which would include parts of the slopes of Peter's Canyon and East Canyon. In addition, BLM would adhere to fence standards to allow wildlife movement when fences are being developed or maintained and adhere to BLM

Habitat Management Guidelines for the American Pronghorn Antelope (BLM 1981 as revised). Predator management would continue to be coordinated with APHIS-Wildlife Services and UDWR under the existing MOU with APHIS-Wildlife Services.

In seasonal wildlife protection areas wildlife would benefit from special conditions regulating use during certain seasons. These special conditions would not affect maintenance and operation activities for mineral production or hunting during recognized hunting seasons.

Most of the acreages listed describe areas to be protected with timing stipulations. These protections will benefit the four big game species for which the protections are designed by reducing surface disturbance and other human-related disturbances; they will also benefit other wildlife species such as birds, small mammals, and reptiles that use the same habitats.

Under all alternatives and the Proposed Plan, protections for deer and elk habitat occur primarily in sagebrush/perennial grass and pinyon-juniper woodlands, while those in pronghorn habitat occur primarily in desert shrubland. Land protected for desert bighorn is dominated by both desert shrub and pinyon-juniper woodland. Therefore, wildlife species that occur in sagebrush perennial grass, pinyon-juniper, and desert shrub habitats (see Table 4.241 at the beginning of this section) would be likely to benefit most from the special protection of big game habitats.

The BLM would pursue appropriate NRHP designation of eligible sites under current policy and guidelines as management decisions for cultural resources under all alternatives and the Proposed Plan. New field inventories would be identified based upon probability for unrecorded significant cultural resources. In all land and resource use authorizations, the BLM would comply with Section 106 of the NHPA, the Native American Graves Protection and Repatriation Act (NAGPRA), and other federal and state laws specific to cultural resource management. In so doing BLM would consult with the State Historic Preservation Officer (SHPO), Tribes, and other interested parties. Any impacts to NRHP-eligible cultural resources would be mitigated. Sites, structures, objects, and traditional use areas that are important to Tribes would be protected to maintain the viewshed, intrinsic values, and the auditory, visual, and esthetic settings of the resources. Finally, since McLoyd Canyon-Moon House Management Zone and Grand Gulch National Historic District are within WSAs these areas would be managed under the IMP though management prescriptions for cultural resource protection vary between alternatives and the Proposed Plan. All these management decisions would have long-term beneficial impacts on wildlife since they generally result in avoidance or mitigation of surface-disturbing activities in potential habitat. Impacts common to all alternatives and the Proposed Plan related to the Cedar Mesa Cultural SRMA are discussed in Section 4.3.19.3.12 Impacts of Recreation Decisions on Wildlife and Fisheries.

The following lands and realty decisions would impact wildlife and fisheries in the Monticello PA: access, easements, leases and permits, utility/transportation systems, exchanges, disposals, and withdrawals. The Monticello FO AMS Chapter 7 contains a complete list of common realty issues the Monticello FO can expect (BLM 2005c). Under all alternatives and the Proposed Plan, lands adjacent to Recapture Lake and land for two water treatment facilities and two airports would be identified for disposal in the Monticello PA. Total acreage of the land disposal would be approximately 8,879 acres. Because of the proposed uses of the areas identified for disposal, there is the potential for adverse impacts on wildlife resources on these lands due to loss of habitat. These adverse impacts would be reduced by required revegetation and/or minimization of surface disturbance in sensitive habitats. In addition, this disposal would lead to the potential

acquisition of sensitive species habitat and relict vegetation areas as part of the exchange program, which would decrease the magnitude of the adverse impacts associated with the loss of native habitat in the Monticello PA. The implementation of the lands and realty program would have both short- and long-term adverse impacts on wildlife resources in the Monticello PA due to the surface-disturbing activities associated with land and realty decisions. Some adverse impacts would be reduced because of the many withdrawals and excluded areas that help preserve and protect sensitive environmental resources and areas. Other protection measures that would help to reduce the adverse impacts of this program on wildlife resources would include the acquisition and retention of any TES habitat, quality riparian areas, and key productive ecosystems.

Applications for lands and realty-related filming permits would have to meet the following criteria for approval: no impact to sensitive species habitat, no use of exotic species, no use of pyrotechnics or explosives, no more than temporary impacts to land, air, and water, and no adverse impact on relict environments or riparian areas. Applications for filming permits for activities in WSAs, WSR corridors, NRHP-eligible sites, and Native American sacred sites would have to meet additional criteria for approval (no significant use of livestock and a maximum of 15 vehicles and 75 people in the sensitive area). The increased human traffic, with attendant trampling of habitat and vegetation removal associated with filming operations could result in short- and long-term adverse impacts on vegetation resources and consequently, wildlife habitat. Filming operations also result in noise and visual disturbance to wildlife from the presence of humans. Adverse impacts would be reduced by adherence to the minimum impact criteria listed above.

For all alternatives' and Proposed Plan impacts from lands and realty decisions, Monticello FO AMS Chapter 7 contains a list of ACECs and SRMAs closed to ROWs in the Monticello PA. These closures would benefit wildlife by reducing human traffic and habitat disturbance. However, all areas not identified as avoidance or exclusion would be available for ROWs and could be subject to multiple-use terms on a case-by-case determination (BLM 2005c). The use of ROWs for utility and communication infrastructure could have direct, short- and long-term adverse impacts on wildlife due to loss of habitat, habitat fragmentation, and short-term human disturbance during construction activities.

Under all alternatives and the Proposed Plan, livestock grazing would be managed according to the Guidelines for Grazing Management to achieve the Standards for Rangeland Health, which would benefit wildlife by maintaining or restoring the proper functioning condition (PFC) of riparian and wetland wildlife habitat, maintaining desired species (including native and special status species) at a level appropriate to the site and conditions, and maintaining or improving aquatic habitat by ensuring that all state and federal water quality standards are met. Grazing would continue to be unavailable on 125,356 acres (specific areas identified in Table 2.1) and 17,300 acres in Peter's Canyon and East Canyon would continue to be allotted to wildlife. Management decisions common to all alternatives and the Proposed Plan would make livestock grazing unavailable on certain allotments, directly benefiting big game by making more forage available. Alternatives that make fewer areas unavailable to livestock grazing would expose big game to the adverse impacts of competition for forage and cover. Livestock grazing in riparian areas could have adverse impacts on riparian-associated wildlife species (see Table 4.241). Direct adverse impacts would include competition with wildlife for forage, and possible trampling of individual animals or nests. Indirect adverse impacts of livestock use of riparian

areas include an increased susceptibility to invasion by noxious weeds, which reduce the value of forage, and reduction of cover species for sensitive wildlife (Popolizio et al. 1994; Kauffman et al. 1983; Sarr et al. 1996). Bird species that rely on native riparian trees for nesting and roosting sites and protection from predators would be adversely affected by the replacement of native vegetation with introduced species (Saab et al. 1995). Fish, amphibian, and other aquatic species would be adversely impacted if improper livestock grazing caused erosion in saline soils. This would contribute to increased salinity in surface waters in the Monticello PA, which could modify species composition within an ecosystem (Galindo-Bect and Glenn 1999; Hart et al. 1998) and cause mortality of freshwater species (Nelson and Flickinger 1992). Sedimentation can have similarly adverse impacts. Soil compaction due to grazing in riparian areas would result in less rainwater infiltration into soils and more overland flow. The result would be large, short-lived flows rather than small, perennial flows (Trimble and Mendel 1995). This would reduce the duration of seasonal water availability for a wide range of wildlife species.

Under all alternatives and the Proposed Plan adverse long-term impacts from minerals decisions on wildlife and their habitats would include habitat loss and fragmentation and subsequent occupation of areas for oil and gas well pads, open pit mines, and associated roads and infrastructure. These long-term impacts would also result in wildlife avoidance of these areas, reducing their value as habitat. Many species of wildlife avoid areas with high or inconsistent levels of noise, roads with frequent automobile/truck traffic, areas that are brightly lit at night, and areas surrounding human-built structures. Adverse short-term impacts include degradation resulting from the removal of vegetation (surface disturbance) and wildlife avoidance of disturbed areas. Surface disturbance would also increase the potential for invasion of undesirable plant species, including noxious weeds (Piemeisel 1951). The loss of native vegetation would result in long-term adverse impacts on wildlife by decreasing the amount of available habitat and degrading existing habitat. Wildlife species that use pinyon-juniper habitat would likely be the most heavily impacted by surface disturbance and related impacts due to oil and gas well development since pinyon-juniper habitat is the most common habitat type in the Monticello PA. Wildlife species that use desert scrub would likely be the next most heavily impacted by surface disturbance related impacts since desert scrub is the next most common habitat type in the Monticello PA (see Table 4.242 below).

Adverse impacts of minerals decisions on wildlife resources would be reduced by the implementation of BMPs outlined in Section 2.1 and Appendix M. These include NSO stipulations in riparian habitat, required revegetation of oil and gas well sites upon project completion, and land management decisions that meet or move toward meeting Utah's Standards for Rangeland Health. In addition, the implementation of BMPs for the benefit of wildlife and their habitats (e.g., centralization of drill rigs and storage tanks, reduction of the number of access roads, and interim and final reclamation practices) would also reduce some of the short- and long-term adverse impacts listed above. Interim reclamation occurs during the operational phase of a project and consists of revegetating all areas surrounding wells and roads that are not actively used during oil or gas production. Final reclamation occurs when a well has been decommissioned and includes the practices of recontouring soil surfaces to match surrounding landforms, replacing topsoil, and reseeding with native plant species. The number of years required for successful final reclamation would depend on the habitat type; grasslands recover more quickly than sagebrush or desert shrub, which recover more quickly than forested areas such as pinyon-juniper or conifer habitat. A commonly used average value and goal for

reclamation across the project is 10 years. Following the successful reclamation of a well site or road, the long-term adverse impacts to wildlife species would be largely eliminated.

Table 4.242. Percentages of Vegetation/Habitat Types that Occur in the Monticello PA

Vegetation Types	Monticello PA
Agriculture	0.3%
Conifer and Mountain Shrub	0.6%
Desert Scrub	23.6%
Developed	0.0%*
Disturbed	0.4%
Invasive Species / Noxious Weeds	0.2%
Pinyon-Juniper	64.3%
Riparian / Wetland	1.2%
Sagebrush / Perennial Grasslands	9.3%
Water	0.1%
Total	100.0%

*Values have been rounded to the nearest tenth of a percent. A value of 0.0% does not necessarily indicate that there are no acres of that vegetation type on the land – only that they are less than 0.1% of the total acres.

The amount of land that is open to oil and gas leasing or other mineral use is not necessarily indicative of the number of acres that will be directly disturbed. Areas managed under Standard or Timing and/or Controlled Surface Use stipulations allow minerals development, but all of those acres would not be subjected to surface disturbance. Areas categorized as NSO or Closed exclude all surface-disturbing minerals development. Riparian and wetland habitat, lands with a slope greater than 40%, and VRM Class I areas have been excluded from analysis because they have been assigned the leasing category of NSO, which excludes them from all surface disturbance. The impacts of minerals decisions are analyzed for the entire Monticello PA rather than for each individual RFD area for the purposes of comparison. Impacts may be concentrated in particular RFD areas, however. Depending on the distribution of wildlife habitat across particular RFD areas with high levels of disturbance, the amount of particular habitats disturbed may not match the composition of vegetation in the Monticello PA. The Blanding Sub-basin and Paradox Fold and Fault Belt RFD areas are projected to experience the greatest minerals development-related disturbances, and therefore impacts to wildlife and their habitat. These RFD areas contain predominantly pinyon-juniper habitat with desert scrub habitat as the second most common habitat. Of the three oil and gas development areas within the Monticello PA, wildlife habitat in the Blanding Sub-basin RFD area is expected to be most intensely impacted by minerals decisions because it has the highest predicted levels of oil and gas well development (41 wells total for 15 years under Alternative A). Site-specific analysis would be necessary to determine the exact impacts to wildlife from oil and gas development.

Under all alternatives and the Proposed Plan the primary impacts of recreation on wildlife would include surface disturbance of wildlife habitat by vehicles and non-motorized recreationists, the introduction and spread of noxious weeds, and direct mortality through wildlife collisions with

motor vehicles, and crushing of eggs or nests. In addition, many wildlife species (birds in particular) are sensitive to traffic and other human-caused noise. Traffic noise has been shown to directly interfere with bird vocal communication, which affects territorial behavior and mating success (Reijnen and Foppen 1994). Increased road traffic also increases the risk of direct mortality of wildlife species due to vehicle impacts; carrion-eating raptors and mule deer attempting to cross roads are especially vulnerable. Where designated, Special Recreation Management Areas (SRMAs) would reduce adverse impacts on wildlife by restricting recreation and reducing dispersed recreational activities in some habitat areas. In general, the impact of recreation decisions on wildlife and fisheries are expected to be minimal since areas used by recreationists are generally previously disturbed and recreationists are limited to and have a tendency to use established routes. Also, adverse impacts of recreation decisions would be partially mitigated by the required reclamation of disturbed areas to meet the Utah Standards for Public Land Health and Guidelines for Recreation Management and protective measures outlined for federally listed species under Impacts Common to All Alternatives and the Proposed Plan. In addition, careful recreation management through decisions on woodland harvesting and gathering, permit number limits, camping and travel controls, implementation of fees, alternation of when use takes place, group size limits, pet regulations, designated camping sites, and other similar decisions would help to mitigate some impacts.

Though the Comprehensive Travel Plan and OHV Area Designations are discussed under Recreation (Table 2.1) the impacts of recreation decisions on wildlife and fisheries resources are discussed in Section 4.3.19.3.17 Impacts of Travel Management Decisions on Wildlife and Fisheries. The impacts of general policy for issuance and management of Special Recreation Permits (SRPs) are not discussed as these impacts would be negligible. The impacts of recreation decisions dealing with the ERMA also are not discussed. Assuming that recreationists in the ERMA use established routes and either camp in previously disturbed areas only or stay within 150–300 feet of these routes (as specified under each alternative and the Proposed Plan) the difference between alternatives and the Proposed Plan in terms of the impacts of recreation decisions on wildlife and fisheries would be negligible. The impacts of recreation decisions regarding SRMAs are discussed below.

Under all alternatives and the Proposed Plan, riparian areas would be managed as NSO for oil and gas leasing. They would be open to mineral entry and disposal of mineral materials, but not in active floodplains or within 100 m of riparian areas. Woodland product collection would be prohibited in all riparian areas. In addition, the Utah Standards for Rangeland Health and Guidelines for Grazing and Recreation would be followed to achieve proper functioning condition (PFC). The BLM would avoid degradation of habitats that could result in the loss of riparian vegetation, and would implement the Southwestern Willow Flycatcher (SWFL) Recovery Plan where appropriate. These restrictions would decrease the intensity of surface disturbance in riparian habitat, which would benefit wildlife species that are found in riparian areas in the Monticello PA. However, because livestock grazing would be allowed in riparian areas under all alternatives and the Proposed Plan, there would be some direct and indirect adverse impacts to riparian-dependent wildlife resulting from trampling and knocking nests out of shrubs and trees, and impacts to riparian vegetation, soils, and water quality. Improper livestock grazing has been shown to have adverse impacts on riparian ecosystems (Armour et al. 1994) and it may be necessary to remove livestock from an area if it is determined that the site is "Functioning at Risk."

Soils and watershed decisions under all of the alternatives and the Proposed Plan would comply with Utah's Standards for Rangeland Health and Guidelines for Grazing and Recreation. In addition, all floodplains and riparian/wetlands would be managed in accordance with Executive Order 11988, which would protect the quality of stream water and federally listed species habitat. Uses in the Monticello PA would be managed to minimize and mitigate damage to soils, and activities located in areas with sensitive soils would be subject to site-specific NEPA analysis. These restrictions would decrease the number of acres in the Monticello PA subject to the adverse impacts of surface-disturbing activities on wildlife habitats, including surface water contamination and sedimentation by runoff from disturbed soils.

For impacts common to special designation areas under all alternatives and the Proposed Plan, special designation areas, such as ACECs, WSRs, and WSAs would generally have long-term beneficial impacts on the wildlife and fisheries that occur within their boundaries by limiting or preventing surface disturbance, human activities, and associated habitat degradation and fragmentation. Possible adverse impacts to wildlife that are associated with special designations decisions include restrictions on or the exclusion of habitat improvements, watershed improvements, and vegetation treatments in wildlife habitats included within ACECs, WSRs, or WSAs. The restriction of these decisions could adversely impact wildfire prevention practices (e.g., by preventing the thinning of young, fire-ladder trees) or adversely affect the ability to provide high value forage in a steep part of an eroding watershed. These restrictions could also potentially prevent the effective management of an area for wildlife habitat (e.g., preventing the encroachment of pinyon-juniper forest on sagebrush or grassland habitat). However, not all vegetation treatments would be beneficial to all wildlife species, as some species prefer woodlands while others depend on more open habitat for their survival. So, the exclusion of vegetation treatments in special designations areas would benefit some wildlife and adversely affect others. ACECs designated specifically to protect wildlife and vegetation would directly benefit wildlife species and their habitats. ACECs designated to preserve historic, cultural, and scenic values (as opposed to wildlife or vegetation) would indirectly benefit wildlife by limiting human and surface disturbance, preserving habitat or preventing noise. All ACECs are assumed to be beneficial to wildlife. Like ACECs, WSAs are assumed to beneficially impact wildlife resources through focused management. Under all alternatives and the Proposed Plan, WSAs would be managed under the Interim Management Policy and Guidelines for Lands under Wilderness Review (IMP), and are designated as VRM Class I. Also, 2,155 acres of non-WSA lands with wilderness characteristics contiguous to the Butler Wash WSA would be managed so as to maintain their wilderness values. Where ACECs overlap WSAs, WSA management would take precedence. The designation of a river as suitable for WSR status would beneficially impact wildlife that utilize habitats directly associated with the river (e.g., riparian, wetlands, open water) by mandating the protection of the river's "free-flowing character" and applying an NSO stipulation within 1/4 mile of the river.

For impacts common to all alternatives and the Proposed Plan pertaining to special status species decisions, no activities would be permitted on public lands that would jeopardize the continued existence of plant or animal species that are listed, officially proposed, or candidates for listing as Threatened and Endangered (T&E). The BLM would commit to current and future conservation agreements, management plans, and recovery plans specific to T&E and BLM Sensitive Species, as described in Table 2.1. Although meant to protect and conserve special

status species, the decisions would also benefit other wildlife species that share habitat with the targeted special status species.

Under all travel alternatives and the Proposed Plan, non-mechanized travel would be limited to designated routes and would continue to be managed under the 1991 San Juan RMP and under closure and restriction notices published in the Federal Register. Also under all alternatives and the Proposed Plan, three National Scenic Byways and three National Scenic Backways would be established (Table 2.1). These management prescriptions are not likely to result in appreciable impacts on wildlife or wildlife habitat since they are existing routes already in use.

Under vegetation decisions impacts common to all alternatives and the Proposed Plan, seed gathering and plant collection would be allowed in all areas meeting Utah's Rangeland Health Standards. This could have short-term, direct, adverse impacts on wildlife species and habitat due to trampling and human disturbance during collection activities, and in some cases depletion of food sources for some species. The spread of noxious, invasive, and non-native weed species would be controlled through implementation of the BLM weed management policies and action plans and by requiring pack stock and riding stock users to use certified weed-free feed. Restoration/rehabilitation activities would also be required to use certified weed-free seed mixes, mulch, fill, etc. Actions taken to help slow/stop the spread of weeds in the Monticello PA would help reduce the adverse impacts of surface disturbance associated with stock use, oil and gas development, and other activities that result in an adverse alteration of wildlife habitat. Sagebrush habitat would be managed under the Sage-grouse Habitat Conservation Strategy (BLM 2004d), which would have long-term beneficial impacts on wildlife species that utilize sagebrush habitat (Monsen 2004).

Under all alternatives and the Proposed Plan for decisions related to visual resources, lands in the Monticello PA would be managed under one of four visual resource management classes (described in Section 3.19). All WSAs would be designated and managed as VRM Class I. Limited and very limited management activities would be allowed in these areas including non-mechanized short-term vegetation treatments and other surface-disturbing activities designed to enhance wildlife habitat. Similar restrictions on surface disturbances apply in designated VRM Class II areas. These types of disturbances could have minor short-term adverse impacts on wildlife habitats due to human traffic and temporary habitat disruption, but in the long-term these impacts benefit wildlife. Some areas that are classified as VRM Class I or II may be late succession areas with a monoculture of plant species. Not allowing vegetation treatments in these areas would have a long-term adverse impact on some wildlife species that benefit from a mid-succession habitat type with more understory or varying types of plant species. In areas designated as VRM Class III or IV, changes to the landscape could be moderate or high. Most types of vegetation treatments and other surface-disturbing activities would be allowed in these areas. These types of disturbances could have long-term adverse or beneficial impacts on wildlife habitats in the Monticello PA, depending on the extent or type of treatment.

Under all alternatives and the Proposed Plan for woodlands, the Healthy Forest Initiative and the Healthy Forest Restoration Act of 2003 would be implemented. In addition, National BLM Forest Health and Forest Management Guidelines would be followed. These decisions would partially mitigate the adverse impacts of woodland harvesting on wildlife species and their habitats in areas of the Monticello PA open to wood harvesting. Woodland treatments would be prioritized in high value/high risk areas including FRCC III, Wildland Urban Interface (WUI),

and developed recreation facilities. These projects would allow for harvest of woodland products. Further, live woodland harvest would be allowed in areas with pinyon pine and juniper encroachment with a focus on creating sagebrush steppe communities. This action would result in short-term adverse impacts on mule deer and elk summer habitats due to temporary human disturbances, but in creating sagebrush steppe communities, it would have long-term beneficial impacts on mule deer and elk winter habitats. Finally, all non-WSA lands with wilderness characteristics would be closed to woodland product use, with long term, beneficial impacts on habitat from reduced human disturbance.

Under all alternatives and the Proposed Plan adherence to the Migratory Bird Treaty Act and Executive Order 13186 "Responsibilities of Federal Agencies to Protect Migratory Birds" would have beneficial impacts on migratory birds including priority species identified on the current USFWS Birds of Conservation Concern list (2002 and as updated) and the Partners-in-Flight priority species list (as updated). The use of adaptive management strategies would more effectively conserve habitat and avoid impacts to these species. Avoidance of surface-disturbing activities and vegetation-altering projects, including broad-scale use of pesticides, during nesting season (May 1-July 30) would reduce adverse impacts on birds and their nesting habitats in the Monticello PA in the short-term. In the long-term vegetation-altering projects may improve habitat by providing more food sources and/or cover for birds or by helping to reduce fire risk. Further, the prioritization of habitat types most commonly used by migratory birds (lowland riparian, wetlands, and low and high desert shrub) for maintenance and improvement would increase the availability of high-quality habitat and reduce the adverse impacts of invasive plants (e.g., cheatgrass, tamarisk, Russian olive). Finally, in the Coordinated Implementation Plan for Bird Conservation in Utah, several Bird Habitat Conservation Areas were identified that would receive priority bird habitat conservation projects through cooperative funding initiatives that would benefit bird species (Martinsen et al. 2005).

Under all alternatives and the Proposed Plan raptors would benefit from the use of "Best Management Practices for Raptors and Their Associated Habitats in Utah" (BLM 2006c; see also Appendix M) and from adherence to USFWS Guidelines for Raptor Management. Seasonal and spatial buffers, as well as mitigation, would be used to maintain and enhance raptor nesting and foraging habitat, while allowing other resource uses. BLM would also cooperate with utility companies, UDWR, and USFWS to prevent raptor electrocution, and close areas near raptor nests to recreational and other activities if those activities might result in nest abandonment.

Under all alternatives and the Proposed Plan bighorn sheep would benefit primarily from prioritized habitat improvement projects on the five mesa tops (56,740 acres) within crucial habitat where potential conflict occurs between bighorn sheep and surface-disturbing activities. Further, livestock grazing and associated range improvement projects would not be allowed in these areas and mitigation to replace lost forage would be required for projects that disturb or remove forage and browse species used by bighorn sheep. Domestic sheep would not be allowed to replace cattle in crucial bighorn habitat to prevent disease transmission and competition for forage. Bighorn sheep would benefit from BLM adherence to the recommendations of the BLM Bighorn Sheep Rangeland Management Plan (BLM 1993b, as revised) and the 1996 (as revised) Utah BLM Statewide Desert Bighorn Sheep Management Plan.

4.3.19.2. IMPACTS COMMON TO ALL ACTION ALTERNATIVES AND THE PROPOSED PLAN

Management decisions for all action alternatives and the Proposed Plan for cultural resources would implement specific plans, Cultural Resource Management Plans (CRMPs), and a plan for the Cedar Mesa Cultural SRMA (discussed in Section 4.3.19.3.12, Impacts of Recreation Decisions on Wildlife and Fisheries) would be developed. These plans would include protective measures; Native American consultation; regulatory compliance; cultural monitoring systems; identification of sites needing stabilization and protective measures; development of research designs; designation of sites for interpretive/educational development; identification of areas for cultural inventory; and development of specific mitigation measures. Plans would also designate sites, districts, landmarks, and landscapes that would be nominated for inclusion on the NRHP. These management efforts would result in beneficial long-term impacts on wildlife as they would help prevent disturbance-causing activities.

Also under all cultural resources action alternatives and the Proposed Plan, BLM would: proactively manage wildlife risk around susceptible archaeological and cultural sites, reduce or eliminate threats from natural or human-caused deterioration or conflict with other resource use, and promote collaborative partnerships to help meet management goals and objectives for cultural resources. Further, identified at-risk cultural properties would be off limits to visitors with pets, climbing aids would be prohibited for access to ruins/cultural sites (except for emergencies or administrative needs), and cultural sites may be closed to visitation if they are at risk or pose visitor safety hazards.

Under all action alternatives and the Proposed Plan decisions for lands and realty, new avoidance and exclusion areas and transportation and utility corridors would be established (see Table 2.1). Avoidance and exclusion areas would have a long-term beneficial impact on wildlife by preventing surface disturbance in these areas. Transportation and utility corridors, on the other hand, would have short- and long-term adverse impacts on wildlife by allowing surface disturbance, associated noise and disruption during surface-disturbing activities, and from habitat fragmentation.

Under all action alternatives and the Proposed Plan, livestock grazing season of use changes would be implemented on several allotments (specific areas are identified in Table 2.1) throughout the Monticello PA. Also, desired utilization levels for key forage species would be identified, as needed, to achieve desired future conditions (DFC). In areas where utilization levels are not established, the level of use would be consumption of 50% of the current year's forage production.

Recreation decisions, under all action alternatives and the Proposed Plan, would not allow camping within 200 feet of springs, Benefits Based Management (BBM) goals would be in effect for each SRMA, and selected recreation sites would be developed or improved on a prioritized basis (see Table 2.1). Further, all SRMAs would be designated as *special areas* under the Land and Water Conservation Fund definition, which could translate into permit requirements and fee payments for use of these areas. Long-term, beneficial impacts to wildlife would result from each of these decisions from habitat preservation, except the recreation site development and improvements decisions, whereby further surface disturbance and loss of habitat would be expected from development and use of these sites.

Under all action alternatives and the Proposed Plan for special designation areas, cultural resource management plans would be written for Alkali Ridge, Cedar Mesa, Hovenweep, and Shay Canyon ACECs. These management plans would result in long-term benefits to wildlife since they would focus on protection of the cultural resources in these areas resulting in additional protection of wildlife resources by avoidance of surface disturbance and other disrupting activities.

Under all action alternatives and the Proposed Plan for travel, designated routes would be categorized for type of travel and adjustments to these categories would be made based on recreational demand and potential conflict. Impacts of adjustments would be analyzed and disclosed on the activity planning level. All non-motorized travel would be allowed on designated routes, and OHV travel would be allowed on the same routes unless otherwise designated. Routes in riparian areas classified as Functioning at Risk would be closed based on site-specific analysis of OHV impacts. A number of trails (Table 2.1) would be managed for non-mechanized use including foot travel, stock overnight use, and stock day use. These management prescriptions are likely to result in minor impacts to wildlife or wildlife habitat because they pertain to existing routes already in use.

Under vegetation action alternatives and the Proposed Plan, 30,000 to 50,000 acres of vegetation treatments in FRCC III areas would occur over a 15-year period. Certain sagebrush communities (Table 2.1) would be prioritized for treatment. These treatments would have short-term adverse impacts on wildlife by removing forage and cover and by causing noise and other human disturbance during treatment activities, but long-term beneficial impacts on wildlife by re-establishing the historic fire regime in treated areas. Also under all action alternatives and the Proposed Plan, greasewood would be removed in a number of areas (Table 2.1), which would have short-term adverse impacts on wildlife habitats in the treatment areas, but long-term beneficial impacts as a whole by removing undesirable, non-native plant species, and allowing the establishment of a diverse native vegetation community.

For visual resources, areas open to oil and gas leasing would be managed as VRM Class III or IV. Wild and scenic segments of WSRs would be managed as VRM Class I and II, respectively, while recreation segments would be managed under the same VRM Class as the surrounding lands.

Under all action alternatives and the Proposed Plan for woodlands, numerous sites (listed in Table 2.1) would be excluded from woodland harvesting except for limited onsite collection of dead wood for campfires. These exclusions would mitigate the adverse impacts of woodland product use on wildlife resources in areas of the Monticello PA open to woodland harvesting (see alternatives and Proposed Plan analysis below for a discussion of these adverse impacts).

4.3.19.3. ALTERNATIVES AND PROPOSED PLAN IMPACTS

Impacts varying between the alternatives and the Proposed Plan would primarily result from varying temporal and spatial restrictions on oil and gas leasing activities, geophysical work, and permitted or commercial OHV use in BLM managed wildlife habitats. These protections would benefit big game species by reducing surface disturbance and other human-related disturbances in critical locations and during critical times of the year. They would also benefit other wildlife species such as birds, small mammals, and reptiles that use the same habitats for the same reasons.

Management decisions related to air quality, health and safety, and paleontology would have a negligible impact on wildlife and fisheries and are excluded from the following analyses. The impacts would be negligible because protecting air quality by monitoring and maintaining constituent pollutants within established air quality standards, protecting public health and safety by reclaiming AML sites and managing hazardous materials within the PA, and allowing recreational and scientific fossil collecting would not affect wildlife species habitat protection and/or management.

4.3.19.3.1. ALTERNATIVE A

Under Alternative A varying acreages of crucial habitat would be closed to oil and gas leasing activities, geophysical work, and OHV use during certain times of the year for mule deer, pronghorn, and desert bighorn sheep (Table 4.243; Maps 78 and 100). These decisions would benefit these species by preventing disturbance in crucial habitat during critical use periods. For mule deer and desert bighorn sheep, portions of crucial habitat fall within ROS P-Class (recreation primitive areas) or SPNM-Class (semi-primitive non-motorized recreation areas) designated areas, which impose stricter conditions that take precedence over the temporal closures described. These conditions would benefit these species by further restricting surface-disturbing activities in crucial habitat. Additional measures affecting each species are discussed on a species by species basis below. Overall, Alternative A would provide the least amount of wildlife habitat subject to special wildlife conditions (540,260 acres) and therefore would benefit wildlife and fisheries the least.

Table 4.243. Acreage Closed and Season of Closure for Mule Deer, Elk, Pronghorn, and Desert Bighorn Sheep By Alternative

Species	Special Conditions	Alternatives					Proposed Plan
		A	B	C	D	E	
Mule Deer	Acres Closed	197,550	785,921	266,406	182,315	785,921	383,098
	Timing	12/15-4/30	11/1-5/15	11/15-4/15	12/1-4/15	11/1-5/15	11/15-4/15
	Days Closed	137	196	152	136	196	152
Elk	Acres Closed	N/A	191,173	97,471	62,484	191,173	97,471
	Timing	N/A	11/1-5/15	11/15-4/15	12/1-4-15	11/1-5/15	11/15-4/15
	Days Closed	N/A	196	152	136	196	152
Pronghorn	Acres Closed	12,960	29,365	29,365	13,961	29,365	29,365
	Timing	5/15-6/15	5/1-6/15	5/1-6/15	5/1-6/15	5/1-6/15	5/1-6/15
	Days Closed	32	46	46	46	46	46
Desert Bighorn Sheep	Acres Closed ¹	329,750	453,388	453,390	299,009	453,388	453,388
	Timing	a. 4/1-7/15 b. 10/15-12/31	a. 4/1-7/15 b. 10/15-12/31	a. 4/1-6/15 b. 10/15-12/15	a. 4/1-6/15 b. 10/15-12/15	a. 4/1-7/15 b. 10/15-12/31	a. 4/1-6/15 b. 10/15-12/31
	Days Closed	a. 106 b. 78	a. 106 b. 78	a. 76 b. 62	a. 76 b. 62	a. 106 b. 78	a. 76 b. 78

¹ The letter "a" denotes the acreage and timing for lambing and the letter "b" is for rutting.

4.3.19.3.1.1. Mule Deer

Proposed land treatments would be considered on a case-by-case determination on approximately 9,800 acres of sagebrush parks within crucial deer winter range. These sagebrush parks have been identified as providing a concentrated food source for wintering deer and land treatments in these areas would benefit deer by maintaining this food source.

4.3.19.3.1.2. Elk

Under Alternative A, no crucial elk habitat is identified. Excluding elk habitat considerations from management decisions would have an adverse impact on elk since there would be no consideration given to the species' minimum requirements for healthy herds and individuals.

4.3.19.3.1.3. Desert Bighorn Sheep

Under Alternative A, competition for forage and transmission of disease from domestic to wild sheep would be prevented by denying changes in kind of livestock from cattle to sheep in crucial desert bighorn sheep habitat. Desert bighorn sheep would benefit from these measures through increased forage and decreased incidence of disease within the population.

4.3.19.3.2. ALTERNATIVES B AND E

Under Alternatives B and E seasonal wildlife protection areas would have special conditions for all land-use activities except woodland harvest. All seasonal wildlife protection areas would be closed to oil and gas leasing activities, geophysical work, permitted or commercial OHV use, and low-flying aircraft during the established season. Noise impacts from pyrotechnics, shooting and similar activities during permitted filming would also not be allowed. Acreages subject to these special conditions vary by species, as do seasons of closure (see Table 4.243; Maps 79 and 101). All species would benefit from special conditions by protecting habitat during critical use periods. Additional measures affecting pronghorn are further discussed below. Total acreage subject to special wildlife conditions would be greater under Alternatives B and E than under Alternative A (Table 4.244).

Table 4.244. Total Acres Subject to Special Wildlife Conditions by Alternative and the Proposed Plan

	Alternatives					Proposed Plan
	A	B	C	D	E	
Acres	540,260	1,459,847	808,637 and 846,632	557,769	1,459,847	963,322

4.3.19.3.2.1. Mule Deer

Alternatives B and E would have more beneficial impacts on mule deer than Alternative A because of greater forage availability given the expanded seasonal wildlife protection area and the lengthened season of closure. The length of timing stipulations are of particular importance

because mule deer migration timing may vary each season due to weather severity and seasonal changes in the energy needs of the animal (Garrott et al. 1987).

4.3.19.3.2.2. Elk

Alternatives B and E would have greater beneficial impacts on elk than Alternative A because Alternatives B and E establish seasonal wildlife protection areas and timing stipulations for elk whereas Alternative A contains no prescriptions for elk.

4.3.19.3.2.3. Pronghorn

Alternatives B and E would be more beneficial to pronghorn than Alternative A since the seasonal protection area for pronghorn would be more than doubled under this alternative. Also, the pronghorn timing stipulations are lengthened by 14 days, a 43.75% increase, over the stipulations under Alternative A, benefiting pronghorn during fawning season. Additionally, spring grazing (April 15 – June 15) would be eliminated in the Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, Tank Draw, and Hart Draw grazing allotments within pronghorn habitat. This would benefit pronghorn by increasing available coverage for new born fawns in these areas and providing more forage for pregnant and lactating females, thereby increasing fawn survival.

4.3.19.3.2.4. Desert Bighorn Sheep

Alternatives B and E would have greater beneficial impacts on desert bighorn sheep than Alternative A by expanding the seasonal wildlife protection area for desert bighorn sheep thereby allowing more area for foraging, reducing habitat fragmentation caused by disturbance and reducing disturbance to sheep and lambs during the sensitive times of their life cycles. These alternatives would also provide more food for pregnant and lactating females, which would be expected to increase recruitment. Singer et al. (2001) concluded that management with goals to restore or increase bighorn sheep populations should focus on large habitat patches located at least 23 km from domestic sheep herds. By adding acreage to the bighorn seasonal wildlife protection area Alternatives B and E are consistent with this conclusion.

4.3.19.3.3. ALTERNATIVE C

Alternative C is the same as Alternatives B and E except that Alternative C allows for a limited number of permitted or commercial OHV users. Permitted or commercial OHV use in seasonal wildlife protection areas would have an adverse impact on wildlife due to habitat fragmentation and increased noise. Also, under Alternative C pronghorn would be impacted by the continuation of current livestock-grazing prescriptions. Where opportunities exist livestock-grazing would be adjusted to enhance forb production on pronghorn ranges including the grazing allotments listed under Alternative B. However, this method of forb enhancement does not ensure that habitat would be improved for pronghorn since cattle have been shown to eat forbs during times of grass dormancy (McCollum and Galyean 1985).

In terms of the acreage of seasonal wildlife protection areas Alternative C is more beneficial than Alternative A for mule deer, elk, pronghorn, and desert bighorn sheep since these areas are larger under Alternative C (see Table 4.244; Maps 80 and 102).

In terms of timing stipulations Alternative C is more beneficial than Alternative A for mule deer elk, and pronghorn since the timing stipulations are longer under this alternative. For desert bighorn sheep Alternative C is less beneficial than Alternative A because the timing stipulations are shorter under Alternative C (see Table 4.244).

Total acreage subject to special wildlife conditions is less under Alternative C than Alternative B but greater than Alternative A (see Table 4.244).

4.3.19.3.4. ALTERNATIVE D

Alternative D decisions would be the same as Alternatives B and E with the exception of OHV restrictions (Maps 81 and 103). Under this alternative, permitted or commercial OHV use would be restricted to designated routes. Restricting OHV use to designated routes would be beneficial to wildlife by concentrating surface disturbance and noise in these locations. However, OHV use in general would have an adverse impact on wildlife by increasing noise disturbance and human presence in seasonal wildlife protection areas and fragmenting habitat. Also, under Alternative D pronghorn would be beneficially impacted by the use of prescriptive livestock grazing to favor forb production on pronghorn ranges in grazing allotments identified under Alternatives B and C.

In terms of acreage of seasonal wildlife protection areas Alternative D is less beneficial than Alternative A for mule deer and desert bighorn sheep because it would provide the smallest area. For elk Alternative D would provide more area than Alternative A and therefore would be more beneficial. Pronghorn would benefit from 1,001 acres more seasonal wildlife protection area under Alternative D than Alternative A.

With respect to timing stipulations Alternative D and Alternative A are similar for mule deer (136 compared to 137 days) and identical for desert bighorn sheep. For elk and pronghorn Alternative D is more beneficial than Alternative A.

4.3.19.3.5. PROPOSED PLAN

The Proposed Plan is the same as Alternatives B and E except that the Proposed Plan allows for a limited number of permitted or commercial OHV users. Permitted or commercial OHV use in seasonal wildlife protection areas would have an adverse impact on wildlife due to habitat fragmentation and increased noise. Also, under the Proposed Plan pronghorn would be impacted by the continuation of current livestock-grazing prescriptions. Where opportunities exist livestock-grazing would be adjusted to enhance forb production on pronghorn ranges including the grazing allotments listed under Alternative B. However, this method of forb enhancement does not ensure that habitat would be improved for pronghorn since cattle have been shown to eat forbs during times of grass dormancy (McCollum and Galyean 1985).

In terms of the acreage of seasonal wildlife protection areas the Proposed Plan is more beneficial than Alternative A for mule deer, elk, pronghorn, and desert bighorn sheep since these areas are larger under the Proposed Plan (see Table 4.244; Maps 82 and 104).

In terms of timing stipulations the Proposed Plan is more beneficial than Alternative A for mule deer, elk, and pronghorn since the timing stipulations are longer under the Proposed Plan. For desert bighorn sheep the Proposed Plan is the same as Alternative A because the timing stipulations are the same (see Table 4.244).

Total acreage subject to special wildlife conditions is less under the Proposed Plan than Alternative B but greater than Alternative A (see Table 4.244).

4.3.19.3.6. IMPACTS OF CULTURAL RESOURCE DECISIONS ON WILDLIFE AND FISHERIES

Impacts varying between alternatives and the Proposed Plan primarily involve the establishment of Cultural Special Management Areas (CSMAs), Special Recreation Management Areas (SRMAs), and Management Zones (MZs) within SRMAs where identified cultural resources can be protected over the long-term from potentially destructive practices such as minerals extraction, geophysical activities, permitted or commercial OHV use, and uncontrolled visitation. Decisions to establish or expand CSMAs, SRMAs, and MZs are generally directly beneficial to wildlife as they prevent some or many of these activities, which are also detrimental to wildlife habitat integrity and population viability.

Though human visitation to cultural sites would likely deter wildlife from using these areas, impacts on wildlife are expected to be negligible since visitation would be controlled through management prescriptions and/or sites are already being impacted by visitation. Other possible adverse impacts to wildlife that are associated with cultural resource decisions include restrictions on or the exclusion of habitat improvements, watershed improvements, and vegetation treatments in wildlife habitats included within CSMAs, SRMAs, and/or MZs. While helping to preserve an area's cultural resources, the restriction of these decisions could adversely impact wildfire prevention practices (by preventing the thinning of young, fire-ladder trees) or the ability to provide high value forage in a steep part of an eroding watershed. These restrictions could also potentially prevent the effective management of an area for wildlife habitat (e.g., preventing the encroachment of pinyon-juniper forest on sagebrush or grassland habitat). However, not all vegetation treatments would be beneficial to all wildlife species, as some species prefer woodlands while others depend on more open habitat for their survival. So, the exclusion of vegetation treatments in CSMAs, SRMAs, and/or MZs would benefit some wildlife and adversely affect others.

Impacts varying between alternatives and the Proposed Plan resulting in notable differences in impacts to wildlife and fisheries are described below by proposed CSMA/SRMA/MZ, the Grand Gulch National Historic District, and Historic Trails. Habitat types by CSMA/SRMA/MZ and the Grand Gulch National Historic District are described in Table 4.245 to provide an indication of which species would be most affected by management decisions.

Table 4.245 Acreage of each Cultural Area by Vegetation Cover Type and Associated Wildlife

Vegetation Type	Wildlife Associations	Comb Ridge	Tank Bench	Beef Basin	McLoyd Canyon-Moon House	Grand Gulch National Historic District
Conifer/ mountain shrub	Mule deer, elk, mountain lion, neotropical birds, upland game birds.	15,884	0	20	0	13

Table 4.245 Acreage of each Cultural Area by Vegetation Cover Type and Associated Wildlife

Vegetation Type	Wildlife Associations	Comb Ridge	Tank Bench	Beef Basin	McLoyd Canyon-Moon House	Grand Gulch National Historic District
Desert scrub	Pronghorn, desert bighorn, elk (winter), raptors, neotropical birds, upland game birds.	0	858	181	0	7,154
Pinyon-juniper	Mule deer, elk, mountain lion, neotropical birds, upland game birds.	17,576	1,564	15,796	1,408	26,902
Riparian and wetland	Mule deer, elk, mountain lion, neotropical birds, upland game birds, amphibian and fish species.	3,378	225	17	3	860
Sagebrush and perennial grassland	Mule deer, elk, pronghorn, desert bighorn, mountain lion, neotropical birds, upland game birds.	1,147	0	4,285	196	2,434
Total Vegetated Acres		37,985	2,647	20,299	1,607	37,363

4.3.19.3.6.1. Comb RidgeAlternative A

Under Alternative A, there would be no specific management restrictions at Butler east of Comb Ridge limiting or mitigating against the adverse impacts of visitation as described above. Further, the area would be open to permitted or commercial OHV use and grazing. OHV use and grazing would have adverse impacts on wildlife as described in Section 4.3.19.3.17, Impacts of Travel Management Decisions on Wildlife and Fisheries, and Section 4.3.19.3.9, Impacts of Livestock Grazing on Wildlife and Fisheries, respectively.

Alternative B

Under Alternative B, the Comb Ridge CSMA would be managed as a CSMA for heritage tourism and traditional cultural values. It would be closed to woodland product collection and geophysical work, disposal of mineral materials and locatable mineral entry. It would be open to oil and gas leasing subject to NSO and would only be available for non-surface-disturbing vegetation treatments. The area would also be available for range, wildlife habitat, and watershed improvements. Camping would be limited to designated campgrounds and hiking and permitted or commercial OHV use would be limited to designated trails with group size limits. Alternative B would be more beneficial to wildlife than Alternative A since Alternative A would allow for more surface-disturbing activities than Alternative B.

Alternative C

Alternative C is the same as Alternative B except that woodland product collection and surface-disturbing vegetation treatments would be allowed under Alternative C. Vegetation treatments could be either adverse or beneficial for wildlife, depending on the treatment under discussion and which habitat a species primarily uses. Alternative C would be more beneficial for wildlife than Alternative A because of greater restrictions on surface-disturbing activities than Alternative A.

Alternative D

Under Alternative D Comb Ridge would not be managed as a CSMA. Instead, the area would be managed with the same prescriptions as surrounding lands. Compared to Alternative A, the management of Comb Ridge under Alternative D would be more beneficial for wildlife, since the impacts related to OHV use would be reduced by limiting OHVs to designated trails.

Alternative E

Alternative E is the same as Alternative B except that under Alternative E Comb Ridge CSMA would be closed to oil and gas leasing and OHV use and range, wildlife habitat, and watershed improvements could be maintained with no new improvements permitted. In general Alternative E would be more beneficial to wildlife than all other alternatives and the Proposed Plan since it places the greatest restrictions on surface-disturbing activities. For some species this alternative would have mixed benefits since new range, wildlife habitat, and watershed improvements would not be permitted.

Proposed Plan

The Proposed Plan is the same as Alternative C except that the area would be managed as an MZ within Cedar Mesa SRMA. The area would be managed as VRM Class II and there would be no private group size limit. As with Alternative C, the Proposed Plan would be more beneficial for wildlife than Alternative A because of greater restrictions on surface-disturbing activities than Alternative A.

4.3.19.3.6.2. Tank Bench

Alternative A

Under Alternative A, there would be no specific management prescriptions for Tank Bench.

Alternatives B and E

Under Alternatives B and E, the Tank Bench CSMA would be managed as a CSMA and would have the same surface disturbance restrictions as the Comb Ridge CSMA under Alternative B, except that campfires, OHV use, domestic pets, and pack animals would not be allowed. Prohibiting campfires would reduce fire risk for wildlife habitat and prohibiting OHV use would protect more intact habitat for wildlife species while reducing noise disturbance. Disallowing pets would reduce wildlife harassment and noise disturbance caused by these animals. People using pack animals are required to bring their own weed-free hay as animal feed so there would be no discernible difference in forage availability and therefore no impact on wildlife from prohibiting pack animals. Alternatives B and E would be more beneficial to wildlife than all

other alternatives since these alternatives place greater restrictions on surface-disturbing activities.

Alternative C

Alternative C is the same as Alternative B except that the following surface-disturbing activities would be allowed: oil and gas leasing under standard lease terms; locatable mineral entry, disposal of mineral materials, and geophysical work; hiking off trail; and surface-disturbing land treatments. However, in comparison to Alternative A, the management of Tank Bench CSMA under Alternative C would be more beneficial to wildlife and their habitats, since Alternative C would still allow fewer surface-disturbing activities.

Alternative D

Under Alternative D the Tank Bench area would not be managed as a CSMA. There would be no restrictions on surface-disturbing activities as in other alternatives; therefore Alternative D would result in greater adverse impacts on wildlife than all other alternatives.

Proposed Plan

The Proposed Plan is the same as Alternative C except that the area would be managed as an SRMA and it would be available for campfires and open to domestic pets and pack animals though use may be limited if damage occurs to cultural resources. In comparison to Alternative A, the management of Tank Bench SRMA under the Proposed Plan would be more beneficial to wildlife and their habitats, since the Proposed Plan would still allow fewer surface-disturbing activities.

4.3.19.3.6.3. Beef Basin

Alternative A

Under Alternative A, there would be no specific management restrictions at Beef Basin. Impacts would be of the nature described above under Alternative and Proposed Action Impacts.

Alternative B

Under Alternative B, Beef Basin CSMA would be managed as a CSMA for heritage tourism, traditional cultural values, and scientific research of prehistoric cultural landscapes. Under this alternative, Beef Basin would be subject to a number of human disturbance restrictions. These restrictions would have beneficial impacts on wildlife resources in the area by reducing human disturbances. Alternative B would be more beneficial to wildlife than Alternative A.

Alternative C

Alternative C is the same as Alternative B except that groups could be up to 20 people, open campfires would be allowed (fire pan required), and additional areas for primitive car camping would be established as needed. This alternative would be more beneficial to wildlife than Alternative A due to increased restrictions on surface-disturbing activities.

Alternative D

Under Alternative D Beef Basin would not be managed as a CSMA. It would be managed the same as under Alternative A except that it would be closed to woodland products harvest. The fact that Beef Basin would not be managed as a CSMA under Alternative D should have no

bearing on impacts to wildlife if the logistics of management remain the same as under Alternative A.

Alternative E

Alternative E is the same as Alternative B except that additional restrictions would be in place to avoid impacts in areas with non-WSA wilderness characteristics. Alternative E would be more beneficial to wildlife than all other alternatives since it would result in the fewest surface-disturbing activities.

Proposed Plan

The Proposed Plan is the same as Alternative C except that the area would be managed as an MZ within the Cedar Mesa SRMA and it would be available for private and/or commercial use of woodland products and open to campfires without a fire pan. The Proposed Plan would be more beneficial to wildlife than Alternative A due to increased restrictions on surface-disturbing activities.

4.3.19.3.6.4. McLoyd Canyon-Moon House

Alternative A

Under Alternative A, no public travel would be allowed on the northern section of spur road D4798 except for the purpose of BLM site maintenance. This decision would affect very little habitat area and likely would have very little impact on wildlife resources in the area. Under this alternative there are no additional management prescriptions for protection of cultural resources.

Alternatives B–E

Under Alternatives B–E, McLoyd Canyon-Moon House CSMA would be subject to a number of surface disturbance restrictions which vary slightly between each alternative. Further, Utah State Section 2, Township 39S Range 19E, would be acquired. Under each of these alternatives surface disturbance restrictions and the acquisition of the aforementioned land area would have long-term beneficial impacts on wildlife resources in the area by reducing human disturbances. Though management prescriptions do vary this variation is minor and is therefore not expected to result in appreciable differences between alternatives in terms of impacts on wildlife.

Proposed Plan

The Proposed Plan is the same as Alternatives B-E except that McLoyd Canyon-Moon House would be managed as an MZ within the Cedar Mesa SRMA under the Proposed Plan.

4.3.19.3.6.5. Grand Gulch National Historic District

Alternative A

Under Alternative A, the Grand Gulch National Historic District would be closed to mineral leasing and disposal of mineral materials, and excluded from commercial use of woodland products except for limited on-site collection of deadwood for campfires. No motorized or mechanized equipment would be allowed, including OHVs. Because the site would be managed as an ROS P, only primitive recreation opportunities would be allowed, and even primitive recreation could be limited if cultural resources or scenic values become impacted. The area would be open to livestock use except for 9,000 acres in and around Grand Gulch Canyon and its

tributaries. With the possible exception of the livestock use provision, these management decisions would have beneficial impacts to wildlife by limiting surface-disturbing activities.

Alternatives B and E

Under Alternatives B and E, the Grand Gulch National Historic District would be closed to all surface disturbances with the exception of designated trails and camping areas. These restrictions would beneficially impact wildlife species and their habitats in the area by reducing human disturbances. The greater restrictions associated with Alternatives B and E would have more beneficial impacts to wildlife than Alternative A.

Alternative C

Alternative C is the same as Alternatives B and E except that non-motorized habitat improvements, watershed improvements, and vegetation treatments as well as pack animals would be permitted. As stated above vegetation treatments would have short-term adverse impacts to wildlife (during the active phase of removing vegetation—though impacts would be less with non-motorized techniques than motorized) though wildlife would benefit in the long-term. The presence of pack animals would have a negligible impact on most wildlife species, since horses and mules are not known to harass wildlife, and since they would feed on weed-free hay rather than forage. In comparison to Alternative A, the management of Grand Gulch National Historic District under Alternative C would be more beneficial to wildlife and their habitats.

Alternative D

Alternative D is the same as Alternative C except that the area would be open to oil and gas leasing subject to NSO and open to "casual use" geophysical exploration if the WSA is released by Congress. Provided Congress releases the WSA, Alternative D would impose more harmful impacts on wildlife than all other alternatives.

Proposed Plan

The Proposed Plan is the same as Alternative C except that Grand Gulch National Historic District would be managed as a management zone within the Cedar Mesa SRMA. Also, pets and pack animals may be limited or prohibited in canyons requiring permits if cultural or natural resources or the visitors' experiences are impacted. The Proposed Plan would be more beneficial to wildlife and their habitats than Alternative A owing to greater restrictions on surface-disturbing activities.

4.3.19.3.6.6. Historic Trails

Alternatives A–E and the Proposed Plan

Under all alternatives and the Proposed Plan the Old Spanish National Historic Trail would be managed to protect the resource values for which it was designated. Protection of these resource values would result in beneficial impacts to wildlife since surface-disturbing activities would be prevented or curtailed.

4.3.19.3.7. IMPACTS OF FIRE MANAGEMENT DECISIONS ON WILDLIFE AND FISHERIES

The impacts of fire management on wildlife would be the same under all alternatives and the Proposed Plan, with all decisions guided by the Utah Land-use plan Amendment (LUP Amendment) for Fire and Fuels Management (BLM 2005g). Adherence with the LUP Amendment (which mandates the maintenance of existing healthy ecosystems and the protection of threatened, endangered, and special status species) would have beneficial impacts on wildlife habitat in the Monticello PA wherever wildlife habitat overlaps with that of protected special status species, and would ensure that healthy ecosystems are not adversely impacted by fire management and fuels reduction. Wildland fire use would not be authorized in areas that are known to be highly susceptible to post-fire cheatgrass or other weed invasion, important terrestrial and aquatic habitats, and non-fire adapted vegetation communities unless reasonable Resource Protection Measures (RPMs) were in place. These RPMs would have beneficial impacts on wildlife habitat by reducing the spread of weeds and preserving native plant species, thereby maintaining suitable wildlife forage, cover, and habitat.

Fuels management decisions include fuels-reduction treatments on 5,000 to 10,000 acres annually. These fuels-reduction treatments include: mechanical and manual treatments, prescribed fire, chemical or biological vegetation control, and aerial/ground seeding. These fuels management decisions would likely have a beneficial long-term impact on wildlife and fish populations by helping to restore the natural fire regime, which would improve habitat health (Lewis and Harshbarger 1976), forage, nesting opportunities, and cover. Restoring the natural fire regime would also reduce the chance of wildland fire, and the subsequent loss of major ecosystem components. In the short-term, vegetation treatments could result in trampling or removal of wildlife forage and/or habitat, and human-caused wildlife disturbance.

4.3.19.3.7.1. Terrestrial Species

Short-term adverse impacts to terrestrial wildlife from fire management decisions include mortality, habitat destruction, and habitat displacement. Fire management decisions would likely affect habitat used by raptors, migratory birds, small mammals, amphibians, reptiles, and big game species. Direct impacts from wildfire suppression could include habitat corruption from fire retardant and aviation fuel, soil erosion from fireline construction on steep slopes, and damaged vegetation and soils from heavy equipment and fire camps.

The adverse impacts of fuels management decisions include the short-term disturbance of wildlife habitat while it regenerates and the thinning and removal of ecologically desirable species. Short-term impacts of treatments would include the mortality of non-target plants due to herbicide use and from seeding methods that cause soil surface disturbance. These decisions could result in a reduction of native species diversity and consequently a reduction in wildlife habitat.

However, managed wildfire and prescribed burns provide long-term benefits to wildlife and wildlife habitat. Fire produces a varied mosaic of habitats and results in the regeneration of old and decadent vegetation, which can be favorable to big game. Fuel reduction treatments also reduce the risk of catastrophic fire, which otherwise could cause the long-term loss of wildlife habitat.

4.3.19.3.7.2. Aquatic and Amphibious Species

Adverse impacts to fish, amphibians, and other aquatic species would include an increase risk of contaminating water sources with fire retardant or vehicle fluids; soil erosion following surface-disturbing fire suppression measures; damage to riparian vegetation and soils by heavy equipment; and reduced stream flow where water for fire suppression is drawn directly from streams and water bodies. Erosion would increase the sedimentation of surface waters, which affects water temperature, turbidity, and chemistry. These changes in water quality would generally have adverse impacts on aquatic species. In the long-term, fish, amphibians, and other aquatic species would benefit from fire management decisions by an overall reduction in erosion and soil loss and sedimentation of surface waters, and an increase in ground cover.

4.3.19.3.8. IMPACTS OF LANDS AND REALTY DECISIONS ON WILDLIFE AND FISHERIES

Impacts that vary between alternatives and the Proposed Plan largely result from variation in the acreage of right-of-way avoidance and exclusion areas and the acreage and location of areas that would be recommended for withdrawal from locatable mineral entry. Locatable mineral entry, where allowed, would result in loss of wildlife habitat, habitat fragmentation, human disturbance during construction and mineral extraction activities, and the potential introduction of invasive plant species by construction equipment and construction and mineral extraction personnel.

ROW avoidance and exclusion areas would have direct, long-term beneficial impacts by reducing surface disturbance in these areas therefore resulting in less habitat loss and fragmentation and human disturbance. Under the Proposed Plan and all action alternatives ROW avoidance areas would include Indian Creek and Lavender Mesa ACECs; Dark Canyon non-WSA with wilderness characteristics; Alkali National Historic Landmark; Comb Ridge; San Juan River SRMA Segments 1 and 2; Colorado River Segment 3; and Hovenweep ACEC (880 acre Visual Emphasis Zone). ROW exclusion areas would include WSAs; non-WSA with wilderness characteristics areas Nokai Dome East, Nokai Dome West, Grand Gulch, and Mancos Mesa; developed recreation sites; San Juan River Segments 3 and 5, and Valley of the Gods ACEC. Other ROW avoidance and exclusion areas vary by alternative and the Proposed Plan.

Development associated with wind and solar energy would have direct, long-term, adverse impacts on wildlife where installation occurs. These impacts would result from loss of wildlife habitat, habitat fragmentation, human disturbance during construction and maintenance, and the potential introduction of invasive plant species by construction equipment and construction and maintenance personnel. ROW applications for wind and solar development would incorporate BMPs and provisions contained in the Wind Energy or Solar Programmatic EIS documents, once these documents become final.

4.3.19.3.8.1. Alternative A

Impacts associated with Alternative A would be the same as impacts discussed above and under impacts common to all alternatives and the Proposed Plan. ROW exclusion areas under Alternative A would include Cedar Mesa ACEC, a portion of Grand Gulch, Dark Canyon ACEC, the ROS SPM area of San Juan River SRMA, and developed recreation sites (120,800 total acres). ROW avoidance areas under Alternative A would include Alkali Ridge ACEC, Bridger Jack Mesa ACEC, Butler Wash ACEC, Cedar Mesa ACEC (partial), Hovenweep ACEC, Indian Creek ACEC, Lavender Mesa ACEC, Pearson Canyon Hiking Area, Scenic Highway

Corridor ACEC, Shay Canyon ACEC, and most ROS P-class areas (253,790 total acres). The total area recommended for withdrawal from locatable mineral entry would be approximately 132,380 acres.

4.3.19.3.8.2. Alternative B

Impacts associated with Alternative B would be the same as impacts discussed above and under impacts common to all alternatives and the Proposed Plan. Under Alternative B approximately 125,105 acres would be ROW avoidance areas. This is 51% less than under Alternative A. On the other hand, Alternative B would establish 416,612 acres of ROW exclusion areas (245% more than under Alternative A). Under Alternative B approximately 251,710 acres (119,330 more acres, or 90% more, than under Alternative A) would be recommended for withdrawal from locatable mineral entry in areas listed in the Summary Table of Alternatives and the Proposed Plan (Table 2.1)

4.3.19.3.8.3. Alternative C

Alternative C is the same as Alternative B except that approximately 39,323 and 395,329 acres would be ROW avoidance and exclusion areas, respectively, under this alternative. This is approximately 85% less acreage as ROW avoidance and 227% more acreage as ROW exclusion than under Alternative A. Approximately 121,912 acres would be recommended for withdrawal from locatable mineral entry. This would be 10,468 (8%) fewer acres than under Alternative A. Areas that would be recommended for withdrawal from locatable mineral entry are listed in the Summary Table of Alternatives and the Proposed Plan (Table 2.1).

4.3.19.3.8.4. Alternative D

Alternative D is the same as Alternatives B and C except that approximately 14,175 and 386,853 acres would be ROW avoidance and exclusion areas, respectively, under this alternative. This is approximately 94% less acreage as ROW avoidance and 220% more acreage as ROW exclusion than under Alternative A. Approximately 46,131 acres would be recommended for withdrawal from locatable mineral entry. This would be 86,249 (65%) fewer acres than under Alternative A. Areas that would be recommended for withdrawal from locatable mineral entry are listed in the Summary Table of Alternatives and the Proposed Plan (Table 2.1).

4.3.19.3.8.5. Alternative E

Under Alternative E, 834,070 acres would be recommended for withdrawal from mineral entry. This is 701,690 (530%) more acres than under Alternative A. Also, under Alternative E approximately 53,915 and 974,463 acres would be ROW avoidance and exclusion areas, respectively. This is approximately 79% less acreage as ROW avoidance and 707% more acreage as ROW exclusion than under Alternative A.

4.3.19.3.8.6. Proposed Plan

Under the Proposed Plan, the impacts of lands and realty decisions on wildlife and fisheries resources would be the same as under Alternatives A, B, C, D, and E except that approximately 133,293 and 416,115 acres would be ROW avoidance and exclusion areas, respectively, under this alternative. This is approximately 47% less acreage as ROW avoidance and 244% more acreage as ROW exclusion than under Alternative A. There would be 50,665 acres

(approximately 81,715, or 62%, less than under Alternative A) withdrawn from locatable mineral entry under the Proposed Plan.

4.3.19.3.9. IMPACTS OF LIVESTOCK GRAZING DECISIONS ON WILDLIFE AND FISHERIES

Impacts that vary between alternatives and the Proposed Plan result from variation in the number of areas that would be unavailable for grazing. Impacts would be the same in nature as those common to all alternatives and the Proposed Plan. Where more areas are unavailable for grazing there would be fewer adverse impacts on wildlife, and where fewer areas are unavailable for grazing there would be more adverse impacts on wildlife.

4.3.19.3.9.1. Alternative A

Under Alternative A, the Comb Wash Allotment side canyons including Mule Canyon below U-95, Arch, Fish, Owl, and Road Canyons are currently unavailable (and would remain unavailable for grazing under all of the proposed alternatives) based on an Interior Board of Land Appeals (IBLA) court decision. A portion of Comb Wash's 73,614 acres are included in this closure (side canyon acreages are not available). These closures would decrease the magnitude of the potential adverse impacts associated with livestock grazing in the Monticello PA by removing acreage available for livestock grazing. Other areas unavailable for livestock grazing would include Bridger Jack Mesa (near relict vegetation); Grand Gulch area (within the canyon) of Cedar Mesa; Dark Canyon Area (partial); Lavender Mesa (relict vegetation); Five identified mesa tops (White Canyon Area); Pearson Canyon (hiking area boundary); developed recreation sites; and parts of the slopes of Peter's Canyon and East Canyon (wildlife habitat).

4.3.19.3.9.2. Alternatives B and E

Alternatives B and E would be the same as Alternative A with the addition of the following areas as unavailable for grazing: Slickhorn Canyon (146,144 acres), Rone Bailey Mesa (1,162 acres), Dodge Canyon Allotment (1,638 acres), Mule Canyon (1,984 acres), Arch Canyon (2,562 acres), Fish and Owl Canyon (7,252 acres), Road Canyon (4,801 acres), Rodgers Allotment (40 acres), portions of West Butler Wash Canyons, and Horsehead Canyon (4,904 acres) within the Montezuma Canyon allotment. Additional areas (Moki Canyon, Lake Canyon, Harts Canyon, and Indian Creek from Kelly Ranch vicinity to the USFS boundary) would be restricted to livestock trailing only. Also, under these alternatives the BLM would develop seasonal restrictions, closures, and/or forage utilization limits on grazing in riparian areas functioning at risk. The closures and restrictions associated with these alternatives would decrease the magnitude of the potentially adverse impacts associated with livestock grazing decisions more than under all other alternatives.

4.3.19.3.9.3. Alternative C and the Proposed Plan

Alternative C is the same as Alternatives B and E, except that Mule Canyon would only be unavailable for grazing south of U-95 under this alternative. The Proposed Plan is the same as Alternative C except for the U-95 closure listed above. The closures and restrictions associated with Alternative C and the Proposed Plan would decrease the magnitude of potentially adverse impacts associated with livestock grazing more than under Alternative A.

4.3.19.3.9.4. Alternative D

Alternative D is the same as Alternatives B and E except that Horsehead Canyon within Montezuma Canyon allotment, Dodge Canyon allotment, and Mule Canyon north of U-95 would be available for grazing and no areas would be restricted to livestock trailing only. The unavailability of these areas to livestock grazing that would be in effect under Alternative D would decrease the magnitude of the potentially adverse impacts associated with livestock grazing in the Monticello PA compared with Alternative A, but would still allow for more adverse impacts related to habitat disturbance than Alternatives B and E.

4.3.19.3.10. IMPACTS OF MINERALS DECISIONS ON WILDLIFE AND FISHERIES

The impacts of minerals decisions on wildlife resources would be of the same nature under all alternatives and the Proposed Plan but would vary in the acreage over which those decisions would impact wildlife and wildlife habitat (Tables 4.204–4.207). The below discussion of impacts of minerals decisions on wildlife and fisheries pertains primarily to oil and gas leasing, mineral material disposal, mineral entry, and geophysical activity. The discussion of impacts due to oil and gas leasing and geophysical activity includes surface disturbance approximations due to these activities. Surface disturbances for other mineral activities would also occur; under the Proposed Plan and all alternatives there would be approximately 851 acres of surface disturbance total for 15 years as a result of uranium and vanadium activities (300 acres), placer gold activities (10 acres), limestone activities (50 acres), sand and gravel activities (360 acres), building stone activities (113 acres), and clay activities (18 acres). This disturbance would have adverse impacts (as described below) on wildlife and fisheries resources.

Table 4.246. Estimated Surface Disturbance (in acres) for Oil and Gas Well Development, by Vegetation (Wildlife Habitat) Type

Habitat Type	Associated Wildlife	Alternatives					Proposed Plan
		A	B	C	D	E	
Conifer and Mountain Shrub	Mule deer, elk, mountain lion, black bear (primarily old growth), neotropical birds, upland game birds, reptiles.	4	4	4	4	3	4

**Open" includes Standard, Timing, Controlled Surface Use and CST lease stipulations.

***Closed" includes NSO and Closed leasing stipulations. The percent of the total designated habitat closed is listed in parentheses.

Note: The percentage was derived by adding the open and closed numbers and dividing by the total.

Table 4.249. Acres of Big Game Habitat (Crucial Winter, Lambing/Rutting, and Crucial Fawning UDWR Designated vs. BLM Managed) Open and Closed to Surface Disturbance by Alternative and the Proposed Plan.

Big Game Species	Agency Designating / Managing Habitat	Alternatives										Proposed Plan	
		A		B		C		D		E		Open	Closed
		Open*	Closed**	Open	Closed	Open	Closed	Open	Closed	Open	Closed		
Mule Deer (Crucial Winter)	UDWR Designated	783,267	302,785 (28%)	784,574	300,860 (28%)	816,326	269,108 (25%)	820,374	265,060 (24%)	588,793	496,638 (46%)	774,301	311,138 (29%)
	BLM Managed	170,630	11,685 (6%)	607,035	178,886 (23%)	264,312	2,101 (1%)	150,496	961 (1%)	431,504	354,417 (45%)	335,901	47,192 (12%)
Elk (Crucial Winter)	UDWR Designated	234,233	57,457 (20%)	244,139	47,393 (16%)	244,296	47,236 (16%)	246,647	44,885 (15%)	151,688	139,846 (21%)	234,912	56,620 (19%)
	BLM Managed	N/A	N/A	169,140	22,028 (12%)	39,478	11,093 (22%)	4,491	0 (0%)	125,816	65,357 (34%)	82,456	15,014 (15%)
Pronghorn (Crucial Fawning)	UDWR Designated	29,363	0 (0%)	29,368	37 (0.1%)	29,405	0 (0%)	29,404	0 (0%)	26,581	2,823 (10%)	29,404	0 (0%)
	BLM Managed	13,961	0 (0%)	29,328	37 (0.1%)	29,365	0 (0%)	13,961	0 (0%)	26,541	2,823 (10%)	29,404	0 (0%)
Desert Bighorn Sheep (Lambing/Rutting)	UDWR Designated	135,977	31,213 (19%)	140,689	26,479 (16%)	146,198	20,971 (13%)	147,965	19,204 (11%)	42,661	124,507 (74%)	127,632	39,537 (24%)
	BLM Managed	155,149	92,833 (37%)	257,358	196,122 (43%)	297,706	1,497 (1%)	228,946	70,063 (23%)	90,900	362,486 (80%)	278,883	174,504 (38%)

*"Open" includes Standard, Timing, Controlled Surface Use and CST lease stipulations.

***"Closed" includes NSO and Closed leasing stipulations. The percent of the total designated habitat closed is listed in parentheses.

4.3.19.3.10.1. Alternative A

Leasable Minerals

Under Alternative A, 40 wells (approximately 699 acres of surface disturbance) are expected in the Monticello PA total for 15 years. Further, approximately 379,201 acres of pinyon-juniper habitat would be managed as either NSO or Closed, while approximately 125,306 acres of desert scrub would be managed under the same designations. A total of 547,713 acres (of all habitat types) would be managed as NSO or Closed.

Mule Deer. Under Alternative A, UDWR designated mule deer habitat that would fall under Closed leasing types (302,785 acres) would comprise 28% of the total designated deer habitat established by UDWR. Six percent (11,685 acres) of BLM managed mule deer habitat would be considered Closed to leasing.

Elk. Under Alternative A, the BLM would not specifically manage habitat for elk. Approximately 57,457 acres (20%) of UDWR designated elk habitat would fall under Closed leasing types.

Pronghorn. Under Alternative A, all of the UDWR designated and BLM managed pronghorn habitat would fall under Open leasing types.

Desert Bighorn Sheep. Under Alternative A approximately 19% (31,213 acres) of UDWR designated habitat and 37% (92,833) of BLM managed habitat would fall under Closed leasing types.

Geophysical Activity

Under Alternative A, approximately 886 acres (59 acres per year for the next 15 years) of wildlife habitat would be temporarily impacted by geophysical exploration. Impacts to wildlife habitat associated with exploration would include short-term impacts such as noise and disturbance from people working in the area to long-term impacts such as the potential spread of invasive and weedy plant species within the areas directly disturbed by geophysical drilling.

Salable Minerals

The exploration and development of salable minerals would have similar impacts to wildlife as other development described above. Under Alternative A, 584,270 acres of land in the Monticello PA would be available for disposal of mineral materials subject to standard terms and conditions. That is approximately 33% of the 1,784,724 acres in the Monticello PA. There are 821,070 acres (approximately 46% of the Monticello PA) subject to special conditions under Alternative A and 373,850 acres (approximately 21% of the Monticello PA) closed to disposal of mineral materials.

Locatable Minerals

Under Alternative A, 1,652,743 acres (approximately 93%) of land in the Monticello PA would be open to mineral entry. There are currently 132,380 acres (approximately 7% of the Monticello PA) recommended to Congress for withdrawal from mineral entry. Because withdrawals require congressional approval and are extremely difficult to obtain, these areas only have the potential to be exempt from impacts related to open pit mining activities. Impacts resulting from locatable mineral exploration and development would be similar to those discussed above.

4.3.19.3.10.2. Alternative B

Leasable Minerals

Under Alternative B 66 wells (approximately 636 acres of surface disturbance) are expected in the Monticello PA total for 15 years. Alternative B would result in 63 (9%) fewer acres of oil- and gas-related surface disturbance than Alternative A. Overall, Alternative B would include fewer oil- and gas-related adverse impacts to wildlife than would Alternative A, since less surface disturbance would mean more intact habitat, fewer roads, and a lower level of human presence.

Under Alternative B across the Monticello PA approximately 363,405 acres of pinyon-juniper habitat would be managed as either NSO or Closed, while approximately 131,744 acres of desert scrub would be managed under the same designations. The total number of acres (of all habitat types) to be managed under NSO or Closed designations would be approximately 564,080 under Alternative B. Approximately 5% more land would be managed under Closed designations under Alternative B than Alternative A.

Mule Deer. There is less than 1% difference between Alternatives B and A in terms of the acreage of UDWR designated deer habitat falling under Closed leasing types. BLM managed deer habitat falling under Closed leasing types would increase by 167,201 acres (93%) under Alternative B. Alternative B would be more beneficial for mule deer than Alternative A.

Elk. Under Alternative B 47,393 acres (16%) of UDWR designated elk habitat would fall under closed leasing types. This is 4% less than under Alternative A. Approximately 22,028 acres (12%) of BLM managed elk habitat would fall under Closed leasing types. This is an improvement over Alternative A since no elk habitat is identified by BLM under that alternative.

Pronghorn. Alternative B would be more beneficial to pronghorn than Alternative A since the BLM would manage more than two times as much pronghorn habitat under this alternative than under Alternative A. In terms of UDWR designated pronghorn habitat there is a 5-acre difference between Alternatives B and A. Approximately 37 acres of BLM managed and UDWR designated pronghorn habitat would fall under Closed leasing types under Alternative B, compared to zero acres under Alternative A.

Desert Bighorn Sheep. Under Alternative B, more than twice as much BLM managed desert bighorn sheep habitat (196,122 acres compared to 92,833 acres) would fall under Closed leasing types as under Alternative A. Fewer acres of UDWR designated desert bighorn sheep habitat would fall under these leasing stipulations under Alternative B (26,479) than Alternative A (31,213). Overall, there are more beneficial impacts to desert bighorn sheep under Alternative B than Alternative A since considerably more BLM managed habitat falls under Closed leasing types.

Geophysical Activity

Under Alternative B there would be approximately 794 acres of surface disturbance associated with geophysical exploration. This is approximately 12% fewer acres of disturbance than would be expected under Alternative A, which could result in a slightly smaller impact overall due to the decreased acreage open to exploration.

Salable Minerals

Under Alternative B, 219,102 (38%) fewer acres would be open to mineral disposal subject to standard terms and conditions than under Alternative A. Overall, more land would be protected under special conditions (876,736 acres vs. 821,070 acres) or closed altogether (542,402 acres vs. 373,850 acres) to mineral disposal under Alternative B than under Alternative A, which would beneficially impact wildlife species by protecting more of their habitats from potential surface-disturbing activities and their associated impacts.

Locatable Minerals

Under Alternative B, 1,598,561 acres of land in the Monticello PA would be open to mineral entry. That is 3% less than under Alternative A. Also, under Alternative B 186,562 acres would be recommended to Congress for withdrawal from mineral entry (41% more than under Alternative A).

4.3.19.3.10.3. Alternative C

Leasable Minerals

Under Alternative C, 74 oil and gas wells are expected across the Monticello PA total for 15 years. Oil and gas development under Alternative C would result in the direct removal of wildlife habitat from approximately 710 acres. Compared to Alternative A, Alternative C plans for 11 (2%) more acres of oil- and gas-related surface disturbance. This translates into more adverse impacts to wildlife than under Alternative A.

Under Alternative C across the Monticello PA, approximately 306,107 acres of pinyon-juniper habitat would be managed as either NSO or Closed, while approximately 90,817 acres of desert scrub would be managed under the same designations. The total number of acres (of all habitat types) to be managed under NSO or Closed designations approximate 426,762 under Alternative C. This is more than 115,000 fewer acres than under Alternative A.

Mule Deer. Less UDWR designated and BLM managed mule deer habitat falls under Closed leasing types under Alternative C than under Alternative A. Because fewer acres of mule deer habitat fall under Closed leasing types under this alternative it would be more adverse to mule deer than Alternative A, which protects more habitat from surface disturbance through Closed leasing type designations.

Elk. Under Alternative C, 47,236 acres (16%) of UDWR designated elk habitat would fall under closed leasing types. This is 4% less than under Alternative A. Approximately 11,093 acres (22%) of BLM managed elk habitat would fall under Closed leasing types. This is an improvement over Alternative A since no elk habitat is identified by BLM under that alternative. However, under Alternative C only 50,571 acres of elk habitat would be managed by BLM compared to 191,168 acres under Alternative B. Also, 22,028 acres (12%) of BLM managed elk habitat would fall under Closed leasing types under Alternative B. Overall, the prescriptions include in Alternative C would be more beneficial to elk than Alternative A but less beneficial than Alternative B.

Pronghorn. Under Alternative C neither BLM managed nor UDWR designated pronghorn habitat fall under Closed leasing types. Total acres of BLM managed pronghorn habitat are the

same as Alternative B. There is a negligible difference between Alternatives C and A in terms of impacts to pronghorn.

Desert Bighorn Sheep. Under Alternative C, 1,497 acres (1%) of BLM managed and 20,971 acres (13%) of UDWR designated desert bighorn sheep habitat fall under Closed leasing types. For desert bighorn sheep, Alternative C would result in more adverse impacts than Alternative A since 91,336 (98%) fewer acres of BLM managed and 10,242 (33%) fewer acres of UDWR designated desert bighorn sheep habitat would fall under Closed leasing types.

Geophysical Activity

Under Alternative C, there would be approximately 903 acres of surface disturbance associated with geophysical exploration. This is approximately 2% more acres of disturbance than under Alternative A. Therefore, compared to Alternative A, Alternative C would likely result in a larger adverse impact to wildlife overall due to the increased acreage open to exploration.

Salable Minerals

Under Alternative C, 40,464 (7%) more acres would be available for disposal of mineral materials subject to standard terms and conditions than Alternative A. Acreage available for mineral disposal subject to special conditions would be 12% (96,836 acres) less than under Alternative A. Finally, acreage closed to mineral disposal would be 16% (61,488 acres) more than under Alternative A. This would beneficially impact wildlife species by protecting more of their habitats from potential surface-disturbing activities and their associated impacts. Though Alternative C would close more acres to mineral disposal than Alternative A, overall, Alternative C would be less beneficial to wildlife species than Alternative A because it would protect fewer habitats with special stipulations for disposal and open more acres to disposal under standard stipulations.

Locatable Minerals

Under Alternative C, 1,663,221 acres of land in the Monticello PA would be open to mineral entry. That is 10,478 more acres (1%) than under Alternative A. Under this alternative approximately 121,912 acres would be recommended to Congress for withdrawal from mineral entry. That is 10,468 acres (8%) less than what is recommended for withdrawal from mineral entry under Alternative A. Alternative C would be less beneficial to wildlife than Alternative A, because Alternative C would open more acres to mineral entry and recommend fewer acres for withdrawal.

4.3.19.3.10.4. Alternative D

Leasable Minerals

Under Alternative D, 75 oil and gas wells are expected in the Monticello PA total for 15 years. Oil and gas development under Alternative D would result in the direct removal of wildlife habitat from approximately 721 acres. This is 22 (3%) more acres of oil- and gas-related surface disturbance than under Alternative A. Overall, Alternative D would include the most oil- and gas-related adverse impacts to wildlife when compared to Alternatives A, B, C, and E since more surface disturbance translates to less intact habitat, more roads, and a higher level of human presence.

Under Alternative D across the Monticello PA, approximately 298,417 acres of pinyon-juniper habitat would be managed as either NSO or Closed, while approximately 64,712 acres of desert scrub would be managed under the same designations. The total number of acres (of all habitat types) to be managed under NSO or Closed designations approximate 392,979 under Alternative D. Alternative D would set aside approximately 149,000 fewer acres of habitat for management under NSO and Closed designations than Alternative A.

Mule Deer, Elk, and Pronghorn. Less UDWR designated and BLM managed mule deer, elk, and pronghorn habitat falls under Closed leasing types under Alternative D than under any other alternative. Alternative D would be the most adverse to these species of all alternatives because less habitat would be protected under Closed leasing types.

Desert Bighorn Sheep. Less UDWR designated desert bighorn sheep habitat falls under Closed leasing types under Alternative D than under any other alternative. BLM managed desert bighorn sheep falling under Closed leasing types is greater under Alternative D than Alternative C but less than all other alternatives. Desert bighorn sheep, like mule deer, elk, and pronghorn, would be subject to more adverse impacts from oil and gas leasing under Alternative D than under all other alternatives.

Geophysical Activity

Under Alternative D, there would be approximately 924 acres of surface disturbance associated with geophysical exploration. This is approximately 4% more acres of disturbance than would be expected under Alternative A, 16% more than Alternative B, 2% more than Alternative C, and 56% more than Alternative E. Compared to all other alternatives, Alternative D would likely result in the largest impact overall due to the increased acreage open to exploration.

Salable Minerals

Under Alternative D, 378,009 (39%) more acres would be open to mineral disposal subject to standard stipulations than under Alternative A. Approximately 400,072 (49%) fewer acres would be open to mineral disposal subject to special conditions and 27,177 (7%) more acres would be closed to mineral disposal than under Alternative A. Though Alternative D would close slightly more acres to mineral disposal than Alternative A, overall, Alternative D would be less beneficial to wildlife species than Alternative A as it would protect fewer habitats with special stipulations for disposal and open more acres to disposal under standard stipulations.

Locatable Minerals

Under Alternative D, 1,738,992 acres of land in the Monticello PA would be open to mineral entry. That is 86,249 acres (5%) more than would be open under Alternative A. Under this alternative, approximately 46,131 acres would be recommended to Congress for withdrawal from mineral entry. This is 86,249 acres (65%) less than would be recommended for withdrawal from mineral entry under Alternative A. Alternative D would also recommend fewer acres for withdrawal from mineral entry than Alternatives B, C, and E, and the Proposed Plan. Therefore, Alternative D would be the least beneficial for wildlife and their habitats of all alternatives and the Proposed Plan as it opens more acres to mineral entry and recommends fewer for withdrawal.

4.3.19.3.10.5. Alternative E

Leasable Minerals

Under Alternative E, 54 wells (approximately 518 acres of surface disturbance) are expected to be drilled in the Monticello PA total for 15 years. This alternative would result in about 118 (23%) fewer acres of oil- and gas-related surface disturbance than Alternative B, and between 181 and 203 (35%–39%) fewer acres of surface disturbance than any other alternative, resulting in fewer adverse impacts to wildlife since less surface disturbance translates to more intact habitat, fewer roads, and a lower level of human presence.

Under Alternative E, throughout the Monticello PA approximately 617,449 acres of pinyon-juniper habitat would be managed as either NSO or Closed, while approximately 275,826 acres of desert scrub would be managed under the same designations. The total number of acres (of all habitat types) to be managed under NSO or Closed designations (1,008,439 acres) is greater under Alternative E than under all other alternatives.

Mule Deer, Elk, and Desert Bighorn Sheep. Under Alternative E more UDWR designated and BLM managed mule deer, elk, and desert bighorn sheep habitat falls under Closed leasing types than under any other alternative, offering these species more protection from adverse impact than other alternatives.

Pronghorn. The acreage of UDWR designated and BLM managed pronghorn habitat that would be closed to leasing or NSO (2,823 acres) is greater under Alternative E than under any other alternative. This alternative would be more beneficial to pronghorn than other alternatives due to the protection from disturbance offered by closed and NSO designations.

Geophysical Activity

There would be approximately 591 acres of surface disturbance associated with geophysical exploration under Alternative E. This is approximately 34% fewer acres of disturbance than would be expected under Alternative B, which is the next most beneficial alternative in terms of expected wildlife impacts due to geophysical exploration. All other alternatives would result in more surface disturbance (between 50% and 56% more than Alternative E) associated with geophysical exploration than Alternative E.

Salable Minerals

Under Alternative E, 370,980 (63%) fewer acres would be open to mineral disposal subject to standard terms and conditions than under Alternative A. On the other hand, less land (34%) would be protected under special conditions (545,641 acres vs. 821,070 acres) for mineral disposal. Almost three times (174%) more land would be closed to mineral disposal under Alternative E than under Alternative A. The decrease in acreage open to mineral disposal subject to standard terms and conditions coupled with the increase in acreage closed to mineral disposal mean that Alternative E would more beneficially impact wildlife species than Alternative A by protecting more wildlife habitats from potential surface-disturbing activities associated with mineral disposal.

Locatable Minerals

Under Alternative E, 1,598,561 acres of land in the Monticello PA would be open to mineral entry. That is 3% less than under Alternative A. Also, under Alternative E 186,562 acres would

be recommended to Congress for withdrawal from mineral entry (41% more than under Alternative A).

4.3.19.3.10.6. Proposed Plan

Leasable Minerals

Under the Proposed Plan, 72 oil and gas wells are expected across the Monticello PA total for 15 years. Oil and gas development under the Proposed Plan would result in the direct removal of wildlife habitat from approximately 688 acres. Compared to Alternative A, the Proposed Plan plans for 11 (2%) more acres of oil- and gas-related surface disturbance. This translates into more adverse impacts to wildlife than under Alternative A.

Under the Proposed Plan across the Monticello PA, approximately 382,989 acres of pinyon-juniper habitat would be managed as either NSO or Closed, while approximately 127,809 acres of desert scrub would be managed under the same designations. The total number of acres (of all habitat types) to be managed under NSO or Closed designations approximate 547,077 under the Proposed Plan. This is about 5,364 more acres (1%) than under Alternative A.

Mule Deer. More UDWR designated and BLM managed mule deer habitat falls under Closed leasing types under the Proposed Plan than under Alternative A. Because more acres of mule deer habitat fall under Closed leasing types under the Proposed Plan it would be less adverse to mule deer than Alternative A, which protects less habitat from surface disturbance through Closed leasing type designations.

Elk. Under the Proposed Plan, 56,620 acres (19%) of UDWR designated elk habitat would fall under closed leasing types. This is 1% less than under Alternative A. Approximately 15,014 acres (15%) of BLM managed elk habitat would fall under Closed leasing types. This is an improvement over Alternative A since no elk habitat is identified by BLM under that alternative. Overall, the prescriptions included in the Proposed Plan would be more beneficial to elk than Alternative A.

Pronghorn. Under the Proposed Plan neither BLM managed nor UDWR designated pronghorn habitat fall under Closed leasing types. Total acres of BLM managed pronghorn habitat are the same as Alternative B. There is a negligible difference between the Proposed Plan and Alternative A in terms of impacts to pronghorn.

Desert Bighorn Sheep. Under the Proposed Plan, 174,504 acres (38%) of BLM managed and 39,537 acres (24%) of UDWR designated desert bighorn sheep habitat fall under Closed leasing types. For desert bighorn sheep, the Proposed Plan would result in fewer adverse impacts than Alternative A since 81,671 (88%) more acres of BLM managed and 8,324 (27%) more acres of UDWR designated desert bighorn sheep habitat would fall under Closed leasing types.

Geophysical Activity

Under the Proposed Plan, there would be approximately 903 acres of surface disturbance associated with geophysical exploration. This is approximately 2% more acres of disturbance than under Alternative A. Therefore, compared to Alternative A, the Proposed Plan would likely result in a larger adverse impact to wildlife overall due to the increased acreage open to exploration.

Salable Minerals

Under the Proposed Plan, 40,464 (7%) more acres would be available for disposal of mineral materials subject to standard terms and conditions than Alternative A. Acreage available for mineral disposal subject to special conditions would be 12% (96,836 acres) less than under Alternative A. Finally, acreage closed to mineral disposal would be 16% (61,488 acres) more than under Alternative A. This would beneficially impact wildlife species by protecting more of their habitats from potential surface-disturbing activities and their associated impacts. Though the Proposed Plan would close more acres to mineral disposal than Alternative A, overall, the Proposed Plan would be less beneficial to wildlife species than Alternative A because it would protect fewer habitats with special stipulations for disposal and open more acres to disposal under standard stipulations.

Locatable Minerals

Under the Proposed Plan, 1,734,458 acres of land in the Monticello PA would be open to mineral entry. That is 81,715 (5%) more acres than under Alternative A. Under the Proposed Plan approximately 50,665 acres would be recommended to Congress for withdrawal from mineral entry. That is 81,715 (62%) acres less than are recommended for withdrawal from mineral entry under Alternative A. The Proposed Plan would be less beneficial to wildlife than Alternative A, because the Proposed Plan would open more acres to mineral entry recommend fewer acres for withdrawal.

4.3.19.3.11. IMPACTS OF NON-WSAs WITH WILDERNESS CHARACTERISTICS DECISIONS ON WILDLIFE AND FISHERIES

4.3.19.3.11.1. Alternatives A, B, C, and D

Under Alternatives A, B, C, and D, no areas within the Monticello PA would be managed as non-WSA areas with wilderness characteristics.

4.3.19.3.11.2. Alternative E

Under Alternative E, approximately 582,357 acres of non-WSA lands wilderness characteristics would be managed to preserve their wilderness values. Proposed decisions to protect wilderness values would include managing the areas under VRM I objectives, closing the area to oil and gas leasing and locatable mineral development, closing the areas to off-route OHV use and new road construction, designating the areas as ROW exclusion areas, and closing the areas to woodland harvest and wood gathering. These proposed decisions would have long-term beneficial impacts on wildlife and fisheries and their habitat by reducing the potential for surface disturbances, noise, and alteration of habitat.

4.3.19.3.11.3. Proposed Plan

Under the Proposed Plan, 88,871 acres would be managed for their wilderness characteristics. These areas would include Dark Canyon (11,540 acres), Grand Gulch (13,657 acres), Mancos Mesa (30,068 acres), and Nokai Dome East (18,618 acres and Nokai Dome West (14,988 acres). Proposed decisions to protect wilderness values would include: 1) managing the areas under VRM II objectives; 2) closing most units to oil and gas leasing and establishing the Dark Canyon unit as NSO; 3) limiting OHV use to designated roads/trails; 4) establishing units as ROW

avoidance areas; 5) maintaining existing improvements within units; 6) unavailable for private and commercial wood harvest; 7) available for non-ground disturbing treatments; 8) not proposed for mineral withdrawal; 9) available for mineral materials disposal if the oil and gas leasing category is standard or timing/controlled surface use, otherwise closed to mineral materials disposal; and 10) unavailable for coal and geothermal leasing. These proposed decisions would have long-term beneficial impacts on wildlife and fisheries and their habitat by reducing the potential for surface disturbances, noise, and alteration of habitat.

4.3.19.3.12. IMPACTS OF RECREATION DECISIONS ON WILDLIFE AND FISHERIES

Impacts varying between alternatives result primarily from variations in the level of mineral exploration and development allowed and specific recreation prescriptions for SRMAs. Assuming that recreationists in SRMAs use established routes and, where dispersed camping is allowed, either camp in previously disturbed areas only or stay within 150–300 feet of these routes, the difference between alternatives in terms of the impacts of these recreation decisions on wildlife and fisheries would be negligible. Impacts would generally be of the nature described above and would vary slightly depending on the specific management prescriptions in each alternative. Key differences between alternatives resulting in notable differences in impacts to wildlife and fisheries are described below by proposed SRMA.

4.3.19.3.12.1. San Juan River SRMA

Alternative A

Under Alternative A, the San Juan River SRMA would encompass 15,100 acres. Motorized boating would be allowed downstream while upstream travel would only be allowed for emergency purposes. Approximately 40,000 user/days (private and commercial trips combined) per year would be permitted with groups no larger than 25 people for private trips and 25 people plus 8 crew for commercial trips. Commercial use would be allowed up to 50% of total use while administrative and research use would not be included in launch limits. Camping would be allowed in 9 designated campsites (available for reservation) in the Slickhorn Canyon to Clay Hills area. Camping in this area would be limited to 1 or 2 nights depending on the season. Vehicle camping in the SRMA would not be restricted. Grazing prescriptions for this area would remain as in the current RMP (see Table 2.1 Livestock Grazing). No management prescriptions would be in place for minerals or watersheds.

Alternative B

Under Alternative B the total acreage of the San Juan River SRMA would be 10,203 acres (approximately 32% smaller than Alternative A). No motorized boating would be allowed except in emergency situations. Approximately 30,000 user/days per year would be allowed with a trip size limit of 20 people (including crew for commercial trips). Commercial use would be restricted to up to 30% of total use and administrative and research use would be limited to that which can be accommodated within the launch limits. Camping would be allowed per Memorandum of Understanding between the NPS/GCNRA and the Navajo Nation. Vehicle camping in the SRMA would be limited to areas upstream of Comb Wash except along Lime Creek Road, the Mexican Hat Rock area, and the Mexican Hat Boat Ramp. The area would be open to oil and gas leasing subject to NSO and closed for mineral entry and disposal. Seasonal grazing restrictions would be in place not to exceed PFC. Watershed prescriptions would include

surface restrictions for watershed control structures to protect bighorn sheep lambing and rutting areas and vehicle access would be limited to designated routes. OHV use would be limited to designated roads and trails throughout the SRMA. These management prescriptions would place further restrictions on surface disturbance and visitor generated noise and visual disturbance than under Alternative A; therefore, Alternative B would be more beneficial to wildlife than Alternative A.

Alternatives C and E and the Proposed Plan

Under Alternatives C and E and the Proposed Plan the total acreage of the San Juan River SRMA would be about 9,859 acres, or 5,241 fewer acres than Alternative A. Management prescriptions related to motorized boating and administrative and research use would be the same as Alternative A except under Alternative E where non-WSA lands with wilderness characteristics would be closed to oil and gas leasing and OHV use. Management prescriptions related to designated campsites, vehicle camping, minerals, grazing, and OHV use would be the same as Alternative B. Launch limits would be the same as Alternative A except that the commercial trip size limit of 25 people would include crew members. Commercial use would be restricted to up to 40% of total use. In general, Alternatives C and E and the Proposed Plan would be more beneficial to wildlife than Alternative A, as Alternatives C and E and the Proposed Plan would more closely limit visitor numbers and minerals-related activities.

Alternative D

Under Alternative D the total acreage of the San Juan River SRMA would be about 6,365 acres, or 8,735 fewer acres than Alternative A. Management prescriptions related to motorized boating and administrative and research use would be the same as Alternative A. Management prescriptions related to designated campsites, minerals, and grazing would be the same as Alternative B. All other management prescriptions would be less restrictive of disturbance-generating activities than any other alternative. Alternative D would be less beneficial to wildlife than any other alternative due to the decreased SRMA acreage proposed under this alternative, and fewer restrictions on visitors groups and group sizes.

4.3.19.3.12.2. Cedar Mesa SRMA

The proposed Cedar Mesa SRMA would include the Grand Gulch Plateau Mesa Top Day Use, Grand Gulch Plateau Mesa Top Camping, Grand Gulch Plateau In-canyon Private/Commercial Day Use, and Grand Gulch Plateau In-Canyon Permitted Overnight Camping areas. While management prescriptions for these areas vary between alternatives these variations represent negligible impacts on wildlife and only negligible differences between alternatives. All management prescriptions are intended to limit or curtail disturbance-causing activities. Management prescriptions for the area as a whole are discussed below by alternative.

Alternative A

Under Alternative A the proposed Cedar Mesa SRMA (385,000 acres) would remain the Grand Gulch SRMA. Management prescriptions (see Table 2.1) for camping, campfires, areas for day use only, pets, stock use, group size, and disposal of human waste would be implemented to allow for private and commercial use of the area while protecting resource values. Impacts to wildlife would be the same as those discussed under Impacts Common to All Alternatives and the Proposed Plan.

Alternative B

Alternative B is the same as Alternative A except that further restrictions would be placed on pets and stock as well as camping activities and the acreage of the SRMA would be 375,739 acres (9,261 acres of 2% less than under Alternative A). Also, watershed, range, and wildlife improvements and vegetation treatments would be allowed. Alternative B would be more beneficial to wildlife than Alternative A due to the increased restrictions on disturbance-causing activities and the potential for watershed, range, and wildlife improvements and vegetation treatments.

Alternative C

In terms of pets and stock Alternative C is the same as Alternative A except that restrictions on pets and stock would be greater under Alternative C. In terms of other activities Alternative C is the same as Alternative B except that campfires would be allowed on mesa tops only (with fire pans) and commercial and private use of woodland products would be allowed. The Cedar Mesa SRMA under Alternative C would be 375,739 acres as under Alternative B. Impacts associated with Alternative C would be less than Alternative A due to increased restrictions but greater than Alternative B.

Alternative D

Alternative D is the same as Alternative C except that pets or stock may be limited or prohibited if resources or the visitor experience are adversely affected. Stock limitations would be the same as Alternative A. In general, Alternative D places the fewest restrictions on disturbance-causing activities and therefore would be the least beneficial to wildlife of all alternatives and the Proposed Plan.

Alternative E

Alternative E is the same as Alternative B except that non-WSA lands with wilderness characteristics would be managed to protect wilderness values. Alternative E would be the most beneficial to wildlife of all alternatives and the Proposed Plan since it places the greatest restrictions on disturbance-causing activities.

Proposed Plan

Under the Proposed Plan the Cedar Mesa SRMA would be approximately 407,098 acres (6%, or 22,098 acres, larger than under Alternative A). The area would include two management zones—Comb Ridge (30,752 acres) and McLoyd-Moonhouse (1,607 acres). Under the Proposed Plan the SRMA would be managed the same as under Alternative B except that campfires would be allowed on mesa tops only with a fire pan required and the area would be available for private and/or commercial use of woodland products as under Alternative C. Further, pets and stock would be allowed subject to prescriptions as under Alternative C.

4.3.19.3.12.3. Dark Canyon SRMA

Alternatives A–E and the Proposed Plan

Under all alternatives and the Proposed Plan the Dark Canyon SRMA would be managed to limit recreational impacts and protect resource values, though under Alternative A Dark Canyon

would remain part of the Canyon Basins SRMA (214,390 acres). Variations between alternatives and the Proposed Plan relate to:

- group size limits (range from no limit to 18 people per group);
- commercial trips allowed per week (range from no limit to 7 commercial trips per week);
- camping restrictions (range from open dispersed camping in any location to camping only in designated campsites);
- campfire restrictions (range from no restrictions to allowed on mesa tops only);
- limits on collection of woodland products (range from no restrictions to prohibiting collection of woodland products); and
- pet restrictions (range from no pets allowed to pets allowed without restrictions).

Variations in pet restrictions are the main difference between alternatives and the Proposed Plan in terms of impacts on wildlife. Pets create additional noise disturbance that can result in avoidance behavior amongst wildlife. Also, pets off leash wander from designated routes creating additional surface disturbance and potentially threaten individual animals. Alternatives B and E would be most beneficial to wildlife as they would prohibit pets. Alternatives C and D would allow pets on leash and under control, which would limit pet-created disturbance but not prevent it. Finally, Alternative A would allow pets without further restrictions. This alternative would result in the greatest pet-caused wildlife disturbances.

Remaining variations between alternatives and the Proposed Plan are negligible and would result in negligible impacts to wildlife since all prescriptions would limit or curtail disturbance-causing activities.

4.3.19.3.12.4. Indian Creek SRMA

Alternatives A–E and the Proposed Plan

Under all alternatives and the Proposed Plan the Indian Creek SRMA would be managed to limit recreational impacts and protect resource values. Alternative A is unique in that the Indian Creek SRMA would remain part of the Canyon Basins SRMA (214,390 acres). Other variations between alternatives and the Proposed Plan relate to restrictions on camping (i.e., allowing dispersed camping versus limiting camping to designated camp sites). In terms of impacts on wildlife there is little difference between the alternatives and the Proposed Plan since recreationists tend to use designated (or previously disturbed) campsites rather than disturbing new sites. Impacts to wildlife associated with management prescriptions in the Indian Creek SRMA would be minimal since these management prescriptions are designed to limit or curtail disturbance-causing activities.

4.3.19.3.12.5. White Canyon SRMA

Alternative A

Under Alternative A, White Canyon SRMA would be managed using minimal management prescriptions. Permits would be required for commercial use but activities related to private use would be unrestricted. The area would not be managed as an SRMA under this alternative.

Alternatives B–E and the Proposed Plan

Under Alternatives B–E and the Proposed Plan, White Canyon SRMA (2,828 acres) would be managed to limit recreational impacts. Management prescriptions vary by alternative and the Proposed Plan though these variations would not result in appreciable differences between the alternatives and the Proposed Plan nor appreciable impacts on wildlife since all alternatives and the Proposed Plan would implement prescriptions designed to limit or curtail disturbance-causing activities.

4.3.19.3.13. IMPACTS OF RIPARIAN DECISIONS ON WILDLIFE AND FISHERIES

4.3.19.3.13.1. Alternatives A and D

Under Alternatives A and D BLM would manage riparian areas to reduce resource loss from floods and erosion; maintain water quality; and preserve, protect, and restore natural functions. All lands would be managed in accordance with laws, executive orders, and regulations on floodplains and wetlands. These decisions would mitigate some of the adverse impacts caused by mineral leasing (discussed in Section 4.3.19.3.10), grazing (discussed in Section 4.3.19.3.9), and recreation (discussed in Section 4.3.19.3.12) on wildlife species that utilize riparian habitat.

Alternatives A and D would provide no additional restrictions on actions in riparian areas outside of management common to all alternatives and the Proposed Plan. These alternatives would be less beneficial to wildlife than all other alternatives and the Proposed Plan.

4.3.19.3.13.2. Alternatives B, C, and E and the Proposed Plan

Under Alternatives B, C, and E and the Proposed Plan OHV routes in selected riparian areas would be closed where site-specific analysis determines that OHV use is contributing to these areas Functioning At Risk. In addition, some riparian areas would be closed to livestock grazing, while others would be subject to seasonal restrictions and forage utilization limits if areas are found to be Functioning At Risk. Riparian areas identified as Functioning At Risk would be closed to motorized camping until PFC is restored. These restrictions would decrease the amount of wildlife habitat subject to the adverse impacts of surface disturbance in sensitive riparian areas and therefore these alternatives and the Proposed Plan would be more beneficial to wildlife than Alternatives A and D.

4.3.19.3.14. IMPACTS OF SOILS/WATERSHED DECISIONS ON WILDLIFE AND FISHERIES

4.3.19.3.14.1. Alternative A

Under Alternative A, the impacts of soils and watershed management decisions on wildlife resources would be the same as impacts common to all alternatives and the Proposed Plan.

4.3.19.3.14.2. Alternatives B and E

Under Alternatives B and E if surface-disturbing activities could not be avoided on slopes between 21 and 40%, a plan would be required which would include an erosion control strategy. No surface disturbance would be allowed on slopes greater than 40%, excluding 87,601 total acres of land in the Monticello PA from surface disturbance and preventing the adverse impacts associated therewith. Though surface-disturbing activities may still occur on slopes between 21

and 40% (218,790 acres) erosion control strategies and approved survey and design would be expected to mitigate adverse impacts. Pinyon-juniper habitat makes up 88% of slopes greater than 40% and 83% of slopes between 21 and 40%. The species associated with this habitat would benefit from the large number of acres protected from surface-disturbing activities (Table 4.250). The decisions associated with Alternatives B and E would have less adverse impacts on wildlife than Alternative A.

Table 4.250. Acreage and Percentage of Slopes by Cover Type and Associated Wildlife

Vegetation Type	Wildlife Associations	Slope > 40%	% of Total acres	Slope 21–40%	% of Total acres
Pinyon-juniper	Mule deer, elk, mountain lion, neotropical birds, upland game birds.	77,331	88.3	180,954	82.7
Desert Scrub (Saltbush and Blackbrush)	Pronghorn, desert bighorn, elk (winter), raptors, neotropical birds, upland game birds.	6,390	7.3	27,473	12.6
Sagebrush and Grassland	Mule deer, elk, pronghorn, mountain lion, neotropical birds, upland game birds.	1,684	1.9	5,534	2.5
Riparian	Mule deer, elk, mountain lion, neotropical birds, upland game birds, amphibian and fish species.	683	0.8	1,461	0.7
Conifer/mountain shrub	Mule deer, elk, mountain lion, neotropical birds, upland game birds.	1,323	1.5	2,662	1.2
Other cover types		188	0.2	708	0.3
Total Acres		87,599	100	218,792	100

4.3.19.3.14.3. Alternative C and the Proposed Plan

Alternative C and the Proposed Plan are the same as Alternatives B and E except that for slopes greater than 40% surface disturbance would still be allowed if other placement alternatives would cause undue or unnecessary degradation. Alternative C and the Proposed Plan would have greater adverse impacts on wildlife resources than Alternatives B and E because they would not rule out surface disturbance on 87,601 acres of habitat (slopes greater than 40%).

4.3.19.3.14.4. Alternative D

Alternative D would only require a plan for slopes greater than 40%, and would not rule out surface disturbance on slopes of any grade. Among all alternatives and the Proposed Plan, Alternative D would be the most adverse to wildlife because of the increased potential for erosion and habitat destruction.

4.3.19.3.15. IMPACTS OF SPECIAL DESIGNATION DECISIONS ON WILDLIFE AND FISHERIES

Within the Monticello PA, there are 12 proposed ACECs and 12 reviewed WSR segments. Not every proposed ACEC or WSR segment would be designated under each alternative (Table 4.251 and Table 4.252). Other than stipulating that WSAs would be managed according to IMP and as VRM Class I there are no blanket management prescriptions within proposed ACECs, so the impacts to wildlife and fisheries resources from ACEC designations would vary depending on the management stipulations for each area under each alternative and the Proposed Plan.

Table 4.251. Proposed ACEC Acreage under the Proposed Plan and Each Alternative

ACEC	Alternatives					Proposed Pan
	A ^a	B	C	D	E	
Alkali Ridge	39,202	39,196	39,196	0	39,196	39,196
Bridger Jack Mesa	6,260	6,225	0	0	6,225	0
Butler Wash North	17,464	17,365	0	0	17,365	0
Cedar Mesa	295,336 ^b	306,742	0	0	306,742	0
Dark Canyon	61,660	61,660	0	0	61,660	0
Hovenweep	1,798	2,439	2,439	0	2,439	2,439
Indian Creek	8,510	8,510	3,908	0	8,510	3,908
Lockhart Basin	N/A	47,783	0	0	47,783	0
Lavender Mesa	649	649	649	0	649	649
Shay Canyon	3,561	119	119	0	119	119
San Juan River	0	7,590	7,590	0	7,590	4,321
Scenic Highway	57,637 ^c	0	0	0	0	0
Valley of the Gods	0 ^d	22,863	22,863	0	22,863	22,863
Total	492,077	521,142	73,495	0	521,141	73,495

^a GIS technology has changed since the last RMP. Acres listed under this alternative may be slightly different even though the polygon is the same size under other alternatives.

^b Includes Pine and Step Canyons 21,280 acres of the Scenic Highway Corridor ACEC

^c Does not include 21,380 acres that overlaps with the Cedar Mesa ACEC.

^d Acreage included in Cedar Mesa ACEC (31,387 acres).

Table 4.252. Acreage of WSR Segment Recommended for Designation by Alternative

WSR Segment	Alternatives					Proposed Plan
	A	B	C	D	E	
Colorado River Segment 1 (Recreational)	No evaluation	352	0	0	352	0
Colorado River Segment 2 (Scenic)	Suitable, acreage not specified	880	880	0	880	880
Colorado River Segment 3 (Scenic)	Suitable, acreage not specified	1,040	1,040	0	1,040	1,040
Indian Creek (Recreational)	No evaluation	1,536	0	0	1,536	0

Table 4.252. Acreage of WSR Segment Recommended for Designation by Alternative

WSR Segment	Alternatives					Proposed Plan
	A	B	C	D	E	
Fable Valley (Scenic)	No evaluation	2,176	0	0	2,176	0
Dark Canyon (Wild)	No evaluation	2,048	2,048	0	2,048	2,048
San Juan River Segment 1 (Recreational)	No evaluation	1,360	0	0	1,360	0

San Juan River Segment 3 (Wild)	Suitable, acreage not specified	2,128	0	0	2,128	0
San Juan River Segment 4 (Recreational)	Suitable, acreage not specified	672	0	0	672	0
San Juan River Segment 5 (Wild)	Suitable, acreage not specified	2,768	2,768	0	2,768	2,768
Arch Canyon (Recreational)	No evaluation	2,208	0	0	2,208	0
Total	N/A	18,768	6,736	0	18,768	6,736

4.3.19.3.15.1. Alternative A

Ten of the 12 proposed ACECs would continue to be managed as ACECs under Alternative A (approximately 489,480 acres in total). This includes Valley of the Gods, which would be a Special Emphasis Area for scenic value within the Cedar Mesa ACEC as well as Pine and Step Canyons, which would be managed with the same prescriptions as Cedar Mesa ACEC. The proposed Lockhart Basin ACEC is not currently an existing ACEC but a portion of it includes the Indian Creek ACEC (8,642 acres). This portion would continue to be managed as an ACEC and is included in the total acreage above. The proposed San Juan River ACEC would continue to be managed under SRMA status (15,100 acres). Approximately 25% of the land under ACEC designation would be managed as open to mineral leasing, while approximately 75% would be managed as closed.

Under Alternative A, 6 of the 12 river segments reviewed for WSR status would be designated as suitable for WSR status. The remaining six segments were not evaluated for WSR eligibility in the 1991 San Juan RMP.

4.3.19.3.15.2. Alternatives B and E

Under Alternatives B and E, all 12 of the proposed ACECs (approximately 521,141 acres in total) would be designated and managed as ACECs. Alternatives B and E would designate more land as ACECs than all other alternatives and the Proposed Plan, which would indirectly benefit wildlife by providing protections from surface disturbance. Approximately 28% of the land under ACEC designation would be managed as open to mineral leasing, while approximately

72% would be managed as closed. Under Alternatives B and E approximately 3% fewer acres would be closed to mineral leasing than under Alternative A. This is a negligible difference between alternatives given the larger acreage managed as ACECs under Alternatives B and E.

Under Alternatives B and E, all 12 of the river segments reviewed for WSR status would be recommended as suitable for WSR status (18,768 acres in total). Management prescriptions vary from river segment to river segment (see Table 2.1 for specific prescriptions by segment) but this variation does not represent a notable difference between alternatives and the Proposed Plan in terms of the impacts of WSR designation since Alternatives B and E recommend more river segments for WSR status than all other alternatives and the Proposed Plan.

4.3.19.3.15.3. Alternative C

Under Alternative C, seven of the proposed ACECs (approximately 73,495 acres in total) would be recognized and managed as ACECs. Alternative C would designate approximately 85% less land as ACECs than Alternative A, limiting protections from surface disturbance compared to Alternative A. Under Alternative C approximately 53% of the land under ACEC designation would be open to minerals leasing, while approximately 47% would be managed as closed. Approximately 12% more land would be open to mineral leasing under Alternative C than under Alternative A.

Four of the 12 river segments reviewed for WSR status would be designated as suitable for WSR status under Alternative C (6,736 acres in total). The remaining segments would not be recommended as suitable for WSR status. Alternative C would include two-thirds as many WSR recommended river segments as Alternative A.

4.3.19.3.15.4. Alternative D

Under Alternative D, none of the 12 proposed ACECs would be designated and approximately 43% of the land within the areas proposed for ACEC designation would be managed as open to mineral leasing, while approximately 57% would be managed as closed. Fewer acres would be closed to surface-disturbing activities under Alternative D than under all other alternatives and the Proposed Plan.

Under Alternative D, none of the river segments reviewed for WSR status would be recommended as suitable for WSR status. This is fewer than all other alternatives and the Proposed Plan.

4.3.19.3.15.5. Proposed Plan

Under the Proposed Plan, seven of the proposed ACECs (approximately 73,492 acres in total) would be designated and managed as ACECs. The Proposed Plan would designate approximately 85% less land as ACECs than Alternative A, limiting protections from surface disturbance compared to Alternative A. Under the Proposed Plan approximately 53% of the land under ACEC designation would be open to minerals leasing, while approximately 47% would be managed as closed. Approximately 70% and 90% less land, respectively, would be open and closed to mineral leasing under the Proposed Plan than under Alternative A.

Four of the 12 river segments reviewed for WSR status would be designated as suitable for WSR status under the Proposed Plan (6,736 acres in total). The remaining segments would not be

recommended as suitable for WSR status. The Proposed Plan would include two-thirds as many WSR recommended river segments as Alternative A.

4.3.19.3.16. IMPACTS OF SPECIAL STATUS SPECIES DECISIONS ON WILDLIFE AND FISHERIES

The alternatives and the Proposed Plan vary in terms of the acreage of crucial year-round habitat that would be established for Gunnison Sage-grouse as well as specific management prescriptions for Gunnison Sage-grouse, Mexican Spotted Owl, and flannelmouth sucker. Under Alternative A, the impacts of special status species management decisions on wildlife would be the same as impacts common to all alternatives and the Proposed Plan. Alternatives B and E would provide more protection for special status species than all other alternatives and the Proposed Plan, and indirectly other wildlife and fish populations. Alternative D would provide the least protection for these species. Alternative C and the Proposed Plan would provide similar levels of protection for special status species, though Alternative C would provide more protection in some respects such as protections for Gunnison Sage-grouse in year-round habitat (Alternative C would prescribe a 6-mile zone around active strutting grounds from May 16 to March 19 while the Proposed Plan would prescribe a 4-mile zone).

4.3.19.3.17. IMPACTS OF TRAVEL MANAGEMENT DECISIONS ON WILDLIFE AND FISHERIES

The impacts of travel management decisions on wildlife would primarily depend on the number of acres open and closed to OHV use and where OHV use is limited to designated roads and/or trails under each alternative and the Proposed Plan. Table 4.253 details acres open, closed, and limited to designated roads and/or trails for OHV use by vegetation type and in total for each alternative and the Proposed Plan. Areas that are classified as developed, disturbed, characterized by invasive/noxious weeds, or characterized as water are not included since their acreages are small.

Table 4.253. Wildlife Habitat (acres) Open, Limited, and Closed to OHV Use by Vegetation Type and Alternative/Proposed Plan*

Vegetation Type	Status	Alternatives					Proposed Plan
		A	B	C	D	E	
Conifer/Mountain Shrub	Open	6,709	0	0	0	0	0
	Limited	3,236	9,728	9,728	10,802	8,029	9,740
	Closed	856	1,074	1,074	0	2,774	1,061
Desert Shrub	Open	150,188	0	1,847	1,847	0	0
	Limited	218,564	350,720	351,592	418,829	168,996	356,351
	Closed	53,096	69,957	67,238	0	250,403	64,276
Pinyon-Juniper	Open	356,773	0	321	321	0	0
	Limited	572,435	828,766	830,534	1,145,957	498,214	849,664
	Closed	218,188	317,500	315,524	0	648,062	296,553
Riparian/Wetland	Open	10,870	0	135	135	0	0
	Limited	6,302	16,458	16,623	20,300	11,656	16,894
	Closed	3,525	3,977	3,676	0	8,779	3,539

Table 4.253. Wildlife Habitat (acres) Open, Limited, and Closed to OHV Use by Vegetation Type and Alternative/Proposed Plan*

Vegetation Type	Status	Alternatives					Proposed Plan
		A	B	C	D	E	
Sagebrush/ Perennial Grass	Open	65,782	0	6	6	0	0
	Limited	88,073	134,739	165,517	165,571	108,525	137,439
	Closed	12,256	30,838	0	0	57,050	28,122
Total	Open	590,322	0	2,309	2,309	0	0
	Limited	888,610	1,340,411	1,373,994	1,761,459	795,420	1,370,088
	Closed	287,921	423,346	387,512	0	967,068	393,551

*Note that acreages in Table 4.253 do not add up to acreages referenced in the text. Acreages included in the table are only for key wildlife habitats. Acreages in the text include areas open, limited, and closed to OHV use for agricultural, disturbed, invasive species and noxious weeds, water, developed, and barren land use/land cover types.

OHV use can cause damage to vegetation used as wildlife forage and cover, as well as cause noise disturbance. OHV use therefore generally has long- and short-term adverse impacts on wildlife species, especially birds, in the Monticello PA (Reijnen and Foppen 1994; Gelbard and Belnap 2003). OHV use also contributes to habitat fragmentation and habitat degradation, including the spread of noxious weeds. These would have long-term adverse impacts to wildlife. Greater acreage open to OHV use would result in more short- and long-term adverse impacts to wildlife than less acreage open to OHV use. Likewise, more acreage closed to OHV use would be more beneficial to wildlife than less acreage closed to OHV use. Areas closed to OHV use would include some ACECs, WSAs, SRMAs, vegetation study areas, and non-WSA lands with wilderness characteristics (a list of closed areas under each alternative and the Proposed Plan is provided in Table 2.1).

4.3.19.3.17.1. Alternative A

Under Alternative A, a total of 611,310 acres would be open to OHV use, which is more than under any other alternative. OHV use would be limited to designated roads and/or trails on approximately 1,329,430 acres and approximately 276,430 acres would be closed to OHV use.

4.3.19.3.17.2. Alternatives B and E

Under Alternatives B and E zero acres would be open to OHV use while 1,359,417 acres would be limited to designated routes under Alternative B and 812,679 acres would be limited to designated routes under Alternative E. Alternatives B and E would close 423,698 and 970,436 acres, respectively, to OHV use. For Alternative B this is 147,268 acres (53%) more than under Alternative A. For Alternative E this is 694,006 acres (251%) more than under Alternative A. Further, under Alternatives B and E Arch Canyon would be closed to OHV use to protect wildlife. These alternatives would prevent more surface disturbance and weed spread associated with OHV use than any other alternatives and the Proposed Plan.

4.3.19.3.17.3. Alternative C

Under Alternative C a total of 2,311 acres would be open to OHV use while approximately 1,362,142 acres would be limited to designated routes. Alternative C would close 418,667 acres to OHV use, which is 142,237 acres (51%) more than under Alternative A. This alternative would prevent approximately the same amount of surface disturbance and weed spread associated with OHV use as Alternative B except that this alternative allows for 7 designated “ways” in corridors to reach trailheads whereas Alternative B does not allow these routes. The designated “ways” associated with Alternative C would result in impacts, as described above, in these areas. These impacts would not be sustained under Alternative B. Alternative C would also include seasonal restrictions on 3.8 miles of trail in Arch Canyon to protect wildlife, though OHV use would otherwise be permitted limited to designated routes.

4.3.19.3.17.4. Alternative D

Under Alternative D a total of 2,311 acres would be open to OHV use while 1,780,807 acres would be limited to designated routes. Alternative D would close no land to OHV use (including Arch Canyon). The lack of closures would make the adverse impacts to wildlife species and their habitats of this alternative greater than under all other alternatives and the Proposed Plan.

4.3.19.3.17.5. Proposed Plan

Under the Proposed Plan zero acres would be open to OHV use while approximately 1,388,191 acres would be limited to designated routes. OHV use in Indian Creek would be limited to designated roads/trails. Also, the Arch Canyon route would be opened for the entire length of the canyon to within 0.5 miles of the USFS boundary with seasonal restrictions. The Proposed Plan would close 393,895 acres to OHV use, which is 117,465 acres (42%) more than under Alternative A. The Proposed Plan would prevent approximately the same amount of surface disturbance and weed spread associated with OHV use as Alternatives B except that the Proposed Plan would allow for 4 or fewer designated "ways" in corridors to reach trailheads whereas Alternative B does not allow these routes. The designated "ways" associated with the Proposed Plan would result in impacts, as described above, in these areas. These impacts would not be sustained under Alternative B.

4.3.19.3.18. IMPACTS OF VEGETATION DECISIONS ON WILDLIFE AND FISHERIES

Impacts varying between alternatives and the Proposed Plan result from varying treatment acreages (Table 4.254). Though vegetation treatments would likely cause short-term adverse impacts to all wildlife in the area, impacts would vary over the long-term; depending on what sort of habitat is removed and what habitat type is encouraged to regenerate, some species would benefit and others would experience adverse impacts due to loss of forage or cover. Vegetation treatments focused on removing non-native plants would have long-term, beneficial impacts on the treated wildlife habitats as a whole; removing undesirable, non-native plant species, would allow the establishment of a diverse, native vegetation community.

Table 4.254. Acres of Annual Vegetation Treatments by Vegetation Type and Alternative

Vegetation Type	Alternatives					Proposed Plan
	A	B	C	D	E	
Existing treatments on various vegetation types	U ¹	1,000	1,500	2,000	1,000	1,500
Sagebrush	U	1,000	1,500	2,000	1,000	1,500
Invasive Weeds	U	3,000	3,000	3,000	3,000	3,000
Pinyon/juniper	U	2,000	3,000	4,000	2,000	3,000
Riparian	U	500	100	100	500	100
Greasewood	U	100	200	200	100	200
Total	U	7,600	9,300	11,300	7,600	9,300

U=Unspecified. Total land treatments for Alternative A = 9,320 acres

4.3.19.3.18.1. Alternative A

Under Alternative A, existing land treatments would be maintained and new land treatments would be provided applying RMP stipulations and special conditions through NEPA documentation. Treatments would occur on a dispersed basis on 232,130 acres. Impacts to wildlife would be of the nature described above.

4.3.19.3.18.2. Alternatives B and E

Under Alternatives B and E there would be a total of approximately 7,600 acres of vegetation treatments annually. Of all alternatives and the Proposed Plan, this is the smallest acreage of annual vegetation treatments. Thus, short-term adverse impacts to wildlife would be least pronounced under these alternatives but long-term beneficial impacts to wildlife would also be least pronounced.

4.3.19.3.18.3. Alternative C and the Proposed Plan

Under Alternative C and the Proposed Plan there would be a total of approximately 9,300 acres of vegetation treatments annually. Impacts on wildlife would be intensified under this alternative and the Proposed Plan compared to Alternative A since a greater number of acres would be treated per year.

4.3.19.3.18.4. Alternative D

Under Alternative D there would be a total of approximately 11,300 acres of vegetation treatments annually. The acreage of vegetation treatments is greater under this alternative than under any other alternative and the Proposed Plan, therefore the impacts to wildlife would be most pronounced under this alternative.

4.3.19.3.19. IMPACTS OF VISUAL RESOURCES DECISIONS ON WILDLIFE AND FISHERIES

The impacts to wildlife from visual resources decisions are generally associated with whether or not lands are protected from surface disturbance (due to the visual impacts of such disturbance).

If lands are considered to have high scenic quality, they will likely be inventoried and designated as VRM Class I or II. Landscapes with lower scenic quality are likely inventoried and designated as VRM Class III or IV. Usually VRM Classes I and II are most beneficial to wildlife and their habitats because lands with such ratings are more carefully protected from surface disturbance and its associated adverse impacts to animals.

Impacts that vary between alternatives and the Proposed Plan result from varying acreages that would be designated as VRM Classes I, II, III, or IV (Table 4.255).

Table 4.255. Total Acreage in Monticello PA Designated Under Each VRM Class by Alternative

VRM Class	Alternatives					Proposed Plan
	A	B	C	D	E	
I	371,575 (21%)	497,668 (28%)	425,179 (24%)	390,424 (22%)	998,370 (56%)	422,989 (24%)
II	355,112 (20%)	250,641 (14%)	132,001 (7%)	8,838 (<1%)	111,478 (6%)	228,041 (13%)
III	418,006 (23%)	426,350 (24%)	531,920 (30%)	692,741 (39%)	264,369 (15%)	507,583 (28%)
IV	637,875 (36%)	608,463 (34%)	693,995 (39%)	691,119 (39%)	407,459 (23%)	623,002 (35%)
Total¹	1,783,368	1,783,122	1,783,095	1,783,122	1,781,676	1,781,615

¹ Total acreages vary due to slight differences in GIS shapefiles.

4.3.19.3.19.1. Alternative A

Under Alternative A, 41% of land in the Monticello PA would be designated as VRM Class I or II. The wildlife species that use these lands would benefit from the increased protection from surface-disturbing activities that management under these VRM Classes affords, but may adversely impact some species that benefit from vegetation treatments that are designed for wildlife.

4.3.19.3.19.2. Alternative B

Under Alternative B 42% of land in the Monticello PA would be designated as VRM Class I or II. This alternative would be the more beneficial to wildlife and their habitats than Alternative A since a slightly greater percentage of land would be managed under the most restrictive VRM Classes. Some species may be adversely impacted in the long-term by greater restrictions on surface-disturbing activities, which includes habitat improvements and vegetation treatments.

4.3.19.3.19.3. Alternative C

Under Alternative C approximately 31% of land in the Monticello PA would be designated as VRM Class I or II. This alternative would be less beneficial to wildlife and their habitats than Alternative A since 10% less of the land area in the Monticello PA would be managed under the most restrictive VRM Classes. On the other hand, fewer restrictions also allow for more habitat

improvements and vegetation treatments which would translate into greater benefits for some species.

4.3.19.3.19.4. Alternative D

Under Alternative D 22% of land in the Monticello PA would be designated as VRM Class I or II. This alternative would be the least beneficial to wildlife compared to all other alternatives and the Proposed Plan since it manages the least amount of land under the most restrictive VRM Classes. Some species would benefit more under this alternative since more habitat improvements and vegetation treatments could occur.

4.3.19.3.19.5. Alternative E

Under Alternative E 62% of land in the Monticello PA would be designated as VRM Class I or II. This alternative would be the most beneficial to wildlife compared to all other alternatives and the Proposed Plan since it manages the greatest amount of land under the most restrictive VRM Classes. Some species may experience more adverse impacts due to lack of habitat improvements and vegetation treatments, which would be restricted or prohibited under this alternative.

4.3.19.3.19.6. Proposed Plan

Under the Proposed Plan approximately 37% of land in the Monticello PA would be designated as VRM Class I or II. The Proposed Plan would be less beneficial to wildlife and their habitats than Alternative A since 4% less of the land area in the Monticello PA would be managed under the most restrictive VRM Classes. On the other hand, fewer restrictions also allow for more habitat improvements and vegetation treatments which would translate into greater benefits for some species.

4.3.19.3.20. IMPACTS OF WOODLANDS DECISIONS ON WILDLIFE AND FISHERIES

Impacts from woodlands decisions on wildlife vary depending primarily upon the number of acres of wildlife habitat open to woodland harvest under each alternative and the Proposed Plan (Table 4.256). Adverse impacts to wildlife from woodland harvest include direct habitat loss, habitat degradation, and habitat fragmentation. Indirect, adverse impacts of wood gathering on wildlife species and their habitats include trampling and removal of native vegetation, which results in habitat degradation that can include reduction of prey species, forage species, and cover. All areas open to woodland harvest in each alternative and the Proposed Plan are woodland vegetation types.

Table 4.256. Acres in the Monticello PA Open to Woodland Harvesting

	Alternatives					Proposed Plan
	A	B	C	D	E	
Total Open Areas	1,309,894	730,074	841,938	841,938	548,477	841,938

4.3.19.3.20.1. Alternative A

Under Alternative A, more acres would be open to woodland collection with fewer restrictions than under any other alternative making Alternative A the most adverse to wildlife.

4.3.19.3.20.2. Alternative B

Under Alternative B there would be 579,820 fewer acres (a 44% decrease) open to woodland harvesting than under Alternative A. This alternative would be less adverse to wildlife than Alternative A since it closes more land to harvest of woodland products. Further, limitations on off-road travel and seasonal restrictions on wood collection would help mitigate the adverse impacts of woodland product collection and harvest, where it occurs, on wildlife resources.

4.3.19.3.20.3. Alternative C and the Proposed Plan

Under Alternative C and the Proposed Plan, 467,956 fewer acres (a 36% decrease) would be open to woodland harvesting than under Alternative A. Also, seasonal restrictions on wood collection would not apply in any area and wood collection in certain areas would be restricted to within 150 feet of designated routes and permitted off-road travel. Despite the lack of seasonal restrictions on wood collection Alternative C and the Proposed Plan would have fewer adverse impacts on wildlife resources than Alternative A due to the decreased acreage open to wood collection.

4.3.19.3.20.4. Alternative D

Alternative D impacts would be the same as Alternative C and the Proposed Plan except that wood collection in certain areas would not be restricted to any buffer zone along designated routes or permitted off-road travel. Alternative D would have greater adverse impacts on wildlife than Alternative C and the Proposed Plan since it places the fewest restrictions on wood collection. However, impacts associated with Alternative D would be less than Alternative A due to the greater acreage open to woodland product use under Alternative A.

4.3.19.3.20.5. Alternative E

Under Alternative E there would be fewer acres open to woodland harvest than under any other alternative (761,417 fewer acres—a 58% decrease—available for harvesting than under Alternative A). This alternative would be the least adverse to wildlife of all alternatives and the Proposed Plan since it would open the least amount of land to woodland collection.

4.3.19.3.21. IMPACTS OF HABITAT FRAGMENTATION ON WILDLIFE

In addition to directly disturbing wildlife habitat, roads associated with minerals and travel decisions also fragment adjacent (undisturbed) habitat, thereby degrading its value to wildlife. Habitat fragmentation may be less obvious than direct impacts such as vehicle collisions with wildlife or vegetation removal, but often carries considerable consequences for long-term population and reproductive success. Large expanses of habitat may be required to meet the minimum habitat requirements of the largest, most widely roaming species, including top carnivores and large migrating herd animals.

The impacts of habitat fragmentation from foreseeable oil and gas development were analyzed for deer and elk, desert bighorn sheep, sage-grouse, and migratory birds (discussions of impacts

to sage-grouse are provided in Section 4.3.15, Special Status Species). These species were selected for analysis for three reasons: 1) they are species of high interest; 2) published studies were available that provided suitable fragmentation thresholds to assess impacts to the species; and 3) GIS data were available to support the analyses. Other wildlife species (e.g., amphibians, reptiles, small game, and raptors) would likely also be impacted by habitat fragmentation, but did not meet the analysis criteria above.

The impacts of habitat fragmentation on various animal species are difficult to quantify. Even with site-specific, peer-reviewed ecological research on the impacts to particular wildlife species from habitat fragmentation, many variables that contribute to the severity of the impacts to nearby wildlife remain difficult to predict. Such variables include vehicle use per hour and day, vehicle speed, noise per vehicle, how often drivers leave their vehicles, etc. Unless otherwise stated, for the purpose of this analysis it is assumed that all roads in the Monticello PA (existing and proposed) would have equal impact on a wildlife species.

4.3.19.3.21.1. General Methodology

GIS models were created to analyze the degree of habitat fragmentation under each alternative and the Proposed Plan. The models were based on the BLM's best available GIS data for existing roads within the Monticello PA. To facilitate comparisons between alternatives and the Proposed Plan the model utilized the same baseline habitat acreages (for mule deer, elk, and bighorn sheep 2006 UDWR habitat coverages for all seasons were used) for the analysis of impacts under each alternative and the Proposed Plan. Within areas of the Monticello PA that would be open to oil or gas well development (under Standard, Controlled Surface Use, or Controlled Surface Use and Timing Stipulations), the number of wells expected under the RFD scenario were randomly distributed by RFD area. Only roads effects were considered in the models; individual wells were assumed to have no area and no impact on fragmentation.

Once the wells had been distributed within the network of existing roads, the model generated new roads that connected each well to the nearest existing road. Roads were generated as the shortest straight line from well to existing road, without consideration for topography or ease of travel. The habitat fragmentation analysis considered the effects of all BLM-identified existing roads and new computer-generated roads on the habitat of each wildlife species examined.

Several potential sources of error affect these analyses. First, not all existing roads were included in the GIS database utilized in the models due to unofficial and uninventoried roads. Therefore, these analyses may slightly underestimate some adverse impacts from habitat fragmentation. Second, many roads in the Monticello PA are rarely traveled by vehicles (personal communication, Katie Stevens), and therefore would have little contribution to habitat fragmentation. Including roads with little travel would tend to overestimate the impacts of roads on wildlife habitat. Because the effects of under- and over-estimation would be consistent across all alternatives and the Proposed Plan, the results presented should be useful for comparative purposes.

4.3.19.3.21.2. Analysis of Impacts to Wildlife

Mule Deer and Elk

Methodology

Habitat fragmentation for mule deer and elk was assessed by determining the proportion of habitat where road densities would exceed 0.16 km/km². Habitat where this threshold would be exceeded was considered unfavorable, following Sawyer et al. (2006), who found that mule deer preferentially use habitat where road densities are ≤ 0.16 km/km² in a natural gas field in western Wyoming. Because elk are thought to experience similar impacts to mule deer when disturbed, and as they often occur in similar habitat types as mule deer (Sawyer et al. 2006) this information was also used to predict the spatial distribution of elk since there were no comparable elk data. Road density was calculated per square km of UDWR-designated habitat in the Monticello PA.

Results

Table 4.257 presents the proportion of UDWR-designated mule deer and elk habitat that would be considered unfavorable to each species due to fragmentation by roads under each alternative and the Proposed Plan. Fragmentation of elk habitat under each alternative and the Proposed Plan is shown in Maps 95–99, and mule deer habitat fragmentation is shown in Maps 100–104.

Table 4.257. Percent of Mule Deer and Elk Habitat Considered Unfavorable After Fragmentation by Roads (Road Density < 0.16 km/km²)

Species	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Mule Deer	53.2%	50.1%	52.9%	54.4%	50.1%	52.9%
Elk	49.9%	49.2%	52.2%	52.9%	49.2%	52.2%

Under each alternative and the Proposed Plan approximately half of the mule deer and elk habitats in the Monticello PA would be unfavorable to mule deer due to existing roads and those expected due to reasonably foreseeable minerals development. The small difference (4.3%) between the most and least favorable alternatives and the Proposed Plan seems to indicate that existing roads in the Monticello PA cause most of the habitat fragmentation for mule deer and elk. The number of new roads to be built under each alternative and the Proposed Plan, as modeled, varies considerably, but in comparison to existing roads, new roads only contribute a few percentage points to habitat fragmentation.

Desert Bighorn Sheep

Methodology

The impacts of habitat fragmentation on desert bighorn sheep were assessed using habitat patch size, rather than road density (as with mule deer and elk). This assessment assumed that patch sizes smaller than 159 km² were generally unsuitably fragmented, following Singer et al. (2001), who found that bighorn sheep released into habitat patches of at least 158.7 km² ± 60.3 km² colonized an average of one neighboring patch, while bighorn sheep released in smaller patches did not colonize neighboring areas and eventually left the area. Patch colonization is a necessary precursor to reproduction and population maintenance. Desert bighorn sheep are more sensitive to encroachment and habitat fragmentation than are other ungulates in the Monticello PA (Singer et al. 2001).

Desert Bighorn Sheep Results

Table 4.258 presents the acres of UDWR-designated desert bighorn sheep habitat that would be found in patches larger or smaller than 159 km² under each alternative and the Proposed Plan.

Table 4.258. Desert Bighorn Sheep Habitat Fragmentation Analysis

Alternative	Road Corridor	Habitat Patch <158.7	Habitat Patch ≥158.7	Total
A	3,873	261,751	879,033	1,144,658
B	2,995	253,611	888,051	
C	3,697	333,632	807,328	
D	3,908	380,348	760,401	
E	2,995	253,611	888,051	
Proposed Plan	3,617	333,632	807,409	

Alternatives E, B, and A are the most favorable alternatives for unfragmented habitat within the Monticello PA. Alternative C and the Proposed Plan would allow for roughly 80,000 fewer acres of isolated habitat for desert bighorn sheep than these alternatives.

Migratory Birds*Methodology*

Fragmentation of migratory bird habitat was assessed by calculating the acreage of migratory bird habitat that would be impacted by vehicle and pedestrian traffic for all lands within the Monticello PA. All lands within the Monticello PA were used for these calculations to avoid falsely introducing fragmentation due to land ownership. The potential area of impact was assumed to be a 400-m buffer along each side of all roads in designated migratory bird habitat. This buffer represents an average distance based on applicable literature (Clark and Karr 1979, Connelly et al. 2000, Crawford et al. 2004, UDWR 2002).

Because numerous migratory bird species use various habitats in the Monticello PA, impacts were analyzed based on habitat types, which could then be extrapolated to specific bird species.

Results

Table 4.259 presents the acreage of each habitat type that falls within the 400-m buffer surrounding roads in the Monticello PA by alternative and the Proposed Plan, as well as representative bird species that would be impacted. Although other birds utilize these habitats, these migratory birds were selected for analysis because many of them are found on lists of sensitive species (Partners in Flight and Birds of Conservation Concern). The presence of roads can have numerous adverse impacts on avian communities, including displacement, loss of habitat, and vehicular-related mortalities. Vehicles often hit and kill birds that are attracted to roadside vegetation, spilled grain, or dead animals (Forman and Alexander 1998).

Table 4.259. Acres of Vegetation Habitat Types Impacted by Roads and Buffers

Vegetation Type	Associated Species	Alternatives					Proposed Plan
		A	B	C	D	E	
Conifer and Mountain Shrub	Clark's Nutcracker, Flammulated Owl, Grace's Warbler, Gray Vireo.	92,333	109,518	110,535	110,860	109,518	110,535
Desert Scrub	Ash-throated Flycatcher, Brewer's Sparrow, Golden Eagle.	479,823	454,789	473,849	484,668	454,789	471,719
Pinyon-Juniper	Black-throated Gray Warbler, Gray Vireo, Juniper Titmouse, Pinyon Jay.	619,620	535,820	599,590	627,324	535,820	596,782
Riparian and Wetland	Blue Grosbeak, Cooper's Hawk, Hermit Thrush, Peregrine Falcon, Northern Harrier.	27,974	27,056	27,867	28,603	27,056	27,859
Sagebrush and Perennial Grassland	Horned Lark, Brewer's Sparrow, Sage Thrasher, Western Meadowlark.	174,899	162,975	171,214	176,480	162,975	170,931
Total		1,394,649	1,290,158	1,383,055	1,427,935	1,290,158	1,377,826

Under each of the alternatives and the Proposed Plan, birds that use pinyon-juniper woodlands would experience the most habitat fragmentation. Migratory birds that utilize desert scrub habitats would be the next most heavily impacted by road effects and habitat fragmentation.

Of all the alternatives and the Proposed Plan, Alternative D would cause the most fragmentation by allowing approximately 137,777 more acres of disturbance than Alternatives B and E, 44,880 more than Alternative C, 50,109 more than the Proposed Plan, and 33,286 more than Alternative A. Alternatives B and E would cause the least amount of road-related disturbance to migratory bird habitat (104,491 fewer acres of disturbance, in total, than Alternative A).

4.3.19.4. SUMMARY OF IMPACTS

Table 2.2 contains a summary of impacts of management decisions on wildlife and fisheries resources.

4.3.19.5. MITIGATION MEASURES

The protective measures for wildlife described in Table 2.1, Management Common to All Alternatives and the Proposed Plan in Chapter 2, Appendix M (Raptor Best Management Practices), and Appendix I (SOPs) in addition to BMPs for other resources would serve to avoid and/or minimize impacts to wildlife resources in the Monticello PA.

4.3.19.6. UNAVOIDABLE ADVERSE IMPACTS

Unavoidable adverse impacts to wildlife would include short-term reductions in cover due to trampling and grazing by livestock, trampling and weed introduction by human visitors (motorized and non-motorized), and noise disturbance of individual animals associated with human presence. Permanent alteration of wildlife habitat due to clearing activities such as oil well pad installation and woodland harvest would constitute long-term adverse impacts on wildlife.

4.3.19.7. SHORT-TERM USE VERSUS LONG-TERM PRODUCTIVITY

As discussed throughout this section, some of the short-term, multiple uses of the Monticello PA would adversely impact wildlife habitats. These uses include oil and gas development, livestock grazing, dispersed and developed camping, off-road vehicle travel, and woodland harvest. Most of these impacts, however, are accompanied by economic benefits, and would be partially mitigated by the protective measures discussed in the Impacts Common to All Alternatives and the Proposed Plan sections for each management decision. Effective implementation of these protective measures would prevent these uses from substantially impacting the long-term productivity of wildlife and fisheries resources.

4.3.19.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

There would be no anticipated irreversible impacts to wildlife, fisheries, or wildlife habitat associated with the management decisions proposed for the Monticello PA. There would, however, be irretrievable impacts associated with surface-disturbing activities proposed throughout the planning area. The native vegetation that would be removed or disturbed when roads or trails are cut, oil pads installed, or areas are over-grazed would be irretrievably lost until

successful restoration occurs. The effects of habitat fragmentation due to roads and other disturbances would also persist until removed and successfully reclaimed.

4.3.20. WOODLANDS

The management of high-use recreation areas, some ACECs, non-WSA land with wilderness characteristics, and all WSAs prohibits the harvesting of woodland products. Most woodland harvesting within the Monticello PA is by individuals for use as firewood, fence posts, Christmas trees, landscaping, and greenwood cutting (see Section 3.21.3, Woodlands, for a description of resource demand and use). Thus, it was assumed that areas within the PA that were open to woodlands harvesting would have beneficial impacts on the resource because 1) opportunities would be available to the public to harvest wood for a variety of uses, and 2) managed woodland harvesting (harvesting-related fuel load reductions) would reduce wildland fire risks in dense woodland stands and potentially improve woodland ecosystem health. The quantitative criteria for impacts analysis were the number of acres available and unavailable for woodland harvesting within the Monticello PA.

4.3.20.1. IMPACTS COMMON TO ALL ALTERNATIVES AND THE PROPOSED PLAN

Under the Proposed Plan and all of the alternatives, 391,599 acres in 13 WSAs (approximately 22% of the planning area) would be excluded from woodland harvesting and product use, which would have long-term, restriction-related, adverse impacts on opportunities for woodland harvesting until Congress makes a final determination on the wilderness suitability of these areas. The impacts to opportunities for woodland resources use would be minor because, while these areas are currently and would continue to be closed to harvesting, they are also relatively inaccessible to woodland harvesting because of topography and/or the lack of OHV access routes.

Long-term, beneficial impacts to woodland resources harvesting opportunities under all of the proposed alternatives would include: (1) allowing woodland harvesting in coordination with fire management fuels treatments projects, and (2) and allowing pinyon and juniper harvesting in areas where these woodland species are encroaching on the sagebrush steppe vegetation community.

Implementing the Healthy Forest Initiative and the 2003 Healthy Forest Restoration Act under the Proposed Plan and all of the alternatives would have long-term, beneficial impacts on woodland resources by improving the health and ensuring the sustainability of the resource for long-term harvesting and product use.

Allowing woodland harvesting as part of fuel treatment projects would provide beneficial opportunities for woodland products use while also beneficially reducing the risks stand-altering wildland fire.

Restricting riparian woodland species harvesting (cottonwood and willow) to Native American ceremonial use-only in order to maintain or achieve healthy riparian ecosystems would have long-term, beneficial impacts to riparian woodland resources because these restrictions would ensure the health and sustainability of this resource.

4.3.20.2. IMPACTS COMMON TO ALL ACTION ALTERNATIVES AND THE PROPOSED PLAN

Managing OHV used for wood gathering would ensure that woodland resources remain sustainable, reduce potential resource impacts, and/or to accommodate OHV use for wood gathering in areas where impacts are not a serious concern would be beneficial in the long term

for woodland resources. This is because managed OHV use would limit OHV-caused soil impacts, reduce the development of unwarranted roads, and reduce the opportunities for the establishment and spread of invasive, non-native, weedy species. Also, allowing OHV use for wood gathering would create beneficial opportunities for woodland resource harvesting by allowing greater access.

4.3.20.3. ALTERNATIVES AND PROPOSED PLAN IMPACTS

For the Proposed Plan and all of the alternatives, woodland resource use and management would be required to meet VRM Class objectives. All of the alternatives would designate acreages within the PA as VRM Class I through VRM Class IV, with VRM Class I management objectives having the most restrictions on surface-disturbing activities and VRM Class IV objectives having the least (see Sections 3.19 and 4.3.18 for a discussion of VRM). For analysis purposes, it was assumed that the more protective VRM classes (VRM Classes I and II) would place more restrictions on woodland harvesting opportunities because harvesting is a surface-disturbing activity that could create visual contrasts and impact scenic quality. Thus, in general, VRM Class I and II designations would potentially have long-term, adverse impacts on opportunities for woodland harvesting by restricting these surface-disturbing activities in visually protected areas. It was assumed that VRM Classes III and IV would likely have the least long-term, adverse impacts on opportunities for woodland harvesting because the VRM management objectives under these classes would be the least restrictive on surface-disturbing activities.

It was also assumed that OHV areas that are designed as open to cross-country use and limited to designated routes would provide adequate access to woodland resources areas for harvesting and transporting woodland products. Consequently, it was assumed that closing an area to OHV motorized travel would essentially preclude woodland harvesting in that area.

The following resource management decisions would have negligible to minor impacts on woodland resources and will not be analyzed further in this section:

- Air Quality

Air quality management decisions would have negligible impacts on woodland resources because timing prescribed burns and managing emissions to prevent air quality degradation and comply with state and federal air quality standards would not interfere with woodland harvesting and gathering, woodland restoration, and compliance with the Healthy Forest Initiative.

- Health and Safety

Health and safety management decisions for all the alternatives that would identify and address abandoned minelands safety concerns, respond to hazardous waste releases, and protect public health and safety would have negligible impacts on woodland resources management and woodland harvesting for products use. The hazardous materials management decisions would not interfere or restrict woodland harvesting and gathering, woodland sustainability, and woodland restoration.

- Lands and Realty

Management decisions common to all alternatives for lands and realty for access, permits, transfer, acquisition, or exchange of lands within the Monticello PA would have negligible

impacts on woodland resources or woodland harvesting for wood products. The impacts would be negligible because there are no lands and realty management decisions that address woodlands resources management or specifically identify woodland harvest areas.

- **Livestock Grazing**

Grazing management decisions would have negligible to minor impacts on woodland resources because grazing restrictions and exclusions and authorized grazing use within the planning area do not impinge on woodland resources management and woodland harvesting for products use.

- **Paleontology**

Management decisions common to all alternatives for paleontological resources would have negligible impacts on woodland resources because the collection of fossils for personal, commercial, and scientific use and the protection of this resource would not affect woodland resources harvesting or gathering or woodlands resource management for sustainable woodland products use.

- **Special Status Species**

The impacts of special status species management decisions common to all alternatives on woodland resources would be negligible because temporary seasonal or spatial buffers and restrictions for roosting or nesting birds and habitat enhancement to protect special status species would not restrict woodland harvesting or woodlands management.

4.3.20.3.1. ALTERNATIVE A

4.3.20.3.1.1. Impacts of Cultural Resources Decisions on Woodlands

The Grand Gulch Special Emphasis Area/National Historic District (37,433 acres) would be excluded from woodland harvesting because it lies within a WSA, which is approximately 3% of the total area open to woodland harvesting under this alternative. Closing this area would have long-term, adverse impacts on the opportunities for woodland products use because the area would not be open to harvesting.

4.3.20.3.1.2. Impacts of Fire Management Decisions on Woodlands

No areas or acreages are specified for fire management under this alternative, except for fuels treatments on an estimated 5,000 to 10,000 acres per year. Woodland resources would be subject to fire management fuels treatments at the site-specific level to reduce the risk of wildland fire. It is impossible to quantitatively analyze the potential impacts of these treatments since it is not known how much, where, or when they would occur. The impacts of these treatments would be analyzed through site-specific NEPA analyses. However, it is likely that these treatments would have an adverse, short-term impact on woodlands because of the loss of vegetation (including woody vegetation), and surface disturbances caused by managed, naturally ignited wildland fire, prescribed fire, fuel load reductions, fuels treatments, and fire suppression. This vegetation loss and soil disturbance would likely result in some soil erosion and compaction, as well as increasing the potential for noxious weed and exotic species invasion and establishment. Fire treatments would also have short-term, adverse impacts on woodlands harvesting by potentially restricting entry into treated areas until vegetation re-growth and establishment, typically for two

years (personal communication between Daryl Trotter, Moab FO, and David Harris, SWCA, 2006). However, fire management decisions (including managed, naturally ignited wildland fire) under this alternative would have long-term, beneficial impacts on woodland resources because they would reduce the risk of wildland fire due to reduced fuel loads and would improve fire condition classes, resulting in sustainable yields of woodland products.

4.3.20.3.1.3. Impacts of Minerals Decisions on Woodlands

Minerals management decisions for the exploration and development of leasable, locatable, and salable minerals under Alternative A would have potential long-term, adverse impacts on woodland resources through surface disturbances (e.g., access road and well pad construction, seismic and geophysical exploration) that would remove or trample woodland resources, which would reduce woodland resources productivity and reduce the opportunities for woodland harvesting and gathering in developed areas. These impacts would be the same under all of the alternatives.

Under Alternative A, approximately 1,238,230 acres would be available under standard (Category 1) and timing and controlled surface use (Category 2) leasing category stipulations for oil and natural gas exploration and development. However, it should be noted that an estimated total of 73 wells would be drilled within 15 years after Plan approval, with a potential total surface disturbance of 699 acres. Predicted geophysical exploration would impact approximately 886 acres within 15 years after approval of the plan. Thus, the expected potential surface disturbance from oil and natural gas exploration and development would be less than 0.1% of the area available for minerals leasing and development. Under this alternative, locatable and salable minerals impacts are expected to total 851 acres of surface disturbances. These minerals activities would include gold, uranium, and vanadium mining, and the mining of sand, gravel, limestone, building stone, and clay. The impacts from these activities would be minor because the potential loss of woodlands and woodland productivity would be within a relatively small area. Based on the expected level of oil and gas development in the PA and the relatively small area of impact, the potential loss of woodland resource productivity from oil and gas development would also be minor.

4.3.20.3.1.4. Impacts of Recreation Decisions on Woodlands

Under Alternative A, there would be no restrictions from recreation management decisions on woodland resource harvesting, and wood collecting within the designated Canyon Basins, Grand Gulch Plateau, and San Juan River SRMAs. There would be no harvesting restrictions within the ERMA, except for the 1,280-acre Pearson hiking area, approximately 196,040 acres of ROS P-Class areas, and 250 acres of developed recreation sites where harvesting would be excluded. This would have long-term, beneficial impacts on harvesting opportunities in undeveloped recreation areas because relatively few acres would have harvesting prohibitions from recreation-related decisions (11% of the Monticello PA); however, under this alternative, there would also be direct, long-term, adverse impacts caused by unrestricted, unlimited harvesting of the resource that could reduce long-term woodland resource productivity and threaten the long-term sustainability of resource harvesting.

4.3.20.3.1.5. Impacts of Riparian Decisions on Woodlands

Management decisions under this alternative would exclude riparian areas from private and commercial woodland harvesting, except for Native American traditional purposes as site specifically determined. Additionally, fire suppression would be conducted in riparian areas to protect riparian resources and habitat. This would have long-term, beneficial impacts on riparian woodland resources (i.e., cottonwood and willow) by ensuring the sustainability and stability of riparian-woodland resources. Although the limitations on woodland harvesting within riparian areas would have some long-term adverse impact on opportunities for resource harvesting, this impact would be minor because riparian vegetation (e.g., cottonwood and willow) are typically not highly sought after for private or commercial harvesting.

4.3.20.3.1.6. Impacts of Soils/Watershed Decisions on Woodlands

Alternative A soils and watershed decisions would have negligible impacts on woodlands resources management or woodland harvesting because there are no vegetation or watershed treatments proposed that would affect woodlands or access to woodland resources.

4.3.20.3.1.7. Impacts of Special Designations Decisions on Woodlands

ACECs

Under Alternative A, approximately 137,275 acres would be closed to harvesting in the following existing ACECs: Bridger Jack Mesa, Butler Wash, Dark Canyon, Hovenweep, Indian Creek, Lavender Mesa, Shay Canyon ACECs, and the Grand Gulch Special Emphasis Area portion of Cedar Mesa ACEC. This would have long-term, adverse, but minor impacts on woodland resources use because less than 8% of the Monticello PA would be closed to harvesting opportunities because of ACEC special designation decisions.

Wild and Scenic Rivers

Under this alternative, river segments encompassing approximately 7,168 acres of the San Juan River and 1,920 acres along the Colorado River were determined to be eligible for suitability determination under the NWSRS, and thus excluded from woodland products harvesting and use. This would have long-term, adverse, but minor impacts to woodland resources harvesting for reasons as discussed under WSAs above.

4.3.20.3.1.8. Impacts of Travel Decisions on Woodlands

Under Alternative A, OHV use would be designated as open, limited to existing or designated routes, or closed. Areas that are closed to OHV use would have long-term, adverse impacts on woodland harvesting because opportunities for harvesting access to woodland resources would be limited or prohibited.

Under this alternative, 276,430 acres would be closed to OHV use (or 21% of the acreage available for woodland harvesting), with long-term, adverse impacts on opportunities for woodland harvesting as discussed above.

4.3.20.3.1.9. Impacts of Vegetation Decisions on Woodlands

Under Alternative A, vegetation treatments would be applied to approximately 232,130 acres. These treatments would reduce fuel loading and control of non-native, invasive species, with long-term, indirect, beneficial impacts on woodland productivity by reducing the risk of wildland fire and reducing the likelihood of displacement of woodlands by non-native, exotic, invasive species. Potential short-term impacts to woodlands would be the same as those discussed under Fire Management because the methods used for vegetation treatments would be similar: short-term, minor, direct and indirect impacts that would cause woody vegetation productivity losses and soil compaction in treatment areas.

4.3.20.3.1.10. Impacts of Visual Resources Decisions on Woodlands

Alternative A would designate approximately 726,687 acres as VRM Class I and Class II ([41% of the Monticello PA]; 371,575 acres would be managed under VRM Class I objectives and 355,112 acres under VRM Class II objectives). See Table 4.240 in Visual Section 4.3.18 for proposed acreages of the designated VRM classes, by alternative. The impacts would be long-term and adverse on woodlands harvesting opportunities from likely restrictions on the amount and type of harvesting to preserve scenic quality; however the impacts would be minor because: (1) non-mechanized harvesting could be allowed within VRM Class I areas if the management class objectives were met, and (2) mechanized harvesting would be allowed in VRM Class II if the degree of harvesting related surface disturbances met VRM Class II scenic quality objectives. Approximately 1,054,681 acres would be managed under VRM Class III and IV objectives, with negligible impacts on woodland harvesting opportunities because few restrictions would be applied under these VRM class objectives to limit harvesting.

4.3.20.3.1.11. Impacts of Wildlife and Fisheries Decisions on Woodlands

Under this alternative, general management decisions for the improvement of riparian habitat areas, control of invasive and non-native plants to maintain migratory bird habitat, and decisions that encourage the regeneration of cottonwood and willows would beneficially protect and improve woodland ecological conditions for sustainable riparian woodlands harvesting. These impacts would be applicable to all of the alternatives.

Under Alternative A, the impacts of specific wildlife and fisheries management decisions on woodland resources use would be negligible because management decisions for wildlife and fish species would not restrict or prohibit woodland harvesting.

4.3.20.3.1.12. Impacts of Woodlands Decisions on Woodlands

Management decisions under Alternative A would allow commercial and private woodland harvesting within the Monticello PA, except for approximately 473,282 acres within WSAs and the woodland harvesting exclusion areas described in the current RMP (see Map 83). Accordingly, approximately 1,309,894 acres (73% of the planning area) would be open to harvesting and the remaining 27% would be closed because of WSA protection constraints under the IMP and other management decisions to protect resource values. There would be few other restrictions on harvesting woodland resources under this alternative. This would allow many harvesting opportunities and represents a generally beneficial impact on woodland harvesting and product use in the Monticello PA. The relatively small area closed for woodland harvest

under this alternative would not substantially limit woodland harvesting opportunities. Based on GIS GAP data acreage calculations of pinyon and juniper within the PA, these woodland species cover approximately 793,757 acres (61%) of the 1,309,894 acres available for harvesting. Table 4.260 shows a comparison of available woodland acreages under each alternative.

Table 4.260. Woodland Available for Woodland Harvesting, by Alternative

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Available for Woodland Harvesting in Monticello PA (Acres)	1,309,894	730,074	841,938	841,938	548,477	837,939
Percentage of Monticello PA Available for Harvesting	73%	41%	47%	47%	31%	47%
Percentage of Pinyon-Juniper Coverage in Available Areas	61%	69%	71%	71%	13%	71%
Acres of Pinyon- Juniper in Available Areas	793,757	504,666	597,086	597,086	73,428	597,086

4.3.20.3.2. ALTERNATIVE B

4.3.20.3.2.1. Impacts of Cultural Resources Decisions on Woodlands

Planned reductions of hazardous fuels or mitigation of potential fuel load hazards around archaeological sites would reduce the risk of wildland fire in the long-term, thus beneficially reducing the risk of loss of woodland productivity and preserving the resource for sustainable harvesting. Specific acreages for these fuel reduction treatments around archaeological sites are not known, but would be analyzed through site-specific NEPA processes when treatments areas are proposed. These impacts would be the same for Alternatives B, C, D, E and the Proposed Plan.

Under this alternative, approximately 99,955 acres would be excluded from woodland harvesting (except for harvesting in the Tank Bench CSMA for traditional cultural uses) within the Comb Ridge, McLoyd Canyon-Moon House, Tank Bench and Beef Basin CSMA, and in the Grand Gulch National Historic District, with adverse restriction-related impacts on woodland harvesting opportunities. Compared to Alternative A, this alternative would close more than two and one-half times more acres to woodlands harvesting (62,522 more acres) than Alternative A.

4.3.20.3.2.2. Impacts of Fire Management Decisions on Woodlands

The impacts would be the same as those discussed under Alternative A because the management decisions are the same.

4.3.20.3.2.3. Impacts of Minerals Decisions on Woodlands

Under Alternative B, approximately 1,241,910 acres would be available under standard and timing and controlled surface use leasing category stipulations for oil and natural gas exploration and development. The potential impacts of mineral exploration and development on woodland resources would be the same as those discussed above under Alternative A because the predicted minerals development within the planning area would be the same. Under this alternative, it is estimated that an average of 66 wells would be drilled during within 15 years after approval of the proposed RMP, causing surface disturbances on approximately 636 acres, with 794 acres of impacts from geophysical exploration. Compared to Alternative A, the expected potential disturbance from oil and natural gas exploration and development would be the same (less than 0.1% of the area available for minerals development), with impacts to woodland resources as discussed under Alternative A. The impacts of salable and locatable minerals development would also be the same as discussed under Alternative A because the predicted acreages of disturbance from these activities would be practically the same.

4.3.20.3.2.4. Impacts of Recreation Decisions on Woodlands

Recreation management decisions under Alternative B would close existing and future recreational facilities to private and commercial woodland harvesting, including the collection of deadwood for campfires. The San Juan River SRMA (10,203 acres) would be closed to woodland harvesting, except for limited, on-site campfire wood collecting and permitted wood gathering by Native Americans. Cottonwood and willow harvesting would be allowed for Native American ceremonial use only. The long-term impacts of these management decisions on woodland resource uses along this high-use river corridor would be to beneficially maintain a sustainable yield of riparian woodland resources. The 375,739-acre Cedar Mesa C-SRMA, Indian Creek SRMA (89,271 acres), White Canyon SRMA (2,828 acres), and the Dark Canyon SRMA (30,820 acres), totaling 498,658 acres, would be closed to all woodland resource use, which would have long-term, adverse impacts on woodland resources because opportunities for harvesting and wood gathering would be reduced. Compared to Alternative A, this alternative would have more adverse impacts on woodlands by excluding or restricting woodland harvesting on more acres within the Monticello PA.

4.3.20.3.2.5. Impacts of Riparian Decisions on Woodlands

The impacts to woodland resources would be the same as those discussed under Alternative A for riparian resources, except that: (1) riparian woodland harvesting (cottonwood and willow) for traditional purposes would be allowed, and (2) OHV use in specified riparian areas would be designated as closed. Native American harvesting of riparian woodlands for traditional purposes would have negligible or minor impacts on riparian woodland resources because restrictions on harvesting would be applied as necessary to protect, improve, and maintain the riparian woodland resource at a proper functioning condition. Closing riparian areas to OHV use would have long-term, beneficial impacts on riparian woodlands sustainability by directly protecting the resource from surface disturbance-related degradation of this resource, and indirectly protecting

riparian soils. Compared to Alternative A, this alternative would be more adverse in the short-term on woodland harvesting by restricting resource use, but also more beneficial in the long-term by managing sensitive riparian woodland resources for sustainable resource harvesting and wood gathering.

4.3.20.3.2.6. Impacts of Soils/Watershed Decisions on Woodlands

Under Alternative B, vegetation treatments to reduce tamarisk in watersheds would have short-term and long-term impacts on woodland resources the same as those discussed under Fire Management for Alternative A because the impacts of vegetation treatments would be the same as fuel reduction treatments. This alternative would potentially restrict woodland harvesting on up to 1,000 acres per year because of proposed vegetation treatments (see Section 4.3.20.3.2.9, below), with adversely reduced opportunities for harvesting. Compared to Alternative A, the soil and watershed decisions under this alternative would be less adverse to woodlands because fewer acres would be affected by vegetation treatments.

4.3.20.3.2.7. Impacts of Special Designations Decisions on Woodlands

ACECs

Under Alternative B, approximately 521,141 acres (29% of the Monticello PA) would be closed to woodland harvesting within proposed ACECs. The impacts would be the same as discussed under Alternative A, but to a greater degree because this alternative would restrict woodland harvesting on 383,866 more acres, with similar impacts on opportunities for harvesting, but to a greater degree, because more acres of woodlands would be affected by harvesting prohibitions.

Wild and Scenic Rivers

This alternative would exclude approximately 17,888 acres from woodlands harvesting to preserve eligible river corridors. The adverse impacts would be the same as those discussed under Alternative A, but to a greater degree because more area (8,800 more acres than Alternative A) would be excluded from woodland harvesting.

4.3.20.3.2.8. Impacts of Travel Decisions on Woodlands

Under Alternative B, 423,698 acres would be closed to OHV use, with long-term, adverse impacts to harvesting opportunities in the OHV closed areas because access to and transport of woodland products would be prohibited. When compared to Alternative A, this alternative would close approximately 147,268 (53%) more acres to harvesting and collection, with more adverse impacts on harvesting opportunities from reduced OHV access to woodlands.

4.3.20.3.2.9. Impacts of Vegetation Decisions on Woodlands

In general, the impacts to woodlands resources from vegetation decisions would be the same as those discussed under Fire Management because the treatments for vegetation fuel load reductions, noxious weed control, and modification of fire condition classes would be the same treatments used for woodlands. These impacts would be applicable under all of the action alternatives.

Alternative B would treat approximately 2,500 acres per year in pinyon-juniper and riparian areas, totaling approximately 37,500 acres. This alternative would have short-term and long-term

impacts in these treated areas, as discussed under Fire Management. Compared to Alternative A, this alternative would be more beneficial in the long-term to woodland resources because vegetation treatments in pinyon-juniper and riparian woodlands would reduce fuel loads, thus increasing the likelihood for sustained use of the resource and reducing the likelihood of stand-destroying wildland fire.

4.3.20.3.2.10. Impacts of Visual Resources Decisions on Woodlands

This alternative would designate approximately 748,309 acres (42% of the PA) as VRM Class I (497,668 acres) and VRM Class II (250,641 acres), with the same impacts as discussed under Alternative A. Compared to Alternative A, this alternative would designate 21,622 more acres for higher levels of visual resource protection, which would likely restrict the amount and type of woodland harvesting on more acres in these areas than under Alternative A, with greater long-term, adverse impacts on opportunities for harvesting.

4.3.20.3.2.11. Impacts of Wildlife and Fisheries Decisions on Woodlands

The impacts of this alternative on woodlands sustainability and harvesting opportunities would be the same as those as discussed under Alternative A because the management decisions are essentially the same.

4.3.20.3.2.12. Impacts of Woodlands Decisions on Woodlands

Alternative B would potentially allow commercial and private woodland products harvesting (with permitted off-road travel to collect wood) on a total of 730,075 acres within designated woodlands harvesting zones (see Map 84). This would permit woodland harvesting on approximately 41% of the PA, with 59% of the planning area (1,055,053 acres) closed to woodland harvesting. It should be noted that, based on GIS acreage calculations of pinyon and juniper GAP data for the woodland zones, these woodland species cover approximately 504,666 acres (69%) of the designated 730,075 acres within the woodland zones available for harvesting.

Under this alternative, the impacts to woodland resources would include: (1) permitted harvesting of woodlands on a substantial portion of the PA, and (2) controlled use of OHVs to collect wood, which would reduce the direct impacts from soil compaction and the indirect, long-term impacts to woodland resources from OHV-caused surface disturbances that create the conditions for exotic plants establishment and soil erosion. Compared to Alternative A, Alternative B would have the same impacts on woodland resources, but to a less beneficial degree, because fewer total acres would be open to woodland harvesting. This alternative would have long-term, potentially adverse impacts on woodland resources through restrictions on selective harvesting on 65,807 acres in the non-WSA portion of the Cedar Mesa Zone. As discussed in Section 3.21.3, the Cedar Mesa area is currently in need of fuel load reductions, and restrictions on commercial and private selective woodland harvesting would potentially maintain the excessive fuel loading conditions in the area and maintain the risks of wildland fire.

Prohibiting OHV use on Cedar Mesa would likely have some beneficial impacts on long-term woodland sustainability and productivity by reducing the OHV impacts to woodland soils caused by soil and surface disturbances and soil erosion.

4.3.20.3.3. ALTERNATIVE C

4.3.20.3.3.1. Impacts of Cultural Resources Decisions on Woodlands

Under this alternative, approximately 61,943 acres would be excluded from woodland harvesting and product use (except for traditional cultural use in Tank Bench) within the Tank Bench, Beef Basin, McLoyd Canyon-Moon House CSMAs, and in the Grand Gulch National Historic District. Compared to Alternative A, this alternative would exclude one and one-half times more acres (24,510 acres) from harvesting within the Monticello PA because of cultural management decisions, with resultant decreases in opportunities for woodland harvesting.

4.3.20.3.3.2. Impacts of Fire Management Decisions on Woodlands

No areas or acreages are specified for fire management under this alternative, so the impacts would be the same as those described under Alternative A.

4.3.20.3.3.3. Impacts of Minerals Decisions on Woodlands

Under Alternative C, approximately 1,348,973 acres would be available under standard stipulations and timing and controlled surface use leasing categories for oil and natural gas. The potential impacts on woodland resources would be the same, as discussed above under Alternative A, because the RFD forecast for minerals development within the planning area would be the same. Under this alternative, an estimated 74 wells would be drilled in 15 years, with total surface disturbances of approximately 710 acres. Predicted geophysical exploration impacts under this alternative would be approximately 903 acres. The expected potential disturbance from oil and natural gas exploration and development would be the same as Alternative A (less than 0.1% of the area available for minerals development) and the impacts to woodland resources would be the same as those discussed under Alternative A. Also, the impacts from salable and locatable minerals activities would be the same as discussed under Alternative A because the expected acreages of development would be practically the same.

4.3.20.3.3.4. Impacts of Recreation Decisions on Woodlands

Alternative C would have the same impacts on woodland resources from San Juan River SRMA decisions as discussed under Alternative B because the decisions would be similar: no woodland harvesting except for on-site wood gathering, cottonwood and willow harvesting allowed for Native Americans, for ceremonial use only. The Dark Canyon, White Canyon, and Indian Creek SRMAs (with the same acreages as Alternative B) would be closed to all woodland resource use. These decisions would adversely reduce the opportunities for woodland harvesting in the long-term, with impacts the same as discussed under Alternative B. Areas outside of canyon bottoms and outside of WSAs within the 407,098-acre Cedar Mesa C-SRMA would be available for private and commercial harvesting, so there would be beneficial impacts to woodland resources within this SRMA. However, compared to Alternative A, this alternative would have more restrictions on harvesting opportunities in the long-term on more acres.

4.3.20.3.3.5. Impacts of Riparian Decisions on Woodlands

The impacts would be the same as discussed under Alternative B because the management decisions are the same.

4.3.20.3.3.6. Impacts of Soils/Watershed Decisions on Woodlands

The impacts of this alternative would be the same as those discussed under Alternative B because the management decisions are similar. Compared to Alternative A, this alternative would have impacts similar to those discussed under Alternative B, but to a greater degree because potentially more acres in riparian woodlands would be subjected to riparian vegetation treatments (1,500 acres per year).

4.3.20.3.3.7. Impacts of Special Designations Decisions on Woodlands

ACECs

Approximately 34,006 acres would be closed to woodland harvesting within proposed ACECs under this alternative (2% of the PA). This alternative would have the same impacts as Alternative A, but to a lesser degree, because 103,269 fewer acres would be adversely excluded from harvesting opportunities.

Wild and Scenic Rivers

This alternative would exclude approximately 6,736 acres from woodlands harvesting along eligible and recommended river segments, with adverse impacts on harvesting opportunities. The impacts would be less adverse for harvesting opportunities in the long-term when compared to Alternative A because less area (2,352 fewer acres than Alternative A) would be excluded from woodland harvesting.

4.3.20.3.3.8. Impacts of Travel Decisions on Woodlands

Under Alternative C, 418,667 acres would be designated as Closed to OHV use. This would have similar impacts to those discussed under Alternative A, but to a greater adverse degree, because this alternative would effectively close approximately 51% more acres to OHV harvesting and collection.

4.3.20.3.3.9. Impacts of Vegetation Decisions on Woodlands

As discussed under Alternative B, vegetation treatments under Alternative C would have the same impacts on woodland resources because the treatments would be the same. Alternative C would treat approximately 3,100 acres per year in pinyon-juniper and riparian areas, totaling approximately 46,500 acres. Compared to Alternative A, this alternative would have the same impacts as discussed under Alternative B: more beneficial in the long-term to woodland resources because vegetation treatments in pinyon-juniper and riparian woodlands would reduce fuel loads, thus reducing the risks of stand-destroying wildland fire.

4.3.20.3.3.10. Impacts of Visual Resources Decisions on Woodlands

This alternative would designate 425,179 acres as VRM Class I and 132,001 acres as VRM Class II (totaling 557,180 acres), with the same impacts as discussed under Alternative A, but to a less adverse degree, because fewer acres would have harvesting restrictions under VRM Classes I and II objectives. Compared to Alternative A, 169,507 fewer acres (designated as VRM Class I and Class II) within the PA would have potential restrictions placed on surface-disturbing woodland harvesting in order to protect visual and scenic resources and meet VRM class objectives, which would have fewer long-term, adverse impacts on opportunities for woodlands

harvesting and woodland treatments to improve woodland ecological conditions and fire conditions.

4.3.20.3.3.11. Impacts of Wildlife and Fisheries Decisions on Woodlands

The impacts of this alternative on woodlands would be the same as those discussed under Alternative A because the management decisions are similar.

4.3.20.3.3.12. Impacts of Woodlands Decisions on Woodlands

Alternative C would permit woodland harvesting on 841,936 acres within designated woodland harvesting zones (encompassing approximately 47% of the Monticello PA) (see Map 85). Approximately 53% of the PA (943,189 acres) would be closed to woodland harvesting. As noted in the Alternative B analysis, GAP data were used to determine that pinyon and juniper woodland species cover approximately 597,086 acres (71%) of the designated 841,936 acres within the proposed woodland zones. The impacts on woodland resources would be similar to those described under Alternative A, but to a less beneficial degree because 467,958 fewer acres (26% less of the PA) would be open to opportunities for woodland harvesting. The indirect, potentially adverse impacts on woodland resources and soils would be greatly reduced when compared to Alternative A because of additional restrictions and management prescriptions on off-road OHV travel in woodland areas: 2,311 acres would be designated as Open to cross-country OHV use (0.1% of the planning area, but in previously disturbed areas without woodland resources) and limited off-route travel would be allowed to collect harvested wood, so the indirect impacts on woodlands from cross-country OHV use (e.g., from surface disturbance-caused soil erosion and soil compaction) would be minor.

4.3.20.3.4. ALTERNATIVE D

4.3.20.3.4.1. Impacts of Cultural Resources Decisions on Woodlands

Under this alternative, approximately 59,297 acres would be excluded from woodland harvesting in the McLoyd Canyon-Moon House CSMA, in Beef Basin (approximately 20,302 acres), and on the 37,388 acres of the Grand Gulch National Historic District. These exclusions would reduce the opportunities for woodland harvesting with the same impacts as described under Alternative C because the number of acres within which harvesting would be prohibited are similar. Compared to Alternative A, approximately 21,864 acres (approximately one and one-half times more acres than Alternative A) within the PA would be adversely excluded from woodland harvesting opportunities because of management prescriptions to protect cultural resources.

4.3.20.3.4.2. Impacts of Fire Management Decisions on Woodlands

The impacts of fire management on woodland resources would be the same to as those described under Alternative A because the management decisions are similar.

4.3.20.3.4.3. Impacts of Minerals Decisions on Woodlands

Under Alternative D, approximately 1,383,283 acres would be available under standard and timing and controlled surface use leasing categories stipulations for oil and natural gas. The RFD potential disturbance from oil and natural gas exploration and development would have the same

impacts as those discussed under Alternative A (less than 0.1% of the area available for minerals leasing would be impacted by oil and gas surface disturbances) because the estimated development would be similar to that discussed under Alternative A: an average of 75 wells drilled in 15 years, with approximately 721 total acres of surface disturbances and predicted geophysical exploration impacts totaling 924 acres. The impacts from salable and locatable minerals development would be the same as discussed under Alternative A because the predicted surface disturbances from these activities would be the same.

4.3.20.3.4.4. Impacts of Recreation Decisions on Woodlands

Alternative D would have the same impacts on woodland resources from recreational decisions for the San Juan River SRMA as discussed under Alternative B, except under this alternative the SRMA would encompass 6,365 acres. Under this alternative, the Dark Canyon SRMA (30,820 acres), Indian Creek SRMA (89,271 acres), and the White Canyon SRMA (2,828 acres), and the canyon bottoms within the 375,739-acre Cedar Mesa C-SRMA would be closed to all woodland resource use, with impacts as discussed under Alternative C. Compared to Alternative A, this alternative would be less beneficial for woodland harvesting opportunities because more acreage would be excluded from harvesting opportunities.

4.3.20.3.4.5. Impacts of Riparian Decisions on Woodlands

The impacts would be the same as discussed under Alternative A because the management decisions are the same.

4.3.20.3.4.6. Impacts of Soils/Watershed Decisions on Woodlands

The impacts of this alternative on woodland resources would be the same as those discussed under Alternative B because the same erosion control strategies and similar surface disturbance mitigation would be applied. Compared to Alternative A, this alternative would apply vegetation treatments to more acres within the planning area (2,000 acres per year) with the same impacts as those discussed under Alternative B, but to a greater degree because more acres would be managed for vegetation treatments.

4.3.20.3.4.7. Impacts of Special Designations Decisions on Woodlands

ACECs

Under this alternative, approximately 2,146 acres within the Alkali Ridge Historic Landmark (within the Alkali Ridge ACEC) would be closed to woodland harvesting. The impacts to woodland harvesting opportunities would be minor, as special designations decisions for ACECs would allow harvesting in the other proposed ACECs. Compared to Alternative A, this alternative would have more beneficial impacts on woodland resources because more area with ACECs would be available for harvesting.

Wild and Scenic Rivers

This alternative would not recommend any river segments as suitable for Wild and Scenic River designation. Accordingly, the impacts under this alternative would be beneficial in the long-term on woodland resources use because no acres would be excluded from resource use within the Monticello PA area river corridors, except for protection of riparian resources. Compared to

Alternative A, this alternative would have more beneficial impacts to woodland harvesting because it would provide more opportunities for woodland resource use.

4.3.20.3.4.8. Impacts of Travel Decisions on Woodlands

Under Alternative D, no acres would be closed to OHV use, and the PA (1,783,118 acres) would be accessible in OHV open areas and along designated OHV travel routes. This alternative would have negligible impacts on woodland resources areas because there would be very few limitations or restrictions on OHV access to woodland resources in those areas open to woodland harvesting within the Monticello PA. When compared to Alternative A, this alternative would have more beneficial impacts to woodland resource harvesting opportunities because more acres (all of the PA, with the exception of the 391,599 acres of WSAs) would be accessible to OHV use for woodland harvesting along designated OHV routes.

4.3.20.3.4.9. Impacts of Vegetation Decisions on Woodlands

Alternative D would treat approximately 4,100 acres annually in pinyon-juniper and riparian areas, totaling approximately 61,500 acres. The impacts on woodlands would be the same as those discussed under Alternative B because the management decisions are similar.

4.3.20.3.4.10. Impacts of Visual Resources Decisions on Woodlands

This alternative would designate 399,262 acres (22% of the planning area) as VRM Class I (390,424 acres) and VRM Class II (8,838 acres), with the same impacts as those described under Alternative A. However, compared to Alternative A, this alternative would be less adverse in the long-term on harvesting opportunities because 327,425 fewer acres within the PA would be managed under VRM Class I and II objectives that could limit or restrict woodland harvesting.

4.3.20.3.4.11. Impacts of Wildlife and Fisheries Decisions on Woodlands

The impacts of this alternative on woodlands would be the same as those discussed under Alternative A because the management decisions are similar.

4.3.20.3.4.12. Impacts of Woodlands Decisions on Woodlands

The impacts of woodland management decisions under this alternative would be similar to the impacts described under Alternative C because the acreages available for woodland resource harvesting within woodland zones would be the same (see Map 85). Compared to Alternative A, the impacts on woodland harvesting would be less beneficial because of the fewer number of acres potentially available for woodland harvesting (47% of the PA compared to 73% under Alternative A). The indirect, potentially adverse impacts on woodland resources and soils from OHV use would also be similar to those discussed under Alternative C.

4.3.20.3.5. ALTERNATIVE E

Under Alternative E, the impacts on woodland resources would be very similar to the impacts discussed under Alternative B because the management decisions are similar, except that this alternative would manage 582,360 acres of non-WSA lands with wilderness characteristics for the protection of wilderness values. Protection-related management decisions applicable to these areas would partially include VRM Class I designation, prohibitions on fire and vegetation

treatments, closure to wood gathering and harvesting, and closure to OHV use. These areas would also be closed to minerals leasing and new road construction.

4.3.20.3.5.1. Impacts of Cultural Resources Decisions on Woodlands

The impacts within the Cedar Mesa, Tank Bench, and Beef Basin CSMA for the protection of cultural resources would be the same as discussed under Alternative B because the management decisions are the same. Approximately 8,514 acres of non-WSA lands with wilderness characteristics lie within the proposed Cedar Mesa C-SRMA (and would be off limits to woodland harvesting). However, Alternative E cultural resource management decisions would also prohibit woodland harvesting within the proposed C-SRMA, so protection of wilderness values within this area (including prohibitions on woodland harvesting and gathering) would have no impact on woodland harvesting opportunities beyond those discussed under Alternative B.

4.3.20.3.5.2. Impacts of Fire Management Decisions on Woodlands

The impacts of fire management would be the same as those discussed under Alternative A, except under this alternative "light on the land" impacts fire suppression methods would be allowed within the 582,360 acres of non-WSA lands with wilderness characteristics. Vegetation treatments would also be allowed in non-WSA lands with wilderness characteristics areas for fuel load reduction, but would be required to meet VRM Class I objectives. It is likely that non-mechanical methods (e.g., limited, prescribed burning and/or chemical treatments) would meet these objectives because these methods would cause minimal long-term surface disturbances. So, the impacts of fire treatments under this alternative to reduce fuel loads in woodlands and in non-WSA wilderness areas would be beneficial in the long term because wildland fire risks would be reduced, particularly within pinyon-juniper woodlands in the Cedar Mesa area where the risks are high, as discussed above under Alternative B. This alternative would prohibit more area from woodland harvesting than Alternative A, which would be more adverse than the No Action alternative because of reduced opportunities for harvesting.

4.3.20.3.5.3. Impacts of Minerals Decisions on Woodlands

The impacts of oil and gas minerals decisions under Alternative E would be the same as those discussed under Alternative A, but to a lesser degree, because leasing would be available under standard and timing and controlled surface use stipulations on 758,931 acres. Leasing would be allowed on the 582,360 acres on non-WSA lands with wilderness characteristics. The reduction of lands available for leasing with surface disturbances would still have impacts on woodland harvesting and woodland resources productivity similar to those discussed under Alternative A because the expected reduction in minerals activities (and surface disturbances) would likely be less than 20 wells within the planning area: oil and gas leasing minerals disturbances under Alternative E would total approximately 519 acres from an expected drilling of 54 wells, with geophysical exploration impacts occurring on an estimated 761 acres. This would be less than 0.2% of the land available for oil and gas leasing under all leasing categories. The impacts of salable and locatable minerals on woodland resources would be slightly less than Alternative A because the non-WSA lands with wilderness characteristics would be closed to minerals disposal (i.e., sand, gravel); however, the impacts of locatable minerals disturbances on woodlands would be the same as Alternative A because the expected level of mining would be the same.

4.3.20.3.5.4. Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Woodlands

The impacts of wilderness characteristics decisions on woodland resources under Alternative E would be adverse in the long term, as approximately 582,360 acres of non-WSA lands with wilderness characteristics within the PA would be protected from surface disturbances, including private and commercial woodland harvesting to preserve their wilderness values and to meet VRM Class I objectives. However, non-mechanical methods to reduce fuel loading and improve woodland health (and meet VRM objectives) would be beneficial because wildland fire risks would be reduced, and exotic species encroachment concerns would be addressed. Compared to Alternative A, this alternative would have more adverse impacts on woodland resources because (1) of the greater restrictions on surface disturbances in non-WSA lands with wilderness characteristics that would prevent woodland resource management from, fully responding to wildland fire risks and applying the full range of treatments-related improvements to woodland ecosystem health, and because (2) of the reduced opportunities for woodland harvesting.

4.3.20.3.5.5. Impacts of Recreation Decisions on Woodlands

The impacts of SRMA recreation management decisions would be the same as discussed under Alternative B, but to a more adverse degree, on woodland resources because woodland harvesting would be prohibited within all of the proposed SRMAs, including limited harvesting of riparian woodland species (cottonwood and willow) for ceremonial purposes in those areas determined to have non-WSA wilderness characteristics. Within the ERMA, approximately 416,526 acres have non-WSA wilderness characteristics, with the same adverse impacts on woodlands harvesting. Compared to Alternative A, this alternative would have more adverse impacts because more area within the proposed SRMAs, the C-SRMA, and the ERMA would have woodland harvesting prohibitions.

4.3.20.3.5.6. Impacts of Riparian Decisions on Woodlands

Under this alternative, the impacts of wilderness characteristics areas that lie within riparian areas on woodland resources would be similar to those discussed under the Alternative B, but to a greater adverse degree, because no cottonwood and willow harvesting for ceremonial purposes would be permitted within the non-WSA lands with wilderness characteristics managed under this alternative. Compared to Alternative A, this alternative would have more adverse impacts because more area would be excluded from woodland harvesting.

4.3.20.3.5.7. Impacts of Soils/Watershed Decisions on Woodlands

Soils and watershed decisions on woodland resources within non-WSA wilderness characteristics areas would allow vegetation treatments (including tamarisk treatments). The impacts of this decision on woodland resources would be beneficial in the long-term because treatments for tamarisk vegetation would be applied to control its encroachment into riparian woodland species habitat and the replacement of riparian woodland species by this exotic, non-native species. This alternative would have more adverse impacts on riparian woodland species than Alternative A because greater restrictions would be placed on controlling exotic, non-native species that encroach on riparian woodlands.

4.3.20.3.5.8. Impacts of Special Designations Decisions on Woodlands

The impacts of ACEC and WSR special designation decisions on woodlands would be the same as those discussed under Alternative B (521,141 acres of proposed ACECs would be excluded from woodland harvesting). Under this alternative, 109,205 acres of non-WSA lands with wilderness characteristics that lie within the ACECs would have prohibitions on woodland harvesting for protection of wilderness values, but this would have no impacts on harvesting opportunities because, as discussed, the ACECs would have prohibitions applied as part of the special designation management prescriptions. The impacts on woodland resources would be adverse in the long-term, and when compared to Alternative A, because these areas would not be available for harvesting.

4.3.20.3.5.9. Impacts of Travel Decisions on Woodlands

Under this alternative, travel decisions would close 970,436 acres to OHV travel, including 582,360 acres of non-WSA lands with wilderness characteristics to all motorized OHV travel (and approximately 179 miles of D-Class OHV routes within non-WSA wilderness characteristics lands). These decisions would have long-term, adverse impacts on woodland resources within and adjacent to the non-WSA wilderness characteristics lands because of the OHV inaccessibility of these areas and the potential difficulty in accessing adjacent woodland harvesting areas. Compared to Alternative A, this alternative would have more adverse impacts on harvesting opportunities because: (1) 761,417 more acres or 42% more of the PA would be closed to harvesting within the PA to preserve non-WSA wilderness and other resource values, and (2) OHV access to adjacent woodland harvesting zones or areas would be impeded or prevented on 694,006 more acres and travel route miles (959 more miles of D-Class OHV routes) under this alternative than Alternative A (see Section 4.3.16, Travel Management, for a detailed comparison of the travel alternatives).

4.3.20.3.5.10. Impacts of Vegetation Decisions on Woodlands

Management decisions under this alternative would be the same as Alternative B, except this alternative would impose some limitations on vegetation treatments within non-WSA lands with wilderness characteristics to meet VRM Class I objectives in these areas. The impacts on the resource would be adverse in the long-term in these protected areas because limited efforts would be applied within 582,360 acres to restore pinyon-juniper ecosystem health and/or reduce fuel loading through vegetation treatments. Compared to Alternative A, this alternative would have more adverse impacts on woodlands because more woodland acreage would be managed to limit vegetation treatments-related surface disturbances that would improve woodland ecosystem health and sustainability.

4.3.20.3.5.11. Impacts of Visual Resources Decisions on Woodlands

As mentioned above, non-WSA lands with wilderness characteristics would be designated as VRM Class I under this alternative. The objectives of this VRM class would prohibit or greatly restrict woodland harvesting within these areas. This would have long-term, adverse impacts on harvesting opportunities because under this alternative 998,370 acres would be designated as VRM Class I and 111,478 acres would be designated as VRM Class II. When combined, these VRM classes would encompass 1,109,848 acres or 62% of the PA, with VRM objectives that would either restrict or prohibit woodland harvesting and vegetation and fire treatments in order

to preserve scenic quality and to preserve wilderness values within non-WSA lands with wilderness characteristics. Compared to Alternative A, this alternative would manage visual resources with greater degrees of restriction on harvesting and more adverse impacts on woodland resources because more area (383,161 more acres) would be impacted by VRM Class I and Class II management objectives to restrict or prohibit woodland harvesting and/or treatments.

4.3.20.3.5.12. Impacts of Wildlife and Fisheries Decisions on Woodlands

The impacts on woodland resources would be the same as those discussed under Alternative A because the management decisions are similar.

4.3.20.3.5.13. Impacts of Woodlands Decisions on Woodlands

Under this alternative, approximately 608,476 acres within the Monticello PA would be available for woodland harvesting (or 34% of the planning area) (see Map 86). Of the areas available for harvesting, GAP vegetation data indicate that 73,428 acres (or 12% of available acres) would have pinyon-juniper coverage. The adverse impacts of woodland decisions under this alternative would be the same as those impacts discussed above in Section 4.3.20.3.5.4, Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Woodlands, for the same reasons: the approximately 582,360 acres of non-WSA lands with wilderness characteristics would not be available for woodland harvesting; however, limited treatments or improvements in woodland health through vegetation treatments would be allowed if they met VRM Class I objectives and retained wilderness values. Closing the Cedar Mesa Zone to woodland harvesting would have the same adverse and beneficial impacts to woodland harvesting as discussed above under Alternative B. Compared to Alternative A, this alternative would have greater adverse impacts on woodland harvesting for the reasons discussed: a smaller area (701,418 fewer acres) would be available under Alternative E for harvesting because of non-WSA lands with wilderness characteristics prohibitions and preservation of other resource values from surface disturbances that could degrade wilderness and other natural resource values.

4.3.20.3.6. PROPOSED PLAN

4.3.20.3.6.1. Impacts of Cultural Resources Decisions on Woodlands

Under the Proposed Plan, 41,641 acres would be excluded from woodland harvesting and product use within the Tank Bench SRMA, the McLoyd Canyon-Moon House Management Zone, and in the Grand Gulch National Historic District. These decisions would have long-term, adverse impacts on the opportunities for woodland products use because the areas would not be open to harvesting. Compared to Alternative A, the Proposed Plan would exclude 4,208 more acres from commercial and private harvesting within the Monticello PA because of cultural management decisions, so the adverse impacts to woodlands would be the same.

4.3.20.3.6.2. Impacts of Fire Management Decisions on Woodlands

The fire management decisions under the Proposed Plan would be the same as those for the alternatives (fuel reduction treatments of 5,000 – 10,000 acres/year), so the short term and long-term impacts would be the same as those described under Alternative A. Under the Proposed Plan, 88,871 acres of non-WSA lands with wilderness characteristics would be managed under

VRM Class II objectives that would limit the level of allowable vegetation treatments to meet visual management objectives. However, it is likely that some non-mechanical treatment methods (chemical and/or limited prescribed burning) would meet visual objectives because of the minimal long-term surface disturbances caused by these methods.

4.1.1.3.6.1 Impacts of Minerals Decisions on Woodlands

Under the Proposed Plan, approximately 1,224,811 acres would be available under standard and timing and controlled surface use leasing categories stipulations for oil and natural gas development. The potential impacts on woodland resources would be the same as discussed above under Alternative A because the RFD forecast for minerals development within the planning area would be very similar. Under the Proposed Plan, an estimated 72 wells would be drilled within 15 years after approval of the proposed RMP, with total surface disturbances of approximately 692 acres. Predicted geophysical exploration impacts under the Proposed Plan would be approximately 903 acres, and expected surface disturbances from salable and locatable minerals development would be the same under Alternative A (851 acres). The expected potential disturbance from oil and natural gas exploration and development would be the same as Alternative A (less than 0.1% of the area available for minerals development) so the impacts to woodland resources would be the same as those discussed under Alternative A.

4.3.20.3.6.3. Impacts of Non-WSA Lands with Wilderness Characteristics Decisions on Woodlands

Under the Proposed Plan, 88,871 acres of non-WSA lands with wilderness characteristics would be managed to preserve their wilderness values. Management decisions to retain scenic quality under VRM Class II objectives, permit OHV travel along designated routes, prohibit woodland harvesting, and allow fire suppression and vegetation treatments would have beneficial and adverse impacts. Allowing fire and vegetation treatments would have beneficial impacts in these areas by reducing fuel loads and controlling natural wildland fires that would either destroy woodland stands or create conditions for increased fire risks. Prohibiting woodland harvesting would have long term, adverse impacts on woodland resources because opportunities for harvesting would not be available. Compared to Alternative A, this alternative would have more adverse impacts on woodlands because more area would be unavailable for harvesting and open to a full range of treatments techniques.

4.3.20.3.6.4. Impacts of Recreation Decisions on Woodlands

The Proposed Plan would have the same impacts on woodland resources from designation of the 9,859-acre San Juan River SRMA as discussed under Alternative B because the decisions affecting woodland harvesting would be the same. The Dark Canyon SRMA (30,820 acres), the Indian Creek SRMA (89,271 acres), and the White Canyon SRMA (2,828 acres) and the canyon bottoms within the 375,734-acre Cedar Mesa SRMA (including the 13,600 acres of non-WSA lands with wilderness characteristics within the SRMA) would be closed to all woodland harvesting and resource use. The 75,271 acres of non-WSA lands with wilderness characteristics that lie within the ERMA would be unavailable for private or commercial woodland harvesting (though wood gathering for campfires would be allowed). These decisions would adversely reduce the opportunities for woodland harvesting in the long-term in these areas. Compared to

Alternative A, the Proposed Plan would exclude and adversely reduce harvesting opportunities in the long-term on more acres because of recreation decisions.

4.3.20.3.6.5. Impacts of Riparian Decisions on Woodlands

The impacts would be the same as discussed under Alternative B because the management decisions are the same.

4.3.20.3.6.6. Impacts of Soils/Watershed Decisions on Woodlands

The impacts of the Proposed Plan would be the same as those discussed under Alternative B because the management decisions are similar. Compared to Alternative A, the Proposed Plan would have impacts similar to those discussed under Alternative B, but to a greater degree because potentially more acres would be subjected to riparian vegetation treatments (1,500 acres per year).

4.3.20.3.6.7. Impacts of Special Designations Decisions on Woodlands

ACECs

Approximately 34,006 acres would be closed to woodland harvesting within ACECs under the Proposed Plan (the same as Alternative C). The Proposed Plan would have the same impacts as discussed under Alternative C because 103,269 fewer acres would be adversely excluded from harvesting opportunities, when compared to Alternative A. The impacts would be long-term, adverse, but minor on woodland resources use because 2% of the Monticello PA would be closed to harvesting opportunities from ACEC special designation decisions.

Wild and Scenic Rivers

The Proposed Plan would exclude approximately 6,736 acres from woodlands harvesting along eligible and recommended river segments, with long term, adverse impacts on harvesting opportunities. The impacts would be more beneficial for harvesting opportunities in the long-term when compared to Alternative A because less area (3,200 acres or 55% of the acreage under Alternative A) would be excluded from woodland harvesting.

4.3.20.3.6.8. Impacts of Travel Decisions on Woodlands

Under the Proposed Plan, 393,895 acres would be designated as Closed to OHV use. This would have similar impacts to those discussed under Alternative B because the acres closed to OHV use would be similar. Compared to Alternative A, the Proposed Plan would have more adverse impacts to harvesting opportunities because the Proposed Plan would effectively close approximately 51% more acres to OHV harvesting and collection than the No Action alternative.

4.3.20.3.6.9. Impacts of Vegetation Decisions on Woodlands

As discussed under Alternative B, vegetation treatments under the Proposed Plan would have the same impacts on woodland resources because the treatments would be the same. The Proposed Plan would treat approximately 3,100 acres per year in pinyon-juniper and riparian areas, totaling approximately 46,500 acres. Compared to Alternative A, the Proposed Plan would have the same impacts as discussed under Alternative B: more beneficial in the long-term to woodland

resources because vegetation treatments in pinyon-juniper and riparian woodlands would reduce fuel loads, thus reducing the risks of stand-destroying wildland fire.

4.3.20.3.6.10. Impacts of Visual Resources Decisions on Woodlands

The Proposed Plan would designate approximately 651,030 acres (37% of the PA) as VRM Class I (422,989 acres) and VRM Class II (228,041 acres), with the same impacts as discussed under Alternative A, but to a less adverse degree, because fewer total acres would have harvesting restrictions under VRM Classes I and II management objectives (see Table 4.198 in Visuals section 4.3.18). Compared to Alternative A, the Proposed Plan would designate 75,657 fewer acres within the PA would with potential restrictions placed on surface-disturbing woodland harvesting to protect visual and scenic resources and meet VRM Class I and Class II objectives. Therefore, the Proposed Plan would have fewer long-term, adverse impacts on opportunities for woodlands harvesting and woodland treatments to improve woodland health.

4.3.20.3.6.11. Impacts of Wildlife and Fisheries Decisions on Woodlands

The impacts of the Proposed Plan on woodlands would be the same as those discussed under Alternative A because the management decisions are similar.

4.3.20.3.6.12. Impacts of Woodlands Decisions on Woodlands

The Proposed Plan would permit woodland harvesting on 841,936 acres within designated woodland harvesting zones (encompassing approximately 47% of the Monticello PA, the same as Alternative C) (see Map 85). Under the Proposed Plan, approximately 4,000 acres of woodlands would be unavailable for private and commercial harvesting within non-WSA lands with wilderness characteristics. Approximately 53% of the PA (947,188 acres) would be closed to woodland harvesting. As noted in the Alternative C analysis, GAP data were used to determine that pinyon and juniper woodland species cover approximately 597,086 acres (71%) of the designated 841,936 acres within the proposed woodland zones. The impacts on woodland resources would be similar to those described under Alternative A, but to a less beneficial degree, because 467,958 fewer acres (26% less of the PA) would be open to opportunities for woodland harvesting. The indirect, potentially adverse impacts on woodland resources and soils would be greatly reduced when compared to Alternative A because of additional restrictions and management prescriptions on off-road OHV travel in woodland areas: under the Proposed Plan, 97 acres would be designated as Open to cross-country OHV use (less than 0.1% of the planning area, but in previously disturbed areas without woodland resources) and limited off-route travel would be allowed to collect harvested wood, so the indirect impacts on woodlands from cross-country OHV use would be minor.

4.3.20.4. SUMMARY OF IMPACTS

Table 2.2 of Chapter 2 contains a summary of impacts of management decisions on woodland resources.

4.3.20.5. MITIGATION MEASURES

Mitigation measures to reduce the impact to woodland resources would include:

- Prioritizing vegetation treatments in woodland areas that have been impacted through disturbances by prescribed fire, OHV access, fire suppression, woodland harvesting, and other surface disturbances to prevent exotic species growth and establishment that could otherwise inhibit or prevent re-growth of woodland species; and
- Reclaiming trails or mitigate the impacts (i.e., apply soil erosion techniques) of OHV access routes used for woodland harvesting, recreation, fire suppression, or vegetation treatments to reduce soil erosion and soil compaction that could indirectly affect woodland productivity.

4.3.20.6. UNAVOIDABLE ADVERSE IMPACTS

Treatments of woodland areas to reduce fuel loading through prescribed burning, to control woodland insect infestations or disease, and to control the spread of exotic species or other activities to improve woodland resources would have unavoidable short-term, adverse impacts on woodland resources. Long-term, unavoidable adverse impacts would be produced by minerals development within woodland areas (e.g., construction of production well pads, access roads, and infrastructure) that would impact woodland resources.

Impacts to woodland resources from woodland harvesting would be unavoidable. However, if managed properly, this use could result in long-term benefits by preventing fuel loading and associated wildland fire.

4.3.20.7. SHORT-TERM USE VS. LONG-TERM PRODUCTIVITY

Short-term uses that could produce long-term losses of woodland resources productivity would include short-term woodland harvesting without adequate control or prevention of exotic vegetation growth and establishment in disturbed areas. This would have long-term adverse impacts on woodland productivity by preventing or slowing woodland re-growth, altering fire regimes, and/or altering the successional pattern of vegetation re-growth to favor exotic vegetation rather than woodland species.

Adequate management of woodland harvest and effective restoration of areas affected by fire or surface disturbance would ensure the long-term productivity of this resource.

4.3.20.8. IRREVERSIBLE AND IRRETRIEVABLE IMPACTS

There are no proposed management decisions that would irreversibly remove woodlands or prevent woodland re-growth. Proposed management decision impacts that would cause the irretrievable loss of woodland resources would include: woodland harvest, construction or minerals-related activities that would cause the loss of productivity until areas are rehabilitated or reclaimed; prescribed fire, vegetation, or woodland treatments that would cause the short-term loss of productivity until woodland re-growth; uncontrolled wildland fire that would cause the short-term loss of productivity until woodland re-growth; and recreation and travel-related activities (e.g., OHV use in woodland resource areas) that could affect vegetation undergrowth and soil stability.

4.4. CUMULATIVE IMPACTS

Cumulative impacts occur when there are multiple impacts on the same resources. These are incremental impacts of proposed activities or projects when combined with past, present, and reasonably foreseeable future actions. As stated in 40 CFR 1508.7 (1997), a "cumulative impact" is the impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

Resource decisions from this RMP could combine with other past, present, and reasonably foreseeable future actions to produce cumulative impacts to resources within the planning area. These resources could include air quality, livestock grazing, mineral development, wildlife habitat, and recreation use.

Co-occurring planning projects in the region that would contribute to cumulative impacts include the Manti-La Sal National Forest, the BLM Moab RMP, the Trail of the Ancients, and Hovenweep National Monument. Also, similar management direction and resource uses would occur in the adjacent BLM Field Offices in Colorado. Activities on Utah School and Institutional Trust Land Administration lands (SITLA), private lands, and city and county use plans for surrounding communities could have cumulative impacts where land is developed adjacent to BLM lands.

Past actions that have affected the resources in the Monticello planning area are reflected in the "Affected Environment" section in Chapter 3 of the Proposed RMP/FEIS. Present, ongoing and reasonably foreseeable actions are included in the "Reasonably Foreseeable Actions" described below.

The following reasonably foreseeable actions were identified that may contribute cumulative impacts to the project. Reasonably foreseeable actions are planned or proposed, not speculative or in the distant future. They also include continuation of recent trends in use. The following actions are identified as reasonably foreseeable:

- Land and Resource Management planning in the planning area and surrounding adjacent areas.
- Residential growth and business development throughout the planning area
- Expansion of mineral extraction activities on BLM lands within the planning area and surrounding adjacent areas along with state and private lands
- Utility corridor development
- Increase in recreational use, both motorized and non-motorized, on BLM lands
- National Fire Plan activities for federal and state land management agencies
- Continuing implementation of Utah BLM's Rangeland Health Standards and Guides
- BLM's 13 Western States Vegetation Environmental Impact Statement
- Planning for streams not meeting state water quality standards

- Continued noxious weeds infestation
- Continued human-caused, including prescribed burning, and natural ignitions
- Vegetation treatments and sagebrush restoration
- New coal-fired power plants

4.4.1. CUMULATIVE IMPACTS ON AIR QUALITY

The cumulative impacts on air quality discussed here should be considered in addition to those discussed in previous chapters and under the related resource sections. Activities contributing to cumulative impacts to air quality include prescribed burning; construction, equipment operation, and surface-disturbing activities related to oil and gas development; and OHV activity throughout most of the MPA.

Short-term cumulative impacts from the activities proposed for all resource decisions on air quality are projected to be minimal to negligible under all alternatives. Direct and indirect short-term impacts include increases in airborne particulate and gaseous emissions from prescribed burning, construction sites, and/or OHV trails/use areas. Reasonably foreseeable future projects or actions have the potential to add to the impacts of any of the management decisions currently being considered.

The primary source of air quality impacts from mineral resource development decisions in the Monticello FO is the production of oil and gas. The magnitude of air quality impacts associated with these activities is directly related to the density and intensity with which extraction proceeds. It is reasonable to assume that oil and natural gas exploration and development would continue within the project area over the next 15 years. Accordingly, it is likely that potential air quality impacts from non-project and project-related mineral development in the project area will continue at the current level for the next 15 years. Assuming appropriate application of control measures and strict adherence to existing regulatory and permitting processes, no appreciable cumulative, short-term, adverse air quality effects can be projected specific to oil and gas development.

Long-term cumulative impacts from the activities proposed for all resource decisions on air quality are also projected to be minimal to negligible under all alternatives and under the Proposed Plan. Direct and indirect long-term cumulative impacts include increases in particulate and gaseous emissions from equipment specific to oil and gas development, and associated use of service roads. Detrimental effects from oil and gas development are expected to be small as emissions and fugitive dust control would be a required part of the permitting process. No appreciable cumulative, long-term adverse air quality effects are projected for oil and gas development assuming the conditions described under short term cumulative impacts.

Implementing the national Fire Plan across Utah would cause additional short-term localized increases in particulate emissions from planned ignitions. However, a long-term reduction in the risk of violations of air quality standards from large, uncontrolled smoke emissions would occur.

Increased motorized recreational use, ongoing growth and development, and new coal-fired power plants would contribute particulate matter emissions and fugitive dust emissions. The

incremental contribution of emissions from activities occurring under the Proposed Plan and the alternatives to past, present and reasonably foreseeable actions will not cause concentrations of Co, Sox, PM or NoX to exceed national standards.

OHV-related, air quality impacts are expected to be very short-term and site-specific in nature and are not projected to affect the wider planning area.

4.4.2. CUMULATIVE IMPACTS ON CULTURAL RESOURCES

Impacts associated with resource decisions from this PRMP/FEIS, combined with other past, present, and reasonably foreseeable actions, could produce cumulative impacts on cultural resources and resources of religious or traditional importance to Native American tribes associated with the decision area. The potential for cumulative impacts includes neighboring lands with connected cultural resources including adjoining BLM Field Offices, state and private lands within the planning area, Navajo and White Mountain Ute Reservations, and the Manti-LaSal National Forest. The same management direction and resource uses occur in both planning areas. Surface disturbance associated with consumptive uses such as oil, gas, and other minerals development, and forage use could result in cumulative impacts over a larger landscape scale than what is analyzed in this Monticello RMP. However, planning decisions related to the Moab Field Office and other federal lands are also subject to federal cultural resource laws and application of the Section 106 process of the NHPA. Further, general planning decisions of adjacent federal lands have the potential to impact cultural resources on adjacent lands within the planning area (i.e., fire fuels reduction, erosion reduction through effective vegetation management, etc.), and would generally have a positive effect on cultural resources within the planning area.

Oil and gas development and mineral exploration and development has occurred across this region in the past and would continue into the future. However, the cumulative impacts of these activities on cultural resources in the general vicinity of planning area would likely be less than the potential impacts from the continually increased recreational visitation that cultural sites in the region will be subject to. The advent of the Internet has resulted in the wide publicizing of the locations and types of cultural resources in and around the planning area. This combined with the easy and rapid access afforded by the substantial increase in OHV ownership and recreational use will continue to subject cultural resources in the region to heightened risk of damage, vandalism, and/or looting.

Many decisions related to visual resource management, special designations, and restrictions on surface disturbance have the potential to provide a net positive benefit to cultural resources within the Monticello PA. These decisions would reduce or control the frequency and extent of ground-disturbing activities that present the greatest threat to maintaining the use values of cultural resources. In general, all minerals and recreation decisions under all alternatives have the potential to increase or at least maintain current levels of adverse impacts to cultural resources. Decisions for minerals and recreation generally increase or maintain current levels of surface and subsurface disturbance, and have as an indirect impact an increase in human activity within those areas of minerals development and recreational use. Increased human activity tends to equate with increased adverse impacts on cultural resources, even if these impacts are inadvertent.

In general, implementation of the array of resource decisions under Alternative E would have the lowest degree of potential negative impact on cultural resources within the Monticello FO, and in

many cases Alternative E has the highest overall benefit for cultural resources. Overall, fewer acres of land would be open for ground-disturbing activities under this alternative than under any other alternative. Although no direct correlation exists between acres of surface and subsurface disturbance and numbers of cultural resources impact, this general trend holds true. By comparison, Alternative D and Alternative A (No Action) have the potential for roughly comparable levels of potential adverse impact to cultural resources. Decisions under Alternative C and under the Proposed Plan would have a potential for adverse impacts between those in Alternatives B and E and those in Alternative D. Under all alternatives, specific undertakings that could result in surface and subsurface disturbance and have the potential to impact cultural resources are subject to the Section 106 process of the NHPA, which calls for the identification of historic properties (i.e., NRHP-listed sites or sites determined eligible for listing on the Register) within the area of potential impacts and the consideration of alternatives to the planned undertaking that could avoid impacts to said properties. In the event that avoidance is not possible, mitigation of the impacts is to be considered.

The incremental contribution of the Proposed Plan and the alternatives on the cumulative impacts to cultural resources is anticipated to be minimal since cultural resources are managed in compliance with federal laws, regulations, and policies.

4.4.3. CUMULATIVE IMPACTS ON FIRE MANAGEMENT

Cumulative impacts are a combination of impacts from each alternative with the past, present, and reasonably foreseeable future actions associated with the project and surrounding area. The entire area is managed according to the Moab Fire District Fire Management Plan, which was recently revised. Based on the impetus that the federal fire management agencies are placing on implementing the Federal Wildland Fire Policy, the Healthy Forests Initiative, and the National Fire Plan, these revisions include vegetation management to decrease fuel loading and, consequently, decreased fire risk.

4.4.4. CUMULATIVE IMPACTS ON HEALTH AND SAFETY

Minerals development within surrounding areas would increase the use, generation, and transportation of hazardous materials. City and County use plans for surrounding communities could have cumulative impacts, whereby mineral resources are developed adjacent to BLM lands. State lands that are surrounded by BLM land could have impacts from inholding development.

Hazardous materials are regulated by the EPA and administrated by state agencies regardless of land status. The incremental contribution of the Proposed Plan and the alternatives on the cumulative impacts to health and safety is anticipated to be minimal if all applicable laws, regulations, safeguards, and procedures are followed.

4.4.5. CUMULATIVE IMPACTS ON LANDS AND REALTY

The number of land-use authorizations, particularly rights-of-way and permits, is a function of demand for these uses. Additional future development of adjacent federal, state, and private lands would likely result in additional requests for and approval of land-use authorizations for facilities such as roads, utilities, and communication sites.

City and County use plans could have cumulative impacts where land is developed adjacent to BLM lands. Both the Grand and San Juan County Use Plans have no net loss of private land as a result of government agency land ownership adjustments. Even though land exchange would be the preferred means of land ownership adjustment, such a position could affect the land ownership adjustment program by more strongly favoring land exchanges and outright disposals of public land over purchases of private land.

The designation of right-of-way avoidance and exclusion areas on BLM lands, along with similar restrictions on right-of-way development on adjacent lands, particularly National Forest lands, would have a cumulative impact of reducing routing options for right-of-way facilities such as utilities and roads. Alternative E has the most avoidance and exclusion areas, followed by Alternative B, followed next by Alternative C and the Proposed Plan.

4.4.6. CUMULATIVE IMPACTS ON LIVESTOCK AND GRAZING

Cumulative impacts to livestock and grazing could result from activities on adjacent private lands, activities scheduled for State and Institutional Trust Land Administration lands, and administrative actions on adjacent National Forest Service lands on the Manti-La Sal National Forest. These cumulative impacts have been considered as part of the direct and indirect impacts analysis, as the calculated AUMs include current and reasonably foreseeable grazing on state, private, and tribal lands.

It is likely that adjacent lands would see an increase in land uses (such as development and recreation) that may influence available resources within the Monticello PA in the future. These factors may increase the demand for BLM lands available for grazing. However, this increased demand would not be met because the number of acres available for grazing is fixed for the next 15 years. Proper grazing would ensure rangeland quality.

The incremental contribution of the Proposed Plan and the alternatives on the cumulative impacts to livestock grazing is minimal.

4.4.7. CUMULATIVE IMPACTS ON MINERALS

Past and present mineral resource development management actions that have affected the mineral resources in the Monticello FO are listed in the Mineral Potential Report and in Section 3.8 of Chapter 3. Reasonable foreseeable future mineral resource development management actions include those listed in the RFD scenario as occurring on all lands in the Monticello FO, including USFS, NPS, state, private, and tribal lands; according to the RFD, an average of 195 oil and gas wells is expected on all lands in the Monticello FO over the next 15 years. Some past, present, and reasonably foreseeable future mineral resource development includes lands administered by two or more agencies, including those already listed and the Moab, Richfield, Kanab, Hassayampa, Grand Junction, Uncompahgre, and Dolores Field Offices of the BLM (BLM 2005a; BLM 2005b). These cumulative mineral resource management actions result in beneficial impacts to mineral resource knowledge, yields, and royalties in the Monticello FO, as described in Section 4.3.7.3, Summary of Locatable RFD and Salable RFD. By the same token, continued extraction of mineral resources, over time, reduces the finite quantities of these resources in the Monticello FO.

Past, present, and reasonable foreseeable future management actions regarding other resources would also impact mineral resource development:

- Non-discretionary management of WSAs under the IMP precludes most surface-disturbing activities. Impacts of designation of WSAs are discussed in Section 4.3.7.4.
- VRM decisions on Monticello FO lands adjacent to the other BLM lands (i.e., Moab, Richfield, Kanab, Hassayampa, Grand Junction, Uncompahgre, and Dolores planning areas) may be based in part on viewsheds looking into those other BLM lands. As consistent VRM decisions would be made across these boundaries, VRM decisions for the Moab, Richfield, Kanab, Hassayampa, Grand Junction, Uncompahgre, and Dolores planning areas would likely result in cumulative impacts to mineral resources—either beneficial if VRM III or IV, or adverse if VRM I or II.
- Wildlife habitat decisions made by the Utah Division of Wildlife Resources (e.g., crucial habitat for a given sensitive species, habitat fragmentation) have the potential to impact mineral resource development in the Monticello FO. These decisions would result in generally adverse impacts in the form of controlled surface use or timing limitation stipulations on mineral resource development activities.

Generally, resource decisions occurring on multiple-use, non-Monticello FO lands managed by state and federal agencies (e.g., SITLA, USFS, the BLM Moab Field Office) would have cumulative impacts similar in type to those on Monticello FO lands. Individual private land parcels represent a full spectrum of impacts, from full mineral resource development/use (beneficial) to resource preservation (adverse).

4.4.8. CUMULATIVE IMPACTS ON NON-WSAs WITH WILDERNESS CHARACTERISTICS

Resource decisions from this RMP could combine with other past, present, and reasonably foreseeable future actions to produce cumulative impacts to wilderness characteristics associated with the planning area. Resource decisions for other lands adjacent to the Monticello PA could result in cumulative impacts. The same management direction and resource uses occur in all of the above planning areas. Resource management on adjacent federal lands (including USFS-administered land and NPS land), private land, and state lands would also affect wilderness characteristics in the area. USFS management would generally have a similar management focus as BLM decisions. NPS decisions would generally enhance wilderness characteristics, because its lands are managed under a preservation rather than multiple-use mandate. Surface disturbance associated with consumptive uses such as oil, gas, and other minerals development would result in cumulative impacts over a larger landscape scale than analyzed in this document. Private and state lands have a different mandate for management. Activities and management of these lands would negatively impact non-WSA lands with wilderness characteristics found on public land.

In addition to the acreage currently being managed to protect and preserve their wilderness characteristics, BLM Utah is considering management options for 2,847,156 additional acres of non-WSA lands (5.4% of Utah lands) with wilderness characteristics in six ongoing land-use planning efforts. This includes the 582,357 acres in the Monticello PA. There are other federal lands with wilderness characteristics in Utah that are currently being managed to protect those values. These are identified in Table 4.261 below.

Table 4.261. Federal Lands with Wilderness Characteristics in Utah that are Currently Being Managed to Protect Those Values

Land Administrator	Administrative Unit	Acres	Percent of Land in Utah*
BLM	Designated Wilderness	127,700	0.24
BLM	Wilderness Study Areas	3,214,740	6.12
National Park Service	Recommended Wilderness	1,467,082	2.79
U. S. Forest Service	Designated Wilderness	773,124	1.47
U. S. Forest Service	Recommended Wilderness	83,390	0.16
Total		5,666,036	10.78

*The percentage figures shown in this table are based on a total land area of 52,541,440 acres in Utah.

Oil and gas development has occurred across this region in the past and will continue at an increasing rate into the future. The combined amount of surface disturbance of these past, present, and future actions would be detrimental to areas surrounding non-WSA lands with wilderness characteristics (depending on their location).

The overall cumulative impact of activities proposed for all resource decisions on non-WSA lands with wilderness characteristics includes short-term detrimental impacts and long-term improvements to habitat. Major contributors to detrimental impacts include OHV activities throughout most of the area, surface degradation from mineral development related activities, all other surface-disturbing activities, and vegetation treatments such as sagebrush removal. Direct impacts would be due to loss of naturalness, including loss of individual plants or animals, from mineral development or other surface-disturbing activities. Indirect impacts would also occur with habitat fragmentation due to mineral development, and changes in OHV use due to increased roads or use of roads. These activities would concentrate recreation use on non-WSA lands with wilderness characteristics. The cumulative impacts of all these uses could lead to loss of naturalness in the future.

4.4.9. CUMULATIVE IMPACTS ON PALEONTOLOGICAL RESOURCES

Unauthorized activities such as OHV use, dispersed recreation, and vandalism would continue to have adverse impacts on paleontological resources under all alternatives. These impacts would be reduced under Alternative B and E and to a lesser extent under Alternative C and the Proposed Plan because they provide more constraints on OHV use and dispersed recreation activities. Alternative A showed 611,310 acres open to OHV travel. All action alternatives have only a small open area (from 0-2,311 acres). There would also be impacts as a result of permitted surface-disturbing activities such as mineral development in areas containing significant paleontological resources. The potential for inadvertent adverse impacts to paleontological resources from surface-disturbing activities would be greater under Alternatives A and D. The cumulative impacts of alternatives that include surface-disturbing activities within areas containing fossils have the potential to damage this fragile, nonrenewable resource. However, existing laws, regulations, and policies provide ample opportunity to mitigate adverse impacts

through avoidance or collections of specimens and data. While it is expected that some fossils will be destroyed in the course of other legitimate uses of public lands, mitigation measures will bring consultant paleontologists to areas in the Monticello FO where no researchers are currently studying fossils. Thus fossils that would otherwise have disintegrated over time due to weathering and erosion will be collected, placed in repositories, and preserved in perpetuity.

4.4.10. CUMULATIVE IMPACTS ON RECREATION

Recreational visitation within and around the project area will likely continue to increase steadily over the long-term. Past and present actions that have had and are having impacts on recreation include mineral development, wildland fire suppression and fuels treatments, OHV travel, utility corridor development, grazing and recreational activities in riparian areas, and management within existing SRMAs and the ERMA. Recreational uses that are expected to have the greatest growth would be OHV use, cultural visitation, river running, and motorized visitation of adjacent scenic areas such as Canyonlands National Park, Monument Valley, Valley of the Gods, and Arches National Park. This increased visitation will satisfy more recreational needs but may result in a cumulative loss in the recreational experience by increasing crowding and resulting in long-term impacts to natural and cultural resources that are integral to this experience. In as much as energy development and other surface-disturbing activities increase, there will be a negative impact to recreationists. Based on the RFD for oil and gas, negative impacts are expected to be largely contained in or near existing fields.

The potential cumulative impacts on recreation from actions within the Monticello PA and adjacent and local administrative agencies are as follows:

- Oil, gas, locatable, and salable minerals exploration and development could have a long-term, cumulative effect on the recreational viewshed from surface disturbances and facilities. VRM mitigation would reduce these effects, but it is likely that the activities would remain visible from points of view within the MPA and from viewpoints within the adjacent national parks.
- Wildland fire suppression would temporarily affect recreation use in or adjacent to areas where prescribed fire or other vegetation treatments are being conducted. The long-term cumulative effects would reduce fire risks to recreation areas and facilities within the MPA and on lands under other administrative agencies. Prescribed burning would temporarily degrade air quality (and scenic quality), but with the reduced risks of wildland fire, there would be a cumulative decrease in smoke emissions.
- OHV travel management would have beneficial cumulative effects on recreational experiences and resources by reducing surface impacts to soils, cultural resources, riparian areas, and wildlife habitat by generally confining travel to designated routes within the MPA. The reduction in OHV-related surface disturbances would also cumulatively reduce the spread and establishment of exotic, invasive plant species.
- Riparian areas would be beneficially affected by cumulative actions to improve ecological conditions within these sensitive areas, which would improve recreation experiences for wildlife viewing, camping, and hiking.
- The cumulative effect on recreation resources would be enhanced in the long-term by managing existing and proposed SRMAs and the ERMA in the Monticello PA and in adjacent BLM Moab FO. The designation of SRMAs would help to reduce the conflicts

between the different recreation uses. The cumulative effect of managing the Monticello PA to respond to the expected increase in visitation, changes in recreational demand, and the wide range of recreational activities would have beneficial effects on recreation.

The incremental contribution to the overall cumulative impacts on recreation opportunities, setting and experience would be greatest under Alternatives A and D, as restrictions on surface development and protections afforded to natural resources within the planning area would be less intensive under these alternatives. Alternative E would provide the greatest protection to natural resources and the highest level of non-motorized recreation opportunities. The Proposed Plan and Alternative C would contribute an amount in between Alternatives B/E and D to the cumulative impacts on recreation

4.4.11. CUMULATIVE IMPACTS ON RIPARIAN RESOURCES

Past and present actions within the MPA and on adjacent USFS-administered lands, state lands, and private lands that affect and have affected riparian areas include livestock grazing, recreational uses (including OHVs, non-motorized recreation, etc.), mineral exploration and development, and upstream water withdrawals and impoundments. In general, these actions have all had cumulatively adverse impacts on riparian health. Livestock grazing, recreation, and mineral-related activities have led to surface disturbance, soil compaction, removal of riparian vegetation, bank trampling, and alteration of riparian areas' physical structure. They have also resulted in the widespread introduction of invasive weeds. Water withdrawals and impoundments have limited the health and extent of riparian zones by decreasing water availability, and encouraged the introduction of invasive plants through the stabilization of formerly dynamic sediment deposits, such as bars and banks.

Reasonably foreseeable future actions that would affect riparian areas include an expansion of recreational use and ongoing mineral exploration, development, and extraction. All of these actions could have a potential adverse effect on riparian areas. Beneficial impacts would result from USFS planning efforts, which will reduce negative impacts to riparian resources on National Forest lands. Future impacts on private lands may include both positive and negative impacts as described above.

Under the Proposed Plan and all alternatives, riparian resources would benefit from management for PFC in accordance with the Utah Standards for Rangeland Health and Guidelines for Grazing Management for BLM in Utah (BLM 1997). Adherence with these plans would mitigate many of the adverse impacts from past, present, and future actions. In addition, continuing closure of several allotments to grazing with perennial streams and riparian vegetation would continue the restoration and enhancement of riparian resources in these areas.

In terms of project contributions to cumulative impacts, the Proposed Plan and Alternative C would present a level of riparian resource protection balanced between Alternatives E and D. Alternative D would favor resource development, and more surface-disturbing activities would occur than in the other action alternatives. Alternative E would favor riparian resource protection, and fewer surface-disturbing activities would occur than in other action alternatives. Alternative A (No Action) is such that many of the management guidelines are unspecified with respect to riparian and other resources. However, with respect to recreation, cross-country OHV use under Alternative A presents the greatest potential risk of adverse impacts to riparian areas

and soils. All the action alternatives benefit from removing the large area open to OHV travel (611,000 acres) and making essentially all lands either limited or closed.

Therefore, the incremental contribution of the Proposed Plan and the alternatives to the cumulative impacts on riparian resources is expected to be minimal.

4.4.12. CUMULATIVE IMPACTS ON SOCIOECONOMICS

The master plans for San Juan and Grand Counties set forth a desired direction for the local economy of each county. These plans, when taken together with the allowable activities on federal lands, could cumulatively increase the economic condition of the region by increasing jobs and population.

The mission of the State of Utah Travel Council is to promote tourism throughout Utah. The Travel Council currently promotes the Monticello area as a place where visitors can explore cultural and scenic resources through hiking, biking, OHV use, and river running. Cultural visitation, OHV use, and river running have become recreational pursuits for which this portion of southwestern Utah has become well known. The visitation resulting from this marketing, combined with the nationwide increase in OHV use, when considered together with recreational activities that would occur on federal lands, could create a beneficial cumulative impact to the regional tourism industry. This potential for increased visitation and economic benefits is even more probable when one considers that the planning area is surrounded by several other well-known popular tourist destinations managed by other agencies, including Canyonlands National Park, Hovenweep National Monument, Monument Valley, and Valley of the Gods.

Mineral development outside the Monticello FO's jurisdiction, but within or near the Monticello PA, could also impact social and economic conditions. According to the BLM's RFD, the total maximum amount of wells predicted to be drilled on all lands within the planning area over the next fifteen years is 195 wells (see Table 4.1). According to the Alternative A (No Action), the maximum amount of wells projected for BLM lands is 73 (see Table 4.66). Additional development of producing oil and gas wells could bring additional tax and royalty revenue to the counties. Additional jobs may be created with the increased production.

Additional mineral development, including the potential increase in uranium mining on federal and non-BLM lands and the start up of the White Mesa Mill, will increase working mines and provide an economic benefit. A potential increase in uranium extraction throughout the MPA could have some short-term beneficial economic impact on local communities; however, uranium development is not projected to be extensive, and therefore should not adversely impact visitor experience and recreation-related revenues. Additionally, establishment of the Lisbon Valley Copper Mine could have short- and long-term beneficial impacts on local economic conditions with regard to employment and tax revenue for San Juan County. The Lisbon Valley Copper Mine is expected to employ approximately 145 people and produce more than 12,500 tons of ore per day (BLM 2004e).

4.4.13. CUMULATIVE IMPACTS ON SOIL AND WATER RESOURCES

Reasonably foreseeable actions affecting soil and water resources include reasonably foreseeable increased oil and gas development on adjacent tribal, private, and state-owned lands, as well as non-BLM federal lands located near the planning area. This development would include disturbances associated with drilling, building of access roads, and placement of pipelines. Other

associated impacts include the increased need for water to support this mineral development. It is estimated that a total of 195 wells would likely be developed on non-BLM land in or adjacent to the planning area over the next 15 years. This compares with the estimated total of 73, 66, 74, and 75 wells that would be developed on BLM lands under Alternatives A, B, C, and D, respectively.

Past and present actions that affect and have affected soil and water resources include livestock grazing, recreational uses (including OHVs, non-motorized recreation, etc.), mineral exploration and development, woodland harvest, and vegetation treatments (including those for fire management on lands managed by both the state and other federal agencies).

Livestock and recreation resource uses on non-BLM lands would cause both beneficial and adverse cumulative impacts to soil resources. With respect to livestock, trampling would be adverse to soils, but proper grazing management would preserve vegetation cover, thereby reducing soil erosion. With respect to recreation, open OHV use on state and private lands would generally be adverse to soils.

Soil productivity would be primarily impacted by surface disturbance and vegetation loss associated with these activities, increasing soil erosion and loss, as well as landslides and flooding. Surface water quality would primarily be impacted by increased soil erosion, increased salinity, and sedimentation of streams. Changes in the timing and magnitude of surface water flows would also reasonably be expected depending on the magnitude of the actions.

Groundwater quality may be affected through the discharge of saline or hydrocarbon-impacted waters during drilling and development of oil and gas wells. Utilization of groundwater as a water supply to support resource development may result in decreased aquifer storage and lower water levels. Shallow alluvial aquifers may be negatively impacted due to development as well. The vertical movement of groundwater along fractures and faults induced by production of hydrocarbons and water from oil and gas wells could change salinity concentrations over a short or long period of time, depending upon structural controls and rock types. These impacts may have an effect on surface water features, such as springs and perennial flows, and may have an economic impact on domestic wells through increased pumping costs.

Under all alternatives, soils and water resources would benefit from management, in accordance with the Standards for Rangeland Health and Guidelines for Grazing Management of BLM Lands in Utah (BLM 1997). Adherence to these standards would reduce many of the adverse impacts from future actions. In general, Alternatives A and D would be the least protective of soil and water resources, result in the least beneficial impacts on soils and water resources, and have the least mitigating effect on past impacts to soils and water resources in the Monticello PA. Alternative E would be the most protective and would provide the greatest reductions of cumulative impacts by excluding the most areas from surface disturbance. The Proposed Plan and Alternative C would provide a level of protection and mitigation of cumulative impacts between that of Alternatives B/E and D.

However, Alternative A (No Action) would likely result in higher contributions to cumulative impacts from OHV use and camping due to the lower level of restrictions on cross-country OHV travel and dispersed camping.

Outside of BLM lands, resource decisions occurring on other lands managed by state and federal agencies (such as the USFS) would have cumulative impacts similar to the BLM. Private lands

present a full spectrum, from full resource development/use (adverse) to resource preservation (beneficial).

4.4.14. CUMULATIVE IMPACTS ON SPECIAL DESIGNATIONS

ACECs and WSRs

There would be negligible cumulative impacts to those areas managed in the Proposed Plan as Special Designations for ACECs or WSRs. Cumulative impacts to those areas proposed for Special Designations in Alternatives B and E can result from decisions on BLM lands and state lands. Adverse impacts would occur mainly from surface-disturbing activities such as mineral development and OHV use off existing roads. Direct adverse impacts would be due to the loss of vegetation resulting in impacts to soils, wildlife habitat, and visual resources. These cumulative impacts could lead to the loss of Relevant and Important values for ACECs and Outstanding Remarkable Values (ORVs) for Wild and Scenic Rivers not designated in the Proposed Plan. The potential for damage to the important resource values identified within proposed Special Designations is greatest for Alternatives A and D, least for Alternative B, and intermediate for the Proposed Plan and Alternative C.

With congressional designation of a Wild and Scenic River, the BLM would continue to manage for the ORVs, classification, and free-flowing nature of the river. Congressional designation would provide management with mechanisms to maintain free-flowing values, protect or enhance water quality, protect ORVs, manage consistently with the wild, scenic, or recreational classifications, and where it is a management plan objective, to purchase property as well as promote economic development, tourism, or recreational use.

Congressional designation does not affect existing river compacts, nor does it provide federal authority to regulate non-federal lands. On navigable rivers, the bed and banks are state lands, and the federal and state governments would collaborate on matters affecting instream flow and other river resources.

The Wild and Scenic Rivers Act implies a federal reserved water right; however, it must be the minimal amount necessary for purposes of the Act, it must be adjudicated through state processes, and it would be junior to existing water rights. The amount of the federal right would vary from river to river, depending on the river's flows, the unappropriated quantities in the river, and the values for which the river is being protected. Rather than initiating efforts to secure water rights for instream flows, the BLM could develop cooperative or voluntary water-flow management strategies with other water users and the state. In some situations, the state may have already established minimum stream flows for fish protection or other purposes that may be adequate to meet the wild and scenic river needs.

Designated wild rivers would be closed to mineral location. The Federal Energy Regulatory Commission (FERC) would be prohibited from licensing the new construction of hydroelectric facilities "on or directly affecting" a designated WSR. The Wild and Scenic Rivers Act also prohibits any department or agency of the United States from assisting in the construction of any water resources project that would have a "direct and adverse" impact on the values for which the river was designated. It also precludes federal assistance to projects below/above a designated river that are determined by the administrative agency to invade the area or

unreasonably diminish the scenic, recreational, and fish and wildlife values present as of the date of designation.

Please see the WSR suitability appendix for an evaluation of suitability for each river segment. A suitability finding will be made in the record of decision (ROD).

Those rivers not found suitable for Wild and Scenic River designation in the Proposed Plan could be subject to the alteration of their free-flowing character resulting from potential future water developments.

Therefore, the incremental contribution to the cumulative impacts on Special Designations is greatest for Alternatives A and D, least for Alternatives B and E, and in between for the Proposed Plan.

Wilderness and WSAs

The Proposed Plan and the alternatives would contribute no adverse cumulative impacts to Wilderness Study Areas because they are protected by law, resolution and policy.

4.4.15. CUMULATIVE IMPACTS ON SPECIAL STATUS SPECIES

Resource decisions from this RMP could combine with other past, present, and reasonably foreseeable actions to produce cumulative impacts to special status species associated with the planning area. Co-occurring planning projects in the region include the Moab Field Office BLM RMP. Resource decisions for the Moab Field Office, which is adjacent to the Monticello FO, would likely result in cumulative impacts. The same management direction and resource uses occur in both planning areas. The Manti-La Sal National Forest management decisions would also overlap regarding several of the same resources. Surface disturbances associated with consumptive uses such as forage use as well as oil, gas, and other minerals development would result in cumulative impacts over a larger landscape scale than what is analyzed in this Monticello RMP.

Oil and gas development has occurred across this region in the past and will continue into the future. The combined amount of surface disturbance of these past, present, and future actions would be detrimental to special status plants. The spatial layout of oil and gas facilities disturbs a large proportion of vegetation when considered across the landscape. Each disturbed area for a well pad or road increases the opportunity for weed invasions, and disrupts the spatial continuity of vegetation communities. Other activities such as road construction and increased OHV use will increase access to sensitive areas upon which Special Status Species are dependent for survival. For example, increased access into prairie dog sites will increase mortality by shooters and indirectly impact all the species associated with them.

The overall cumulative impact of activities proposed for all resource decisions on special status plants is projected to be moderate to detrimental at localized areas within the short-term. Major contributors include OHV activities throughout most of the area; increased livestock grazing; habitat destruction from mineral-development-related activities; some vegetation treatments such as sagebrush removal; and possible project developments such as livestock water developments resulting in redistribution of livestock into previously unused areas that are sensitive to disturbance. Direct impacts would be due to loss of individual plants from mineral-, oil-, and gas-related development. Indirect impacts from habitat fragmentation due to development,

changes in OHV use due to increased roads, and rock/fossil collection would also occur. These activities would concentrate grazing pressures and recreation use on habitat sites for some species. The cumulative impacts of all these uses could lead to lower populations of Special Status plants and animals in the future. However, protections provided by the Endangered Species Act would minimize the potential adverse cumulative impacts to listed species. Conversely, beneficial impacts would be obtained with BLM designation of proposed ACECs, Wild and Scenic Rivers, and management of non-WSA lands to protect, preserve and maintain wilderness characteristics, because numerous plant populations and wildlife habitats would be given special management protection within the boundaries of those designated areas. As a result of these proposed designations, the incremental contribution of the cumulative impacts on plant and animal habitats would be the greatest under Alternatives A and D, the least under Alternatives B and E, and in between these two sets of alternatives under Alternative C and the Proposed Plan.

4.4.16. CUMULATIVE IMPACTS ON TRAVEL

Other past, present, and foreseeable future actions that would cumulatively impact travel opportunities within the Monticello FO planning area include changes in recreational use, both within the planning area and in adjacent federally managed areas (the Moab FO planning area, Manti-LaSal National Forest, and Canyonlands and Arches National Parks). Trends indicate that visitation and recreation are increasing within the Monticello FO planning area and on these adjacent, federally administered lands. Increasing recreational use within the region could affect travel within the Monticello FO planning, as increasing demands for recreational opportunities could require more road signs, more travel kiosks and information booths, and more restrictions on roadside parking and camping.

Transportation and road networks adjacent to BLM lands include routes shared with other federal agencies, SITLA, and private landowners. Cumulative impacts to transportation and access would occur primarily from actions that facilitate, restrict or preclude motorized access. Management actions that restrict OHV use would limit the degree of travel opportunities and the ability to access certain portions of the planning area. The continued maintenance of federal and state highways would provide arterial connections to BLM roads. County-maintained routes that connect federal and state highways to BLM-system routes would maintain and improve access to the MPA's resources.

Past minerals activities produced many of the current travel routes within the planning area, but foreseeable minerals exploration and development (primarily oil and gas) within the planning areas and on adjacent federal lands, while creating access routes to production wells, would probably have minor impacts on travel opportunities within the planning area. New routes would generally be short spur roads that would be reclaimed once they no longer serve their intended functions.

Therefore, the incremental contribution of the Proposed Plan and the alternatives to the cumulative impacts on Travel Management is expected to be minimal because the designated routes under the Proposed Plan and the alternatives provide sufficient travel opportunities throughout the Monticello planning area.

4.4.17. CUMULATIVE IMPACTS ON VEGETATION

Past and present actions that affect and have affected vegetation resources include livestock grazing, recreational uses (including OHVs, non-motorized recreation, etc.), mineral exploration and development, woodland harvest, and vegetation treatments (including those for fire management) on adjacent tribal, private and state-owned lands, as well as non-BLM federal lands located near the planning area. This development would include disturbances associated with drilling, building of access roads, and placement of pipelines. Other associated impacts include the increased need for water to support this mineral development. It is estimated that approximately 120 wells would likely be developed on non-BLM land in or adjacent to the planning area over the next 15 years. This compares with the estimated total of 73, 66, 74, and 75 wells that would be developed on BLM-lands under Alternatives A, B, C, and D, respectively.

Other vegetation impacts are associated with recreational uses, including hiking, equestrian, camping, and OHV use on lands managed by both the state and other federal agencies. These uses have the potential to trample or crush vegetation. Typically hiking and equestrian use occurs on existing trails. However, the increased popularity of four-wheelers in the general region poses a risk to vegetation on state and private lands where OHV use may not be restricted to existing roads and trails. Additionally, the lack of regulations on dispersed camping, combined with the increased recreational visitation that the area continues to experience, indicates that the potential for long-term vegetation disturbance from dispersed camping and associated recreation will increase.

4.4.18. CUMULATIVE IMPACTS ON VISUAL RESOURCES

Past and present actions causing cumulative impacts on visual resources include fire suppression, minimal fuels treatments, and minimal prescribed fire treatments, resulting in a buildup of hazardous fuels materials. Minerals exploration, development, and extraction have been and are being conducted within the Monticello PA and are producing surface disturbances. The demand for recreational opportunities has been and is presently intensifying, resulting in impacts on backcountry and frontcountry recreation areas as visitors expand into previously undisturbed areas of the MPA. Other management efforts within and outside the planning area boundaries could produce long-term cumulative impacts on visual resources. Reasonably foreseeable future actions, including planning efforts to locate and develop mineral and hydrocarbon resources within the Monticello FO, could have adverse impacts on visual resources. Impacts would be caused by surface disturbance from production, exploration, and construction of drilling and mining facilities, and OHV use.

Actions outside of the Monticello FO that could potentially affect visual resources would include mineral development on adjacent private lands, as well as the adjacent national forest and the Moab Field Office. The impacts on visual resources would be cumulatively beneficial if these administrative areas coordinate their planning efforts to preserve scenic quality along their boundaries with the Monticello FO. Conversely, if planning efforts are not coordinated, scenic quality could be adversely affected for both the Monticello FO and adjacent scenic areas such as Deadhorse Point and Canyonlands National Park.

Therefore, the incremental contribution to the cumulative impacts on Visual Resources is expected to be the greatest under Alternative D, the least under Alternatives B and E, and in between those options under the Proposed Plan and Alternative C.

4.4.19. CUMULATIVE IMPACTS ON WILDLIFE AND FISHERIES

Resource decisions from this RMP could combine with other past, present, and reasonably foreseeable actions to produce cumulative impacts to wildlife and fisheries populations associated with the planning area. Co-occurring planning projects in the region include the Moab Field BLM RMP. Resource decisions for the Moab Field Office, which is adjacent to the Monticello FO, would likely result in cumulative impacts. The same management direction and resource uses occur in both planning areas. Surface disturbance associated with consumptive uses such as forage use as well as oil, gas, and other minerals development would result in cumulative impacts over a larger landscape scale than what is analyzed in this Monticello RMP.

Oil and gas development has occurred across this region in the past and will continue into the future. Additionally, both copper and uranium mining have occurred and would continue to occur in the planning area. The combined amount of surface disturbance of these past, present, and future actions would be detrimental to vegetation. The spatial layout of oil and gas facilities disturbs a large proportion of vegetation and wildlife habitat when considered across the landscape. Each disturbed area increases the opportunity for weed invasions and disrupts the spatial continuity of vegetation communities.

4.4.20. CUMULATIVE IMPACTS ON WOODLANDS

Other management efforts within the planning area boundaries could produce long-term cumulative impacts on woodland resources. Reasonably foreseeable future actions, including planning efforts to locate and develop mineral and hydrocarbon resources within the planning area, would potentially have adverse impacts on woodland resources by removing the resource from production and use in construction and support facility areas. Most foreseeable future development within the Monticello FO consists of oil and gas well exploration and development and potential uranium mining. Actions outside of the Monticello FO that could potentially affect woodlands resources include oil and gas leasing, fire management, and timber sales in the Moab FO and Manti-La Sal National Forest. These planning efforts could have cumulative beneficial impacts on woodland resources if inter- and intra-agency coordination were included. Coordination would be useful in managing wildfires and prescribed burns. Cumulatively, these planning efforts would create greater woodland diversity and health through fire and vegetation treatments. Conversely, if planning coordination were not included in these management plans, the potential for the loss and/or degradation of woodland resources would be increased. Other resource use management actions would have adverse impacts on woodland resources by restricted resource harvesting (WSAs and Wilderness Areas, ACECs, SRMAs, and wilderness characteristics areas), and would continue to restrict resource harvesting in the future; however, the area of harvesting restrictions would be relatively small compared to the area managed as open to opportunities for resource harvesting.

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 AFFECTED ENVIRONMENT

3.1 PROJECT AREA OVERVIEW

3.1.1 GEOGRAPHIC SETTING

The Monticello planning area (PA) is located in the southeastern corner of Utah, adjacent to the Colorado and Arizona borders. A part of the Colorado Plateau region, the Monticello PA, is bounded by the Colorado River to the west, Canyonlands National Park and the Moab PA to the north, and the Colorado and Arizona state borders to the east and the south, respectively. The Abajo Mountains are situated in the heart of the Monticello PA. Elevations within the Monticello PA range between 3,700 at Lake Powell (near Bullfrog) and 11,360 feet at Abajo Peak (located in the Manti-LaSal National Forest).

3.1.2 CLIMATE

The climate of the Monticello PA shows wide seasonal temperature variations and both temperature and precipitation vary with elevation. Across the Monticello PA, summer precipitation generally comes from brief, heavy thunderstorms. Accumulated winter snow pack melts early in the spring and acts to infiltrate dry desert soils and recharge aquifers.

Precipitation in the southern section of the Monticello PA (near Bluff) averages 8 inches annually with most falling as rain in the late autumn months. Spring and summer thunderstorms are generally brief and violent, often resulting in flash flooding. Summers are hot, with daytime highs averaging 94°F and lows in the high 50s, although extreme highs over 110°F are not uncommon. Winters are cold, with highs averaging 46°F, and lows averaging 20°F.

The western section of the Monticello PA receives an average of 6 inches of precipitation a year, mostly in the late fall as snow. However, rain is not uncommon in the spring and late summer. Maximum summer temperatures average in the high 90s, while winter highs average 48°F, with lows generally in the high 20s.

The climate of the middle section of the Monticello PA (near Blanding) includes low humidity, warm summer temperatures and cool winters. Annual precipitation averages 13 inches, most of which comes in the form of fall rains and winter snows (11 inches). Maximum summer temperatures average 81°F, while winter temperatures average highs of 38°F and lows of 16°F.

The northern section of the Monticello PA (near Monticello) receives an average of 15 inches of precipitation annually; most of this comes in late summer thunderstorms and fall snows, which can leave heavy accumulations in the higher elevations. Maximum summer temperatures average in the high 80s during the day and low 50s at night. Winter high temperatures average 42°F, with nighttime temperatures in the high teens.

Air temperature and precipitation data collected from 1948 through 2003 for 4 locations in the Monticello PA are displayed in Table 3.1 and Figure 3.1 (WRCC 2004). (Peak elevation temperature and precipitation information was not available.)

Table 3.1. Temperature and Precipitation Data for 4 Locations in the Monticello PA

Temperature (°F)								
Station	General Location	Elevation (feet)	Summer Means		Winter Means		Extremes	
			High	Low	High	Low	High	Low

Figure 3.1. Thirty-year precipitation and air temperature plots for Monticello, Utah (WRCC 2004).

The Monticello PA has been experiencing drought for much of the last 5 years. The effects of the drought are discussed in detail in Sections 3.2, Air Quality, and 3.18, Vegetation.

3.2 AIR QUALITY

3.2.1 INTRODUCTION

Meteorological and topographical characteristics within the Monticello PA and the surrounding lands affect the transport, deposition and dispersion of emissions within the planning area and region. The effects of both emissions and management decisions within the area influence air quality throughout the area, not just within the boundaries of the planning area. The area within which air resources could be affected by activities within the planning area is referred to as the study area. The Monticello RMP study area includes the planning area and other areas such as Canyonlands and Zion National Parks.

The Monticello PA has been experiencing drought for much of the last 5 years, with extremely dry conditions occurring during the summer of 2002, when the Palmer Drought Severity Index (PDSI) reached near-record severity based on the last 100 years of instrumental data (NCDC 2004). These dry conditions have resulted in an increase of wind-blown dust and associated particulate matter in the Monticello PA and adjacent areas.

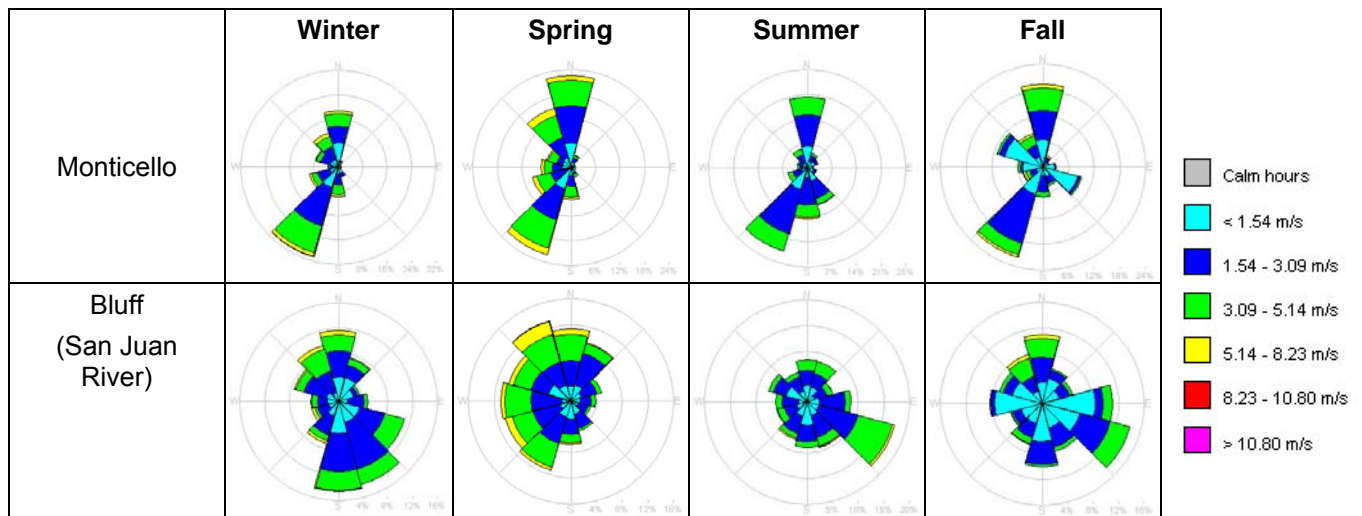

Drought is not the only climatic condition that can affect air quality in the planning area. Winter inversions and wind direction and speed can also have a great impact on air quality. When the air temperature near the ground is lower than the air temperature above, a phenomenon called a surface temperature inversion occurs. Surface inversions form because the ground cools faster than the air above. In most areas of the Monticello PA, inversions are fairly typical winter occurrences that dissipate rapidly when early morning sunlight warms the air near the ground surface. In areas where the local topography acts to pool and trap cold air (deep valleys surrounded by steep mountains) however, cold temperatures associated with stationary or slow moving high pressure systems can last for days or (rarely) even weeks and create inversions that result in poor air quality due to the compression of cold air masses and lack of circulation.

Inversions can hinder air pollutant dispersion by reducing vertical mixing. The mixing height of the plume is the height above the surface through which free vertical mixing occurs. Mixing height is often bounded by the inversion layer in the atmosphere. The dispersion of air pollutants is confined within the mixing height of the atmosphere. High mixing heights promote emissions dispersion and result in low ground level pollutant concentration. On the other hand, low mixing heights often trap emissions and result in high ground level concentration. Monticello, Blanding and Bluff are not as prone to inversions compared to other parts of the Monticello PA due to local topography, minimal snowfall, warmer wintertime low temperatures or other climatological conditions.

Air pollutant dispersion is also dependent on the wind. The pollutant path is determined by the wind direction, and the speed of transport is determined by the wind speed. Wind direction in the Monticello PA is highly influenced by the local terrain. For example, the winds along the San Juan River in San Juan County tend to blow from the west and the northwest in the spring and

blow from the east and the southeast in the other seasons (Trinity Consultants [Trinity] 2003). In the city of Monticello, which is located on the flanks of the Abajo Mountains, the winds predominately blow from the south or southwest.

Figure 3.2 presents the windroses for two cities in the Monticello PA. Windroses are graphical representations of wind speed, frequency, and direction for a given location. As can be seen from the seasonal windroses, the wind patterns in the area vary widely by season and local terrain. Therefore, dispersion and transport of pollutants are also variable in this region depending on the locations.

Data Source: 1996 Mesoscale Model (MM5) data processed using the CALMET meteorological model. The observed data from various meteorological stations are used to generate these windroses. Meteorological stations include Grand Junction, Montrose County Airport, Price/Carbon, etc.

Figure 3.2. Seasonal windroses¹ in the Monticello PA.

3.2.2 NATIONAL AMBIENT AIR QUALITY STANDARDS

The Code of Federal Regulations (CFR) sets National Ambient Air Quality Standards (NAAQS) in Title 40 of CFR, Part 50 (40 CFR 50). The purpose of primary NAAQS is to protect the health of the most sensitive people such as elderly and asthmatic individuals, while the purpose of secondary NAAQS is to protect public welfare from known or anticipated adverse effects associated with the presence of air pollutants, such as damage to property or vegetation. The NAAQS apply to 6 pollutants: carbon monoxide (CO), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), ozone (O₃), and particulate matter whose diameters are smaller than 10 micrometers (PM₁₀) or smaller than 2.5 micrometers (PM_{2.5}), and lead (Pb). An area that does not meet the NAAQS for one or more of these pollutants would be designated as a non-attainment area on a pollutant by pollutant basis. The Monticello PA is located in an area designated as attainment for

¹ Windroses depict the relative frequency of wind direction as defined by the directions on a compass scale. In the diagrams above 8 directions are used (north, northeast, east, southeast, south, southwest, west and northwest, starting from the top of the diagram and going clockwise. Each ring on the wind rose represents an increased frequency (percent of the total) as described by the values listed at the bottom of the diagram (for example: 8%, 16%, 24%, 32% for winter winds in Monticello). Each branch of the rose represents wind coming from that direction. The branches are divided into segments of different thickness and color, which represent wind speed ranges from that direction. Speed ranges are identified in the scale to the right of the diagram. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

all pollutants (EPA 2003a). Table 3.2 present the existing ambient air quality in the Monticello PA (EPA 2003b).

The data listed are the most recent available for each pollutant. If there is no monitor located within the boundary of the Monticello PA, the data from the nearest representative monitor(s) were chosen. Most of the available monitoring stations are located east or southeast of the planning area. As outlined in Table 3.2 of this chapter, the air quality in and near the Monticello PA meets the NAAQS by a large margin with the exception of ozone which is just under the 8-hour NAAQS at Canyonlands National Park.

A recent assessment of air quality in National Parks around the country found that ozone concentrations and ammonium deposition increased significantly at Canyonlands National Park between 1995 and 2004 (GPRA 2005). The same report, however, found improvements in nitrate and sulfate deposition, although these improvements were not found to be statistically significant (GPRA 2005). In 2005, Canyonlands National Park did not meet a National Park Service internal air quality goal (called Ia3), which incorporates visibility, atmospheric deposition, and ozone concentration targets.

Table 3.2. Ambient Air Quality Data for the MPA

Pollutant	Averaging Period ^a	NAAQS	Monitored Concentration	Monitored Location (City, County, State)
CO	1 hour	35.0 ppm ^b	2.8 ppm ⁿ	Grand Junction, Mesa Co., CO
	8 hour	9.00 ppm ^b	1.8 ppm ⁿ	Grand Junction, Mesa Co., CO
NO ₂	Annual	0.053 ppm	0.003 ppm ^k	La Plata Co., CO
			0.016 ppm ^k	Bloomfield, San Juan Co., NM
SO ₂	3 hour	0.50 ppm ^{b,c}	0.082 ppm ⁱ	Shiprock, San Juan Co., NM
	24 hour	0.14 ppm ^b	0.013 ppm ⁱ	Shiprock, San Juan Co., NM
	Annual	0.03 ppm ^b	0.002 ppm ^k	Shiprock, San Juan Co., NM
Ozone	1 hour	0.12 ppm ^d	0.086 ppm ⁱ	La Plata County, CO
			0.077 ppm ⁱ	Mesa Verde NP, Montezuma Co., CO
			0.086 ppm ⁱ	Farmington, San Juan Co., NM
			0.082 ppm ⁱ	Island-in-the-Sky, Canyonlands NP, UT
	8 hour	0.075 ppm ^e	0.055 ppm ^j	La Plata County, CO
			0.073 ppm ^j	Mesa Verde NP, Montezuma Co., CO

Table 3.2. Ambient Air Quality Data for the MPA

Pollutant	Averaging Period ^a	NAAQS	Monitored Concentration	Monitored Location (City, County, State)
			0.072 ppm ^j	Farmington, San Juan Co., NM
			0.070 ppm ^j	Island-in-the-Sky, Canyonlands NP, UT
PM ₁₀	24 hour	150 µg/m ³ ^f	25 µg/m ³ ^o	Farmington, San Juan Co., NM
	Annual	50 µg/m ³	15 µg/m ³ ^k	Farmington, San Juan Co., NM
PM _{2.5}	24 hour	35 µg/m ³ ^g	13 µg/m ³ ^m	Farmington, San Juan Co., NM
	Annual	15 µg/m ³ ^h	5.9 µg/m ³ ^k	Farmington, San Juan Co., NM

^a The concentration values listed in this table are based on the monitored concentrations in 2007 provided by the EPA AirData database (URL: <http://www.epa.gov/oar/data/>).

^b Not to be exceeded more than once per year.

^c SO₂ 3-hour standard is a secondary NAAQS that sets limits to protect public welfare, including protection against decreased visibility, damage to animals, crops, vegetation, and buildings.

^d The standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above 0.12 ppm is ≤ 1. As of June 15, 2005 EPA revoked the 1-hour ozone standard in all areas except the 8-hour ozone nonattainment Early Action Compact (EAC) areas.

^e The 3-year average of the fourth-highest daily maximum 8-hour average ozone concentrations measured at each monitor within an area over each year must not exceed 0.075 ppm (effective May 27, 2008).

^f Not to be exceeded more than once per year on average over 3 years.

^g To attain this standard, the 3-year average of the 98th percentile of 24-hour concentrations at each population-oriented monitor within an area must not exceed 35 µg/m³ (effective December 17, 2006).

^h To attain this standard, the 3-year average of the weighted annual mean PM_{2.5} concentrations from single or multiple community-oriented monitors must not exceed 15.0 µg/m³.

ⁱ Concentration is the maximum value detected at the monitored location in 2007 according to the EPA AirData database.

^j Concentration is the 3 year average of 4th maxima detected at the monitored location in 2005, 2006, and 2007 according to the EPA AirData database.

^k Concentration is the arithmetic mean at the monitored location in 2007 according to the EPA AirData database.

^m Concentration is the 3-year average of the 98th percentile of the 24-hour values collected in 2005, 2006, and 2007 according to the EPA AirData database.

ⁿ Concentration is the 2nd maximum value detected at the monitored location in 2007 according to the EPA AirData database.

^o Concentration is the 3-year average of the 2nd maxima detected at the monitored location in 2005, 2006 and 2007 according to the EPA AirData database.

3.2.3 PREVENTION OF SIGNIFICANT DETERIORATION

Potential air quality impact criteria also include Prevention of Significant Deterioration (PSD) increments. A PSD increment is the maximum increase in ambient concentrations of a certain pollutant that is allowed to occur above a baseline concentration for that pollutant. Federal Mandatory Class I areas with pristine air quality, such as some wilderness areas, National Parks, and Tribal reservation lands, are accorded the strictest protection. Only very small incremental increases in concentration are allowed in these areas to ensure the maintenance of their pristine air quality. The State of Utah has the authority and responsibility to determine compliance with PSD by performing a regulatory PSD Increment Consumption Analysis.

In Utah, 5 areas have been designated as mandatory Class I areas. These areas are: Arches National Park, Bryce Canyon National Park, Canyonlands National Park, Capital Reef National Park, and Zion National Park. PSD Class II areas are essentially all areas that are not designated Class I, and larger incremental increases in concentration are allowed, although the concentrations are not allowed to reach the concentrations set by Federal standards (NAAQS). Air quality data for Class I areas within the study area are also included, where available.

3.2.4 VISIBILITY IN CLASS I AREAS

Visibility is "the clarity with which distant objects are perceived" (EPA 2001), and is affected by pollutant concentrations, plume impairment, regional haze, relative humidity, sunlight, and cloud characteristics. A typical visual range without any manmade air pollutants would be about 140 miles in the Western states (EPA 2001). Aerosols (small particles made of solid and/or liquid molecules dispersed in the air) are the pollutants that most often affect visibility in the Class I areas. Five key contributors to visibility impairments are sulfate, nitrate, organic carbon, elemental carbon, and crustal materials. Their relative contributions to visibility impacts in the Canyonlands National Park, a Class I area within the planning area of the FO, are summarized in Table 3.3 (EPA 2001).

Table 3.3. Summary of Visibility Impairment Pollutants Measured in the Canyonlands National Park^a

Pollutant	Contribution ^b	Emission Sources
Sulfate	34%	Fossil fuel combustion and forest fires.
Crustal Material	27%	Fugitive dust from roads, agricultural and forestry operations, and wind erosion.
Organic Carbon	22%	Wood burning, open burning, vehicle exhaust, and wildfires and prescribed burning.
Elemental Carbon	10%	Vehicle exhaust, wood burning, and wildfires and prescribed burning.
Nitrate	7%	Motor vehicle exhaust. Secondary sources include fossil fuel combustion and prescribed burning.

^a Data source: U.S. EPA. 2001.

^b Contributions are calculated by pollutant concentrations regularly measured in the Canyonlands National Park. Light extinction coefficients and visibility indices are then calculated from these values.

The 1977 Clean Air Act (CAA) included legislation to prevent future and remedy existing visibility impairment in Class I areas. In 1985, the United States Environmental Protection Agency (EPA) established a collaborative monitoring program called the Interagency Monitoring of Protected Visual Environments (IMPROVE) to monitor visibility in Class I areas. The IMPROVE network has operated a monitor in the Canyonlands National Park, located near the western boundary of the Monticello PA, since 1988. The most-impaired days in Canyonlands National Park exhibit visual ranges between 62 to 90 miles and appears to show an improvement over the decade of 1994 to 2004. The mid-range days have visual distances of 78 to 109 miles and show no significant change. The least-impaired days have visibility ranges from 107 to 144 miles and also demonstrate improvements over the decade of approximately 25% (EPA 2003c).

The visibility trend from 1990 to 2004 in the Canyonlands National Park is summarized in Figure 3.3. A more recent assessment of visibility in the Canyonlands National Park indicates that the improvement trend in visibility has continued through 2004, although the trend was measured in different units and was not found to be statistically significant (GPRA 2005). While some visibility impairments are the result of natural sources such as windblown dust and soot from wildfires, which cannot be controlled; manmade sources of pollution can also impair visibility. These include motor vehicles (organic carbon), electric utility and industrial fuel burning (sulfates and particulate), and manufacturing operations (sulfates and fine particulate matter). Visibility in Canyonlands National Park is most influenced by sulfates, fine particulate matter (i.e., dust), and organic carbon. The visibility improvements seen over the past decade are the result of implementing state and federal stationary and mobile source regulations.

Figure 3.3. Trend in air pollution impacts on visibility observed in Canyonlands National Park, Utah, 1990 through 2004 (IMPROVE).

3.2.5 ATMOSPHERIC DEPOSITION

Atmospheric deposition refers to the processes by which air pollutants are removed from the atmosphere and deposited on terrestrial and aquatic ecosystems, and is reported as the mass of material deposited on an area (kilogram per hectare - year). Atmospheric deposition can cause acidification of lakes and streams. One expression of lake acidification is change in acid neutralizing capacity (ANC), the lake's capacity to resist acidification from atmospheric deposition. Acid neutralizing capacity is expressed in units of micro-equivalents per liter ($\mu\text{eq/l}$).

3.2.5.1 WET DEPOSITION

Wet deposition refers to air pollutants deposited by precipitation, such as rain and snow. One expression of wet deposition is precipitation pH, a measure of the acidity or alkalinity of the precipitation (see Figure 3.4).

There are 5 NADP stations in Utah: Logan, Murphy Ridge, Green River, Bryce Canyon NP and Canyonlands NP. The NADP stations in Bryce Canyon NP and Canyonlands NP have assessed precipitation chemistry from 1985 and 1997 through to the present. Figure 3.4 shows precipitation pH has ranged from 4.95 to 5.69.

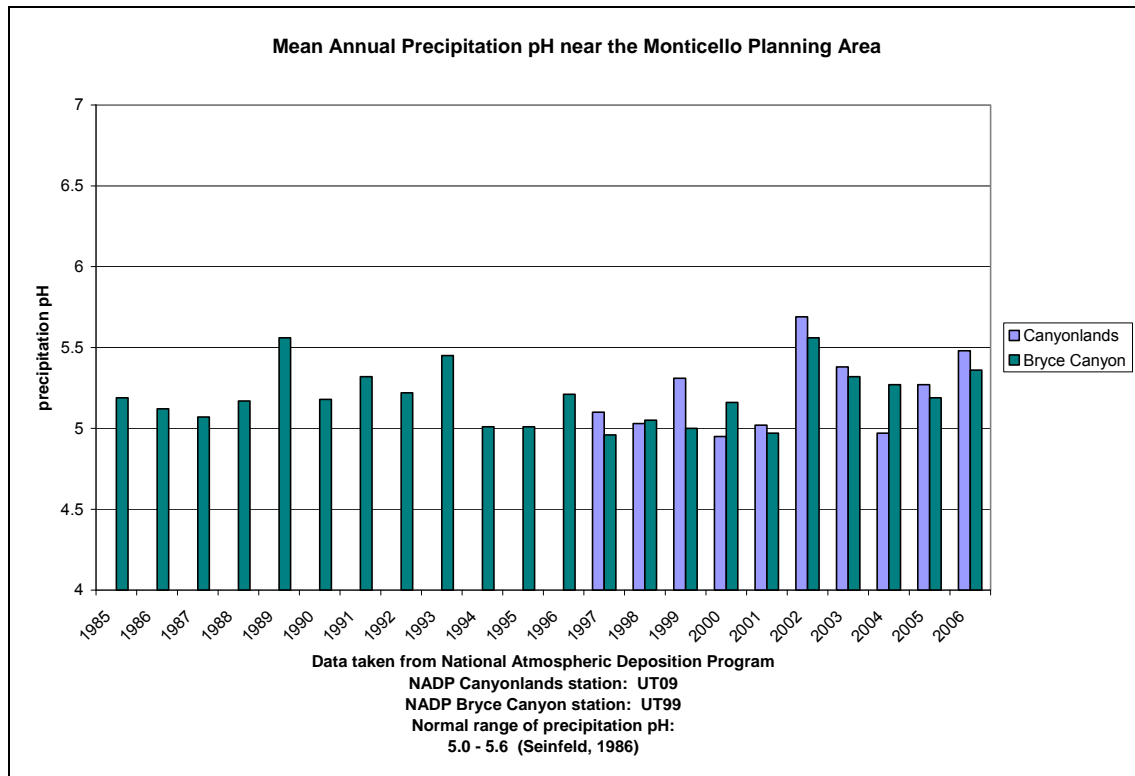

Figure 3.4. Mean annual precipitation pH near in Bryce and Canyonlands National Parks. Data source: National Atmospheric Deposition Program.

3.2.5.2 DRY DEPOSITION

Dry deposition refers to the transfer of airborne gaseous and particulate material from the atmosphere to the Earth's surface. The Clean Air Status and Trends network (CASTNet) has measured dry deposition of ozone (O_3), sulfur dioxide (SO_2), nitric acid (HNO_3), sulfate (SO_4^{--}), nitrate (NO_3^-), and ammonium (NH_4^{++}), in the United States since the late 1980s. There is one CASTNet stations in Utah at Canyonlands NP.

3.2.5.3 TOTAL DEPOSITION

Total deposition refers to the sum of airborne material transferred to the Earth's surface by both wet and dry deposition. Total nitrogen deposition is calculated by summing the nitrogen portion

of wet and dry deposition of nitrogen compounds, and total sulfur deposition is calculated by summing the sulfur portion of wet and dry deposition of sulfur compounds.

Total deposition has been measured at Canyonlands National Park from 1995 through the present. Total nitrogen deposition has ranged from 1.7 to 2.2 kg/hectare-year since 1996 (Figure 3.5). Total nitrogen deposition of 3 kg/hectare-year represents the total pollution loading where acidification is unlikely and "below which a land manager can recommend a permit be issued for a new source unless data are available to indicate otherwise" (Fox, 1989). Studies in Rocky Mountain National Park suggest that acidification may occur with wet nitrogen deposition of 1.5 kg/hectare-year (Baron, 2006). Total sulfur deposition has ranged from 0.66 to 1.1 kg/hectare-year since 1995 (Figure 3.6).

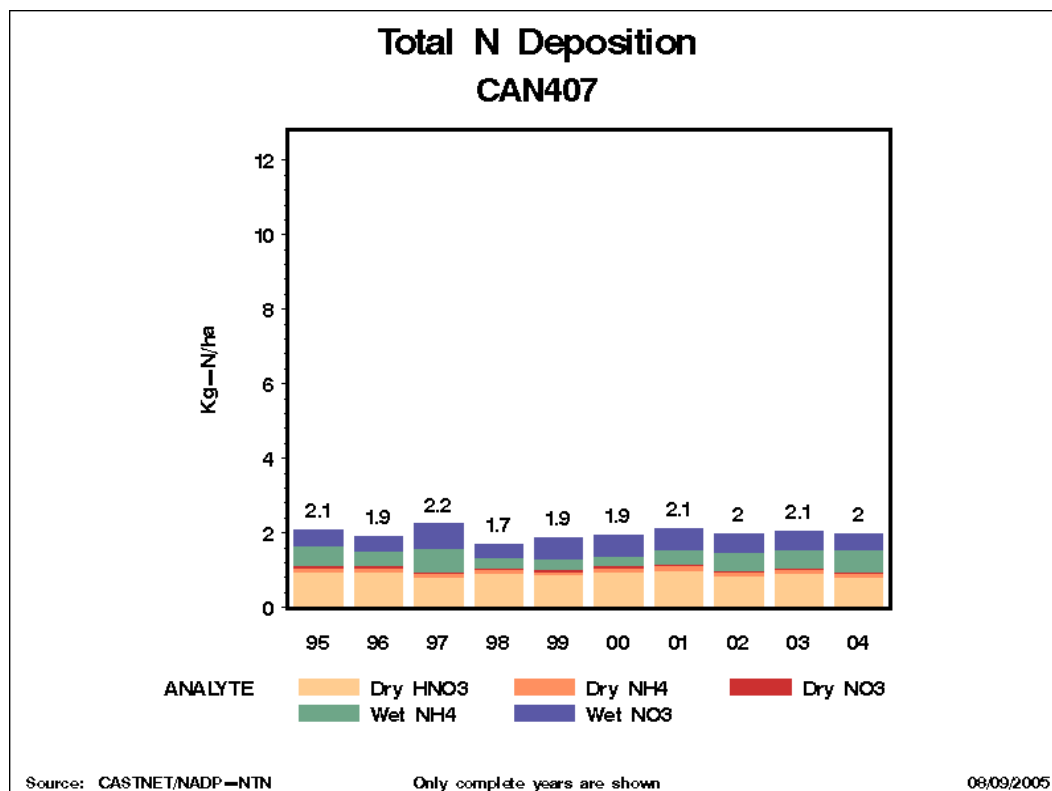

Figure 3.5. Total nitrogen deposition at Canyonlands National Park. Source: National Atmospheric Deposition Program.

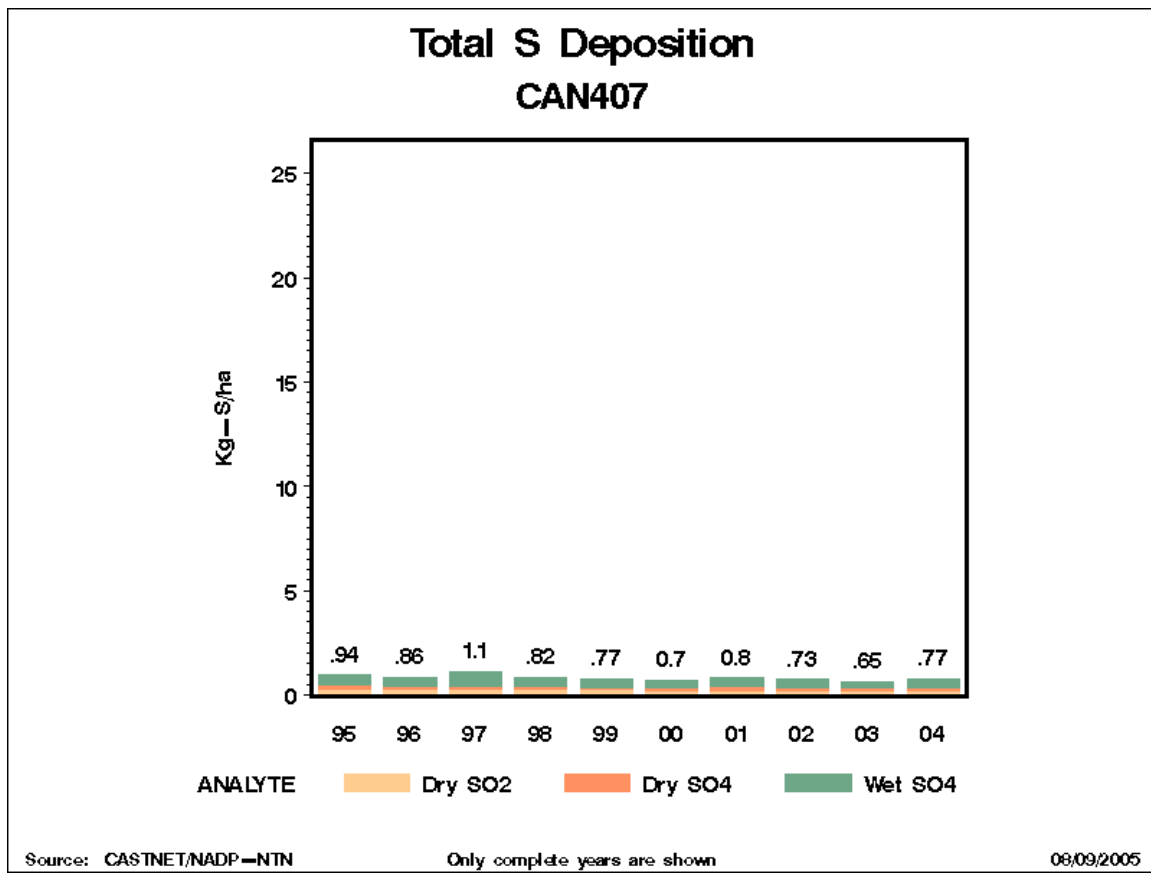

Figure 3.6. Total sulfur deposition at Canyonlands National Park. Source: National Atmospheric Deposition Program.

3.2.5.4 LAKE CHEMISTRY

Atmospheric deposition can cause acidification of lakes and streams. One expression of lake acidification is change in acid neutralizing capacity (ANC), the lake's capacity to resist acidification from atmospheric deposition. Acid neutralizing capacity is expressed in units of micro-equivalents per liter ($\mu\text{eq/l}$). Lakes with ANC values of from 25 to 100 $\mu\text{eq/l}$ are considered to be sensitive to atmospheric deposition, lakes with ANC values of from 10 to 25 $\mu\text{eq/l}$ are considered to be very sensitive, and lakes with ANC value of less than 10 are considered to be extremely sensitive. Based on a search of the EPA STORET database, no ANC data are currently available for Grand and San Juan County. This could be a future consideration in developing monitoring plans.

3.2.6 STATUS OF EMISSIONS

The Monticello PA covers most of San Juan County. Currently, emission sources within the Monticello PA consists mostly of oil and gas development facilities and some mineral processing facilities as identified in Table 3.4.

Table 3.4. 2005 Emissions Inventory for Grand and San Juan Counties, Utah

County	Source	2005 Emissions (tons per year)						
		CO	NO _x ^b	PM ₁₀	PM _{2.5}	SO _x ^c	VOC ^d	HAPs ^e
Grand County	Area source	206	16	430	88	3	285	
	Non-road mobile	2,962	176	37	30	8	905	
	On-road mobile	8,118	1,042	381	78	16	572	
	Point source	225	378	4	4	<1	69	
	Biogenics	6,596	-	-	-	-	34,973	
	Total Grand County	18,107	1,611	851	200	27	36,803	19
San Juan County	Area source	517	35	1,109	224	35	517	
	Non-road mobile	1,868	59	21	20	11	546	
	On-road mobile	6,657	1,058	399	89	21	470	
	Total San Juan County	9,042	1,153	1,529	332	67	1,533	10
Regional Total		27,149	2,764	2,380	532	94	38,337	29

^a Emission inventory data from 2005 State Summary of Emissions by Source. URL: www.airquality.utah.gov/Planning/Emission-Inventory/2005_State/05/State_List.htm

^b Nitrogen oxides - one of the main ingredients involved in the formation of ground-level ozone.

^c Sulfur oxides - contribute to respiratory illness, atmospheric deposition, and the formation of atmospheric particles that can cause visibility impairment.

^d VOC (volatile organic compounds) refers to any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate that participates in atmospheric photochemical reactions. Also a precursor to ozone.

^e HAPs (hazardous air pollutants) are generally defined as those pollutants that are known or suspected to cause serious health problems. Section 112(b) of the Clean Air Act identifies a list of 188 pollutants as HAPs. The emissions inventory for HAPs available from the State of Utah only includes those reported by stationary industrial sources.

The 2005 emissions inventory available from the Utah Department of Environmental Quality, Division of Air Quality (UDAQ) was used to characterize base-year emissions in San Juan and Grand County. Emissions are summarized by source type for criteria pollutants including area source, non-road mobile, on-road mobile, point sources, and biogenics. The emission inventory for hazardous air pollutants only includes emissions from stationary industrial sources.

3.2.6.1 ADDITIONAL SOURCES OF EMISSIONS

The seasonal windroses presented in Figure 3.2 for Monticello and Bluff (in the Monticello PA) show that prevailing wind speeds rarely exceed 5 m per second, and vary seasonally in direction. Local topography in the Monticello PA is complex and likely to influence local wind patterns to a substantial degree. As meteorological data are not available for all sites within the planning area, the stations at Monticello and Bluff were assumed to be representative of dominant trends

in prevailing wind direction for the northern and southern sections of the Monticello planning area, respectively. Due to the complexity of local topography, this assumption may not hold on a site-specific scale but is expected to be representative when applied as an annual average area-wide trend.

As stated previously, current air quality in the Monticello PA is, with the exception of ozone, consistently below the NAAQS by a large margin, as shown in Table 3.2 (observed ozone concentrations near the Monticello PA is less than, but near, the NAAQS). The Utah DEQ indicated that ozone concentrations in Class I areas of the western states have shown significant increases in the past decade and are approaching the NAAQS level (personal communication between Brock LeBaron, Utah DAQ, and Trinity Consultants on August 8, 2003). Ozone is generally not emitted directly, but forms from a chemical reaction between emissions of volatile organic carbons (VOCs) and nitrogen oxides (NOx) in the presence of heat and sunlight. Sources of VOC emissions include automobiles, gasoline stations, compressor emissions, and many other sources. Nitrogen oxides are emitted from combustion processes in automobiles, power plants, compressors, etc. Although ozone is produced throughout the year, the highest ozone concentrations in most urban areas are usually observed in the summer when strong sunlight and high temperatures drive the chemical reactions. In rural areas of the Rocky Mountain West such as the Monticello PA, high ozone concentrations have been measured in the winter. The processes of this winter ozone are not yet well understood. Stagnant meteorological conditions, such as inversions in some parts of the Monticello PA, can trap the air in the region for several days. Ozone concentrations are generally considered a regional issue. This means that ozone concentrations in a given area can result from emissions that are transported into the area from distant emissions sources, as well as from local emissions sources .

Additional concerns address emissions specific to visitation and through-traffic within the Monticello PA. Most recreational visitors engage in motorized activities that are emission sources in addition to the highway vehicles used for transportation.

Prescribed fire and naturally caused fires also present a concern to air quality. Prescribed burning is a useful tool for resource management and may be used to achieve a variety of objectives such as restoring a fire-dependent ecosystem, enhancing forage for cattle, improving wildlife habitat, preparing sites for reforestation, or reducing hazardous fuel loads. Fire used for any of these management reasons, will produce smoke and other air pollutants. Some short-term air pollutant releases are necessary to achieve the benefits of prescribed burning. Short-term effects on air quality from prescribed burns include a general increase in particulate matter, CO₂ and ozone precursor emissions. Land managers recognize that smoke management is critical to avoid air quality intrusions over sensitive areas or visibility problems. Vegetation management is an active part of fire management techniques and long-term effects of prescribed burning include a reduction in particulate matter, CO₂ and ozone precursor emissions specific to wildfire in unmanaged areas. Prescribed fire management is designed to minimize impacts.

3.2.7 GLOBAL CLIMATE CHANGE

On-going scientific research has identified the potential impacts of climate changing pollutants on global climate. These pollutants are commonly called "greenhouse gases" and include carbon

dioxide, CO₂; methane; nitrous oxide; water vapor; and several trace gas emissions. Through complex interactions on a regional and global scale, these emissions cause a net warming effect of the atmosphere, primarily by decreasing the amount of heat energy radiated by the Earth back into space. Although climate changing pollutant levels have varied for millennia (along with corresponding variations in climatic conditions), recent industrialization and burning of fossil carbon sources have caused CO₂ concentrations to increase dramatically, and are likely to contribute to overall climatic changes, typically referred to as global warming. Increasing CO₂ concentrations also lead to preferential fertilization and growth of specific plant species.

Global mean surface temperatures have increased nearly 1.0°C (1.8°F) from 1890 to 2006 (Goddard Institute for Space Studies, 2007). However, observations and predictive models indicate that average temperature changes are likely to be greater in the Northern Hemisphere. Figure 3.7 demonstrates that northern latitudes (above 24° N) have exhibited temperature increases of nearly 1.2°C (2.1°F) since 1900, with nearly a 1.0°C (1.8°F) increase since 1970. Without additional meteorological monitoring systems, it is difficult to determine the spatial and temporal variability and change of climatic conditions, but increasing concentrations of these "greenhouse gases" are likely to accelerate the rate of climate change.

The Intergovernmental Panel on Climate Change (IPCC) has recently completed a comprehensive report assessing the current state of knowledge on climate change, its potential impacts, and options for adaptation and mitigation. At printing of this PRMP/FEIS, this assessment is available on the IPCC web site at <http://www.ipcc.ch/>. According to this report, global climate change may ultimately contribute to a rise in sea level, destruction of estuaries and coastal wetlands, and changes in regional temperature and rainfall patterns, with major implications to agricultural and coastal communities. The IPCC has suggested that the average global surface temperature could rise 1 to 4.5 degrees Fahrenheit (°F) in the next 50 years, with significant regional variation. The National Academy of Sciences (2006) has confirmed these findings, but also indicated that there are uncertainties regarding how climate change may affect different regions. Computer models indicate that such increases in temperature will not be equally distributed globally, but are likely to be accentuated at higher latitudes, such as in the Arctic, where the temperature increase may be more than double the global average (BLM 2007). Also, warming during the winter months is expected to be greater than during the summer, and increases in daily minimum temperatures is more likely than increases in daily maximum temperatures. Vulnerabilities to climate change depend considerably on specific geographic and social contexts.

The BLM recognizes the importance of climate change and the potential effects it may have on the natural environment. Several activities occur within the planning area that may generate emissions of climate changing pollutants. For example, oil and gas development, large fires, and recreation using combustion engines, can potentially generate CO₂ and methane. Wind erosion from disturbed areas and fugitive dust from roads along with entrained atmospheric dust has the potential to darken glacial surfaces and snow packs resulting in faster snowmelt. Other activities may help sequester carbon, such as managing vegetation to favor perennial grasses and increase vegetative cover, which may help build organic carbon in soils and function as "carbon sinks."

Figure 3.7. Annual Mean Temperature Change for Northern Latitudes (24–90° N).

3.3 CULTURAL RESOURCES

3.3.1 OVERVIEW

Cultural resources are non-renewable remains of past human activity. For BLM management purposes, these remains take the form of sites, artifacts, buildings, structures, ruins, features, and natural landscapes with particular cultural importance. With a few exceptions, these remains must be at least 50 years old. In the case of natural landscapes, the period of traditional cultural use must also be at least 50 years old to be considered significant or eligible for or listed on the National Register of Historic Places (NRHP). Cultural resources also include places identified by traditional groups (e.g., Native American tribes) as sacred or otherwise important to the maintenance of group identity even if no physical manifestations of past activities are present at that location. Such locations are referred to as Traditional Cultural Properties (TCPs). Additionally, certain areas of the landscapes have particularly high densities of cultural resources and can be designated as Areas of Critical Environmental Concern (ACECs) with cultural values. This section provides an overview to the culture history of the Monticello PA, as background for understanding the types of cultural resources present. This is followed by an overview to the ethnographic data for the area. Resources are then discussed including a summary of information regarding known resources, potential TCPs, and ACECs with cultural values.

3.3.2 CULTURAL RESOURCE HISTORY OF THE MONTICELLO PA

The following section contains a brief overview of past human activity on lands under the jurisdiction of the Monticello FO. This overview is divided into 3 sections: Prehistory, History, and Ethnography. It is intended only to provide a very broad outline within which to understand the basic types and affiliations of cultural resources that are present within the boundaries of Monticello PA. This overview is not a complete recitation of the entire existing body of knowledge regarding past human activity within the PA. It does not incorporate information from very recent and ongoing investigations (i.e., the condition assessment project at Moon House or excavations in Comb Wash) that are beginning to yield data that may change the existing knowledge of prehistoric land-use patterns, cultural affiliations, and timing of events and trends.

An outline of the prehistory and history of the lands incorporated by the Monticello PA is useful in understanding the broad patterns of human occupation, land use, and habitation that have occurred within the region. Humans of multiple cultures have inhabited, traversed, mapped, and developed these lands for greater than 12,000 years and have left evidence of their activities on the landscape in the form of archaeological sites, buildings, and structures. It is this material evidence that the BLM must consider when making land-use decisions within the PA.

3.3.2.1 PREHISTORY

Although the precise timing and nature of human entry into North America is currently a matter of considerable debate (Dillehay 1997; Swedlund 1999), the first period of significant recognized human occupation of the continent occurs toward the end of the Pleistocene when the climate was cooler and moister than the present (Jennings 1989:60). This time period is often referred to as the Paleoindian Period and represents the oldest time period for which archaeological evidence exists of human activity in the region. The environmental conditions during this period supported the presence of large game mammals such as giant bison, mammoth, camel, and ground sloth (Grayson 1993). Human populations over much of the continent appear to have concentrated, albeit to varying degrees, on the exploitation of these mammals during this period (Jennings 1989:59; Simms 1988). Few archaeological sites from this earliest period of known human occupation of southeastern Utah have been found within the Monticello PA. The Lime Ridge Clovis site, located 15 kilometers (km) southwest of Bluff, Utah, is a significant archaeological site on the northern Colorado Plateau in Utah (Davis 1989:66). Research conducted in Glen Canyon has also demonstrated a limited human presence during the Paleoindian period (Geib 1996:7). Archaeological evidence from this period tends to be very limited and is often confined to stone tools designed for hunting large game mammals.

The next period of prehistoric occupation in the Monticello PA is typically referred to as the Archaic Period. This period can be subdivided into several phases based on technological (tool kit) differences and different approaches the prehistoric peoples used for obtaining food; though they were still relying on hunting and gathering, they pursued smaller game animals than the previous period. Archaeological sites from this period are more numerous than those from the Paleoindian Period and contain a wider variety of artifacts. Stone tools from Archaic Period sites tend to be smaller and exhibit evidence of being used differently than the spear points Paleoindian peoples used for hunting such animals as mammoth and giant bison. The lands of the

Monticello PA appear to have been very popular for Archaic peoples as archaeological sites from this period are found throughout the FO PA. In fact, the archaeological record for San Juan County indicates widespread occupation of the area between 6000 B.C. and A.D. 100 (Geib 1996:7-9; Nielson 1985). Cedar Mesa, Elk Ridge, and Montezuma Canyon are noted for numerous Archaic Period sites of varying size and complexity. Notable sites include Alkali Ridge, Cowboy Cave, Old Man Cave, and Dust Devil Cave (Brew 1946; Schroedl 1994; Geib 1996:117). Because the peoples of this period were still relying on hunting and gathering, they had to follow migrating animals and seasonally ripening plants across the landscape, and as a result, they left evidence of their activities as numerous small sites located throughout the region.

Following the Archaic Period was the Formative Period. This period differs from the Archaic Period in that Formative Period peoples changed their approach to obtaining food from a strategy based on hunting and gathering wild animals and plants to one in which they began to grow their own food through an early form of agriculture. In the Monticello PA, the Formative Period lasted from A.D. 100 through A.D. 1300. Because the Formative Period peoples spent more time farming, they needed to spend less time pursuing animals and plants. As a result, the archaeological sites they left behind tend to be much larger and have more complex village sites than those of their more nomadic predecessors. Both large village sites and smaller archaeological sites representing the activities of Formative Period peoples are found in very large numbers throughout the Monticello PA.

Within southeastern Utah, the Formative Period has one distinct culture occupying San Juan County: the Anasazi (or *Hisatsinom*, as they are called by the Hopi). This group is hereinafter referred to as the Ancestral Puebloans. The boundaries for the culture are debated; it is known that the Ancestral Puebloans occupied the Four Corners, but the extent of the occupation as far as Las Vegas, New Mexico to Las Vegas, Nevada is debated among professional archaeologists (Geib 1996:98-88; Cordell 1997:196). Table 3.5 presents the chronology of the region during the Formative Period (Jennings 1989:306).

Table 3.5. Formative Period Chronology

Period	Date Range
Pueblo IV/V	A.D.1300–1700
Pueblo III	A.D.1100–1300
Pueblo II	A.D.900–1100
Pueblo I	A.D.750–900
Basketmaker III	A.D.450–700
Basketmaker II	A.D.1–500

Two traditions of Ancestral Puebloans are believed to have occupied the southeastern portion of Utah: the Kayenta and the Mesa Verde (Geib 1996:531; McVickar 2001:233). Interactions with Ancestral Puebloan groups to the east southeast (Chaco Canyon) and west (Virgin River Branch) also influenced people in the area. Clear delineation between these groups is difficult due to the nature of regional integration during the Formative period (Geib 1996:99, Varien 1996:11). What

is now San Juan County was the borderland for these two groups. Archaeological sites in the area contain evidence that the two groups interacted with each other (McVickar 2001:232, 233).

It is also hypothesized that during the latter part of the Formative Period, the peoples (Athabaskans) who would later identify themselves as the Navajo and Apache moved into the region (Maryboy and Begay 2000:271). This theory is supported by both linguistic and physical similarities among Northern and Southern Athabaskan groups (Maryboy and Begay 2000:271).

3.3.2.2 HISTORY

The written history of the Monticello PA covers a long period from the early Spanish explorers to the recent past. While physical evidence of past human activities during the historic period is present within the FO, much has been lost as a result of subsequent land uses in the same locations. Cultural resource sites from the historic period can be found almost anywhere within the FO boundaries, though most are found around the roadways, communities, and developments that exist today.

The primary impetus for early historic period use of southeastern Utah was trade, and as the most lucrative markets included slaves, horses, firearms, and other wares illegal to trade with Native Americans, few of the earliest expeditions were ever recorded. However, records do exist to demonstrate that Spanish traders were among the first, if not *the* first, Euro-Americans to make use of the lands within the Monticello PA. This use primarily took the form of trade routes passing through the area, and remnants of the Old Spanish National Historic Trail can still be found northeast of Monticello. Such routes were also used and expanded upon by fur trappers and traders who used the area during the early 1800s. Archaeological evidence of trading posts has been found along these trade routes throughout Utah.

As the dominance of the fur trade waned, European traffic through the Four Corners Region took on a different tone. With the settlement of the Salt Lake Valley by the Mormons in 1847, the Church of Jesus Christ of Latter-day Saints (LDS) became a prominent religious and political player in an area that was being more rapidly divided by boundaries and economic interests. In 1854, the LDS church dispatched William Huntington and Jackson Stewart to explore the Four Corners region for possible expansion of Brigham Young's burgeoning religious state, Deseret. As a result of information obtained during the Huntington Expedition, the Elk Mountain Mission of 1855 was executed in the La Sal Mountains. As the Elk Mountain Mission spread south into the San Juan River drainage to establish relations with the Navajo Nation, the resources of the mission were spread thin. Many of the tribes grew disdainful of the LDS presence, and after a number of the mission party members were killed the project was generally abandoned. Limited, if any, archaeological evidence of these early interactions between the LDS church and Native American groups is likely to be present within the FO.

In 1875, the U.S. made its first real indication of territorial interest in the region by sending U.S. Geological Survey teams lead by James L. Gardiner and Henry Gannet, under the direction of Ferdinand V. Hayden, to survey the La Sal Mountains. After two weeks, the Hayden Expedition of 1875 shifted attention to the Abajo Range whereupon they fell under attack by a band of Utes. They were forced to abandon their equipment in Peters Canyon, at an archaeological site that has

been identified. Much of their equipment has since been recovered, and is archived at the University of Wyoming (Pierson 1980:82).

By the late 1800s, relatively large numbers of settlers of the LDS church had been sent to southeastern Utah to colonize the area. The green valleys of the San Juan River, Colorado River, and Green River drainages became attractive destinations for cattlemen seeking to graze herds destined for sale in the new markets of the west. The first cattle were grazed in the valleys of the region in 1874 (Pierson 1980:88-90). Little archaeological evidence of this early cattle grazing is likely to be present on BLM lands in the FO as many such homesteads/ranches now exist on private lands. The same such condition would exist for agricultural communities and farmsteads established by pioneers who settled the region alongside and after the cattle ranchers. Irrigation ditches, holding ponds, and rows of poplar trees planted as wind breaks are scattered across the southeastern Utah landscape, though again mostly on private lands.

By the 1890s, placer mining in the Abajo Mountains began to draw prospectors (Pierson 1980:91). Within a few short years, silver, copper, and other minerals drew almost equal attention. Even uranium and related deposits of vanadium and carnotite attracted some speculative interest, but would not be of much regional importance until after atomic weapons had been developed. Archaeological evidence of these and later mining efforts are known to exist with the Monticello PA.

Into the twentieth century, growth was slow and steady, limited by the nature and degree of industries to which the land was suited. World War I had minor influence upon San Juan County's economy, as did the Great Depression, which may have had a positive effect upon the towns of the region. Southeastern Utah was sparsely populated and, lacking a well-developed economic foundation, there was little to be affected by a national economic downturn. As the U.S. pulled out of the Great Depression and resumed normal life, San Juan County started an economic transition. World War II had attracted the support of tribal members and European Americans alike, but aside from exposing the residents of southeastern Utah to new skills and various parts of the world the economy was affected very little. The detonation of two nuclear weapons on Japanese soil changed the regional economy in a way far greater than any other single factor had to this time.

Uranium, once a mineral of minimal economic importance, became a commodity in an international arms race. In 1952, Charles Steen discovered the Mi Vida mine in Big Indian Canyon (McPherson 1995:256). Subsequent discoveries resulted in the opening of a uranium mill outside Moab in 1956 (Pierson 1980:100). The population of southeastern Utah multiplied exponentially, and as more lands were consolidated under subsurface mineral rights and homes were constructed for the new arrivals, farming and ranching industries began to decline. Despite the poorly understood, but formidable, health risks associated with uranium mining and milling, the economy of the region grew exponentially.

By this time, more Americans took to the highways than ever before. Interstate roadways developed since the 1920s were refined, automobiles were nearly perfected, fuel was inexpensive, and families enjoyed surplus incomes. As mining, ranching, and agriculture declined, southeastern Utah's tourism industry expanded. Arches National Monument was turned

into a National Park, and was joined by Canyonlands (Pierson 1980:101). The completion of the Glen Canyon Dam in 1963 created a vast manmade reservoir that attracts fishermen, houseboat and water sport enthusiasts.

With tourism came a need for more federal employees to play host to visitors and, as a result, a new economy began to form. Support industries evolved in and around population centers and along highways. The trends following the 1950s have not changed dramatically, but continue to expand as southeastern Utah becomes an increasingly popular location for residents of Salt Lake City, Denver, and surrounding areas who frequently visit the valley for mountain biking, climbing, off-road vehicle recreation, and sight seeing. The economy of San Juan County, derived primarily from use of public lands, has become more than a regional issue. General concern from environmental interest groups, outdoor recreationists, and community leaders seeking to enhance the interests of their residents has resulted in numerous attempts to sway national law in one direction or another. As these issues are refined through discussion, San Juan County's population follows seasonal fluctuations dictated by the peaks and valleys of the tourist industry.

3.3.3 ETHNOGRAPHIC DATA

The history and concerns of individual tribes and tribal groups are detailed and complex and beyond the scope of summary in this document. A separate, comprehensive ethnographic overview is being prepared in conjunction with the current updating of the Monticello FO Resource Management Plan (RMP) and will provide field office cultural resource specialists and managers with in-depth descriptions of the claims to, concerns about, and importance ascribed to lands within the Monticello PA (Molenaar et al. [in progress]). This stand-alone document will be a companion to the new RMP and will be used in making decisions regarding land uses contained in or permitted by the RMP.

For the purpose of this chapter, ethnographic summaries and a discussion of potential site types to which tribes may ascribe religious or cultural values are provided in the following sections. These summaries outline what is currently known about concerns individual tribes have regarding management of lands within the Monticello PA and note the types of resources that have been identified as sacred or of traditional importance to the individual tribes.

3.3.3.1 UTE MOUNTAIN UTE AND WHITE MESA UTES

The aboriginal territory of the Ute once covered an extensive area that included what is now Colorado, Utah, and New Mexico. Of the 3 bands that make up the Southern Ute populations (Muache, Capote, Weenuche), the Weenuche (Ute Mountain Utes and White Mesa Utes) inhabited the Monticello PA. They ranged from the Dolores River in the east, to the Colorado River in the north and west, to the San Juan River in the south. There are few diagnostic indicators, such as distinctive pottery or wickiup sites, which provide proof of Ute occupation in the San Juan region of Utah and Colorado. Utes tended to utilize existing structures and leave few cultural markers behind upon leaving an area. However, ethnographic data place the Utes in the San Juan region at least since the 1500s.

Utes place religious and traditional importance on many land features throughout southeastern Utah. Significant places of traditional use include Water Canyon or River-Flowing-From the Sunrise (San Juan River), Sagebrush Canyon or Crows Canyon (Montezuma Canyon), Slick Rock Mound (Comb Ridge), Two Rocks Canyon (Cow Canyon), Where-the-Sun-Sets-Last (Mount Tukuhtukivats in the La Sal Mountains). Bitter Root Mountain (Sleeping Ute Mountain) and the Colorado River are mythical places. Blue Mountain and Standing-Alone-Mountain (Navajo Mountain) are considered to be places of worship to the Utes. Mancos (Jim) Mesa and Spanish Mossback Mesas were used in historic times as Ute fortresses in times of conflict (McPherson and Yazzie 2000). Historically, the Bear Dance, a spring ceremony symbolic of nature's awakening, was performed in Bluff, Montezuma Canyon, and Allen Canyon. Today the ceremony takes place in the fall in White Mesa; however, the Utes may ascribe cultural significance to these historic ceremony locations.

3.3.3.2 PAIUTE TRIBES

San Juan County is considered to be on the periphery of traditional Paiute territory that extended across southern Utah and Nevada, northern Arizona, and down along the western side of the Colorado River into California. The Monticello PA is east and north of traditional Paiute territory, although the San Juan Band Paiutes may have used resources along the San Juan River in what is now the boundary between San Juan County and the Navajo Reservation (Kelly and Fowler 1986; McPherson and Yazzie 2000). There are no known places of religious or traditional importance to the Paiute on lands managed by the Monticello FO. The Paiute Indian Tribe of Utah has indicated an interest in the traditional plant usage of the San Juan region.

3.3.3.3 THE HOPI TRIBE

The Hopi have rich oral traditions that tell of Hopi clan migrations throughout the Southwest, including southern Utah (Schroeder 1985). Archaeological evidence places the Hopi's ancestors originally within the San Juan region of the Southwest. Sometime during the end of the 1200s, a prolonged drought forced these people to move away from the area towards the north, west, south, and east. After several generations, the people continued their migrations, eventually settling on the southern escarpment of Black Mesa in northeastern Arizona. In present times, Hopi clans continue to inhabit and practice agriculture in Black Mesa country (Ferguson et al. 1993; Brew 1979; Courlander 1971).

Places of religious and traditional importance for the Hopi have not been identified in the Monticello PA. However, the Hopi claim to be culturally affiliated with the occupants of prehistoric places such as habitation sites, pictograph sites, or petroglyph sites. These occupants are known in the scientific community as Paleoindian, Archaic, Fremont, and Anasazi but are known to the Hopi as *Motisinom* (First People) and *Hisatsinom* (Ancient Ancestors) (Ferguson 1997; Newton 1999). The Hopi Cultural Preservation Office does claim cultural affiliation to archaeological sites within the Monticello PA.

3.3.3.4 PUEBLO OF ZUNI

The Pueblo of Zuni is located in a part of western central New Mexico that has been inhabited by ancestors of the Zuni since A.D. 700 or 800 (Woodbury 1979). Like the Hopi, the Pueblo of Zuni claims traditional cultural use of areas far from their present-day reservation (Ferguson and Hart 1985). The Zuni claim stewardship over all lands upon which they hunted, collected materials such as plants and minerals, or traveled regularly to trade. Zuni forbearers especially journeyed great distances for the purpose of collecting materials for ceremonial purposes. Traditional hunting and gathering areas extended as far south as the Mogollon and Gallo Mountains in southwestern New Mexico and westward into Arizona (Ferguson and Hart 1985). It should be noted that this area does not extend into present-day Utah; however, like the Hopi, the Zuni claim cultural affiliation to the Paleoindian, Archaic, Anasazi, and Fremont peoples (Pueblo of Zuni 1995). Therefore, all prehistoric or ancestral Puebloan sites within the Monticello PA are considered by the Zuni as places of traditional importance (Panteah and Zuni Cultural Resources Advisory Team 1997).

3.3.3.5 NAVAJO NATION

Navajos are believed to have entered the southwest during the mid-to-late 1500s and into southern Utah by the 1700s. Their traditional lands covered the area bounded by the 4 sacred mountains that are of primary religious and sacred significance to the Navajo: Blanca Peak, Mount Taylor, the San Francisco Peaks, and the La Plata Mountains (Maryboy and Begay 2000). Today, the Navajo presently occupy a reservation that is roughly 25,000 square miles and covers much of northeastern Arizona, northwestern New Mexico, and a small portion of southern Utah. The northern border of the Navajo Reservation borders the Monticello PA.

The earliest known Navajo site in San Juan County is a hogan in White Canyon, west of Bear's Ears, dating to 1620. Early Navajo expansion into the Monticello PA is also supported by a Navajo petroglyph at Bluff, Utah, which is in an eighteenth-century style. Navajos also attach cultural significance to 3 mountains in Utah that are mentioned in Navajo rite-myths: *Dzil Diloi* (Abajo Peaks), *Naatsisaan* (Navajo Mountain), and *Shash Jaa* (Bear's Ears) (Gilpin 2001; Packak et al. 1992). Recently, the Navajo claimed the Colorado River watershed, including the Green River, as a place of religious and traditional importance based on creation stories (Molenaar 2003c).

3.3.3.6 PUEBLO OF JEMEZ

The Towa-speaking Jemez people are thought to have migrated with the ancestors of the Zia into the Jemez Mountains around A.D. 1250, eventually settling into the valley along the Jemez River (Ford et al. 1972; Ellis 1956; Sando 1982). Jemez people believe that their ancestors came into this world at *Hoa-sjela*, or Stone Lake, a place located on the present-day Jicarilla Apache Reservation in northwestern New Mexico (NAU and SWCA 1996). Although no places of religious or traditional importance to the Pueblo of Jemez have been identified in the Monticello PA, Jemez religious leaders are thought to have made treks to an emergence shrine at "Banana Mountain" which may be another name for Sleeping Ute Mountain (Ellis 1967:40).

3.3.3.7 PUEBLO OF ZIA

The Zia are thought to have migrated southward from southwestern Colorado into the Greater Mesa Verde and Chaco Canyon regions and claim both areas as ancestral homes. By the late 1300s, Zians had settled in a series of sites along the Jemez River, where they eventually settled (Ellis 1956, 1967). The Zia pueblo originally consisted of 5 villages in the 1500s, but their numbers were reduced following the Pueblo Revolt of 1689. Today, the Zia Pueblo consists of one village and two separate land parcels, is presently situated along the Jemez River, 30 miles north of Albuquerque. The Pueblo of Zia, like other Pueblos, claim cultural affiliation to prehistoric cultures of southeastern Utah based on ancestral migration and origin stories. The Pueblo of Zia has consulted with the Monticello FO on cultural resource issues but has not identified any places of religious or traditional importance.

3.3.3.8 PUEBLO OF ACOMA

Acoma is a Keresan-speaking pueblo located 20 miles southeast of Grants in north-central New Mexico. Prehistoric Acoma culture ranged from the plains of eastern New Mexico, to the Zuni Mountains in the west, to the Rio Puerco in the east, and to the north of Mount Taylor (Holmes 1989). Like other Pueblos, Acoma oral traditions tell of their ancestors as having emerged from under the earth at *Shipap*, their place of origin in the north. Archaeological data such as pottery dating and oral traditions hold that Acoma has been occupied since prehistoric times, possibly as early as A.D. 700 (Ruppe 1990; Ruppe and Dittert 1952) with a later mix of migrants arriving from Mesa Verde, Chaco Canyon, and possibly the Gila and Cebolleta regions around A.D. 1300 (Horr 1974; Ellis 1974). Like other Pueblos, the Pueblo of Acoma claims cultural affiliation to prehistoric cultures of southeastern Utah based on their migration stories. The Pueblo of Acoma has consulted with the Monticello FO on cultural issues but has not identified any places of religious or traditional importance.

3.3.4 CULTURAL RESOURCE OVERVIEW

More than 25,000 cultural resource sites have been documented thus far in all of San Juan County. An estimated 60–65% of all of these sites are located on public lands, with the majority of these being under the jurisdiction of the BLM Monticello FO. The BLM's management responsibility for the archaeological record of San Juan County grows significantly each year. During the 16 years since the completion of the existing RMP (BLM 1991a), an average of 450 new cultural resource sites have been documented each year in San Juan County. Most of these sites were identified as a result of the Section 106 process of the National Historic Preservation Act of 1966 (NHPA) associated with applications for use of public lands. In order to make sound management decisions regarding land uses, cultural resource specialists and managers within the Monticello PA must understand how cultural resources are distributed across the landscape, which types of cultural resources are present within the FO PA, and which portions of the FO PA have been subject to cultural resource inventories, and which areas have not. At the present time, no comprehensive overview of known cultural resource sites and cultural resource survey projects conducted to-date within the Monticello PA exists. The Monticello FO recognizes the need for such an overview and is currently pursuing its preparation in conjunction with the RMP revision.

While thousands of cultural resource sites may be found eligible for listing on the NRHP, only an extremely small percentage are ever actually formally nominated and listed on the Register. Of the known sites within the Monticello PA, 7 are listed on the NRHP as either individual entities or as part of a larger archaeological district or National Historic Landmark. Table 3.6 summarizes these sites.

Table 3.6. National Register-listed Sites and Districts, National Historic Landmarks, and National Monuments within the Monticello PA

Site Number/Name	Year Designated	Acreage Included	Status
Alkali Ridge	1985	2,340 acres	National Historic Landmark
Big Westwater Ruin	1974	< 1 acre	National Register-listed site
Hole-in-the-Rock Trail, Dance Hall Rock	1980	40,300 acres linear corridor	National Register-listed site
Sand Island Petroglyph Panel	1980	< 1 acre	National Register-listed site
Newspaper Rock Petroglyph Panel	1976	< 1 acre	National Register-listed site

Grand Gulch	1982	4,240 acres	National Register-listed archaeological district

While there have been many inventories for cultural resources in the Monticello PA, there are significant gaps in the database that have increased the difficulty in management of these resources. These limitations include large unsurveyed areas where there is no current knowledge about cultural resources, gaps in the database of particular site types, and research-related data limitations. Despite the many cultural resource inventories within the Monticello FO PA, the total percentage of the area covered has been relatively small. While a systematic audit of surveyed and as-yet unsurveyed lands within the Monticello PA is beyond the scope of this document, a cursory review of previous project location mapping available at the Utah State Historic Preservation Office (SHPO) suggests that less than 10% of all BLM lands within the Monticello FO PA have been subjected to intensive-level cultural resource inventories. As a consequence, there are still large areas for which there is no current information regarding the numbers, types, and distribution of cultural resources.

Further, the majority of previous cultural resource inventories within the FO PA have been driven by Section 106 compliance related to specific development or land-use projects. These inventories have addressed discrete locations and have typically resulted in the "clearance" of small parcels of land and narrow linear corridors. As such, much of the current understanding of site types and their distributions, as well as of prehistoric and historical land-use patterns, is based on piecemeal information gleaned from this patchwork of small, disparate surveys.

3.3.5 POTENTIAL TRADITIONAL CULTURAL PROPERTIES

Consultation with Native Americans can result in the identification of traditional cultural properties (TCPs), which are physical locations of importance to the cultural identity or history of a living community of people today. Based on previous consultations with tribal organizations, the following TCP site types have the potential for being identified in the Monticello PA.

3.3.5.1 ARCHAEOLOGICAL SITES

Many Native American groups claim affiliation with prehistoric archaeological sites such as rock art, burials, and village sites. The Hopi Tribe, for example, claims that often the exact locations of some of these places, such as ancestral archaeological sites and burials, are unknown to tribes until these sites are identified by Hopi cultural experts during ethnographic or ethnohistoric investigations or by archaeologists during archaeological investigations of a given study area. Not only do the Hopi consider these sites to be TCPs, they also believe that they are historic properties eligible for inclusion on the National Register under Criteria A, B, C, and D for the following reasons:

- **Criterion A** because they are associated with the Hopi clan migrations, which have made a significant contribution to the broad patterns of Hopi history.
- **Criterion B** because they are "associated directly with Ma'saw and the Hopis' covenant to leave their footprints across the land."
- **Criterion C** because "ancestral archaeological sites, that may be individually anonymous, are identified as part of the great clan migration that are central to all that is Hopi."
- **Criterion D** because they have yielded or have the potential to yield information important to Hopi prehistory (Ferguson 1997; Hopi Cultural Preservation Office 1995).

Other tribes also consider ancient Native American archaeological sites as places of traditional importance. For example, the Zuni have identified all "ancestral" archaeological sites as places of traditional importance, as well as being eligible for inclusions on the National Register (Anyon 1995; Hart 1993:40). They say that these sites meet Criteria A and B (as outlined in National Register Bulletin 15) because of their association with the Zuni ancestors and their oral migration histories (Panteah and Zuni Cultural Resources Advisory Team 1997). The Utes also consider some of these sites to be culturally significant and sacred and maintain that the spirit of their ancestors dwell at archaeological sites and will remain as long as the sites are not disturbed (Newton 1999; Perlman 1998). Recently, a spiritual leader of the Uintah and Ouray Ute Tribe has stated that the disturbance of significant archaeological sites is leading to the destruction of Ute religion and diminishing the power of the spirits that remain at these sites (Molenaar 2003a).

3.3.5.2 ROCK ART SITES

Many tribes have strong spiritual convictions regarding petroglyphs and pictographs and usually request that these sites not be disturbed, especially if the site was created with the intention of connecting with a spiritual or natural power. Many Ute and Puebloan groups also believe that rock art created by their ancestors retains the spirits of their ancestors. The Hopi Cultural

Preservation Office has ascribed cultural values to Fremont rock art panels as far north as Nine Mile Canyon in the Price Field Office area (Molenaar 2003b).

Rock art panels are also seen by tribes as physical evidence of Native American land use indicating territorial boundaries, hunting and camping sites, and trail or migration markers. It is generally accepted by Native Americans that some panels depict tribal stories and legends and that only those with special cultural knowledge can interpret them. In the past, Utes have derived spiritual powers and authority from special petroglyph panels for their Bear Dances (Spangler 1995:775). In the course of Section 106 consultations, the Uintah and Ouray Ute Tribe often request one-half mile buffers around rock art panels, if possible (Molenaar 2003b).

3.3.5.3 ROCK SHELTERS

Rock shelters and cave sites located within the Monticello PA can potentially be identified as TCPs. These locations include overhangs, crevices, and cave sites and are significant to Native Americans as ancestral dwellings. These site types are also potential ancestral grave sites for the Ute Tribe (Pettit 1990). These sites also may be identified as places where Native Americans communicated with the supernatural world by means of prayer, offerings, and vision quests (Molenaar 2003a).

3.3.5.4 NON-ARCHAEOLOGICAL SITE TYPES

Non-archaeological site types are distinguished from archaeological site types in order to discuss places that are not necessarily associated with prehistoric or historic artifact assemblages and collections. These sites are typically identified by tribal representatives during the government-to-government consultation process that is required of federal agencies. Some common site types are lakes and springs, land features, and traditional gathering or collection areas.

3.3.5.4.1 LAKES AND SPRINGS

Native Americans often claim places of water as places of traditional importance and have traditional stories about mythical beings or water spirits that live in lakes, springs, and rivers. The Colorado River and its tributaries have sacred significance to the Navajo. The Colorado, Green, and Price rivers have been identified as sacred to the Navajo because they come from natural spring water and also because the Colorado River flows from the north and can be associated with some of the Navajo creation stories. According to the Navajo, when the Green River is impacted, the cultural integrity of the spring water is affected, which in turn affects traditional procurement use values (Molenaar 2003c).

3.3.5.4.2 TRADITIONAL GATHERING OR COLLECTION AREAS

Traditional plant or other resource gathering areas may be places of traditional importance to Native American groups. These areas are generally places where Native Americans go to collect resources such as medicinal plants used and minerals to be used in ceremonies and are often in current use when identified. Within the Monticello PA, such resources include green willow

found in riparian areas throughout the FO, and a variety of other plant resources, including firewood, gathered from Cedar Mesa (Molenaar et al. 2005).

3.3.5.4.3 LAND FEATURES

Large geographic regions, such as deserts, mountain ranges, and valleys are often identified as TCPs but none have been formally documented as such. Examples of such types of places near the Monticello PA are Sleeping Ute Mountain and the Henry Mountains.

3.3.6 DESIGNATED ACECs WITH CULTURAL RESOURCE VALUES

Under the existing RMP (BLM 1991a), approximately 362,920 acres were designated as ACECs based upon combinations of the use categories described above (see Table 3.7). Additionally, clusters of sites comprising approximately 357,780 acres were identified as desirable for nomination to the National Register as archaeological districts, primarily for their scientific and conservation use values (Table 3.7). Four cultural resource sites comprising a total of 13 acres were identified as desirable for nomination to the National Register as individual listings owing primarily to their allocation to the scientific, conservation, and traditional use value categories (Table 3.8).

Management of the Grand Gulch area and Cedar Mesa ACEC is currently governed by the Grand Gulch Plateau Cultural and Recreation Area Management Plan (BLM 1993c). This plan provides for: 1) the formation of a PA archaeological committee to identify important research questions relevant to the archaeological record of the area; 2) active consultation with the Navajo Tribe, Ute Tribe, Hopi Tribe, Zuni Tribe, All Pueblo Council, San Juan County Historical Society, and Four Corners Heritage Council; 3) archaeological surveys based on the likelihood of impacts to National Register eligible sites; 4) stabilization of select ruins; 5) restrictions on and issuance of special area use permits for commercial and non-commercial use; 6) the development of an interpretive plan to educate visitors about the cultural resources of the area; 7) monitoring to assess impacts to archaeological resources; and 8) development of a public affairs plan related to the area. Specific management prescriptions are also outlined for individual units within the larger FO PA.

Table 3.7. ACECs with Cultural Resource Values Designated by the Monticello FO

ACEC Name	Year Designated	Acreage Included	Justification
Alkali Ridge	1991	35,890 acres	Significant diversity of cultural sites; large Pueblo I sites (A.D. 700–900) in this area are part of the Alkali Ridge NHL. Large pueblos with complex architecture and connecting prehistoric roads are included in this diverse cultural landscape. This unique Historic Landmark is significant in the history of archaeology in the southwestern U.S. This ACEC has high scientific and conservation use values.
Cedar Mesa	1991	323,760 acres	This ACEC contains a wide array of cultural resources reflecting most of the history of human use of southeastern Utah. Basket Maker -Pueblo I

Table 3.7. ACECs with Cultural Resource Values Designated by the Monticello FO

ACEC Name	Year Designated	Acreage Included	Justification
			interface sites (pre-A.D. 1 to A.D. 700), terminal Pueblo III occupations (ca. A.D. 1300), plastered rooms in buildings associated with the Pueblo III occupations (A.D. 1100 to 1300), prehistoric roads, the historic Hole-in-the-Rock Trail, and pioneer era sites are all represented within this ACEC. The ACEC also has high Native American traditional uses and values as well as scientific, conservation, and public values.
Shay Canyon	1991	1,770 acres	This ACEC contains significant rock art associated with Archaic and Pueblo motifs as well as important paleontological resources including at least one dinosaur track way. The ACEC has high public and conservation use values.
Hovenweep	1991	1,500 acres	This ACEC contains large structural Pueblo II–Pueblo III sites (A.D. 850–1300), a terminal Pueblo III occupation (ca. A.D. 1300) as well as evidence of interaction with the Mesa Verde Anasazi population. The ACEC has high scientific, public, and conservation use values.

Table 3.8. Sites and Districts Identified in the 1991 RMP for National Register Listing

Name	Acreage Included	Site or District
San Juan Prehistoric Roads	500 acres	District
Cedar Mesa	349,640 acres	District
Fable Valley	5,030 acres	District
Tin Cup Mesa	2,610 acres	District
Ruin Spring	10 acres	Site
Kachina Panel	1 acre	Site
Monarch Cave	1 acre	Site
Three Story Ruin	1 acre	Site

3.4 FIRE MANAGEMENT

3.4.1 INTRODUCTION AND RESOURCE OVERVIEW

The Monticello PA is within the BLM Moab Fire District, which consists of approximately 6.5 million acres of public land interspersed with state, private, and other federally regulated lands throughout Carbon, Emery, Grand, and San Juan counties. The divergent elevations throughout the area support a wide range of vegetation and soil types including riparian areas, forested high mountain watersheds, grasslands and shrublands, and sparse, arid desert sands. During a normal

fire year the entire district averages 100 wildfires resulting in 10,000 to 16,000 acres each year of burned and potentially damaged land. Most fire activity occurs in the eastern half of the district, although fires can occur in almost all areas of each field office. In the 25-year period between 1980 and 2005, approximately 74% of wildland fires occurring in the entire Moab Fire District were caused by lightning. Prior to 1995, an average of 100 fires per year burned an average of 10,000 acres per year. The past decade has shown a trend of increasing wildland fire, with an average of 130 fires each year burning an average of 16,000 acres each year.

Wildland fire occurrence and size can depend on a range of factors including elevation, vegetative community, fuel moisture, precipitation and/or a lack of precipitation, the ability of fire to carry in specific types of vegetation, and other climate dynamics such as dry summer weather following a wet spring or extended periods of drought. Human-caused fires in the Monticello PA are negligible, but may occur near roads from vehicle ignitions and/or in camping areas outside of designated campsites such as along the San Juan River corridor. Resource values threatened by fire include recreation sites, oil/gas sites, cultural sites, watersheds, wildlife habitat and wildland-urban interface areas. High intensity fires that cover large acreages have occurred in almost all areas, although 90% of the wildland fires in the Moab Fire District are less than 10 acres. Depending on climatic conditions, a typical fire season stretches from March through October with the peak occurring in the lightning-prone period from mid-June to mid-August.

The Moab Fire District has a wide variety of fuel types comprised of numerous species such as grassland mixes, sagebrush and sage/grass, brushland/grass, pinyon/juniper, ponderosa pine, mountain brush, mixed conifer, and invasive species including cheatgrass, tamarisk and others. The affect of wildland fire or the absence of fire in these vegetative communities is closely tied to other public lands resources such as watersheds, soils, wildlife, and livestock grazing. Historically, fire was essential to a healthy ecosystem, providing the needed regeneration of some species and promoting diversity of other species in riparian areas, grasslands, shrublands, woodlands, and forests. The exclusion of fire over the past century, in combination with other land management practices, has compromised the health of many vegetative communities. Two of the predominant issues in the Monticello PA are the loss of shrubland and grassland communities to pinyon/juniper encroachment, and the spread of prolific invasive species.

Communities surrounded by these compromised ecosystems are becoming increasingly susceptible to wildland fire with an accompanying threat to lives and property. Communities in need of management action to reduce the threat from wildland fire on adjacent public lands are identified as wildland-urban interface areas (WUIs). WUIs presently recognized within the Monticello PA include the communities of Blue Mountain Ranch, Natural Bridges, Bug Point, Cedar Point, Canyon Terrace, Boulder Point, Eastland, Ucolo, Summit Point, Montezuma Canyon, Bluff, Peter's Canyon, Blanding, and Monticello.

Current fire management direction encourages wildland fire use and both fire and non-fire fuel reduction treatments to restore natural fire regimes and to promote the overall ecological health of public lands. The operational role of the Moab Fire District is multi-faceted and comprises wildland fire control and suppression activities, hazardous fuels reduction, wildland fire prevention and education, and collaboration with other agencies in suppression activities as well as in both WUI and non-WUI fuels reduction projects. The Monticello FO Manager authorizes

management response to wildland fires within the Monticello PA, approves decisions for prescribed fire and non-fire fuels reduction treatments, and issues restrictions and closures within the Monticello PA during periods of high fire activity.

3.4.2 SPECIFIC MANDATES AND AUTHORITY

Fire management on BLM lands falls under several broad federal laws and regulations as outlined previously in this document (see Chapter 1), and is also directed by more specific legislation and policy. The following section discusses those mandates and authorities specific to BLM fire management.

- The Federal Wildland Fire Management Policy (BLM 1995), revised as Federal Fire Policy (U.S. Department of the Interior 2001): Provides for firefighter and public safety first, while protecting and improving public lands through fire management activities. Reviewed in 2001, improvements to implementation actions were recognized as necessary to ensure adoption of the Federal Fire Policy (USDI 2001) by all federal agencies. The review concluded that while the 1995 Policy is still appropriate, the role of fire should be emphasized in land management to improve ecosystem health and sustainability. Also, more attention must be given to fire risk in the wildland urban interface, and implementation of the Policy could be improved through better interagency and interdisciplinary coordination.
- The National Fire Plan (USDI 2000): Developed under Presidential direction following the fires of 2000, calls for the continued development and support of firefighting resources, to restore damaged landscapes, and to rebuild communities, with economic assistance as necessary.
- 2000 Cohesive Strategy (Lavery and Williams 2000): Aims to reduce wildland fire risk to communities and to restore and maintain ecosystem health by restoring vegetation to their historic fire regime (i.e., fire frequency and intensity).
- Healthy Forests, An Initiative for Wildfire Prevention and Stronger Communities (signed by the President on August 22, 2002): Designed to improve regulatory processes to ensure more timely decisions and greater efficiency in the effort to reduce catastrophic wildland fire, especially in the wildland-urban interface. As a result of the initiative, in 2003 the Department of the Interior adopted two new categorical exclusions under NEPA: (1) 1.12 for hazardous fuel reduction and (2) 1.13 for post-fire rehabilitation of resources and infrastructure.
- Healthy Forests Restoration Act (Public Law 108–148, December 2003): Crafted to improve statutory processes for hazardous-fuel reduction projects. Provides authorities and direction to help reduce hazardous fuels, especially in the wildland/urban interface, and to restore healthy forest and rangeland conditions. Encourages collaboration with other entities, early public involvement in the planning process, and monitoring of hazardous fuel reduction projects.
- Southeastern Utah Annual Fire Operation Plan (prepared annually): Coordinates cooperation between other BLM districts, U.S. Forest Service (USFS), Bureau of Indian Affairs (BIA), State of Utah, and NPS. Includes procedures for initial attack of a wildfire.

- Instruction Memorandum 2004–007: Land Use Plan and Implementation Plan Guidance for Wildland Fire Management (BLM 2003c), which supersedes BLM Handbook 1601-1 (BLM 2005a) Appendix C, Section J, Fire Management. The interim guidance ensures Federal Wildland Fire Management Policy and 10 Year Comprehensive Strategy guidance are incorporated into land-use plans.
- BLM Manual Handbook H-1742-1 (BLM 1999a) (and supplemental guidance 11/27/2002): Provides direction for emergency stabilization and rehabilitation (ESR).
- BLM Prescribed Fire Manual H-9214 (BLM 2000): Provides direction for planning and implementation of prescribed fire projects and associated prescribed fire plan content.
- Interim Management Policy for Lands Under Wilderness Review H-8550-1 USDI (BLM 1995) Section J, Fire Management: Provides direction for fire management activities in these specially managed areas.
- Final Environmental Impact Statement and Record of Decision (Utah) Vegetation Treatment on BLM Lands in the Thirteen Western States (BLM 1991b): Directs the appropriate use of vegetation management techniques.
- BLM Utah Land Use Plan Amendment for Fire and Fuels Management (2005g): Directs and coordinates BLM fire and fuels management statewide and amends individual field office RMPs.

3.4.3 FIRE MANAGEMENT PLAN

The Moab Fire District Fire Management Plan (FMP) acts as the primary strategic document for fire management in the Monticello PA (Map 3). The FMP integrates RMP direction, goals and objectives for resources influenced by wildland fire, suppression actions, fuels treatment activities, and emergency stabilization and rehabilitation (ES&R). The overlying goal of the FMP is to describe specific actions authorized on the public lands within the Moab Fire District to protect life and ensure public safety, target resource goals and objectives, reduce fuel loads, and to achieve and maintain healthy, functioning ecosystems.

3.4.4 DESIRED WILDLAND FIRE CONDITION

The desired wildland fire condition (DWFC), as described in the Utah Land Use Plan Amendment for Fire and Fuels Management, incorporates both condition class and fire regime in the development of fire management strategies (BLM 2005g). The condition class of a vegetative community is defined in terms of its departure from the historic fire regime; determined by current vegetative composition including alterations and disturbances, and also by the length of fire return intervals within that particular community. Along with one of 3 possible condition classes, 5 combinations of fire frequency intervals or "fire regimes" are considered in assigning attributes to categorize a vegetative community's current condition. The combination of both of these measurements gives a vegetative community a fire regime/condition class rating or "FRCC." As the FRCC is an index of ecosystem at-risk conditions, the DWFC is the description of the desired condition of a vegetative community as it relates to susceptibility from severe fire effects (e.g., the loss of key ecosystem components—soil, vegetation structure, species; or alteration of key ecosystem processes—nutrient cycles, hydrologic regimes). For example, a healthy ecosystem at low risk of losing key ecosystem components following wildland fire

would be considered at optimum DWFC. A lengthy description of fire regime, condition class analyses and historic fire return intervals can be found in Appendix D of the Utah Land Use Plan Amendment for Fire and Fuels Management (BLM 2005g).

3.4.5 LANDSCAPE LEVEL MANAGEMENT

Fire management actions authorized for wildland fire activities, prescribed fire and non-fire fuel treatments, and ES&R are based on the DWFC. The Utah Land Use Plan Amendment for Fire and Fuels Management (BLM 2005g) addresses specific fire management objectives for each major vegetation group, designed to result in progress toward the DWFC of public lands under the jurisdiction of the BLM. Specific actions designed to meet the DWFC are detailed in Table 2.1 of the Utah Land Use Plan Amendment for Fire and Fuels Management and attached to this document as Appendix B. Vegetation groups and fire management objectives are briefly summarized below.²

3.4.5.1 SALT DESERT SHRUB

Salt desert shrub occurs over approximately 85,000 acres in the Monticello PA. The DWFC for this community is native, open salt desert shrub with little invasive species and fire exclusion because of the historical infrequent fire return interval. Management objectives include wildland fire suppression, no wildland fire use, a wide array of fuels treatments, and aggressive seeding in ES&R treatments.

3.4.5.2 PINYON AND JUNIPER WOODLAND

Pinyon/juniper woodlands cover a large portion of the Monticello PA, with estimates averaging over one million acres on public lands. Objectives differ for those areas where pinyon and juniper did and did not occur historically. The DWFC in historic pinyon/juniper areas is open stands with grass and shrub understory. These areas historically experienced a fire return interval of 15–50 years, which prevented movement of pinyon/juniper into other vegetative communities. The DWFC in non-historic pinyon/juniper areas is the restoration of the vegetative community previous to pinyon/juniper encroachment. Management objectives include minimal suppression where possible to mimic natural fire return interval, wildland fire use where feasible, a wide array of fuel treatments, and aggressive seeding in ES&R treatments.

3.4.5.3 SAGEBRUSH

Healthy sagebrush stands have declined throughout the Monticello PA, with an estimated 170,000 acres remaining. The DWFC is diverse age class with grass and forbs understory. Management objectives involve a balance between invasive species concerns, wildlife habitat, and restoration of historic fire return interval. Objectives include wildland fire use when appropriate, full-spectrum fuel treatment, and aggressive seeding in ES&R.

² Total acres by vegetation type presented in this section vary from those presented in the Vegetation section because the fire acreages were calculated using GAP and the vegetation acres were calculated using ReGAP.

3.4.5.4 GRASSLAND

Grasslands occur over approximately 13,000 acres of the Monticello PA. In historic native grassland areas, the DWFC is native grass/forbs community. Dependent upon other resource objectives, the DWFC in non-native grasslands is native grassland or shrub community. Management objectives consider historic fire return interval of 15–50 years and may include wildland fire use, prescribed fire and mechanical and chemical fuel treatments to reduce invasive grasses and encroachment by other trees/shrubs, and aggressive seeding in ESR.

3.4.5.5 BLACKBRUSH

Blackbrush communities in Utah are thought to have poor regeneration following wildland fire. These communities cover approximately 300,000 acres of the Monticello PA, and management objectives include excluding wildland fire as well as prescribed fire and non-fire fuels treatments.

3.4.5.6 MOUNTAIN SHRUB

In the Monticello PA, mountain shrub areas cover approximately 6,500 acres. The DWFC in mountain shrub would be differing age classes in mosaic patterns with the exception of WUI areas. When possible, management objectives allow wildland fire to mimic historic fire return intervals. Fuels treatment of all types is encouraged to decrease the potential for high-severity fire.

3.4.5.7 MIXED CONIFER/DOUGLAS FIR/ASPEN

Mixed conifer/Douglas fir and aspen woodlands cover less than 1,000 acres in specific areas within the Monticello PA. Healthy forests would include a grass/brush understory as well as differing age classes of trees. To achieve this, management objectives include allowing wildland fire where it is possible without high-severity fire and encouraging fuels treatment to retain age diversity, remove ladder fuels, and to reduce fuels where wildland-urban interface values are at risk. Preferred ES&R treatments include tree planting to promote forest regeneration.

3.4.5.8 PONDEROSA PINE

There are approximately 1,000 acres of ponderosa pine forest in the Monticello PA, most of which is considered condition class 3 in need of treatment. The DWFC of a healthy ponderosa stand would be open stands with grass/forb understory and a diversity of age classes. Management objectives include allowing fire to play a natural role when possible by allowing fire, conducting mechanical fuels treatments, and consideration of seeding in ESR treatments.

3.4.5.9 RIPARIAN WETLAND

Although this vegetative type covers less than 1% of the total acreage in the Monticello PA, overall it is a vital component. The DWFC of riparian wetland focuses on the reduction of invasives and the retention or restoration of the historic vegetative composition appropriate to the

site. Management objectives allow low-intensity fire in most riparian areas and encourage prescribed fire and mechanical treatment to restore native riparian and wetland species. Active as opposed to passive restoration would be the primary focus of ES&R treatments in riparian wetland areas.

3.4.6 FIRE MANAGEMENT PRIORITIES

Protection of human life, including the lives of firefighters committed to an incident, is the mandated priority for fire management activities. This priority overrides other strategies, actions, and RMP resource goals and objectives. The protection of human communities and infrastructure, other property and improvements, and natural and cultural resources is based on human health and safety, and the costs of protection. Balancing priorities in fire management decisions considers the protection of WUI areas, the maintenance of existing healthy ecosystems, the protection of high priority subbasins or watersheds (HUC 4 or HUC 5), special status species, and/or cultural resources and landscapes.

3.4.7 FIRE MANAGEMENT ACTIVITIES TO MEET THE DWFC

All BLM field offices were given national direction to establish general landscape level goals and objectives for fire management. Landscape level management goals incorporated into the Utah Land Use Plan Amendment for Fire and Fuels Management (BLM 2005g) that apply to the Monticello PA include:

1. Establishing firefighter and public safety as the primary goal in all fire management decisions and actions.
2. Using wildland fire to protect, maintain, and enhance resources and when possible allowing fire to assume a natural ecological role.
3. Reducing hazardous fuels to protect human, natural and cultural resources as well as to restore ecosystems and protect communities.
4. Suppressing fires according to resource objectives and with consideration for firefighter/public safety and other benefits and values to be protected.
5. Providing a consistent, safe, and cost-effective fire management program through appropriate management of planning, staffing, training, and equipment.
6. Establishing fire management units (FMUs) for acreages with burnable vegetation on all BLM-administered lands.
7. Providing emergency stabilization, rehabilitation and restoration to protect and sustain resources, and to safeguard public health and safety as well as community infrastructure.
8. Working with partners and other affected groups to reduce risks to communities and to restore healthy ecosystems.

More specific resource objectives are incorporated in FMPs for individual field offices. To ascertain the most effective methods for achieving DWFC goals in each of the vegetative communities in Utah, fire management activities listed below were discussed and authorized in the decision record for the Utah Land Use Plan Amendment for Fire and Fuels Management (BLM 2005g).

3.4.7.1 SUPPRESSION

A wildland fire requires an appropriate management response or AMR. The AMR can range from full suppression to managing fire for resource benefit (wildland fire use). AMR is guided by the resource strategies, goals and objectives of the RMP with an emphasis on firefighter and public safety, benefits and values to be protected, and suppression costs. FMU objectives as described in the FMP would provide further guidance for an AMR.

3.4.7.2 WILDLAND FIRE USE FOR RESOURCE BENEFIT

Wildland fire use may be an AMR to a naturally ignited wildland fire to accomplish specific resource management objectives in predefined designated areas. Operational management of wildland fire use for resource benefit is detailed in a Wildland Fire Implementation Plan (WFIP). Due to resource condition (FRCC) and proximity to values at risk, wildland fire for resource benefits is not acceptable on all BLM lands within the Monticello PA. As the DWFC of resources move from a higher FRCC to a lower FRCC, wildland fire use for resource benefits in some FMUs may become more practicable. FMUs will be periodically reassessed by fire and fuels staff as well as by resource staff to ascertain changes in vegetation and potential for wildland fire use as a resource tool.

3.4.7.3 PRESCRIBED FIRE AND NON-FIRE FUELS TREATMENTS

Prescribed fire and non-fire treatments are used for hazardous fuels reduction and for community protection from wildland fire. Treatments are also implemented to accomplish resource goals and objectives such as wildlife and range improvements. Treatment projects and acreages are determined through RMP goals and objectives.

Approximately 90% of all non-fire treatment acres are mechanical and/or seedings. Chemical and biological treatments comprise less than 10% of total non-fire treatment acreages. Limitations in applying prescribed fire to meet fuels reduction targets include the condition of vegetation (i.e., aggressive non-native species invasion, or extended periods of drought), air quality restrictions, restrictions on motorized access, budget allocations, personnel capabilities, risk, policy and guidance, and social acceptability.

3.4.7.4 EMERGENCY STABILIZATION AND REHABILITATION

Emergency stabilization and rehabilitation actions following wildland fire may be implemented to protect and sustain resources, and to safeguard public health and safety as well as community infrastructure. All ES&R activities following wildland fire in the Monticello PA would be implemented following the Emergency Fire Rehabilitation Handbook (BLM 1999a) and treatments would be designed according to the Normal Year Fire Stabilization and Rehabilitation Plan (NFRP) for the Moab Fire District, of which the Monticello Planning Area is a part.

3.4.7.5 MONITORING

Monitoring actions would quantify results from fire management decisions and activities. Monitoring conclusions could be used to determine the need for additional or different activities, revisions to the FMP and/or NFRP, or amendments to the RMP.

3.4.8 SUMMARY

National fire management policy has changed and advanced over the past several years in response to increased fatalities, property loss, local economic disruptions and the risk to ecosystems associated with severe wildland fire seasons and increasing WUI conflicts. Because of the imperative to immediately incorporate national and interagency direction into BLM fire management, the Utah BLM amended several BLM land-use plans to include fire management direction and current scientific understanding regarding the nature of fire in the ecosystem. The Utah Land Use Plan Amendment for Fire and Fuels (BLM 2005g) is a lengthy document with an accompanying biological opinion from the U. S. Fish and Wildlife Service (USFS). Although it remains a separate document, fire and fuels management direction contained within the amendment is incorporated by reference in this RMP in its entirety, along with all appendices, tables, and attachments. Also incorporated into this RMP are the resource protection measures (RPMs) identified through the LUP Amendment process that were determined necessary to protect natural or cultural resource values in the implementation of fire management practices.

Fire management direction, activities, and objectives that affect the resources within the Monticello PA are summarized above. Specific goals and objectives for resources within the Monticello PA that are determined in this RMP and that may alter or augment the current decisions for fire and fuels management as dictated by the Utah Land Use Plan Amendment for Fire and Fuels Management (BLM 2005g) will be analyzed in Chapter 4 of this document.

3.5 HEALTH AND SAFETY

3.5.1 INTRODUCTION

A priority in land management for the Monticello FO is ensuring health and human safety on its public lands. The BLM's goals are to effectively manage hazardous materials and safety hazards on the public lands to protect the health and safety of public land users and stewards, protect the natural and environmental resources, minimize future hazardous and related risks, costs and liabilities, and to mitigate physical hazards in compliance with all applicable law, regulation, and policy. These goals stem from the BLM's response to the finding of the National Research Council, Committee to Evaluate the Hazardous Materials Program of the Bureau of Land Management (the Committee). In 1992, the Committee recommended that the BLM "...integrate hazard management activities into BLM's continuing land-use planning and environmental functions." Accordingly, BLM follows its national, state, and local contingency plans as they apply to emergency responses. These plans are also consistent with federal and state laws and regulations.

3.5.2 HAZARDOUS MATERIALS

Hazardous materials are generally defined as a usable product or substance that may cause harm to humans, natural resources, or the environment when spilled, released, or physically contacted. Hazardous materials are used in every day activities and may be in the form of a solid, liquid, or gas. Regardless of their physical state, hazardous materials may be toxic, flammable, combustible, reactive, and/or corrosive. When used and stored properly, associated risks are minimized or eliminated.

Physical hazards that pose a threat to the health and safety of humans or animals (e.g., abandoned mine sites, abandon structures, dams, earthquakes, floods, discarded solid waste, etc.) are responsibilities under this program.

Hazardous materials problems within the Monticello PA can result from programs conducted by state and local governments, by local businesses and industries, and/or by illegal dumping of hazardous materials on lands administered by the BLM. There are no approved hazardous material dumps or repositories within the Monticello PA.

3.5.2.1 POTENTIAL HAZARDS

The various producers of hazardous waste pose a potential impact to the health and safety of area residents and visitors, and to the physical environment itself. Both commercial and illegal activities can lead to the creation of hazardous waste sites. Spills, illegal dumping, and the discovery of abandoned hazardous materials are probable within the Monticello PA boundaries. Contaminants from these sites can pose an imminent threat to public safety and negatively impact the environment by impacting soils, ground water flows, air quality, and water quality. The following paragraphs discuss the area's potential hazardous material generators within the Monticello PA.

Oil and Gas Drilling Operations

Oil and gas drilling operations are a major user and producer of hazardous materials within the Monticello PA. Potentially hazardous materials or substances typically used in drilling and completion operations are listed in Table 3.9. These substances are contained by the operator and disposed of in a licensed commercial disposal facility. Oil and gas operations are exempt from the Resource Conservation and Recovery Act (RCRA) as oil or gas products become subject to RCRA only after they have been purchased from the oil and gas operator. Oil and gas operations are required to have an emergency response protocol to manage hazardous materials during production and transportation.

Table 3.9. Typical Hazardous Materials Used in Well Drilling and Completion Operations

Hazardous Material or Substance	Use
Sodium hydroxide	pH control
Diesel fuel	Engine fuel while drilling
Methanol	Surfactant

Table 3.9. Typical Hazardous Materials Used in Well Drilling and Completion Operations

Hazardous Material or Substance	Use
Hydrochloric acid	Acidizing agent
Acetic acid	Acidizing agent
Formaldehyde	Acidizing
Ethylene glycol	Coolant/dehydration
Benzene, hexane	Natural gas condensate
Lead, cobalt, barium, and manganese compounds	Paints (various types)
Zinc and copper compounds	Grease and lubrication oil
Propane	Fuel

Source: BLM 2005j.

Well fires are rare but could occur under favorable conditions, and a well fire could result from a blowout during drilling or workover activities from a gas leak. Conditions that would cause gas accumulation in a confined space, and ignition by a spark would likely produce a well fire. Well fires and explosions during and after drilling operations are a potential health and safety risk, but there have been no reported well fires within the Monticello PA since 1990 (personal communication between Jeff Brown, Monticello FO, and Laura Burch, SWCA on September 5, 2006). Regulations, proposals for operations, Applications for Permits to Drill or Conditions of Approval provide well control measures to minimize blowouts and fires.

Oil and Natural Gas Pipelines

There are several major natural gas pipelines within the Monticello PA along with numerous secondary pipelines. Operators of the major pipelines include Williams, Anadarko Petroleum, and EnCana Oil and Gas (USA) Inc. Hazardous materials associated with natural gas pipelines include emissions from compressor stations, and benzene and hexane from natural gas condensates. Pipeline accidents have been infrequent in the county, but a possibility of accidents remains due to a number of factors including earthquake, landslide, flood, dam failures, wild fire and man-made causes (San Juan County 2002a). Please see San Juan County's Hazardous Materials Emergency Response Plan (HMERP) for locations of pipelines.

Within the Monticello PA, water, natural gas, and oil pipeline leakages or ruptures have been occurring annually, with an average of 2 to 3 incidences per year. The leakages or ruptures often occur close to the well pads. They are repaired and cleaned up by the operator, and contaminated soil is taken to appropriate treatment facilities on BLM-administered or private lands (personal communication between Jeff Brown, Monticello FO, and Laura Burch, SWCA on September 5, 2006).

Major transportation pipeline design, materials, maintenance, and abandonment procedures are required to meet the standards set forth in U.S. Department of Transportation (DOT) regulations (49 CFR Part 192, Transportation of Natural Gas by Pipelines). Further construction specifications are recommended for safety and are available through the American Society of Mechanical Engineers (ASME-31.8) and the American Petroleum Institute (API Standard 1004).

Mining Operations

Mining operations are currently a minor user and producer of hazardous materials within the Monticello PA. While the majority of mining operations in the Monticello PA are no longer active, a few operations are currently in production including the Lisbon Valley Copper Mine (under Moab FO jurisdiction) and the White Mesa Uranium Mill. Potentially hazardous materials or substances typically used in mining and processing operations may include those items listed in Table 3.9. As with oil and gas operations, these substances are contained by the operator and disposed of in a licensed commercial disposal facility. Performance standards for mining operations, including environmental standards, are regulated by 43 CFR 3809.420, RCRA and its implementing regulations in 40 CFR 240-282, and the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). Additionally, mine site reclamation must address hazardous materials to comply with state law, UCA-40-8-2(3). Abandoned mine reclamation is discussed later as a specific safety hazard within the Monticello PA.

Uranium Tailings

The White Mesa Mill, located in Blanding, Utah, currently receives, processes, and disposes of uranium-bearing waste material. The mill has been in operation for over 20 years and is owned by the International Uranium Corporation.

Fry Canyon is an abandoned uranium mill site located in central San Juan County. The site is under the BLM's jurisdiction and has not yet been reclaimed.

Storage Tanks

The presence and use of aboveground storage tanks (AST) and underground storage tanks (UST) are regulated by the EPA and administered by the State of Utah. It is the responsibility of the operator to understand and comply with the EPA regulations that became effective on December 22, 1998. Within the Monticello PA, storage tanks located on private lands include gasoline and fuel storage facilities, bulk propane and butane facilities and local propane service stations. ASTs on BLM-administered lands include oil, produced water and other chemicals. There are no known USTs on BLM lands within the PA.

Landfills and Transfer Stations

Landfills are subject to regulation under the RCRA. Permitted landfills include those at Monticello and White Mesa (San Juan County Landfill). Transfer stations are located near Bluff, Mexican Hat, Blanding, Monticello and La Sal. Waste collection services by city and county vary with each community. Where solid waste collection is not provided, residents are required to take their solid waste to a nearby transfer station.

San Juan County owns and manages the county landfill. By law the landfill cannot take in any hazardous waste to be buried in the landfill. Hazardous waste is anything flammable, toxic, reactive, or corrosive, such as pesticides, liquids, batteries, bio-medical wastes, used oil, PCBS, friable-asbestos, or radioactive waste.

Illegal Dumps

The remoteness of lands within the Monticello PA creates an opportunity for illegal dumping of hazardous materials and solid waste. If responsibility for the illegal dumping can be determined, then the information is reported to the appropriate authorities for prosecution. Protocol for removing illegally dumped hazardous material can be found in San Juan County's HMERP and the Monticello Field Office Contingency Plan.

Small Businesses

The types of small businesses that generate or use hazardous materials include automotive, printing, and hospitals. These operations are regulated by the EPA and administered by the State of Utah. It is the responsibility of the business owner to understand and comply with EPA regulations.

Transportation

Transportation accidents could lead to accidental spills and releases within the county. According to the county's HMERP, transportation releases pose the highest threat to the public and emergency responders. Trucks carrying hazardous materials use the county's major highway corridors, SR-191, SR-163 and SR-491 as transportation routes from El Paso, Texas, and Albuquerque, New Mexico, to Salt Lake City, Utah. Additionally, oil and gas development within the county requires the transportation of hazardous materials on many state and county roads.

3.5.2.2 HAZARDOUS MATERIALS MANAGEMENT

The Monticello FO Hazardous Materials Program is responsible for hazardous materials handling, storage, transport, and emergency response. In October 2002, the Monticello FO approved an HMERP that specified the necessary steps to begin an emergency response. There are also several state and federal mandates, authorities, and handbooks that provide the BLM with management guidelines, objectives and actions pertaining to hazardous materials management. The federal and state prescribed mandates ensure the field office's compliance with applicable laws and regulations.

Management objectives identified within these documents include:

- Protecting public health, safety, and the environment on public lands;
- Identifying and controlling hazards or threats to human health and the environment from hazardous materials releases on public lands;
- Ensuring that activities on public lands comply with applicable federal, state, and local laws, regulations, policies, and procedures;
- Preventing hazardous waste contamination by BLM-authorized actions; and
- Maintaining land health through assessment, cleanup, and reclamation of contaminated sites.

Management actions include:

- Determining, through a pre-acquisition environmental assessment, the nature and extent of potential liability resulting from hazardous substances associated with property during acquisitions and disposals;
- Reporting, securing, and cleaning up public lands within the Monticello PA that are contaminated with hazardous wastes in accordance with federal laws, regulations, and contingency plans;
- Identifying parties responsible for hazardous waste contamination who are liable for cleanup and resource damage costs;
- Identifying appropriate mitigation for surface-disturbing activities associated with hazardous materials and waste management; and
- Following precautions to prevent hazardous waste releases into the environment, and providing adequate warning to potentially affected communities should such releases occur.

3.5.3 ABANDONED MINES

The early mining practices in San Juan County were subject to minimal environmental regulations as was common with most mining districts throughout the West. Federal land management agencies had no requirements for reclamation of abandoned mines on public lands. Mine closures were often inadequate or non-existent. While many abandoned mines are small and their waste is inert, some abandoned mines are a threat to human health and the environment. Physical safety hazards associated with abandoned mines can also be a concern on public lands.

According to the Monticello FO Mineral Potential Report, there are 17 mining districts within the Monticello PA. Within the mining districts, there may be between 1,000 to 1,500 abandoned openings (personal communication between Terry Snyder, BLM, and Laura Burch, SWCA Environmental Consultants, February 2, 2006). Areas with the highest concentration include Cottonwood Wash, Montezuma Canyon, Lisbon Valley, Red Canyon, White Canyon/Fry Canyon, Deer Flat, Elk Ridge, and the southern section of Indian Creek (BLM 2005b).

3.5.3.1 POTENTIAL HAZARDS

Abandoned mine sites may pose hazards and risks to human health, the environment, and physical safety. Threats to health and the environment consist of: heavy metal contamination, metal contaminated tailings impoundments, stored chemicals, and leaking containers. Changes in the chemical composition or soil loss near abandoned mine land (AML) sites can result in alterations or loss of natural habitat for native wildlife. Abandoned mines may also impact ground water flows and water quality. The impacts to water quality are generally the result of contaminated sediments or metal salts that can affect human health, fisheries, wildlife, and vegetation. Air pollution from contaminated dust can occur on tailings impoundments and waste rock piles near abandoned mill sites. There may also be releases or potential releases of hazardous substances from waste materials and beyond AML sites.

Open mines are unstable; mine adits (horizontal openings or tunnels) may collapse, internal supports may fail, and mine shafts (vertical openings) and winzes (vertical connections between adits) may be obstructed or unseen. Oxygen can be at lethally low concentrations and toxic gases can be at high concentrations or capable of displacing oxygen. Exposure to radiation in the mine atmosphere, particularly radon gas, can be a hazard, especially in abandoned uranium mines. Many abandoned mines in southern Utah are potential sources of radiation.

Water can be a hazard in flooded mines; shallow water can conceal winzes and sharp objects. Hazardous wastes, such as boxes or containers of explosives, and chemicals used in milling or drilling operations could be present. Illegal dumping of hazardous wastes within abandoned mines is also a possibility.

3.5.3.2 ABANDONED MINE MANAGEMENT/RECLAMATION ACTIVITIES

The BLM has recently developed the AML program that addresses the environmental and safety hazards associated with AML sites on public lands. Once the sites are identified they are then prioritized, and appropriate actions are taken on the historic mine sites that pose health and safety risks. The BLM's priority for reclamation of environmentally contaminated sites is based on risk assessments that address threats to human health and the environment. For example, abandoned mine land sites that impact water quality are usually a greater concern and receive a higher priority for reclamation than those that do not impact water quality.

In conformance with the BLM's long-term strategies and national policies regarding AML, this RMP recognizes the need to work with our partners toward identifying and addressing physical safety and environmental hazards at all AML sites on public lands.

3.5.4 DEBRIS FLOWS

There are no known sites in the PA subject to debris flows; therefore this plan will not address this concern.

3.6 LANDS AND REALTY

3.6.1 RESOURCE OVERVIEW

Under the Federal Land Policy and Management Act of 1976 (FLPMA), the BLM has the responsibility to manage the public lands for multiple use and sustained yield and develop management plans. As defined by FLPMA, public lands are those federally owned lands, and any interest in lands (e.g., federally owned mineral estate), that are administered by the Secretary of the Interior, specifically through the BLM. The land surface and mineral ownerships within the Monticello PA are varied and intermingled; consequently, so are the administrative jurisdictions for land use and minerals. The boundaries of the Monticello PA contain approximately 4.5 million acres, of which approximately 1.8 million acres, (39%), are public lands administered by the BLM. Another 54% of lands within the PA boundary are under the ownership of other federal or state agencies. Because of the retention mandates of the other federal agencies and the mandates of state land ownership, BLM-administered lands are

generally considered to be available to help with the county economic base and future community expansion needs. For the most part, the public lands are located in large, contiguous tracts that provide for effective and efficient management (see Map 1).

3.6.2 LANDS AND REALTY PROGRAM

Management of ownership and access to lands within the Monticello PA falls under a variety of categories. These categories depend on whether the BLM is retaining lands, relinquishing control of lands (e.g., sales, exchanges, etc.), granting rights-of-way, permits, or other access, withdrawing lands for certain uses, or otherwise determining the disposition of specific tracts of land. The various categories of lands and realty management within the PA are discussed in the following sections.

The overall goals of the BLM lands and realty program are to:

- Manage the public lands to support goals and objectives of other resource programs;
- Respond to public requests or applications for land-use authorizations; and
- Acquire administrative and public access where necessary to enhance the resource management objectives of the BLM.

3.6.2.1 LAND TENURE ADJUSTMENTS

As mandated by Section 106(a)(1) of FLPMA (43 United States Code [U.S.C.] 1701), public lands are retained in federal ownership. The exception being those public lands that have future potential for disposal (i.e., sale and exchange), as described under Section 203(a) and Section 206 of FLPMA (43 United States Code [U.S.C.] 1713; 1716). Public lands have potential for disposal when they are isolated and/or difficult to manage. Lands identified for disposal must meet public objectives, such as community expansion and economic development. A balanced approach involving land sales and other disposal methods (land exchange, RPP, etc.) would be used. Other lands can be considered for exchange on a case-by-case basis, if land tenure adjustment (LTA) criteria are met. Disposal actions are usually in response to public request or application that results in a title transfer, wherein the lands leave the public domain. Appendix C, Lands and Realty, lists lands identified for disposal by FLPMA Section 203 sale within the Monticello FO. Two land acquisitions, both from private parties, have taken place in the recent history of the Monticello FO. In 1996, the BLM purchased approximately 560 acres east of Hovenweep National Monument. In 2000, an exchange resulted in the acquisition of 160 acres west of Hovenweep. Both acquisitions were acquired to provide a buffer adjacent to the Monument.

Split-estate situations are generally avoided when acquiring land, if possible. Management of such lands and the resources they contain is difficult, and the special mandates placed on split-estate lands may run contrary to the overall resource program goals and objectives of the BLM. Split-estate lands within the FO are primarily within the McCracken Extension.

3.6.2.1.1 SALES

Public sales are managed under the disposal criteria set forth in Section 203 of FLPMA. Public lands determined suitable for sale are offered on the initiative of the BLM. The lands are to be sold at not less than fair market value. Public lands classified, withdrawn, reserved, or otherwise designated as not available or subject to sale are unavailable.

The Monticello FO has not had an aggressive program to dispose of public lands through exchange. The lands that are currently identified in Appendix C, Lands and Realty, would be considered for disposal by FLPMA Section 203 sale, and other authorities, except in cases where said lands contain species status species or their critical habitat.

3.6.2.1.2 EXCHANGES

Exchanges are initiated in direct response to public requests or by the BLM, to improve management of the public lands. Lands need to be formally determined suitable for exchange, and any exchange must be in the public interest. They are to be in the best interest of the public before an exchange would be considered. In addition, lands considered for acquisition would be those lands that meet specific land management goals identified in the RMP.

3.6.2.2 ACCESS

Access may be closed or restricted, where necessary, to protect public health and safety, and to protect significant resource values.

Throughout much of Utah, the state owns and manages 4 isolated sections in each 36-section township. These are generally sections 2, 16, 32, and 36, and are ordinarily one mile square (640 acres). They are primarily administered by the Utah School and Institutional Trust Lands Administration (SITLA) for the purpose of economic support of the state's public schools and institutional trust funds. Activities on state land generally are not substantially different from those on the surrounding land administered by the BLM. Many of the SITLA lands generate funds through grazing permits, right-of-way easements and permits, and hydrocarbon or other mineral leases.

Many BLM lands with management restrictions, such as WSAs, have state lands that are adjacent to or within their boundaries. State lands that are completely or almost entirely surrounded by BLM lands with management restrictions, or are in conjunction with administratively endorsed NPS lands, are termed state inholdings.

Existing access to inheld state lands varies. Some of the parcels have direct access through cherry-stemmed or boundary roads of WSAs. Inheld parcels may or may not currently have access, depending upon whether or not existing vehicle routes lead to them. BLM policy, as required by the Cotter decision, is that "the state must be allowed access to the state school trust lands so that those lands can be developed in a manner that will provide funds for the common school..." This decision confined the issue of access to situations directly involving economic revenues generated for the school trust. For example, if a holder of a state oil and gas lease on a

parcel of state land that is completely surrounded by a WSA requires access to develop that lease, the BLM must grant the leaseholder reasonable access with consideration given to minimize impacts to wilderness character.

3.6.2.3 EASEMENTS

Public land cannot be effectively administered without legal and physical access. Easements are acquired to provide access to public lands for recreational, wildlife, range, cultural/historical, mineral, ACEC, special management areas, and other resource needs.

Methods used to acquire legal rights that meet resource management needs include negotiated purchase, donation, and exchange. Acquisition alternatives include purchase of fee or less-than-fee interest above, on, and below the surface; and perpetual exclusive, and permanent or temporary nonexclusive, easements. Acquisition of road or trail easements is probably the most frequently encountered access need. Easements can include:

- road easements
- scenic conservation easements
- sign locations
- stream clearance projects
- utility easements
- hunting and fishing easements
- range improvements
- conservation easements

Acquisition of access rights support one or more of these resources: lands, minerals, woodlands, range, wildlife, recreation, and watershed. Most existing easements in the Monticello PA are related to range management (fences, roads, spring developments), though one is a conservation easement related to Gunnison Sage-grouse. Additional easements can be acquired when there is a need; however, no such need had been identified as of the writing of this document.

3.6.2.4 LEASES AND PERMITS

Section 302 of FLPMA authorizes the use, occupancy, or development of public lands, through leases and permits, for uses not authorized under other authorities. Applicants can be state and local governments and private individuals. These uses of public lands include agricultural development, residential use (only under certain conditions), commercial use, advertising, and National Guard use. Leases are long-term authorizations that usually require a significant economic investment in the land.

Permits are usually short-term authorizations not to exceed 3 years. Filming permits are one of the more commonly requested permits. The Monticello FO issued 27 film permits during calendar years 1998–2003. Because of the time sensitive aspect of filming, the BLM is using this RMP process to establish minimum impact criteria for film permitting. These criteria will

simplify both the applications and approval process, resulting in fast and efficient processing of filming permit applications (see Actions Common to All, Chapter 2). Map 4 illustrates common filming locations.

3.6.2.5 WITHDRAWALS/CLASSIFICATIONS

Withdrawals are formal Secretarial- or Congressional-level actions that set aside, withhold, or reserve federal land by statute or administrative order for public purposes. A withdrawal may remove areas from the public lands to be managed under the authority of another federal agency or department, but the land does not leave federal ownership. Withdrawals accomplish one or more of the following:

- Transfer total or partial jurisdiction of federal land between federal agencies.
- Close (segregate) federal land to operation of all or some of the public land laws and/or mineral laws.
- Dedicate federal land to a specific purpose.

Withdrawals are often used to preserve sensitive environmental values, protect major federal investments in facilities or other improvements, support national security, and provide for public health and safety. Withdrawals segregate a particular portion of public lands, suspend operation of the public land laws (withdrawn from settlement, sale, location, or entry), and prevent any disposal of public lands or resources involved in certain types of land-use application. Withdrawals remain in effect until reviewed pursuant to Section 204 of FLPMA and continued, modified, or revoked.

Withdrawal review is mandated by FLPMA, which requires the BLM to eliminate all unnecessary withdrawals and classifications. The BLM must ensure withdrawals are supported by showing need, and must revoke withdrawals that lack sufficient justification. Before recommending a withdrawal is continued, the BLM must explore alternatives such as rights-of-way and interagency agreements.

Three withdrawals existed within the Monticello PA as of 2005. Two of the withdrawals were for the Baker Administrative Site of the USFS, and one was to accommodate a road to Natural Bridges National Monument for the NPS (Table 3.10). There are no pending withdrawals.

Table 3.10. Existing Withdrawals in the Monticello PA

National Park Service	T. 37 S., R. 18 E.	Road to Natural Bridges
U.S. Forest Service	T. 33 S., R. 23 E.	Baker Administrative Site
U.S. Forest Service	T. 33 S., R. 23 E.	Baker Administrative Site

In addition to the above withdrawals, the 1991 RMP identified several withdrawals that were to be undertaken. These withdrawals were never initiated.

There are several Power Site Reserves/Classifications along the San Juan River corridor administered by the Monticello FO. The lands were opened to the operation of the mining laws in 1958; therefore, their only withdrawal is from disposal actions. Rights-of-way can be granted

on these lands with a Federal Energy Regulatory Commission (FERC) stipulation in the grant. Disposal actions require partial revocation of the withdrawal.

3.6.2.6 UTILITY/TRANSPORTATION SYSTEMS

3.6.2.6.1 RIGHTS-OF-WAY

A right-of-way (ROW) is an authorization to place facilities over, upon, under, or through public lands for construction, operation, maintenance, or termination of a project. Public lands are made available throughout the Monticello PA for ROWs. With the exception of defined exclusion and avoidance areas, the FO area is subject to ROW designations. ROWs either will not be granted in these exclusion or avoidance areas, or, if granted, will be subject to stringent terms and conditions. The areas are ROW exclusion and avoidance areas in the 1991 RMP:

Avoidance Areas

- Alkali Ridge ACEC
- Bridger Jack Mesa ACEC
- Butler Wash ACEC
- Cedar Mesa ACEC, partial
- Hovenweep ACEC
- Indian Creek ACEC
- Lavender Mesa ACEC
- Pearson Canyon hiking area
- Scenic Highway Corridor ACEC
- Shay Canyon ACEC
- Most ROS P class areas

Exclusion Areas

- Cedar Mesa ACEC, partial (Grand Gulch special emphasis area)
- Dark Canyon ACEC
- ROS SPM class area in San Juan River SRMA
- Developed recreation sites

ROWs are granted on a case-by-case basis. The majority of ROWs granted between 1998 and 2005 were for non-energy type activities. Only 34% of new ROWs have been for oil and gas gathering systems or roads. In the same period, 35 ROWs were transferred to right-of-way holders. Of these, 17% were not energy related and 83% were energy related. Historically, pipeline ROWs granted within the area have been small surface pipelines, because they were determined to be least environmentally damaging. The larger diameter (10 inches and over) pipelines have been buried. Exclusion areas prohibit ROWs and corridor/window designation.

The trend in oil and gas development during the early 2000s suggests that demand for rights-of-way within the Monticello PA will continue to increase into at least the near future.

3.6.2.6.2 RIGHT-OF-WAY CORRIDORS

ROW corridors were presented as existing groupings of ROWs for electric transmission facilities, pipelines 10 inches and larger, communication lines, federal and state highways, and major county road systems. However, no specific areas were identified by map or legal description. In the 1999 Western Utility Corridor Study (WUG), the US Highway 191, State Highways 491 and 276 corridors, the UP&L 345kV line, and the MAPCO/Williams loop pipelines were identified as preferred ROW corridors through the Monticello PA. The West-wide Energy Corridor Study (WWEC) of 2006 proposes corridors through the Monticello FO.

3.6.2.6.3 COMMUNICATION SITE RIGHTS-OF-WAY

The explosion of wireless networking in the U.S. has fostered an expectation from the public that they will have cell phone coverage virtually anywhere. Within the Monticello PA, there are 10 designated communication sites. This trend is expected to continue with increasing demands placed on the existing 10 sites. Communication sites within the FO are illustrated on Map 4.

3.6.2.7 TRESPASS

The BLM is responsible for realty trespass abatement, which includes prevention, detection, and resolution. Land authorizations, such as leases and permits, have been issued to resolve agriculture and occupancy trespass, where consistent with the LUP. Locations in the FO area where trespass typically occurs are along drainages, oil fields, and areas bordering public lands.

3.6.2.8 RECREATION AND PUBLIC PURPOSES ACT (R&PP)

The R&PP Act was established by Congress as a means for state and local governments as well as non-profit organizations to acquire public lands at no cost or a reduced cost. Many western governmental entities have taken advantage of this Act to provide the public with much needed local services and locations for recreational activities.

To date, 11 R&PP authorizations had been made within the Monticello PA (Table 3.11).

Table 3.11. R&PP Authorizations for the Monticello PA

R&PP Leases/Grants	Authorization Type	Purpose	Acres
American Legion	Patent	Rodeo grounds	40.00
San Juan Foundation/Blanding	Patent	Hiking trail	160.00
LDS. Church	Patent	Church building	2.00
San Juan County	Patent	Road shed	5.97
Utah Division of State Parks	Patent	State park	10.00
San Juan County	Patent	Landfill	390.00

Table 3.11. R&PP Authorizations for the Monticello PA

R&PP Leases/Grants	Authorization Type	Purpose	Acres
City of Blanding	Patent	Reservoir	100.00
City of Blanding	Patent	Water pipeline and recreation site	158.00
College of Eastern Utah	Patent	Campus	40.00
San Juan Foundation	Patent	Campus	120.00
San Juan Water Conservancy District *	Classification	Recreation site	20.00

* R&PP application withdrawn. Classification still in place.

An additional 470 acres adjacent to Recapture Reservoir has been classified as suitable for R&PP lease or patent. The cities of Monticello and Mexican Hat have expressed interest in obtaining ownership of the parcels on which they have a right-of-way for city water treatment plants and the Mexican Hat sewer treatment facility. Although not currently classified for R&PP, these parcels are suitable for such classification as a means of transferring ownership to the cities.

3.6.2.9 PROTECTION ZONES

Protection Zones are small areas within which critical resources, such as potable water sources, exist and must be protected for health and human safety reasons. Within the Monticello PA, only one such protection zone has been established. This water source protection zone has been established around the water well supplying the Sand Island campground and boat launch facility. It is displayed on the appropriate master title plat.

3.6.2.10 ALTERNATIVE ENERGY SOURCES

A national trend is to use public lands to develop renewable energy sources such as wind power, solar power, and hydropower. National organizations are looking at public land to help provide non-polluting power sources for a growing population. In the future, BLM-administered lands could play an increasing role in providing clean energy sources.

The U.S. Department of Energy publication "Assessing the Potential for Renewable Energy on Public Lands" prepared by the U.S. Department of Energy (DOE 2003) assessed the potential for the following renewable energy sources on public lands in the 11 western states: solar, biomass, geothermal, water, and wind. More recently, the *Programmatic EIS on Wind Energy Development on BLM-administered Lands in the Western United States* (BLM 2005f) provided specific data on wind energy development potential on public lands. The data show that the Monticello PA has been identified as possessing a low potential for all of the resources studied.

3.7 LIVESTOCK GRAZING

3.7.1 INTRODUCTION

Livestock grazing allotments occur on approximately 93% of all BLM lands located within the Monticello PA boundary. Within Monticello Field Office (Monticello FO) there are 1,633,253 BLM acres (93%) available for grazing and 128,098 BLM acres (7%) unavailable for livestock grazing for resource protection, which includes an estimated 15,720 acres outside of grazing allotments reserved for wildlife use along the slopes of East and Peters Canyons. Also, an administrative horse pasture encompasses 288 BLM acres.

Of the lands within grazing allotments, 1,761,351 acres (78%) are BLM lands; 190,366 acres (8%) are SITLA lands; 53,704 acres (2%) are private; 261,574 acres (12%) are NPS lands; and 2,701 acres (>1%) are water. The acres within each entity are shown on Figure 3.8.

Figure 3.8. Acres within grazing allotments.

3.7.2 RESOURCE OVERVIEW

The following sections provide a summary of the number of permitted allotments, amount of riparian area, allotment management categories, ecological status and current management practices for the allotments. Allotment-specific information can be found in Appendix D, Livestock Grazing.

3.7.2.1 ALLOTMENT STATUS

A total of 75 allotments exist within the boundaries of the Monticello PA. However, one of these allotments (Rogers) is currently not permitted for use by domestic livestock. The Squaw Canyon

allotment, some of which is within the boundaries of the Monticello PA, is administered by the Durango FO.

In addition, the Monticello FO administers one entire allotment (Monucolo) and a part of another allotment (Bug-Squaw) located outside the Monticello PA boundary. The Monucolo allotment and the Colorado portion of the Bug-Squaw allotment are managed in accordance with direction given in the San Juan and San Miguel RMP (Durango FO).

3.7.2.2 RIPARIAN AREAS

Riparian areas, consisting of 28,994 acres (based on 1990's inventory data, subject to reevaluation), occur within 49 of the allotments. The amount of riparian area occurring within these allotments ranges from 0.1% to 10.3%. Riparian areas comprise 1.3% of the total allotment acreage. Further information regarding riparian areas may be found in Section 3.12, Riparian Resources.

3.7.2.3 ALLOTMENT MANAGEMENT CATEGORY

Each permitted allotment has been evaluated and designated into one of 3 categories: maintain (M), improve (I), or custodial (C). Allotments in the M Category are in generally good condition and have no serious resource conflicts under present management. These may have some potential for a positive return on investments. I Category allotments may have serious resource conflicts, or their resource production is below its potential under present management. These allotments have potential to improve or have conflicts that can be resolved through changes in grazing management or investments in range improvement projects. Allotments in the C Category have low productivity potential, limited resource conflicts, and no opportunity for a positive return on public investments. A more detailed list of criteria used for categorizing each allotment may be found under Section D.3, Criteria Used to Determine Allotment Management Category, of Appendix D.

3.7.2.4 LIVESTOCK GRAZING ALLOTMENTS

The number of allotments in each category are shown in Table 3.12 below.

Table 3.12. Allotments in the Monticello PA by Management Category

M Category (Maintain)	I Category (Improve)	C Category (Custodial)
9 Allotments (12%)	29 Allotments (39%)	36 Allotments (49%)

3.7.2.5 ECOLOGICAL STATUS

The ecological status of each allotment was estimated in the 1980s. Four classes are used to express the proportion of which the present kinds, proportions, and amounts of plants in a biotic community reflect the potential natural community (PNC). These classes are as follows:

Potential Natural Community (PNC):	76–100% similar
Late Seral:	51–75% similar
Mid Seral:	26–50% similar
Early Seral:	0– 25% similar

The percentage of acres within the allotments in each seral stage class are shown in Table 3.13.

Table 3.13. Percent of Acres within the Monticello FO Boundaries by Ecological Class

PNC	Late Seral	Mid Seral	Early Seral	Other (Rock Outcrop/Badlands/Seedings)
3.6%	13.0%	53.4%	17.1%	12.8%

3.7.3 CURRENT MANAGEMENT PRACTICES

Of the 74 allotments currently permitted within the Monticello PA boundaries, cattle graze 61 allotments and cattle and horses graze 13 allotments. A total of 78,796 animal unit months (AUMs) are currently authorized (active). Of these, 77,365 AUMs (98%) are used by cattle and 1,431 (2%) are used by horses. An additional 7,299 AUMs are allowed through exchange of use (other ownership). The term "AUM" is a measure of forage quantity and refers to the amount of forage necessary for the sustenance of one cow (including her calf under 6 months of age) or its equivalent for a period of one month. It is used to denote an increase or decrease in the amount of forage available for livestock grazing and not necessarily a change in grazing preference. "Grazing preference" or "preference" refers to the total number of AUMs on public lands that are attached to base property owned or controlled by the grazing allotment permittee, and includes both active AUMs (AUMs available for livestock grazing on a permittee's permit) and AUMs held in suspension (AUMs not available for livestock use until the BLM, through decision, would activate them).

The grazing management systems currently in use on the permitted allotments are as follows:

- Season-long—35
- Deferred—11
- Deferred rotation—28

The lengths of season under season-long grazing systems vary from one to 12 months. The majority of grazing systems include both "dormant season" and "growing season" use. However, 12 allotments are grazed only during the growing season and nine allotments only during the dormant season.

Two of the permitted allotments (Tank Draw and East Canyon) have allotment management plans (AMPs) that prescribe a sequence of grazing among pastures in accordance with the terms and conditions of the grazing permits. The remaining 71 allotments are managed in accordance with the terms and conditions of each grazing permit. AMPs for many of these allotments may be developed in the future.

Appendix D includes various documents related to livestock grazing, including:

- Allotment Situation Summary
- Fundamentals of Rangeland Health
- Utah Standards and Guidelines
- Allotment Management Category Criteria
- Allotment Situation Tables

3.7.4 RESOURCE DEMAND AND ANALYSIS FORECAST

The resource demand is considered to be the amount of grazing by both domestic livestock and wildlife. However, the resource demand discussed here will be limited to grazing by domestic livestock, which is considered to be the total of current authorized (active) use (78,796 AUMs) and suspended use (17,173 AUMs). This amounts to a total resource demand by domestic livestock of 95,969 AUMs.

The changes in total authorized (active) use since the 1985 Management Situation Analysis are due to 1) changes in land ownership, or as a result of rangeland monitoring that indicated the need for adjustment, and 2) the grazing allotment closure in Comb Wash. In 1993, a portion of the Comb Wash allotment (comprised of approximately 16,599 acres of federal land in Mule Canyon south of U-95, and Arch, Fish, Owl, and Road canyons) was made unavailable to grazing by court decision (see IBLA 92-264). Trends in authorized use prior to that time are not known.

3.8 MINERALS

The Monticello PA is known to have significant occurrences of mineral resources, as noted in a variety of studies. Recently, a multi-agency effort produced a "Scientific Inventory of Onshore Federal Lands' Oil and Gas Resources and Reserves and the Extent and Nature of Restrictions or Impediments to their Development" (U.S. Departments of the Interior, Agriculture, and Energy 2003). This report is based on the USGS estimation of undiscovered, technically recoverable resources, Energy Information Administration (EIA) reserve calculations, and an estimate of restrictions or impediments to the development of those resources and reserves. It is BLM policy to consider this information in its planning process. Although the main purpose of the report is to classify the availability of land for leasing and leasing stipulations, resources are also evaluated. The calculation of resources is primarily mathematical and the estimates are provided on a multiple-state, basin-wide scale and are of limited use on the local, PA scale.

The BLM compiled more site-specific data based on oil and gas play areas, past exploration, and other records it has for the Monticello PA. Numerous data sources, including USGS, UGS, academic research, UDOGM, industry and government sources, were used to compile the Mineral Potential Report for the Monticello Planning Area (BLM 2005b). It characterizes the mineral resources of the Monticello PA; summarizes past and present development activities; and classifies the potential and certainty for mineral occurrence and the potential for future development of each mineral resource. Mineral potential is classified using the rating system outlined in BLM Manual 3031 (USDI 1985; Table 3.14). Under this system:

- **Occurrence potential** is based strictly on the geologic likelihood of the mineral to be present in an area. It does not address the economic feasibility of developing the resource.
- **Development potential** for a resource is based on review of available literature on the mineral's market factors; communication with industry experts and government officials familiar with the specific resource and area; and other considerations such as occurrence potential, historical development, commodity price, and supply and demand. The potential for development of each mineral resource is projected for 15 years, and is rated as high, moderate, or low (Maps 14–17).

Table 3.14. Ratings for Mineral Occurrence Potential and Certainty

Rating	Description
Level of Potential Ratings	
O	The geologic environment, the inferred geologic processes, and the lack of mineral occurrences do not indicate potential for the accumulation of mineral resources.
L	The geologic environment and the inferred geologic processes indicate low potential of accumulation of mineral resources.
M	The geologic environment, the inferred geologic processes, and the reported mineral occurrences or valid geochemical/geophysical anomaly, and the known mines or deposits indicate moderate potential for accumulation of mineral resources.

Table 3.14. Ratings for Mineral Occurrence Potential and Certainty

Rating	Description
H	The geologic environment, the inferred geologic processes, and the reported mineral occurrences or valid geochemical/geophysical anomaly, and the known mines or deposits indicate high potential for accumulation of mineral resources. The known mines and deposits do not have to be within the area that is being classified, but have to be within the same type of geologic environment.
ND	Mineral potential not determined due to lack of useful data.
Level of Certainty Ratings	
A	The available data are insufficient and/or cannot be considered as direct or indirect evidence to support or refute the possible existence of mineral resources within the respective area.
B	The available data provide indirect evidence to support or refute the possible existence of mineral resources.
C	The available data provide direct evidence but are quantitatively minimal to support or refute the possible existence of mineral resources.
D	The available data provide abundant direct and indirect evidence to support or refute the possible existence of mineral resources.

3.8.1 LIMITED MINERAL RESOURCES NOT DISCUSSED FURTHER

Geologic host formations exist in the Monticello PA for mineral resources *other* than those described and analyzed in detail in this EIS, but their known occurrence is limited or insignificant. There is minimal or no interest in the development of several minor resources present on public lands within the Monticello PA, including coalbed methane, geothermal water, lode gold, manganese, humate, gypsum, barite, zeolite, shale, fire clay, crushed stone, and collectable rocks. These resources are describe briefly here but will not be discussed further in this EIS.

- **Coalbed methane** development potential is very low or nonexistent. The coal in the Dakota Sandstone is generally thin and discontinuous and not usually thick enough to be an attractive reservoir. Shallow and dissected deposits of coal are likely to have lost any contained gas to the atmosphere. The coal is also of low rank, generally subbituminous C, and as such will not have generated any thermogenic gas. The coal is commonly impure or boney, with thinly interlaminated shale, and nearly everywhere contains higher ash content (more than 30%), that reduces the gas carrying capacity of the coal.
- Low-temperature **geothermal waters** (20–36 °C [68–97°F]) have been recorded from several springs and wells in the Monticello PA, including the Warm Springs Canyon geothermal area identified by the USGS. However, because of where the Monticello PA is situated within the Colorado Plateau geologic province, no high-temperature geothermal resources are expected within reasonable drilling depths (Gloyn et al. 1995). There is potential for direct use of low-temperature geothermal water for space heating of buildings, but no such development on public lands within the Monticello PA exists or is expected.
- Minor, non-commercial deposits of **lode gold** occur in the Tertiary intrusives of the Abajo Mountains (Witkind 1964; Gloyn et al. 1995).

- A small number of **manganese** deposits are found in Jurassic and Cretaceous sedimentary rocks along the Lisbon Valley fault system, which is mostly north of the Monticello PA (Baker et al. 1952; Weir and Puffet 1981; Gloyn et al. 1995). No recent exploration activity for manganese in these formations in the Monticello PA is known, and the potential for discovery of any economic deposits is minimal (BLM 2005b, 2005c).
- Weathered coal and carbonaceous shales and mudstones of the Cretaceous Dakota Sandstone have potential for sale as **humate**, a natural soil conditioner (Gloyn et al. 1995). However, no known humate exploration has taken place on public lands within the Monticello PA, and development potential is considered very low.
- **Gypsum** can be found throughout the Monticello PA in the Pennsylvanian Paradox Formation, the Permian Cedar Mesa Sandstone, and the Triassic Moenkopi Formation (Gloyn et al. 1995). However, gypsum is a very low unit value commodity and generally must be located close to existing wallboard plants to be economical. Therefore, development potential of gypsum in the Monticello PA is very low.
- A small amount of **barite** was reported associated with uranium-vanadium-copper mineralization at a mine in the west-central part of the Monticello PA (Trites and Chew 1955). However, these occurrences are insignificant compared to Nevada's large-bedded barite deposits and, thus, are not likely to be developed.
- Minor **zeolite** deposits are known to be contained in the Brushy Basin Member of the Morrison Formation, and hypothetically, potential exists for zeolite production in the Monticello PA (Gloyn et al. 1995). However, high-purity zeolites have not yet been found, and the zeolite industry continues to be very small.
- Common **fire clay** and fire clay of "fair to good quality" is known to occur in the Triassic Moenkopi Formation, the Petrified Forest Members of the Triassic Chinle Formation, the Brushy Basin and Westwater Canyon Members of the Jurassic Morrison Formation, and the Cretaceous Mancos Shale (Gloyn et al. 1995; BLM 2005c). No information is available regarding past and present exploration, development, or production within the Monticello PA (BLM 2005b, 2004b).
- **Stone suitable for crushing** in the Monticello PA includes limestones in the Pennsylvanian Hermosa Group Honaker Trail Formation and the Jurassic Navajo Sandstone (Ritzma and Doelling 1969), as well as some sandstones and conglomerates of the Cretaceous Dakota Sandstone and Burro Canyon Formation. Although LR 2000 records indicate there has been only one authorization since 1989 (BLM 2005b), this resource could become more significant as presently suitable sand and gravel resources are exhausted. In any event, the need for crushed stone in the foreseeable future is anticipated to be insignificant.
- **Collectable rocks** and semiprecious gemstones present in the Monticello PA include petrified wood containing opal and agate, chalcedony, garnet, azurite, and malachite. Petrified wood is found scattered throughout the Monticello PA, hosted in the Jurassic Morrison and Triassic Chinle Formations. Deep red to black pyrope garnets have been recovered from volcanic vent deposits of the Mule Ear and Moses Rock occurrences near Mexican Hat. The amount of garnet material known to be present in this area is so small that commercial extraction is unlikely (Gloyn et al. 1995). None of the above-mentioned collectable materials have been or are expected to be produced on public lands in large quantities.

3.8.2 LEASABLE MINERALS

Leasable minerals are subject to disposal by lease under the authority of the Mineral Leasing Act of 1920, as amended. A classification for leasable minerals such as a Designated Tar Sand Area (DTSA) or a Known Potash Leasing Area (KPLA) is an area where a potentially valuable deposit has been identified and where competitive leasing is required. Existing leases are shown on Map 18.

3.8.2.1 OIL AND GAS

The exploration and development of leasable minerals is accomplished in several stages of activity. The first stage (land categorization) involves determining which public domain lands should be leased and under what conditions. This is accomplished through the land-use planning process. The second stage is leasing. The third stage includes exploration, development, and production operations.

The BLM has designated 4 allocations that describe the conditions placed upon public domain lands in regard to their availability for fluid hydrocarbon leasing. Under the existing plan, the BLM has assigned one of four following oil and gas leasing stipulations to the public lands:

- **Standard Stipulations**—Areas identified with standard stipulations are open to exploration and development, subject to standard lease terms and conditions.
- **Special Conditions**—Areas identified with these stipulations are open to exploration and development, subject to relatively minor constraints such as seasonal restrictions.
- **No Surface Occupancy**—Areas identified as NSO are open to exploration and development subject to highly restrictive lease stipulations, including no surface occupancy.
- **Closed to Leasing**—Areas identified as closed to leasing either by discretionary or non-discretionary decisions. Discretionary closures involve lands where the BLM has determined that mineral leasing would not be in the public interest. Non-discretionary closures involve lands that are specifically closed to mineral leasing by law, regulation, Secretarial Decision, or Executive Order.

3.8.2.1.1 RESOURCE OVERVIEW

The primary formations from which oil and gas are currently being produced are the Ismay and Desert Creek zones of the Paradox Formation, the Devonian McCracken Sandstone Member of the Elbert Formation, the Mississippian Leadville Limestone, and the Pennsylvanian Honaker Trail Formation.

As described in the 1995 National Assessment of the U.S. Oil and Gas Resources—Results, Methodology, and Supporting Data (Gautier et al. 1996), the USGS has delineated a number of oil and gas plays, both structural and structural-stratigraphic, in the Paradox Basin Province. Approximately 70 oil and gas fields are located in these plays in the Monticello PA (Table 3.15). These 78 fields encompass approximately 1,135 active wells (including producing oil and gas wells, shut-in oil and gas wells, temporarily abandoned oil and gas wells, and water injection, disposal, and source wells; Table 3.16) and, as of December 2003, have cumulatively produced

more than 535 million barrels of oil and 1.26 billion million cubic feet (MCF) of gas (UDOGM 2004; see Table 3.15). Approximately 5–21 oil or gas wells have been drilled per year in the PA, with an average of 13 wells drilled per year on all lands in the PA. Oil and gas plays that occur in the Monticello PA are as follows:

- The **Buried Fault Black play** is located in the northern part of the Monticello PA, in the Paradox Fold and Fault Belt. This play contains the McCracken Sandstone Member of the Elbert Formation and the Leadville Limestone. The largest of the 6 oil and gas accumulations in this play is the Lisbon field, which contains approximately 43 million barrels of oil and 250 billion cubic feet of natural gas.
- The **Porous Carbonate Buildup play** contains most of the oil and gas fields in the Monticello PA (Huffman 1996a, 1996b). The fields in this play occur primarily in the Blanding subbasin and produce oil and gas from mounds of algal limestone and dolomitic reservoirs in the Pennsylvanian Hermosa Group. This play contains the largest oil field in Utah: the Greater Aneth field.
- The **Fractured Interbed play** is an unconventional continuous-type play that depends on extensive fracturing in the clastic or carbonate interbeds between evaporates of the Paradox Formation. These same interbeds provide the source rocks for most of the oil and gas in the Paradox Basin (Huffman 1996a, 1996b). These include Kane Creek, Chimney Rock, Gothic, and Hovenweep Shales.
- The post-Mississippian **Salt Anticline Flank play** is also located in the northern portion of the Monticello PA. It occurs along the flanks of the northwest-trending salt anticlines in the area (Huffman 1996a, 1996b). Only a few oil and gas fields have accessed the Hermosa Group and Cutler Group reservoirs of this play.
- The **Permo-Triassic Unconformity play** extends west from the tar sand deposits of south-central Utah (Huffman 1996a, 1996b). Reservoirs for oil are in the Permian White Rim Sandstone and the White Rim and DeChelly Sandstones of the Paradox Basin. Reservoir thicknesses can vary from a few feet to several hundred feet. This play is only lightly explored and contains no developed oil and gas fields in the Monticello PA.
- Although not delineated as a Paradox Basin play, the USGS has also defined a hypothetical play in the southwest corner of the PA called the **Late Proterozoic** (Chuar-sourced) and **Lower Paleozoic play** (Huffman 1996a, 1996b; Butler 1996). Very few wells have penetrated the Chuar Group in Utah (Butler 1996).

Table 3.15. Monticello Planning Area Oil and Gas Field Statistics as of December 31, 2003 (Includes All Lands within the Area)

Field Name	UDOGM Field Number	Field Type	Producing Formation	Status	Year Disc.	Active Wells	Cumulative Oil Production (barrels)	Cumulative Natural Gas Production (MCF)	Cumulative Water Production

Table 3.16. Summary of Status of All Wells Located within the Monticello PA, as of March 24, 2005

Well Status	Number of Wells
ACTIVE WELLS	
Producing oil wells	493
Producing gas wells	15
Shut-in oil wells	198
Shut-in gas wells	14
Temporarily abandoned oil wells	29
Temporarily abandoned gas wells	1
Active water injection wells	371
Active water disposal wells	11
Active water source wells	3
Active Wells (subtotal)	1,135
ABANDONED WELLS*	
Abandoned oil locations	475
Abandoned gas locations	5
Abandoned Wells (subtotal)	480
ALL OTHER WELLS	
Approved oil permits	3
Approved gas permits	0
Dry holes	1,034
Inactive water injection wells	35
Released oil wells**	415
Released gas wells**	8
Released water injection wells**	30
Released water disposal wells**	11
Released water source wells**	20
Unknown well types	96
All Other Wells (subtotal)	1,652
Total	3,267

*Release pending completion of satisfactorily completed surface reclamation.

**Released: well plugged and abandoned and reclamation satisfactorily completed.

3.8.2.1.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

The production of oil and gas in the Monticello PA has primarily occurred in the eastern portion of the PA. A large area of concentrated oil and gas fields occurs in the southeastern portion of the Monticello PA within the Blanding subbasin region of the Paradox Basin. Operations also occur in the northeastern portion of the Monticello PA in the Lisbon Valley area of the Paradox Fold and Fault Belt. Although limited, some oil and gas production has occurred outside these two distinct areas at single well locations.

For purposes of analysis and reporting of the oil and gas resources in the Monticello PA, the PA was divided into 3 exploration and development areas, so delineated based on distinct geologic descriptions, historic/current production activities, and the potential for ongoing and future oil and gas development (Map 57). These areas are the Paradox Fold and Fault Belt, the Blanding Basin area, and the Monument Upwarp area.

The Paradox Fold and Fault Belt, located in the northern part of the Monticello PA, encompasses only 5 oil and gas fields: Lisbon, which straddles the northern Monticello PA border; Lightning Draw; Lightning Draw SE; Paiute Knoll; and a wildcat. Production from the Devonian McCracken Sandstone Member of the Elbert Formation first occurred in the Lisbon field. Later testing in the Mississippian Leadville Limestone resulted in the discovery of a giant oil and gas accumulation, which has resulted in approximately 90% of the oil produced from the Leadville Limestone. Oil and gas accumulations, though no economic production, have also been recorded in the Paradox and Hermosa intervals in the Lisbon field. Both hydrogen sulfide (H₂S) and helium have also been produced from the McCracken and Leadville reservoirs in the Lisbon field (personal communication with E. Jones, BLM Moab Field Office, June 2004). Production of these commodities as a by-product of oil and gas production is expected to continue. The Lightning Draw field produced oil and gas from the Kane Creek fractured shales. One new gas well (the Federal 1-31) was recently completed in the Lightning Draw SE field, and one well is currently being worked over. Development plans include construction of a pipeline connecting these wells to the existing gathering line and the Lisbon gas processing facility.

Oil and gas were first discovered in the Blanding Basin area of the Monticello PA at Boundary Butte in 1948. Subsequent geophysical work on adjacent Navajo Indian land resulted in the 1956 discovery of the Greater Aneth field, which produces from the Desert Creek zone of the Paradox Formation, with some minor production from the Ismay zone. The Greater Aneth field is by far the most productive field in the Monticello PA (see Table 3.16). There are a host of other Ismay and Desert Creek reservoirs in the Blanding subbasin, accessed by fields such as Bluff and Recapture Creek, which were discovered in the 1950s. Some of the larger producers from these reservoirs include Bug, Cave Canyon, Cherokee, Deadman-Ismay, Kachina, Ismay, Kiva, Mustang Flat, and Tin Cup Mesa fields (see Table 3.15).

Completion of producing wells in the Monument Upwarp area has been sparse compared with the Paradox and Blanding Basin areas. Despite over 150 exploratory wells drilled in this area, only two fields have been established. These two fields, the Mexican Hat field and the Lime Ridge field, are located in the south-central portion of the Monticello PA. The Lime Ridge field managed to develop a significant gas show from Mississippian Leadville Limestone. Other representative activities on the Monument Upwarp include tests at the Nokai Dome in the

southwest portion of the Monticello PA; a well located in T40S, R12E that encountered oil and gas in the Triassic Shinarump Member of the Chinle Formation; a well that had a show of gas in Pennsylvanian sediments (McDougall 2000a); and a 1992 exploratory well drilled in the west-central portion of the Monticello PA that had a significant show of oil and/or gas in the Ismay zone of the Paradox Formation (McDougall 2000b).

3.8.2.1.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

Areas of high, moderate, and low potential for the occurrence of oil and gas have been identified for the plays of the Monticello PA (Map 17). The Buried Fault Black play (2101) and the Salt Anticline Flank play (2105) are rated as having a high (H) occurrence potential with a D level of certainty, as are the southeastern portion of the Porous Carbonate Buildup play (2102), and the northern part of the Fractured Interbed Play (2103). Areas rated with an H oil and gas occurrence potential and a C level of certainty are the northwestern portion of the Porous Carbonate Buildup play, on the Monument Upwarp, the western and southern portions of the Fractured Interbed Play, and the Permo-Triassic Unconformity play (2106). The area around the Abajo Mountains is rated with a low (L) occurrence potential for oil and gas with a C level of certainty; the Porous Carbonate Buildup play and the Fractured Interbed play both encroach into this area. The Late Proterozoic (Chuar-sourced) and Lower Paleozoic play (2403) is rated with an H occurrence potential but only a B level of certainty, because this play is only speculative.

The potential for future oil and gas exploration and development in the Monticello PA is based on the history and extent of development in the area, consultation with petroleum companies actively studying fields and plays in the Monticello PA, and discussions with state and federal agencies familiar with activities in the area (see separate oil and gas Reasonable Foreseeable Development document). Based on these factors, potential for oil and gas exploration and development in the Paradox Fold and Fault Belt and Blanding Basin areas of the Monticello PA is rated as high. Less activity is expected in western areas of the Monticello PA on the Monument Upwarp, and development potential there is rated as moderate. The potential for exploration and development around the Abajo Mountains, within national parks or monuments, within WSAs, or within other protected lands, is rated as low.

Existing surface disturbance for approximately 1,135 active wells, approximately 480 abandoned wells, and associated roads and pipelines is 15,504 acres, or an average of 9.6 acres per well. Future oil and gas drilling for the next 15 years is projected to be 5–21 wells per year on all lands in the PA. Assuming an average of 13 wells per year, a total of 195 wells would be drilled within the PA. Disturbance from these wells and associated infrastructure would equal approximately 1,872 additional acres. During this period, 27 dry wells, 20 newly abandoned wells, and all 480 existing abandoned wells should be successfully reclaimed, making 5,059 total acres of reclaimed surface area. Accordingly, the total cumulative surface disturbance for wells in the Monticello PA during the life of this plan is projected to be approximately 12,317 acres. Additionally, surface disturbance over the next 15 years for geophysical exploration (1,230 linear miles) amounts to about 2,236 acres. Reclamation of all these disturbed lands would be successful over the scope of 10 years (BLM 2005c).

3.8.2.2 COAL

Coal resources are allocated through a coal lease. Exploration can occur under license before a lease is issued. Prior to issuing coal leases, areas considered unsuitable for all or certain stipulated methods of coal mining must be identified based on the unsuitability criteria found at 43 CFR Section 3461. These criteria are applied through the BLM's land-use planning process.

3.8.2.2.1 RESOURCE OVERVIEW

Coal resources are located in the San Juan coal field in the eastern part of the Monticello PA, in the Blanding Basin and Paradox Fold and Fault Belt areas. The coal in this field occurs in the Cretaceous Dakota Sandstone. The middle coal-bearing unit within the Dakota Sandstone, which is 45–122 feet thick and whose individual coal beds range from two to 15 feet thick (Gloyn et al. 1995), contains 4 coal horizons in the Sage Plain area. These coals typically have been of poor quality.

3.8.2.2.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Coal activity in the 530,000-acre San Juan coal field has been limited to 4 areas:

1. exposures of Dakota Sandstone along Recapture and Johnson Creeks in T35S, R22E and R23E, and T36S, R22E and R23E;
2. an area near Monticello where several openings had been reported;
3. prospect holes located in T34S, R26E, including the Crepo Mine and a bulldozed outcrop representing the best showing in the field; and
4. several pits opened in an area located along Piute Creek, including the Rasmussen mine located in T33S, R26E (BLM 1985).

Most production has been conducted for local consumption. Reported activities, including two small mines, primarily occurred prior to 1929, with insignificant production. All mines and prospects have been closed in this area since 1971 (BLM 1985). After drilling several exploration holes near Eastland, Utah in the late 1970s, Arjay Petroleum estimated that 77 million tons of coal may be recoverable by surface mining in their exploration area, but development is limited by poor coal quality and lack of rail transportation (Gloyn et al. 1995; Wilson and Livingston 1980).

3.8.2.2.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

Old coal mines and drill-hole data suggest a high (H) occurrence potential with a D level of certainty for coal in the Cretaceous Dakota Sandstone in a small portion of the San Juan coal field southeast of Monticello. Other areas of the San Juan coal field are rated as having an H occurrence potential, but with a C level of certainty. Due to the poor quality of the coal and the lack of historical activity, development potential is rated low (L).

3.8.2.3 POTASH AND SALT

The potash resource is allocated by a variety of instruments. These are the prospecting permit, the preference right lease, the application for exploration license, the competitive lease, and the fringe acreage lease/lease modification.

3.8.2.3.1 RESOURCE OVERVIEW

Potash (potassium-bearing) deposits in the Monticello PA, comprising primarily salt, sylvite (potassium chloride, or KCl), and carnallite (hydrated potassium magnesium chloride, or $\text{KMgCl}_3 \cdot 6\text{H}_2\text{O}$), are hosted exclusively by the Pennsylvanian Paradox Formation in the Monticello PA. Known potash and salt deposits underlie a 2,800-square-mile area of the Paradox Basin's deeper northeastern half. Both sylvite and carnallite occur in varying proportions throughout most potash deposits, but sylvite is dominant in those horizons under economic consideration (Hite 1960; Dames and Moore 1978; Gloyn et al. 1995). Using a cutoff grade of 14% K_2O , Patterson (1989) estimates that known resources of K_2O potash contain 254 million tons, while inferred resources are estimated at 161 million tons.

Most of the interest in potash and salt deposits in the Paradox Basin has been concentrated in the fold and fault belt, where potash beds are relatively close to the surface. However, in some areas, extraction is a challenge because salt flow is extensive (up to 13,000 feet thick) and destroys the continuity of the potash deposits (Hite 1960). Although the only commercial deposits in the area are found in the Cane Creek area in the Moab Planning Area, north of the Monticello PA, other potentially valuable deposits are known to occur in the Monticello PA. These include the Lisbon Valley and Gibson Dome areas (Gloyn et al. 1995). In 1960, the USGS classified the Cane Creek and Lisbon Valley areas as Known Potash Leasing Areas (KPLAs)—areas where potentially valuable deposits of potash are known to exist. There also appears to be sufficient data available to define the Gibson Dome area as a KPLA (BLM 2005b).

3.8.2.3.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Potash deposits in the Paradox Basin were initially discovered during the exploration for oil and gas between 1924 and 1944. Based on these initial discoveries, further potash exploration concentrated in Cane Creek and Lisbon Valley and contributed to the classification of these areas as KPLAs in 1960 (Hite 1960). Portions of the Cane Creek and Lisbon Valley KPLAs occur within the northern part of the Monticello PA and extend into the Moab Planning Area. The Moab Salt Company's Cane Creek Mine, located in the portion of the Cane Creek KPLA in the Moab Planning Area, is the sole producer of potash and salt by-product in the region.

Some incidental exploration has occurred in the Gibson Dome area. Oil and gas drilling in this area has contributed data on its potash deposits. In addition, a borehole was drilled in the 1980s by the U.S. Department of Energy for the purpose of evaluating the salt structure in the Gibson Dome area as a potential repository for high-level nuclear waste. This borehole encountered potentially valuable potash-bearing zones (Woodward-Clyde Consultants 1982; Merrell 1979; Dames and Moore 1978).

3.8.2.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

The two KPLAs in the Monticello PA and the Gibson Dome area are rated as having a high (H) occurrence potential with a D level of certainty for both potash and salt (Map 18). The other areas of known potash and salt deposits in the Paradox Basin are rated as H occurrence potential with C certainty for both commodities. The more expansive areas underlain by potash and salt also have a high (H) occurrence potential and are rated with a C certainty.

A combination of factors, including the high cost of extraction and easier-to-mine deposits outside the PA, contributes to the low (L) development potential for both potash and salt within the Monticello PA.

3.8.2.4 TAR SANDS

The Monticello PA contains areas of tar sands resources. This resource has been, and currently is, available for lease under the Combined Hydrocarbon Leasing Act of 1981 and in accordance with the decisions in the existing BLM land-use plans.

The major tar sand resources lie only in Utah within 11 designated Special Tar Sands Areas (STSAs) managed by the BLM Vernal, Price, Richfield, and Monticello field offices (Map 18). One of these STSAs lies within the Grand Staircase-Escalante National Monument where leasing is prohibited. The Monticello FO manages one of the remaining 10 STSAs.

When the Monticello RMP Revision (revision) was initiated in 2003, there was no reasonable foreseeable development expectation for tar sands over the next 15 years. The mineral report identified this resource, but did not foresee any leasing or development due to prevailing and anticipated economic factors.

Since the start of this RMP revision, Congress enacted the Energy Policy Act of 2005. Section 369 of the Energy Policy Act requires the Secretary of Interior to "complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with an emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming." On December 13, 2005, the BLM published a Notice of Intent in the Federal Register initiating a Programmatic Environmental Impact Statement (PEIS) to support a commercial oil shale and tar sands leasing program on federal lands in these 3 states.

In light of this statutory requirement, all decisions related to tar sands leasing in this RMP are being deferred to the ongoing PEIS on Oil Shale and Tar Sands Leasing. The Record of Decision (ROD) on the final PEIS will amend the existing Monticello RMP by changing allocation decisions on whether or not to allow leasing and future development of tar sands on public lands for those areas where the resource is present. These decisions will be incorporated into the Monticello RMP as it is finalized or will amend the Monticello RMP. Combined hydrocarbon and tar sand leasing in the STSAs will also be deferred to the PEIS. Additional opportunities for public involvement and comment will occur when the PEIS becomes available in draft form.

Site-specific requirements will be addressed in future NEPA analysis for specific project applications after the PEIS is completed.

This RMP will, however, develop allocation decisions for conventional oil and gas leasing in the STSAs.

3.8.2.4.1 RESOURCE OVERVIEW

Since 1981, tar sands have been allocated by competitive leasing. In Special Tar Sand Areas (STSAs), tar sands are leased by competitive bonus bidding for combined hydrocarbon leases (CHLs). Outside STSAs, tar sands are allocated by conventional oil and gas leases.

Tar sand in the Monticello PA has been identified in the White Canyon Designated Tar Sand Area (DTSA, established on January 21, 1981 [46 Federal Register 6077]), which extends over 10,000 acres in the western portion of the White Canyon Slope area and into the Monument Upwarp area, in the western portion of the Monticello PA). The Hoskinnini Member of the Triassic Moenkopi Formation, which hosts the deposit, is exposed in Long, Short, and Fort Knocker Canyons. The deposit is estimated to contain 12 to 15 million barrels of oil in place (McDougall 2000b). From the research done to-date, it appears that the tar sands in the White Canyon DTSA are low-grade and fractured. A second deposit of tar sands in the Monticello PA occurs in the walls of the San Juan River canyon near the Mexican Hat field (BLM 2005b). This deposit, minor compared to the White Canyon area, is found in the Pennsylvanian Honaker Trail Formation. Ritzma (1979) estimated the contained oil to be 0.4 to 0.5 million barrels.

3.8.2.4.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

There has been no exploration or production activity regarding the tar sand deposits located in the White Canyon DTSA (BLM 2005h). Ritzma and Doelling (1969) stated that the Hoskinnini Member in the White Canyon tar sand deposit is "lightly" saturated with oil and that a reconnaissance assessment of the deposit indicates that it is not of commercial significance. Furthermore, the stratigraphy may prevent both in situ thermal recovery of oil and surface mining methods. Compared with the oil and gas resources throughout the Monticello PA that can be extracted with modern drilling and pumping methods, tar sand extraction requires higher-cost mining techniques such as open pits and associated earth-moving and reclamation activities.

3.8.2.4.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

The White Canyon DTSA, along with smaller tar sand deposits near Mexican Hat, are rated as having a high (H) occurrence potential with a D level of certainty. Considering the dearth of leases in the White Canyon DTSA, the lack of interest shown by developers, and the high cost associated with extraction in the Monticello PA, tar sand development potential in the Monticello PA is considered low (L).

3.8.3 LOCATABLE MINERALS

Locatable minerals are subject to disposal by mining claim location under the authority of the Mining Law of 1872. Locatable minerals comprise the base and precious metal ores, ferrous metal ores, and certain classes of industrial minerals. These minerals are allocated via claim staking or location, at the initiative of the public. Operations under the 43 CFR 3809 regulations may take place on public lands that are open to mineral entry without a claim. Surface-disturbing activities (beyond casual use) to explore or develop are not allowed under a claim alone and require a Notice of Intent (NOI) or Mining Plan of Operations (MPO). All public lands within the Monticello PA are open to mineral location unless specifically closed by withdrawal.

3.8.3.1 URANIUM-VANADIUM

3.8.3.1.1 RESOURCE OVERVIEW

Sediment-hosted uranium in the Monticello PA occurs in quantities that are commercially extractable. It is usually found intimately associated with vanadium and sometimes copper. The most prolific hosts of the uranium-vanadium mineralization include Mesozoic sequences such as the Moss Back and basal Shinarump Conglomerate Members of the Triassic Chinle Formation, as well as the Salt Wash Member of the Jurassic Morrison Formation, which tends to host deposits that have larger reserves and higher grades and are more closely clustered than those occurring in other formations (Chenoweth 1981; Johnson and Thordarson 1959). Small uranium-vanadium deposits are also found in the late Paleozoic Permian Cutler Group (a result of an unconformity with the Chinle Formation), particularly the Cedar Mesa Formation, as evidenced by historic mining production in the northern part of the Monticello PA (Gloyn et al. 1995).

3.8.3.1.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Although uranium deposits in the Monticello PA had been mined for over 90 years, first for their radium content and then for their vanadium co-product, it was the "Uranium Boom" beginning in the late 1940s that initiated large-scale extraction (Chenoweth 1996). However, a national and international trend of declining uranium and vanadium demand and prices began in the 1980s (Chenoweth 1996; BLM 2005h). The last mines and mills in the Monticello PA closed in 1990.

In the Monticello PA, the greatest amount of production has occurred from the Salt Wash Member of the Jurassic Morrison Formation and the Moss Back and Shinarump Conglomerate Members of the Triassic Chinle Formation. The least amount of production has occurred from the Permian Cutler Group. Mines developed in the Chinle Formation produced 92% of the ore between the early 1950s and the mid-1960s. However, by the mid-1970s, production from the Morrison Formation overtook and slightly exceeded that of the Chinle (\$600 million vs. \$500 million, respectively). Regionally, remaining recoverable reserves of uranium-vanadium are estimated at 4.2 million tons of ore in the Four Corners Region. Approximately 57% of these reserves are hosted in the Morrison Formation, 39% in the Chinle Formation, and 4% in the Cutler Group (Johnson and Thordarson 1959; Gloyn et al. 1995). Table 3.17 lists the mining areas in the Monticello PA and the uranium host deposits for each. Table 3.18 provides a summary of historical mining production in the Monticello PA.

Below are the more notable uranium-vanadium mining operations within the Monticello PA:

- The Cottonwood Wash mining area is centered at the junction of Cottonwood and Brushy Basin Washes, just west of Blanding, Utah. Some 55 properties produced over 350,000 tons of ore between 1931 and the 1980s (see Tables 3.18 and 3.19; Gloyn et al. 1995). There are currently no mining permits filed with UDOGM for this area.
- The Montezuma Canyon mining area includes deposits on the sides of Montezuma Canyon and its tributaries, east of Blanding, Utah. Sixty-eight properties produced about 109,000 tons of ore between the late 1940s and the mid-1980s (see Tables 3.18 and 3.19; Gloyn et al. 1995). Currently, only one mine in the Montezuma Canyon area, the Dusty Mine, has a permit registered with UDOGM; however, it is listed as inactive.
- Only the southeastern portion of the Lisbon Valley mining area is located in the Monticello PA; the rest of it is in the Moab Planning Area. Some of the largest, high-grade uranium-vanadium ore bodies have been mined in this area (see Tables 3.18 and 3.19). Only one mine in the Monticello PA portion of the Lisbon Valley area has a permit registered with UDOGM; it is also listed as inactive.

Table 3.17. Historical Locations and Hosts of Uranium-Vanadium Deposits in the Monticello PA, by Mining District

Mining Area	Salt Wash Member/ Morrison Formation	Moss Back Member/ Chinle Formation	Shinarump Member/ Chinle Formation	Cedar Mesa Formation/ Permian Cutler Group
Lisbon Valley Area*		Major		Minor
Combined White Canyon Area (Red Canyon, White Canyon/Fry Canyon, Deer Flat, Elk Ridge, and southern Indian Creek Areas)			X	
Inter-river, Lower Kane Creek, Indian Creek Areas*		Major		Minor
Dry Valley Area	X			
Cottonwood Wash Area	X			
Oljeto Mesa Area (Monument Valley)			X	
Montezuma Canyon Area	X			
Bluff-Butler Wash Area	—	—	—	—
Abajo Area	—	—	—	—
Ucolo Area	X			

Note: Xs indicate that the data say that this host occurs in the mining area. The words "major" and "minor" are used when hosts within a mining area are compared to each other.

Sources: Johnson and Thordarson 1959; Merrell 1979; Chenoweth 1996; Sprinkel 1999; Gloyn et al. 1995; Gloyn 2004.

*Is also located in the Moab Planning Area to the north.

— No data.

Table 3.18. Historical Uranium-vanadium Production in the Monticello PA

Mining Area	Average Ore Grade		Production (lb)		Estimated Reserves (lb U ₃ O ₈)	Develop. Potential
	% U ₃ O ₈	% V ₂ O ₅	U ₃ O ₈	V ₂ O ₅		
Lisbon Valley Area*	0.30–0.37	0.34–0.40	79,560,000	534,000	3,500,000	High
Combined White Canyon Area	0.25–0.30	0.04	11,069,000	216,000	2,000,000+	High to Moderate
Inter-river, Lower Kane Creek, Indian Creek Areas*	0.20–0.22	1.50–2.00	3,276,000	195,000	unknown	Moderate
Dry Valley Area	0.20	1.00–1.70	1,525,000	12,662,000	1,000,000	High
Cottonwood Wash Area	0.15–0.20	0.96–1.70	896,000	5,664,000	300,000	High
Oljeto Mesa Area (Monument Valley)	0.25–0.30	0.65	323,000	533,000	unknown	Moderate
Montezuma Canyon Area	0.16	0.60	88,000	775,000	unknown	High
Bluff-Butler Wash Area	unknown	unknown	53,000	--	unknown	Moderate
Abajo Area	unknown	unknown	7,000	1,000	unknown	Moderate
Ucolo Area	0.15	1.50–2.00	unknown	unknown	3,000,000	High

*Includes production from the Moab Planning Area to the north.

Source: Gloyn et al. 1995; Chenoweth 1996; Gloyn 2004.

The White Canyon mining area is located in the northwestern part of the Monticello PA (Gloyn 2004). In addition to uranium and vanadium, ore from the White Canyon area contains from 0.3% to 1.3% copper (Chenoweth 1990, 1993). The Cu:U₃O₈ ratio is as high as 13:1, and copper grades range up to 1–2% (Johnson and Thordarson 1959). The Red Canyon section of this area contains an estimated two million pounds of U₃O₈, while reserves for other areas are unknown (see Tables 3.17 and 3.18; Gloyn 2004). One mine in the White Canyon area has a registered permit with UDOGM; it is classified as being in its final stages of reclamation.

3.8.3.1.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

The designated mining areas (Gloyn 2004) within the Monticello PA are rated as having high (H) occurrence potential with a D certainty level (Map 20). Outside these known mining areas, the areal extent of the Jurassic Morrison and Triassic Chinle Formations has been classified as having a moderate (M) occurrence potential with C level of certainty. Where mineralization in the Cutler has occurred in Lisbon Valley mining area, uranium and vanadium has a moderate (M) occurrence potential; otherwise, mineralization in the Cutler is not expected.

Uranium prices have recently reached the level that could encourage some new production from existing reserves in the Monticello PA, and vanadium prices have also recently increased significantly, to the point that vanadium could be a highly desirable co-product or even the primary metal, especially considering the relatively high ratio of vanadium to uranium in most of the Salt Wash deposits in the area (BLM 2005b). Development potential is, therefore, rated H for the Red Canyon, Deer Flat, Cottonwood Wash, Montezuma Canyon, Lisbon Valley, Dry Valley,

and Ucolo mining areas, where known reserves are significant and infrastructure is in place. Development potential is rated M for the White Canyon-Fry Canyon, Oljeto Mesa (Monument Valley), Bluff-Butler Wash, Elk Ridge, Abajo, Indian Creek, Lower Kane Creek, and Inter-river areas. Development potential is rated L for host formations outside designated mining areas.

3.8.3.2 COPPER

3.8.3.2.1 RESOURCE OVERVIEW

For convenience, copper deposits are divided into two types in this section: vein-type and redbed-hosted. Vein-type deposits are generally fault zone-hosted veins and strata-bound, mineralized layers. As their name suggests, redbed copper deposits form in red host rocks, which get their color (essentially rust) from the oxidation of the rock's exposure to the atmosphere. Redbed mineralization can be either volcanic or sedimentary. Sedimentary-hosted deposits, which form in fluvial (river) environments, are the type found in the Monticello PA. Sedimentary redbed deposits are relatively small in comparison to the volcanic redbed deposits and vein-type deposits, and few are ever brought into production.

Blanket-like deposits of copper mineralization are hosted by late Paleozoic to Mesozoic redbed sequences throughout the Southwest (Hahn and Thorson 2002). In the Monticello PA, copper mineralization has been observed primarily in the Triassic Chinle and Moenkopi Formations (McFaul 2000). These observed copper occurrences have been associated with uranium deposits in several areas, including the White Canyon, Oljeto Mesa (Monument Valley), and Indian Creek mining areas. In the Indian Creek area, the Permian Cutler Group contains deposits representing a transition zone between fluvial rocks to the east and marine rocks to the west. Small uranium-copper deposits are found in this transition of the Cutler Formation, as well as in the overlying Moenkopi Formation.

3.8.3.2.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Copper production in the Monticello PA has often been associated with uranium mining. The White Canyon, Red Canyon, Deer Flat, and Elk Ridge mining areas were the location of redbed, disseminated copper production in the late 1940s and early 1950s. At their local mill, primarily in 1953, the Vanadium Corporation of America attempted to recover copper from uranium-vanadium ore, without success (Chenoweth 1993). Since the 1960s, several other companies have evaluated low-grade, disseminated copper deposits in the Monticello PA and adjacent areas, but attempts at production of these deposits, even in association with uranium and/or during times of favorable copper prices, have been unsuccessful or uneconomical (Hahn and Thorson 2002). Other areas for copper occurrence in the Monticello PA are in the Oljeto Mesa (Monument Valley) and Indian Creek mining areas. Both areas contain limited prospects, and no mining has developed.

3.8.3.2.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

Based on available information, there is a high (H) occurrence potential with a D level of certainty for redbed-type copper deposits in the Triassic Chinle Formation in the White Canyon, Oljeto Mesa (Monument Valley), and Indian Creek uranium mining areas. Occurrences in the Moenkopi Formation are isolated, limited to just a few uranium mines in the White Canyon area. Therefore, the Moenkopi in this area is rated as having a moderate (M) occurrence potential with C certainty, while other exposures of Moenkopi are rated as having a low (L) occurrence potential and C certainty.

Throughout the Monticello PA, copper deposits are low-grade and sparse. Even with the increase in prices, copper development potential throughout the PA is rated as being L.

3.8.3.3 PLACER GOLD

3.8.3.3.1 RESOURCE OVERVIEW

Placer gold in the Monticello PA has been documented to occur sporadically along the Colorado and San Juan rivers and their respective tributaries. Along the Colorado River, it occurs in alluvial bars and has been found in terraces as much as 200 feet above the present river. The gold occurs primarily in the present-day river gravels and in older, higher level terrace gravels (Ritzma and Doelling 1969). Placer gold deposits in San Juan River gravels are known to extend from the mouth of Montezuma Creek to the confluence of the Colorado River (Johnson 1973). In addition to the Colorado and San Juan rivers, placers have also been located in the Abajo Mountains along Johnson Creek and Recapture Creek (Johnson 1973; UGS 2003).

Historical placer operations in the Monticello PA were small-scale, so most of the gold production was not reported. Due to the fine, flaky mode of the gold and the difficulty in recovering it, most operations have not been commercially successful (Butler et al. 1920; UGMS 1966; Johnson 1973; Chatman 1987). The gold grades of historical placer operations range from 0.03 to 0.05 ounces per cubic yard (Gloyn et al. 1995).

3.8.3.3.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Only small, sporadic extraction activities have taken place in the Monticello PA since the late 1980s, and currently, there is little production of placer gold in the Monticello PA. One small, active placer operation is located below the dam on Recapture Creek near Blanding. The BLM also recently accepted a proposal to conduct gold exploration using backhoe trenching on a small site in Johnson Creek (T. McDougall, BLM, 2004). Small-scale operations like these typically have a surface disturbance of 5 to 10 acres.

3.8.3.3.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

The known placer gold sites have a high (H) occurrence potential with a D certainty level, given that gold has been produced at these locations. Alluvial deposits along the San Juan River, from the mouth of Montezuma Creek to Lake Powell, are considered to have an H occurrence potential with a C certainty level, as are deposits along Johnson and Recapture Creeks in the Abajo Mountains north of Blanding. Because of the ongoing operation and the recent proposal on Recapture and Johnson Creeks, respectively, these areas are rated as having an H development potential. All other areas are assigned a moderate (M) to low (L) development potential.

3.8.3.4 LIMESTONE

3.8.3.4.1 RESOURCE OVERVIEW

Desirable limestone deposits in the Monticello PA are primarily hosted in the Pennsylvanian Honaker Trail Formation, but also are in the Jurassic Navajo Sandstone (Gloyn et al. 1995). The marine limestones in the Honaker Trail Formation have been shown to contain small amounts of relatively high-quality limestone in San Juan County (Gloyn et al. 1995). Four lenses, or beds, of the Honaker Trail Formation, each one to 3 feet thick, are observed in the San Juan River canyon west of Mexican Hat (Ritzma and Doelling 1969). A 7-to-10-foot-thick bed containing 97% calcium carbonate (CaCO₃) has also been reported at a 200- to 300-acre site located on Lime Ridge and northeast of Mexican Hat. Additionally, studies from a site on the Navajo Indian Reservation in the southern portion of the Monticello PA show that limestone in Honaker Trail Formation may be utilized for producing high-quality burned lime, cement rock, and rock dust (Ritzma and Doelling 1969). Outcrops of the Honaker Trail Formation also occur in the northwest portion of the Monticello PA along the Colorado River and its tributaries. Lacustrine limestones in the Jurassic Navajo Sandstone in the Monticello PA contain some beds of high-calcium, blue-gray, cherty limestone that locally cap small mesas (Gloyn et al. 1995).

3.8.3.4.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Current limestone operations in the Monticello PA are primarily on Lime Ridge. The Holliday Construction Lime Ridge quarry is an active operation located on state lands northeast of Mexican Hat. Production from 1998 through 2003 at this site has been reported at approximately 29,000 tons (UDOGM, verbal communication 2004). The Moon No. 4 quarry, also permitted on state lands near Mexican Hat, is now inactive. It was operated by Western Industrial Minerals. An area considered likely for development is the 200- to 300-acre, 7-to-10-foot-thick site occurring on 60 claims and located 13 miles northeast of Mexican Hat on Lime Ridge. The deposit is amenable to simple quarrying techniques (Gloyn et al. 1995).

Exploration and proposed development of chemical-quality limestone has occurred in the Monticello PA in the past:

- Dames and Moore, Inc., under a contract to the Arizona Public Service Company, conducted substantial exploration on two claims for high-calcium limestone in the mid to late 1970s.

These efforts resulted in the identification of the massive, 200- to 300-acre bed of limestone in the Honaker Trail Formation (see above). Development of the deposit was to be used at power plants in New Mexico and Arizona.

- In 1986, the Environmental Lime Corporation submitted a proposal to the BLM regarding a project located northeast of Mexican Hat to produce 1,100 tons per day of high-calcium limestone. No work was ever carried out on this project.
- In 1994, the Navajo Nation drilled core samples on claims located in T41S, R20E, to ascertain whether high-calcium limestone was present and if it could be used for proposed sulfur dioxide scrubbers/absorbers at a power plant in Page, Arizona.

3.8.3.4.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

The identified limestone sites in the Monticello PA have been characterized as having high (H) potential for the occurrence with a D certainty level. Elsewhere in the Monticello PA, the Honaker Trail Formation is characterized as having H potential with C certainty for the occurrence of limestone. Limestone development potential on Lime Ridge is rated as H, not only because of past production in that locale, but because of the significant interest in limestone in southeastern Utah. Development of the formation in the northwest portion of the Monticello PA, along the Colorado River and its tributaries is considered unlikely.

3.8.4 SALABLE MINERALS

Salable mineral materials are subject to disposal by sales contract or free use permit under the authority of the Materials Act of 1947. Salable mineral materials are generally common varieties of construction materials and aggregates. Salable mineral material disposal can be exclusive or nonexclusive. Under exclusive disposals, the applicant has sole rights to the material applied for and sole responsibility for the development and reclamation of the source site. Exclusive sites include negotiated sales sites, competitive sales sites, free use permits, and material sites under the Federal Highway Act. Nonexclusive disposals are made from sites to which the general public has access, such as community pits and common use areas (see Appendix K). Detailed descriptions of the salable mineral materials in the Monticello PA and their locations, disposal, and production are provided in the Mineral Potential Report (BLM 2005b).

3.8.4.1 SAND AND GRAVEL

3.8.4.1.1 RESOURCE OVERVIEW

Sand and gravel development is largely driven by the need to find suitable material for public works projects, including local and state road projects and community development. Sand and gravel are the rock products that have the greatest demand in the Monticello PA, and the operations are widely dispersed across the PA to facilitate distribution of the materials and keep the costs to consumers low. They are commonly found near population centers and aligned along roadways. Sand and gravel deposits are mostly associated with unconsolidated Quaternary sediments. Important sand and gravel deposits occur along the San Juan River (where it is high-

quality), surrounding the Abajo Mountains (where the material is softer and not as suitable for concrete aggregate), and near the town of Blanding.

3.8.4.1.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

A review of LR 2000 records indicates that since 1989, there have been 57 authorizations made by the BLM for mining of sand and gravel in the Monticello PA, for a cumulative total of 1.9 million cubic yards (BLM 2005h). Production has primarily occurred in the eastern and southern portion of the Monticello PA, from alluvial deposits located along the San Juan River, and from sediments (i.e., erosional surfaces of low relief that slope away from the base of mountains) in the vicinities of Blanding and Monticello. Due to transportation costs, most production has occurred in close proximity to road infrastructure, communities, and specific points of use. The main producers are the Utah Department of Transportation and the County Highway Department. Surface disturbance is typically two to 10 acres for each authorization.

3.8.4.1.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

All of the known alluvial deposits, such as those along the San Juan River, are rated as having high (H) sand and gravel occurrence potential and with a D level of certainty. Deposits located within 3 miles of a road are rated as having an H development potential, whereas deposits located further from roads have a moderate (M) development potential (Map 19).

3.8.4.2 BUILDING STONE

3.8.4.2.1 RESOURCE OVERVIEW

Within the Monticello PA, sandstone appropriate for use as a high-quality building stone is present in the Triassic Moenkopi and Chinle Formations, the Jurassic Kayenta and Morrison Formations, and the Cretaceous Dakota Sandstone and Cedar Mountain Formation (Atwood and Doelling 1982). Sandstones in the Triassic Chinle Formation and the Jurassic Navajo Sandstone are also suitable for commercial crushing operations (Ritzma and Doelling 1969). The granites of the Abajo and La Sal Mountains may also have building stone potential (Gloyn et al. 1995).

3.8.4.2.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Building stone production in the Monticello PA has primarily occurred from the Cretaceous Dakota Sandstone at quarries located southeast of Blanding (UDOGM, verbal communication 2004). Production has also occurred from operations in the Jurassic Kayenta and Triassic Moenkopi and Chinle Formations. Since 1989, there have been 7 authorizations made by the BLM for mining building stone, which have yielded a cumulative total of approximately 130 tons (BLM 2005h). Most of the production in the Monticello PA has occurred on unpatented mining claims, 6 of which are recorded with the BLM, so no production figures are available. Total surface disturbance for an operation is typically 5 to 10 acres.

3.8.4.2.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

Known sites of building stone production in the Monticello PA are rated as having a high (H) potential for occurrence with a D level of certainty. Elsewhere, the formations are classified as having a moderate (M) occurrence potential and a C level of certainty. Development potential, particularly in the general areas where there has been previous production, and considering the continued demand for building stone in the growing communities of the West, is rated as H.

3.8.4.3 CLAY

3.8.4.3.1 RESOURCE OVERVIEW

Bentonite and bentonitic clays—among the most commercially desirable clays—swell when saturated with water and can be used as a natural sealant for reservoirs, stock ponds, ditches, and landfill linings. Several geologic units in the Monticello PA have potential for bentonite production: the Triassic Petrified Forest and Monitor Butte Members of the Chinle Formation (where it is ubiquitous throughout the Monticello PA), the Cretaceous Brushy Basin and Westwater Canyon Members of the Morrison Formation, and the Cretaceous Mancos Shale (Gloyn et al. 1995). Triassic bentonite deposits can be found southeast of Mexican Hat, as well as near Monument Valley, Clay Hills and Comb Ridge (Gloyn et al. 1995). The thickness and purity of the bentonite is quite variable, but very pure deposits have nonetheless been located. Samples taken from the upper portion of the Brushy Basin Member of the Jurassic Morrison Formation in the Lisbon Valley north of the Monticello PA have a measured bentonite content exceeding 90% (Gloyn et al. 1995). Samples taken from the undifferentiated Brushy Basin at Montezuma Creek also averaged more than 90% bentonite.

3.8.4.3.2 PAST AND PRESENT EXPLORATION, DEVELOPMENT, AND PRODUCTION

Small-scale mining of bentonite for local engineering purposes has occurred in the Monticello PA. In 1977, the Butterfield mine southeast of Montezuma Creek is known to have produced about 5,000 cubic yards of bentonitic clays from the Brushy Basin Member of the Jurassic Morrison Formation (Gloyn et al. 1995). Two other mine sites located in the southwest portion of the Monticello PA have produced bentonitic clay from the Triassic Chinle Formation. Since 1989, the LR 2000 records indicate that 6 BLM authorizations for exploration and production have been issued and have yielded 550,000 cubic yards of clay (BLM 2005h), or less than one authorization and approximately 92,000 cubic yards every two and a half years over the past 15 years. Surface disturbance for each authorization is typically one to 5 acres.

3.8.4.3.3 OCCURRENCE AND DEVELOPMENT POTENTIAL AND REASONABLE FORESEEABLE DEVELOPMENT (RFD)

Given available information, known bentonite clay sites in the Monticello PA have been classified as having a high (H) potential for occurrence with D certainty level. Elsewhere the favorable formations are rated as having a moderate (M) occurrence potential with C certainty. Based on past use, it is likely that there will be continued development (or H development

potential) in the Monticello PA of bentonite clay resources for engineering applications, particularly around areas where there has been previous production.

3.9 NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

3.9.1 BACKGROUND AND HISTORY

Since wilderness study areas (WSAs) were established in the 1980s, wilderness in Utah has become a prominent national issue. For more than 20 years, the public has debated which lands have wilderness characteristics and should be considered by Congress for wilderness designation. As a result of the debate (and a significant passage of time since the BLM's original inventories), in 1996 the Secretary of the Interior directed the BLM to take another look at some of the lands in question. In response to the direction of the Secretary, the BLM inventoried these lands and approximately 2.6 million acres of public land statewide (outside of existing WSAs) were found to have wilderness characteristics (BLM 1999b). Although the Glossary defines "wilderness characteristics" in detail, for purposes of inventory maintenance for this plan revision, the BLM focused on the following criteria: 1) the appearance of naturalness, 2) outstanding opportunities for solitude or primitive or unconfined recreation, and 3) an area with a minimum of 5000 acres in size (with some exceptions) so as to make practicable the management of wilderness characteristics (see also Glossary).

Non-WSA lands with wilderness characteristics are areas having 5,000 acres, or areas less than 5,000 acres that are contiguous to designated wilderness, WSAs or other administratively endorsed for wilderness management lands or, in accordance with the Wilderness' Act's language, areas "of sufficient size as to make practicable its preservation and use in an unimpaired condition." The BLM used the same criteria for determining wilderness characteristics as in the 1979 wilderness inventory. The 5,000 acre value was helpful to the BLM in making preliminary judgments, but it was not considered a limiting factor.

In September 2005, the BLM and the State of Utah, the Utah School and Institutional Trust Land Administration (SITLA), and the Utah Association of Counties (collectively "Utah") reached an agreement negotiated to settle a lawsuit originally brought in 1996 by Utah, challenging the BLM's authority to conduct new wilderness inventories. The settlement stipulated that the BLM's authority to designate new WSAs expired no later than October 21, 1993. The BLM, however, does have the authority to manage for characteristics associated with the concept of wilderness through the land-use planning process. The BLM's Land Use Planning Handbook (BLM 2005a) states that decisions on whether or not to protect wilderness characteristics are to be considered during planning. Refer to *Wilderness Characteristics* in the glossary.

3.9.2 PLANNING AREA PROFILE

There are 29 areas in the Monticello PA, outside of existing WSAs that the BLM determined to have the wilderness characteristics of size, naturalness, and outstanding opportunities for solitude or primitive recreation. The BLM found in the 1999 Inventory that there were approximately 485,525 acres within the Monticello PA that had wilderness characteristics.

In addition to the 485,525 acres found to have wilderness characteristics in the 1999 Utah Wilderness Inventory, additional lands in the Monticello PA have been reviewed for wilderness characteristics by the BLM. These are lands currently proposed for wilderness as part of S.1170, America's Red Rock Wilderness Act of 2007, and are neither WSAs nor a part of the 1999 Utah Wilderness Inventory (Note: The Act has been introduced in this year's Congress as S.1170.) The process used by the BLM to determine the non-WSA acreage with wilderness characteristics consisted of several steps. The BLM used a combination of field visits, data layers including roads, vegetative treatments, (especially chaining), range improvements, and rights-of-way, aerial photography interpretation, and interdisciplinary review to reach a conclusion on those acreages that have wilderness characteristics. This process resulted in a determination that an additional 96,832 acres have the wilderness characteristics of size, naturalness, and outstanding opportunities for solitude or primitive recreation.

The processes described above resulted in 29 areas of non-WSA lands with wilderness characteristics totaling 582,360 acres (Table 3.19). These non-WSA lands with wilderness characteristics have been carried through this land-use planning process to determine how their wilderness characteristics will be managed. Many of the inventoried lands were found to lack wilderness characteristics; these are discussed in staff reports available in the Monticello FO.

Table 3.19. Summary of Lands Evaluated for Wilderness Characteristics

Name of Lands	Total Acreage Evaluated	Non-WSA Lands with Wilderness Characteristics (Acres)	Non-WSA Lands without Wilderness Characteristics (Acres)	Adjacent Lands with Wilderness Characteristics
Allen Canyon	6,410	0	6,410	NA
Arch Canyon	13,600	50	24,700	Contiguous to Mule Canyon WSA
Bridger Jack Mesa	27,170	23,050	4,120	Contiguous to Bridger Jack Mesa WSA and to lands administratively endorsed for wilderness in Canyonlands National Park
Butler Wash	3,040	1,660	1,380	Contiguous to Butler Wash and South Needles WSA and to lands administratively endorsed for wilderness in Canyonlands National Park
Cheesebox Canyon	16,080	13,240	2,840	Contiguous to Cheesebox Canyon WSA and lands administratively endorsed for wilderness in Natural Bridges National Monument
Copper Point	4,420	0	4,420	NA
Comb Ridge	16,400	13,760	2,637	
Cross Canyon	2,100	1,350	745	Contiguous to Cross Canyon WSA

Table 3.19. Summary of Lands Evaluated for Wilderness Characteristics

Name of Lands	Total Acreage Evaluated	Non-WSA Lands with Wilderness Characteristics (Acres)	Non-WSA Lands without Wilderness Characteristics (Acres)	Adjacent Lands with Wilderness Characteristics
Dark Canyon	67,850	66,330	1,520	Contiguous to Dark Canyon WSA and to the Forest Service's Dark-Woodenshoe Canyon Wilderness and lands administratively endorsed for wilderness in Canyonlands National Park and Glen Canyon National Recreation Area
Fish and Owl Creeks	28,740	24,650	2,090	Contiguous to Fish Creek Canyon WSA
Fort Knocker Canyon	12,800	12,410	390	
Gooseneck	3,840	3,570	270	Non-WSA lands with wilderness characteristics shared with the Moab Field Office. Only those acreages in the Monticello FO are shown. Also contiguous to lands administratively endorsed for wilderness in Canyonlands National Park
Grand Gulch	58,010	55,240	2,770	Contiguous with Grand Gulch ISA Complex and lands administratively endorsed for wilderness in Glen Canyon National Recreation Area
Gravel and Long Canyons	37,100	36,890	167	
Hammond Canyon	4,700	4,700	0	
Harmony Flat	10,200	9,660	540	Contiguous with lands administratively endorsed for wilderness in Natural Bridges National Monument
Harts Point	57,796	24,740	31,582	Non-WSA lands with wilderness characteristics shared with the Moab Field Office. Only those acreages in the Monticello FO are shown.

Table 3.19. Summary of Lands Evaluated for Wilderness Characteristics

Name of Lands	Total Acreage Evaluated	Non-WSA Lands with Wilderness Characteristics (Acres)	Non-WSA Lands without Wilderness Characteristics (Acres)	Adjacent Lands with Wilderness Characteristics
Hatch/Lockhart	23,320	1,760	21,560	Non-WSA lands with wilderness characteristics shared with the Moab Field Office. Only those acreages in the Monticello FO are shown.
Indian Creek	25,230	23,280	1,950	Contiguous to Indian Creek WSA and to lands administratively endorsed for wilderness in Canyonlands National Park
Lime Creek	5,560	5,560	0	Contiguous to Road Canyon WSA
Mancos Mesa	73,900	61,570	11,710	Contiguous with Mancos Mesa WSA
Monument Canyon	18,180	0	18,180	NA
Nokai Dome	94,330	94,270	60	Contiguous with lands administratively endorsed for wilderness in Glen Canyon National Recreation Area
Red Rock Plateau	62,150	17,010	45,140	
Road Canyon	13,900	11,320	2,580	Contiguous to Road Canyon WSA
San Juan River	15,100	14,340	400	
Shay Mountain	15,020	6,710	8,310	
Sheep Canyon	4,700	4,000	702	Contiguous to lands administratively endorsed for wilderness in Glen Canyon National Recreation Area
Squaw and Papoose Canyon	3,750	3,570	182	Contiguous to Squaw and Papoose Canyon WSA
The Needle	10,740	0	10,740	NA
The Tabernacle	7,440	0	7,440	NA
Tin Cup Mesa	15,900	0	15,900	NA
Upper Red Canyon	25,080	24,920	160	
Valley of the Gods	14,560	13,670	890	

Table 3.19. Summary of Lands Evaluated for Wilderness Characteristics

Name of Lands	Total Acreage Evaluated	Non-WSA Lands with Wilderness Characteristics (Acres)	Non-WSA Lands without Wilderness Characteristics (Acres)	Adjacent Lands with Wilderness Characteristics
White Canyon	12,980	9,080	3,900	Contiguous to Dark Canyon WSA/ISA Complex
Totals	805,686	582,360	236,385	

¹ The names of these lands are conglomerates of many parcels and may not track to the names given by other groups or public

² These are GIS numbers and may not exactly track to previously published numbers

Non-WSA lands with wilderness characteristics analyzed in this document include about 582,360 acres of BLM-administered public land within the Monticello PA. Additional information concerning these lands is contained in Appendix O. Detailed information about non-WSA lands with wilderness characteristics is part of the administrative record at the Monticello FO and includes: 1) 1999 Utah Wilderness Inventory; 2) 1999 Utah Wilderness Inventory Revision Document for the Monticello FO; 3) 1999 Utah Wilderness Inventory Case Files for the Monticello FO; 4) Reasonable Probability Determinations for the Monticello FO; and 5) Documentation of Wilderness Characteristics Review for the Monticello FO.

3.10 PALEONTOLOGICAL RESOURCES

3.10.1 RESOURCE OVERVIEW

Paleontology is a biological and geological scientific discipline involving the study of fossil materials. Paleontological resources, or fossils, include the body remains, traces, or imprints of plants or animals that have been preserved in the Earth's crust. Among paleontologists, fossils are generally considered to be scientifically significant if they are unique, unusual, or rare; diagnostically or stratigraphically important; or add to the existing body of knowledge in a specific area of the science. The BLM considers all vertebrate fossils to be scientifically significant. Invertebrate and plant fossils may be determined to be significant on a case-by-case basis.

Paleontological resources identified on public lands are considered by the BLM as constituting a fragile and nonrenewable scientific record of the history of life on earth, and are thus considered to represent an important and critical component of America's natural heritage. Once damaged, destroyed, or improperly collected, their scientific and educational value may be reduced or lost forever. In addition to their scientific, educational, and recreational values, paleontological resources can be used to inform land managers about interrelationships between the biological and geological components of ecosystems over long periods of time.

Young alluvial deposits or deep soils may cover and obscure sedimentary bedrock, and any fossils that may occur in that bedrock would be unidentifiable or irretrievable prior to

disturbance actions. In most of these cases, the fossil resources can not be quantified, but the potential for impacting paleontological resources should be addressed in the proposals.

The types of fossils preserved in a sedimentary rock sequence depend on the geologic age of the rocks in which they occur and the environment in which the sediments that comprise the rocks accumulated. Rocks that crop out (are exposed) at the surface of an area and can potentially yield fossils are the result of geologic (depositional, structural, and erosional) history. Geologic formations and sediments exposed at the surface in the Monticello PA range from Pennsylvanian to Recent in age. General geologic mapping of the Monticello PA is available as Hintze's (1975) Geological Highway Map, digitally by Hintze et al. (2000), and in published USGS 2 degree sheets (scale 1:250,000) by Haynes et al. (1972) and Hackman et al. (1973). More detailed descriptions of the geology of the Monticello PA are provided in the Mineral Potential Report.

In the Monticello PA, fossil-bearing sedimentary rocks range in age from Pennsylvanian to Quaternary and represent parts of the 3 great periods of Earth history during the Phanerozoic (*phaneros* = visible, *zoic* = life) eon: the Paleozoic, Mesozoic, and Cenozoic. Fossils preserved in these deposits include invertebrate, vertebrate, plant, and trace fossils. Mesozoic age rocks are most abundant and the only Cenozoic rocks are Quaternary in age. Cenozoic rocks older than Quaternary age that may have been present have been removed by erosion. Vertebrate fossils from the Monticello PA include the body remains of fish, amphibians, reptiles (including dinosaurs), and mammals, as well as tracks and traces of terrestrial animals. These fossils occur in rocks of Pennsylvanian, Permian, Triassic, Jurassic, Cretaceous, and Quaternary age and include some specimens known from nowhere else.

Within the Monticello PA, scientifically significant or important and valuable vertebrate and non-vertebrate paleontological resources are most abundant in the Cedar Mountain, Burro Canyon, Morrison, and Chinle Formations (Classes 4 and 5), and are locally present but less abundant in the Mancos, Dakota, Summerville, Kayenta, Moenave, Moenkopi, Cutler, Rico, and Hermosa Formations (Class 3). Scientifically significant or important vertebrate and non-vertebrate fossils occur but are generally uncommon in Pleistocene-age surficial deposits—that is, the Bluff, Entrada, Curtis, Carmel, Navajo, and Wingate Formations, and in the White Rim Sandstone Member of the Cutler Formation (Class 2). Scientifically significant or important vertebrate and non-vertebrate fossils do not occur in relatively young (Holocene-age) surficial deposits (Class 2), or in igneous rocks such as the Abajo Mountain Intrusives, Minette Intrusives, and Explosion Breccia of volcanic origin (Class 1).

A search of the Utah Geological Survey (UGS) fossil database in Salt Lake City revealed a total of 311 fossil localities in the Monticello PA (Personal communication from M. Hayden to G. F. Winterfeld, Erathem-Vanir Geological, in 2003). Of these, 74 yield vertebrate fossils; 135 yield invertebrate fossils; 88 yield plant fossils; and 42 yield vertebrate trace fossils. Information from this database supplemented by published references and personal experience documents that vertebrate fossils (which the BLM considers of scientific significance) are known from 19 geologic units (formations or members).

3.10.2 CURRENT MANAGEMENT PRACTICES

The BLM has identified 4 objectives for the management of fossil resources on lands it administers. They are: 1) locating, evaluating, managing, and protecting fossil resources; 2) facilitating appropriate scientific, educational and recreational uses of fossils; 3) ensuring that proposed land uses do not inadvertently damage or destroy important fossil resources; and 4) fostering public awareness of the Nation's rich paleontological heritage. Uniform procedural guidance for management of paleontological resources on BLM lands is provided by the BLM's Paleontology Resources Management Manual and Handbook H-8279-1 (BLM 1998a).

Collection of fossils from BLM-administered lands in the Monticello PA is allowed with some restrictions, depending on the significance of the fossils and the place of collection. Under existing regulations, recreational collection of common invertebrate or plant fossils by the public is allowed in reasonable quantities using hand tools. Exceptions to this include except in developed recreation sites or areas or where otherwise prohibited and posted. The public is also allowed to collect petrified wood without a permit for personal, noncommercial purposes. Petrified wood is treated by the BLM as a mineral material rather than as a fossil. Individuals can collect up to 25 pounds plus one piece per person per day, with a maximum of 250 pounds in one calendar year. Current regulations do not allow any commercial collecting of paleontological resources, but a commercial permit may be obtained for the collection and sale of petrified wood.

Recreational collecting of vertebrate fossils, as well as noteworthy fossil invertebrates and plants, is prohibited on all BLM-administered lands. Vertebrate fossils are the remains or traces of animals with backbones such as fish, turtles, dinosaurs, mammals, reptiles, and birds, and include material such as fossil bones, teeth, tracks, coprolites, and burrows. Significant plant and invertebrate fossils are determined on a case-by-case basis.

Professional paleontologists conducting research or assessment and mitigation are primarily regulated through the permit process. Two types of paleontological resource use permits are issued. The basic permit is a survey and limited surface collection permit, issued for reconnaissance work and collection of surface finds, with a one-square-meter limit on surface disturbance. If disturbance during the paleontological work will exceed this limit, or will require mechanized equipment, the researcher must apply for an excavation permit. Prior to authorization of an excavation permit, the BLM must prepare an environmental assessment of the proposed location. All fossils collected under a permit remain public property, must be placed in an approved repository, and never can be sold. Annually, the BLM issues one or two paleontological resource use permits specifically for the Monticello PA (Personal communication with Laurie Bryant, 2003). There are also approximately 12 statewide research permits allowing surface collecting/reconnaissance that would include the Monticello PA. In addition, the BLM issues approximately 8 consulting permits annually in Utah, all of which are statewide and thus include the Monticello PA. The number of amateurs involved in collecting is unknown. The Monticello FO receives several inquiries each year regarding fossil collection. Certainly many important paleontological discoveries have been and will continue to be made by amateurs or those who accidentally encounter fossils, but the number of such discoveries is also unknown.

The BLM favors the development of museum exhibits and informational kiosks or similar developments at roadside turnouts over the interpretation of areas where fossils remain in the ground. These projects provide opportunities for learning and enjoyment. There may be substantial risk of damage or unauthorized collecting of fossils by the public in interpretive areas that are not staffed.

3.10.3 RESOURCE ISSUES

Fossil theft and vandalism is a problem within the FO boundaries. Public interest in fossils and the commercial value of fossils have increased significantly in recent years. As public interest waxes and the prices of fossils rise, federal land managing agencies (including the BLM) are under increasing pressure to both protect scientifically significant fossil resources and to ensure their appropriate availability to the general public. Escalating commercial values of fossils also means that increasingly, fossils on federal lands are subject to theft and vandalism. These crimes reduce scientific and public access to scientifically significant and instructive fossils and destroy the contextual information critical for interpreting the fossils. As described in Title 43 CFR Subparts 8365.1-5 and 8360.0-7, willful disturbance, removal and destruction of scientific resources or natural objects on federal lands is illegal and there are penalties for such violations. Often, the most pronounced damage is the loss of the context and other significant scientific data, the worth of which is difficult to evaluate in monetary terms.

3.10.4 SENSITIVITY EVALUATION

The Monticello FO uses two systems to classify its lands with regard to paleontological resources: the Paleontology Condition System, which is in standard use, and the Probable Fossil Yield Potential, which has been informally adopted by some state BLM offices.

The Paleontology Condition System classifies areas according to their potential to contain vertebrate fossils, or noteworthy occurrences of invertebrate or plant fossils. According to the BLM Handbook 8270-1 (BLM 1998a, revised), this system uses the following classifications:

Condition 1: Areas that are known to contain vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils. Consideration of paleontological resources will be necessary if the Field Office review of available information indicates that such fossils are present in the area.

Condition 2: Areas with exposures of geological units or settings that have high potential to contain vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils. The presence of geologic units from which such fossils have been recovered elsewhere may require further assessment of these same units where they are exposed in the area of consideration.

Condition 3: Areas that are very unlikely to produce vertebrate fossils or noteworthy occurrences of invertebrate or plant fossils based on their surficial geology, igneous or metamorphic rocks, extremely young alluvium (sediment deposited by flowing water), colluvium (a loose deposit of rock debris accumulated through the action of gravity) or eolian (carried by the wind) deposits, or the presence of deep soils. However, if possible, it should

be noted at what depth bedrock may be expected in order to determine if fossiliferous deposits may be uncovered during surface-disturbing activities (BLM 1998a, revised).

The Probable Fossil Yield Potential is a planning tool involving the rating of geological units, usually at the formation or member level, according to the probability of yielding paleontological resources that are of concern to land managers. The classes include the following (personal communication from D. Hanson to G. F. Winterfeld, Erathem-Vanir Geological, 2003):

Class 1: Igneous and metamorphic (tuffs are excluded from this category) geologic units or units representing heavily disturbed preservational environments that are not likely to contain recognizable fossil remains.

Class 2: Sedimentary geologic units that are not likely to contain vertebrate fossils or scientifically significant nonvertebrate fossils.

Class 3: Fossiliferous sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence. Also sedimentary units of unknown fossil potential.

Class 4: Geologic units that are Class 5 units (see below) that have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation.

Class 5: Highly fossiliferous geologic units that regularly and predictably produce vertebrate fossils and/or scientifically significant nonvertebrate fossils, and that are at risk of natural degradation and/or human-caused adverse impacts.

3.11 RECREATION

3.11.1 RESOURCE OVERVIEW

The Monticello PA (previously referred to as the San Juan Resource Area in the 1991 RMP [BLM 1991a]) administers an area that has gained international recognition for its extraordinary natural beauty and numerous recreational opportunities. In addition to the recreational amenities it manages, the Monticello PA is near several popular destinations managed by other federal and state land management agencies. These areas include Glen Canyon National Recreation Area (NRA), Monument Valley, Canyonlands NP, Goosenecks State Park, Hovenweep National Monument and Natural Bridges National Monument.

The Moab PA, internationally recognized for its recreation resources as well, borders the northern edge of the Monticello PA. As the popularity of the entire region has increased, seasonal visitation and demand for a variety of recreational opportunities in the Monticello PA has increased as well. These opportunities include: hiking, biking, boating, cultural resource viewing, camping, off-highway vehicle (OHV) use, rock climbing, horseback riding, hunting, wildlife viewing, sightseeing and scenic photography. Visitation in the Monticello PA occurs throughout the year, while the busy seasons occur in the spring and fall.

3.11.2 CURRENT MANAGEMENT PRACTICES

Although San Juan County is actively promoting itself as a recreational destination, BLM facilities and recreation staff remains limited. There have been major increases in recreational

visitation and use over the last 15 years, and impacts to other resources derived from recreation have been identified.

3.11.2.1 RECREATION OPPORTUNITY SPECTRUM (ROS)

The ROS is a tool used by BLM recreation planners to identify existing outdoor recreational opportunities and management potential, based on a combination of 3 criteria: recreational activity, setting, and experience. Utilizing the ROS system, the range of recreational opportunities in the Monticello PA is divided into the 6 management classes described below (BLM 1991a). Please see Map 35 for the location of each of these current classes throughout the FO. The Recreational Opportunity Spectrum (ROS) will not be carried forward in any of the action alternatives.

- **Primitive (P):** These areas are characterized by a roadless, essentially unmodified natural environment. Approximately 245,723 acres are currently managed to be essentially free from evidence of human use. Activities allowed are those that would protect the primitive recreational activities, settings, and experiences.
- **Semiprimitive Nonmotorized (SPNM):** These areas are characterized by a roadless, predominantly unmodified environment. Approximately 550,537 acres are currently managed to provide a predominantly natural environment with limited evidence of human use. The recreational goal in these areas is to provide not more than 20 group-encounters a day.
- **Semiprimitive Motorized (SPM):** These areas are the same as Semiprimitive, except that motorized use is permitted. Approximately 375,074 acres are currently managed similarly to P-class areas, but motorized boat use on the San Juan River is allowed.
- **Roaded Natural (RN):** These areas are characterized by a generally natural environment, with evidence of natural resource modification and use that is in harmony with the natural environment. Approximately 725,510 acres are currently managed to maintain this generally natural environment.
- **Rural (R):** These areas are characterized by a substantially modified natural environment. Approximately 14,286 acres are currently managed for unlimited access and high visitation, while still in harmony with the natural environment.
- **Urban (U):** These areas are characterized by a user-intensive, developed, and modified resource setting. Approximately 2,371 acres are currently managed for high visitation and development.

3.11.2.2 THE SAN JUAN RESOURCE MANAGEMENT PLAN

The 1991 San Juan RMP (BLM 1991a) for the Monticello FO is the current guiding document for recreation management throughout the San Juan Resource Area (SJRA). The management objectives are: "to develop recreation sites; to designate SRMAs and manage so as to protect recreational opportunities in accordance with RMP goals; to manage public lands to preserve most ROS P-Class areas and protect most ROS SPNM-class areas in accordance with RMP goals; to designate all of SJRA as Open, Closed, or Limited for outstandingly remarkable value

(ORV) use, depending in part on ROS classes and on the need to recognize critical environmental values in specific areas" (BLM 1989).

3.11.2.3 OFF-HIGHWAY VEHICLE MANAGEMENT (OHV)

The San Juan RMP (BLM 1991a) defines the level of OHV opportunities, and the reasons for OHV closure areas. Currently there are 611,310 acres open to OHV use without restrictions, 540,260 acres designated as limited use with seasonal restrictions, 570,390 acres designated as limited to existing roads and trails, 218,780 acres limited to designated roads and trails and 276,430 acres closed to OHV use in the Monticello PA. No maps or inventories were completed for the areas where travel is limited to existing roads and trails. Additionally, the Monticello FO has not completed a designation process for the areas where travel is limited to existing roads and trails.

Off-highway vehicle use is monitored intermittently in 4 areas in the PA, including Fish Creek Canyon, Butler Wash, Bridger Jack Mesa and Indian Creek. Monitoring includes the determination of the number of tracks encountered along a transect, the type of tracks observed, and any vehicles observed. The monitoring report concludes with any recommended action or immediate on-the-ground action. Photographic logs are also kept to document resource damage. All WSAs in the PA are monitored for OHV intrusions.

Areas that have intense OHV use include Butler Wash, Comb Wash, Montezuma Creek, Indian Creek, and Hole in the Rock Trail. Demand for OHV activities is expected to continue to increase in the Monticello PA. This will place demands on the FO to provide for and monitor motorized users. This upcoming demand also has implications for OHV designation and for route marking.

There are active OHV groups, both local and national, that want to see improved management from the BLM in terms of OHV route development and opportunities. The BLM has received comments from the public asking for marked OHV trails and trailhead facilities and staging areas. The BLM has also received numerous complaints about OHV use, misuse, and illegal trail building. There is a growing level of conflict between motorized and nonmotorized users of the PA (see Section 3.11.4.3, User Conflicts).

The Monticello FO has received increased requests from commercial companies for special recreation permits (SRPs) related to OHV guiding and tours, as well as from groups that organize group events such as the San Juan ATV Safari and the Jeep Jamboree.

The Utah Division of State Parks and Recreation monitors OHV registration through the Utah Division of Motor Vehicles (DMV). The following data show a dramatic increase in OHV ownership in the State of Utah and San Juan County during the past 5 years. (Note: OHV registrations include all-terrain vehicles [ATVs], non-street legal motorbikes, snowmobiles and dune buggies. Vehicles that are street legal, such as jeeps and trucks, are licensed, and are not considered OHVs for registration purposes.)

Table 3.20. OHV Registrations in 1998, 2002, and 2003

	1998	2002	2003	Percent Increase
Statewide	77,361	160,583	167,174	216%
San Juan County	342	914	961	28%

Source: Personal communication between Julie Nelson, DMV Analyst, and David Harris, SWCA Environmental Consultants, April 8, 2004.

An OHV Survey completed by the Institute for Outdoor Recreation and Tourism entitled Off-Highway Vehicle Four-Wheeler Survey (Reiter and Blahna 1998b), summarizes the use characteristics of visitors to the Moab Easter Jeep Safari. The results of this study can be extrapolated as a representation of all OHV users in the region, and is relevant also to the Monticello PA. Typical expectations of OHV users include scenery, naturalness, seeing a new area, and remoteness. Socializing within one's group was also identified as a high expectation of this user group. Typical users were not characterized as risk takers. The primary management priorities of this user group are to:

- protect natural resources;
- not close or restrict use on any existing routes;
- provide new trails;
- mark and sign popular routes;
- let existing trails get more difficult; and
- emphasize information and educational approaches to minimize impacts and to inform and educate OHV recreationists (Reiter and Blahna 1998a).

3.11.2.4 SPECIAL RECREATION PERMITS (SRPs)

With 89 land-and river-based commercial outfitters in the Monticello PA for 2006, guiding and events are becoming an increasingly important part of the local San Juan County economy. However, permitting is a time-consuming activity for BLM staff because a NEPA environmental analysis must be completed before a permit can be issued. A Cost Recovery Program is in place for any NEPA proposal that is estimated to take more than 50 hours of BLM specialists' time. The types of SRPs issued by the Monticello FO are described in detail below.

3.11.2.4.1 NON-COMMERCIAL SPECIAL RECREATION PERMITS (SRPs) AND SPECIAL EVENTS

Special recreation permits are required for commercial and competitive recreational uses for groups and for OHV events involving 50 or more vehicles on BLM-administered public lands. SRPs may be required for recreational use on public lands by organized non-commercial groups of greater than one person, but permit issuance would be at the discretion of the FO Manager and based on site-specific conditions (personal communication between Brad Colin, Monticello FO, and David Harris, SWCA Environmental Consultants, June 22, 2007). Commercial outfitters are required to submit a schedule of use prior to the BLM issuing an SRP (BLM 2002b).

3.11.2.4.2 COMMERCIAL AND NON-COMMERCIAL RIVER PERMITTING

In addition to the permit stipulations stated above, additional stipulations apply to the San Juan River. In 2005, the BLM received 4,325 non-commercial permit applications for the San Juan River; of which 964 were approved. Due to the high and growing demand, the BLM has instituted a mandatory, assigned campsite system on the San Juan River at Slickhorn (sites A–E), Grand Gulch, Trimble, Oljato, and Steer Gulch campsites, which are the only campsites available at higher water levels. The BLM reserves dates at these nine campsites on a rotating basis for commercial use (BLM 2002b). Currently, 11 commercial permits have been issued for the San Juan River, and a moratorium on issuing additional commercial permits is in effect.

3.11.2.4.3 FEE DEMONSTRATION, FEE COLLECTION, AND BUDGET FOR PROGRAMS

Due to a lack of base budgetary support, the Monticello FO has come to rely on the Federal Lands Recreation Enhancement Act for needed funds. The Monticello FO collects fees for recreational use in several locations including the San Juan River, Cedar Mesa and fee collection sites at two campgrounds.

Services to the public are provided from these fee monies. These services include (but are not limited to) maintenance of campgrounds, boat ramps, and restroom facilities; staffing of the San Juan River Ranger Station and the Kane Gulch Ranger Station; and expenses related to the San Juan River and Cedar Mesa permit activities. Fees amounted to \$259,330 in 2005. Fee, receipts vary greatly depending on water levels in the San Juan River and the amounts of drinking water in the canyons available for backpackers. Fees from the river program support both the river program and the Cedar Mesa program. While the Cedar Mesa program does collect fees, they are not enough to cover the expenses incurred for the management of the area.

3.11.2.5 RECREATION MANAGEMENT AREAS

The BLM recreational management includes the designation two types of recreational management areas; Special Recreation Management Areas (SRMAs) and the Extensive Recreation Management Area (ERMA). SRMAs are areas with very specific recreational opportunities or needs that require intensive management. SRMAs typically receive more intensive use and require higher numbers of staff and/or facilities to manage. The ERMA encompasses all those areas within the Monticello PA that are not managed as SRMAs. Detailed descriptions of the SRMAs and the ERMA in the Monticello PA are given below. Within the Monticello PA, 3 areas have been designated as SRMAs, including the San Juan River, Grand Gulch (which encompasses Cedar Mesa), and Canyon Basins. The Colorado River lies within the ERMA, but is not designated as part of the ERMA.

Another management technique is the designation of ACECs. ACECs are designated areas in the FO area where special management attention is needed to: 1) protect and prevent irreparable damage to important historic, cultural, and scenic values, fish or wildlife resources, or other natural systems or processes; or 2) to protect human life and safety from natural hazards. While ACECs typically are not associated directly with recreational management, in many cases the protection of ACEC resource values provides certain types of recreational opportunities generally relating to cultural, historic, scenic, or wildlife resources.

3.11.2.5.1 SPECIAL RECREATION MANAGEMENT AREAS (SRMAs)

3.11.2.5.1.1 San Juan River SRMA

The San Juan River SRMA (SJRMA) encompasses approximately 15,000 acres on the north side of the San Juan River, from Montezuma Creek downstream to the boundary of the Grand Gulch Plateau SRMA, west of the town of Mexican Hat, Utah. The south side of the San Juan River is under the jurisdiction and administration of the BIA and the Navajo Nation.

Boating use on the San Juan River is very popular. A total of 1220 trips were recorded for 2005 with 45,059 user days. 2004 use was 1015 trips with 37,632 user days. Use varies widely depending on water flows in the river. 2005 was a record high water year. This intensive use necessitated the initiation of a lottery system for obtaining permits to control the number of visitors on the river. Many more private users apply than obtain permits, and many more companies would like to have commercial permits on the San Juan River. Pending the completion of a San Juan River Management Plan, commercial use is currently capped by the number of operators and by the number of launch dates.

The majority of float trips occur from March through September, though river use is open year-round. Launch sites include Sand Island and the Mexican Hat Boat Ramp while other sites are also used occasionally. Take-out locations are the Sand Island Boat Ramp, the Mexican Hat Boat Ramp, and Clay Hills.

There is no current river management plan for the San Juan River. Natural resources issues identified by staff in the Monticello FO are described below:

- A San Juan River Management Plan is needed.
- Expansion of invasive, non-native species along the riparian corridor and popular camping areas.
- High recreational use is making the protection of threatened and endangered species more difficult. Increase in recreation, especially in riparian areas and canyons, is impacting special status species, making protection more difficult. These species include the Yellow-billed Cuckoo, the Southwestern Willow Flycatcher, the Gunnison Sage-grouse and the Mexican Spotted Owl (see Section 3.16, Special Status Species).
- Increased visitation, and access to more information, has escalated the amount of looting and degradation of cultural sites. OHV riders both create and follow trails that pass directly through cultural sites. Secondary impacts include increased scouring and erosion of cultural resource sites as a result of vegetation loss from OHV use and dispersed camping related to OHV use.
- Siltation on the lower half of the river has changed the boating experience and may cause potential closure in 10–15 years.
- Water development in the upper San Juan River basin has created lower flows to lower river segments; boaters, especially those with larger commercial boats, are having problems getting through and are canceling launches.

- Launch ramps at the Sand Island Campground and at Mexican Hat Boat Launch are prone to flood damage.
- Management Agreements with the Navajo Nation and Glen Canyon NRA should be written (as of February 2004 these are underway).
- The boundaries of the SRMA need to be changed due to the "accretion" of land at approximately River Mile (minus) -9 to River Mile approximately (minus) -5, south of the private parcels located at the town of Bluff.

The 2001 Utah Rivers Study completed by the Institute for Outdoor Recreation and Tourism asked visitors to identify problems along the Upper and Lower San Juan River. Table 3.21 shows results of this study. However, it should also be noted that 98% of boaters on the upper San Juan and 99% on the lower San Juan said they were satisfied with their river trip experience.

The most popular trip origin and destination on the San Juan River is from Sand Island to Mexican Hat, with more than double the trips as any other stretch of the river. The majority of trips originate from Sand Island Campground.

Table 3.21. Issues Identified by Users on the San Juan River

Upper San Juan River	Lower San Juan River	Both Sections
Destruction of historic resources	Hard finding unoccupied campsites	Litter along the river
Graffiti or other vandalism	Not enough campsites along river	Evidence of cattle
Lack of information about river	Cattle droppings at campsites	Graffiti/Vandalism
Lack of water at launches/ take-outs	Destruction of historic resources	Lack of water at launches
Vegetation and soil trampling at launches	Litter along river	
	Low flying aircraft	
	Lack of water at launches/take-outs	

Source: Blahna and Reiter 2001.

Developed sites within the San Juan SRMA include the Sand Island Campground with 24 sites, Sand Island Boat Launch, and Mexican Hat Boat Launch. The river take-out point at Clay Hills is on land administered by Glen Canyon NRA. There is little development at Clay Hills; a pit toilet, an unimproved dirt ramp, and a rough dirt access road.

3.11.2.5.1.2 Grand Gulch Plateau SRMA/Cedar Mesa

The Grand Gulch Plateau SRMA includes not only the Grand Gulch canyon system, but also Cedar Mesa and its canyon systems. The Cedar Mesa area of the Grand Gulch Plateau SRMA is an area of regional, national and international significance for recreation. It is located approximately 25 miles west of the town of Blanding, Utah and 10 miles north of the town of Mexican Hat, Utah. It is bordered on the north by the Manti-La Sal National Forest (NF), on the

east by Butler Wash, on the west by Scenic Highway Route 276, and on the south by Highway 163 and the Glen Canyon NRA.

The major attractions within Cedar Mesa are its cultural resources including: lithic scatters, petroglyph and pictograph panels, pit houses and pit structures, Pueblo kivas, granaries, and cliff dwellings. Currently Cedar Mesa is being managed under the Grand Gulch Plateau Cultural and Recreation Area Management Plan (BLM 1993c). Due to increasing demand, a backcountry permit allocation system was adopted in 1999 for Cedar Mesa hikers. Permits are required to hike the area and are obtained either at the Monticello FO or at the Kane Gulch Ranger Station on Cedar Mesa.

The Grand Gulch Plateau Cultural and Recreational Area Management Plan (BLM 1993c) established the following overall objectives for the Cedar Mesa area (including Grand Gulch):

- protect and preserve cultural resources;
- protect, preserve, and enhance the natural character, solitude, inspirational value and scenic quality;
- protect and preserve primitive and semiprimitive and nonmotorized recreation opportunities; and
- increase awareness, appreciation, and stewardship of cultural and natural resources through education and interpretation.

Recreation resource management decisions specific to the Grand Gulch Plateau SRMA include:

- The Grand Gulch Plateau area was identified as an area to be managed to preserve Recreation Opportunity Spectrum (ROS) primitive (P) class and protect ROS semiprimitive nonmotorized class (SPNM) areas (see Section 3.10.2.2 above for detailed ROS information).
- The following ROS classes were assigned within the Cultural and Recreation Management Area: primitive (P) class, semiprimitive nonmotorized (SPNM) class, semiprimitive motorized (SPM) class, and roaded natural (RN) class (See Map 35 for a depiction of current ROS areas within the FO PA).
- Five recreation sites were identified for development or improvement including: Kane Gulch Ranger Station Area, which was constructed in 2005 and 2006. Comb Wash Campground, which is funded for 2006; Arch Canyon Campground, Butler Wash Ruin, and Mule Canyon Ruin. All have been developed or being planned for development except for Arch Canyon (Arch Canyon will likely not be recommended for development in the current RMP revision).

The Kane Gulch Ranger Station, located at the main access point into Grand Gulch, is the primary administrative site for the management of the area. BLM employees and volunteers, who live and work there seasonally from mid-February to November, staff the ranger station. Several other buildings and a number of travel trailers are sited there. Developed recreation sites within Grand Gulch Plateau SRMA include: the Kane Gulch Ranger Station, Bullet Canyon Trailhead, Government Trailhead, Collins Springs Trailhead, Arch Canyon Ruin, Comb Wash Campsite, Fish and Owl Canyon Trailheads, Moon House Trailhead, and the Butler Wash Ruin and Mule Canyon Ruin Interpretive Sites.

3.11.2.5.1.3 Canyon Basins SRMA

Canyon Basins SRMA encompasses approximately 214,000 acres. It is surrounded by Canyonlands National Park (NP) and Glen Canyon NRA on the west, Manti-La Sal NF on the south, and Hart's Point on the east. Located within the SRMA boundaries are the following ACECs: Indian Creek, Lavender Canyon, Bridger Jack Mesa, Shay Canyon, Butler Wash, and Dark Canyon. Other well-known recreation areas within the SRMA include Beef Basin, Shay Mesa, Dark Canyon Plateau, and Salt Creek Mesa.

The Indian Creek Recreation Corridor is a recognized attraction for rock climbing, while also providing opportunities for camping, backpacking, motorized vehicle use, and archeological site viewing. The Access Fund, a climbing lobbying group, has a very strong commitment to this area and recently, with private industry support, is revising a brochure on Indian Creek. An environmental assessment (EA), funded by the Nature Conservancy was signed in October 2005 for the Indian Creek Recreation Corridor. A private group, the Friends of Indian Creek Inc. was established in 2006 to assist the BLM with the implementation of the Indian Creek Recreation Corridor EA.

The rapidly increasing popularity of the area has severely increased the impact of humans on the corridor environment, and has created a demand for additional visitor services and facilities. Issues and concerns arising from the area's increase in popularity include: an increase in size and use of dispersed camping areas; management of human waste; preventing human-livestock conflicts; lack of adequate and safe parking; and protection of cultural sites within the immediate climbing area.

Existing facilities within the Canyon Basins SRMA include: Newspaper Rock Interpretive Site, Indian Creek (upstream from the Falls) Campsite (3 sites), and Hamburger Rock Campground (8 sites).

Dark Canyon ACEC is located in Canyon Basin SRMA. The Dark Canyon ACEC encompasses approximately 62,040 acres and has the same boundaries as the Dark Canyon Primitive Area. It includes Dark Canyon with its side canyons of Lost, Lean-To, Youngs, and Black Steer, and then Bowdie Canyon, Gypsum Canyon, and Fable Valley. This area was designated as a primitive area in December 1970 to protect its scenic, recreational, and other values and became an instant Wilderness Study Area in 1976. The lower portions of Dark Canyon (3 miles), Bowdie Canyon (2 miles), and Gypsum Canyon (3 miles) are within the Glen Canyon NRA and are areas proposed for wilderness designation. The upper portion of Dark Canyon is within the Manti-La Sal NF and was designated in 1984 as the Dark Canyon Wilderness Area, encompassing about 50,000 acres (BLM 1986a).

Beef Basin is located within the Canyon Basin SRMA. This area is popular with those seeking a backcountry driving experience, primitive camping and an opportunity to see ruins.

Since the implementation of mandatory permit system on Cedar Mesa, there is increasing private recreational use of Dark Canyon as well as increasing demand for permits from commercial operators. If this trend continues, a permit system for Dark Canyon will likely be necessary. Commercial interest and the use of Dark Canyon is originating from FS, NPS, and BLM public

lands. There is little current on-the-ground management by the BLM within the Dark Canyon ACEC.

3.11.2.5.2 EXTENSIVE RECREATION MANAGEMENT AREA

3.11.2.5.2.1 Colorado River

The Colorado River lies within the Extensive Recreation Management Area (ERMA), but is not designated as part of the ERMA. The Monticello FO manages the portion of the Colorado River from the northernmost PA boundary at the Colorado River south to Canyonlands NP (approximately river mile 50 to river mile 31).

Guidance supports dispersed recreation use throughout the San Juan PA, with permits required for commercial and private use in special areas where protection of resource values is needed. There is very little unpermitted day use of the river in Canyonlands NP because of the distance from put-ins and take-outs. Commercial use is expected to increase outside of the park (personal communication between Dave Wood, Canyonlands NP, and David Harris, SWCA Environmental Consultants, on March 30, 2004). A joint agreement between the BLM Monticello FO and Canyonlands NP to manage the Colorado River segment needs to be completed.

3.11.2.5.2.2 Hole in the Rock Trail

This trail is both an historic feature as well as a recreational opportunity. The trail was established in 1879 as a route between the settlements of Escalante and Bluff. Major use of the trail is by four-wheel drive vehicles for scenic driving. The trail segment within the Monticello PA is approximately 115 miles long.

The trail is open to OHV use. Sections of this trail lead into Glen Canyon NRA, and within the Glen Canyon NRA, vehicle use is open to licensed vehicles, but not unlicensed OHVs. There is increasing use and interest for both private and commercial use of the trail. These uses include cultural tours, OHV tours, bicycle tours, canyoneering, backpacking, and special uses such as OHV Safaris and adventure races. Many local residents have ancestors that traveled on this trail. These residents want to visit the area, and they have established The Hole in the Rock Foundation to protect their interests and work with the BLM on issues concerning this trail.

3.11.2.5.2.3 Old Spanish National Historic Trail

Approximately 20 miles of the Old Spanish National Historic Trail (a designated National Historic Trail running from New Mexico to California), lies within the Monticello PA, and except where crossing private land, the trail corridor is open for vehicle use. There are no BLM-administered facilities along the trail segment, and the BLM is currently not actively managing the trail. The BLM is currently cooperating with the NPS to complete a plan to manage the entire trail.

3.11.2.5.2.4 Valley of the Gods

The Valley of the Gods is located in the southern portion of the Monticello PA. Recreational activities in Valley of the Gods include sightseeing, primitive camping, hiking, and biking. The annual one-day Bluff Balloon Festival is held there in January. The area is well known for its scenic quality, with outstanding views of Cedar Mesa sandstone and other unique geologic formations. County Road 242 (dirt, single-lane road) takes a 17-mile circuitous route through the valley, passing many features of interest.

3.11.2.5.2.5 Three Kiva Pueblo

Three Kiva is a pueblo site with a reconstructed kiva. Kivas are an important Southwestern architectural form. "Kiva" is a Hopi word used to refer to specialized round and rectangular rooms in Pueblos. Modern kivas are used for men's gathering and ceremonial purposes. Archeologists believe that ancient kivas were used for similar purposes. The site, near Montezuma Creek, has an interpretive sign as well as a ladder allowing visitors an opportunity to view a pueblo kiva.

3.11.2.5.2.6 Trail of the Ancients National Scenic Byway.

The Trail of the Ancients National Scenic Byway is a scenic drive providing an opportunity for viewing prehistoric and modern Native American cultures and remarkable desert scenery. This scenic byway runs through a portion of the Grand Gulch Plateau SRMA.

3.11.3 TRENDS IN OUTDOOR RECREATION ACTIVITIES

According to staff in the Monticello FO, the following trends in recreation have been observed in the resource area:

- increased OHV use;
- increased commercial activity requests;
- increased Special Event requests;
- increased rock climbing;
- increased visitation of recreation and cultural sites due to increase in distribution of information via the Internet;
- increased demand for private and commercial river use;
- the displacement of campers out of areas with mandatory permit systems;
- increased overflow camping use by visitors that cannot find room in NPS campgrounds;
- increased visitor expectation that the BLM's information sources are comparable to that available on the Internet; and
- displacement of private visitors and commercial operators from the NPS lands around Moab; these visitors are moving into the Monticello area (Reiter and Blahna 1998a, 1998b).

The Recreation Management Information System (RMIS) documents visitor days for various activities throughout the FO area. Although these numbers are not completely accurate, they do reflect the proportionate use as well as the increase in use of the resource for recreation activities. The table below shows recreation use for the Fiscal years 2001, 2002 and 2003.

3.11.4 ISSUES AND CONCERNS

3.11.4.1 INCREASED RECREATION USE

SRMA boundaries need to be reevaluated based on increased visitor use, recreation opportunities and the resource involved. The current RMP does not identify the kinds of levels of land use that could sustain recreational values. There are no accurate numbers on private recreational use other than the permitted uses on the San Juan River and Cedar Mesa. At current staff levels, it is becoming difficult to keep up with SRP and NEPA workloads.

Table 3.22. Visitor Days 2001–2005

Activity	2002	2003	2004	2005	2002–2005 Increase or Decrease
Camping	36,103	51,266	85,759	84,560	48,457
Boating (nonmotorized)	19,308	21,696	28,094	32,700	13,392

3.11.4.2 RESOURCE CONFLICTS/IMPACTS

Various recreational activities create impacts to resources including riparian areas, vegetation, wildlife, vegetation, soils, grazing, oil and gas, and cultural resources. Resource conflicts occur when two uses compete for the same resource, such as recreational use in wildlife habitat. Specific areas where resource conflicts are occurring include:

- Recreation vs. Natural Resources—specifically at Indian Creek where camping impacts the riparian area, traffic impacts safety, and high use impacts human health and safety.
- Recreation vs. Cultural Resources—The Cedar Mesa area of Grand Gulch has a reputation for being a premier place to hike into Indian ruins and remote canyons. Although managed

by permit, information available on the Internet and in guidebooks is leading hikers to sensitive cultural sites. The issue is how to protect cultural sites and still allow for visitation and education at Newspaper Rock, Butler Wash, Comb Wash, Cedar Mesa, and Montezuma Creek. This issue is particularly intense along the San Juan River and on Cedar Mesa.

3.11.4.3 USER CONFLICTS

As recreational use has increased throughout the Monticello PA, users have moved into areas historically used by other resource users, such as ranchers, and the oil and gas industry. Conflicts have developed among these user groups as long-term users resent encroachment of recreationists on the public lands. In turn, some recreation users see their use of the public land as the highest and best use, and feel that the established users have no place on that land. Another source of tension is among various recreation user groups.

When recreational use reaches a certain threshold, user groups start to resent the multi-use nature of public lands. For example, some hikers resent mountain bikers and motorized users on shared trails, while mountain bikers may seek some trails free from motorized use. Conflicts are known to exist between:

- recreation and grazing users;
- nonmotorized recreation and motorized recreation users;
- rock-climbing and grazing (specifically in Indian Creek) users;
- commercial vs. private users (related to San Juan River users as well as backpackers throughout the resource area, especially in Dark Canyon); and
- river runners and OHV users.

3.11.4.4 PUBLIC HEALTH AND SAFETY

Human waste disposal is becoming an issue in the more popular slot canyons and dispersed camping areas, such as Indian Creek. Climbers and hikers, the primary users of this area, have written letters to the BLM asking the agency to address this problem. The availability of facilities is directly related to public health. Inadequate numbers of organized campgrounds and restroom facilities contribute to unhealthy levels of human waste in some areas, posing a health risk to visitors. Funding for maintenance of existing and needed facilities is also a serious issue.

Flooding is an issue for recreational use in the SJRA. Flash floods are a real and seasonal danger in narrow canyons and canyon crossings. Recent flooding in specific areas provides an example of the problem: portions of Newspaper Rock and Sand Island Campground were recently inundated by floodwaters. Sand Island campground is particularly prone to flood damage. Trails may also become inundated and nonfunctional. The BLM currently lacks the funding to address and rectify the damage that occurs from flooding.

3.11.4.5 OFF-HIGHWAY VEHICLES (OHVs)

3.11.4.5.1 OHV USE

The increase in the use of OHVs has created several issues for the Monticello FO. First, the speed of OHVs allows easier access than foot travel to remote parts of the area, making management of this activity and the area utilized more difficult, while also increasing the potential range of impacts. Secondly, the popularity of this activity continues to grow, and the addition of special events puts additional strain on resources. Planning for areas in which OHVs can be used continues to receive national and local attention. Specific issues identified by the BLM include:

- Although the current RMP identifies all public lands as open, limited, or closed, the Plan does not give specific management guidance within these designations.
- The OHV designations outlined in the SJRMP do not currently address the amount of recreational use now occurring or the potential of resource damage associated with this use.
- In the current RMP none of the OHV designations have been implemented. Maps depicting existing RMP decisions are out of print and not available to the public.
- Increased use creates the need for additional management and planning, which is not funded.

Part of this RMP revision process is to evaluate and update the OHV designations and develop a current map of the Monticello PA in order to ensure that the FO is in compliance with Executive Order 11644 as amended by Executive Order 11989 and also to ensure that the FO is following the National Management Strategy for Motorized Off-Highway Vehicle Use on Public Lands, January 2001.

3.11.4.5.2 OHV LEGAL ISSUES

Monticello FO, like much of Utah, continually deals with OHV-associated conflicts, including those that have legal implications. These conflicts have ranged from minor disagreements between resources users, to unauthorized opening of an old trail into a WSA. The BLM has struggled with OHV management in the Monticello FO due to the lack of a completed travel plan that includes designated areas for OHV use and a completed roads and trails system. Without a final travel plan, the BLM cannot update travel maps or undertake to educate users on OHV restrictions to protect natural resources, particularly cultural resources, which are found in abundance on public lands in the Monticello FO.

3.12 RIPARIAN RESOURCES

Riparian areas and wetlands are some of the most diverse and productive ecosystems in Utah, but on the landscape level they typically compose very little of the total land area. Riparian and wetland ecological systems comprise less than 1% of the 22 million acres of public lands administered by the BLM in Utah. However the functions and habitat value provided by these areas are essential to both humans and wildlife. For humans, these values are recreational, scenic, livestock production, and hunting. Riparian areas are also typically tied to cultural and historical values. Additionally, the lifecycles and migration routes of many mammals, birds, amphibians,

and fishes rely partially or wholly on riparian habitat. Riparian and wetland resources are among the first landscape features to show impacts from management activities and provide an indicator of overall watershed condition.

Riparian and wetland areas are vegetative or physical ecosystems that develop in association with surface or subsurface water (Leonard et al. 1997). Benefits of riparian/wetland ecosystems include:

- maintaining water quantity and quality;
- enhancing soil stability and reducing sediment loads;
- reducing destructive energies associated with flood events;
- providing for diverse plant and wildlife ecosystems, including special status species;
- economic value derived from sustainable uses (open space, hunting, livestock grazing and commercial recreation);
- migration corridors for wildlife; and
- thermal/shade protection for both humans and wildlife, which is especially important within the arid southwest.

3.12.1 RESOURCE OVERVIEW

The BLM administers approximately 20,912 acres (1.6% of lands within the Monticello FO) that are riparian and wetland resources. Linear riparian distance in the Monticello FO totals 1,078 miles. Wetlands in the Monticello FO are primarily concentrated along these riparian zones. Some isolated springs do occur, and while these make up a very small percentage of wetland resources, they are critical to both wildlife and livestock.

Within most riparian/wetland systems in the arid southwest, the potential of a riparian/wetland ecosystem is strongly dependent upon the availability of water. The degree, timing and source of water availability, among other physical factors, contribute to a stream falling into one of 3 categories:

- **Perennial**—A stream that flows continuously. Perennial streams are generally associated with a water table in the localities through which they flow.
- **Intermittent**—A stream that flows only at certain times of the year when it receives water from springs or some surface source such as melting snow in mountainous areas.
- **Ephemeral**—A stream that flows only in direct response to precipitation, and whose channel is above the water table at all times.

Existing riparian vegetation communities in the Monticello FO were catalogued in 1990 using aerial photographic interpretation with some ground-truthing. Identified species reflected the dominant vegetation in the community during the cataloguing. Existing riparian vegetation cover types and percent composition of riparian area during this time period are included below in Table 3.23.

Table 3.23. Riparian Community Acreages, 1990 Inventory, Monticello FO

Riparian Community	Percent Composition
Cottonwood	65.9%
Willow	<0.1%
Tamarisk*	30.2%
Grasses	0.3%
Oak	3.6%

*This is an invasive, non-native species.

3.12.2 RIPARIAN/WETLAND STUDIES

The BLM has developed Riparian Proper Functioning Condition (PFC) methodology for use by interdisciplinary teams of natural resources professionals (BLM 1993d). This methodology assesses riparian areas relative to what would be expected under natural conditions and limiting factors, i.e., political, social and economic constraints. Levels of functionality include functional, functional-at risk, nonfunctional and unknown. A preliminary summary of data on riparian functioning condition was prepared by Paul Curtis, Rangeland Conservationist, Monticello FO (Table 3.24). These data were collected by private contract in 1994 and by BLM resource specialists from 1994 to present. Approximately 50% or less of the actual stream mileage was traversed during the collection of this data. Functioning condition is divided into 5 classes, which are defined below, with corresponding miles of riparian habitat in each class for the Monticello PA (BLM 1998b):

- **PFC:** Currently 639 miles (59%) of riparian/wetland areas in the Monticello FO are in PFC when adequate vegetation, landform, or woody debris is present to:
 - dissipate high-energy water flow;
 - filter sediment, capture bedload, and aid floodplain development;
 - improve floodwater retention and groundwater recharge;
 - develop root masses that stabilize streambanks;
 - develop diverse fluvial geomorphology (pool and channel complexes) to provide habitat for wildlife; and
 - support greater biodiversity.
- **Functioning at Risk, trend not apparent (FAR):** Currently 240 miles (22%) of riparian/wetland habitat are in functional condition, but at least one soil, water, or vegetation attribute makes them susceptible to degradation following high flow events. The trend in these systems is not apparent. Management practices that may make them At Risk are commonly livestock grazing, presence of roads, OHV activities, and recreational activities and development.
- **Functioning at Risk, upward trend (FAR>):** Currently 43 miles (4%) of riparian/wetland habitat are in functional condition, but an existing soil, water, or vegetation attribute makes them susceptible to degradation following high flow events. However, the limiting attribute is improving, causing the system to trend upward. Some degradation could be natural.

Management practices that may make them At Risk are commonly livestock grazing, presence of roads, OHV activities, and recreational activities and development.

- **Functioning at Risk, downward trend (FAR<):** Currently 149 miles (14%) of riparian/wetland habitat are in functional condition, but an existing soil, water, or vegetation attribute makes them susceptible to degradation following high flow events. The limiting attribute is not improving, causing the system to trend downward. Some could be natural degradation. Management practices that may make them At Risk are commonly livestock grazing, presence of roads, OHV activities, and recreational activities and development.
- **Nonfunctioning (NF):** Currently 7 miles (0.6%) of riparian/wetland habitat are clearly not providing adequate vegetation, landform, or large wood debris to dissipate stream energy associated with high flows, and thus are not reducing erosion, improving water quality, etc. Some degradation could be natural. Management practices that may make them At Risk are commonly livestock grazing, presence of roads, OHV activities, and recreational activities and development.

Riparian/wetland exclosures have been constructed within 15 sites: Comb Wash (1), Indian Creek (3), Montezuma Creek (2), Nancy Patterson (1), Monument Canyon (1), Horsehead (1), and Cross Canyon (6), to either determine ecological site potentials or protect/improve natural functions. Riparian pastures have been established within the Montezuma Canyon allotment to provide special protection to sensitive riparian/wetland ecosystems. Grand Gulch and major portions of Fish and Owl, Mule, Road canyons, and Arch Canyon receive no livestock grazing.

3.12.3 RIPARIAN/WETLAND RESTORATION

Restoration of riparian/wetland ecosystems can involve efforts to manually, mechanically, chemically, or biologically alter or restore riparian/wetland resources or conditions for the benefit of the riparian/wetland ecosystem.

Invasive, non-native species (namely tamarisk, Russian olive, and Russian knapweed) are now common within most riparian/wetland ecosystems along major river ways in the Monticello PA. Some of the common riparian native species are Fremont Cottonwood, coyote willow, rushes, and sedges. Possibly the most devastating aspect of invasive, non-native species is the cumulative alteration to an unhealthy riparian ecosystem. Effects of invasive, non-native species include the following:

- invasive plants often dewater riparian sites with deeper tap roots to out-compete natives for availability of water in arid environments;
- tamarisk secretes salt and increase soil and water salinity, resulting in reduced seed establishment of native species, and reduced downstream water quality. Additionally, tamarisk has deeper roots than native willows, and it will out-compete those for water;
- invasive plants compete for sun and space along the narrow riparian habitats;
- invasive plants have large numbers of seeds and long seed establishment periods (very prolific in comparison to native species);
- invasive plants provide poor habitat, with subsequent reductions in biodiversity (significant decreases in numbers and types of associated biotic species including birds, bats, insects, amphibians, etc.);
- invasive plants promote entrenched systems with highly destructive flooding energies that remain un-dissipated within deep channels, resulting in high bank loss, sedimentation, and salinity; and
- invasive plants are typically less palatable to livestock and wildlife (e.g., willow versus tamarisk), putting native species at a competitive disadvantage, and often resulting in a reduced presence within the riparian community.

3.12.4 RESOURCE DEMAND AND FORECAST

Riparian/wetland ecosystems are strong attractors for both animal and human activities, especially in the arid southwest where summer temperatures often exceed 100 °F. Demand for diverse riparian/wetland ecosystems is high and currently exceeding the average capacity of these systems in the PA, with resulting decreases in sustainability, and proper functioning

condition. The recreational demand within riparian/wetland is highest during critical spring growing seasons when seedling establishment and stand recruitment occurs, but recreation peaks again during fall seasons after extreme summer temperatures decline. Demands for water resources with potential direct and indirect impacts to associated riparian/wetlands would likely increase in response to current and prolonged droughts. With decreasing quantity and quality of riparian/wetlands due to growing popularity, the demand for diverse wildlife habitat and refuge becomes even more critical as more species and habitats become sensitive or endangered.

3.12.4.1 RECREATION

The majority of developed BLM recreational campgrounds, trails and facilities are located in association with riparian/wetland ecosystems. Native cottonwoods are some of the most susceptible species with regard to functioning condition and long-term sustainability, but are also the most desirable native and diverse riparian/wetland ecosystem within Monticello PA. Recreational developments within riparian/wetlands increase competition for natural habitats, or eliminate habitats critical to riparian-dependent wildlife species.

Recreational demand for hiking, horse trails, and commercial recreation permits often concentrate uses along streams due to the available water source, thermal protection, and scenery. However, unconsolidated alluvial soils often located within riparian canyons have shown to be extremely susceptible to erosion and degradation by such uses.

3.12.4.2 GRAZING

Livestock production continues to be a source of income for some San Juan County residents, and these operations rely on public lands to provide forage for their livestock. Overgrazing can impact riparian resources through the introduction of invasive species, stream bank degradation, reduction in plant recruitment, and decrease in water quality.

3.12.4.3 INVASIVE SPECIES

Tamarisk (*Tamarix ramosissima*), Russian olive (*Elaeagnus angustifolia*), and cheatgrass (*Bromus tectorum*) have invaded waterways throughout the Monticello PA, drastically changing the composition of riparian vegetation communities. Cheatgrass is a highly competitive, non-native, and invasive grass that has displaced many native plant species across a sizeable portion of rangelands, and has invaded riparian areas and waterways. This grass provides little resource value because of its annual growth form, shallow root system, and protruding awns, and its flammability increases the risks of wildland fire. Populations of Russian knapweed (*Acroptilon repens*) and camelthorn (*Alhagi maurorum Medik.*) have also reached high levels in many river corridors. Strategies used to control tamarisk and other riparian invasive species appear in Section 3.18, Vegetation. The management and maintenance of native diverse ecosystems has become a larger issue in recent years. Vegetative conversions to invasive, non-native species from native species have occurred within riparian/wetlands with influence of management practices.

3.13 SOCIOECONOMICS

The socioeconomic context of this RMP/EIS refers to the social, cultural and economic settings of communities impacted by the implementation of the BLM's management actions. The following section provides a summary of the PA's social history and current demographic and economic trend information as well as a description of the key industries that are may be affected by management action implementation.

3.13.1 COUNTY OVERVIEW

San Juan County is situated in southeastern Utah, bordering Colorado to the east and Arizona to the west. It is one of the most remote counties in the state. Located far from major transportation corridors and industrial centers, the small towns and communities within the county continue to maintain their rural character. The county comprises over 5 million acres and has approximately two people per square mile; it is one of the state's most sparsely populated counties. The federal government administers more than 3,000,000 acres (61%) of public lands within the county. The BLM manages the majority of the county's federal land, with jurisdiction over more than two million acres (41.5%). Of the over two million acres of BLM lands, 1,785,127 acres are managed by the Monticello FO. The remaining 290,473 acres located in San Juan County are managed by the Moab FO. Native Americans have jurisdiction over 1.2 million acres (26%) of land in San Juan County. Only 8.2% of the land is privately owned. Table 3.25 shows the land composition of San Juan County.

Table 3.25. Land Jurisdiction in San Juan County

Administrative Agency	Total Acres	Percent of County
Federal lands	3,053,847	61.0
BLM lands	2,075,600	41.5
U.S. Forest Service	403,875	8.1
National parks	266,117	5.3
National Recreation Areas	262,244	5.2
USFS Wilderness Area	46,011	0.9
State lands	263,287	5.3
Private*	411,077	8.2
Native American	1,277,637	25.5
Total acres within the county	5,005,848	100.0

*May include some local government land.

Source: Utah Division of Travel Development 2004.

Unique to Utah, more than half of the population of San Juan County is composed of Native Americans. Where data are available, the Navajo Nation is discussed as a unique subset of the greater population.

The isolative and rural character of San Juan County is both a "blessing and a curse" to the county's residents, according to the San Juan County Community Development Department. The natural landscape provides outstanding opportunities for solitude and recreation. The County contains colorful sandstone canyons and deserts, timbered mountains, ancient Indian ruins, the Colorado, San Juan, and Green rivers, Lake Powell, National and State parks and monuments. On the other hand, the lack of economic diversity can be problematic for County residents. The current job market does not offer many opportunities and the wages earned rank among the lowest in the state (San Juan County 2002b).

3.13.2 HISTORICAL SOCIAL CONTEXT

The Monticello PA is an area rich in cultural and natural history. Past settlements and uses in the PA by a variety of peoples have been as important as the ecological processes that have created and shaped the place that the BLM manages today. A brief review of the social and cultural history in the area will provide background information on the present-day social setting in the PA.

Archaeological evidence suggests that San Juan County and the larger Four Corners Area was inhabited by Native Americans called Ancestral Pueblo People (Anasazi) between the years 1 and 1300 A.D., with some evidence dating back as early as 1500 B.C. (BLM 2005i). The Ancestral Pueblo People successfully farmed the Four Corners Area for over a thousand years but evidence suggests they left the region by 1300 A.D. Other Native Americans occupied the San Juan County area after the Ancestral Pueblo People, including the Utes, Paiute and Navajo. Remains of Native American dwellings and rock art throughout the Monticello PA provide glimpses into the history of the cultures that once inhabited the region.

Spanish explorers entered into the San Juan County area as early as 1765 looking for a route from Santa Fe, New Mexico to California. Traders and trappers later used the trail established by the explorers as a route to the valley of the Great Salt Lake. This trail, now known as the Old Spanish National Historic Trail, was the first known commercial route in Utah. The Trail entered San Juan County at the Utah/Colorado border, along the current US Highway 491 and went northward along the present day US Highway 191, crossing the Colorado River just outside of Moab, Utah (San Juan County 2002b).

In the late 1800s, cowboys, outlaws, gold-seekers, ranchers and farmers began arriving to the area. As the Anglo settlers began to homestead the San Juan County area and other lands throughout the west, conflicts between Native Americans and the new settlers arose. The conflicts resulted in the creation of reservations for the Ute and Navajo people. The Navajo Reservation was established in 1868 and encompasses the southern portion of San Juan County. The Ute Reservation at White Mesa was established in 1920 (San Juan County 2002b).

3.13.3 RECENT REGIONAL HISTORY

San Juan County's twentieth century is illustrative of a boom-and-bust economy. As people began to homestead the west at the recommendation of the federal government, many individuals were hopeful they could farm and ranch in the arid region. The grazing and farming took a toll

on the landscape, making continued practices difficult. Agricultural success ebbed and flowed throughout the twentieth century and by the end of the century self-sufficient agricultural practices proved challenging. The 1990 census indicates that fewer than 50 people in San Juan County claim agriculture is the sole support for their livelihood (McPherson 1995).

Mining in San Juan County has also seen several booms and busts. Beginning in the late nineteenth century people seeking gold and silver entered the area, but the inability to "strike it rich" in the area prompted their departure. Copper became the next sought-after mineral and in 1918 the first copper mill began operating. Oil drilling operations were also occurring around this time, but did not prove fruitful for many operators. Mining operations slowed significantly by the mid-1920s and it was not until demand for uranium in World War II revived the mining industry. The Monticello Mill and the Rio Algom Mill were established in the county to process uranium and vanadium (McPherson 1995). By the early 1980s, demand for uranium decreased and both of the mills had closed.

3.13.4 CURRENT DAY SOCIAL AND ECONOMIC CONTEXT

3.13.4.1 SOCIAL SETTING

Today, San Juan County is a collection of rural communities characterized by pastoral landscapes, open space, and small town qualities. The area's historical link to agricultural endeavors has shaped the communities' land-based values. Many of the area residents are of Mormon pioneer heritage, devoutly religious, and independent (San Juan County 2002b). The County's residents are interested in maintaining the rural lifestyle, coupled with strong family values, and a quality environment that has been so much a part of their past (San Juan County 1996).

Maintaining the rural character of San Juan County has been a struggle for area residents. Most agricultural producers are no longer able to support themselves on farming and ranching alone. And because federal, state, and tribal governments manage over 90% of the land, residents believe that much of the county's potential wealth is tied to its public lands. Therefore, communities are very interested in public land-use management decisions.

San Juan County is a collection of diverse communities. Blanding and Monticello are the only incorporated towns and together contain the majority of the non-Reservation population of the county. Oljato, Aneth, Montezuma Creek, Navajo Mountain, and Halchita are all communities within the Navajo Reservation. White Mesa is associated with the Ute tribe. Schools are a large part of the identity in the county. Each community is described in Table 3.26.

Table 3.26. Communities in San Juan County

Community	Population	Structure	Characteristics
Blanding	3,162	Incorporated	Largest community in San Juan County. Higher education including College of Eastern Utah—San Juan branch, and Utah State University Education Facility. Edge of Cedars State Park, Dinosaur Museum.
Monticello	1,958	Incorporated	Serves as the county seat, home of government offices for San Juan County. Location of BLM Monticello FO, and the Monticello Ranger District of the USFS.
Monument Valley and Oljato	864	Unincorporated town; Navajo Chapter Headquarters; part of Navajo Nation	Communities function together. Monument Valley is a Navajo Tribal Park known for scenic beauty. Gouldings Lodge associated with the Park is the major employer for the community.
Aneth	598	Unincorporated town; Navajo Chapter Headquarters; part of Navajo Nation	Home to Aneth oil field, a major producer of oil and gas in Western states. Location of Navajo boarding school.
Montezuma Creek	507	Unincorporated town; Part of Navajo Nation	Aneth oil field is close and provides jobs. Hovenweep National Monument is 20 miles northeast.
La Sal	400	Unincorporated town	Closely tied to Moab and Grand County. Settled originally for ranching, has experienced the boom and bust cycles of mining, and now most people work in Moab.
Navajo Mountain	379	Unincorporated town; Navajo Chapter Headquarters; part of Navajo Nation	Remote from anywhere in San Juan County
Mexican Hat and Halchita	358	Unincorporated town; Navajo Nation	Mexican Hat is on the north side of the San Juan River and Halchita is on the south side. Halchita is part of the Navajo Nation.
Bluff	320	Unincorporated town	On the bank of San Juan River. First Anglo-settled community in the county. Historic community with many Victorian homes still in use. Staging area for San Juan River trips. Many outfitters based in Bluff.

Table 3.26. Communities in San Juan County

Community	Population	Structure	Characteristics
White Mesa	277	Unincorporated town, governed by Ute Council; Ute Reservation	Branch of Ute Mountain Tribe headquartered in Colorado. Sits between Blanding and Bluff.
Spanish Valley	181	Unincorporated town	Closely aligned with Moab and Grand County, although lies within San Juan County
Eastland	130	Unincorporated town	Settled as a farming community and is still surrounded by cultivated fields.
Halls Crossing	89	Unincorporated town	On the shores of Lake Powell. Employment is dependent on Lake activities.

Source: San Juan County 2002b.

As mentioned above, 65% of land in San Juan County is public lands under state and federal jurisdiction. A statewide social survey was conducted by Utah State University (USU) in 2007 to assess the ways in which Utah residents use and value public land resources and their views about public lands management. A complete analysis of the results had not been completed as of February, 2008. "Public lands," as described in the study, consist of all federal and state managed lands, and not only the BLM. Surveys were mailed to a random sample of residents of all 29 Utah counties. According to the authors, the study and sample sizes are designed to produce results generalizable at the state-wide level, with generalization increasingly risky as the sample area diminishes.

The areas sampled do not necessarily coincide with field office PA boundaries, as that was not the focus of the study. Nonetheless, the study provides current and interesting results not available elsewhere, and shows the dependence of local communities on public lands for a variety of economic and recreational pursuits. Appendix R contains initial summary results for Grand and San Juan Counties lying within the Monticello Field office. Where appropriate, study results are incorporated within the discussion of individual resources in Chapter 4. There is nothing in the preliminary USU results that affect the formulation of alternatives in Chapter 2 or the analysis of impacts in Chapter 4.

3.13.4.2 ECONOMIC SETTING

This section describes existing economic conditions surrounding the Monticello PA and provides a baseline for assessing the potential impacts of the RMP alternatives. Based on the implementation of a particular alternative, the BLM can affect (directly or indirectly) the local economic conditions of the nearby communities. For example, local employment and income levels can be directly impacted by changing the way it manages natural resources or grazing allotments. The construction of new recreation trails or facilities, road maintenance, and other activities can also influence local socioeconomic conditions described in this section. The BLM

can also indirectly influence local economic conditions by pursuing new management strategies that alter visitation levels, thus affecting total future spending by recreationists and other tourists (BLM 2004e). The demographic information and selected economic indicators of social well-being (poverty, unemployment, and per capita household income) are also presented in this section to help provide context and put local conditions in perspective relative to statewide conditions.

3.13.4.2.1 POPULATION

The Utah Department of Workforce Services reports that San Juan County has posted positive population growth numbers for every decade of the twentieth century. In 1900, the county had 1,023 residents, and by 2000, the population grown to 14,413. During the 20th century of growth the county did experience a number of population booms. Throughout the 1950s and the Cold War the demand for the county's uranium caused the population to double in just 10 years. San Juan County's population boomed again in the 1970s as the nation's high energy prices made the development of the area's natural resources profitable (Workforce Services 2005). As mining jobs decreased in the 1980s out-migration of the population occurred.

The Governor's Office of Planning and Budget (GOPB) for the State of Utah projects that population in 2030 will reach 19,459. The population growth rate of San Juan County is slower than that of the State of Utah: approximately 1% annual growth in the county, versus 2.3% annual growth in the state. Long-term trends show steady growth: from 1970 to 2000 San Juan County grew by 4,680 people, a 48% increase in population. Much of the recent growth in San Juan County has been in southern Spanish Valley, adjacent to Moab; this area is located within the boundaries of the Moab Field Office. The 2004 population estimate data show San Juan County has a total of 14,353 residents, slightly below that 2000 Census data (Workforce Services 2005).

The median age for the county is 25.5, similar to the state median age of 27.1. Table 3.27 shows population characteristics in San Juan County. 43% of the population is under 20 years old, a 4% decrease since 1990.

The 2000 Census indicated that American Indian/Alaskan Native made up 1.33% of the Utah population. In San Juan County the American Indian/Alaskan population is more than half of the total population at 55.7% (Table 3.28). Population on the Navajo Nation has grown steadily over the last two decades. In 1980 population on the reservation was 4,554, 5,252 in 1990 and 6,280 in 2000. The Navajo Reservation has experienced strong growth in its middle-aged population and slow growth in its youth population; this growth is contrary to many Native American groups (GOPB 2002). In 2000, nearly half of the population on the Reservation was between 20 and 65 years old (U.S. Census Bureau 2000). Table 3.28 shows steady increase in overall San Juan County population according to race and ethnicity.

Table 3.27. Population by Category, 1990 and 2000

	1990	% of Total	2000	% of Total	% Change, 1990–2000	% Change per Year, 1990–2000

Total	12,621	100.0	14,195	100.0

Note: Population is broken out by both race and ethnicity because Hispanics can be of any race.
Source: GOPB 2002.**3.13.4.2.2 UNEMPLOYMENT**

Unemployment levels are frequently used as an indicator for economic strength of the local economy and social well-being of its population. Table 3.29 presents the size of the labor force and average annual unemployment rates in San Juan County. State of Utah unemployment information is given for comparative purposes.

Table 3.29. Unemployment Rates

	1990		2000		2004 (projected)	
	Labor Force	Unemployment Rate	Labor Force	Unemployment Rate	Labor Force	Unemployment Rate
San Juan County	4,032	7.4%	4,754	9.2%	4,682	11.0%
State of Utah	814,000	4.3%	1,143,200	3.3%	1,208,400	4.7%

Source: Workforce Services 2005.

Unemployment in San Juan County is higher than the state or national average. In 2004 the unemployment rate in San Juan County was 11.0%, compared to 4.7% for the state and 5.3% for the nation. Employment grew by roughly 1.8% from 2000 to 2004, but the rise in jobs did very little to decrease the rising unemployment rate. Slow job growth and high unemployment levels are symptomatic of an economic community that is working to stabilize itself (Workforce Services 2005). Figure 3.9 shows the fluctuation in unemployment patterns in the county.

Over the past two decades, the Navajo Reservation has consistently experienced unemployment rates higher than the state average. In 1988, the unemployment rate in Utah was approximately 5.5%; in San Juan County it was approximately 8%, and on the Reservation it was almost 40%. This rate decreased to just above 30% in 2000 (U.S. Census Bureau 2000).

Source: Sonoran Institute 2003.

Figure 3.9. Unemployment.

3.13.4.2.3 PER-CAPITA PERSONAL INCOME³

Personal income is another indicator of social well-being, as income can be directly related to an individual's or a community's quality of life. Table 3.30 shows per capita personal income (i.e.,

³ Personal income is the income that is received by persons from all sources. It is calculated as the sum of wage and salary disbursements, supplements to wages and salaries, proprietors' income with inventory valuation and capital consumption adjustments, rental income of persons with capital consumption adjustment, personal dividend income, personal interest income, and personal current transfer receipts, less contributions for government social insurance. This measure of income is calculated as the personal income of the residents of a given area divided by the resident population of the area. In computing per capita personal income, BEA uses the Census Bureau's annual midyear population estimates (U.S. Department of Commerce 2005).

total personal income divided by population) in San Juan County and in Utah. Per capita personal income in the county has been consistently lower than the state average. In 2003 San Juan County had the lowest per capita income in the state.

Table 3.30. Per-capita Personal Income

Area	1980	1990	2000	2003
San Juan County	\$5,841	\$8,955	\$12,881	\$14,363
Navajo Reservation	\$4,500 (approx)	\$5,300 ¹ (approx)	\$6,200 (approx)	--
State of Utah	\$8,510	\$14,913	\$23,878	\$25,407

Source: U.S. Department of Commerce 2005; GOPB 2003.

¹ Data from 1999.

-- = no data available.

3.13.4.2.4 POVERTY

The poverty rate of an area is an estimate of the percentage of the area's total population living at or below the poverty threshold established by the U.S. Census Bureau. Table 3.31 presents poverty rates in San Juan County, with statewide figures included for comparative purposes.

Table 3.31. Poverty Rates

Area	1989	2003
San Juan County	36.4%	22.6%
State of Utah	11.8%	10.0%

Source: U.S. Census Bureau 2005.

Poverty rates for San Juan County are significant higher than the state average. Although the rate decreased significantly from 36.4% in 1989 to 22.6% in 2003, it is more than double the state's overall rate. The race with the highest poverty rate in San Juan County is the "American Indian and Alaskan Native," with 3,809 (48%) of the total race under the poverty level in 1999 (Sonoran Institute 2005).

3.13.4.2.5 HOUSING

According to the 2000 Census, San Juan County has a total of 5,449 housing units, 75% of which are occupied. Of these units, 13.5% are for seasonal and recreational use, and 20% are renter-occupied. Average household size is 3.57 residents, just above the state's average. The median value of owner-occupied housing in 2000 was \$68,400, up from \$52,833 in 1990. Table 3.32 shows housing population trends in San Juan County.

Table 3.32. Population by Household Type in San Juan County, 2000

	County	% of Total	State	% of Total
Total housing units	5,449		768,594	
Total occupied housing units	4,089	75.0	701,281	91.2

Table 3.32. Population by Household Type in San Juan County, 2000

	County	% of Total	State	% of Total
Seasonal, recreational, or occupational use	733	13.5	29,685	3.9
Vacant housing units	1,360	25.0	67,313	8.8
Homeowner vacancy rate (%)	2.1%		2.1%	
Rental vacancy rate (%)	12.8%		6.5%	
Housing tenure				
Total occupied housing units	4,089		701,281	
Owner-occupied housing units	3,242	79.3	501,547	71.5
Renter-occupied housing units	847	20.7	199,734	28.5
Average household size, owner occupied	3.57		3.3	
Average household size, renter occupied	3.07		2.8	

Source: Sonoran Institute 2003.

Yet another indicator of economic strength is the amount of new residential building permits granted for a particular area. An increase or decrease in the amount of building permits granted reflects the growth of a community and allows planners and local governments to plan for the amount of necessary infrastructure (i.e., roads, water, sewer, and power).

Residential building permits for San Juan County have increased tremendously from 5 permits issued in 1991 to 76 permits in 1998. The amount of building permits has dropped slightly since then. There was a small rise in the number of permits issued for new dwelling units in 2004 as the county issued 61 permits, up from 55 in 2003. Residential construction in the unincorporated areas of San Juan County has consistently exceeded that within the cities of Blanding and Monticello. For example, in 2004 five permits were issued for dwelling units in Blanding, 3 permits were issued for Monticello and 53 permits were issued for unincorporated areas in the county (Workforce Services 2005).

It should be noted that residential growth has been particularly strong in the Spanish Valley area, just south of Moab, Utah. Most of the growth occurring in this San Juan County area is affected primarily by the land management decisions of the Moab FO's RMP, whose office covers the northern third of San Juan County. For general housing conditions in the Spanish Valley area please see the Moab RMP.

3.13.4.2.6 EMPLOYMENT

Local and regional employment levels could be affected directly or indirectly by the implementation of the updated RMP. The following information reflects trends in employment since the 1970s.

In 2000, 5,618 jobs were identified in San Juan County. Wage and salary employment included approximately 79% of the total market while the remaining 21% was from proprietorships, including sole ownerships, partnerships and tax-exempt cooperatives. The Services and

Professional Sector is the largest employment sector in the county comprising 46% of the market. The Government sector accounts 30% of the total employment. The remaining jobs are in Farm and Agriculture Services, Mining and Manufacturing. Note that the Services and Professional sector includes services, retail trade, finance industries, transportation and public utilities, and wholesale trade (Table 3.33).

Table 3.33. Employment by Industry, Changes from 1970 to 2000—SIC Codes

	1970		2000		New Employment	
	Jobs	% of Total	Jobs	% of Total	Jobs	% of Total
Total employment	2,818		5,618		2,800	
Wage and salary employment	2,272	80.6	4,413	78.6	2,141	76.5
Proprietors' employment	546	19.4	1,205	21.4	659	23.5
Farm and agricultural services	414	14.7	N/A	N/A	N/A	N/A
Farm	398	14.1	318	5.7	-80	NA
Agricultural services	16	0.6	N/A	N/A	N/A	N/A
Mining	423	15.0	313	5.6	-110	NA
Manufacturing (incl. forest products)	147	5.2	220	3.9	73	2.6
Services and professional						
Transportation and public utilities	125	4.4	181	3.2	56	2.0
Wholesale trade	N/A	N/A	101	1.8	N/A	N/A
Retail trade	335	11.9	763	13.6	428	15.3
Finance, insurance and real estate	N/A	N/A	N/A	N/A	N/A	N/A
Services (health, legal, business, others)	378	13.4	1,509	26.9	1,131	40.4
Construction	147	5.2	303	5.4	156	5.6
Government	791	28.1	1,678	29.9	887	31.7

Agriculture Services include soil preparation services, crop services, etc. It also includes forestry services, such as reforestation services, and fishing, hunting, and trapping. Manufacturing includes paper, lumber and wood products manufacturing.

SIC = Standard Industrial Classification System (SIC) used to categorize employment trends over time.

Source: Sonoran Institute 2003.

Characteristic of the rest of the state as well as the country, San Juan County has seen a large increase in the Services and Professional sector in the last two decades. The decrease in mining and farming operations, and the growth in the tourism as well as the overall growth in population can be largely accredited for the increase. The Services and Professional sector is expected to see continued growth.

Shift in Regional Economic Activity

Perhaps more important to understanding the economy of San Juan County are trends in economic activity. Between 1970 and 2000, the San Juan County economy experienced a dramatic shift in job base. As shown in the graph below, the economy shifted away from mining

in the 1980s. Discussions with the community identify this curve as the "mining bust." Ed Scherick, San Juan County Planner, in a memo to the BLM on February 10, 2004 states that "the real reason for the bust was due to the shift towards a cheaper free market. This market went to cheaper sources to purchase the product because of time and costly delays created by environmental regulation and lawsuits. Agencies also placed more and more restrictions on exploration and development on leaseholders until they reached a point of collapse."

As jobs were lost in mining and farming, jobs in trade and services increased dramatically (see Table 3.33). Despite the lack of data for the Service and Professional sector, Table 3.33 shows a general recognizable trend in this sector as an increase in jobs in trade and services over the last 15 years. The trade and service sector employs a large amount of people to support the tourism industry around Lake Powell; however, many of these jobs are seasonal in nature, with most lasting from April to mid-October. Figure 3.10 illustrates the shift in employment sectors over time in San Juan County.

SIC= Standard Industrial Classification System used to categorize employment trends over time.

Source: Sonoran Institute 2003.

Figure 3.10. Job Base (by SIC code) in San Juan County, 1969–1999.

The shift in service related jobs over the last decade illustrates the county's growing tourism industry. While this shift has added new jobs and revenue for the county, many residents are somewhat apprehensive about dependence on such an industry. Community residents are interested in maintaining a diverse economic base that includes grazing and agriculture, mineral extraction, oil and gas development, recreation and tourism (San Juan County 1996).

Direct BLM Contributions to Area Economic Activity

Under the federal Payment-in-Lieu-of-Taxes (PILT) Program, payments from the BLM and other federal agencies assist in financing the operations of local governments containing tax-

exempt public lands. The annual PILT payments serve as an offset payment to the local governments because, unlike privately owned lands, taxes are not collected from federal lands. Payment amounts are based on a complex formula that considers among other things revenue sharing from the previous year, county population, and acreage of a county in federal ownership. The PILT payments may be used for any governmental purpose including improving schools, road, water, and other infrastructure systems.

Because nearly 61% of San Juan County is federally owned land, PILT payments are important to the area. PILT payments to San Juan County have continually increased in recent years. Table 3.34 shows PILT Payments to San Juan County between FY 2001 and FY 2006.

Table 3.34. PILT Payments to San Juan County

Year	Total PILT Payment
2001	\$637,790

3.13.4.2.7 LOCAL ECONOMIC ACTIVITY AFFECTED BY BLM MANAGEMENT

Recreation and Tourism

The natural landscape in San Juan County has drawn visitors from all over the world. Visitors to the PA are involved in a multitude of outdoor activities, including mountain biking, hiking, boating, camping, climbing, OHV driving and general recreation. These activities occur in this area because of the large expanses of vast and relatively undeveloped lands and because of the unique geologic and scenic beauty the area has to offer. Since the later part of the twentieth century, the tourism industry has become an increasingly important revenue generator for the county. Although many people feel that the county should maintain a diverse economy that does not depend too heavily on tourism, the economic value of the tourism industry is recognized as an important source of revenue (San Juan County 2002b). More information on the recreation and tourist destinations within the Monticello PA can be found in Section 3.11, Recreation.

Visitation data can be used to illustrate tourism and recreation trend in the Monticello PA. Visitation to the area, outside of BLM lands, follows the traveler-spending trend, as it increased throughout the 1990s and has leveled off in the new century. Table 3.35 shows visitation numbers for several locations in San Juan County that can be used as indicators for visitation to the area.

Table 3.35. Visitation to Local Attractions in 2003

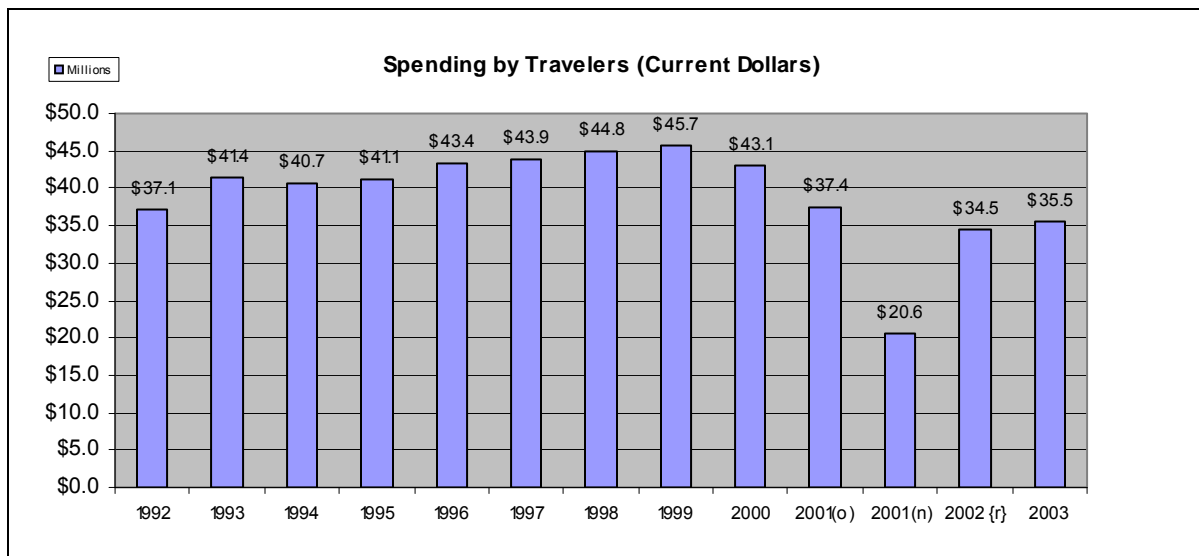

Count Location	Visitors
US 491 Utah–Colorado border	784,750

Table 3.35. Visitation to Local Attractions in 2003

Count Location	Visitors
SR 163 Utah–Arizona Border	730,800
Glen Canyon NRA	1,842,942
Monument Valley	218,000
Canyonlands National Park	386,985
Gooseheads State Park	57,098
Rainbow Bridge National Monument	98,865
Hovenweep National Monument	25,134
Natural Bridges National Monument	118,965

Source: Utah Division of Travel Development 2004.

Tourism is considered a resource-based industry, because the visitors who come to the county recreate on public lands and rivers. These same visitors contribute to the tax base of the county, which helps stimulate the local economy. Tourist spending, visitation to locations in close proximity, as well as tax collections from tourist activity are indicators of tourism in San Juan County and its importance to the overall economy. Traveler spending in San Juan County grew slowly and consistently throughout the 1990s. In 1990, traveler spending was slightly under \$33 million. Spending peaked in 1999, at over \$45.7 million and decreased to \$35.5 million in 2003. Figure 3.11 shows traveler spending from 1990 to 2003.

Source: Utah Division of Travel Development 2004.

Figure 3.11. Tourist Spending San Juan County, 1992–2003.

The Utah Division of Travel Development reports that travelers spent \$35.5 million dollars in San Juan County in 2003 and 1,083 jobs in the county were travel and tourism related. Total tourism-related tax revenues for 2003 were estimated at \$744,000, down from \$879,000 in 2000 (see Table 3.37). It is important to note that many tourists spend their money in and around the city of Moab in Grand County, before traveling to San Juan County to recreate.

San Juan County ranked twelfth out of 29 counties in the state for gross taxable room rents at 7.2 million in 2003. Gross taxable room rents increased steadily from 1996 to 1999 and have dropped continually since 2000. San Juan County is also twelfth in collection of transient room tax: \$218,400 in 2000. This number reached its peak in 1999 and has slowly dropped since then. San Juan County does not collect restaurant or car rental taxes (Utah Division of Travel Development 2004). Table 3.36 shows the contribution of tourism to the local economy.

Table 3.36. Tourism-related Tax Trends in San Juan County

County Indicator	1996	2000	2003
Spending and employment			
Spending by traveler (millions)	\$43.4	\$43.1	\$35.5
Travel and tourism related employment (jobs)	800	816	1,083
Tourism Tax Revenues (000s)

Budget and Fee Collection for Programs

Due to a lack of base budgetary support, the Monticello FO has come to rely on the Federal Lands Recreation Enhancement Act, generally called the Fee Demonstration program, for needed funds. The Monticello FO collects fees for recreational use in several locations including the San Juan River, Cedar Mesa and fee collection sites at 3 campgrounds.

Services to the public are provided from these fee monies, such as maintenance of campgrounds, boat ramps, and restroom facilities; staffing of the San Juan River Ranger Station and the Kane Gulch Ranger station; and expenses related to the San Juan River and Cedar Mesa permit activities.

Table 3.37 below shows the Base Funding for the Recreation Program in 2003, and visitation and revenues from the Fee Demonstration projects.

Table 3.37. Base Funding for Recreation and Fee Demonstration Projects (BLM 2005c)

	2002 Visitation	2002 Revenues	2003 Visitation	2003 Revenues
San Juan River	13,048	\$105,822	13,690	\$116,591

Monticello—other	81,269	0	75,338	\$39,487
Recreation—base funding				\$98,000
Total	102,382	\$171,058	97,311	\$316,513

Agriculture and Grazing

The agriculture industry has declined in the last 3 decades. Several factors contributed to the decline, including drought, market prices, and world politics. In 1970, total net income from farming and ranching in San Juan County was \$8.8 million. By 1985, that number had dropped to \$-0.8 million and in 2000, to an all-time low of \$-2.1 million. Negative net income means that production expenses were higher than gross income. In San Juan County, 41% of gross agricultural and grazing income is from livestock and products, and 12% of gross income is from crop production.

The remainder of income is from government payments and rents received. Figure 3.12 shows the decrease in personal income from farming and ranching.

Source: BLM 2004e.

Figure 3.12. Income from agriculture, 1970–2000.

The composition of livestock and crop production has also shifted in the last decade. In 1970, 52% of gross farm income was from livestock, while 28% was from crops. Gross income from crops has dropped by 16% since 1970. Currently, San Juan County's main agricultural contributors are wheat, pinto beans, safflower, and cattle (San Juan 1996).

While the income generated from farming and ranching has decreased significantly in past decades, the number of farms has actually increased. In 1982 the number of farms was 214 and in 2002 the number grew to 231. A significant number of farms in San Juan County are 1,000 acres or more and the average farm size has jumped from 1,696 acres in 1982 to 6,747 acres in 2002. Table 3.38 shows the trends agricultural data for San Juan County.

Table 3.38. San Juan County Agricultural Data

	1982	1987	1992	1997	2002
Farms (number)	214	218	206	231	231

Source: Workforce Services 2005.

The BLM provides livestock grazing opportunities on public lands for local ranchers through the administration of livestock grazing. These permits generate local income and employment benefits to ranchers and their employees as well as other economic benefits to the county, including sales, income tax revenue, and indirect expenditures made by ranchers to local service or industry. Changes in Monticello FO grazing practices could potentially affect the local economy.

Livestock grazing allotments occur on approximately 99% of all BLM lands located within the Monticello FO boundary. An estimated 17,300 acres outside of grazing allotments are allocated to wildlife use and another 288 acres are administrative horse pasture. Within boundary allotments, 137,440 acres (6.1%) are unavailable for livestock grazing for resource protection.

Of the lands within grazing allotments, 1,761,351 acres (78%) are BLM lands. Of the 74 allotments currently permitted within the Monticello PA boundaries, cattle graze 61 allotments and cattle and horses graze 13 allotments. A total of 78,796 animal unit months (AUMs) are currently authorized (active). Of these, 77,365 AUMs (98 %) are used by cattle and 1,431(2%) are used by horses. An additional 7,299 AUMs are allowed through exchange of use (other ownership). For more information on current grazing conditions, please see Section 3.7, Livestock Grazing.

Mineral Resources

The contribution of mineral extraction to the San Juan County economy has fluctuated throughout the previous century. Since the demand for uranium decreased in the in the early 1980s, mineral extraction has contributed minimally to the local economy and local job base. In 2004, mining jobs contributed only 4% of non-farm jobs (163 out of 3,936 non-farm jobs) in the county (Workforce Services 2005). Oil and gas production within the Monticello PA has

generally been declining since 1984, but has decreased more rapidly since 1998 (see Figure 3.9). As of March 2005, there have been 3,267 wells drilled in the Monticello PA, of which 2,132 wells have been plugged and abandoned. Of the remaining 1,135 active wells, 508 are currently producing oil and gas. Approximately, 41% of the wells drilled in San Juan County during the period of 1991–2004 were dry (BLM 2005h).

The economic benefit to San Juan County of oil and gas activities comes primarily in the form of mineral lease payments and royalties from the State of Utah to the county. The State of Utah collects payments from a variety of sources, including lease and royalty payments made to the BLM and to the Minerals Management Service of the Department of the Interior. Royalties are based on the sale of oil and gas and increase or decrease based on quantity of production and prices. Approximately one-half of the payments received by these agencies are remitted to the State of Utah, which in turn distributes about one-half to the counties. The State of Utah payments to the counties are based very closely on actual leasing and production activities within each county.

According to the Mineral Management Service, in the 2000 fiscal year, San Juan County reported a total of \$5,955,862 in sales volume for gas, and \$633,808 in sales volume for oil. Royalty values to the State of Utah were \$1,848,180 and \$1,638,434, respectively. The amount disbursed to the state was \$924,590 for gas and \$819,217 for oil (USDII 2000). Oil and gas production has been steadily declining since 1990. In 1990 San Juan County produced 7,774,204 barrels of oil and 29,580,534 thousand cubic feet (MCF) of gas. In 2004 the county produced 3,986,802 barrels of oil and 17,392,707 MCF of gas. Figure 3.13 illustrates oil and gas production trends in San Juan County.

A potential benefit to San Juan County from oil and gas and mineral production is in the jobs created, both in direct production activities and associated services. Many of the current oil and gas activities are located on the Utah–Colorado border and some of those employed live in western Colorado. The White Mesa Mill employs approximately 40 people and most are living in or around the town of Blanding.

Source: BLM2005d.

Figure 3.13. Production from oil and gas wells in the Monticello FO.

The Utah Permanent Community Impact Fund Board (CIB) provides loans and grants to agencies within the state that may be socially or economically impacted by mineral resource development on federal lands. In 2005 San Juan County received \$2,536,232 in loans and grants from the CIB. From fiscal year 2001–2005 the county received \$3,027,588 (Department of Community and Culture 2005). The source of CIB's funding is a portion of the federal mineral lease royalties returned to the State of Utah by the federal government. The money from the CIB to fund various infrastructure projects is not directly related to the amount of production per county, but rather on applicant eligibility determined by the Board.

A recent increase in the price of uranium has led to a surge of filings for uranium claims within the Monticello PA. According to the Mineral Potential Report, the price of uranium was \$29.00 per pound in May of 2005 (BLM 2005b). While the thousands of claims filed in 2004 and 2005 do not necessarily predict a resurgence of a uranium boom in the area, exploratory holes are being drilled and the potential for impacts to socioeconomics could result from uranium extraction on BLM lands.

3.13.4.3 TRIBAL INTERESTS

The high acreage of Navajo lands is a significant factor in the social and economic conditions of the county, as in the case of San Juan County's unique tax laws regarding the Reservation. Oil and gas companies as well as other Anglo businesses on the reservation are taxed by the county; however, the personal property of tribal members (homes, vehicles) on the reservation do not contribute to the county's tax base. The reservation receives revenue from oil and gas lease fees on its land; however, it is not eligible to receive royalties generated from oil and gas production. The Navajo Tribe Utilities Authority (NTUA) provides infrastructure services such as sewer and water on the reservation, as opposed to the county services. San Juan County also does not provide law enforcement on the reservation, however, the county search and rescue is used by the reservation.

Over the last 10 years, the Navajo Nation has gone from living in scattered units to living in more consolidated centers, such as Aneth, Montezuma Creek, and Shiprock, New Mexico. This shift has made it easier to make essential services more available to tribal members. However, not all Navajos have made this shift. More traditional people and the elderly have been more reluctant to change their living circumstances.

The Navajo Nation currently depends less on grazing of sheep and the sale of sheep products than in the past, and more on wage work. A large percentage of available jobs are government jobs, and many people travel off the Reservation for this work. Crafts have been an important way for Navajos to augment wage income, and most of the resources needed are found on public lands. These resources include firewood, pinyon nuts, willow for baskets, cottonwood root for carving, and plants to make paint pigment. Continued use of these lands and its resources are important in sustaining this aspect of Navajo livelihood.

According to the public scoping meetings and consultation with tribal leaders, access to sacred sites, gathering of traditionally used plants and minerals, tribal consultation, and the protection of

cultural resources (including places, burials, and plants) are issues requiring attention by the Monticello FO as land management decisions are made (SWCA 2004).

3.13.5 ENVIRONMENTAL JUSTICE

3.13.5.1 BACKGROUND AND REGULATORY GUIDANCE

"Environmental justice" refers to the fair and equitable treatment of individuals regardless of race, ethnicity, or income level, in the development and implementation of environmental management policies and actions. In February 1994, President Clinton issued Executive Order (EO) 12898, "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." The objective of this EO is to require each federal agency to "make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority and low income populations (EO 12898 1994).

Convened under the auspices of the EO, the Interagency Working Group defines Black/African American, Hispanic, Asian and Pacific Islander, American Indian, Eskimo, Aleut, and other non-white persons as minority populations. Low-income populations are defined as persons living below the poverty level based on total income of \$13,359 for a family household of 4 based on the 2000 census. Minority populations are identified as either: (1) the minority population of the affected area exceeds 50%, or (2) the minority population percentage of the affected area is meaningfully greater than the minority population percentage in the general population or other appropriate geographic area (BLM 2002c).

3.13.5.2 MINORITY AND LOW-INCOME POPULATIONS

Land use management decisions within the Monticello PA have the potential to directly or indirectly affect the county's minority and low-income populations.

Unique to Utah, populations in San Juan County typically known as "minority" comprise more than half of the population in San Juan County. San Juan County ranks first in the state for Native American/Alaskan Native population. San Juan County is home to 27% of the state's Native American population and at 55.7% of the county's total population, Native Americans are not the minority. In Utah, 93.8% of the entire population identify themselves as white and 1.3% of the population identify themselves as Native American/Alaskan Native (GOPB 2002). Therefore, when considered state or region-wide, Native Americans are considered a minority race. Despite the population data that indicate non-minority status within San Juan County, Native Americans are considered a minority group for the purposes of achieving environmental justice during this RMP process.

As mentioned earlier within the context of "poverty" as an economic indicator for the economic well-being, persons in San Juan County living below the poverty line in 2003 was higher than the state average (22.6% vs. 10%). While San Juan County poverty trends show a decrease over time they remain higher than the state average. In 2003 the poverty level established by the by the Census Bureau for a family of 4 was \$18,810 and in that year 31% or 4,443 people in San

Juan County were living below the poverty level (U.S. Census Bureau 2006). In terms of race, the Native American population has the highest poverty level in the county at 48% or 3,809 individuals.

3.13.5.3 ADDITIONAL ENVIRONMENTAL JUSTICE ISSUES

Potential land management decisions pertaining to woodlands in the Monticello PA could disproportionately affect the area's low-income and minority population. Navajo tribal members have been gathering wood in the Cedar Mesa area and using the resource as their primary heat source in the winter months. Unmanaged woodland harvesting has damaged surface cultural resource sites and created a network of unauthorized roads and trails that degrade visual quality, and which also may increase soil erosion and sedimentation, and affect overall watershed quality. Through the development of the RMP, it is anticipated that an organized and systematic plan will be developed to allow the Navajo Tribe to remove fuelwood and minimize future damage to the area.

Native Americans also want to be able to collect live cottonwood, however, this species is valuable for wildlife (T&E species) habitat, riparian function, and overall watershed health. It currently is at risk of being replaced by invasive species including tamarisk. The access and gathering of other plants traditionally used by tribes is an issue within the Monticello PA. Plants important to Native American's traditional cultural practices include: willows, sage, yarrow and squirrel tail (SWCA 2004).

3.14 SOILS AND WATER

3.14.1 RESOURCE OVERVIEW

Watershed incorporates several separate resources (soil, water, etc) and takes into consideration the interaction between them and their effect on conditions and processes occurring on the landscape, culminating with their impact on surface water quality. To assess these impacts, the resources that are discussed in this section are soils and surface water.

3.14.2 WATERSHEDS AND GENERAL TOPOGRAPHY

The Monticello PA lies within portions of nine separate hydrologic subbasins (Table 3.39) located within the Upper Colorado hydrologic region (Region 14). The majority of the PA is contained within the San Juan subbasin, though the northern portion of the PA is largely within the Kane Springs subbasin. Subbasin boundaries are shown on Map 49, and are described in Table 3.39.

The PA is also within an administrative area designated by the Utah Division of Water Resources (UDWRe) called the Southeast Colorado River Basin. The boundaries of this area are a mix of political and geographic features, and almost completely overlap the Moab and Monticello PAs.

Table 3.39. Subbasins within the Monticello PA

4th Order HUC	Subbasin Name
14030005	Upper Colorado – Dolores – Kane Springs
14070001	Upper Colorado – Dirty Devil – Upper Lake Powell
14080201	Lower San Juan – Four Corners
14080202	Lower San Juan – McElmo
14080203	Lower San Juan – Montezuma
14080205	Lower San Juan – Lower San Juan

The topography of the Monticello PA is defined largely by high mountains, steep escarpments, and incised canyons. The boundaries of the PA itself are defined by the Colorado border to the east, the San Juan River and Navajo Indian Reservation to the south, and the Colorado River to the west. The northern boundary of the Monticello PA approximately follows the elevational divide along Hatch Point, and the Lower Lisbon Valley. Elevations vary from 3,700 feet above mean sea level (amsl) in the southwest near Lake Powell, to approximately 7,500 feet amsl near the base of the Abajo Mountains.

The Abajo Mountains themselves lie within the Manti-La Sal National Forest and are the highest topographic features in the PA. Dry Valley extends north from the Abajo Mountains. The region west of the Abajo Mountains consists of a deeply incised plateau, and includes the Canyonlands National Park. The southern portion of the PA that extends from the Abajo Mountains to the San Juan River is characterized by similar terrain, though less steep, and an overall loss in elevation to about 4,500 feet amsl at the River.

3.14.3 GEOLOGY

The geology of the Monticello PA is characterized primarily by the relatively flat stratigraphic sequence of sedimentary units dating from the Cretaceous, Jurassic, Triassic, and Permian and Pennsylvanian periods. The older Permian and Triassic rocks, which include the Cutler Group and the Moenkopi formation and the Chinle Formation, dominate the area between the Abajo Mountains and the Colorado River. This area is known as the Monument Upwarp, a late Cretaceous uplift that resulted in the erosional removal of the younger strata from the underlying rock. The remainder of the Monticello PA is still dominated by younger sedimentary units of Cretaceous and Jurassic age, which includes the Dakota and Morrison Formations and the Glen Canyon Group.

3.14.4 SOILS

Soils are the medium for plant growth, and soils provide nourishment for nearly all terrestrial organisms. Soils in the Monticello PA have developed in residuum (residual material from parent rock), colluvium (rock debris accumulated by gravity at the base of a cliff), alluvium (clay, silt, sand or gravel deposited by a stream or moving water), eolian sands (sands deposited by wind), and loess (yellowish brown loamy material deposited by wind). They are derived primarily from

the sedimentary geologic deposits that occur throughout the Monticello PA. Some soils are derived from igneous parent materials that occur around the Abajo Mountains.

3.14.4.1 SOIL DATA

Soil mapping for the Monticello PA was prepared using the Soil Survey Geographic database (SSURGO) for Utah. NRCS Soil surveys for the Monticello PA include:

- San Juan Area 1962
- San Juan County, Central Part 1993
- Canyonlands Area 1991

3.14.4.2 SOIL CLASSIFICATION

Aridisols (dry soils), Mollisols (soils with a dark surface horizon), Entisols (geologically young soils), and Alfisols (forested soils) comprise the Monticello PA soil orders. Soils are classified or grouped into similar categories based on physical and chemical properties. A soil order is the broadest soil taxonomic grouping. The next, more refined soil taxonomic level is the suborder. The finest level of classification is the series or phase. For the purposes of this discussion soils are summarized by order and suborder. Within the Monticello PA there are generally 5 major soil orders represented and 7 suborders. These are described and their acres summarized in Table 3.40.

Table 3.40. Soil Orders and Suborders, Monticello PA (BLM 2001a)

Soil Order Soil Suborder	Acreage	Description
Aridisols (dry soils)		
Argids	292,574 acres	Aridisols with clay accumulation in one or more subsurface horizons.
Orthids	354,966 acres	Aridisols without any exceptional characteristics.
Entisols (developmentally young soils)		
Fluvents	26,170 acres	Entisols formed in a fluvial environment, such as a floodplain.
Orthents	926,129 acres	Entisols are recently developed soils without any exceptional characteristics. Orthents are typically formed in colluvial and aeolian deposits. These soils are the most widespread in the Monticello PA.
Mollisols (soils that have dark surface horizons due to organic matter accumulation)		
Borolls	10,464 acres	Mollisols formed under cooler temperatures.
Ustolls	18,258 acres	Dry Mollisols (precipitation occurs more frequently than in Xerolls).
Xerolls	29,909 acres	The driest Mollisols (precipitation occurs less frequently than in Ustolls).
Other Lands		
Rock outcrop/ rubblelands/ water	354,966 acres	Includes all of these. No soil development is present on these lands; water makes up a small percentage of this acreage.

3.14.4.3 SENSITIVE SOILS

Soils in the resource area are composed of a wide variety of soil types and characteristics. Sensitive soils are those soils that have one or more limiting characteristics that would make them difficult to reclaim, if they were disturbed. Limiting soil chemical features include sodium, soluble salts, carbonates, and gypsum. Limiting soil physical characteristics include soils that are susceptible to wind and/or water erosion, and soils that are protected by biological soil crusts. . Sensitive soils are identified using information from published soil surveys, ecological site descriptions, local monitoring records and field data, and research studies. The information below provides general estimates and descriptions of limiting soil features as determined by the published soil survey information. For the purposes of this analysis, this information was used to identify amounts of soils with limiting features or that could be considered "sensitive soils" within various land management allocations that may differ between alternatives, as a means of comparing impacts to and from soil resources between alternatives. This information may also be used in site specific planning to help determine whether additional BMP's or mitigation measures would be required to protect soil productivity or to improve chances for successful reclamation following disturbance.

3.14.4.3.1 ERODIBLE SOILS

Wind erodible soils were determined from each mapping unit's wind erodibility group (WEG), which ranges from 1 (highest erodibility) to 8 (lowest erodibility). Soils with a WEG of 1–2 are highly erodible; soils with a WEG of 3, 4, and 4L are moderately erodible. Wind erosion strips the surface horizon of soil and nutrients necessary for seed germination and plant recruitment. Wind erosion can also result in the formation and expansion of sand dunes. Aeolian deposition can bury and kill biological soil crusts by prohibiting photosynthesis in cyanobacteria, lichens and mosses. In the Monticello PA, moderately and highly wind erodible soils occur over 986,765 acres and 65 acres, respectively (Map 47).

Water erosion causes the formation of rills and gullies, and can contribute to the sedimentation of streams and reservoirs. Two variables were factored into determining a soil's erodibility: the soil's erodibility constant (the "k" factor) and slope. Water erodible soils were divided into 3 classes: slightly, moderately, and highly erodible. The table below summarizes the erodibility constants and slope parameters used to determine the level of erodibility.

Slightly water erodible soils totaled 1,789,629 acres, moderately water erodible soils totaled 8,659 acres, highly water erodible soils totaled 206,451 acres, and (Map 46).

Table 3.41. Soil Erodibility Factors

Erodibility	k Factor	Slope
High	>0.37 0.20–0.36	>10% >30%
Moderate	0.20–0.36 <0.20	>10 to ≤30% > 30%
Slight	<0.20 any k-factor	10 to 30% <10%

3.14.4.3.2 SALINE AND SODIC SOILS

Soil salinity can have significant impacts on soil erosion and reclamation potential. Erosion of saline soils can also have significant impacts on the water quality of downstream watersheds. Soil map units with (saline soils) exhibit electrical conductivity levels of 8 decisiemens per meter (dS/m) or greater are shown in Map 44. Sodic soils are those soils with sodium adsorption ratios (SAR) greater than 13:1. The soil survey maps do not indicate that saline or sodic soils occur on BLM lands within the Monticello PA, but they are expected to occur within San Juan County (Maps 44 and 45).

3.14.4.3.3 RECLAMATION-SENSITIVE SOILS

Reclamation sensitive soils are those soils with one or more of the following characteristics that would make them difficult to revegetate if disturbance occurred on them:

- pH \geq 9.0
- SAR \geq 13:1
- Salinity \geq 8 dS/m

As stated above, saline and sodic soils are not likely to occur within the Monticello PA, but there are some strongly alkaline soils present within the PA. Due to the characteristics listed above, reclamation sensitive soils would be difficult to revegetate, due to their limiting soil chemical properties. The Monticello PA contains 286,736 acres of reclamation-sensitive soils (Maps 34, 37, and 38).

3.14.4.3.4 BIOLOGICAL SOIL CRUSTS

Many of the biotic communities found in the Monticello PA have evolved with the presence of biological soil crusts. Biological soil crusts include mats or filaments of cyanobacteria, lichens, and mosses. These crusts play a major role in reducing water and wind erosion and in preventing the establishment of invasive annual grasses (BLM 2001b).

The presence of biological crusts in arid and semiarid lands have a significant influence on reducing soil erosion by both wind and water, fixing atmospheric nitrogen, retaining soil moisture, and providing a living organic surface mulch. They can be used as an indicator of rangelands' ecological health. Development of biological crusts is strongly influenced by soil texture, soil chemistry, and successional colonization by crustal organisms. The SSURGO data and NRCS soil surveys do not contain information on the amounts or types of biological crusts that may occur in each soil mapping unit. However, extensive research on soil biological crusts has been done in nearby areas such as Canyonlands National Park and the Grand Staircase Escalante National Monument (see USGS 2007; Bowker et al. 2006).

3.14.5 SURFACE WATER SUPPLY AND USE

Surface water supply comes from larger regional rivers (Colorado and San Juan rivers), and those intermittent and perennial streams in the Monticello PA that originate in the Abajo

Mountains. Runoff occurs from snowmelt and from brief intense storms that generally occur in late summer. Most of the surface runoff occurs from snowmelt during the months of April, May, and June. Stream segments farther away from the mountains, or with headwaters originating at lower elevations, are less likely to be perennial and more dependent on summer precipitation. Diverted surface water in the FO PA is used for agricultural, municipal, industrial, and recreational purposes.

Major creeks, rivers, and lakes are summarized in Table 3.42. Average annual streamflows for some of the creeks and rivers are included in Table 3.43.

Table 3.42. Major Waterbodies within the Monticello Planning Area

Subbasin	Major Waterbodies
Upper Colorado – Dolores – Kane Springs	Colorado River, Indian Creek
Upper Colorado – Dirty Devil – Upper Lake Powell	Colorado River, Lake Powell
Lower San Juan – Four Corners	San Juan River, Butler Wash, Comb Wash, Recapture Creek, Recapture Reservoir, Blanding City Reservoirs
Lower San Juan – Montezuma	Vega Creek, Verdure Creek, Montezuma Creek, Keller Reservoir, Lloyd's Lake
Lower San Juan – Lower San Juan	San Juan River, Lime Creek, Lake Powell

Table 3.43. Annual Mean Streamflow of Selected Waterbodies

Major Waterbodies	Flow Regime	Avg. Annual Streamflow (cfs) ¹	Period of Record
Colorado River	Perennial	12,500	1928–1982
Indian Creek	Perennial	4.2	1950–1990
Montezuma Creek	Intermittent	11.8	1986–1992
Recapture Creek	Intermittent	1.3	1966–2001
San Juan River	Perennial	2,300	1915–2001

¹ Based on published USGS data (USGS 2006).

The largest use of surface water is for agricultural irrigation for approximately 5,100 acres of land, diverting an average of 17,000 acre-feet annually. Of this diversion, approximately 9,700 acre-feet are depleted through evapotranspiration with the rest returning to the hydrologic system as runoff or infiltration. These numbers are based on data compiled for a region roughly equivalent to the PA for the year 1996 (UDWRe 2000).

Municipal and industrial (M&I) surface water use in San Juan County accounted for diversions of approximately 3,500 acre-feet in 1996 (UDWRe 2000). Industrial water uses in San Juan County account for approximately 30% of the M&I diversions and include mining and mineral processing, lumber processing, construction and rock products, and meat processing.

Intermittent and perennial surface water flow also provides the basis for wet and open areas and supports riparian vegetation. BLM surface water developments include stock ponds, erosion control structures, rainfall catchments, guzzlers for wildlife, and spring developments.

There is no irrigated agriculture associated with BLM lands within the Monticello PA, with the exception of minor acreage being farmed in trespass.

3.14.6 MUNICIPAL WATERSHEDS

Some municipalities within the PA rely on surface water as part of their water supply, with some parts of the watershed administered by the BLM. Most of the culinary water supplied by Blanding is surface water from Indian, Johnson, and Recapture creeks, and all of the culinary water supplied by Mexican Hat is surface water from the San Juan River. Culinary or potable water supplied by Bluff, Eastland, Monticello, and the San Juan Special Services District all originates as groundwater derived from springs or wells.

Forty-five parcels within the PA have been withdrawn by the BLM for public water preservation. These lands total approximately 3,800 acres, and are summarized in Table 3.44.

Table 3.44. Summary of BLM Public Water Reserve Lands

Parcel	Acres

Total	3,794.9

3.14.7 SURFACE WATER QUALITY

The U.S. Geological Survey (USGS), the BLM, and the UDEQ implement surface water quality sampling programs within the Monticello PA. The USGS sampling program regularly monitors only the major rivers within the PA including the Colorado and San Juan rivers. The USGS monitoring program has been continuously conducted for more than 60 years. The UDEQ and BLM sampling programs support state water quality assessments and are more extensive, including many of the smaller creeks, springs, and lakes. The UDEQ sampling program was started in 1997 as the basis for Utah's water quality assessment required under Section 305(b) of the Clean Water Act, and the Section 303(d) list of impaired water bodies.

Impaired water bodies within the Monticello PA were limited to the Kane Springs and Lower San Juan subbasins. Within the Kane Springs subbasin, Indian Creek was identified as impaired with respect to pH. Within the Lower San Juan subbasin, Johnson Creek and North Creek are

impaired with respect to pH, and Cottonwood Wash is impaired due to radionuclides (gross alpha) due to historical mining and mine tailings in the area. Within the Lower San Juan subbasin, Recapture Reservoir is impaired with respect to dissolved oxygen.

A full list of streams and water bodies located within the Monticello PA and listed on Utah's 303(d) list are included as Table 3.45, and shown in Map 48.

Table 3.45. Waterbodies on Utah's 303(d) List of Impaired Waters

HUC Code	Name	Stressor
14030005	Indian Creek from Newspaper Rock north boundary to headwaters	pH
14080201	Johnson Creek from Recapture Creek to headwaters	pH
14080201	Cottonwood Wash from Westwater to USFS Boundary	Gross alpha ⁴

14080201	Recapture Reservoir	Dissolved Oxygen

Source: UDEQ 2000a, UDEQ 2002.

Excess salinity is the major surface water quality problem in the PA, and is of national significance under the Colorado River Basin Salinity Control Act of 1974. Salinity contributions occur from naturally occurring saline springs, from saline groundwater interception by streams, and from erosion of saline soils. During low flow periods, salt contribution comes from seeps, springs, and groundwater flow; during high flow periods, erosion of saline soils becomes a major contributor to salinity problems.

Based on the UDEQ sampling program, problem watersheds within the Monticello PA have been identified and are summarized in Table 3.46. Two parameters can be used to describe salinity impacts from each watershed: total dissolved solids, which are reflective of saline groundwater contribution as well as erosion of saline soils; and total suspended solids, which are an indicator or erosion potential of a watershed. Other stream systems within the Monticello PA may also have problems, but the data are not currently available to make this assessment.

Table 3.46. Watersheds with Potential High Salinity Contributions

Subbasin/Stream System Sampling Locations	Average Total Dissolved Solids (mg/L)	Average Total Suspended Solids (mg/L)	Percent of Time TDS Limit Exceeded ¹	Percent of Time TSS Limit Exceeded ²	Approximate Percent of Watershed on BLM Lands
Lower San Juan/Lime Creek					90
Lime Creek (mouth)	2,750	20	92	8

3.15 SPECIAL DESIGNATIONS

For the purposes of this analysis, Special Designations fall into 3 categories: Areas of Critical Environmental Concern (ACECs), Wild and Scenic Rivers (WSR), and Wilderness Study Areas (WSAs). (There is no designated wilderness within the Monticello PA). Special designations are applied to areas when they have certain resources or characteristics that require special management. Detailed descriptions of each of these areas and the criteria for proposing them are given below. Area of Critical Environmental Concern (ACEC)

3.15.1.1 INTRODUCTION

FLPMA defines an ACEC as an area "within the public lands where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards." Private lands and lands administered by other agencies are not included in the boundaries of ACECs.

FLPMA states that the BLM will give priority to the designation and protection of ACECs in the development and revision of land-use plans (43 United States Code [U.S.C.] 1712 [c]).

Regulations at 43 CFR 1610.7-2 require that for an area to be considered as a potential ACEC, both of the following criteria shall be met: 1) Relevance—there shall be present a significant historic, cultural or scenic value; a fish or wildlife resource or other natural system or process; or a natural hazard; and 2) Importance—the above described value, resource, system, process, or natural hazard shall have substantial significance and values. This generally requires qualities of more than local significance and special worth, consequences, meaning, distinctiveness, or cause for concern.

ACECs differ from some other special management designations in that designation by itself does not automatically prohibit or restrict other uses in the area. The special management attention is designed specifically for the relevant and important values, and therefore varies from area to area. The one exception is that a mining plan of operation is required for any proposed mining activity that would create surface disturbance greater than casual use within a designated ACEC (43 CFR 3809 Regulations).

The first step in the ACEC designation process is a call for nominations during public scoping for the RMP. The BLM, other federal and state agencies, special-interest groups, or members of the public may formally nominate an area for ACEC designation. The nominations are reviewed by a BLM interdisciplinary team to determine if the criteria of relevance and importance have been met. In addition, existing ACECs are subject to reconsideration when plans are revised.

If the relevance and importance criteria are met, the area is considered as a potential ACEC to be considered for ACEC designation during the RMP planning process or during the RMP amendment process. The signing of the ROD of the proposed RMP or RMP amendment by the

BLM state director officially designates an ACEC. Following ACEC designation, special management identified in the RMP or RMP amendment is implemented.

3.15.1.2 REGIONAL OVERVIEW

The Monticello PA has 10 existing ACECs that were reconsidered during the RMP process for relevance and importance values along with a total of nine new internal and external nominations. Several of the new nominations overlapped existing ACECs. The determination rationale for all existing ACECs and new nominations, including those that did not meet relevance and importance criteria, are outlined in Appendix H, Special Designations, Relevance and Importance Criteria Evaluations.

3.15.1.3 EXISTING ACECS

With the approval of the San Juan RMP (BLM 1991a), the BLM designated 10 ACECs, comprising approximately 513,452 acres, in the Monticello PA. These areas are recognized as requiring special management attention for the protection of cultural sites, scenic qualities, recreational opportunities, vegetation, or wildlife resources. With the exception of the Grand Gulch Plateau Cultural and Recreation Management Plan (BLM 1993c), separate management plans have not been developed for these ACECs. Instead, the special management conditions (from the 1991 San Juan RMP), direct how the existing ACECs are managed. When a project is allowed to proceed within an ACEC, these established management conditions must be followed, and are incorporated directly into the management prescription for the proposed project. The 10 existing ACECs are summarized in Table 3.47. Please see Map 50 for their locations.

Table 3.47. Monticello PA ACECs from 1991 RMP (Existing ACECs)

Existing ACECs	Value(s)	1991 RMP Acreage ¹	Existing ACEC Mapped Acreage per ArcView ²
Alkali Ridge	Cultural	35,890	39,202
Bridger Jack Mesa	Near-relict Vegetation	5,290	6,260
Butler Wash	Scenic	13,870	17,463
Cedar Mesa	Cultural, Scenic	323,760	295,335
Dark Canyon	Scenic	62,040	61,659
Hovenweep	Cultural, Habitat Management	1,500	1,798
Indian Creek	Scenic	8,640	8,509
Lavender Mesa	Relict Vegetation	640	649
Scenic Highway Corridor	Scenic	78,390	79,017
Shay Canyon	Cultural and Special Emphasis Area	1,770	3,560
Total		531,790	513,452

¹Acreage listed in 1991 San Juan RMP (BLM 1991a).

²Acreage for current existing ACECs determined by ArcView program. Difference represents mapping/GIS discrepancy.

3.15.1.4 POTENTIAL ACECs

After analyzing both currently existing and nominated areas based on relevance and importance criteria for the purpose of ensuring "that the most environmentally important and fragile lands will be given ... early attention and protection." (Senate Report 94-583, on FLPMA), and to protect important resources from irreparable damage, the BLM identified 11 potential ACECs, totaling 535,936 acres within the boundaries of the Monticello PA (Table 3.48–3.50; Map 51). It should be noted that some of these are existing ACECs, and some are new nominations for designation as ACECs. In addition, some of these potential ACECs are reconfigurations of existing and nominated areas.

Portions of potential and/or existing ACECs are within existing WSAs. Table 3.49 shows the acreage of WSA that is within an ACEC. Those ACECs that are not listed have no acres of WSA within the ACEC.

For detailed information on the Monticello FO ACEC process please refer to ACEC Evaluations, Appendix H.

Table 3.48. Summary Table of Potential ACECs

Area Name	Value(s)	Acreage
Alkali Ridge	Cultural	39,202
Bridger Jack Mesa	Near-relict vegetation	6,225
Butler Wash North	Scenic	17,463
Cedar Mesa	Cultural and Scenic, with Special Emphasis Areas—Grand Gulch, Valley of the Gods, and Arch Canyon, and Pine/Step Canyon area	344,262
Dark Canyon	Scenic, Cultural and Wildlife	61,659
Hovenweep	Cultural with Special Wildlife Habitat	2,438
Indian Creek/ Lockhart Basin	Scenic	56,293 ¹
Lavender Mesa	Relict-vegetation	649
Shay Canyon	Cultural	119
San Juan River	Scenic, Cultural, Wildlife and Natural System	7,626
Valley of the Gods	Scenic	-- ²
Total		535,936

¹ Indian Creek: 8,509 acres, included within Lockhart Basin total.

² Valley of the Gods: 34,771 acres, included in Cedar Mesa total.

Table 3.49. ACEC Acreage within Wilderness Study Areas (WSAs), by ACEC

Potential ACEC	Total ACEC Acreage	WSA(s) within the ACEC	Acreage of WSA within the ACEC	Percent of ACEC within WSA
Bridger Jack Mesa	6,225	Bridger Jack Mesa	6,225	100%

Table 3.49. ACEC Acreage within Wilderness Study Areas (WSAs), by ACEC

Potential ACEC	Total ACEC Acreage	WSA(s) within the ACEC	Acreage of WSA within the ACEC	Percent of ACEC within WSA
Butler Wash	17,463	Butler Wash, South Needles	17,248	99%
Cedar Mesa	344,262	Fish Creek Canyon, Bullet Canyon, Pine Canyon, Shieks Flat, Grand Gulch ISA, Mule Canyon, Road Canyon	196,349	57%
Dark Canyon	61,659	Dark Canyon ISA	61,326	99%
Indian Creek	8,509	Indian Creek	4,602	54%
Lockhart Basin	47,784	Indian Creek	1,821	4%
Scenic Highway Corridor	79,017	Cheese Box Canyon, Fish Creek Canyon, Pine Canyon, Shieks Flat, Grand Gulch ISA, Mule Canyon, Road Canyon	9,929	8%

Table 3.50. Description and Relevance and Importance Summary of Potential ACECs

Description	Summary of Relevance and Importance
Alkali Ridge Existing ACEC—39,202 acres	
Alkali Ridge lies between Alkali Canyon and Montezuma Canyon in the eastern portion of the resource area. This area is one of the best-known and influential examples of scientific archeological investigation in the southwestern U.S. The area contains the Alkali Ridge National Historic Landmark (2,340 acres).	The cultural resources located in this area are regionally and nationally significant and include a large number of high density cultural sites of the Basketmaker and Pueblo cultures. This area contains numerous large structural sites that have revealed evidence of the full range of prehistoric pueblo occupation from Basketmaker II to Pueblo III (500–1300 AD) and represent the defining morphological site type for the prehistoric Pueblo II cultural period (900–1150 AD).
Bridger Jack Mesa Existing ACEC—6,225 acres	
Bridger Jack Mesa is located in the Indian Creek Corridor on the west side of Scenic Highway 211. Bridger Jack Mesa ACEC covers a large mesa top consisting of pinyon-juniper woodland and sagebrush-grass parks. The mesa is public land except for approximately 420 acres of state land.	This area contains near-relict plant community unaltered by human intervention. The cliffs surrounding the mesa top form a natural boundary providing a relatively isolated area that has not been grazed since 1957. Bridger Jack Mesa provides a natural exclosure control area to study the recovery of pinyon-juniper woodland and sagebrush-grass communities from livestock grazing. It is important as a baseline for the study and comparison of pinyon-juniper woodlands and sagebrush-grass community management in other parts of the Colorado Plateau and is, therefore, more than locally significant.

Table 3.50. Description and Relevance and Importance Summary of Potential ACECs

Description	Summary of Relevance and Importance
Butler Wash Existing ACEC—17,463 acres	
Butler Wash North ACEC is located south of and adjacent to Canyonlands National Park, and includes Butler Wash, and several forks of Salt Creek. The southern part of the ACEC flat areas drop abruptly into the heads of the various forks of Salt Creek.	The scenic values of this area are a continuation of the remarkable rock formations, spires, domes and buttes seen in the adjacent Needles District of Canyonlands National Park. They are important to regional, national, and international visitors who travel to Canyonlands NP and backpack into the remote, natural areas adjacent to the park. Salt Creek is one such area. Gray, cream, coral and red sandstones band the walls of the canyons of Salt Creek.
Cedar Mesa Existing ACEC—295,335 (Includes 4,240 acres in Grand Gulch, and 34,771 in Valley of the Gods)	
Cedar Mesa ACEC is located on the southern boundary of the field office bounded by Comb Wash on the east, Highway 163 and Glen Canyon NRA on the south and State Highway 276 on the west. This ACEC encompasses the Grand Gulch Archeological District and the Grand Gulch Primitive Area.	Cultural resources in the Cedar Mesa/Grand Gulch area are of regional, national, and worldwide significance because of the wealth of intact Basketmaker and Pueblo cliff dwellings in excellent condition. Arch Canyon, in particular, has a ruin of unique architectural elements that are one-of-a-kind in this area. Arch Canyon also has designated critical habitat for the Mexican Spotted Owl, potential habitat for the Southwestern Willow Flycatcher, and riparian habitat essential for amphibians and neo-tropical migratory birds. Sensitive fish species such as the flannelmouth sucker are present in the canyon.
Dark Canyon Existing ACEC—62,659 acres	
Dark Canyon ACEC is located on the western boundary of the field office adjacent to Glen Canyon NRA on the west, and on the east the Dark Canyon Wilderness Area (45,000 acres) of the Manti-La Sal NF Dark Canyon ACEC is surrounded by National Forest and NPS lands. This area is primitive, roadless and undeveloped in nature. It is limited to access due to the canyon rims that form a natural boundary that protect its natural scenery and wildlife values. The area includes Dark, Gypsum, and Fable Valley and several smaller side canyons all of which are part of the Colorado River drainage.	Dark Canyon is one of the deepest canyon systems in the region. The remote location, dramatic rugged terrain, and undeveloped naturalness of the area contribute to the high scenic value and make this a destination for primitive backcountry exploration by national and international travelers. The canyon has unobstructed and expansive views including 1,200 foot vertical cliffs, rimrock, outcrops and spires, pour-offs and potholes, and color contrasts between soil and rock, flowing water, and diverse vegetation. The proximity to Glen Canyon NRA, the Colorado River, Canyonlands NP, and the Manti-La Sal National Forest contribute to Dark Canyon as a visitation destination for primitive backcountry experience. Dark Canyon is within designated critical habitat for the Mexican Spotted Owl. It is also important habitat for Willow Flycatchers, Peregrine Falcon, and other raptors. There is a large variety of wildlife present in the area including ringtail cats, desert bighorn sheep, bobcats, black bear, deer, elk, and mountain lions.

Table 3.50. Description and Relevance and Importance Summary of Potential ACECs

Description	Summary of Relevance and Importance
Hovenweep Existing ACEC—1798 acres + 620 acres¹	
<p>Hovenweep ACEC is located on the eastern boundary of the field office and is adjacent to the Square Tower Unit in Hovenweep National Monument (NPS).</p>	<p>Hovenweep ACEC contains cultural resources in the same vicinity and of the same types as Canyons of the Ancients National Monument and Hovenweep National Monument and adds cohesiveness to the management of the cultural resources of the two National Monuments.</p> <p>It has two special emphasis areas, Cajon Pond and a visual protection zone (880 acres) for the unobstructed viewing of cultural sites. Cajon Pond, a constructed reservoir covers approximately 10 acres and provides important riparian habitat for migrating waterfowl and other wildlife in a desert, semiarid climate that has very little surface water present.</p>
Indian Creek Existing ACEC—8,509 acres	
<p>Indian Creek ACEC is located in the northern area of the FO, east of and adjacent to Canyonlands NP / Needles District. The Indian Creek ACEC buffers the scenic view from Needles Overlook across BLM land into Canyonlands NP. The area includes the lower end of Indian Creek and Rustler Canyon.</p>	<p>The Indian Creek ACEC is noted for its incised, meandering canyons that wind through dark red mudstones, forming many rounded spires, and "hoo-doo" (boulders atop eroded rock that look like mushrooms). These various formations continue uninterrupted into Canyonlands NP, which contains some of the most unique landforms in the world. Visitors from around the world come to view this area from overlooks across BLM land and NPS Canyonlands NP.</p>
Lavender Mesa Existing ACEC—649 acres	
<p>Lavender Mesa ACEC covers the top of Lavender Mesa, which is located in the Indian Creek corridor of the FO.</p> <p>Lavender Mesa is isolated and inaccessible to man and herbivores by ground routes, even small mammals such as rabbits and mice appear to be absent. The mesa top supports a relict plant community environment. Most of the mesa is pinyon-juniper woodland with the exception of a small 20-acre sagebrush-grass park.</p>	<p>The vegetative community present on the top of Lavender Mesa is unique because it has developed without the influence of grazing animals and most other mammals. The area is ecologically relevant because it presents an isolated, relict plant community that remains unaltered by human or animal intervention. The vegetative community is important as a baseline for comparative studies of pinyon-juniper woodland and sagebrush-grass communities in other parts of the Colorado Plateau.</p>
Shay Canyon Potential ACEC—119 acres	
<p>Shay Canyon ACEC is located in the southern portion of the Indian Creek corridor and is adjacent to the northern boundary of the Manti-La Sal National Forest. It includes sections of the upper Indian Creek drainage with a Special Emphasis Area for the protection of aquatic and riparian habitat, delineated as a 275-foot corridor along upper Indian Creek.</p>	<p>Cultural resources in this area represent the interface between two prehistoric cultural groups: Anasazi and Fremont. This interface is represented in the unique motifs in the rock art. The area provides an opportunity for cultural scientific research, and paleontology study. Dinosaur tracks in the bottom of the Shay Canyon streambed are a unique visual reminder of the area's distant geologic and natural past.</p> <p>This area is heavily traveled area by visitors to the Needles District of Canyonlands National Park as Route 211 is the only way into and out of the park.</p>

Table 3.50. Description and Relevance and Importance Summary of Potential ACECs

Description	Summary of Relevance and Importance
Lockhart Basin Potential ACEC—56,293 acres	
<p>The Lockhart Basin ACEC nomination area is bounded on the north by the Colorado River, on the east by the cliffs of Hatch Point [the Moab and Monticello FOs boundary], and on the west by Canyonlands National Park. The southern boundary contours from the eastern rims to south of Indian Creek Existing ACEC and west to the boundary of Canyonlands National Park.</p> <p>This ACEC nomination includes lower Indian Creek, Rustler, Horsethief, and Lockhart Canyons and is nominated to protect scenic values as viewed from the numerous rims above the eastern ACEC nominated boundary, and looking into Canyonlands National Park.</p>	<p>The visual resources of the Lockhart Basin ACEC are some of the most impressive of the entire Colorado Plateau, and are of local, national, and international significance.</p> <p>The overlooks from the Needles Overlook provide an extensive viewshed of miles of vistas looking deep into Canyonlands NP. The unique characteristics of landforms, the National Park, the relative pristine nature of the land, the sensitivity of visitors to scenic resources, and the ability of the visitor to view the area from many vantage points make this an extraordinary and important visual resource.</p> <p>The cultural inventory areas within Lockhart Basin indicate multi-cultural occupations, unique to the canyonlands area of Utah.</p>
Valley of the Gods Potential ACEC—34,771 acres	
<p>Valley of the Gods lies north of US Highway 163 extending north to the south cliff line of Cedar Mesa. The Valley of the Gods is currently a Special Emphasis Area within the existing Cedar Mesa ACEC.</p>	<p>Valley of the Gods provides significant vistas to those who travel the roads surrounding the area. The Valley of the Gods is important to regional, national and international visitors who view and photograph the scenery. Panoramic views can be seen from the highways bordering the area and from the Valley of the Gods Loop (graded gravel and clay, 17 miles) Road. The eroded, wind-sculpted spires and buttes, and long rock fins resemble animals or "gods." Seven Sailors, Rooster Butte, Setting Hen Butte, Pyramid Peak, Castle Butte, and Bell Butte are found here. The West Fork of Lime Creek, Lime Creek, and the northwest portion of Lime Ridge are included in t area.</p>
San Juan River Potential ACEC—7,626 acres	
<p>The San Juan River ACEC nomination is located along the river from west of Bluff, Utah to the boundary of Glen Canyon NRS, with the Navajo Nation on the southern portion of the river center-line. A portion of the nominated area lies within the San Juan River SRMA.</p>	<p>The scenery along the San Juan River includes tilted formations as the river crosses Comb Ridge, steep vertical cliffs hundreds of feet high with walls of interbedded sandstone and limestone, and the 1,200-foot high walls of the Goosenecks. The Goosenecks are one of the best examples of entrenched meanders in the U.S. Riparian areas with various hues of green border the watercourse and contrast with red sandstone, presenting a diverse and varied scenic viewing area. Hanging gardens occur in ledges of Navajo Sandstone.</p> <p>The rock art along the San Juan River is unsurpassed, recognized as "Type Sites" for their specific rock art motifs. Cultural sites are present along the river banks and within the tributaries of the San Juan River.</p> <p>The San Juan River has a unique endemic fish population and designated habitat for the endangered Colorado pikeminnow and the razorback sucker, as well as the state sensitive</p>

Table 3.50. Description and Relevance and Importance Summary of Potential ACECs

Description	Summary of Relevance and Importance
	flannelmouth sucker. Bighorn sheep inhabit the rocky precipices of the lower river. The river corridor is used by migrating Southwestern Willow Flycatcher (a T&E species), and Yellow-billed Cuckoo (a candidate species). The San Juan River supports riparian habitat for several other species of wildlife, including amphibians, neo-tropical birds, and waterfowl.

¹Since the designation of this ACEC in the 1991 San Juan RMP (BLM 1991a), the BLM has acquired an additional parcel of land, approximately 620+ acres, that is adjacent on the east of the BLM Hovenweep ACEC and a state section, and is also on the western boundary of the Canyon of the Ancients NM (COANM) in Colorado. It is proposed that this parcel of approximately 620+ acres be added to the current BLM Hovenweep ACEC. The additional acreage will fill in a previously privately owned parcel between the two national monuments and contribute to consistent management of the cultural value.

3.15.2 WILD AND SCENIC RIVERS

3.15.2.1 INTRODUCTION

The Wild and Scenic Rivers Act, 1968 established legislation for a National Wild and Scenic Rivers System (NWSRS) to protect and preserve designated rivers throughout the nation in their free-flowing condition, as well as their immediate environments. The Act contains policy for managing designated rivers, and created processes for designating additional rivers into the National System. Section 5(d) of the Act directs federal agencies to consider the potential for national wild, scenic and recreational river areas in all land and water development planning. A WSR review is being conducted as part of the current BLM Monticello FO RMP process.

The first phase of the WSR review is to inventory all potentially eligible rivers within the FO area to determine which of those rivers are eligible for consideration in the NWSRS. In order to be eligible, rivers must be free-flowing and possess at least one ORV. The ORVs are evaluated in the context of regional and/or national significance, and must be river-related. A tentative classification of each river/segment found eligible is then made based on the current level of human development associated with that river/segment.

The second phase of the WSR review occurs as all eligible rivers are taken through the land-use planning process of the RMP to determine their "suitability" for designation into the NWSRS. Suitability is discussed in Chapter 4 of the Draft EIS. One RMP planning alternative will consider all eligible river(s)/segments as suitable, another alternative will consider no eligible river(s)/segments as suitable, and other alternatives will consider some river(s)/segments as suitable and other river(s)/ segments not suitable. "Suitability" determinations will be made in the ROD for the RMP.

Those river(s)/segments found suitable are then managed under specified guidelines to protect the free-flowing nature of the river(s)/segment, and to protect the identified ORVs and tentative classification.

Finally, the "suitable" river/segment determinations are reported to Congress. There is no specific time requirement for the completion of this phase; however, it is assumed that reporting

will be done some time following completion of the RMP. Only the U.S. Congress or the Secretary of the Interior, upon request by the state, can designate a river into the NWSRS.

3.15.2.2 ELIGIBLE SEGMENTS

Approximately 1,300 miles of watercourses within the Monticello PA were inventoried and determined to be free-flowing. Each river segment was evaluated on the basis of having at least one river-related ORV considered rare, unique and/or exemplary, with each ORV being at least regionally significant, and having perennial or intermittent flows. Within the Monticello PA, 12 segments totaling approximately 93 miles on 6 rivers were found to meet these criteria (see Map 54). A table listing all of the 167 river segments evaluated in 2003–2004 by the ID team for potential WSR eligibility is available in the *Preliminary Eligibility Determination of Wild and Scenic Rivers* (BLM 2003d). A tentative classification of Wild, Scenic, or Recreational was determined for each eligible river/segment based on the level of human development associated with each river/segment.

- A *Wild* river is free of impoundments, with shorelines or watersheds essentially primitive, and with unpolluted waters.
- A *Scenic* river may have some development, and may be accessible in places by roads.
- A *Recreational* river is considered as a river or segment of river accessible by road (or railroad), may have more extensive development along its shoreline, and may have undergone some impoundment or diversion in the past.

Table 3.51 lists and describes the ORVs of each of the 12 eligible river segments that will be further reviewed for suitability.

Detailed descriptions of the ORVs and the eligibility determinations can be found in the Monticello FO Final Eligibility Report (BLM 2004c). The tentative Classification for each river segment is included in the table, as well as descriptions of the ORVs. Individual worksheets showing evaluation for Tentative Classifications of each river segment are found in Appendix H, Special Designations.

Table 3.51. Individual Eligible Wild and Scenic River(s) Segments (see Map 54)

Segment Description with Approximate River Miles	Length in Total River Miles/BLM River Miles	ORVs	Tentative Classification ¹
COLORADO RIVER Perennial river			
The north/west side of this section of the Colorado River is managed by the BLM Moab Field Office; the south/east side of the same section of river is managed by the BLM Monticello Office. The boundary of the two resource areas is the centerline of the Colorado River.			
Segment 1: Northern FO boundary near River Mile 50.5 on the east side of the river [1 mile north of Potash land] south to private land near River Mile 48.5	6.2 total miles/ 2.2 BLM miles	Scenic Fish Recreation Wildlife Cultural Ecological	Recreational
Segment 2: State lands near	6.8 total miles/	Scenic	Scenic

Table 3.51. Individual Eligible Wild and Scenic River(s) Segments (see Map 54)

Segment Description with Approximate River Miles	Length in Total River Miles/BLM River Miles	ORVs	Tentative Classification¹
River Mile 44 to approx. River Mile 38.5	5.5 BLM miles	Fish Recreation Wildlife Cultural Ecological	
Segment 3: River Mile 37.5 west of state school section to boundary of Canyonlands NP near River Mile 31	6.5 total miles/ 6.5 BLM miles	Scenic Fish Recreation Wildlife Cultural Ecological	Scenic
INDIAN CREEK			
Perennial stream from National Forest boundary to Shay Canyon, and intermittent stream from Shay Canyon to Donnelly Canyon			
Manti-La Sal National Forest Boundary to Donnelley Canyon	6.5 total miles/ 4.8 BLM miles	Cultural	Recreational
FABLE VALLEY			
Perennial stream			
Source to Mouth	6.8 total miles/ 6.8 BLM miles	Wildlife Ecological	Scenic
DARK CANYON			
Perennial stream			
Youngs Canyon to Glen Canyon National Recreational Area	13.6 total miles/ 6.4 BLM miles	Scenic Recreation Wildlife	Wild
SAN JUAN RIVER			
Perennial river			
The north side of the San Juan is under BLM Monticello FO management. The south side falls under the jurisdiction and administration of the Navajo Nation. The boundary between Navajo Nation and the Monticello FO is the centerline of the San Juan River.			
Segment 1: West Montezuma Creek to private land just before "avulsed" parcel of Navajo Nation land at St. Christopher's Mission	15.3 total miles/ 8.5 BLM miles	Fish Wildlife Cultural/Historic	Recreational
Segment 2: West of "accreted" land at town of Bluff, UT River Mile (minus) -1 to River Mile 9	10 total miles/ 10 BLM miles	Fish Recreation Wildlife Cultural/Historic Ecological	Recreational
Segment 3: River Mile 9 to near River Mile 23, above the Mexican Hat formation	13.3 total miles/ 13.3 BLM miles	Scenic Fish Recreation Geologic Wildlife Ecological	Wild

Table 3.51. Individual Eligible Wild and Scenic River(s) Segments (see Map 54)

Segment Description with Approximate River Miles	Length in Total River Miles/BLM River Miles	ORVs	Tentative Classification¹
Segment 4: River Mile 23 to near River Mile 28	5.3 total miles/ 4.2 BLM miles	Scenic Fish Recreation Wildlife Ecological	Recreational
Segment 5: River Mile 28 to boundary of Glen Canyon NRA near River Mile 45	17.3 total miles/ 17.3 BLM miles	Scenic Fish Recreation Geologic Wildlife Ecological	Wild
ARCH CANYON Perennial stream in some reaches, Intermittent stream in others.			
Manti-La Sal National Forest Boundary to ½ mile west of its confluence with Comb Wash	7.7 total miles/ 6.9 BLM miles	Fish Recreation Wildlife Cultural Ecological	Recreational

¹ See appendix.

3.15.3 LANDS STUDIED FOR CONGRESSIONAL WILDERNESS DESIGNATION UNDER FLPMA SECTION 603

3.15.3.1 BACKGROUND AND HISTORY

In 1964, Congress passed the Wilderness Act, establishing a national system of lands for the purpose of preserving a representative sample of ecosystems in a natural condition for benefit of future generations. Until 1976, lands considered for and designated as wilderness were managed by the USFS, the USFWS, or the NPS. With the passage of the FLPMA in 1976, Congress directed the BLM to inventory; study, and recommend which public lands under its administration should be designated as wilderness.

In 1979, the BLM began an inventory of 23 million acres of public land in Utah and determined that 95 areas (approximately 3.3 million acres) possessed wilderness character. These lands are called wilderness study areas (WSAs) or instant study areas (ISAs) if they had previously been identified as outstanding natural areas or primitive areas. For the next several years, these areas were studied to determine which would be recommended to Congress for designation as wilderness. In October 1991, the Secretary of the Interior recommended that Congress designate 69 areas, totaling about two million acres as wilderness. To date, with few exceptions, Congress has not acted on that recommendation.

WSAs are roadless, natural in appearance, provide outstanding opportunities for solitude or primitive and unconfined recreation, and may have supplemental values (such as ecological, geological, or other features of scientific, educational, scenic, or historical value).

3.15.3.2 PLANNING AREA PROFILE

There are 18 WSAs or ISAs in the Monticello PA (Table 3.52 and Map 56). As depicted on the table, some of the WSAs are combined with the Grand Gulch and Dark Canyon ISAs to create 2 ISA complexes. Within the area managed by the Monticello FO, there is also an area totaling 2,160 acres contiguous to the Butler Wash WSA (and included in the Butler Wash WSA acreage), that was studied as a boundary variation during the wilderness review mandated by Congress in FLPMA Sections 603(a) and (b). These lands were addressed in the Utah BLM Statewide Wilderness Final EIS (November, 1990) and were recommended for congressional wilderness designation in the Utah Statewide Wilderness Study Reports (October, 1991). This recommendation was forwarded by the President of the U.S. to Congress in 1993.

All the lands studied during the FLPMA Section 603 wilderness review will continue to be managed in a manner that does not impair their suitability for congressional designation in accordance with FLPMA Section 603(c). Subject to valid existing rights, actions may be allowed on a case-by-case basis only where the BLM determines that the lands' wilderness suitability would not be impaired. All of these areas are designated and protected under the authority of Section 603 of FLPMA, are managed according to the *Interim Management Policy and Guidelines for Lands Under Wilderness Review (IMP)* (BLM 1995), to preserve their wilderness values until Congress either designates them wilderness or releases them for other uses. Only Congress can designate a WSA/ISA as wilderness or release it from the protective mandate of Section 603 of FLPMA, and the status of these areas will not change as a result of this resource management planning process.

Table 3.52. Acreage for BLM WSAs and ISAs in the Monticello PA

Name	San Juan Resource Area ¹ RMP	Utah BLM State Wide Wilderness Final EIS ^{2,3}	Utah Statewide Wilderness Study Report ⁴
Dark Canyon Instant Study Area (ISA) ⁵	62,040	68,030	68,030
Grand Gulch ISA ⁶	37,810 ⁷	105,520	105,520
Indian Creek WSA	6,870	6,870	6,870
Bridger Jack Mesa WSA	5,290	5,290	5,290
Butler Wash WSA	24,190	24,190	24,190
South Needles WSA	160	160	160
Middle Point WSA ⁵	5,990		
Mancos Mesa WSA	51,440	51,440	51,440
Pine Canyon WSA ⁶	10,890		
Cheesebox Canyon WSA	15,410	15,410	15,410
Bullet Canyon WSA ⁶	8,520		

Table 3.52. Acreage for BLM WSAs and ISAs in the Monticello PA

Name	San Juan Resource Area ¹ RMP	Utah BLM State Wide Wilderness Final EIS ^{2,3}	Utah Statewide Wilderness Study Report ⁴
Slickhorn Canyon WSA ⁶	45,390		
Road Canyon WSA	52,420	52,420	52,420
Fish Creek WSA	46,440	46,440	46,440
Mule Canyon WSA	5,990	5,990	5,990
Sheiks Flat WSA ⁵	3,140		
Squaw Canyon WSA	6,580		6,676 ⁸
Cross Canyon WSA	1,000		1,008 ⁹
Totals	387,410	381,760	389,444

¹ In this column, except as noted, all acreage figures are from San Juan RMP (BLM 1991a).

² In this column, except as noted, all acreage figures are from Utah BLM State Wide Wilderness Final EIS (BLM 1990).

³ Squaw/Papoose Canyon and Cross Canyon WSAs were not studied in the Utah BLM State Wide Wilderness Final EIS (BLM 1990) as they were studied in the San Juan / San Miguel Planning Area Wilderness EIS (BLM [Colorado] 1990).

⁴ In this column, except as noted, all acreage figures are from Utah Statewide Wilderness Study Report (BLM 1991c).

⁵ The Dark Canyon ISA combines with the Middle Point WSA to form the Dark Canyon ISA Complex, with a total of 68,030 acres.

⁶ The Grand Gulch ISA combines with the Pine Canyon, Bullet Canyon, Slickhorn, and Sheiks Flat WSAs to form the Grand Gulch ISA Complex, with a total of 105,520 acres.

⁷ The statewide wilderness EIS uses 37,580 acres for the Grand Gulch ISA. Acreage calculations for the San Juan RMP (BLM 1991a) from the master title plats revealed the actual total to be 37,807, which is rounded to 37,810. The difference between the two figures amounts to 0.6%.

⁸ Total acres of this study area are 11,287, of which 4,611 acres are in Colorado.

⁹ Total acres of this study area are 12,588, of which 11,580 acres are in Colorado.

The only decisions that will be made for these areas in this plan revision will be: 1) visual resource management (VRM) class designations in keeping with Bureau policy (VRM Class I); 2) off-highway vehicle management designations in keeping with the IMP (i.e., "closed," "limited to designated roads and trails," or "limited to existing roads and trails"), and 3) route designations where ways are either conditionally open (as long as suitability for Congressional wilderness designation is not impaired) or closed to vehicle use.

Although WSAs are by definition roadless, several of the WSAs do include inventoried ways (Table 3.53). During the 1979–1980 Utah Wilderness Inventory, it was necessary to divide routes used by motorized vehicles into "roads" and "ways." To be considered a road, 3 criteria had to be met: (1) constructed; (2) maintained by mechanical means; and (3) regular and continuous use. All other motorized routes were defined as ways, which could be left open to motorized travel as long as their use did not "impair" the suitability of the area for wilderness designation. There are no known impairments in the WSAs in the Monticello FO.

Table 3.53. List of Inventoried Ways by WSA

WSA Name	Inventoried Ways (miles)
Grand Gulch ISA	15.5
Pine Canyon WSA	2.5
Bullet Canyon WSA	6.0
Slickhorn Canyon WSA	13.25
Sheiks Flat WSA	0
Road Canyon WSA	7.0
Fish Creek WSA	19.8
Mule Canyon WSA	0.3
Mancos Mesa WSA	25.0
Cheese Box Canyon WSA	4.6
Indian Creek WSA	0
Bridger Jack Mesa WSA	0
Dark Canyon Instant Study Area (ISA)	6.0
Middle Point WSA	1.0
Butler Wash WSA	0
South Needles WSA	0
Squaw Canyon WSA	0
Cross Canyon WSA	0
Total	100.95

The BLM does not make decisions establishing scenic byways.

Scenic Byways:

Indian Creek Corridor Scenic Byway: SR-211 (Junction with US-191 14 miles north of Monticello) to its terminus at the Needles District of Canyonlands National Park.

Bicentennial—Trail of the Ancients National Scenic Byway: SR-95 from south of Blanding goes west across the Colorado River at Glen Canyon National Park (with a loop through Natural Bridges National Monument). A section also travels south from Blanding to the town of Bluff and then east to Montezuma Creek, and eventually into Colorado.

Monument Valley to Bluff Scenic Byway: US-163 from the Utah / Arizona border to the town of Bluff.

Scenic Backways:

Lockhart Basin Road Scenic Backway: From Moab, on the Kane Creek Blvd at the intersection of US-191, to Hurrah Pass and onto the Lockhart Basin Road in the Monticello PA and it ends at SR-211 near Indian Creek.

Elk Ridge Road Scenic Backway: Begins 25 miles west of Blanding at the junction of SR-25 and SR-275; it turns onto Forest Road 088 (through the Manti-LaSal National Forest) and ends 48 miles later at the junction of SR-211.

Abajo Loop Scenic Backway: West from Monticello on Forest Road (FR) 105 to the junction of FR 079, and ends 35 miles later in the town of Blanding.

Trail of the Ancients Scenic Backway: Follows SR-261 including the Moki Dugway, from SR-95 to SR-163; and intersects SR-316 to the Goosenecks State Park. The Valley of the Gods road intersects SR-261 below the dugway for a 17 mile dirt and gravel loop drive.

3.16 SPECIAL STATUS SPECIES

For BLM management purposes, special status species include those plant and wildlife species listed as endangered, threatened, proposed, and/or candidate under the Endangered Species Act, as well as those plant and animal species listed or proposed as sensitive by the BLM. Special status arises from habitat degradation and direct disturbance to individuals, often combined with inherently restricted species' distributions. Periodic review of the special status species list allows for additions and/or removals depending on the status of populations, habitat, and potential threats. Evaluation of environmental characteristics in the area of a proposed project is the first step in BLM protocol for special status species protection. If factors such as geology, soils, vegetation community type, elevation, or aspect are likely to support a known special status species, a qualified specialist must complete a survey. If the survey is contracted, a BLM specialist must approve the results. If a federally listed, proposed, or candidate species could potentially be affected by a proposed action, a Biological Assessment is prepared. The BLM must manage these species to prevent further habitat degradation or population loss. Recovery plans, special management area designations, and special management conditions are used to protect special status species. The BLM's Standards and Guidelines for Healthy Rangelands also provide habitat protection.

A total of 10 federally listed species and 59 BLM Sensitive Species were identified as having the potential to occur within the Monticello PA (see Table 3.54 and 3.54). It should be noted that some of the TES species may occur on lands managed by agencies or organizations other than the BLM.

3.16.1 SPECIAL STATUS SPECIES HABITAT

The diversity of habitat in the Monticello PA is reflected in the diversity of animal life that occurs within its borders. The Monticello FO, Utah Division of Wildlife Resources (UDWR), or the USFWS, have identified the following federally protected threatened, endangered, candidate,

or nonessential, experimental population species, and sensitive species that could potentially occur within the Monticello PA.

3.16.2 FEDERALLY THREATENED AND ENDANGERED SPECIES

Table 3.54 provides a listing of the 10 federally threatened, endangered and candidate species potentially occurring in the Monticello PA. A narrative description of each species follows the table.

Table 3.54. Federally Threatened, Endangered, and Candidate Species Potentially Occurring in the Monticello PA

Scientific Name Common Name	Habitat	Status	Area of Potential and/or Known Occurrence
Plants			
<i>Carex specuicola</i> Navajo sedge	Seasonally wet, seeps, springs, hanging gardens in Navajo sandstone. 3,770–5,980'. Blooms late June–July.	Threatened	Endemic to San Juan County, UT and Coconino County, AZ
Wildlife			
<i>Gymnogyps californianus</i> California Condor	Colonies roost in snags, tall open-branched trees, or cliffs, often near important foraging grounds.	Endangered	Experimental, nonessential population known rarely throughout Utah
<i>Empidonax traillii extimus</i> Southwestern Willow Flycatcher	Low shrub, thickets, or groves of small trees, often near watercourses.	Endangered	Throughout southern Utah.
<i>Strix occidentalis lucida</i> Mexican Spotted Owl	Steep rocky canyons.	Threatened	Southern and eastern parts of Utah.
<i>Coccyzus americanus occidentalis</i> (Western) Yellow-billed Cuckoo	Riparian habitats.	Candidate	Throughout Utah.
Fish			
<i>Gila elegans</i> Bonytail	These rare found in eddies, pools, and backwaters near swift current in large rivers.	Endangered	Mainstem of the Colorado and Green rivers
<i>Ptychocheilus lucius</i> Colorado pikeminnow	Adults can be found in habitats ranging from deep turbid rapids to flooded lowlands. Young prefer slow-moving backwaters.	Endangered	Mainstem of the Colorado, Green, and San Juan rivers
<i>Gila cypha</i> Humpback chub	These are found in large rivers and deep canyons.	Endangered	Mainstem of the Colorado and Green rivers

Table 3.54. Federally Threatened, Endangered, and Candidate Species Potentially Occurring in the Monticello PA

Scientific Name Common Name	Habitat	Status	Area of Potential and/or Known Occurrence
<i>Xyrauchen texanus</i> Razorback sucker	These are found in slow backwater habitats and impoundments.	Endangered	Within the Green, Colorado, and San Juan river systems

Navajo Sedge (*Carex specuicola*)

This species is federally listed as threatened. It occurs seasonally in wet, seeps, springs, hanging gardens on sandy to silty soils derived from Navajo sandstone (Natureserve 2005). Navajo sedge is endemic to San Juan County, UT and Coconino County, AZ at elevations from 3,770 to 5,980 feet. There are no known populations on BLM land in the Monticello PA, but potentially suitable habitat is present and there are known populations on Navajo land in San Juan County (e-mail from Paul Curtis, Monticello BLM to Susan Kammerdiener, SWCA, January 26, 2006). This species blooms from late June through July. Existing threats to this species include grazing and groundwater pumping (Natureserve 2005).

Black-footed Ferret (*Mustela nigripes*)

The black-footed ferret is listed as an endangered species. It is considered the rarest mammal in North America but was once common throughout the Great Plains. All native populations have been extirpated. Successful captive breeding programs and reintroduction efforts are returning small populations to their native ranges. Prairie dog burrows provide potential retreats for ferrets and have been shown to be directly lined to fluctuations in the prairie dog population. Their diet consists of 90% prairie dogs and with recent declines in prairie-dog numbers, reintroduced populations are at risk. Within the Monticello PA, no known populations occur, but historical native ranges exist and reintroductions are being examined by state (UDWR) and federal agencies (personal communication between Tammy Wallace, BLM, and Thomas Sharp, SWCA, 2003).

Mexican Spotted Owl (*Strix occidentalis lucida*)

The Mexican Spotted Owl (MSO) is listed as a threatened species. MSO habitat includes steep slopes and canyons with rocky cliffs. Within the Colorado Plateau, owls are known to nest in steep-walled canyon complexes and rocky canyon habitat within desert shrub vegetation. MSOs lay eggs in late March and April with an incubation period of approximately 30 days and most eggs hatch by the end of May. Most owlets fledge in June and are fully independent by early October. The MSO exists in small isolated subpopulations and is threatened by habitat loss and disturbance from recreation, overgrazing, road development, catastrophic fire, timber harvest, and mineral development (USFWS 1995). The Monticello PA contains two MSO protected activity centers. Protected activity centers are areas (at least 600 acres in size) around a known nest or roost site in which minimal management is permitted. Owls may be in other areas within

the field office boundaries or near the borders. There is also USFWS designated critical habitat for this species within the Monticello PA (see Map 93). The USFWS designates critical habitat for threatened or endangered species to protect occupied habitat and to protect suitable but unoccupied habitat to allow for expansion of populations and recovery of the species. The BLM is required not to directly or indirectly alter the value of critical habitat for both the survival and recovery of MSO.

Southwestern Willow Flycatcher (*Empidonax traillii extimus*)

The Southwestern Willow Flycatcher (SWF) is listed as an endangered species. SWF utilizes and breeds in patchy to dense riparian habitats along streams and wetlands near or adjacent to surface water or saturated soils. These dense patches are often interspersed with small openings, open water, and/or shorter/sparser vegetation, creating a mosaic habitat pattern. Historically, nests were constructed in native willow species but currently the SWF will utilize both native and exotic species, such as tamarisk and Russian olive, which provide desired habitat requirements (USFWS 2002e). SWFs begin laying eggs as early as May but typically in mid-June. Young typically fledge the nest between June and mid-August (Sogge et al. 1997). Population declines are attributed to numerous, complex, and interrelated factors such as habitat loss and modification, expansion of invasive, non-native plants into breeding habitat, brood parasitism by cowbirds, vulnerability of small population numbers, and winter and migration stress. SWF have been documented migrating along the San Juan River, Comb Wash, and the Cross Canyon area. Recent mist netting studies in Cross Canyon have shown that they are potentially nesting in the area as well. There is also potentially suitable habitat in larger riparian areas throughout the Monticello PA (see Maps 54 and 84).

Yellow-billed Cuckoo (*Coccyzus americanus occidentalis*)

The Yellow-billed Cuckoo is listed as a candidate species that has been listed due to loss of riparian habitat from agricultural use, water use, road development and urban development. The Yellow-billed Cuckoo is a neotropical migrant that utilizes riparian valleys throughout the state. Yellow-billed Cuckoos have been documented only during migration along the San Juan River. There is also potentially suitable habitat in the larger riparian areas throughout the Monticello PA (see Map 65).

California Condor (*Gymnogyps californianus*)

The California Condor, a species on the federal list, has been sighted statewide since they were recently released as a nonessential, experimental population in northern Arizona in the later 1990s. California Condors prefer mountainous country at low and moderate elevations, especially rocky and brushy areas near cliffs. Colonies roost in snags, tall open-branched trees, or cliffs, often near important foraging grounds. Condors eat carrion, usually feeding on large items such as dead sheep, cattle, and deer.

Bonytail (*Gila elegans*)

The bonytail is listed as an endangered species and has drastically declined in numbers since the 1960s. The reasons for the decline included flow depletion, dams, mining impacts and resulting siltation, and the introduction of exotic fish. It is a large cyprinid fish and little is known about its biological and diet requirements. Historically it was once widespread throughout the Colorado River Basin. Today it is thought to be found in large river reaches of the Colorado and Green rivers (USFWS 2002a). Recruitment in the natural environment is apparently nonexistent or extremely low. Bonytails seem to prefer big-river or mainstreams with eddies and pools rather than swift current. The Monticello PA contains both populations and designated critical habitat for this species (see Map 93).

Colorado Pikeminnow (*Ptychocheilus lucius*)

The Colorado pikeminnow is listed as an endangered species and is the largest cyprinid fish in North America. Natural populations of the Colorado pikeminnow are restricted to the upper Colorado River Basin in Wyoming, Colorado, Utah, and New Mexico (USFWS 2002c). The main stem of the Colorado River from Palisade, Colorado to Lake Powell has known population within this region. A small reproducing population exists in the San Juan River. According to the Colorado pikeminnow recovery goals (USFWS 2002c) these fish can be found in the San Juan River from Shiprock, New Mexico to the inflow of Lake Powell. Flow regulations, migration barriers, habitat loss/alteration, and introduced non-native fish have all been identified as causes for population decline. The Colorado pikeminnow is adapted to seasonally variable flow, high silt loads, and turbulence. The Monticello PA contains both populations and designated critical habitat for this species (see Map 93).

Razorback Sucker (*Xyrauchen texanus*)

The razorback sucker is listed as an endangered species and is a large catostomid fish endemic to the Colorado River basin. The Green River has the only known spawning areas for the razorback sucker (USFWS 2002d). Populations have been identified in the Colorado River from Rifle Colorado to Lee's Ferry Arizona and also in the San Juan River from Shiprock, New Mexico to the inflow of Lake Powell. Populations are being re-established through stocking. The natural population of these fish is mostly aged adults with little or no recruitment. These fish prefer low-gradient, flat-water reaches of rivers. The Monticello PA contains both populations and USFWS designated Critical Habitat for this species (see Map 93).

Humpback Chub (*Gila cypha*)

The humpback chub is listed as an endangered species and is a big-river cyprinid. Populations of humpback chub have been identified in the Upper Colorado River Basin with the highest concentrations found in the Black Rocks and Westwater Canyon reaches of the Colorado River near the Colorado–Utah state line (USFWS 2002b). The presence of juvenile populations suggests spawning may occur in the Upper Colorado River at Black Rock, Westwater Canyon, Cataract Canyon, and Desolation/Gray Canyon. Flow alterations have been identified as a significant cause of decline. The habitat types in which the humpback chub is found include

waters with fast currents, deep pools and boulder habitat; as well at the relatively quiet mouth of the Little Colorado River (USFWS 1990a). The Monticello PA contains both populations and USFWS designated Critical Habitat for this species (see Map 93).

There are no listed threatened, endangered, or candidate amphibian, reptilian or mollusk species with the Monticello PA.

3.16.3 BLM SENSITIVE SPECIES

The BLM maintains a list of sensitive species that may occur on managed lands. The BLM Utah state director's Sensitive Species List includes those that are federally listed species, those identified by the BLM, and those listed as state sensitive by the State of Utah. In 2002, the USFWS developed a list of Birds of Conservation Concern (BCC) that identifies migratory and nonmigratory avian species that, without additional conservation actions, are likely to become candidates for listing under the Endangered Species Act of 1973. Partners in Flight (PIF) Priority Species are those species recognized by Utah Partners in Flight as birds most in need of conservation and are described in further detail in the Utah Partners in Flight Avian Conservation Strategy (Parrish et al. 2002). The following tables list the species that potentially, or are known to occur within the Monticello PA and are either on the BLM Utah state director's Sensitive Species List, the UDWR's State Sensitive Species List, the USFWS's Birds of Conservation Concern, or the UDWR's Partners in Flight Priority Species.

3.16.3.1 SPECIAL STATUS WILDLIFE SPECIES

Thirty-eight BLM sensitive fish and wildlife species are known to occur in the Monticello PA and are listed in Table 3.55.

Table 3.55. Special Status Wildlife Species Potentially Occurring in the Monticello PA

Scientific Name Common Name	Habitat	Status/List	Area of Potential and/or Known Occurrence
<i>Idionycteris phyllotis</i> Allen's big-eared bat	Rocky and riparian areas in woodland and shrubland regions, roosts in caves or rock crevices.	The BLM and Utah	Throughout southern Utah.
<i>Nyctinomops macrotis</i> Big free-tailed bat	Rocky and woodland habitats, roosts in caves, mines, old buildings, and rock crevices.	The BLM and Utah	Throughout southern Utah.
<i>Myotis thysanodes</i> Fringed myotis	Desert and woodland areas, roosts in caves, mines, and buildings.	The BLM and Utah	Throughout southern Utah.
<i>Cynomys gunnisoni</i> Gunnison's prairie-dog	Grasslands, semidesert and montane shrublands.	The BLM and Utah	Extreme southeastern Utah.
<i>Vulpes macrotis</i> Kit fox	Desert, semiarid landscapes.	The BLM and Utah	West desert and south of the Cisco Desert.

Table 3.55. Special Status Wildlife Species Potentially Occurring in the Monticello PA

Scientific Name Common Name	Habitat	Status/List	Area of Potential and/or Known Occurrence
<i>Microtus mogollonensis</i> Mogollon vole	Dry meadows.	The BLM and Utah	Southern part of San Juan County.
<i>Perognathus flavus</i> Silky pocket mouse	Semidesert arid grasslands with rocky or loamy soils	The BLM and Utah	Extreme southeast corner of San Juan County.
<i>Euderma maculatum</i> Spotted bat	Found in a variety of habitats, ranging from deserts to forested mountains; roost and hibernate in caves and rock crevices.	The BLM and Utah	Throughout Utah.
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Occur in many types of habitat, but is often found near forested areas; roosts and hibernates in caves, mines, and buildings.	The BLM and Utah	Throughout Utah.
<i>Buteo regalis</i> Ferruginous Hawk	Flat and rolling terrain in grassland or shrub steppe; nests on elevated cliffs, buttes, or creek banks.	The BLM, Utah, BCC, and PIF	Throughout Utah.
<i>Pelecanus erythrorhynchos</i> American White Pelican	Along lakes, ponds, creeks, and rivers.	The BLM, Utah, and PIF	Throughout Utah.
<i>Dolichonyx oryzivorus</i> Bobolink	Riparian or wetland areas.	The BLM, Utah, and PIF	Throughout Utah.
<i>Athene cunicularia</i> Burrowing Owl	Open grassland and prairies.	The BLM and Utah	Throughout Utah.
<i>Haliaeetus leucocephalus</i> Bald Eagle	Roosts and nests in tall trees near bodies of water.	The BLM and Utah	Throughout Utah
<i>Melanerpes lewis</i> Lewis's Woodpecker	Burned-over Douglas-fir, mixed conifer, pinyon-juniper, riparian, and oak woodlands, but is also found in the fringes of pine and juniper stands, and deciduous forests, especially riparian cottonwoods.	The BLM, Utah, and PIF	High and mid-elevation mountain ranges of Utah.
<i>Accipiter gentiles</i> Northern Goshawk	Mature mountain forest and riparian zone habitats.	The BLM and Utah	High and mid-elevation mountain ranges of Utah.
<i>Peregrinus falconus</i> Peregrine Falcon	Steep, rocky canyons near riparian or wetland areas.	The BLM and BCC	Throughout Utah.
<i>Buteo swainsonii</i> Swainson's Hawk	Plains and grasslands.	BCC	Throughout Utah
<i>Falco mexicanus</i> Prairie Falcon	Plains and wooded areas.	BCC	Throughout Utah

Table 3.55. Special Status Wildlife Species Potentially Occurring in the Monticello PA

Scientific Name Common Name	Habitat	Status/List	Area of Potential and/or Known Occurrence
<i>Asio flammeus</i> Short-eared Owl	Grasslands, shrublands, and other open habitats.	The BLM and Utah	Throughout Utah.
<i>Picoides tridactylus</i> Three-toed Woodpecker	Engelmann spruce, sub-alpine fir, Douglas fir, grand fir, ponderosa pine, tamarack, aspen, and lodgepole pine forests.	The BLM, Utah, and PIF	High and mid-elevation mountain ranges of Utah.
<i>Spizella breweri</i> Brewer's Sparrow	Sage and desert shrub.	PIF and BCC	Throughout Utah
<i>Dendroica nigrescens</i> Black-throated Gray Warbler	Dry western deciduous or coniferous shrub.	PIF and BCC	Throughout Utah
<i>Selasphorus platycercus</i> Broad-tailed Hummingbird	Mountains of Rocky Mountain region and lowland riparian	PIF and BCC	Throughout Utah
<i>Vireo vicinior</i> Gray Vireo	Pinyon and/or juniper woodland	PIF and BCC	Throughout Utah
<i>Lanius ludovicianus</i> Loggerhead Shrike	Sage and desert shrub.	BCC	Throughout Utah
<i>Gymnorhinus cyanecephalus</i> Pinyon Jay	Sage and desert shrub and pinyon and/or juniper woodlands	BCC	Throughout Utah
<i>Amphispiza belli nevadensis</i> Sage Sparrow	Shrub steppe habitat	PIF and BCC	Throughout Utah
<i>Vermivora virginiae</i> Virginia's Warbler	Mountain shrub and pinyon-juniper habitat	PIF and BCC	Throughout Utah
<i>Centrocercus minimus</i> Gunnison Sage-grouse	Sagebrush and sagebrush/grassland habitats (see Map 65).	The BLM, PIF, BCC	Populations known in the northeastern portion of the Mont FO.
<i>Bufo microscaphus</i> Arizona toad	Lowland riparian habitat.	The BLM and Utah	Currently not found in San Juan County. Found in Southern portion of Utah.
<i>Sauromalus ater</i> Common chuckwalla	Predominantly found near cliffs, boulders, or rocky slopes, where they use rocks as basking sites and rock crevices for shelter.	The BLM and Utah	Along the Colorado River in Southern Utah.

Table 3.55. Special Status Wildlife Species Potentially Occurring in the Monticello PA

Scientific Name Common Name	Habitat	Status/List	Area of Potential and/or Known Occurrence
<i>Xantusia vigilis</i> Desert night lizard	Extremely secretive, spending much of its time hiding under Joshua tree limbs and similar cover.	The BLM and Utah	Throughout Southeastern Utah.
<i>Opheodrys vernalis</i> Smooth greensnake	Meadows and stream margins	The BLM and Utah	Abajo mountains
<i>Catostomus discobolus</i> Bluehead sucker	Fast flowing water in high gradient reaches of mountain rivers.	The BLM and Utah	Tributaries of the Colorado and Green rivers.
<i>Gila robusta</i> Roundtail chub	Large rivers, and is most often found in murky pools near strong currents.	The BLM and Utah	Mainstem and tributaries of the Colorado and Green rivers.
<i>Catostomus latipinnis</i> Flannelmouth sucker	Large rivers, where they are often found in deep pools of slow-flowing, low gradient reaches.	The BLM and Utah	Mainstem and tributaries of the Colorado and Green rivers.
<i>Oreohelix Yavapai</i> Yavapai mountainsnail	Aspens and in rocky habitat.	The BLM and Utah	Abajo and Navajo Mountains

3.16.3.2 SPECIAL STATUS PLANT SPECIES

Twenty-one BLM sensitive plant species are known to occur in the Monticello PA and are listed in Table 3.56.

Table 3.56. Special Status Plant Species with the Potential to Occur in the Monticello PA, San Juan County, Utah

Scientific Name Common Name	Habitat	Status (with date if only on one list)	Area of Potential and/or Known Occurrence
<i>Allium geyeri</i> var. <i>chatterleyi</i> Chatterley's onion	Moist pinyon-juniper and sagebrush sites.	Sensitive (2002)	San Juan County (Abajo Mountains endemic)
<i>Asclepias cutleri</i> Cutler milkweed	Sand dunes.	Sensitive (1991)	San Juan County
<i>Astragalus cronquistii</i> Cronquist milkvetch	Cutler formation (Comb Wash), Morrison formation (Aneth), Mancos shale in Colorado.	Sensitive	San Juan County
<i>Astragalus preussii</i> var. <i>cutleri</i> Copper Canyon milkvetch	Warm desert shrub. 3,805'. Copper Canyon.	Sensitive (1991)	San Juan County endemic

Table 3.56. Special Status Plant Species with the Potential to Occur in the Monticello PA, San Juan County, Utah

Scientific Name Common Name	Habitat	Status (with date if only on one list)	Area of Potential and/or Known Occurrence
<i>Cymopterus acaulis</i> var. <i>parvus</i> Skull Valley spring- parsley	Deposits of wind-blown sand.	Sensitive (2002)	San Juan County
<i>Cymopterus beckii</i> Pinnate (Beck's) spring- parsley	Sandy soil of Navajo sandstone origin. Crevices and ledges of slickrock. Mid-high elevation in Abajo Mountains.	Sensitive	San Juan County– Eight occurrences
<i>Dalea favescescens</i> var. <i>epica</i> Hole-in-the-Rock prairie clover	Sandstone bedrock and sand in blackbrush and mixed desert shrub. 4,690–5,000'.	Sensitive	(1991, San Juan County) Southwest San Juan County and east Garfield endemic
<i>Echinocereus</i> <i>triglochidiatus</i> var. <i>inermis</i> Spineless hedgehog cactus	Blackbrush, ephedra, sagebrush, pinyon-juniper mountain brush, aspen communities. 3,200–8,400'.	Sensitive (1991)	San Juan County. Spineless variety is a neotype from San Juan County
<i>Epilobium nevadense</i> Nevada willowherb	Talus slopes, crevices.	Sensitive (2002)	San Juan County (Washington, Iron, and Millard counties)
<i>Erigeron kachinensis</i> Kachina daisy	Seasonally wet seeps, hanging gardens on sandstone outcrops.	Sensitive	San Juan County Colorado Plateau endemic (Natural Bridges National Monument Dark Canyon and Elk Ridge)
<i>Eriogonum racemosum</i> var. <i>nobilis</i> Redroot buckwheat	Sagebrush and pinyon-juniper. 5,000'.	Sensitive (2002)	San Juan County
<i>Gilia latifolia</i> var. <i>imperialis</i> Cataract Canyon gilia	Mixed warm and cool desert shrub communities. 3,280– 5,215'.	Sensitive (2002)	San Juan County (type from Cataract Canyon) Utah Endemic
<i>Habenaria zothecina</i> Alcove bog orchid	Moist streambanks, seeps, hanging gardens, in mixed desert shrub, pinyon-juniper, and oakbrush. 4,360–8,690'.	Sensitive (2002)	San Juan County, Grand County (type) Utah endemic

Table 3.56. Special Status Plant Species with the Potential to Occur in the Monticello PA, San Juan County, Utah

Scientific Name Common Name	Habitat	Status (with date if only on one list)	Area of Potential and/or Known Occurrence
<i>Lomatium latilobum</i> Canyonlands lomatium (C. biscuitroot, or C. desert-parsley)	Slot canyons between Entrada sandstone 'fins' formed from expanded fractures and erosion. Sandy soil or crevices in sandstone. (Sand Flat and Mill Creek it's found in Navajo sandstone that weathers like Entrada.) Prefers the sheltered, cool habitat on all slopes and aspects.	Sensitive	San Juan County, Grand County (Wilson Mesa) Southeastern Utah (and adj. Mesa County Colorado) endemic. Thirteen occurrences
<i>Ostrya knowltonii</i> Western hophornbeam	A small tree at bases of monoliths, hanging gardens of sandstone. 4,000–5,600'.	Sensitive (1991)	San Juan County
<i>Pediomelum aromaticum</i> var. <i>tuhyi</i> Paradox breadroot	Pinyon -juniper and mixed desert shrub. 5,020'.	Sensitive (2002)	San Juan County (This variety differs from more widespread variety by size of flowers.)
<i>Perityle specuicola</i> Alcove rock-daisy	Drier crevices in seasonally wet hanging gardens, alcove communities at 4,000'. Navajo and Windgate sandstone and Rico Formation, but habitat not substrate specific.	Sensitive	San Juan County, Grand County (type north of Moab). Narrowly endemic to Colorado Plateau (from confluence of Colorado River with the Dolores and Dark Canyon)
<i>Phacelia howelliana</i> Howell scorpionweed	Salt and warm desert shrub, pinyon-juniper. 3,690–5,000'.	Sensitive (1991)	San Juan County (type from Bluff). Colorado Plateau endemic
<i>Phacelia indecora</i> Bluff phacelia	Salt desert shrub. 4,500'.	Sensitive (2002)	San Juan County (type from Bluff) Endemic
<i>Proatriplex pleiantha</i> Mancos shadscale	Salt desert shrub in Morrison Formation.	Sensitive (1991)	San Juan County (southeast) Navajo Basin endemic
<i>Sphaeralcea janeae</i> Jane's Globemallow	Sandy soils weathered white rim and Organ Rock members of Cutler Formation. salt desert shrub. 4,000–4,600'.	Sensitive (2002)	San Juan County (type near White Rim road), Grand County (questionable) Canyonlands endemic

3.17 TRAVEL MANAGEMENT

3.17.1 OVERVIEW

In the past, travel management has focused on motor vehicle use; however, travel management encompasses all forms of transportation, including mechanized vehicles such as bicycles, motorcycles, four-wheeled ATVs, cars, and trucks. Off-highway vehicles (OHVs) (also known as off-road vehicles) include ATVs, off-highway motorcycles, and snowmobiles. These are vehicles capable of, or designated for, travel on or immediately over land, water, or other natural terrain.

3.17.2 CURRENT MANAGEMENT PRACTICES

The San Juan RMP (BLM 1991a) included designations for Open, Closed, and Limited OHV areas. Under the Limited category there were two subcategories: 1) limited to existing roads and trails, and 2) limited to designated roads and trails (see Table 3.57 below). Over the subsequent decade, the actual on-the-ground implementation of designations either by mapping or signing of routes was never completed.

Table 3.57. Current OHV Designation and Acreage

Monticello PA Lands (1,783,123)	1991 BLM San Juan Resource Area RMP
OHV Designation Categories	Number of Acres ¹
Open	611,310
Limited to designated	218,780
Limited use, seasonal	540,260
Limited to existing	570,390
Closed	276,430

¹Acreage may be additive because of overlap.

In the current RMP process, state and national guidance for OHV use and travel planning in the subcategories under the Limited designation has changed. Designating Open, Closed, and Limited areas for OHV use continues to be mandated, but under the Limited category only the "limited to designated roads and trails" subcategory is recommended.

Designation of routes under the Limited category provides a purposefully designed and clearly delineated travel network, reduces route proliferation, and facilitates travel management and law enforcement.

3.17.3 ISSUES

The increase in the use of OHVs has created numerous issues within the Monticello PA. The speed and increasing capability of OHVs allows easier access to remote parts of the Monticello PA, making management of this activity more difficult, and increasing the potential range of adverse impacts to natural resources. Cross-country OHV use, in particular, is creating additional resource damage and is an important issue for the Monticello FO. Also, the popularity of OHV-

related activities continues to grow, both in private use and in through special events, which exacerbates the management and resource impacts issues. With the increase in popularity, measures are needed to avoid on-site and off-site impacts to current and future land uses are resources. Issues include noise and air pollution, erodible soils, stream sedimentation, non-point source water pollution, listed and sensitive wildlife species habitats, and historic and archaeological sites.

3.17.4 VEHICULAR ROUTES

Within the Monticello PA, 6,452 miles of B, C and D class roads and trails (including all ownership and all agencies) have been constructed or identified. To clarify, B class roads are regularly maintained; surfaces areas that can be natural, paved, or gravel and are funded by the state for maintenance purposes. C class roads are considered city streets; while D class roads are comprised of all natural surfaces, not funded by the state and not on a regular maintenance schedule. Approximately 2,481 miles of D class roads and trails are located throughout the Monticello PA. These routes provide access for uses such as grazing, wood cutting and mineral development. However, recreational opportunities provide the primary use of these roads and trails.

3.17.4.1 HIGH USE AREAS

Within the Monticello PA, specialists have identified 7 areas where OHV designations need to be addressed due to a variety of resource use conflicts. These conflicts have the potential to bring harm to users as well as the resources potentially impacted. At the very least, user conflicts may potentially degrade user satisfaction. These areas include Indian Creek, Dry Valley Summit, Montezuma Recapture Drainages, Butler-Comb-Lime, Cedar Mesa, Southwest Canyons, and Dark Canyon-Beef Basin. For additional details on user conflicts, see Section 3.11, Recreation.

3.17.4.2 SCENIC BYWAYS AND BACKWAYS

The BLM Backcountry Byways are components of the National Scenic Byway system. The program was established by the U.S. Department of Transportation in 1991. Roads may be recognized as scenic by-ways based on their archaeological, cultural, historic, natural, recreational, and scenic qualities. There are no designated BLM Backcountry Byways in the Monticello PA.

Backways in Utah are primarily on BLM land; however, a few are on state and FS lands. Utah backways were named on June 2, 1989 as part of Utah's Byway and Backway program. All of these roads were a product of a statewide juried/vote process by leaders in regional communities. Since 1989, no Utah Backways have been designated; however, some have been removed for safety reasons (personal communications with Margaret Godfrey, Utah State Byway Coordinator, on January 26, 2006). Descriptions of the Scenic Byways and Backways found within the Monticello PA are given below.

3.17.4.2.1 SCENIC BYWAYS

Indian Creek Corridor Scenic Byway

SR-211 (Junction with US-191 14 miles north of Monticello) to its terminus at the Needles District of Canyonlands National Park.

Bicentennial—Trail of the Ancients National Scenic Byway

SR-95 from south of Blanding goes west across the Colorado River at Glen Canyon National Park (with a loop through Natural Bridges National Monument). A section also travels south from Blanding to the town of Bluff and then east to Montezuma Creek, and eventually into Colorado.

Monument Valley to Bluff Scenic Byway

This route takes travelers on US-163 from the Utah / Arizona border to the town of Bluff.

3.17.4.2.2 SCENIC BACKWAYS

Lockhart Basin Road Scenic Backway

This route runs from Moab, on the Kane Creek Blvd at the intersection of US-191, to Hurrah Pass, then onto the Lockhart Basin Road and ending at SR-211. (This is a 57-mile trail that takes approximately 11 hours to traverse, and is an extremely challenging four-wheel drive, high clearance trail).

Trail of the Ancients Scenic Backway

This route follows SR-261 including the Moki Dugway, from SR-95 to SR-163; and intersects SR-316 to the Goosenecks State Park. The Valley of the Gods road intersects SR-261 below the dugway for a 17-mile dirt and gravel loop drive.

Elk Ridge Road Scenic Backway

This route begins 25 miles west of Blanding at the junction of SR-25 and SR-275; it turns onto Forest Road 088 (through the Manti-La Sal National Forest) and ends 48 miles later at the junction of SR-211.

Abajo Loop Scenic Backway

This route runs from Monticello on Forest Road (FR) 105 to the junction of FR 079, and ends 35 miles later in the town of Blanding.

3.17.4.3 SAN JUAN RIVER

Permitted motorized and nonmotorized travel is allowed on the San Juan River under the current RMP. NO upstream motorized traffic is allowed.

3.18 VEGETATION

3.18.1 INTRODUCTION AND RESOURCE OVERVIEW

Differences in vegetation composition reflect the environmental diversity across the Monticello PA. This vegetation composition is affected by factors such as soils, elevation, aspect, slope, topography, and precipitation. In the current RMP, vegetation in the Monticello PA was classified into one of 4 major vegetation communities (BLM 1989): pinyon pine–Utah juniper (*Pinus edulis*—*Juniperus osteosperma*), saltbush (*Atriplex* spp.), sagebrush (*Artemisia* spp.), and blackbrush (*Coleogyne ramosissima*). These are further divided into 16 vegetation associations and habitat types. Although a small part of the FO area, grasslands, ponderosa pine/mountain shrub, riparian/wetlands and hanging gardens have been added as vegetation communities. Federally threatened and endangered and BLM sensitive plant species are discussed in Section 3.16, Special Status Species.

Vegetation across the Monticello PA has been identified using Utah SWReGap Analysis data (USGS 2004), which was developed using multi-spectral satellite imagery in conjunction with image processing and classification software. The relationship between spectral signatures and vegetation types was further refined through the development of models that incorporated a variety of topographic and distributional information for a given vegetation type. Utah SW ReGAP vegetation data were designed to be used for depicting the distribution of the state's various vegetation types at scales of 1:100,000 or smaller. Thus, while adequate for characterizing vegetation over large areas, this data are less accurate when viewed for smaller project areas. Gap coverage data were used to display the land cover types that exist in the Monticello PA (Map 65). Some of the SW ReGAP vegetation cover types were combined; resulting in the land cover categories presented in Table 3.58. The non-vegetated land cover categories are not discussed in this section. No acreages are provided for the hanging gardens vegetation type due to the vertical nature of the community.

Table 3.58. BLM Acres of Land by SW ReGAP Cover Type

Cover Type	Acres
Pinyon-juniper (includes juniper, pinyon-juniper and pinyon)	1,147,407
Desert shrub (includes salt desert shrub, greasewood and blackbrush)	421,863
Sagebrush/perennial grassland (includes sagebrush, sagebrush/perennial grass, desert grassland and dry meadow)	166,122
Riparian and wetlands	20,699
Conifer /mountain shrub (includes ponderosa pine/mountain shrub, oak/mountain shrub and mountain shrub)	10,802
Invasive plants and noxious weeds	3,429

Table 3.58. BLM Acres of Land by SW ReGAP Cover Type

Cover Type	Acres
Agriculture	5,543
Water	1,446
Developed	227
Disturbed	7,858
Total BLM Lands in FO	1,785,396

3.18.1.1 PINYON-JUNIPER

These woodlands, dominated by pinyon pine (*Pinus edulis*) and Utah juniper (*Juniperus osteosperma*), cover approximately 1,147,407 acres (64%) (USGS 2004) of the Monticello FO. In this habitat type, precipitation in this habitat ranges from 12 to 18 inches annually and occurs primarily in the winter. Productivity, species composition, and resiliency differ within this type depending on soil depth. As stands mature toward full canopy closure, understory vegetation becomes sparse and forage value decreases. Habitat types outlined in the 1986 Draft San Juan RMP (BLM 1986a) include:

- Pinyon pine, Utah juniper, blackbrush (*Coleogne ramosissima*), galleta grass (*Hilaria jamesii*);
- Pinyon pine, Utah juniper, Nuttall's saltbush (*Atriplex nuttallii*), galleta grass, Indian ricegrass (*Oryzopsis hymenoides*);
- Pinyon pine, Utah juniper, big sagebrush (*Artemisia tridentata*);
- Pinyon pine, Utah juniper, Utah serviceberry (*Amelanchier utahensis*);
- Pinyon pine, Utah juniper, mountain big sagebrush (*Artemisia tridentata* var. *vaseyana*), Gambel oak (*Quercus gambelii*).

Unhealthy pinyon-juniper stands are evident across the Monticello PA, especially on sites with shallow soils. Pinyon mortality, attributed to the combination of drought, Ips beetle, and root disease, is estimated at 20–30% in the Monticello PA. Pinyon is a valuable resource for other programs such as woodlands (firewood harvest) and wildlife habitat management. It also provides pine nuts for human collection and consumption. The increase in dead wood has led to an increase in fuel loading and area fire hazards. However, this dead wood also provides a short-term resource as collectable firewood.

Pinyon-juniper encroachment on sites with deep soils is continuing. More sagebrush communities and understory vegetation are lost as this occurs, resulting in an increase in soil erosion. Following wildfires, rehabilitation seedings have occurred in pinyon-juniper woodlands on throughout the Monticello PA. More information on this vegetation type is located in Section 3.21, Woodlands.

3.18.1.2 DESERT SHRUB

This vegetation type includes desert shrub and semidesert shrub species. These areas receive relatively low annual precipitation (5–10 inches), which translates into very low available soil moisture. The soils that support members of the saltbush zone are also often highly saline. These factors limit this type's ability to recover following disturbance. Drier saltbush areas contain species such as four-wing saltbush (*Atriplex canescens*), shadscale (*Atriplex confertifolia*) and winterfat (*Krascheninnikovia lanata*). Greasewood (*Sarcobatus vermiculatus*) dominates in areas where the water table is near the surface (MacMahon 1988). Elevation ranges from 4,000 to 5,400 feet. Approximately 421,863 acres, or 24% of the Monticello FO, includes the following habitat types outlined in the 1986 San Juan Draft RMP (BLM 1986a):

- Shadscale, Mormon tea (*Ephedra* spp.), blackbrush;
- Indian ricegrass, galleta grass, shadscale, fourwing saltbush;
- Shadscale, Mormon tea, blackbrush, pinyon pine, Utah juniper;
- Fourwing saltbush, Mormon tea, blue grama (*Bouteloua gracilis*), Indian ricegrass, galleta grass;
- Fourwing saltbush, blue grama, Indian ricegrass, galleta grass, big sagebrush;
- Pinyon pine, Utah juniper, blackbrush;
- Shadscale, Mormon tea, blackbrush, galleta grass, Indian ricegrass;
- Fourwing saltbush, Mormon tea, galleta grass, Indian ricegrass (USGS National Gap Analysis Program 2004).

3.18.1.3 SAGEBRUSH/ PERENNIAL GRASS

The moderately deep soils and greater amount of precipitation in this zone (11 to 16 inches per year) combine to create these relatively productive vegetation communities. Big sagebrush predominates on the more favorable sites, and black sagebrush (*Artemisia nova*) on the shallow rocky sites. Important associated forage plants include bitterbrush (*Purshia tridentata*), Indian ricegrass, western wheatgrass (*Elymus smithii*), Sandberg bluegrass (*Poa secunda*), and squirreltail (*Sitanion hystrix*). Elevation ranges from 5,500 to 7,300 feet with little localized relief. This vegetation type occurs across approximately 166,122 acres, or 9% of the Monticello FO (USGS 2004), and provides crucial winter range for big game wildlife species. Habitat types outlined in the 1986 Draft San Juan RMP (BLM 1986a) include big sagebrush, pinyon pine, Utah juniper, galleta grass, needle-and-thread grass (*Stipa comata*), blue grama, and Indian ricegrass.

Sagebrush stands are declining due to drought, insects (army cutworm), pinyon-juniper encroachment, motorized off-road travel, and lack of seedling recruitment. Large amounts of decadent plants (older age class) are evident, with a lack of age class diversity. The loss of sagebrush communities threatens wildlife habitat and species diversity across the Monticello PA. Seeding projects in the Monticello PA involve sagebrush restoration for deer winter range and habitat improvement for sage-grouse.

Grassland communities occur as a unique component of the Monticello FO. They are similar to salt-desert, sagebrush, and blackbrush types in species composition, but differ in that grasses dominate instead of browse species. The dominant grass species depend on the soil, with species such as saltgrass (*Distichlis stricta*), galleta grass, squirreltail, blue grama, and western wheatgrass occurring on heavy soils. Sandy sites usually support species such as Indian ricegrass, sand dropseed (*Sporobolus cryptandrus*), and needle- and-thread grass. Grassland communities occur from 4,000 to 6,000 feet with average precipitation total of 5 to 15 inches (Vallentine 1961).

Pinyon-juniper and shrub encroachment, along with that of invasive annuals such as cheatgrass (*Bromus tectorum*) and Russian thistle (*Salsola tragus*), are the main issues of concern for this community type.

3.18.1.4 RIPARIAN AND WETLAND COMMUNITIES

Riparian and wetland areas occur along waterways and water-bodies and are characterized by species such as willows (*Salix* spp.) and cottonwoods (*Populus* spp.). Approximately 28,994 acres of wetland and riparian areas exist in the Monticello Field. Although riparian and wetland areas represent only 1.6% of the FO area, they provide crucial wildlife habitat and contribute greatly to overall vegetation productivity and diversity. Riparian resource issues are covered in detail in Section 3.12, Riparian Resources.

Hanging gardens and spring-fed vegetation communities are rare to the arid and semiarid environments of the Colorado Plateau. Hanging gardens occur where groundwater seeps through sandstone or limestone substrates, often along overhanging cliffs adjacent to rivers. Plants found in hanging garden communities are often wetland-riparian species endemic to the Colorado Plateau (Spence unpub.). Spring-supported communities often contain riparian woodlands of species such as willow and cottonwood. Some less common, mixed-deciduous woodlands comprised of species such as birchleaf buckthorn (*Rhamnus betulifolia*) are also found in the region.

3.18.1.5 CONIFER/ MOUNTAIN SHRUB

This vegetation type occupies elevations between 6,500 and 9,000 feet (Dixon 1935) with an average of approximately 13 inches of precipitation annually (WRCC 2004). Where ponderosa pine is present, the understory is relatively sparse, commonly consisting of Snowberry (*Symphoricarpos* spp.), Rabbitbrush (*Chrysothamnus* spp.), Oregon grape (*Mahonia repens*), squirreltail, and buckwheat (*Eriogonum* spp.) Gambel oak dominated communities may dominate the lower end of the elevation range of this vegetation type and is considered a subclimax community (Dixon 1935). Approximately 10,802 acres of the ponderosa pine/mountain shrub vegetation type exists in the Monticello FO (Edwards et al. 1995). Although this vegetation type is not actively managed and only represents 0.6% of the FO area, it provides crucial wildlife habitat and ecological diversity (see Section 3.20, Wildlife and Fisheries).

3.18.1.6 INVASIVE PLANTS AND NOXIOUS WEEDS

One of the BLM's highest priorities is to promote ecosystem health and one of the greatest obstacles to achieving this goal is the rapid expansion of invasive, non-native species, or weeds, across public lands. A noxious weed is any plant designated by a federal, state or county government as injurious to public health, agriculture, recreation, wildlife or property (Sheley, Petroff, and Borman 1999). Noxious weeds are designated and regulated by various state and federal laws. Approximately 3,429 acres or 0.2% (USGS 2004) of the Monticello PA are dominated by this vegetation type. A systematic weed inventory has not been completed for the PA, but BLM estimates made in 2000 indicate that there were over 35,000 acres of noxious weeds, although most of that estimate was based on Russian Olive and Tamarisk infestation. The Monticello FO treats over 1,000 acres each year. Of particular concern is a population of Camelthorn, which is the only known infestation of this species in Utah. Significant efforts are being made to control it before it becomes widespread.

In most cases, noxious weeds are also non-native species (BLM 1991b). They are capable of invading plant communities and replacing native species, and are particularly successful following a disturbance. The BLM considers plants invasive if they have been introduced to an environment where they did not evolve. As a result, they usually have no natural enemies to limit their reproduction and spread (Westbrooks 1998). These invasive plants can dominate and often cause permanent damage to natural plant communities. If not eradicated or controlled, noxious and invasive weeds could jeopardize the health of the public lands and the myriad of activities that occur on them. Noxious and invasive weed species identified in San Juan County are listed in Table 3.59 and a copy of the Noxious Weed Act is included as Appendix G.

The spread of invasive species across the management area continues to be a primary concern. Tamarisk and Russian olive infestations are found in many waterways and have resulted in vegetation compositions far removed from native riparian plant communities. Although known as a highly invasive species, without official designation as a problematic species, tamarisk eradication has not been mandatory in Utah. Populations of Russian knapweed have also reached high levels in many river corridors with camelthorn and ravenagrass (*Saccharum ravennae*) following suit. New species invasions such as these threaten existing vegetation communities, species diversity, and habitats of special status species.

Effects of the current drought are evidenced by reduced plant productivity. Unfavorable climactic conditions also predispose vegetation to insect infestations. Public interest in visiting the Monticello PA continues to grow, and with this comes a greater risk of disturbance to native plant communities and special status species. Activities such as seed collection have become more popular as the demand for drought-tolerant plants increases. Recreationists are seeking new areas, as well as continuing to visit popular destinations such as the San Juan River. Increased human visitation exposes new areas to disturbance and increases the chance for outbreaks of undesirable weeds.

Controlling undesirable and non-native species is one of the most difficult challenges, as well as one of the most significant problems, facing vegetation managers. The Monticello FO contracts with San Juan County to control weeds on BLM land utilizing integrated pest management strategies (combined use of mechanical, cultural, chemical, manual, biological and prevention

measures. San Juan County surveyed roads within the FO for noxious and invasive plant species in 1997 and 1998. When possible, these surveys are updated annually. Species found in the FO PA are included in Table 3.59.

Table 3.59. Invasive and Noxious Weeds of San Juan County, Utah

Scientific Name	Common Name
<i>Aegilops cylindrica</i>	Jointed goatgrass ^{C S}
<i>Alhagi pseudalhagi</i>	Camelthorn ^C
<i>Asclepias subverticillata</i>	Western whorled milkweed ^C
<i>Bromus tectorum</i>	Cheatgrass
<i>Cardaria draba</i>	Whitetop/Hoary cress ^S
<i>Carduus nutans</i>	Musk thistle ^S
<i>Centaurea diffusa</i>	Diffuse knapweed ^S
<i>Centaurea maculosa</i>	Spotted knapweed ^S
<i>Centaurea repens</i>	Russian knapweed ^S
<i>Centaurea squarrosa</i>	Squarrose knapweed ^S
<i>Cirsium arvense</i>	Canada thistle ^S
<i>Convolvulus arvensis</i>	Field bindweed ^S
<i>Cynodon dactylon</i>	Bermudagrass ^S
<i>Elaeagnus angustifolia</i>	Russian olive
<i>Elytrigia repens</i>	Quackgrass ^S
<i>Isatis tinctoria</i>	Dyer's woad ^S
<i>Lepidium latifolium</i>	Tall whitetop/Perennial pepperweed ^S
<i>Linaria genistifolia</i>	Dalmatian toadflax
<i>Onopordum acanthium</i>	Scotch thistle ^S
<i>Salsola tragus</i>	Russian thistle
<i>Solanum elaeagnifolium</i>	Silverleaf nightshade ^C
<i>Sorghum halepense</i>	Johnsongrass (Perennial Sorghum) ^S
<i>Solanum rostratum</i>	Buffalobur ^C
<i>Tamarix ramosissima</i>	Tamarisk (saltcedar)
<i>Tribulus terrestris</i>	Puncturevine

^C San Juan County Listed Noxious Weed

^S State of Utah Listed Noxious Weed

(Designations adapted from the "Noxious Weed Field Guide for Utah" [Merritt, Belliston, and Dewey 2000])

Weed eradication methods, such as herbicide spraying, must be consistent with the Final Environmental Impact Statement and Record of Decision (Utah) Vegetation Treatment on BLM Lands in Thirteen Western States (BLM 1991b and the Vegetation Treatments Using Herbicides on BLM Lands in 17 Western States (BLM 2007b). The use of certified weed-free hay is one guideline implemented from Utah BLM Health Standards and Guidelines for Healthy Rangelands to control the spread of noxious weeds (BLM 1997). For revegetation purposes, the use and perpetuation of native species is a priority, except for instances when non-intrusive, non-native species are more ecologically or economically feasible.

3.18.2 SEED AND PLANT COLLECTION

Private individuals may collect seed and plants after acquiring a permit, which includes a list of stipulations. The public may collect seed on BLM-administered lands during non-drought years from a seed source that has been verified as being in good vegetative condition (vigor, viable seed, etc.). Popular species for seed collection include fourwing saltbush, globemallow (*Sphaeralcea* spp.), rabbitbrush (*Chrysothamnus* spp.), winterfat, and needle-and-thread grass.

Collection of individual forbs, grasses, and most shrubs is allowed for scientific purposes only. Federally protected plant species may not be collected, but BLM-listed sensitive species may be collected if the population is sufficiently large as to not be affected. Before collecting plant specimens, the local BLM FO must be notified. A list of species collected and a copy of the herbarium labels produced for each specimen must be submitted to the BLM Utah State Office at the end of collection season.

3.19 VISUAL RESOURCES

3.19.1 RESOURCE OVERVIEW

The Monticello PA contains an unusually large number of areas that possess a high degree of scenic quality and a high level of visual sensitivity. Each year, an increasing number of visitors come to the area to recreate and sightsee. The visual attributes of the region have made the Monticello PA popular for locals and visitors alike. In general, high scenic quality within the Monticello PA results from the extraordinarily diverse and distinct topography, geology, and cultural history. The area possesses scenically unique vistas and river ways; rare and unusual geological formations of sandstone, limestone, and shale; colorful and highly contrasting sandstone cliffs, arches, canyons, and spires; a diversity of vegetation ranging from aspen, pinyon and juniper, to cottonwood and cacti; and an extraordinary concentration of prehistoric rock art, and prehistoric and historic structures. Visually sensitive areas within the Monticello PA are also the result of visitor interest in and public concern for the visual resources of a particular area, the high degree of visibility to the public for a particular area, the level of use of an area by the public, and the type of visitor use that an area receives.

The major areas within the Monticello PA that possess both outstanding scenic quality and high visual sensitivity include, but are not limited to: the Dark Canyon Wilderness, Comb Ridge, Comb Wash, Butler Wash, Lockhart Basin, the Grand Gulch/Cedar Mesa Plateau and associated canyons, Valley of the Gods, Indian Creek Corridor, Goosenecks State Park Overlook, and a segment of the San Juan River from Sand Island to Clay Hills.

Areas of high scenic quality and visual sensitivity that are associated with travel corridors within the area include the Indian Creek Scenic Byway, the Scenic Byway from the Arizona Border to Bluff (US-163), Trail of the Ancients National Scenic Byway, the Bicentennial Scenic Byway (U-95), and the Lockhart Basin Road Scenic Backway. The Monticello PA also contains thousands of miles of jeep, bike, and foot trails that are traveled as scenic routes, many of which are internationally recognized.

3.19.2 CURRENT MANAGEMENT PRACTICES

The current management of visual resources within the Monticello PA is guided by decisions made in the San Juan RMP ROD (BLM 1991a). The RMP establishes the Visual Resource Management (VRM) goals, which are to: 1) provide a systematic method to identify, evaluate, and manage visual resource values; 2) protect certain scenic values; and 3) minimize adverse visual impacts in other areas while allowing land-use activities to occur. The management guidance to achieve these objectives are to: 1) designate 5 ACECs (Butler Wash, Cedar Mesa, Dark Canyon, Indian Creek, and the Scenic Highway Corridor) in accordance with special conditions stipulated in Chapter 3 of the RMP; and 2) prepare management plans for these areas.

Under the current RMP, visual resources have been identified according to VRM classes. These classes are based on conditions such as scenic quality, viewing distance zones, and viewer sensitivity levels. The VRM class objectives and their descriptions are:

VRM Class I

The objective of Class I is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activities. The level of change to the characteristic landscape should be very low and should not attract attention.

VRM Class II

The objective of this class is to retain the existing character of the landscape. The level of change to the landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes to the landscape must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.

VRM Class III

The Class III objective is to partially retain the existing character of the landscape. The level of change to the landscape should be moderate. Management activities may attract the attention of the casual observer, but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.

VRM Class IV

The objective of Class IV is to provide for management activities that require major modifications to the existing character of the landscape. The level of change to the landscape can be high. The management activities may dominate the view and may be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repetition of the basic visual elements of form, line, color, and texture (BLM 1986b).

The VRM classes within the Monticello PA are listed in Table 3.60, with their acreages.

Table 3.60. VRM Classes and Acreages

VRM Class	Acres
I	397,477
II	419,536
III	522,921
IV	991,331
Total	2,331,265

Source: BLM 2003e.

The current Monticello RMP has established visual resource stipulations for several areas in the PA that are considered to have high scenic quality. These include the following:

- Butler Wash ACEC is managed to maintain its scenic quality, as VRM Class I. This would be accomplished by limiting surface disturbance to those projects for which revegetation could be successfully established within one year after project completion.
- Cedar Mesa ACEC is managed to protect cultural resources, scenic and natural values associated with primitive recreation. All ROS P class areas within the ACEC are managed as VRM Class I. Activities within the ACEC would be approved only with special conditions to protect visual resources.
- The Grand Gulch special emphasis area within the Cedar Mesa ACEC is managed to maintain scenic quality; surface disturbance would be managed to be compatible with VRM Class I criteria.
- The Valley of the Gods special emphasis area within the Cedar Mesa ACEC is managed to maintain scenic quality; surface disturbance would be managed to be compatible with VRM Class I criteria.
- To maintain scenic quality within the Indian Creek ACEC, surface disturbance will be limited to that for which revegetation could be successfully established within 1 year after project completion. The ACEC is managed as VRM Class I. Indian Creek ACEC is open for mineral leasing with stipulations to prevent surface occupancy; however, the FO manager could grant an exception to the No Surface Occupancy stipulation if an Environmental Assessment (EA) concludes that the project would not unduly impair the visual quality of the area. Recreational use will be limited if the activity causes damage to scenic quality.
- The Scenic Highway Corridor ACEC covers a visual zone along State Highways U-95, U-261, and U-276, and part of the White Canyon viewshed. To maintain scenic quality, surface disturbance will be limited to that for which revegetation could be successfully established within 5 years after project completion, and also managed as VRM Class I. All revegetation must be with native species naturally occurring within the area. The Scenic Highway Corridor ACEC will be open for mineral leasing with stipulations to prevent surface occupancy. However, the FO manager could grant an exception to the No Surface Occupancy stipulation if an EA concludes that the project would not unduly impair the visual quality of the area. Recreational use will be limited if the activity causes damage to scenic quality.

- Dark Canyon ACEC is managed to protect scenic values associated with primitive recreation, and activities within the ACEC would be approved to protect these values. Surface disturbances will be limited to those that can be successfully revegetated within 1 year after project completion. The ACEC is managed as VRM Class I, and recreation would be limited if cultural or scenic values were being damaged by recreational activities. Dark Canyon ACEC is closed to mineral leasing, mineral disposal, and OHV use.

3.19.2.1 CURRENT CONDITIONS

The entire Monticello PA has been visually inventoried and classified according to the BLM VRM process. In general, the visual resources in the Monticello PA can be delineated in relation to US-191 that runs north-south through the FO PA. The area to the east of the highway is designated as VRM Class III and Class IV, with the exception of VRM Class II areas near Montezuma Creek and north of the town of Blanding. The remainder of the Monticello PA, to the west of US-191, contains all of those areas designated as possessing high scenic and visual qualities, that is, VRM Class I and Class II.

The emphasis on VRM has changed since the 1991 RMP was approved. The current 1991 RMP and application of VRM objectives have afforded protection of most resources; however, the subsequent rapid increases in recreational resource uses are having an impact on visual resources.

People are attracted to the area because of its extraordinary scenic quality and the many opportunities for recreation. Throughout the Monticello PA, impacts to the landscape are occurring from increased recreation and tourism, which include the impacts from increased OHV use. Additional impacts are also produced by the development of oil and gas resources, seismic exploration, livestock grazing improvements, and other land-use disturbances.

The increasing number of roads being used by recreationists in the Monticello PA is having indirect effects on visual resources. Seldom Seen zones (those areas that are not visible from major travel routes) are decreasing within the Monticello PA, and an increase in the number of vehicles and people on BLM roads is creating changes in foreground and middleground views and changes in visual sensitivity. An increasingly utilized network of two-track roads and routes is creating conditions that allow OHV users, campers, and woodcutters to expand surface disturbances and impact visual resources.

3.19.2.2 TRENDS

Tourism is increasing within the Monticello PA. Increased recreational and vehicular use, and the increase in the number of visitors to Arches and Canyonlands National Parks, and Natural Bridges National Monument, who remain in the area and then recreate on BLM-administered lands (see Section 3.11, Recreation), contributes to the cumulative impact on visual resources.

The use of OHVs, trail use, and dispersed camping could have long-term cumulative impacts on visual resources. Oil and gas exploration and development are expected to continue within the Monticello PA and contribute some additional impacts to visual resources. Long-term trends for impacts to visual resources are:

- Increasing OHV-related recreational use could cause visual impacts within the FO PA;
- Increasing dispersed camping impacts, often as overflow from the nearby National Parks and Monuments, could impact VRM through increased surface and vegetative disturbance;
- Conflicts between OHV recreationists and hikers, sightseers, cultural site tourists, campers, hunters, river floaters, etc., who seek a high-level of scenic quality.

3.20 WILDLIFE AND FISHERIES

3.20.1 RESOURCE OVERVIEW

Great landscape diversity is found within the Monticello PA with lands associated with the Colorado River, San Juan River, and the Abajo Mountains. These land features have produced a unique combination of landforms and vegetation types and provide important habitat for wildlife and fish species.

3.20.2 BIG GAME SPECIES

3.20.2.1 MULE DEER (*ODOCOILEUS HEMIONUS*)

Mule deer occupy most ecosystems in Utah but likely attain their greatest densities in shrublands characterized by rough, broken terrain and abundant browse and cover. Mule deer summer range habitat types include spruce/fir, aspen, alpine meadows, and large grassy parks located at higher elevations. Winter range habitat primarily consists of shrub-covered, south-facing slopes. Winter range habitat primarily consists of shrub-covered, south-facing slopes. Winter diets of mule deer consist of approximately 75% browse from a variety of trees and shrubs and 15% forbs. In the summer months, mule deer populations could be limited during years where there is little rainfall, water availability, and summer forage that reduces fawning success. In the winter months, insufficient quantity or quality of habitat or deep snow results in heavy concentration of deer on winter ranges, increasing the spread of disease, reduction in population, and fawning success.

The middle and higher elevations of the Monticello PA sustain a large mule deer population. There is one UDWR wildlife management unit for mule deer located within the Monticello PA boundaries. This wildlife management unit contains the San Juan Herd, which is separated into two subunits (Abajo Mountains and Elk Ridge). The present population trend of these herds is down (Table 3.61). There has also been a significant decline in mule deer populations throughout the State of Utah. This has been attributed to the recent drought and loss of winter habitat. Within the Monticello PA, there has been a loss/die-off of sagebrush habitat due to overgrazing, drought and insect infestations. These include crucial wintering areas, such as Beef Basin and Harts Draw. There are plans throughout the state with several agencies to restore sagebrush habitats using different treatment techniques (personal communication between Tammy Wallace,

BLM, and Thomas Sharp, SWCA Environmental Consultants, 2003). Population objectives are set by UDWR and may only be met if there is available habitat.

Table 3.61 Current Population and Objectives for Mule Deer

Herd Unit	Current Population	Population Objective	Percent of Objective
San Juan, Abajo Mountains	6800	13,500	50
San Juan, Elk Ridge	2350	7000	34

Mule deer are a representative guild species for the following habitats in the district, deciduous woodland, riparian, mountain shrub, pinyon-juniper woodland and sagebrush. Impacts to this species can be partly assessed through the impact to these habitat types.

3.20.2.2 ROCKY MOUNTAIN ELK (*CERVUS ELAPHUS NELSONI*)

Rocky mountain elk occupy most ecosystems in Utah but likely attain their greatest densities in grasslands, aspen and montane coniferous forest. Production or calving areas are used from mid-May through June and typically occupy higher elevation sites than winter range. Calving grounds are usually characterized by aspen, montane coniferous forest, grassland/meadow, and mountain brush habitats, and are generally in locations where cover, forage, and water are in close proximity (Fitzgerald et al. 1994; Seidel 1977; Kufeld 1973). Within the Monticello PA, typical elk winter range occurs between 5,500 and 7,500 feet elevation and comprises mountain shrub and sagebrush habitats.

The middle and higher elevations of the Monticello PA provide habitat for the local elk populations. Elk numbers have increased within San Juan County and have reached the population objectives that UDWR set (Table 3.62; personal communication between Chris Colt, UDWR, and Thomas Sharp, SWCA Environmental Consultants, 2003–2004). Population objectives are set by UDWR and may only be met if there is available habitat.

Table 3.62. Current Population and Objectives for Rocky Mountain Elk

Herd Unit	Current Population	Population Objective	Percent of Objective
San Juan	1300	1300	100

Rocky Mountain elk are a representative guild species for the following habitats in the district, grasslands, deciduous woodland, riparian, mountain shrub, pinyon-juniper woodland and sagebrush. Impacts to this species can be partly assessed through the impact to these habitat types.

3.20.2.3 PRONGHORN (*ANTILOCAPRA AMERICANA*)

Pronghorn antelope can be found and are generally associated with open plains where they feed mainly on browse and forbs. Pronghorn prefer to occupy areas with large tracts of flat to rolling open terrain where they rely on keen eyesight and swift movement to avoid predators. Within the

Monticello PA, pronghorn are typically found in the Dry Valley area and rely on this habitat year-round.

The UDWR Hatch Point herd is the only pronghorn herd within the Monticello PA and this herd also extends into the Moab FO PA. The antelope herd has expanded the area it inhabits to the east side of Highway 191. However, the population trend is down from recent years. UDWR will be managing this herd to increase numbers by proposing supplemental transplants. Table 3.63 shows the current pronghorn population and population objective for this herd unit. Population objectives are set by UDWR and may only be met if there is available habitat.

Table 3.63. Current Population and Objectives for Pronghorn Antelope

Herd Unit	Current Population	Population Objective	Percent of Objective
San Juan, Hatch Point	130–150	300	43–50

Portions of the antelope habitat within the Monticello PA are in less than desired condition. There may be insufficient cover available for fawns to hide in because they are born shortly after livestock are removed from the area and there typically has not been sufficient time for vegetation to grow and provide cover. These areas may also lack forb and shrub compositions necessary to provide adequate forage for antelope (personal communication between Tammy Wallace, BLM, and Thomas Sharp, SWCA Environmental Consultants, 2003).

Pronghorn are a representative guild species for grasslands and desert shrub habitats in the district. Impacts to this species can be partly assessed through the impact to these habitat types.

3.20.2.4 DESERT BIGHORN SHEEP (*OVIS CANADENSIS NELSONI*)

Desert bighorn sheep are uniquely adapted to inhabit some of the most remote and rugged areas. They prefer open habitat types with adjacent steep rocky areas for escape and safety. Habitat is characterized by rugged terrain including canyons, gulches, talus cliffs, steep slopes, mountaintops and river benches (Shackleton et al. 1999). Desert bighorn sheep typically forage on shrubs more than grasses and use forbs less than shrubs and grasses. Desert bighorns are found in southern Utah and typically do not migrate.

There are currently 3 UDWR herds units for desert bighorn sheep within Monticello PA. These include the San Juan (Lockhart), the North San Juan, and the South San Juan herds. Since the RMP was written, there is new data indicating bighorn sheep utilize the Lockhart Basin area. Under the current RMP, no provisions or designations of crucial bighorn sheep habitat were made in the Lockhart Basin area. The Moab FO of the BLM manages a small part of the habitat for the Lockhart herd. There is also evidence of the Lockhart herd going up the Redd Sheep Trail to Hatch Point.

Bighorn sheep habitat in the Monticello PA is generally in good condition, although the recent drought has caused forage and water depletions. There has also been a large increase in the amount of OHV use in bighorn sheep areas, which can cause stress to the animals. Additionally, the increased recreational use of roads could exacerbate habitat fragmentation impacts.

Bighorn sheep numbers are down from past stable numbers (Table 3.64). UDWR management goals are to increase all of these herds, as well as expanding the South San Juan Herd into BLM lands along the San Juan River from Bluff downstream to Lake Powell. These may be accomplished with supplemental transplants. Population objectives are set by UDWR and may only be met if there is available habitat.

Table 3.64 Current Population and Objective for Desert Bighorn Sheep

Herd Unit	Current Population	Population Objective	% of Objective
San Juan, South	120	300	40
San Juan, North	50	100	50
San Juan, Lockhart	90	200	45

3.20.2.5 OTHER BIG GAME SPECIES

Within the Monticello PA, there are UDWR management areas for black bear (*Ursus americanus*) (Map 72) and mountain lion (*Felis concolor*). These represent areas where populations of these species are sufficient to support hunting. In the Intermountain West, black bears rarely use open habitats. Here, they are typically associated with forested or brushy mountain environments and wooded riparian corridors (Zevloff and Collett 1988). Black bears tend to be nocturnal and are considered omnivorous. Preferred foods include berries, honey, fish, rodents, birds and bird eggs, insects, and nuts. Black bears obtain most of their meat from carrion. From November to April, bears enter a period of winter dormancy. Winter dens are located in caves, under rocks, or beneath the roots of large trees. The black bear is a representative guild species for old growth conifer habitat in the district. Impacts to this species can be partly assessed through the impact to this habitat type.

The mountain lion or cougar inhabits most ecosystems in Utah. However, it is most common in the rough, broken terrain of foothills and canyons, often in association with montane forests, shrublands, and pinyon-juniper woodlands (Fitzgerald et al. 1994). Lions feed primarily on large mammals, especially deer, but also eat coyotes, porcupines, beavers, mice, rabbits, birds, and even grasshoppers. Considering that the mountain lions primary prey item is the mule deer, addressing the impacts to mule deer habitat can best assess impacts to mountain lions.

3.20.3 AVIAN SPECIES

3.20.3.1 RAPTORS

The Monticello PA includes considerable habitat of value to raptors. Raptors found in this area include eagles, falcons, hawks, harriers, and owls. Special habitat needs for raptors include nest sites, foraging areas, and roosting or resting sites. There are many red-tailed hawks and Cooper's hawk nesting areas as well as a few peregrine and golden eagle nest sites found within the Monticello PA. Raptors forage on small mammals or small birds. The most utilized raptor nesting habitats in the Monticello PA are generally found along riparian areas and/or cliff faces (personal communication between Tammy Wallace, BLM, and Thomas Sharp, SWCA Environmental Consultants, 2003).

The northern goshawk (*Accipiter gentiles*) is a representative guild species for old growth conifer habitat in the district. The golden eagle (*Aquila chrysaetos*) and the prairie falcon (*Falco mexicanus*) are representative guild species for cliff rock habitat. The ferruginous hawk and burrowing owl (*Athene canicularia*) are representative guild species for grassland habitat. The ferruginous hawk is also a representative guild species for desert shrub habitat. Impacts to these species can be partly assessed through the impact to these habitat types.

3.20.3.2 WATERFOWL

Waterfowl in the Monticello PA is generally associated with the Colorado and San Juan river drainages. Some waterfowl can also be found in other riparian areas, such as ponds, reservoirs, and perennial streams. Some individuals or species breed, winter, or remain yearlong in the state, while larger numbers pass through the area during the spring and fall migration. Many species feed on insects and small fish or amphibians in addition to aquatic plant foods. In addition, some species feed frequently on upland grasses and forbs in grassy fields and meadows where such vegetation is succulent and habitat is sufficiently open to preclude hiding predators and enable rapid flight. Within the Monticello PA, the most important areas for waterfowl are the Colorado and San Juan rivers, as well as Recapture Reservoir and a couple of permanent ponds such as those in Cross Canyon and Nancy Patterson Canyon.

3.20.3.3 UPLAND GAME BIRDS

There are several species of upland game birds within the Monticello PA (personal communication between Dean Mitchell, UDWR, and Thomas Sharp, SWCA Environmental Consultants, 2004; UDWR 2002; UDWR 2000). Some of the species include Gunnison Sage-grouse, Chukar (*Alectoris chukar*), Mourning Dove (*Zenaida macroura*), and Wild Turkey (both Merriams and Rio Grandes) (*Meleagris gallopavo*): and Gambel's Quail (*Callipepla gambelii*). Chukars prefer open, rocky, barren lands and eat grass shoots, seeds, grain, and insects. Turkeys utilize open woodland or forest clearings, as well as riparian areas and eat acorns, fruit, and seeds. Mourning doves are found in a variety of habitats, but mostly in farmlands and eat grains, small seeds, acorns, and fruit. Gambel's Quail are found in drier habitats and feed on seeds, grain, and insects.

Gunnison Sage-grouse are used as a representative guild species for sagebrush habitat in the district. Impacts to this species can be partly assessed through the impact to this habitat type. Sage-grouse require large expanses of sagebrush (*Artemisia* spp.) communities below 9,800 feet, with a diversity of grasses and forbs and healthy riparian ecosystems. The presence of each habitat type in healthy condition in close proximity to winter, lek, nesting, and brood-rearing habitat is essential. Population declines within the Monticello FO are attributed to habitat loss and fragmentation from increased roads, power lines, sagebrush conversions to farmlands, and reduction in riparian areas. Other issues decreasing habitat quality are livestock grazing, drought, land treatments, and herbicides. The northeast side of the Monticello PA contains populations and habitat for this species.

3.20.3.4 NEOTROPICAL MIGRATORY BIRDS

There are a wide variety of songbirds and neo-tropical migrants, which spend at least part of the year within the Monticello PA (Parrish et. al. 2002). These species utilize a wide variety of habitats found within the PA. The Monticello FO maintains information regarding neotropical migratory birds by conducting annual breeding bird surveys in June of each year with the U.S. Geological Survey and partnering with the UDWR using mist netting and point count surveys.

Most of the bird species (especially neo-tropical) are decreasing in numbers throughout their ranges. This can be seen with the type of species listed on the threatened and endangered species list for San Juan County. According to Parrish et al. (2002), riparian habitats are used as either breeding or wintering habitat by Utah's birds almost twice as much as any other habitat type. Within Utah, 66–75% of all bird species use riparian habitats during some portion of their life cycle. Shrublands, forest, and additional habitat groups (e.g. water, rock, playa, agriculture, urban, and cliff) all are about equal and second to riparian when considering their importance to bird species. To prevent further population declines for bird species, the protection of these habitat types, especially riparian are crucial. Certain species can be followed more closely as indicators of overall ecosystem health.

Loggerhead shrikes habitat consists of open country with short vegetation: pastures with fence rows, old orchards, mowed roadsides, cemeteries, golf courses, agricultural fields, riparian areas, and open woodlands. The loggerhead shrike is a small avian predator that hunts from perches and impales its prey on sharp objects such as thorns and barbed-wire fences. The Loggerhead shrike is one of the few North American passerines whose populations have declined continent wide in recent decades. Changes in human land-use practices, the spraying of biocides, and competition with species that are more tolerant of human-induced changes appear to be major factors contributing to this decline.

The sage sparrow is a migrant that summers in Idaho and winters in Arizona, New Mexico and northern Mexico. It is found in sagebrush flats and desert shrub areas. It usually nests in sagebrush and typically feeds on insects and seeds. This species has been in recent decline. This decline is due to reduced, fragmented, and lost sagebrush steppe habitat that has resulted from increased wildland fires and cheatgrass invasion.

This sage thrasher's populations are mostly stable where suitable shrub-steppe habitat remains. However, its numbers have been dramatically reduced, and in some cases, local populations have been eliminated, where there has been wholesale conversion of sagebrush rangeland.

The Brewer's sparrow major habitat type is sagebrush shrublands. The Brewer's sparrow is by far the most abundant bird there during spring and summer. Recent (1980s and 1990s) surveys (Rotenberry et. al. 1999) have shown breeding numbers to be in significant decline throughout the species' range. The causes are uncertain, but they may be related to fundamental changes in shrubland ecosystems being brought about by agriculture, grazing, and the invasion of exotic plant species.

The Warbling Vireo occupies predominantly riparian habitat, but may also use a variety of other habitats including oak/mountain shrub and deciduous forest. It builds its nests in the forked limbs

of trees from one to 40 meters (m) above the ground at elevations ranging from sea level to over 3,000 m. The species appears well adapted to human landscapes, as nests have been found in neighborhoods, urban parks, orchards, and farm fencerows. Its reproductive success in these areas has never been quantified, however.

The Green-tailed Towhee prefers species-rich shrub communities within shrub-steppe habitats, and disturbed and open areas of montane forest, often created by forest fires. The bulky nests of this species are concealed in shrubs, but often are prone to predation. In winter, individuals are common in dense mesquite (*Prosopis* spp.) shrub habitat along desert washes. Breeding bird survey data suggest that populations have been stable overall since 1966, with no significant broad trends (Dobbs et. al. 1998).

The juniper titmouse is a year-round resident of the pinyon-juniper and pine woodlands; it is also common in suburbs. It nests in snag holes, natural and made by woodpeckers. They typically feed on fruit, seeds and insects. This species is generally tolerant of human encroachment.

The Gray Flycatcher is a migrant species that summers in Utah and Idaho and winters in Mexico. It nests in arid pinyon-juniper woodlands and sagebrush areas. It builds its nest in the crotch of juniper trees or sagebrush. It feeds exclusively on insects. This species is still quite common but faces the same risks that other Sagebrush guild species face.

No known population of Yellow-billed Cuckoo exist at present within the Monticello PA (personal communication between Tammy Wallace, BLM, and Thomas Sharp, SWCA Environmental Consultants, 2003). The Yellow-billed Cuckoo, however, is a neotropical migrant that utilizes riparian valleys throughout the state. The Western Yellow-billed Cuckoo is associated with cottonwoods and Riparian cover, which provides nesting and brood-rearing habitat. Western Yellow-billed Cuckoos are obligate riparian nesters and are restricted to more mesic habitat along rivers, streams and other wetlands. Yellow-billed Cuckoos are discussed further under the sensitive species section of the document.

The Southwestern Willow Flycatcher (SWFL) utilizes and breeds in patchy to dense riparian habitats along streams and wetlands near or adjacent to surface water or saturated soils. These dense patches are often interspersed with small openings, open water, and/or shorter/sparser vegetation, creating a mosaic habitat pattern. Population declines are attributed to numerous, complex, and interrelated factors such as habitat loss and modification, invasion of exotic plants into breeding habitat, brood parasitism by cowbirds, vulnerability of small population numbers, and winter and migration stress. SWFL are discussed further under the sensitive species section of the document.

Song sparrows are relatively common in riparian habitat. They build open-cup nests near fresh water wherever suitable cover and insect food are present.

Spotted Towhee breed in wide variety of plant associations, all characterized by dense, broadleaf shrubby growth (variously described as brush, thickets, or tangles). This shrubby growth is typically only a few meters tall, with or without emergent trees, and provides deep, sheltered, semishaded litter and humus on ground, and a screen of twigs and foliage close overhead.

Mallard duck success in the wild reflects its adaptability to varied habitats, its hardiness in cold climates, its catholic food tastes, and its tolerance of human activities. The bulk of the Mallard's diet outside the breeding season consists of seeds of both natural wetland plants and agricultural crops. Although the mallard is the most heavily hunted duck species in North America, its populations remain more or less steady, and the species is not considered in danger. Nevertheless, managers carefully monitor and manage mallard populations and their habitats to ensure the continued prosperity of this extremely popular and successful duck (Drilling et al. 2002).

Several of the migratory birds can be used as guild species for different wildlife habitat types. The loggerhead shrike is associated with desert shrub habitat, the sage sparrow, sage thrasher and Brewer's sparrow are associated with sagebrush and perennial grassland, the Warbling Vireo, Green-tailed Towhee and Blue Grouse are associated with oak mountain shrub habitat, the juniper titmouse and Gray Flycatcher are associated with pinyon-juniper habitat and Yellow-billed Cuckoo, Southwestern Willow Flycatcher, Song Sparrow, Spotted Towhee, and Mallard duck are associated with riparian habitat. For the purposes of this analysis, impacts to these habitats will be used, in part, to assess impacts to these species. Unless stated above, the exact population status of all these species in the Monticello PA is not known.

3.20.4 FISH AND AMPHIBIAN SPECIES

The Monticello PA provides habitat for fish and amphibian species because of the variety of aquatic habitats found within the resource PA, which include rivers, streams, ponds, springs, and marsh areas. Aquatic species in the Monticello PA include several TES species such as bonytail, Colorado pikeminnow, razorback sucker, roundtail chub, bluehead sucker, and flannelmouth sucker. Table 3.65 illustrates the current UDWR inventories of fisheries within the Monticello PA (personal communication between Tammy Wallace, BLM, and Thomas Sharp, SWCA Environmental Consultants, 2003).

Amphibians rely on water during a portion of their life cycle and are typically found near water sources. The aquatic habitat in the Monticello PA is generally associated with the Colorado and San Juan river drainages and perennial water sources. The BLM in partnership with U.S. Geological Survey have started conducting amphibian surveys since 2003 on two riparian areas within the Monticello PA. These include Indian Creek and Arch Canyon. These studies are to determine species and abundance that are within these canyons. To date, the species found in Arch Canyon include: Woodhouse's toad (*Bufo woodhousii*), Red-spotted toad (*Bufo punctatus*), and Northern leopard frog (*Rana pipiens*). In Indian Creek, Bufo species of tadpoles and a few red-spotted toads were found.

Table 3.65. Inventory of Fisheries within Monticello PA

FO Area	Species Present
Colorado River	Colorado pikeminnow, razorback sucker, bonytail, humpback chub, flannelmouth sucker, bluehead sucker, channel catfish (<i>Ictalurus punctatus</i>), roundtail chub, speckled dace (<i>Rhinichthys osculus</i>), Plains killifish (<i>Fundulus zebrinus</i>), fathead minnow (<i>Pimephales promelas</i>), red shiner (<i>Cyprinella lutrensis</i>), sand shiner (<i>Notropis ludibundus</i>), smallmouth bass (<i>Micropterus</i>

Table 3.65. Inventory of Fisheries within Monticello PA

FO Area	Species Present
	<i>dolomieu</i>), largemouth bass (<i>Micropterus salmoides</i>), carp (<i>Cyprinus carpio</i>), black bullhead (<i>Ameiurus melas</i>), walleye (<i>Stizostedion vitreum</i>)
San Juan River	Colorado pikeminnow, razorback sucker, flannelmouth sucker, bluehead sucker, channel catfish, roundtail chub, speckled dace, fathead minnow, red shiner, sand shiner, smallmouth bass, largemouth bass, carp, black bullhead, yellow bullhead (<i>Ameiurus natalis</i>), walleye, northern pike (<i>Esox lucius</i>)
Arch Creek	Flannelmouth sucker, mountain sucker, speckled dace
Montezuma Creek	flannelmouth sucker, bluehead sucker, channel catfish, roundtail chub, speckled dace, carp, fathead minnow, red shiner, sand shiner

*Where *fathead minnow*, *red shiner*, *sand shiner* are added in italics, these are not necessarily documented. However, they are prolific in the mainstream Green and Colorado rivers. Thus, it is likely that they are in at least the lower extremities of these smaller tributaries.

3.20.5 OTHER WILDLIFE HABITAT

The Monticello PA contains a high diversity of small mammals because of the variety of habitats within the boundaries. Other wildlife species that are found within the field office area includes small mammals (cottontails, jackrabbits, squirrels, ground squirrels, mice, voles, and shrews), bats, reptiles, and invertebrate (insects). Bats roost in tree and rock crevices and caves. They rely on insects for food and are typically found near water sources feeding on insects (Oliver 2000). Reptiles have become adapted to living and reproducing entirely on land. They include turtles, lizards, and snakes. The Monticello PA contains a high diversity of reptile because of the variety of habitats found within the resource management area. Most turtles are aquatic, although a few live entirely on land. Lizards are found in grasslands and shrub deserts, boulders, cliffs, trees, and loose sand. Snakes can be aquatic, while some live in trees, and some live in burrows.

3.21 WOODLANDS

3.21.1 RESOURCE OVERVIEW

Woodland resources are generally defined as those tree species that are used as non-sawtimber products and are sold in units other than board feet. Woodland resources within the Monticello PA consist primarily of pinyon pine (*Pinus edulis*) and Utah juniper (*Juniperus osteosperma*). Pinyon–juniper woodlands are characterized by trees that are less than 33 feet tall.

Closed conifer woodlands (with a greater than 60% canopy cover) are dominated by pinyon pine, with Utah juniper as a common associate. This is the most extensive forest type in Utah exceeding, in acreage, all other forests combined (Lanner 1984). Utah juniper is the more dry-climate-adapted of the two species, often serving as nurse trees for pinyon in well-developed woodlands. The open conifer woodlands (characterized by a 25–60% canopy cover) form a wide landscape and are found at elevations of 4,000 to 7,000 feet. Major cover types include Utah juniper with associated shrub species such as big sagebrush (*Artemisia tridentata*) and native bunchgrasses. Utah juniper has increased with grazing, and, as grazing has intensified, the species has spread from ridges and mountain slopes to deep valleys. Most of the area where

pinyon/juniper woodland currently dominates was historically characterized by wildland fires burning every 15 to 50 years (Kitchen 2004, Miller and Tausch 2001). Both pinyon and juniper seedlings are tolerant of shade, but as wildland fire opens up the canopy cover, juniper seedlings tend to establish quickly in cut or burned areas, while pinyon seedlings tend to establish best under a canopy cover.

Cottonwood (*Populus* spp.) is a component of the Monticello PA's woodland resources that grows in riparian areas, with value to the Navajo Nation for ceremonial purposes. Cottonwood contributes to the proper functioning of riparian systems, in that it provides bank stabilization, shade, and wildlife habitat.

Timber resources within the Monticello PA consist of small stands of ponderosa pine, Douglas fir (*Pseudotsuga menziesii*), cottonwood, quaking aspen (*Populus tremuloides*), oak species (*Quercus* spp.), and box elder (*Acer negundo*). The quantities and concentrations of these timber species are too low to have commercial value, though they do have scenic, habitat, and watershed resource values. No commercial sales or harvesting of any timber species take place within the Monticello PA.

3.21.2 CURRENT MANAGEMENT PRACTICES

The Monticello FO manages woodland products by controlling harvests and sales. It sells woodland resources in informally designated areas for fuel wood, fence posts, Christmas trees, and other uses as demand arises. Fuel wood harvests are limited to pinyon and juniper; on-site harvests of trees by recreationists, usually as fuel for campfires, are allowed except where specifically excluded (BLM 1991a).

The Monticello FO has conducted 72 pinyon-juniper treatment projects and treated 32,191 acres, primarily in the 1960s and 1970s, to remove pinyon-juniper and convert woodlands to grasslands for livestock and wildlife forage (BLM 2004f). Because of subsequent re-growth of pinyon-juniper stands, many of these project areas are now in need of re-treatment and additional management. These projects are being maintained through the Moab Fire District. Re-treatment would consist of prescribed burning and/or other types of treatments (e.g., mechanical, chemical) to reduce fuel loads (BLM 1989).

3.21.2.1 ALLOCATIONS

In accordance with Monticello FO policy, a portion of the value of all woodland sales are retained at the Monticello FO to defray the cost of road maintenance and land reclamation in woodlandcutting areas.

The current management of woodland resources within the Monticello PA is guided by decisions made in the San Juan RMP (BLM 1991a). This plan identifies management actions to support the woodland management objectives of 1) allowing use of woodland products in areas specified for this use; and 2) preserving woodland products in other areas to meet RMP goals. The current management actions for the resource, as specified in the RMP, include:

- Assigning all forestlands in the resource management area to one of 4 categories:
 1. Lands available for intensive management of forest products
 2. Lands available for restricted management of forest products
 3. Lands where forests are managed to enhance other uses
 4. Forestlands not available for management of forest products
- Using the RMP goals and management objectives to determine which areas are assigned to each category, and imposing conditions on forest products use; and
- Prior to any land treatment project that would remove woodland products, striving first for woodland sales and second for free use of woodland products.

The current management guidance for developing forest resources is:

- The Monticello FO may develop forest resources for sustained yield, where feasible, in areas where forest product sales are allowed under the RMP; and
- The RMP may impose conditions of use or reclamation requirement in certain areas.

3.21.2.2 CURRENT CONDITIONS

It is estimated that pinyon and juniper woodlands have increased ten-fold over the past 130 years throughout the Intermountain West (Miller and Tausch 2001). Wildland fire suppression and lack of thinning have contributed to dense, over-mature stands of pinyon-juniper throughout the Monticello PA, and woodland fuel loading is increasing (see Section 3.4, Fire Management). The inadequate harvesting or thinning of pinyon-juniper woodlands within the PA is also creating conditions in which growth and succession of woodland stands are exceeding their carrying capacity, thus causing a decline in understory vegetation and creating stresses from competition that lead to tree mortality. Stressed trees are more susceptible to disease and insect infestations, further contributing to fuel loading of dead/down wood. These conditions are also increasing the potential for uncontrolled, catastrophic wildland fires. Noxious weed species could replace woodland species in those woodland areas that are burned by uncontrolled, catastrophic wildland fire.

Since the approval of the current RMP, drought has weakened the pinyon and juniper trees, and an infestation by the Ips engraver beetle (*Ips* spp.) has caused a severe die-off. Based on the current trend, the infestation is likely to increase, exacerbated by current drought conditions and the competitive stresses described above. Currently, there is no program to contain the infestation, and though the rate of infestation and the degree of damage to woodland resources are unknown, the potential for a significant loss of woodland and timber resources is high. The loss of these resources would result in more fuel loading, further contributing to conditions that could increase the potential for catastrophic wildland fires (personal communication between Tammy Wallace, BLM, and David Harris, SWCA, March 21, 2003).

Past management practices to improve grazing habitat for wildlife and cattle included chaining of pinyon-juniper stands. This management technique is no longer a preferred treatment and is not being used at this time. Currently, a program is being developed (in coordination with the Moab FO) to thin the woodland understory using prescribed fire to decrease fuel loading/

hazardous fuels and to maintain old chained and reseeded areas (personal communication between Tammy Wallace, BLM, and David Harris, SWCA, March 21, 2003).

Creation of wilderness study areas (WSAs) within the PA have closed these areas to woodcutting, prescribed burning, and other woodland management options, with potentially long-term adverse impacts on woodland resources. The WSAs also preclude commercial harvesting and access trail construction. The WSAs are, in effect, woodcutting and prescribed burning exclusion zones. These conditions support the growth and succession of woodland stands that exceed their carrying capacity, which can cause a decline in understory vegetation, and create stresses from competition that lead to tree mortality, similar to conditions and effects described above for woodland resources throughout the Monticello PA.

Currently, there is no woodland resource monitoring in the Monticello PA, except unscheduled, occasional fuel load assessments being made by BLM fire personnel (personal communication between Tammy Wallace, BLM, and David Harris, SWCA, March 21, 2003).

Woodland harvesting that does not follow required stipulations is currently damaging surface cultural resource sites and creating a network of unauthorized roads and trails that is degrading visual quality, increasing soil erosion and sedimentation, and affecting overall watershed quality.

In addition to the previously described issues in upland woodlands, in riparian zones, cottonwood stands are being encroached upon and impacted by tamarisk (*Tamarix* spp.) and Russian olive, resulting in decreased wildlife habitat and declines in overall watershed health.

3.21.3 RESOURCE DEMAND AND FORECAST

The current use of woodland resources within the Monticello PA is non-commercial harvesting of pinyon and juniper for fence posts, firewood, and Christmas trees. Such harvesting is allowed with a permit issued by the Monticello FO. Permits are not issued for collection of dead and downed cottonwood for ceremonial purposes.

A potential conflict exists between the Navajo Tribe's need to use the resource as fuel-wood and the Monticello FO's need to manage for woodland sustainability and health. Cedar Mesa is an area where the conflict is most obvious between the BLM and tribal resource needs, as most of Cedar Mesa is currently a WSA, which does not allow for firewood collection. Native Americans also want to be able to collect live cottonwood; however, this species is valuable for wildlife habitat, riparian function, and overall watershed health, and is being replaced by invasive species including tamarisk.

The limited information available regarding the current level of woodland harvesting is derived from data on woodland harvesting permits sold by the Monticello FO. For FYs 2000–2003, the trend indicates an increasing number of permits were issued for harvesting wood products (BLM 2003f). The actual level of woodland harvesting within the Monticello PA is unknown because 1) resource monitoring is very limited; 2) the FO area is large, remote, and difficult to access; and 3) it is assumed that some people cut wood without purchasing a permit.

The demand for woodland products (including firewood) is expected to increase. The number of cords of firewood that were sold over recent years has increased from 898 cords in 2000 to 1,137 cords in 2003 (BLM 2003f). The sale of Christmas trees is highly variable, and fluctuates from year to year. There are no limitations on woodland sales except in fire exclusion areas (designated as Wilderness Areas and WSAs).

2.0 PROPOSED PLAN AND DRAFT ALTERNATIVES

This chapter presents the Proposed Plan for managing public lands in the Monticello Field Office (FO). The five alternatives from the Draft RMP/Draft EIS are also provided to illustrate the progression to the Proposed Plan. In accordance with the federal guidelines implementing the National Environmental Policy Act (NEPA), a range of reasonable alternatives was analyzed in the Draft RMP/Draft EIS that helped accomplish the objectives of the Proposed Plan. In crafting the Proposed Plan, the BLM considered all comments provided by the public, the Cooperating Agencies and internally on the Draft RMP/Draft EIS, as well as, issues and concerns raised during scoping, identified goals and objectives associated with the resources and allowable uses on the public lands, and competing uses under the multiple use and sustained yield mandates of the Federal Land Policy and Management Act of 1976 (FLPMA). Chapter 2 has been organized in the following manner:

- Section 2.1 provides brief descriptions of the alternatives that were analyzed in detail in the Draft RMP/Draft EIS.
 - Table 2.1 defines the Proposed Plan and provides a summary of the Draft RMP/Draft EIS alternatives.
- Section 2.2 provides a comparative summary of the environmental impacts associated with the Proposed Plan and each alternative.
 - Table 2.2 provides a summary of the impacts.
- Section 2.3 outlines those alternatives the BLM has considered but has eliminated from detailed analysis, and the justifications for their dismissal from further evaluations.

2.1 BRIEF DESCRIPTION OF THE FIVE ALTERNATIVES ANALYZED IN THE DRAFT RMP/DRAFT EIS AND THE PROPOSED PLAN

The Draft RMP/Draft EIS analyzed five alternatives in detail. Alternative A (the "No Action" Alternative, a continuation of the existing 1991 RMP) was presented for comparison to the four action alternatives. There are four action alternatives in addition to the Proposed Plan; Alternatives B, C, D, and E, represent variations in the existing management and are generally distinguished by the degree of resource protection use.

The Proposed Plan/Final EIS does not carry forward Alternative C (the Preferred Alternative) from the Draft RMP/EIS. Rather, the Proposed Plan/RMP consists of a combination of all the alternatives, including Alternative C from the Draft RMP/EIS and information that was modified in response to public comment. It is based on public comments; the BLM and Cooperating Agency review; and provides the best means to accommodate the widest range of public and agency concerns over resources and resource uses. It provides for continued access to and development of resources with stipulations and mitigation to protect natural and cultural resources.

Alternative A (No Action) would be a continuation of existing management practices defined in the San Juan Resource Management Plan (RMP) (BLM 1991a, as amended). The current plan maintained "multiple use management while providing protection or enhancement to unique and sensitive resources." Areas were designated as open, limited, and closed to off-highway vehicle

(OHV; also referred to as "off-road vehicle") travel. Areas of Critical Environmental Concern (ACECs) were used extensively to manage cultural and recreation resource and use.

Alternative B would minimize human activities, offer more protection for wildlife and other natural resources, and favor natural systems over commodities development. Decisions include minimizing routes and enlarging crucial habitat for wildlife. All potential ACECs are considered in this alternative. All eligible wild and scenic rivers (WSRs) are considered for suitability in this alternative. Oil and gas leasing stipulations were determined and used to protect sensitive resources.

Alternative C was identified as the Preferred Alternative in the Draft RMP and would balance the protection of important environmental values and sensitive resources with commodities development. All areas were designated as open, limited, and closed to OHV travel and routes were designated to allow access and protect resources. A balanced use of ACECs and WSRs was used to protect important resource values.

Alternative D emphasizes commodities development over the protection of natural resources. No ACECs were considered in this alternative. No eligible WSR segments would be determined as suitable under this alternative. Protection of wildlife habitat was minimized to that required by law, regulation, or policy. Access was maximized, as no acres were closed to OHV travel and almost the entire area was designated as limited to OHV travel.

Alternative E would be based on Alternative B, except it emphasizes protection of 582,360 acres of non-Wilderness Study Area (WSA) lands with wilderness characteristics and allows for other activities consistent with that emphasis. Large areas on the west side of the Monticello FO would be difficult to access or do any kind of surface-disturbing activities. Wilderness characteristics would be enhanced as would adjacent wilderness found in WSAs.

The Proposed Plan consists of a combination of proposed decisions taken from an array of all the alternatives but using Alternative C (Preferred Alternative) from the Draft RMP/Draft EIS as its base. This combination of decisions was developed in response to internal, public and cooperating agency comments. It provides a balanced means to accommodate the widest range of public and agency concerns over resources and resource uses. It provides for continued access to and development of resources with stipulations and mitigation to protect natural and cultural resources.

Table 2.1 provides a detailed description of the Proposed Plan and alternatives carried forward from the Draft EIS; the table is organized alphabetically by resource (i.e., air quality, cultural, fire management, etc.). There are twenty resources listed. Each section includes the Proposed Plan goals, management based on actions common to the Proposed Plan and the Draft RMP alternatives, and then itemizes the specific management prescriptions for the Proposed Plan—as well as those management prescriptions for the alternatives from the Draft RMP. If management prescriptions for two different alternatives were the same, then it is merely indicated by a "same as Alternative..." Occasionally, the proposed management decisions are the same but the acreage or the time frames they are applicable to changes, this is indicated in the text.

2.1.1 BRIEF SUMMARY AND HIGHLIGHTS OF THE PROPOSED PLAN AND ALTERNATIVES IN TABLE 2.1

The major resources/uses and associated issues identified during scoping were travel management, recreation, oil and gas leasing and development, special designations (ACECs, WSRs, and WSAs), special status species, wildlife, and non-WSA lands with wilderness characteristics. These resources/uses, among others, are displayed under the Proposed Plan and range of management alternatives from the Draft RMP that set forth different priorities and measures to emphasize some uses or resource values over others to achieve specific goals or objectives outlined in detail in Table 2.1. Below is a brief summary of the range of alternatives for those major resources/uses brought forward during scoping. Much more detail for each of these resources and uses, among others, and their proposed management is in Table 2.1.

2.1.1.1 TRAVEL MANAGEMENT

All public lands are required to have OHV area designations. Areas must be classified as open, limited, or closed to motorized travel activities. OHV designation areas, or categories, are listed by alternative. Summary Table A portrays how travel and access management would be designated under each alternative.

Summary Table A. OHV Acreage and Mileage Designations by Alternative

	Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Open	611,310	0	2,311	2,311	0	0
Limited— Seasonal Restrictions	540,260	N/A	3.8 ¹	N/A	N/A	8.0
Limited— Existing Roads and Trails	570,390	N/A	N/A	N/A	N/A	N/A
Limited— Designated Roads and Trails	218,780	1,359,417	1,362,142	1,780,807	812,679	1,364,453
Closed	276,430	423,698	418,667	0	970,436	418,667
Total²	N/A³	1,783,115	1,780,809	1,783,118	1,783,115	1,783,120
Miles of Routes Designated	2,1794	1,521	1,947	2,205	1,342	1,947

This acreage applies to Arch Canyon.

²Acreage figures may vary by alternative due to the changes in GIS technology and variances in shapefiles.

³Acres are not additive under this alternative because of overlap between limited use categories.

⁴ Miles of existing routes; but undesignated in the 1991 San Juan RMP.

The BLM, in preparing its RMP designations and its implementation-level travel management plans, is following policy and regulation authority found at 43 C.F.R. Part 8340; 43 C.F.R. Subpart 8364; and 43 C.F.R. Subpart 9268. Where the authorized officer determines that OHVs

are causing or would cause considerable adverse impacts, the authorized officer shall close or restrict such areas. The public would be notified.

The BLM could impose limitations on types of vehicles allowed on specific designated routes if monitoring indicates that a particular type of vehicle is causing disturbance to the soil, wildlife habitat, cultural or vegetative resources, especially by off-road travel in an area that is limited to designated routes.

Where routes would remain available for motorized use within WSAs, such use could continue on a conditional basis. Use of the existing routes in the WSAs ("ways" when located within WSAs—see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or noncompliance are found through monitoring efforts to impair the area's suitability for wilderness designation, the BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and nonimpairment of wilderness values.

2.1.1.2 RECREATION

Special Recreation Management Areas (SRMAs) are proposed to manage intensively used recreation areas, and do not restrict other uses. In Alternative B, nonmotorized recreation is emphasized; in Alternative D, motorized recreation is emphasized. Alternative C provides opportunities for both nonmotorized and motorized recreation. Alternative E emphasizes nonmotorized recreation and protection of naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation. The Proposed Plan provides opportunities for motorized and nonmotorized recreation including opportunities for primitive and unconfined recreation while providing for protection of sensitive resources. These are depicted in Summary Table B.

Summary Table B. SRMA Acreage by Alternative

Category	Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
SRMAs	614,490	528,856	525,512	525,018	508,856	554,721

2.1.1.3 OIL AND GAS LEASING AND DEVELOPMENT

One of the major decisions in a land-use plan (LUP) is to determine which areas should be 1) open to leasing subject to the terms and conditions of the standard lease form stipulations, 2) areas open to leasing subject to moderate constraints such as timing limitations (TL) or controlled surface use (CSU) restrictions, 3) areas open to leasing subject to major constraints such as NSO stipulations, or 4) areas unavailable to leasing. All of these proposed decisions must be consistent with the goals and objectives of other resources and uses for each alternative. Summary Table C depicts how oil and gas leasing would be managed under each alternative.

Summary Table C. Oil and Gas Leasing Stipulations Acreage, by Alternative

Stipulation	Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Standard	578,604	365,170	629,472	962,283	213,290	495,432
TL/CSU	659,626	876,740	719,501	421,000	545,641	732,477
NSO	161,224	125,105	39,323	14,175	53,915	64,848
Closed	385,316	416,612	395,329	386,853	974,463	491,552

In addition, this planning revision has applied the same oil and gas stipulations to all other surface-disturbing activities where they are not contrary to laws, regulations, or policy under all of the action alternatives. For example, if an area has a timing stipulation on it for oil and gas development, the BLM would also apply that same timing stipulation on a right-of-way (ROW) construction proposal or an organized recreational event.

2.1.1.4 SPECIAL DESIGNATIONS

2.1.1.4.1 POTENTIAL AREAS OF CRITICAL ENVIRONMENTAL CONCERN

The *Federal Register* Notice of Intent (June 2003) for this plan revision requested ACEC nominations from the public for consideration in the planning effort. In order to be considered and carried forward into the range of alternatives for planning, an ACEC must meet the relevance and importance criteria in 43 CFR 1610.7-2(a), and must require special management. The Monticello FO received and evaluated a total of 17 ACEC nominations of which 13 were determined to meet the relevance and importance criteria. The relevance and importance criteria encompass scenery, sensitive plant species, rare plants, cultural and historic resources, wildlife, fish, natural systems, and natural hazards. Summary Table D shows that all of the 13 potential ACECs were brought forward into Alternative B for designation consideration, and 7 potential ACECs were brought forward into Alternative C for designation consideration. There are 10 existing designated ACECs in the Monticello Planning Area (MPA), and therefore 10 in Alternative A. There were no ACECs brought forward for consideration in Alternative D. Where ACECs are designated, special management attention would be directed at the relevant and important values, resources, natural systems and/or natural hazards.

Summary Table D. Proposed Total Acreage and Number of Potential ACECs by Alternative

Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
488,616	521,141	76,764	0	521,141	74,403
10	12	7	0	12	7

2.1.1.4.2 WILD AND SCENIC RIVERS

During planning, the BLM must assess all eligible river segments and determine which are suitable or unsuitable per Section 5(d)(1) of the Wild and Scenic Rivers Act of 1958, as amended. The Monticello FO reviewed all river segments for WSR eligibility and suitability as

part of the RMP process. Twelve river segments were found to meet the eligibility criteria. The BLM Manual 8351 (BLM 1993b) directs the BLM to provide tentative classifications of Wild, Scenic, or Recreational to the eligible river segments. Under the No Action Alternative (Alternative A), six river segments were identified as eligible for inclusion in the National Wild and Scenic River System. These six segments would be managed to protect their free-flowing nature and outstandingly remarkable values until their suitability for inclusion in the Wild and Scenic River System is determined. Alternative B and E would recommend and manage all of the segments as suitable for Congressional designation into the system, and Alternative C would recommend three river segments as suitable for Congressional designation into the system. The number of miles of rivers recommended suitable for designation are included in Summary Table E below.

Summary Table E. WSRs Recommended Suitable for the Proposed Plan, Including Draft EIS by Alternatives

Alternative	BLM River Miles	Total River Miles	Classifications
A ¹	56.8	59.2	Recreational, Scenic, Wild
B	92.4	115.3	Recreational, Scenic, Wild
C	18.4	26.9	Scenic, Wild
D	0	0	NA
E	92.4	115.3	Recreational, Scenic, Wild
Proposed Plan	35.7	44.3	Scenic, Wild

¹ Miles of river determined eligible under the 1991 San Juan RMP; but suitability not determined.

The BLM would work with the State of Utah and other federal agencies to reach consensus regarding recommendations to Congress for the inclusion of rivers in the National Wild and Scenic Rivers System. Besides applying consistent criteria across agency jurisdictions, the joint review would avoid piecemealing of river segments in logical watershed units in the state. Actual designation of river segments would only occur through congressional action or as a result of Secretarial decision at the request of the governor in accordance with provisions of the Wild and Scenic Rivers Act (the Act). The BLM will work with the state and the agencies involved to coordinate its decision making on WSR issues and to achieve consistency wherever possible.

The BLM recognizes that water resources on most river and stream segments within the State of Utah are already fully allocated. Where stream segments are designated on public lands being managed under this Plan, the BLM will continue to work with affected local, state, federal, and tribal partners to identify in-stream flows necessary to meet critical resource needs including values related to the designation. The BLM would then seek to jointly promote innovative strategies, community-based planning, and voluntary agreements with water users, under State law, to address those needs.

Should designations occur on any river segment as a result of Secretarial or congressional action, existing rights, privileges, and contracts would be protected. Under Section 12 of the Act, termination of such rights, privileges, and contracts may happen only with the consent of the affected non-federal party. A determination by the BLM of eligibility and suitability for the inclusion of rivers on public lands to the National Wild and Scenic Rivers System does not create new water rights for the BLM. Federal reserved water rights for new components of the National

Wild and Scenic Rivers System are established at the discretion of Congress. If water is reserved by Congress when a river component is added to the National Wild and Scenic Rivers System, it would come from water that is not appropriated at the time of designation, in the amount necessary to protect features that led to the river's inclusion into the system. The BLM's intent would be to leave existing water rights undisturbed and to recognize the lawful rights of private, municipal, and state entities to manage water resources under state law to meet the needs of the community. Federal law, including Section 13 of the Act and the McCarren Amendment (43 United States Code [U.S.C.] 666), recognizes state jurisdiction over water allocation in designated streams. Thus, it is the BLM's position that existing water rights and existing developments on such streams would not be affected by designation or the creation of the possible federal reserved water right. The BLM would seek to work with upstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values for which affected river segments were designated.

2.1.1.4.3 WILDERNESS STUDY AREAS

The Monticello FO manages 13 WSAs totaling approximately 389,444 acres. Where routes would remain available for motorized use within WSAs, such use could continue on a conditional basis. Use of the existing routes in the WSAs ("ways" when located within WSAs—see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or noncompliance are found through monitoring efforts to impair the area's suitability for wilderness designation, the BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and nonimpairment of wilderness values. Please see the Special Designation section of Table 2.1 for details.

2.1.1.5 SPECIAL STATUS SPECIES

Land-use planning decisions should be consistent with the BLM's mandate to recover listed species, and should be consistent with objectives and recommended actions in approved recovery plans, conservation agreements and strategies, memorandums of understanding (MOUs), and applicable biological opinions for threatened and endangered species. The Monticello PA has 10 threatened, endangered, and candidate wildlife, fish, and plant species. They are the black-footed ferret, California Condor, Southwestern Willow Flycatcher, Mexican Spotted Owl, Western Yellow-billed Cuckoo, bonytail, Colorado pikeminnow, humpback chub, razorback sucker, and the Navajo sedge. Standard stipulations have been developed in coordination with the United States Fish and Wildlife Service (USFWS) under all alternatives.

In addition, there are 59 Special Status Species (please refer to Section 3.16.3.1 Special Status Species, Tables 3.54 and 3.55 for complete lists) where there is some discretion in management.

Timing Limitations and Controlled Surface Use stipulations are applied to the habitat of some species and are spread by alternative.

2.1.1.6 WILDLIFE

In planning, the BLM should identify actions and area-wide use restrictions needed to achieve desired population and habitat conditions while maintaining a thriving natural ecological balance

and multiple-use relationships. The range of alternatives for wildlife actions and habitats includes:

- **Pronghorn antelope:** A Timing Limitation stipulation for surface-disturbing activities, including oil and gas development would be applied to pronghorn habitat. The size of habitat varies by alternative.
- **Desert bighorn sheep:** Recommendations from the BLM Bighorn Sheep Rangeland Management Plan (BLM 1993c) would be adhered to where practicable. On-site mitigation to replace forage and browse species lost would be required in bighorn habitat. The size of the habitat varies by alternative.
- **Deer and elk:** A Timing Limitation stipulation for surface-disturbing activities, including oil and gas development. Timing limitation and acreage vary by alternative.

2.1.1.7 NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS

During planning, the Monticello FO identified decisions to protect or preserve non-WSA lands with wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation). There are 582,360 acres that were found to have wilderness characteristics outside of existing WSAs; all of them would be protected and managed to preserve their wilderness characteristics values in Alternative E. Likewise, the Proposed Plan would address management of five units totaling 88,871 acres. There would not be specific prescriptions for wilderness characteristics under Alternatives A, B, C, and D. However, some of these areas would receive indirect beneficial protections from other resource prescriptions such as NSO, closed to leasing, VRM Class I, and limited or closed to OHV use.

Table 2.1 provides a comprehensive description of the Proposed Plan and the Draft EIS alternatives carried forward for detailed environmental analysis.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

MANAGEMENT COMMON TO ALL RESOURCES
<p>The goals and objectives described below apply to the Proposed Plan in addition to Draft RMP Alternatives B, C, D, and E. Goals and objectives for Alternative A (No Action Alternative) are described in the 1991 San Juan Resource Area RMP (BLM 1991a). Acreage figures for Alternative A in this matrix may vary slightly from the acreages in the existing 1991 San Juan RMP. This variance is due to the current GIS technology that was used to recalculate more accurate acreages for existing management areas and designations.</p> <p>For the purpose of this plan, OHVs are defined as any motorized vehicle capable of or designed for travel on or immediately over land, water, or other natural terrain, excluding the following: 1) any non-amphibious registered motorboat; 2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; 3) any vehicle whose use is expressly authorized by an authorized officer, or otherwise officially approved; 4) any vehicle in official use; and 5) any combat or combat support vehicle when used in times of national defense emergencies. Designated routes can be categorized as mechanized only (bicycles), single-track motorized (dirt bikes), two-track motorized (four-wheelers, jeeps), available to all vehicles, or any combination of these categories.</p> <p>Wilderness Study Areas would be managed according to the Interim Management Policy and Guidelines for Lands under Wilderness Review (IMP).</p> <p>All ACECs would be retained in public ownership, would be subject to appropriate fire management response, and would have travel limited to designated routes unless otherwise noted.</p> <p>Education and Interpretation</p> <p>The BLM would work with its partners, including local school districts and universities, to develop a variety of opportunities to promote education, research, and interpretation on public lands.</p> <p>Fire, Drought, and Natural Disasters</p> <p>The BLM would coordinate actions with affected parties where natural resources may be impacted by fire, drought, insects and diseases, or natural disasters.</p> <p>Monitoring</p> <p>The BLM would conduct monitoring for all resources to determine the effectiveness of management prescriptions in achieving RMP objectives or making progress toward them.</p> <p>Utah Standards for Rangeland Health</p> <p>BLM lands would be managed and uses would be authorized in a manner consistent with meeting or moving toward meeting Utah's Standards for Rangeland Health (BLM 1997). The current Utah Standards for Rangeland Health (as revised), augmented with ecological condition and trend objectives, would be incorporated across all resource programs as a minimum management objective. Management prescriptions in the form of constraints to use, terms and conditions, and stipulations may be needed to meet resource objectives and/or to comply with current regulations. Management prescriptions may consider, but would not be limited to, the following:</p> <ul style="list-style-type: none"> ● Surface-disturbing activities: These would be closely monitored to ensure compliance with authorizations/permits, conditions of approval, or terms and conditions. Actions minimizing new surface disturbance, as well as actions insuring successful reclamation, would be of paramount concern. During periods of drought, the BLM could require additional actions such as changes to standard seed mix compositions, amounts of seed, and method of application. Methods to ensure successful revegetation following disturbance could include hydromulching, installation of drip irrigation, and/or temporary fencing to exclude ungulate grazing/browsing. ● Livestock grazing: Active livestock use would be authorized in animal unit months (AUMs), season, and duration to meet static (no apparent trend) to upward trends towards achieving site-specific resource objectives. In the case of fire, drought, insects and diseases, or other natural disasters, the BLM would work cooperatively to implement a grazing strategy on an individual grazing allotment basis and make changes to the annual grazing authorizations as appropriate within the limits of the existing permit and in accordance with the grazing regulations. The BLM may temporarily close allotments or portions of allotments to grazing where it is determined that other, less drastic measures would not avoid degradation of vegetative resources. Temporary changes to active permitted use or grazing practices, or non-use may also be implemented voluntarily by the permittee with BLM consent. ● Wildlife management: During periods of prolonged dryness or drought or other natural disaster, to the extent that wildlife grazing ungulate populations may not be sustainable and/or impacts to the resource habitats may occur due to competition for water and/or available forage and/or overall animal health is compromised, the BLM may enter into discussions with the Utah Division of Wildlife Resources (UDWR) regarding temporary adjustments in herd numbers and overall management options to address the effects of drought. ● Recreation: During periods of prolonged dryness or drought, the BLM, in cooperation with local and state fire management agencies, may limit campfires to established fire rings or fully contained fires. The last resort would be to close the public lands to campfires of any kind. ● OHV use: OHV use during period of prolonged dryness could be further restricted to designated routes. If site-specific conditions warrant, closure to OHVs could be implemented to minimize vehicle-induced injury or damage to rangeland and/or woodland resources, and to minimize the potential of spark caused fires. ● SOPs: These would be implemented as described in Appendix I.
AIR QUALITY
<p>GOALS AND OBJECTIVES</p> <p>Ensure that authorized uses on public lands meet or comply with and support federal, state, and local laws and regulations.</p>
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>The best available control technology, recommended by the Utah Division of Air Quality (UDAQ), would be applied as needed to meet air quality standards.</p> <p>Prescribed burns would be consistent with the State of Utah Division of Environmental Quality (UDEQ) permitting process and timed in conjunction with meteorological conditions so as to minimize smoke impacts.</p> <p>The BLM would comply with Utah Air Conservation (UAC) Regulation R307-205, which prohibits the use, maintenance, or construction of roadways without taking appropriate dust abatement measures.</p> <p>The BLM would comply with the current Smoke Management Memorandum of Agreement (MOA) between the BLM, the U.S. Forest Service (USFS), and UDAQ. The MOA, in accordance with UAC regulation R301-204, requires reporting size, date of burn, fuel type, and estimated air emissions from each prescribed burn.</p> <p>The BLM would manage emissions to prevent deterioration to air quality in Class I Airsheds.</p> <p>The BLM will continue to work cooperatively with state, federal, and tribal entities in developing air quality assessment protocols to address cumulative impacts and regional air quality issues.</p> <p>The BLM will continue to work cooperatively with the Utah Airshed Group to manage emissions from wildland and prescribed fire activities.</p> <p>National Ambient Air Quality Standards are enforced by the Utah Department of Environmental Quality, Division of Air Quality (UDEQ-DAQ), with EPA oversight. Special requirements to reduce potential air quality impacts will be considered on a case-by-case basis in processing land-use authorizations.</p> <p>The BLM will utilize best management practices (BMPs) and site-specific mitigation measures, when appropriate, based on site-specific conditions, to reduce emissions and enhance air quality. Examples of these types of measures can be found in the Four</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Corners Air Quality Task Force Report of Mitigation Options, November 1, 2007.					
Project specific analyses will consider use of quantitative air quality analysis methods (i.e., modeling), when appropriate as determined by the BLM, in consultation with state, federal, and tribal entities.					
CULTURAL RESOURCES					
GOALS AND OBJECTIVES					
Identify, preserve, and protect important cultural resources and ensure that they are available for appropriate uses by present and future generations (FLPMA, Section 103[c], 201 [a] and [c]; National Historic Preservation Act, Section 110 [a]; Archaeological Resources Protection Act, Section 14 [a]).					
Seek to reduce imminent threats and resolve potential conflicts from natural- or human-caused deterioration, or potential conflict with other resource uses (FLPMA, Section 103 [c], NHPA 106, 110 [a][2]) by ensuring that all authorizations for land use and resource use comply with the NHPA Section 106.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
The BLM would nominate appropriate cultural resource objects, sites, districts, and multiple listings to the National Register of Historic Places (NRHP).					
Priority geographic areas for new field inventory pursuant to Section 110 of the National Historic Preservation Act (NHPA) and Section 14 of the Archaeological Resources Protection Act (ARPA) would be identified based upon a probability for unrecorded important resources. These inventories would be conducted as funding is available and as opportunities arise.					
The BLM would ensure that all authorizations for land and resource use would comply with Section 106 of the National Historic Preservation Act (NHPA), consistent with and subject to the objectives established in the RMP for the proactive use of cultural properties in the public interest.					
Impacts to any NRHP-listed or eligible cultural resource sites, objects, or districts would be mitigated in accordance with 43 CFR 800, generally through avoidance of cultural sites. Should it be determined the cultural resources eligible or listed on the NRHP cannot be avoided, consultation with the State Historic Preservation Officer (SHPO) would be initiated and the procedures identified in the National Programmatic Agreement and the Utah State BLM Protocol for meeting the BLM's responsibilities under the NHPA would be followed.					
The BLM would consult with Native American tribes to identify, protect, and maintain access for areas of traditional and religious use that includes but is not limited to burials, rock art, traditional use areas, religiously active areas, and sacred sites.					
Burial sites, associated burial goods, and sacred items would be protected in accordance with the Native American Graves Protection and Repatriation Act (NAGPRA) and the Archaeological Resources Protection Act.					
Cultural resources would be evaluated according to National Register criteria (36 CFR Part 60.4) and assigned to appropriate use categories as the basis for management decisions.*					
Cultural sites, including ethnographic properties, would continue to be allocated to one of six management use categories: experimental, discharged from management, public, scientific, traditional, and conservation.*					
The BLM would conduct a consultation process to identify both the resource management concerns and the strategies for addressing them through an interactive dialogue with appropriate Native American communities.					
The BLM would work with tribes and other communities with traditional linkage to public lands to identify places of traditional cultural and religious importance. To the extent allowed by statute, regulation, and policy, such locations would be managed to minimize impacts to important values and to allow continued access for traditional purposes.					
When new sites are discovered, interim protection may be applied until Section 106 consultation and NAGPRA (CFR 10) processes are completed, if warranted.					
The BLM would provide for legitimate field research by qualified scientists and institutions.					
The BLM would work with local communities and other groups to foster heritage tourism throughout the Monticello PA.					
Protective measures would be established and implemented for sites, structures, objects, and traditional use areas that are important to tribes with historical and cultural connections to the land, in order to maintain the view shed and intrinsic values, as well as the auditory, visual, and esthetic settings of the resources. Protection measures for undisturbed cultural resources and their natural settings would be developed in compliance with regulatory mandates and Native American consultation.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES					
A Cedar Mesa management plan would be developed for culturally sensitive areas unless included in other integrated activity plans. The CRMP would be consistent with the goals and objectives with the Monticello RMP. Such plans would include protective measures such as restrictions and limitations on recreation around cultural at-risk areas and sites, Native American consultation, and regulatory compliance. These plans would also include but not be limited to developing cultural monitoring systems; identifying sites and areas in need of stabilization and protective measures (e.g., fences, surveillance equipment); developing research designs for selected sites/areas; designating sites/areas for interpretive and educational development; identifying areas for cultural inventory where federal undertakings are expected to occur; and developing specific mitigation measures. The plan would designate sites, districts, landmarks, and landscapes that would be nominated for inclusion on the NRHP.					
The BLM would proactively reduce hazardous fuels or mitigate the potential hazard around archaeological and cultural sites that are susceptible to destruction by fire from prescribed or wildland fire. Management response to fire would follow the guidelines in the Moab District Fire Management Plan.					
The BLM would promote collaborative partnerships to assist in meeting management goals and objectives for cultural resources.					
Domestic pets and pack animals would not be allowed in cultural sites or on archaeological resources as defined in ARPA.					
Ropes and other climbing aids would not be allowed for access to cultural sites or archaeological resources as defined in ARPA, except for emergencies or administrative needs.					
Camping would not be allowed within cultural sites or archaeological resources as defined in ARPA.					
Cultural sites may be closed to visitation when they are determined to be at risk or pose visitor safety hazards.					
Comb Ridge Cultural Special Management Area (CSMA) (Map 2)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
No was identified in the 1991 San Juan Resource Area RMP, as amended. These lands are managed according to the 1991 San Juan RMP prescriptions.	Comb Ridge (30,752) would be managed as a CSMA with the following prescriptions: <ul style="list-style-type: none"> Managed for heritage tourism and traditional cultural values. 	Comb Ridge (30,752 acres) would be managed CSMA as in Alternative B except for the following: <ul style="list-style-type: none"> Available for private and/or commercial use of woodland products including on-site 	Comb Ridge would not be managed as a CSMA. The area would be managed with the same management prescriptions as the adjacent areas which are: <ul style="list-style-type: none"> Available for private and/or 	Comb Ridge (30,752 acres) would be managed as a CSMA. with the following prescriptions: <ul style="list-style-type: none"> Managed for heritage tourism and traditional cultural values. 	<ul style="list-style-type: none"> Comb Ridge (30,752 acres) would become a Recreation Management Zone within the Cedar Mesa SRMA. A selection of prescriptions from Alternatives A–E have been carried over into the SRMA. See the Recreation section in this Chapter for SRMA prescriptions.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

	<ul style="list-style-type: none"> • Unavailable for geophysical work, disposal of mineral materials, and recommended for withdrawal from locatable mineral entry. • Available for oil and gas leasing subject to NSO. • Open for campfires at designated sites. • Unavailable for private and/or commercial use of woodland products, including on-site collection of dead wood for campfires. • Available for livestock use but it may be limited if cultural resources are impacted. • Available for range, wildlife habitat, and watershed improvements. • Available for non-surface-disturbing vegetation treatments. • OHV use limited to designated routes. • The Comb Wash Campground would be developed (as proposed in 1991 San Juan RMP). • Closed to dispersed camping. Camping limited to designated camp areas and campgrounds with designated access routes and parking. • Establishment of a permit system for day and overnight use if necessary to protect cultural resources. • In camp areas without toilets, human waste must be packed out. • Designation and signing of trails from parking areas to cultural sites, which are included in the Cultural Management Plan. • Limited parking for day use to designated areas. 	<p>collection of dead wood for campfires.</p> <ul style="list-style-type: none"> • Available for range, wildlife habitat, and watershed improvements, and vegetation treatments. • Available for surface-disturbing land treatments if consistent with current law, regulations, policy, and management plan objectives. • Commercial group size limited to 12. 	<p>commercial use of woodland products including on-site collection of dead wood for campfires.</p> <ul style="list-style-type: none"> • Available for range, wildlife habitat, and watershed improvements, and vegetation treatments. • Available for livestock use but it may be limited if cultural resources are impacted. • Available for surface-disturbing land treatments if consistent with management plan objectives. • OHV use limited to designated routes. 	<ul style="list-style-type: none"> • Unavailable for geophysical work, disposal of mineral materials, and recommended for withdrawal from locatable mineral entry. • Unavailable for oil and gas leasing. • Open for campfires at designated sites. • Unavailable for private and/or commercial use of woodland products including on-site collection of dead wood for campfires. • Available for livestock use but it may be limited if cultural resources are impacted. • Maintenance of existing improvements allowed; no new improvements. • Available for non-surface-disturbing vegetation treatments. • Limited OHV use to designated routes and closed in non-WSA lands with wilderness characteristics. • Development of the Comb Wash Campground (as proposed in 1991 San Juan RMP). • Closed to dispersed camping. Camping limited to designated camp areas and campgrounds with designated access routes and parking. • Establishment of a permit system for day and overnight use if necessary to protect cultural resources. • In camp areas without toilets, human waste must be packed out. • Hiking to cultural sites limited to designated trails that would be developed in the CRMP. Group size limited to 12 people. • Limited parking for day use to designated areas. 	
<p>Butler Wash, east of Comb Ridge</p> <ul style="list-style-type: none"> • No allocation limit • No private group size limit • No commercial permit or group size limit • Open to camping • Open to OHV use 	<p>Butler Wash, east of Comb Ridge Manage the same as Comb Ridge with the following exceptions:</p> <ul style="list-style-type: none"> • Private group size limited to 6. • Commercial group size limited to 12. • Butler Wash side canyons close 	<p>Butler Wash, east of Comb Ridge Manage the same as Comb Ridge and the same as Alternative B with the following exceptions:</p> <ul style="list-style-type: none"> • Private group size limited to 8. • Commercial group size limited to 12. 	<p>Butler Wash, east of Comb Ridge Manage the same as Comb Ridge with the following exceptions:</p> <ul style="list-style-type: none"> • Private group size limited to 12. • Commercial group size limited to 12. 	<p>Butler Wash, east of Comb Ridge Manage the same as Comb Ridge with the following exceptions:</p> <ul style="list-style-type: none"> • Private group size limited to 6. • Commercial group size limited to 12. • Butler Wash canyons closed to 	<p>Butler Wash, east of Comb Ridge Would be managed as part of the Comb Ridge Recreation Management Zone (RMZ) within the Cedar Mesa SRMA. Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<ul style="list-style-type: none"> • Dogs allowed • No fees • Grazing allowed • Fires allowed 	<p>to domestic pets and pack animals.</p> <ul style="list-style-type: none"> • Designated primitive campsites. • If necessary, managed as part of Cedar Mesa permits and regulations, including regulations and permit fees. Groups would view low-impact video at Kane Gulch Ranger Station or Sand Island. 			<p>domestic pets and pack animals.</p> <ul style="list-style-type: none"> • Designated primitive campsites. • Managed as if part of Cedar Mesa permits and regulations, including regulations and permit fees. Groups would view low-impact video at Kane Gulch Ranger Station or Sand Island. 	
Tank Bench Cultural Special Management Area (CSMA) (Map 2)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>No CSMA was identified in the 1991 San Juan Resource Area RMP, as amended. These lands are managed according to the 1991 San Juan RMP prescriptions.</p>	<p>Tank Bench (2,646 acres) would be managed as a CSMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Hiking limited to designated trails. • Group size limited to 12 people. • Human waste must be packed out. • Closed to domestic pets and pack animals. • Closed to OHV use. • Available for livestock use but it may be limited if cultural resources are impacted. • Available for watershed, range, and wildlife habitat improvements. • Available for non-surface-disturbing vegetation treatments. • Closed to campfires. • Closed to private and/or commercial use of woodland products (including on-site collection of dead wood for campfires) with the exception of traditional cultural uses, as long as they do not adversely impact other resource values. • Recommended for withdrawal from locatable mineral entry, and unavailable for disposal of mineral materials and geophysical work. • Available for oil and gas leasing, subject to no surface occupancy. 	<p>Tank Bench (2,646 acres) would be managed as a CSMA with the same as Alternative B except for:</p> <ul style="list-style-type: none"> • Hiking not limited to designated trails. • Available for watershed, range, wildlife habitat improvements and vegetation treatments. • Available for surface-disturbing land treatments if consistent with management plan objectives. • Available for locatable mineral entry, disposal of mineral materials, and geophysical work. • Available for oil and gas leasing, subject to standard lease terms. 	<p>Tank Bench would not be managed as a CSMA. The area would be managed the same as adjacent areas with the following prescriptions:</p> <ul style="list-style-type: none"> • Available for livestock use but may be limited if cultural resources are impacted. • Available for watershed, range, and wildlife habitat improvements. • Available for locatable mineral entry. • Available for disposal of mineral materials and geophysical work. • Available for oil and gas leasing, subject to standard lease terms. • Available for campfires. • Available to private and/or commercial use of woodland products, including the on-site collection of dead wood for campfires. 	<p>Tank Bench (2,646 acres) would be managed as a CSMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Hiking limited to designated trails. • Group size limited to 12 people. • Human waste must be packed out. • Closed to domestic pets and pack animals. • Closed to OHV use. • Available for livestock use but it may be limited if cultural resources are impacted. • Available for watershed, range, and wildlife habitat improvements. • Available for non-surface-disturbing vegetation treatments. • Closed to campfires. • Unavailable for private and/or commercial use of woodland products (including on-site collection of dead wood for campfires) with the exception of traditional cultural uses, as long as they do not adversely impact other resource values. • Recommended for withdrawal from locatable mineral entry, and unavailable for disposal of mineral materials and geophysical work. • Available for oil and gas leasing, subject to no surface occupancy. 	<p>Tank Bench (2,646 acres) CSMA would become the Tank Bench SRMA. A selection of prescriptions from Alternatives A–E have been carried over into the SRMA. See Recreation section in this Chapter for prescriptions.</p>
Beef Basin Cultural Special Management Area (CSMA) (Map 2)					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>The BLM would work with USFS and NPS to develop Interagency Recreation Commercial permits.</p>					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>No CSMA was identified in the 1991 San Juan Resource Area RMP, as amended. These lands are managed according to the 1991 San Juan RMP prescriptions.</p>	<p>Beef Basin (20,302 acres) would be managed as a CSMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Management focus for the SRMA would be heritage, tourism, traditional cultural values, and scientific research of prehistoric cultural landscapes. • Unavailable for private and/or commercial use of woodland products (including on-site collection of dead wood for campfires). • Available for oil and gas leasing subject to timing limitations. • Available for livestock use, but may be limited if cultural resources are impacted. • Available for watershed, range, wildlife habitat improvements, and vegetation treatments. • OHV use limited to designated routes. • Development of a car campground in Ruin Park for primitive camping. • Designated primitive car camping areas in Middle Park, House Park, and along Beef Basin Loop Road, as well as other areas as necessary to control impacts to cultural resources. • Closure of all campsites that impact archaeological sites. • Cultural site visitation limited to designated trails. • Unavailable for campfires. • Group size limited to 12 • Removal of human waste required. • Parking for day use limited to designated areas. • Car camping limited to designated camp areas and campgrounds with designated access routes and parking. • Climbing gear use allowed as an aid to hiking routes only. No fixed lines, bolts, chalk, etc. allowed in order to protect rock art. 	<p>Beef Basin (20,302 acres) would be managed as an CSMA the same as in Alternative B, except for the following:</p> <ul style="list-style-type: none"> • Designated primitive car camping areas in Middle Park, House Park, and along Beef Basin Loop Road, as well as other areas as necessary to control impacts to cultural resources • Open for campfires; fire pan required. • Groups larger than 20 people total required to camp in designated areas and remove their waste. 	<p>Beef Basin would not be managed as a CSMA. The area would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> • Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Available for oil and gas leasing subject to timing limitations. • Available for livestock use but may be limited if cultural resources are impacted. • Available for watershed, range, and wildlife habitat improvements, and vegetation treatments. • Designated primitive campsites outside of Ruin Park. • Development of a (seasonal) commercial campground in Ruin Park area. • Closure of all campsites that impact archaeological sites. • No group size limits. • Open for campfires; fire pan required. • Climbing gear allowed as an aid to hiking routes only. No fixed lines, bolts, chalk, etc. allowed. 	<p>Beef Basin (20,302 acres) would be managed as a CSMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Management focus would be on heritage, tourism, traditional cultural values, and scientific research of prehistoric cultural landscapes. • Unavailable for private and/or commercial use of woodland products (including on-site collection of dead wood for campfires). • Available for disposal of mineral materials under special conditions and not recommended for withdrawal from entry. • Available for oil and gas leasing subject to timing limitations. • Available for geophysical work. • Available for livestock use but may be limited if cultural resources are impacted • No new improvements, maintenance of existing improvements allowed. • OHV use limited to designated routes and closed in non-WSA lands with wilderness characteristics. • Development of a car campground in Ruin Park for primitive camping. • Designated primitive car camping within the interior of the Beef Basin Loop Road. • Closure of all campsites that impact archaeological sites or negatively impact wilderness characteristics. • Cultural site visitation limited to designated trails. • Closed to campfires. • Group size limited to 12 people total. • Removal of human waste required. • Parking for day use limited to designated areas. • Car camping limited to designated camp areas and campgrounds with designated 	<p>Beef Basin CSMA (20,302 acres) would become the Beef Basin SRMA. A selection of prescriptions from Alternatives A–E have been carried over into the SRMA. See Recreation section in this Chapter for prescriptions.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

				access routes and parking. <ul style="list-style-type: none"> • Climbing gear use allowed as an aid to hiking routes only. No fixed lines, bolts, chalk, etc, allowed in order to protect rock art. 	
McLoyd Canyon–Moon House Cultural Special Management Area (CSMA) (Map 2)					
McLoyd Canyon–Moon House is within a WSA; WSAs are managed under the IMP. The special management prescriptions below apply to Moon House for cultural protection.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
No SRMA was identified in the 1991 San Juan Resource Area RMP, as amended. These lands are managed according to the 1991 San Juan RMP prescriptions.	McLoyd Canyon–Moon House (1,607 acres) would be managed as a Management Zone (MZ) within Cedar Mesa SRMA with the following prescriptions: <ul style="list-style-type: none"> • Develop a cultural resource management plan (CRMP) for McLoyd Canyon–Moon House. • Public access limited via a permit system for day visits. • No more than 12 36 people allowed to visit Moon House per day. Limitations on visitation may change based on site monitoring of impacts of visitation. • One commercial group per day. Commercial trip numbers included in the day use number of 36. • Access to interior corridor limited to three people at any one time. • Visitors would not be allowed to enter the Moon Room and adjoining rooms. • Human waste must be packed out. • Designated primitive camp and park area west of the Snow Flat Road. Camping prohibited outside of this primitive camp area. • Hiking to Moon House site limited to designated trail. • Closed to pack animals and pets. • Closed to campfires. • Unavailable for private and/or commercial use of woodland products, including on-site collection of dead wood for campfires. • McLoyd Canyon closed to overnight use from the head of the canyon to UTM: 607100E, 4143495N. 	Same as Alternative B except: <ul style="list-style-type: none"> • Access to interior corridor limited to 4 people at any one time. 	Same as Alternative C except: <ul style="list-style-type: none"> • 24 people would be allowed to visit Moon House per day. Limitations on visitation may change based on-site monitoring of impacts of visitation. • Two commercial groups per day allowed, but total number of visitors not to exceed more than 24 people per day. • Travel allowed on Road D4798, limited to the designated route. 	McLoyd Canyon–Moon House (1,607 acres) would be managed as a Management Zone (MZ) within Cedar Mesa SRMA with the following prescriptions: <ul style="list-style-type: none"> • Develop a CRMP for McLoyd Canyon–Moon House. • Public access limited via a permit system for day visits. • No more than 12 people would be allowed to visit Moon House/day. Limitations on visitation may change based on site monitoring of impacts of visitation. • One commercial group per day. • Access to interior corridor limited to three people at any one time. • Visitors would not be allowed to enter the Moon Room and adjoining rooms. • Human waste must be packed out. • Designated primitive camp and park area west of the Snow Flat Road. Camping prohibited outside of this primitive camp area. • Hiking to Moon House site limited to designated trail. • Closed to pack animals and pets. • Closed to campfires. • Unavailable for private and/or commercial use of woodland products, including on-site collection of dead wood for campfires. • McLoyd Canyon closed to overnight use from the head of the canyon to UTM: 607100E, 4143495N. • Utah State Section Township 39S Range 19E, Section 2 to be acquired. 	McLoyd Canyon–Moon House (1,607 acres) would become a recreation management zone within the Cedar Mesa SRMA. See Recreation section in this chapter for prescriptions.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

	<ul style="list-style-type: none"> Utah State Section Township 39S Range 19E, Section 2 to be acquired. Development of a site stewardship program to monitor site and possibly develop guided tours. 			<ul style="list-style-type: none"> Development of a site stewardship program to monitor site and possibly develop guided tours. 	
Grand Gulch National Historic District					
Grand Gulch National Historic District is within a WSA; WSAs are managed under the IMP. The special management prescriptions below apply to Grand Gulch National Historic District for cultural protection.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Grand Gulch Special Emphasis Area/Grand Gulch National Historic District (37,433 acres) would be managed for Cultural and Recreational values (natural values associated with primitive recreation/scenic):</p> <ul style="list-style-type: none"> Unavailable for mineral leasing in Grand Gulch Special Emphasis area. Available for geophysical work except Grand Gulch Special Emphasis area. Closed to disposal of mineral materials. Retained in public ownership and classified as segregated from entry (a Secretarial withdrawal would be requested). Excluded from private ownership and commercial use of woodland products, except for limited on-site collection of dead wood for campfires. Available for livestock use, except Grand Gulch Canyon and associated tributaries, below Kane Gulch fence to the confluence with the San Juan River (approximately 16,599 acres). Closed to OHV use. Managed as VRM Class I. Excluded from surface disturbance by mechanized or motorized equipment. Managed for Recreation Opportunity Spectrum (ROS) Primitive (P)-class to provide primitive recreation opportunities in the ROS areas. ROS P-class areas protected from surface disturbance to the 	<p>Grand Gulch National Historic District (37,388 acres) would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> Unavailable for oil and gas leasing Unavailable for geophysical activities. Unavailable for disposal of mineral materials. Recommended for withdrawal from locatable mineral entry. Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. Campfires limited to mesa tops only (no campfires in the canyon). Available for livestock use, except Grand Gulch Canyon and associated tributaries, below Kane Gulch fence to the confluence with the San Juan River (approximately 16,316 acres). Closed to OHV use. Excluded from surface disturbance by mechanized or motorized equipment. Excluded from habitat improvements, watershed improvements, and vegetation treatments. Exceptions are nonmotorized weed control with no surface disturbance. Designate trails and camping areas as necessary to protect cultural resources. Closed to pack animals and pets. Human waste must be packed out. 	<p>Grand Gulch National Historic District (37,388 acres) would be managed the same as Alternative B except for the following:</p> <ul style="list-style-type: none"> Nonmotorized habitat improvements, watershed improvements, vegetation treatments, including aerial seeding, hand reseeding, planting seedlings, and control of invasive non-native species allowed as long as they do not impact cultural resources based on a site-specific analysis, and are consistent with the IMP. Limitations on numbers of trips may be implemented if cultural resources are impacted. Recommended for withdrawal from locatable mineral entry. 	<p>Grand Gulch National Historic District (37,388 acres) would be managed the same as Alternative C with the following exceptions:</p> <ul style="list-style-type: none"> Available for oil and gas leasing subject to NSO. Available for geophysical exploration that meets definition of "casual use" as defined 43 CFR 3150. Pets and pack animals allowed. 	<p>Grand Gulch National Historic District (37,388 acres) would be managed as prescribed by the IMP and with the following prescriptions:</p> <ul style="list-style-type: none"> Unavailable to oil and gas leasing. Unavailable for geophysical activities. Unavailable for disposal of mineral materials. Recommended for withdrawal from locatable mineral entry. Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. Campfires limited to mesa tops only (no campfires in the canyon). Available for livestock use, except Grand Gulch Canyon and associated tributaries, below Kane Gulch fence to the confluence with the San Juan River (approximately 16,316 acres). Closed to OHV use. Excluded from surface disturbance by mechanized or motorized equipment. Excluded from habitat improvements, watershed improvements, and vegetation treatments. Exceptions are nonmotorized weed control with no surface disturbance. Designated trails and camping areas as necessary to protect cultural resources. Closed to pack animals and pets. Human waste must be packed out. 	<p>Grand Gulch NHD (37,388 acres) would be become a recreation management zone within the Cedar Mesa SRMA. See Recreation section in this chapter for prescriptions.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>maximum extent possible.</p> <ul style="list-style-type: none"> • Open to leasing with NSO in ROS P-class areas. • Managed to limit recreation use if cultural resources or scenic values are being damaged. • Subject to conditional fire suppression with motorized suppression methods used only if necessary to protect life or property. 					
FIRE MANAGEMENT					
<p>Fire management would adopt the comprehensive Utah Land Use Plan Amendment for Fire and Fuels Management, September 2005 (LUP Amendment; BLM 2005c). This document may be found at www.ut.blm.gov/fireplanning/index/htm. Direction and guidance approved by the LUP Amendment is incorporated by reference into this RMP. Refer to Map 3, which identifies the Fire Management Areas. Specific decisions for other resources that could impact fire management are found throughout this table. However, the content and purpose of the LUP Amendment is adopted and is summarized as follows:</p> <ul style="list-style-type: none"> • Establishes landscape-level fire management goals and objectives. • Describes Desired Wildland Fire Conditions (DWFC) and the management strategies and actions to meet DWFC goals. • Describes areas where fire may be restored to the ecosystem through wildland fire use for resource benefit and areas where wildland fire use is not appropriate. • Identifies Resource Protection Measures (RPMs) for fire management practices to protect natural and cultural resource values. • Identifies criteria used to establish fire management priorities. <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>Firefighter and public safety are the primary goals in all fire management decisions and actions.</p> <p>Appendix B, Desired Wildland Fire Condition and Condition Class, shows the different responses allowed for the planning area (PA).</p> <p>Wildland fire would be utilized to protect, maintain and enhance resources and, when possible, would be allowed to function in its natural ecological role.</p> <p>Hazardous fuels reduction treatments would be used to restore ecosystems; protect human, natural and cultural resources; and reduce the threat of wildfire to communities.</p> <p>Fires would be suppressed at minimum cost, taking into account firefighter and public safety as well as benefits and values to be protected that are consistent with resource objectives.</p> <p>The BLM would implement a consistent, safe, and cost-effective fire management program through appropriate planning, staffing, training, and equipment.</p> <p>Fire management objectives would be established for every area with burnable vegetation, based on sound science and consideration of other resource objectives.</p> <p>Emergency stabilization, rehabilitation, and restoration efforts would be implemented to protect and sustain resources, public health and safety, and community infrastructure.</p> <p>The BLM would work together with partners and other impacted groups and individuals to reduce risks to communities and to restore ecosystems.</p> <p>The Reasonable and Prudent Measures and Terms and Conditions identified in consultation with the USFWS for the LUP Amendment would be implemented in fire-related actions.</p> <p>The BLM would work together with Native Americans to provide for their use of woodland products as associated with fire, fuels, and emergency stabilization and rehabilitation (ES&R) actions.</p> <p>Criteria for Establishing Fire Management Priorities</p> <p>Protection of human life is the primary fire management priority. Establishing a priority among protecting human communities and community infrastructure, other property and improvements, and natural and cultural resources is based on human health and safety, the values to be protected, and the costs of protection. When firefighters and other personnel have been committed to an incident, these human resources become the highest values to be protected. Priorities for all aspects of fire management decisions and actions are based on the following:</p> <ul style="list-style-type: none"> • Protection of the Wildland-Urban Interface (WUI) (including At-Risk Communities and At-Risk Watersheds) • Maintaining existing healthy ecosystems • High priority subbasins or watersheds • Threatened, endangered, or special status species • Cultural resources and/or cultural landscapes <p>Suppression</p> <p>An Appropriate Management Response (AMR) procedure is required for every wildland fire that is not a prescribed fire. In all fire management decisions, strategies, and actions, firefighter and public safety are the highest priority followed by consideration of benefits and values to be protected as well as suppression costs. The AMR can range from full suppression to managing fire for resource benefit (wildland fire use). Resource goals and objectives outlined in the RMP guide the development and implementation of AMR fire management activities in regard to the accomplishment of those objectives. The FMP establishes fire suppression objectives with minimum and maximum suppression targets for each Fire Management Unit (FMU) within the PA. While firefighter and public safety are the first priority, considerations for suppression activities also include fire intensity, acreage, and spread potential; threats to life and property; potential to impact high-value resources such as critical habitat for threatened, endangered, and sensitive species; crucial wildlife habitat; cultural resources and/or riparian areas; historic fire regimes; and other special considerations such as wilderness and/or adjacent agency lands.</p> <p>Wildland Fire Use for Resource Benefit</p> <p>Wildland fire is authorized as a tool, when appropriate, to allow naturally ignited wildland fire to accomplish specific resource management objectives. Due to existing resource conditions and proximity to values at risk, fire cannot be allowed to resume its natural role on all BLM lands in the FO. Consideration of ongoing management decisions and other natural changes would direct periodical reassessment of DWFC and determination of potential areas for wildland fire use. Operational management of wildland fire use is</p>					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>described in the Wildland Fire Implementation Plan (WFIP).</p> <p>The FMP identifies FMUs that may have the potential for wildland fire use. Wildland fire use may be authorized for all areas, except when the following resources and values may be negatively impacted and there are no reasonable Resource Protection Measures to protect such resources and values:</p> <ul style="list-style-type: none"> • WUI areas • Areas known to be highly susceptible to post-fire cheatgrass or invasive weed invasion • Important terrestrial and aquatic habitats • Non-fire-adapted vegetation communities • Sensitive cultural resources • Areas of soil with high or very high erosion hazard • Class I areas and PM10 nonattainment areas • Administrative sites • Developed recreation sites • Communication sites • Oil, gas, and mining facilities • Aboveground utility corridors • High-use travel corridors, such as interstates, railroads, and/or highways <p><u>Fuels Treatment</u></p> <p>Fuels management activities outlined in the FMP would be consistent with the resource goals and objectives contained in the RMP. To reduce hazards and to restore ecosystems, authorized fuels management decisions include wildland fire use, prescribed fire, and mechanical, manual, chemical, biological, and seeding treatments. The FMP describes fuels management goals and objectives, and the full range of fuels management strategies and actions authorized for fuels reduction. Fuels treatments are focused on the DWFC of restoring historic fire regimes to ecosystems when feasible, so that future wildland fire use actions can be more easily implemented.</p> <p>Fuels management decisions may include but are not limited to the following activities:</p> <ul style="list-style-type: none"> • Mechanical treatments such as mowing, chopping, or chipping/grinding (brush cutter), chaining, tilling, or cutting • Manual treatments such as handcutting (chainsaw or handsaw) and handpiling • Prescribed fire, including broadcast, underburn, and handpile burning • Chemical spraying or biological treatments such as insects or goats/sheep • Seeding including aerial or ground application (manual or mechanical) <p>Targeted areas may be treated in phases over a period of several years and may involve multiple and varied treatments. Estimated fuels reduction treatments of 5,000 to 10,000 acres/year are targeted dependent on budgetary and time constraints.</p> <p>Implementation of fuels management decisions would be prioritized using the following criteria:</p> <ul style="list-style-type: none"> • WUI areas • Areas with fuel loading that could potentially result in the loss of ecosystem components following wildland fire • Resource management goals and objectives <p><u>Prevention and Mitigation</u></p> <p>Prevention and mitigation goals target a reduction in unauthorized wildland fire ignitions. Goals include coordination with partners and affected groups and individuals, and a wide range of prevention and mitigation activities such as personal contacts, mass media, signing, and defensible space education.</p> <p>Implementation of fire prevention activities would be prioritized using the following criteria:</p> <ul style="list-style-type: none"> • WUI areas • Major travel corridors • Recreation sites • Public lands as a whole <p><u>Emergency Stabilization and Rehabilitation (ES&R)</u></p> <p>A Normal Year Fire Stabilization and Rehabilitation Plan (NFRP) is in place to meet ES&R needs and to comply with up-to-date ES&R policy and guidance. The NFRP is a programmatic implementation plan authorizing treatment options specific to vegetative communities and dependent upon post-wildland fire conditions and other site-specific considerations. Treatment actions that are designed according to the type and severity of wildfire impacts and priorities include but are not limited to areas where the following criteria apply:</p> <ul style="list-style-type: none"> • It is necessary to protect human life and safety as well as property. • Unique or critical cultural and/or historical resources are at risk. • It is determined soils are highly susceptible to accelerated erosion. • Perennial grasses and forbs (fire-tolerant plants) are not expected to provide soil and watershed protection within two years.
--

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<ul style="list-style-type: none"> • There is a need to establish a vegetative fuel break of less flammable species (greenstrips). • Unacceptable vegetation, such as noxious weeds, may readily invade and become established. • Shrubs and forbs are a crucial habitat component for wintering mule deer, antelope, sage-grouse, or other special status species. • Stabilization and rehabilitation are necessary to meet RMP resource objectives, including rangeland seedings. • It is necessary to protect water quality. • It is necessary to quickly restore threatened, endangered, or special status species habitat populations to prevent negative impacts. <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p>Fire suppression on non-WSA lands with wilderness characteristics would be through light on the land techniques. The Moab Fire District Fire Management Plan (FMP) would be updated and amended to meet the direction and objectives of the RMP.</p>
<p>HEALTH AND SAFETY</p>
<p>GOALS AND OBJECTIVES</p> <p>Effectively manage hazardous risks on public lands to protect the health and safety of public land users and stewards; protect the natural and environmental resources; minimize future hazardous and related risks, costs, and liabilities; and mitigate physical hazards in compliance with all applicable laws, regulations, and policies.</p>
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p><u>Human Health and Safety</u> The BLM would strive to ensure that human health and safety concerns on the public lands it manages are appropriately mitigated if determined hazardous.</p> <p><u>Abandoned Mine Lands</u> In conformance with the BLM's long-term strategies and National Policies regarding Abandoned Mine Lands (AMLs), this RMP recognizes the need to work with our partners toward identifying and addressing physical safety and environmental hazards at all AML sites on public lands. In order to achieve this goal, a state strategy has been written. National program criteria for determining site priorities were used to develop the work plan. This state strategy is entitled "Utah Abandoned Mine Land Multi-Year Work Plan." The following criteria would be established to assist in determining priorities for site and area mitigation and reclamation. AML physical safety program priorities:</p> <ul style="list-style-type: none"> • Highest priority would be cleaning up AML sites where (a) a death or injury has occurred, (b) the site is situated on or in immediate proximity to developed recreation sites and areas with high visitor use, or (c) upon formal risk assessment, a high or extremely high risk level is indicated; • AML would be factored into future recreation management area designations, land-use planning assessments, and all applicable use authorizations; • The site is presently listed or is eligible for listing in the Abandoned Mines and Site Cleanup Module; • AML hazards should be, to the extent practicable, mitigated or remediated on the ground during site development. • AML water-quality program priorities are ones where the state has identified the watershed as a priority based on 1) one or more water laws or regulations; 2) threat to public health or safety; 3) threat to the environment; 4) the project reflects a collaborative effort with other land managing agencies; 5) the site is presently listed or is eligible for listing in the Abandoned Mines and Site Cleanup Module; and 6) the project would be funded by contributions from collaborating agencies. <p>These priorities would be maintained and updated as needed in the state AML strategy. The BLM would identify and clean up unauthorized dumping and shooting areas in the PA as required to comply with applicable state, local, and federal regulations. These would include areas such as the unauthorized shooting range west of Blanding, dumps near Hovenweep, the Monticello Airport, and Paiute Knoll.</p> <p><u>Hazardous Materials</u> Use, transportation, storage and disposal of hazardous materials shall comply with the applicable Federal and State laws. Use of pesticides and herbicides shall be used only in accordance with their registered uses and within limitations imposed by the Secretary of the Interior.</p> <p><u>Hazardous Waste</u> The BLM would respond to releases as appropriate.</p>
<p>LANDS AND REALTY</p>
<p>GOALS AND OBJECTIVES</p> <p>The BLM would retain lands within its administration except where necessary to accomplish resource goals and objectives outlined in the plan. The BLM would transfer lands out of federal ownership or acquire non-federal lands or conservation easements where needed to accomplish resource goals and objectives, improve administration of public lands, or to meet essential community needs. Make public land available for a variety of ROWs, alternative energy sources, and permits where consistent with resource, goals, objectives, and prescriptions.</p>
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>The BLM would not transfer out of federal ownership any habitat for listed threatened or endangered species or any habitat for non-listed special status species if it could be determined that such an action would lead to the need to list any species as threatened or endangered. Acquisition of potential/occupied special status species habitat would be high priority. These acquired/exchanged lands would be managed according to BLM land management prescriptions for special status species. Under IMP and Congressional action, WSAs and Wilderness Areas would be exclusion areas for any ROWs (Section 501[a] FLPMA).</p> <p><u>Land Tenure Adjustments</u></p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>Lands would be considered for disposal or acquisition if the changes are in accordance with resource management objectives and other RMP decisions, and would meet one or more of the following criteria as outlined by BLM Land Tenure Adjustment criteria:</p> <ul style="list-style-type: none"> • Such changes are determined to be in the public interest and would accommodate the needs of local and state governments, including needs for the economy, public purposes, and community growth. • Such changes would result in a net gain of important and manageable resources on public lands such as crucial wildlife habitat, important cultural sites, quality riparian areas, live water, listed species habitat, or areas key to productive ecosystems. • Such changes would ensure public access to lands in areas where access is needed and cannot otherwise be obtained. • Such changes would promote effective management and meet essential resource objectives through land ownership consolidation. • Such changes would result in acquisition of lands that serve regional or national priorities identified in applicable policy directives. • Such changes have been identified in existing activity plans (i.e., habitat management plans, etc.). <p>Acquisitions would be managed in the same manner as adjoining lands unless they are acquired for a specific purpose (i.e., wildlife habitat, buffer zones near other federal lands, etc.).</p> <ul style="list-style-type: none"> • A priority section for acquisition would be Utah State Section Township 39S Range 19E, Section 2, to acquire culturally sensitive lands in the McLoyd Canyon–Moon House area. <p>Give land exchanges with the State of Utah priority consideration to resolve in-holdings issues. The BLM would recognize the mission, goals, and objectives of the State of Utah as they relate to the values and resources of state-owned lands. The Monticello FO would work cooperatively with the State of Utah in identifying opportunities for Land Tenure Agreements (LTAs) that may assist the state in furthering its mission. These agreements must comply with applicable law and policy; consider fair market values; consider LTA criteria; and comply with goals and objectives for resource management prescribed in the RMP. They would be processed on a case-by-case basis, with consideration given to the goals, objectives, and decisions of this RMP.</p> <p>Filming Permits</p> <p>Applications for filming permits in the Monticello PA would be limited to existing highways, roads, and pullouts and previously disturbed or cleared areas throughout the Field Office (including Valley of the Gods, Moki Dugway, Highway 211, Newspaper Rock, and Highway 95) and would have to meet the following criteria of minimal impact to be approved without any NEPA analysis. Filming projects that do not meet these criteria would be subject to site-specific NEPA analysis prior to permit approval or use of programmatic NEPA documents including EAs, on BLM-managed lands in Utah within WSAs (EA USO-06-004), or other programmatic NEPA documents that may be developed on a local, state or bureau basis.</p> <ul style="list-style-type: none"> • Project would not impact sensitive habitat or species. • Project would not impact cultural resources or Native American sacred sites. • Project would not involve use of pyrotechnics. • Project would not involve more than minimum impacts to land, air, or water. (Minimum is defined as temporary impact only; no permanent impacts; no surface disturbance allowed that can't be raked out or rehabbed so that there is no sign of activity at the end of the filming). • Project would not involve use of explosives. • Project would not involve use of exotic plant or animal species that could cause danger of introduction into the area. • Project would not involve WSAs, non-WSA lands with wilderness characteristics, WSR corridors, National Register Eligible Sites, and Native American Sacred Sites. • Project would not involve adverse impacts to sensitive surface resource values including: historic, cultural or paleontological sites; sensitive soils; relict environments; wetlands or riparian areas; ACECs. • Project does not involve substantial restriction of public access. • Project does not involve substantial use of domestic livestock. • Project does not involve 15 or more production vehicles within sensitive area. • Project does not involve 75 or more people within sensitive area. • The activity within the sensitive area would not continue in excess of 10 days. • No refueling allowed within sensitive areas. • Aircraft use in area with wildlife concerns is not proposed during crucial wildlife period for more than 1 day and does not exceed frequency of 2 projects per 30-day period. • Aircraft use in area with no wildlife concerns is proposed for no more than 2 days and does not exceed frequency of 3 projects per 30-day period. • Use of aircraft is not proposed within 0.5 mile of a designated campground located within a sensitive area and the number of low-elevation passes would not exceed 4 passes per day. <p>Recreation and Public Purpose Act (R&PP) and Other Authorizations for Disposal</p> <p>Lands conveyed to state or local governments or non-profit organizations under the R&PP Act may include those identified in LTAs. In addition, requests for lands other than those identified could be considered for disposal provided the proposed use would provide a greater public benefit than that which the current management provides, and that the action is otherwise consistent with this RMP. Examples may include but are not limited to local government or non-profit recreational and public purposes facilities such as public shooting ranges, landfills, motocross tracks, racetracks, etc. Other authorizations for disposal include the Airport and Airway Improvement Act, state selections under the Enabling Act, and other authorities.</p> <p>Trespass Resolution</p> <p>Resolution of intentional trespass would be limited to removal and/or restoration as appropriate. Resolution of unintentional trespass may include authorization under ROW grant, commercial/agricultural lease, or permit; disposal of the impacted land through sale or exchange; or removal, depending on the nature of the trespass. In all such trespass cases, administrative costs incurred by the BLM for investigating and resolving trespasses would be collected. All trespass incidents resolved by issuance of ROW grants, leases, or permits would be subject to payment by the holder/lessee/permittee of rent based on market value. Trespass cases resolved by land sales would be based on fair market value, and land exchanges would be completed on an equal value basis.</p> <p>Access</p> <p>ROWs for state and private in-holdings, in-field oil and gas leases, and pipelines for producing oil and gas wells would be approved subject to a determination of "reasonable" access for the "intended purpose" and they are processed and issued upon application. As per the State of Utah v. Andrus, October 1, 1979 (Cotter Decision), the BLM would grant the State of Utah reasonable access to state lands for economic purposes, on a case by case basis.</p> <p>Easements</p> <p>Easements would be acquired from willing landowners and the State of Utah to gain access to public lands or placement of facilities on non-public lands, and acquire easements to accomplish resource objectives.</p> <p>Rights-of-ways</p> <p>Right-of-way (ROW) avoidance and exclusion areas would generally be consistent with the stipulations identified in Appendix A for oil and gas leasing and other surface-disturbing activities. These stipulations have been developed to protect important resource</p>
--

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>values. Areas identified as NSO are open to oil and gas leasing but surface-disturbing activities cannot be conducted on the surface of the land. Access to oil and gas deposits would require directional drilling from outside the boundaries of the NSO areas. NSO areas are avoidance areas for ROWs; no ROW would be granted in NSO areas unless there are no feasible alternatives.</p> <p>Applications for new ROW on public lands would be considered and analyzed on a case-by-case basis, taking into consideration areas identified for avoidance and exclusion. Proposals would be reviewed for consistency with planning decisions and evaluated under requirements of applicable laws for resource protection.</p> <p>Wind and Solar Development ROW applications for wind or solar energy development would incorporate best management practices (BMPs) and provisions contained in the Wind Energy or Solar Programmatic EIS documents Both wind and solar energy development are authorized by ROW grants.</p> <p>Sale Disposal Criteria As described under Sections 203 (a) of FLPMA (43 United States Code [U.S.C.] 1713; 1716), public lands have potential for disposal by sale when they are isolated and/or difficult to manage. Sale or other disposals, approximately 6,580 acres of land, are identified for disposal by legal description in Appendix C (Lands and Realty, Tracts Identified for Disposal) These lands need to be screened on a case by case basis to assure that they meet FLPMA 203 criteria.</p> <p>Transportation and Utility Corridors This RMP would adopt the existing designated ROW corridors including the Western Utility Group (WUG) updates to the Western Regional Corridor Study (Map 4 and Section 368 Energy Policy Act of 2005 West-Wide Energy Corridor), and would designate additional corridors subject to physical barriers and sensitive resource values. Designated transportation and utility corridors include existing groupings of ROWs for electric transmission facilities, pipelines 16 inches and larger, communication lines, federal and state highways, and major county road systems.</p>					
Rights-of-way (ROW)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Lands available for ROWs are divided into four categories according to the 1991 San Juan RMP prescriptions (page 37):</p> <ol style="list-style-type: none"> 1) Lands within designated transportation and utility corridors, 2) lands outside designated transportation and utility corridors, 3) lands to be avoided, and 4) lands to be excluded. <p>Avoidance Areas: 120,800 acres</p> <ul style="list-style-type: none"> • Cedar Mesa ACEC • Portion of Grand Gulch • Dark Canyon ACEC • ROS SPM area of San Juan River SRMA • Developed Recreation Sites <p>Exclusion Areas: 253,790 acres</p> <ul style="list-style-type: none"> • Alkali Ridge ACEC • Bridger Jack Mesa ACEC • Butler Wash ACEC • Cedar Mesa ACEC, partial • Hovenweep ACEC • Indian Creek ACEC • Lavender Mesa ACEC • Pearson Canyon Hiking Area • Scenic Highway Corridor ACEC • Shay Canyon ACEC • Most ROS P-class areas 	<p>Consider lands available for ROWs except for :</p> <ul style="list-style-type: none"> • Avoidance Areas: 125,105 acres. • Exclusion Areas: 416,612 acres. 	<p>Consider lands available for ROWs except for:</p> <ul style="list-style-type: none"> • Avoidance Areas: 39,323 acres. • Exclusion Areas: 395,329 acres. 	<p>Consider lands available for ROWs except for:</p> <ul style="list-style-type: none"> • Avoidance Areas: 14,175 acres. • Exclusion Areas: 386,853 acres. 	<p>Consider lands available for ROWs except for:</p> <ul style="list-style-type: none"> • Avoidance Areas: 53,915 acres. • Exclusion Areas: 974,463 acres. 	<p>Consider lands available for ROWs except for (Map 94):</p> <p>Avoidance Areas: 133,293 acres</p> <ul style="list-style-type: none"> • Indian Creek ACEC (3,908 acres) • Shay Canyon ACEC (119 acres) • Lavender Mesa ACEC (649 acres) • Hovenweep ACEC (880-acre Visual Emphasis Zone) • Alkali Ridge National Historic Landmark (2,146) • non-WSA with wilderness characteristics 88, 871 acres: (Dark Canyon, Nokai Dome East, Nokai Dome West, Grand Gulch, and Mancos Mesa), • Comb Ridge Recreation Management Zone of Cedar Mesa SRMA (30,752 acres) • San Juan River SRMA Segments 1, 2, and 3 • Colorado River Segment 2 • developed recreation sites • floodplains • riparian areas and springs • public water reserves. <p>Exclusion Areas: 393,252 acres</p> <ul style="list-style-type: none"> • WSAs 389,444 acres (Mancos Mesa, Grand Gulch ISA Complex, Road Canyon, Fish Creek Canyon, Mule Canyon, Cheesebox Canyon, Dark Canyon ISA Complex, Butler Wash, Bridger Jack Mesa, Indian Creek, South Needles, Squaw and Papoose Canyons, and Cross Canyon • Lands administratively endorsed for wilderness by Butler Wash North WSA • Valley of the Gods ACEC (22,863 acres) • San Juan River Segment 5 • Colorado River Segment 3
Withdrawal Processing and Review					
General Management Guidance					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>FLPMA requires the BLM to review agency withdrawals and prior Classification and Multiple Use Act (C&MU) classifications according to schedules prepared by USO or upon special BLM or agency request. The Monticello FO would review other-agency withdrawals (24,140 acres); withdrawals found to be obsolete can be removed. New withdrawals are processed upon request from the BLM or other federal agencies, but can be made only by the Secretary or by Congress.</p> <p>Support Support from Utah State Office and Washington Office would be needed for requests for withdrawal. Interdisciplinary staff support would be needed for coordination and development of site-specific mitigation. Coordination with surface owners, surface-administering agencies, or the State of Utah may also be required. Coordination with the U.S. Fish and Wildlife Service would be required where threatened or endangered species are involved.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Withdraw 132,380 acres (Map 5) from locatable mineral entry as listed below. Review existing withdrawals and remove unnecessary ones.</p> <ul style="list-style-type: none"> • C&MU classification (prior to RMP) (92,130 acres) • Acquired lands (9,730 acres) • Lands open prior to the RMP (30,520 acres) 	<p>Areas recommended for withdrawal from mineral entry (251,710 acres) (Map 6):</p> <ul style="list-style-type: none"> • Tank Bench (2,646 acres) • Comb Ridge (42,428 acres) • Grand Gulch NHD (37,388 acres) • All developed recreation sites (232 acres) • San Juan River SRMA (10,203 acres) • Alkali Ridge NHL (2,146 acres) • Valley of Gods ACEC (22,863 acres) • Colorado River Segment 3 (1,040 acres) • Dark Canyon River Segment (2,048 acres) • Dark Canyon ACEC (61,660 acres) • Indian Creek ACEC (3,908 acres) • Lockhart Basin ACEC (47,783 acres) • Butler Wash North ACEC (17,365 acres) 	<p>Areas recommended for withdrawal from mineral entry (121,912 acres) (Map 7):</p> <ul style="list-style-type: none"> • Comb Ridge (42,428 acres) • Grand Gulch NHD (37,388 acres) • All developed recreation sites (232 acres) • San Juan River SRMA (9,859 acres) • Alkali Ridge NHL (2,146 acres) • Valley of Gods ACEC (22,863 acres) • Colorado River Segment 3 (1,040 acres) • Dark Canyon River Segment (2,048 acres) • Indian Creek ACEC (3,908 acres) 	<p>Areas recommended for withdrawal from mineral entry (46,131 acres) (Map 8):</p> <ul style="list-style-type: none"> • Grand Gulch NHD (37,388 acres) • All developed recreation sites (232 acres) • San Juan River SRMA (6,365 acres) • Alkali Ridge NHL (2,146 acres) 	<p>Same as Alternative B except that all non-WSA lands with wilderness characteristics (834,070 acres) (Map 9) would be recommended for withdrawal.</p>	<p>Areas recommended for withdrawal from mineral entry (50,665 acres) (Map 10):</p> <ul style="list-style-type: none"> • Grand Gulch National Historic District (37,388 acres) • All developed recreation sites (232 acres) • San Juan River SRMA (9,859 acres) • Alkali Ridge National Historic Landmark (2,146 acres) • Colorado River Segment 3 (1,040 acres)
LIVESTOCK GRAZING					
GOALS AND OBJECTIVES					
Achieve Rangeland Health Standards (BLM 1997) and other desired resource conditions.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>Manage grazing according to Standards for Rangeland Health and Guidelines for Grazing Management (BLM 1997) (Appendix D).</p> <p>Maintain lands currently unavailable (128,098 acres) for livestock grazing (due to vegetation, recreation, wildlife, or other concerns).</p> <p>Maintain existing land treatments as prioritized in Appendix D, to meet RMP objectives and Standards for Rangeland Health (BLM 1997). Any new land treatments developed in addition to those listed would also be maintained as necessary to meet RMP objectives and Standards for Rangeland Health.</p> <p>Modify and implement existing (Tank Draw and East Canyon) and new Allotment Management Plans (AMPs) as necessary to meet RMP objectives and Standards for Rangeland Health (BLM 1997). Develop and implement 29 new AMPs and others identified on a site-specific basis, for which resource concerns develop that require such action.</p> <p>Continue to authorize current active permitted grazing use unless monitoring data or other factors indicate a need for change (e.g., change in federal land ownership, etc.).</p> <p>Continue to categorize allotments in accordance with BLM policy.</p> <p>Manage allotments towards mid- to late-seral ecological condition that meet other goals and objectives of this RMP until replaced by a more specific allotment objective classification such as Desired Future Condition (DFC).</p> <p>Forage, Livestock/Wildlife Coordinate with UDWR and grazing permittees to manage for long-term forage and habitat and/or ecological condition requirements or needs for livestock and wildlife, consistent with grazing allotment and herd management unit objectives.</p> <p>Seasons of Use Changes in livestock season of use would be made by the FO on an allotment-specific basis to meet RMP objectives or Standards for Rangeland Health (BLM 1997), as shown by monitoring data, and to provide flexibility in management of livestock grazing.</p>					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

**Allotment seasons of use, subject to the statement above, would be the same as in the current RMP (see Appendix D Livestock Grazing) with the following exceptions noted in Management Common to All Action Alternatives below.¹*

MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES

***Season of Use Changes (modified to match grazing permits as currently authorized, yet altered from the 1991 San Juan RMP):¹**

- Church Rock season of use would end May 31.¹
- Indian Rock season of use would end April 15.¹
- Owens Dugout season of use would end April 30.¹
- Laws season of use would be April 16–November 15.¹
- Bear Trap Season of use would be September 1–December 12.¹
- Monument Canyon season of use would be December 1–May 31.¹

***New Allotments—Established Since 1991 San Juan RMP (grazing permits as currently authorized):¹**

- South Vega season of use would be January 6–February 28.¹
- Upper Mail Station season of use would be November 14–February 28.¹
- Big Westwater season of use would be April 1–May 31 or October 15–December 15.¹

Glen Canyon NRA
Specific management direction for livestock grazing is provided for under the Glen Canyon NRA 1999 Grazing Management Plan.

Areas Unavailable for Grazing
Areas made unavailable for grazing may be reconsidered as available for grazing during subsequent revision or amendment of the RMP.

Utilization
Desired utilization levels as management guidelines for key forage species would be identified as needed to monitor use levels on an allotment specific basis to achieve Desired Future Condition (DFC). Where utilization levels have not been established, a use level of 50% would be the management guideline. Utilization is the proportion or degree of current year's forage production that is consumed or removed by animals (including insects). Utilization data should be analyzed in conjunction with climate, actual grazing use, current or historic impacts (wildfire, livestock, wildlife, insects, etc.), and long-term trend data to help evaluate existing and design future management to meet LUP objectives.

Relinquishment of Preference
Voluntary relinquishments of grazing permits and preference, in whole or in part, by a permittee in writing to the BLM will be handled on a case by case basis. The BLM will not recognize relinquishments that are conditional on specific BLM actions as valid, and the BLM will not be bound by them. Relinquished permits and the associated preference will remain available for application by qualified applicants after BLM considers if such action would meet rangeland health standards and is compatible with achieving LUP goals and objectives. Prior to re-issuance of the relinquished permit the terms and conditions may be modified to meet LUP goals and objectives and/or site-specific resource objectives.
However, upon relinquishment, BLM may determine through a site-specific evaluation and associated NEPA analysis that the public lands involved are better used for other purposes. Grazing may then be discontinued on the allotment through an amendment to the existing LUP or a new LUP effort. Any decision issued concerning discontinuance of livestock grazing is not permanent and may be reconsidered and changed through future LUP amendments and updates.

Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Continue to make unavailable for grazing 128,098 acres as follows (Map 12): <ul style="list-style-type: none"> • Comb Wash side canyons (Mule Canyon south of U-95, Arch, Fish, Owl, and Road). These areas were made unavailable to grazing by court decision and are also made unavailable to grazing in this RMP revision. • Bridger Jack Mesa (near relict vegetation) • Grand Gulch area (within the canyon) of Cedar Mesa 	Same as Alternative A with the additional following areas made unavailable to grazing (Map 13): <ul style="list-style-type: none"> • Slickhorn Canyon (Perkins Brother's Allotment) • Rone Bailey Mesa (Upper Mail Station Allotment) • Dodge Canyon Allotment • Mule Canyon (including North and South Forks north of U-95) • Rogers Allotment • Portions of West Butler Wash Canyons • Horsehead Canyon within 	Same as Alternative B except for Mule Canyon, which would be made unavailable for grazing south of U-95 (North and South Forks north of U-95 would be open) (Map 14).	Same as Alternative A with the additional following areas made unavailable for grazing (Map 15): <ul style="list-style-type: none"> • Slickhorn Canyon (within Perkins Brother's Allotment) • Rone Bailey Mesa (within Upper Mail Station Allotment) • Mule Canyon south of U-95 • Rogers Allotment • Portions of West Butler Wash Canyons Grazing in the riparian area of the San Juan River SRMA would be restricted to October 1–May 31 and must meet or exceed PFC, and	Same as Alternative A with the additional following areas made unavailable for grazing (Map 13): <ul style="list-style-type: none"> • Slickhorn Canyon (within Perkins Brother's Allotment) • Rone Bailey Mesa (within Upper Mail Station Allotment) • Dodge Canyon Allotment • Mule Canyon (including North and South Forks north of U-95) • Rogers Allotment • Portions of West Butler Wash Canyons • Horsehead Canyon (within 	Continue to make unavailable for grazing 134,277 acres. as follows (Map 16): <ul style="list-style-type: none"> • Comb Wash side canyons (Mule Canyon south of U-95, Arch, Fish, Owl, and Road). ---	---	--	---	--	---

MINERAL RESOURCES

GOALS AND OBJECTIVES

Continue to meet local and national energy and other public mineral needs to the extent possible. Provide opportunities for environmentally responsible exploration and development of mineral and energy resources subject to appropriate BLM policies, laws, and regulations.

Ensure a viable long-term industry related to leasable, locatable, and salable mineral development while providing reasonable and necessary protections to other resources. Establish conditions of use through land-use planning to protect other resource values.

The following principles would be applied:

Encourage and facilitate the development by private industry of public land mineral resources in a manner that satisfies national and local needs and provides for economical and environmentally sound exploration, extraction and reclamation practices;

Process applications, permits, operating plans, mineral exchanges, leases, and other use authorizations for public lands in accordance with policy and guidance; and

Monitor salable and leasable mineral operations to ensure proper resource recovery and evaluation, production verification, diligence and inspection, and enforcement of the lease, sale, or permit terms.

MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES

The plan would provide for a variety of mineral exploration and development activities. These activities would be allowed in the PA unless precluded by other program prescriptions. The stipulations identified in Appendix A would apply to these activities where they are applicable. Seasonal wildlife conditions would not apply to maintenance and operation activities for mineral production (see also Wildlife).

WSAs and designated Wilderness would remain closed, by law, to mineral leasing and development.

Management for geophysical work would be available unless stated specifically in alternatives that it is unavailable.

The Monticello PA would be open for mineral entry unless specifically withdrawn by Secretarial Order, public law or segregated from mineral entry under specific reservations, such as an R&PP lease.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>In areas where the No Surface Occupancy (NSO) stipulation for oil and gas leasing is applied, the same restriction would also, where appropriate and practical, to other surface-disturbing activities (and occupancy) associated with land-use authorization, permits, and leases issued on BLM lands. The restrictions would not apply to activities and uses where they are contrary to laws, regulations or specific program guidance. The intent is to maintain consistency to extent possible in applying stipulations/restrictions to all surface-disturbing activities.</p> <p>Leasable Minerals</p> <p>Oil and Gas</p> <p>The plan would recognize and be consistent with the I National Energy Policy Act and related BLM policy by adopting the following objectives:</p> <p>recognizing the need for diversity in obtaining energy supplies;</p> <p>encouraging conservation of sensitive resource values; and</p> <p>improving energy distribution opportunities.</p> <p>All lands are available for leasing subject to standard lease terms, unless otherwise specified in the plan. Lease stipulations would be developed in the plan, where necessary, to mitigate the impacts of oil and gas activity (see Appendix A). The stipulations would adhere to the Uniform Format prepared by the Rocky Mountain Regional Coordinating Committee in March 1989. Stipulations reflect the minimum requirements necessary to accomplish the desired resource protection and, would contain provisions and criteria to allow for exception, waiver and modification if warranted. Stipulations from Section 6 of the Standard Lease Terms are incorporated for all leases. Best Management Practices (BMP) will be applied on individual Applications for Permit to Drill and associated ROWs. These procedures are based on WO IM 2007-021 and the <i>Surface Operating Standards and Guidelines for Oil and Gas Development (Gold Book), 2006</i>.</p> <p>Oil and gas leases issued prior to the plan would continue to be managed under the stipulations in effect when issued. Those issued subsequent to this plan would be subject to the stipulations developed in this plan.</p> <p>Certain federal oil and gas resources within the Monticello PA underlie lands not administered by the BLM. The BLM administers the federal leases on these lands. These lands include:</p> <ul style="list-style-type: none"> • 101,720 acres within the Glen Canyon National Recreation Area (NRA) (see Glen Canyon NRA Minerals Management Plan) • 366,850 acres within the Manti-La Sal National Forest (NF), Monticello Ranger District • 51,610 acres within the Navajo Indian Reservation • 1,080 acres within Indian Trust lands • 55,390 acres on split-estate lands <p>Split-estate lands (private surface/federal minerals) and lands administered by other federal agencies are not managed by the BLM. The surface owner or surface management agency (SMA) manages the surface. The BLM administers the operational aspects of oil and gas leases. On lands administered by other federal agencies, lease stipulations would include those required by the SMA. On split-estate lands, lease stipulations would consist of those necessary to comply with non-discretionary federal laws, such as the Endangered Species Act. The one exception to this would be the stipulations developed for Gunnison Sage-grouse as identified in Appendix A. Mitigation measures would also be applied to protect other resource values such as VRM class, Recreation, and non-federally protected fish and wildlife species consistent with Section 6 of the standard lease terms. These mitigation measures would be developed during site-specific environmental analysis and would be attached as conditions of approval (COA) in consultation with the surface owner or SMA.</p> <p>In accordance with an UDEQ-DAQ letter dated June 6, 2008, (see Appendix T) requesting implementation of interim nitrogen oxide control measures for compressor engines; the BLM will require the following as a Lease Stipulation and a Condition of Approval for Applications for Permit to Drill:</p> <ul style="list-style-type: none"> • All new and replacement internal combustion gas field engines of less than or equal to 300 design-rated horsepower must not emit more than 2 gms of NO_x per horsepower-hour. This requirement does not apply to gas field engines of less than or equal to 40 design-rated horsepower. • All new and replacement internal combustion gas field engines of greater than 300 design rated horsepower must not emit more than 1.0 gms of NO_x per horsepower-hour. <p>Coal</p> <p>The coal resources within the Monticello PA are limited to the San Juan Coal Field, totaling about 530,000 acres. Approximately 60% of this field is under private ownership (both surface and mineral estate), and about 212,000 acres of federal surface and federal minerals in the coal field are administered by the Monticello FO. The potential for development of coal resources is low (see Mineral Potential Report and RFD [BLM 2005]). The public has expressed no interest in coal leasing. The RMP does not establish conditions for coal leasing or exploration requirements. This would be done through a plan amendment, should sufficient interest warrant. At such time as interest is expressed in coal leasing, the RMP would be amended and mining unsuitability criteria (43 CFR 3461) would be applied by the Monticello FO before any coal leases are issued. If coal leases are issued, they would be subject to special conditions developed in the RMP amendment and the unsuitability assessment. This may restrict all or certain types of mining techniques. Before any coal could be removed, Monticello FO would have to approve the mining permit application package, incorporating stipulations developed in the RMP.</p> <p>Tar Sand</p> <p>An Oil Shale and Tar Sands Leasing Programmatic Environmental Impact Statement (PEIS) is being prepared for oil shale and tar sands resources leasing on lands administered by the U.S. Department of the Interior, Bureau of Land Management (BLM) in Colorado, Utah, and Wyoming. Based upon the information and analyses developed in this PEIS, the BLM would amend LUPs for these areas.</p> <p>Potash (Nonenergy Leasable)</p> <p>Within the Monticello PA, two areas fall within Known Potash Leasing Areas (KPLAs). KPLA designations, based on known geologic data, would remain in place until potash resources are depleted. In KPLAs, potash leases are acquired through competitive bidding. In areas where potash values are not known, the Monticello PA could issue prospecting permits, which could lead to issuance of a preference right lease. The RMP establishes stipulations that would apply to prospecting permits and leases. The KPLAs are available for leasing subject to the same lease stipulations developed in the RMP for oil and gas. Additional KPLAs could be designated, based on geologic data, if interest warranted. This would be an administrative action. Exploration and mining operations for potash are conducted in accordance with the regulations at 43 CFR 3590.</p> <p>Geothermal</p> <p>A portion of the Warm Springs Canyon geothermal area (approximately 16,320 acres) extends into the Monticello PA. Low temperature geothermal waters have been recorded from springs. Because the Monticello PA is situated within the Colorado Plateau geologic province, where heat flow through the earth's crust is generally low, no high-temperature geothermal resources are expected at reasonable drilling depths. Therefore, development potential is low (see Mineral Potential Report and RFD [BLM 2005]). The public has expressed no interest in geothermal leasing. The RMP does not establish conditions for geothermal leasing or exploration requirements. This would be done through a plan amendment should sufficient interest warrant.</p> <p>Locatable Minerals</p> <p>All public domain lands overlying federal minerals are available for mining claim location unless specifically withdrawn from mineral entry by Secretarial Order or public law or segregated from mineral entry under specific reservations, such as an R&PP lease. The RMP may be used to recommend lands to be withdrawn from mineral entry. Claims located on these areas prior to withdrawal would not be impacted. Operations on BLM-administered lands available for mineral entry must be conducted in compliance with the BLM's surface management regulations (43 CFR Subparts 3802, 3809, 3715 and 3814). BLM surface management regulations do not apply to operations on other federal lands but do apply to all operations authorized by the mining laws on public lands where the</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>mineral interest is reserved to the United States, including Stock Raising Homestead lands. The BLM would evaluate all operations authorized by the mining laws in the context of its requirement to prevent unnecessary and undue degradation of Federal lands and resources. Consistent with the rights afforded claimants under the mining laws, operations would conform to the management prescriptions in the plan. Federally owned locatable minerals underlying federal lands administered by the NPS are not generally available for mineral entry. However, locatable minerals under Glen Canyon NRA may be leased under Title 43 of the Code of Federal Regulations, part 3500 (43 CFR 3500) in accordance with the Mineral Management Plan for the NRA.</p> <p>Salable Minerals All BLM-administered lands in the Monticello PA would be placed in one of the following three categories:</p> <ul style="list-style-type: none"> • Available for disposal of mineral material subject to standard conditions. • Available for disposal of mineral material subject to special conditions. • Unavailable for disposal of mineral material. <p>The plan would develop management conditions for disposal of mineral materials under each category. These management conditions would correspond respectively to the oil and gas leasing stipulations developed in the RMP, as follows:</p> <ul style="list-style-type: none"> • Standard lease terms • TL and CSU • NSO and closed <p>There are currently 16 community pits, totaling about 5,505 acres, designated in the current 1991 San Juan RMP.</p>					
Lands Available for Oil and Gas Leasing¹					
Alternative A (No Action) (Map 27)	Alternative B (Map 28)	Alternative C (Preferred) (Map 29)	Alternative D (Map 30)	Alternative E (Map 31)	Proposed Plan (Map 32)
Acres available for leasing subject to standard lease terms (Category 1): 578,604 The RMP reported 584,270 acres but was modified as discussed below***	Approximately 365,170 acres would be administratively available for oil and gas leasing, subject to standard lease terms.	Approximately 629,472 acres would be administratively available for oil and gas leasing, subject to standard lease terms.	Approximately 962,283 acres would be administratively available for oil and gas leasing, subject to standard lease terms.	Approximately 213,290 acres would be administratively available for oil and gas leasing, subject to standard lease terms.	Approximately 484,217 acres would be administratively available for oil and gas leasing, subject to standard lease terms.
Acres available for leasing subject to special conditions (Category 2): 659,626 The RMP reported 815,690 acres but was modified as discussed below***	TL: Approximately 786,489 acres would be administratively available for oil and gas leasing subject to timing limitations. CSU: Approximately 67,288 acres would be administratively available for oil and gas leasing subject to controlled surface use. CST: Approximately 22,963 acres would be administratively available for oil and gas leasing subject to timing limitations and controlled surface use.	TL: Approximately 569,657 acres would be administratively available for oil and gas leasing subject to timing limitations. CSU: Approximately 51,419 acres would be administratively available for oil and gas leasing subject to controlled surface use. CST: Approximately 98,425 acres would be administratively available for oil and gas leasing subject to timing limitations and controlled surface use.	TL: Approximately 418,242 acres would be administratively available for oil and gas leasing subject to timing limitations. CSU: Approximately 2,758 acres would be administratively available for oil and gas leasing subject to controlled surface use. CST: Approximately 0 acres would be administratively available for oil and gas leasing subject to timing limitations and controlled surface use.	TL: Approximately 511,649 acres would be administratively available for oil and gas leasing subject to timing limitations. CSU: Approximately 25,428 acres would be administratively available for oil and gas leasing subject to controlled surface use. CST: Approximately 8,564 acres would be administratively available for oil and gas leasing subject to timing limitations and controlled surface use.	TL: Approximately 594,469 acres would be administratively available for oil and gas leasing subject to timing limitations. CSU: Approximately 60,741 acres would be administratively available for oil and gas leasing subject to controlled surface use. CST: Approximately 85,384 acres would be administratively available for oil and gas leasing subject to timing limitations and controlled surface use.
Acres available subject to NSO: 161,224 The RMP reported 268,080 acres but was modified as discussed below***	NSO: Approximately 125,105 acres would be administratively available for oil and gas leasing subject to no surface occupancy.	NSO: Approximately 39,323 acres would be administratively available for oil and gas leasing subject to no surface occupancy.	NSO: Approximately 14,175 acres would be administratively available for oil and gas leasing subject to no surface occupancy.	NSO: Approximately 53,915 acres would be administratively available for oil and gas leasing subject to no surface occupancy.	NSO: Approximately 66,108 acres would be administratively available for oil and gas leasing subject to no surface occupancy. Dark Canyon (11,619 acres) non-WSA lands with wilderness characteristics are available subject to no surface occupancy.
Acres unavailable for leasing: 385,316—current management The RMP reported 111,170 acres but was modified as discussed below.**	Approximately 416,612 acres would be unavailable for leasing.	Approximately 395,329 acres would be unavailable for leasing.	Approximately 386,853 acres would be unavailable for leasing.	Approximately 974,463 acres would be unavailable for leasing.	Approximately 493,400 acres would be unavailable for leasing. Mancos Mesa, Nokai Dome West, Nokai Dome East and Grand Gulch non-WSA lands with wilderness characteristics are unavailable for oil and gas leasing.
<p>*** Actual acreage for current management differs from the RMP acreage because WSAs were unavailable for leasing by the IMP. The 1991 San Juan RMP did not close the WSAs to leasing and the acres were not taken into account at the time of RMP. Most of these areas were ACECs and available for leasing subject to special conditions.</p> <p>¹ NSO—No Surface Occupancy; TL—Timing Limitations; CSU—Controlled Surface Use; CST—Controlled Surface Use and Timing Limitations</p>

Lands Available for Mineral Entry					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Approximately 1,652,743 acres would be available for mineral entry.	Approximately 1,533,413 acres would be available for mineral entry.	Approximately 1,663,211 acres would be available for mineral entry.	Approximately 1,738,992 acres would be available for mineral entry.	Approximately 951,053 acres would be available for mineral entry.	Approximately 1,734,458 acres would be available for mineral entry.
Approximately 132,380 acres would be recommended for withdrawal from locatable mineral entry (Map 5).	Approximately 251,710 acres would be recommended for withdrawal from locatable mineral entry (Map 6).	Approximately 121,912 acres would be recommended for withdrawal from locatable mineral entry (Map 7).	Approximately 46,131 acres would be recommended for withdrawal from locatable mineral entry (Map 8).	Approximately 834,070 acres would be recommended for withdrawal from locatable mineral entry (Map 9).	Approximately 50,665 acres would be recommended for withdrawal from locatable mineral entry (Map 10).
Lands Available for Mineral Material Disposal					
Alternative A (No Action) (Map 21)	Alternative B (Map 22)	Alternative C (Preferred) (Map 23)	Alternative D (Map 24)	Alternative E (Map 25)	Proposed Plan (Map 26)
Approximately 584,270 acres would be available for disposal of mineral materials subject to standard terms and conditions.	Approximately 365,168 acres would be available for disposal of mineral materials subject to standard terms and conditions.	Approximately 624,734 acres would be available for disposal of mineral materials subject to standard terms and conditions.	Approximately 962,279 acres would be available for disposal of mineral materials subject to standard terms and conditions.	Approximately 213,290 acres would be available for disposal of mineral materials subject to standard terms and conditions.	Approximately 624,734 acres would be available for disposal of mineral materials subject to standard terms and conditions.
Approximately 821,070 acres would be available for disposal of mineral materials subject to special conditions.	Approximately 876,736 acres would be available for disposal of mineral materials subject to special conditions.	Approximately 724,234 acres would be available for disposal of mineral materials subject to special conditions.	Approximately 420,998 acres would be available for disposal of mineral materials subject to special conditions.	Approximately 545,641 acres would be available for disposal of mineral materials subject to special conditions.	Approximately 724,234 acres would be available for disposal of mineral materials subject to special conditions.
Approximately 373,850 acres would be unavailable for disposal of mineral materials.	Approximately 542,402 acres would be unavailable for disposal of mineral materials.	Approximately 435,338 acres would be unavailable for disposal of mineral materials.	Approximately 401,026 acres would be unavailable for disposal of mineral materials.	Approximately 1,025,378 acres would be unavailable for disposal of mineral materials.	Approximately 435,338 acres would be unavailable for disposal of mineral materials.
NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS					
The BLM has identified non-WSA lands with wilderness characteristics for management consideration in this planning effort. Wilderness characteristics include the appearance of naturalness and outstanding opportunities for solitude or primitive and unconfined recreation.					
GOALS AND OBJECTIVES:					
Protect, maintain and preserve wilderness characteristics (appearance of naturalness and outstanding opportunities for primitive and unconfined recreation or solitude) of non-WSA lands with wilderness characteristics as appropriate, considering manageability and the context of competing resource demands. Manage these primitive lands and backcountry landscapes for their undeveloped character, and to provide opportunities for primitive recreational activities and experiences of solitude, as appropriate.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES:					
There would be no management common to all for non-WSA lands with wilderness characteristics.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Non-WSA lands with wilderness characteristics were not addressed in the 1991 San Juan Resource Area RMP, as amended. These lands are managed according to the 1991 San Juan RMP prescriptions.	No management prescriptions identified for non-WSA lands with wilderness characteristics.	No management prescriptions identified for non-WSA lands with wilderness characteristics.	No management prescriptions identified for non-WSA lands with wilderness characteristics.	Manage 582,360 acres of non-WSA lands with wilderness characteristics for their wilderness characteristics (Map 33) in 29 areas. The following management would apply: <ul style="list-style-type: none"> • Unavailable for mineral leasing • Closed for OHV use • ROW exclusion areas • Closed to disposal of mineral materials • Unavailable for private and commercial woodland harvest • Unavailable for land treatments • VRM Class I • Recommended for withdrawal from mineral entry 	Manage 88,871 acres of non-WSA lands with wilderness characteristics for their wilderness characteristics (Map 34) in 5 individual areas: Dark Canyon (11,540 acres), Mancos Mesa (30,068 acres), Nokai Dome West (14,988 acres), Nokai Dome East (18,618 acres) and Grand Gulch (13,657 acres). The following management would apply: <ul style="list-style-type: none"> • Unavailable for mineral leasing in Mancos Mesa, Nokai Dome West, Nokai Dome East and Grand Gulch; no surface occupancy for mineral leasing (NSO) in Dark Canyon • OHV travel limited to designated roads and trails • ROW avoidance areas • Closed to disposal of mineral materials • Unavailable for private and commercial woodland harvest except for on-site collection of dead wood for campfires • Available for range, watershed or habitat improvements and vegetation treatments if beneficial or nonimpairing to wilderness characteristics and would meet VRM Class II

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

				<ul style="list-style-type: none"> • Unavailable for geothermal leasing • Unavailable for coal leasing • Fire suppression would be through light on the land techniques 	<p>objectives</p> <ul style="list-style-type: none"> • VRM Class II for surface-disturbing activities • All existing improvements could be maintained at their current level • Unavailable for coal leasing • Unavailable for geothermal leasing • Fire suppression would be through light on the land techniques
PALEONTOLOGY					
GOALS AND OBJECTIVES					
Identify area-wide criteria or site-specific use restrictions where necessary to protect paleontological resources from surface-disturbing activities and to promote the scientific, educational, and recreational uses of fossils. Foster public awareness and appreciation of the paleontological heritage.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>Recreational collectors may collect and retain reasonable amounts of common invertebrate and plant fossils for personal, noncommercial use. Surface disturbance must be negligible, and mechanized tools may not be used. Petrified wood collection would be limited to amounts mandated in BLM regulations. Collection of scientifically noteworthy and/or uncommon invertebrate and plant fossils may require a permit. Vertebrate fossils may be collected only under a permit issued by the authorized officer to qualified individuals. Vertebrate fossils include bones, teeth, eggs, and other body parts of animals with backbones such as dinosaurs, fish, turtles, and mammals. Vertebrate fossils also include trace fossils such as footprints, burrows, and dung. Casting of vertebrate fossils, including dinosaur tracks, would be prohibited unless allowed under a scientific/research permit issued by the Utah State BLM Office. Fossils collected under a permit remain the property of the federal government and must be placed in a suitable repository (such as a museum or university) identified at the time of permit issuance. Lands identified for disposal or exchange would be evaluated to determine whether such actions would remove important fossils from federal ownership. In areas where surface disturbance, either initiated by the BLM or by other land users, may threaten substantial or noteworthy fossils, the BLM would follow its policy per Paleontology Resources Management Manual and Handbook 8370-1 (BLM 1998a) to assess any threat and mitigate damage. Where scientifically noteworthy fossils are threatened by natural hazards or unauthorized collection, the BLM would work with permittees and other partners to salvage specimens and reduce future threats to resources at risk.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Not specified.	Conduct on-site evaluation of surface-disturbing activities for all Category 3, 4/5, and 5 areas, and avoid impacts to paleontological resources.	Conduct on-site evaluation of surface-disturbing activities for all Category 5 areas and minimize impacts to paleontological resources to the degree practicable. Evaluation will consider the type of surface disturbance proposed and mitigation will be developed based on site-specific information.	Not specified.	Same as Alternative B.	Conduct on-site evaluation of surface-disturbing activities for all Category 5 areas and minimize impacts to paleontological resources to the degree practicable. Evaluation will consider the type of surface disturbance proposed and mitigation will be developed based on site-specific information.
RECREATION					
GOAL					
To provide for multiple recreational uses of the public lands and to sustain a wide range of recreation opportunities and potential experiences for visitors and residents while supporting local economic stability and sustaining the recreation resource base and other sensitive resource values.					
Explanation of Recreation Planning Concepts					
Under all alternatives, the primary framework for recreation management in the Monticello PA is the Special Recreation Management Area (SRMA). This is used to define the following components of the recreation program: OHV designations, recreation permitting, developed recreation facilities, campsite designation, tourism, and heritage tourism. SRMAs are discussed below to provide the reader with an understanding of how this concept would be used to manage recreation in the Monticello PA. The management tools and techniques that would be used to support these concepts are discussed within each alternative.					
Special Recreation Management Areas (SRMAs)					
SRMAs are defined under LUP Handbook Appendix C, Recreation and Visitor Services, as "... having a distinct, primary recreation-tourism market as well as a corresponding and distinguishing recreation management strategy..." For each SRMA identified, delineate discrete recreation management zone (RMZ) boundaries. Each RMZ has four defining characteristics; it: 1) serves a different recreation niche within the primary recreation market; 2) produces a different set of recreation opportunities and facilitates the attainment of different experience and benefit outcomes (to individuals, households and communities, economies, and the environment; 3) has distinctive recreation setting character; and 4) requires a different set of recreation provider actions to meet the strategically targeted primary recreation market demand."					
SRMAs are designated in each of the alternatives to meet the goals and objectives of the recreation program and to adhere to agency guidance as described above.					
Extensive Recreation Management Areas (ERMAs)					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>The LUP Handbook Appendix C, Recreation and Visitor Services, defines an extensive recreation management area (ERMA) as an areas not delineated as an SRMA. Management within all ERMAs is restricted to custodial actions only.</p> <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>Continue existing reservations issued to the BLM for all existing developed recreation sites and facilities. Issue similar protective reservations for all new recreation facilities.</p> <p>Manage recreation to meet Utah's Rangeland Health Standards guided by the Standards for Public Land Health and Guidelines for Recreation Management. (Appendix E). The guidelines describe the procedures that should be applied to achieve standards for rangeland health within the recreation program.</p> <p><u>BLM Recreation Guidelines</u></p> <ul style="list-style-type: none"> • Recognize that various levels of regulations and limits are necessary. Restrictions and limitations on public uses should be as minimal as possible without compromising the primary goal. • Use on-the-ground presence (BLM, site stewards, volunteers) as a tool to protect public lands. • Limit or control activities where long-term damage by recreational uses is observed or anticipated through specialized management tools such as designated campsites, permits, area closures, and limitations on number of users and duration of use. Revise recreation area management plans (RAMP) as necessary to maintain public land health. • Coordinate with federal and state agencies, county and local governments, and tribal nations in recreation planning and managing traffic, search and rescue operations, trash control and removal, and public safety. • Consider and, where appropriate, implement management methods to protect the resource, as well as maintain the quality of experience of the various user groups. These methods could include limitation of numbers, types, timing, and duration of use. • Encourage the location of public land recreational activities near population centers and highway corridors by placement of appropriate visitor-use infrastructure. Provide restrooms and other facilities that would be adequate for anticipated uses at designated campgrounds, trailheads, and other areas where there is a concentration of recreational users. • Emphasize "Leave No Trace" camping and travel techniques throughout the Monticello PA. • Consider and, where appropriate, implement management methods to protect natural and cultural resources and while giving consideration to community and economic impacts, implement management methods to maintain or enhance recreation opportunities. Management methods may include limitation of visitor numbers, camping and travel controls, implementation of fees, alteration of when use takes place, and other similar actions as they are approved through normal BLM procedures. • Coordinate management of recreation use with other agencies, state and local government, and tribal units to provide public benefits, help assure public safety, and make effective use of staff and budget resources. • Recreational OHV and mechanized travel would be consistent with route and area designations described in the travel management decisions. The BLM would work with agency and government officials and permit holders to develop procedures, protocols, permits or other types of authorization, as appropriate, to provide reasonable access for non-recreational use of OHVs for military, search and rescue, emergency, administrative, and permitted uses. • OHV access for game retrieval would follow all area and route designations. (There would be no off-road retrieval.) • Dispersed camping, where allowed when not specifically restricted, may be closed seasonally or as impacts or environmental conditions warrant. <p><u>General Recreation Management Decisions</u></p> <p>Allow development of hiking paths and trails within the PA subject to site-specific NEPA.</p> <p>The following actions require a signed agreement with the specified agency:</p> <ul style="list-style-type: none"> • Manage the BLM portion of the Colorado River in coordination with Canyonlands National Park and the Moab BLM FO. • Manage the BLM portion of the San Juan River in coordination with Glen Canyon National Recreation Area and the Navajo Nation. • Manage the BLM portion of Dark Canyon Complex in coordination with Manti-La Sal National Forest and Glen Canyon National Recreation Area. • Manage the BLM portion of the Keeley Trail in coordination with Hovenweep National Monument. <p><u>Management of Existing and Development of Future Recreation Facilities</u></p> <p>Existing developed recreation sites would be maintained. New sites/facilities/trails would be developed in response to user demand, amenity value, and critical resource protection needs.</p> <p>All developed recreation sites would be recommended for withdrawal from locatable mineral entry.</p> <p>Recreation facilities would be closed to disposal of mineral materials.</p> <p>Developed recreation sites would be available for oil and gas leasing subject to NSO. NSO boundaries around developed recreation sites are defined as one quarter mile from the perimeter of campgrounds and 200 meters from the perimeter of other developed recreation sites.</p> <p>These sites would also be available for oil and gas leasing subject to NSO and unavailable for disposal of mineral materials.</p> <p>Grazing would be excluded from developed recreation sites.</p> <p>Developed recreation facilities are unavailable for private and/or commercial use of woodland products including on-site collection of dead wood for campfires.</p> <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p><u>General Recreation Management Decisions</u></p> <p>Benefits Based Management Goals and Objectives (BBMs) have been written for most SRMA. (See Appendix E, Recreation.)</p> <p>No camping within 200 feet of isolated springs to allow space for wildlife to access water.</p> <p>No camping is allowed within cultural sites or archaeological resources as defined ARPA.</p> <p><u>Management of Existing and Development of Future Recreation Facilities</u></p> <p>Develop or improve development of recreation sites as prioritized below.</p> <ul style="list-style-type: none"> • Kane Gulch Ranger Station (40 acres) • Sand Island Campground (21 acres)
--

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<ul style="list-style-type: none"> • Mexican Hat Launch site (20 acres) • Hamburger Rock Campground (20 acres) • Comb Wash Campground (10 acres) • Butler Wash Ruin (60 acres) • Mule Canyon Ruin (10 acres) • Three Kiva Pueblo (10 acres) • Shay Mountain Vista Campground (20 acres) • Indian Creek Recreational and Camping Facilities as outlined in the Indian Creek Recreation Corridor Plan (BLM 2005). • The BLM would work with Natural Bridges National Monument to develop an overflow camping area. No campfires would be allowed in these overflow camping areas. • The BLM would work with Canyonlands National Park Needles District to develop an overflow camping area.
<p>SPECIAL RECREATION MANAGEMENT AREAS (SRMA)</p>
<p>MANAGEMENT COMMON TO ALL ALTERNATIVES</p> <p>Provide general recreation management guidance and subsequent implementation of management decisions for activity plan-level actions for SRMAs through continuation of approved Recreation Area Management Plans (RAMPs) and development of new RAMPs for all SRMAs.</p> <p>If necessary, activity plans would be written for SRMAs.</p> <p>Review and update RAMPS as necessary to make adjustments for changing conditions and opportunities.</p> <p>Domestic pets and pack animals would not be allowed in cultural sites or on archaeological resources as defined in ARPA.</p> <p>Ropes and other climbing aids would not be allowed for access to cultural sites or archaeological resources as defined in ARPA, except for emergencies or administrative needs.</p> <p>Camping would not be allowed within cultural sites or archaeological resources as defined in ARPA.</p> <p>Cultural sites may be closed to visitation when they are determined to be at risk or pose visitor safety hazards.</p> <p>General SRMA Guidelines</p> <p>Identify additional SRMAs or add areas to SRMAs as necessary to respond to changing management circumstances. Establishment of post-RMP SRMAs or revision of SRMA boundaries would require a plan amendment. The criteria for establishment of post-RMP SRMAs or revising SRMA boundaries include:</p> <ul style="list-style-type: none"> • Recreation use requires intensive management to provide recreation opportunities or maintain resource values. • A recreation area management plan or interdisciplinary plan with intensive recreation management decisions is approved. • The BLM announces designation and plan approval through media. <p>All recreation management activities and developments in the SRMA would be in support of the individual SRMA goals and objectives.</p> <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p>General SRMA Guidelines</p> <p>All SRMAs would be designated as special areas under the Land and Water Conservation Fund definition. As per the Land and Water Conservation Fund Act and the Federal Lands Recreation Enhancement Act, this could require permits and payment of fees for recreation use.</p>
<p>San Juan River SRMA</p>
<p>GOALS AND OBJECTIVES</p> <p>Provide outstanding river related recreational opportunities and visitor experiences while protecting natural and cultural resource values with integrated management between the BLM, NPS, and the Navajo Nation.</p> <p>Allow for boating and rafting activities regulated through permit issuance.</p> <p>By the year 2012, manage this SRMA to provide opportunities for visitors to realize personal development and growth, enhanced lifestyle increased local tourism revenue and maintenance of distinct recreation setting character, providing no fewer than 80% of responding visitors and impacted community residents at least a moderate realization of these benefits: (i.e., 3.0 on a probability scale where 1 = not at all, 2 = somewhat, 3 = moderate, 4 = total realization).</p>
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>Permits would be issued to commercial companies on a five-year designated basis. They would also be issued to private users through an annual lottery system.</p> <p>River trips on the San Juan River would require a special use permit.</p> <p>Unavailable for woodland product use, except for limited on-site collection of dead wood for campfires. Woodland use within the floodplain would be limited to collection of driftwood for campfires.</p> <p>Cottonwood and willow harvest would be allowed for Native American ceremonial uses only by permit. Restrictions on this permitted harvest would be implemented as necessary to achieve or maintain Proper Functioning Condition (PFC), and to maintain or improve threatened and endangered species/special status species (TES/SSS) habitat.</p> <p>Backpackers in Slickhorn Canyon and Grand Gulch would not be allowed to camp within 1 mile of the river.</p> <p>Campfire use only with a fire pan.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

The bench above Sand Island Campground (256 acres) would be closed to camping.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
SRMA, 15,100 acres (non-GIS calculation from the 1991 RMP) managed to preserve ROS P-class and protect ROS SPNM-class (9,380 acres) (Map 36).	The San Juan River would be managed as an SRMA (10,203 acres) (Map 37). The boundary would remain as in previous RMP. Efforts would be made to purchase private lands within the SRMA boundary. The SRMA boundary east of existing oil and gas leasing category III (NSO) would be below the bench, thereby allowing access to high-quality gravel.	The San Juan River would be managed as an SRMA (9,859 acres) (Map 38). The boundary would remain as in the previous RMP with the exception of State Section 16 and the Holliday Pit Quarry on Lime Ridge. The SRMA boundary east of existing oil and gas leasing category III (NSO) would be below the bench, thereby allowing access to high-quality gravel.	The San Juan River would be managed as an SRMA (6,365 acres) (Map 39). The SRMA boundary east of existing oil and gas leasing category III (NSO) would be below the bench, thereby allowing access to high-quality gravel.	Same as Alternative B (Map 37), except for non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, unavailable for OHV use, ROW exclusion areas, unavailable for disposal of mineral materials, unavailable for private and commercial woodland harvest, VRM Class I, and recommended for withdrawal from mineral entry.	The San Juan River would be managed as an SRMA (9,859 acres) (Map 40). The boundary would remain as in the previous RMP with the exception of State Section 16 or the Holliday Pit Quarry on Lime Ridge. The SRMA boundary east of existing oil and gas leasing category III (NSO) would be below the bench, thereby allowing access to high-quality gravel.
Motorized Boating					
Downstream travel is allowed at low, wakeless speed. Upstream travel is prohibited, except for emergency purposes (SPM).	No motorized boating would be allowed, except for emergency purposes.	Same as Alternative A.	Same as Alternative A.	Same as Alternative B.	Downstream travel is allowed at low, wakeless speed. Upstream travel is prohibited, except for emergency purposes (SPM).
Launch Limits					
Current launch limits allow approximately 40,000 user/days per year, private and commercial trips combined. Trip size is limited to 25 people on private trips, and 25 passengers plus 8 crew on commercial trips.	Launch limits would be reduced to provide a river experience that improves visitor experience and perception of solitude, and would reduce potential impacts on the resource. Launch schedules would allow approximately 30,000 user/days per year. Trip size would be limited to 20 people (including crew) for both private and commercial use.	Launch limits would be changed to allow for an improved visitor experience (e.g., hiking opportunities) and increased perception of solitude below Mexican Hat while remaining within the limitations set by the availability of campsites between Slickhorn Canyon and Clay Hills. Launch limits would allow approximately 40,000 user/days per year. Trip size would be limited to 25 people (including crew) total for both private and commercial trips.	Launch limits would be raised to allow for increased visitor access to resources. Launch schedules would allow approximately 45,000 user/days per year, private and commercial trips combined. Trip size would be increased to a maximum of 35 people per trip for both private and commercial use.	Same as Alternative B. Available for oil and gas leasing subject to NSO.	Launch limits would be changed to allow for an improved visitor experience (e.g., hiking opportunities) and increased perception of solitude below Mexican Hat while remaining within the limitations set by the availability of campsites between Slickhorn Canyon and Clay Hills. Launch limits would allow approximately 40,000 user/days per year. Trip size would be limited to 25 people (including crew) total for both private and commercial trips.
Commercial/Private Allocations					
Commercial use, including day trips, is allowed up to 50% of total use. Commercial day trips are not included in launch limits.	Commercial use would be restricted to 30% of total use. One commercial day trip would be allowed and would be included in the allocation and launch limits.	Commercial use would be allowed up to 40% of total use. One commercial day trip per day would be allowed and would not be included in the launch limits.	Commercial/private allocation would be split on a 50/50 basis. Commercial day trips would be allowed on an unlimited basis and would not be included in the launch limits.	Same as Alternative B.	Commercial use would be allowed up to 40% of total use. One commercial day trip per day would be allowed and would not be included in the launch limits.
Administrative/Research Use					
Administrative and research use is currently not included in the launch limits.	Administrative and research use would be restricted to use that can be accommodated within the launch limit.	Administrative and research use would be authorized on a case-by-case review and determination.	Same as Alternative C.	Same as Alternative B.	Administrative and research use would be authorized on a case-by-case review and determination.
Visitor Services					
Minimal visitor services at Sand Island and Mexican Hat ramp areas	Minimal visitor services at Sand Island and Mexican Hat ramp areas	Same as Alternative B.	Increased visitor services, including trash receptacles and toilet clean-out	Same as Alternative B.	Minimal visitor services at Sand Island and Mexican Hat ramp areas would be provided for visitor health and safety and

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

are provided for visitor health and safety and resource protection.	would be provided for visitor health and safety and resource protection.		facilities, would be provided for visitor health and safety and resource protection at Sand Island, Mexican Hat ramp areas.		resource protection.
Designated Campsites					
To minimize conflict in the area from Slickhorn Canyon to Clay Hills, 9 campsites are available for reservation at the time the permit is issued. From May 15 to June 15, only 1 night is allowed in the reserved area. At other time, 2 nights are allowed if available, but must be at 2 different campsites (i.e., 2 nights cannot be spent at the same campsite).	An MOU would be signed between the NPS/GCNRA and the Navajo Nation. This memorandum would include details on numbers of campsites and their associated permit restrictions.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	An MOU would be signed between the NPS/GCNRA and the Navajo Nation. This memorandum would include details on numbers of campsites and their associated permit restrictions.
Non-boating Use					
Vehicle camping is not restricted.	With the exceptions of along Lime Creek Road, the Mexican Hat Rock area, and Mexican Hat Boat Ramp, vehicle camping would be allowed within the San Juan SRMA only upstream of Comb Wash. Lime Creek campsite would be reserved for river runners only. All campers (including backpackers) must have carry-out toilets. The bench above Sand Island Recreation Area would be closed to camping, including portions outside of the SRMA. Area wide, camping would be closed within 0.5 mile of designated campsites.	Same as Alternative B.	Vehicle camping would not be restricted within the San Juan River SRMA, except for the following: The bench above Sand Island Recreation Area would be closed to camping, including portions outside of the SRMA. Area wide, camping would be closed within a 0.5 mile of designated campsites.	With the exception of along Lime Creek Road, and the Mexican Hat Rock area, and Mexican Hat Boat Ramp, vehicle camping would be allowed within the San Juan SRMA only upstream of Comb Wash. Lime Creek campsite would be reserved for river runners only. All campers (including backpackers) must have carry-out toilets. The bench above Sand Island Recreation Area would be closed to camping, including portions outside of the SRMA. Area wide, camping would be closed within a ½ mile of designated campsites.	With the exceptions of along Lime Creek Road, the Mexican Hat Rock area and Mexican Hat Boat Ramp, vehicle camping would be allowed within the San Juan SRMA only upstream of Comb Wash. In this area, dispersed vehicle camping would be allowed in previously disturbed areas within 150 feet of designated routes. Lime Creek campsite would be reserved for river runners only. All campers (including backpackers) must have carry-out toilets. The bench above Sand Island Recreation Area would be closed to camping, including portions outside of the SRMA. Area wide, camping would be closed within 0.5 mile of designated campsites.
Minerals					
Managed as described in 1991 San Juan RMP (BLM 1991a), pages 78 and 100. Available for mineral leasing with special conditions. Available for geophysical. Available for mineral entry with an approved plan of operations.	Available for oil and gas leasing subject to NSO and recommended for withdrawal from locatable mineral entry and unavailable for disposal of mineral materials.	Same as Alternative B.	Same as Alternative B.	Available for oil and gas leasing subject to NSO and recommended unavailable for locatable mineral entry. and disposal, except for lands with wilderness characteristics that would be unavailable for oil and gas leasing.	Available for oil and gas leasing subject to NSO and recommended for withdrawal from locatable mineral entry and unavailable for disposal of mineral materials.
Grazing					
Available for livestock use.	Grazing in the riparian area would be restricted to October 1–May 31	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	*Grazing in the riparian area would be restricted to October 1–May 31 ³ and must meet or exceed PFC, and incorporate rest-

³ This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

	and must meet or exceed PFC, and incorporate rest-rotation and/or deferment systems. This would include Perkins Brothers, East League, and McCracken Wash Allotments.				rotation and/or deferment systems. This would include Perkins Brothers (outside Slickhorn Canyon), East League, and McCracken Wash Allotments.
Watershed					
	Watershed control structures would be subject to surface restrictions and seasonal restrictions to protect bighorn sheep lambing and rutting areas. Vehicle access in other areas within the SRMA would be limited to designated routes. Area would be subject to fire suppression to protect riparian habitat.	Same as Alternative B.	Same as Alternative B.	No vehicle access through non-WSA lands with wilderness characteristics. Watershed structures would have to meet VRM Class I objectives.	Watershed control structures would be subject to surface restrictions and seasonal restrictions to protect bighorn sheep lambing and rutting areas. Vehicle access in other areas within the SRMA would be limited to designated routes. Area would be subject to fire suppression to protect riparian habitat.
Other					
	Would be managed to maintain an environment of isolation insofar as allowed by river permit and patrol system. Surface disturbance from mining activities on existing claims would be limited to the extent possible without unnecessary impact to valid existing rights. The area above the rim in the vicinity of the Bluff airport lease would be available for mineral materials disposal. No vehicle access would be allowed from Comb Wash downstream to Lime Creek, and below Mexican Hat Bridge. OHV use would be limited to designated roads and trails.	Would be managed to maintain an environment of isolation insofar as allowed by river permit and patrol system. Surface disturbance from mining activities on existing claims would be limited to the extent possible without unnecessary impact to valid existing rights. No vehicle access would be allowed from Comb Wash downstream to Lime Creek and below Mexican Hat Bridge (except for motorized boat use on the river). Mechanized/motorized travel would be limited to designated routes.	Would be managed to maintain an environment of isolation insofar as allowed by river permit and patrol system. Surface disturbing from mining activities on existing claims would be limited to the extent possible without unnecessary impact to valid existing rights. The area above the rim in the vicinity of the Bluff airport lease would be available for minerals materials disposal. No vehicle access would be allowed from Comb Wash downstream to Lime Creek, and below Mexican Hat Bridge. OHV use would be limited to designated roads and trails.	Same as Alternative B.	Would be managed to maintain an environment of isolation insofar as allowed by river permit and patrol system. Surface disturbance from mining activities on existing claims would be limited to the extent possible without unnecessary impact to valid existing rights. No vehicle access would be allowed from Comb Wash downstream to Lime Creek and below Mexican Hat Bridge (except for motorized boat use on the river). Mechanized/motorized travel would be limited to designated routes.
Grand Gulch Plateau SRMA	Cedar Mesa Cultural SRMA (C-SRMA)			Cedar Mesa SRMA	
GOALS AND OBJECTIVES					
Provide outstanding recreational opportunities and visitor experiences while protecting natural and cultural resource values through integrated management between the BLM and NPS. Provide a safe, natural well-designed accessible recreational experience for all visitors to enjoy the world renowned cultural resources and scenic values. Use visitor information and interpretation as a primary tool to protect sensitive resources, discourage vandalism, and encourage visitor appreciation of public lands. By the year 2012, manage this SRMA to provide opportunities for visitors to realize personal development and growth, enhanced lifestyle increased local tourism revenue and maintenance of distinct recreation setting character, providing no fewer than 80% of responding visitors and impacted community residents at least a moderate realization of these benefits (i.e., 3.0 on a probability scale where 1 = not at all, 2 = somewhat, 3 = moderate, 4 = total realization).					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
Portions of the Cedar Mesa SRMA overlay four existing WSAs (Grand Gulch ISA Complex, Fish Creek Canyon, Mule Canyon and Road Canyon, Map 56) and the Valley of the Gods ACEC. WSAs would be managed according to the IMP and Valley of the Gods ACEC would be managed as VRM Class I, unavailable for private and commercial use of woodland products, campfires are not allowed, among other restrictions (see the Valley of the Gods ACEC section in this Chapter under Special Designations).					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES					
A joint recreation/cultural resources management plan (CRMP) would be written for this area based on the RMP.					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>The following stipulations would apply to the Grand Gulch Plateau SRMA (385,000 acres) (Map 36):</p> <p>Camping Allowed only at existing campsites. No new campsites may be developed. Camping in Grand Gulch between Kane Gulch and Bullet Canyon is limited to no more than 2 consecutive nights at one campsite. The bench surrounding Split Level Ruin in Grand Gulch is closed to camping. No unauthorized use of existing corrals.</p> <p>Campfires Prohibited in all canyons.</p> <p>Areas for Day Stock Use Only Bullet Canyon from Grand Gulch to Jailhouse Ruin. Two miles upstream Fish Canyon from the confluence with Owl Canyon, McLoyd Canyon to impassable pour-off, and Owl Canyon to Nevills Arch.</p> <p>Pets No limit or fees for pets. All pets must be collared, leashed, and under human control at all times. No pets are allowed in Slickhorn Canyon or below Collins Canyon in Grand Gulch. Pets are not allowed in or at any alcoves, rock art sites, or ruins. Pets must not harass or harm wildlife. Pets must not harass visitors and other visitors' pets. Pets are not allowed to swim in springs, pot holes, or other natural water sources. Pet waste must be buried in a shallow hole away from trails, campsites, cultural sites, and natural water sources.</p> <p>Stock (horses, llamas, goats, etc.) All commercial and private stock use requires a permit. GGPA allows 1 stock trip at any one time allowed in GGPA, includes day use. Other Cedar Mesa canyons allow 1 overnight stock trip at any one time, and unlimited day use.</p> <p>Overnight Stock Use Areas Kane Gulch, Collins Canyon, Government Trail, Grand Gulch from Kane Gulch to Collins Canyon, Fish Creek Canyon from Comb Wash to confluence with Owl Canyon, Mule Canyon South of U-</p>	<p>Cedar Mesa Cultural Special Recreation Management Area (375,739 acres) (Map 37), formerly the Grand Gulch Plateau SRMA, would be managed according to guidelines stipulated below:</p> <ul style="list-style-type: none"> Where livestock grazing is permitted mitigation activities may be implemented if cultural resources are determined to be at risk. Available for watershed, range, and wildlife improvements and vegetation treatments. Mesa tops and canyons closed to campfire use. Unavailable for commercial and/or private use of woodland products including on-site collection of dead wood for campfires. Open to dispersed camping, except in areas where cultural resources are at risk. Managed as VRM Class III and IV. <p>Pets and Stock Same as Alternative A with the following exceptions:</p> <ul style="list-style-type: none"> Pets would not be allowed in canyons requiring permits. (Grand Gulch and its tributaries), Fish Canyon, Owl Canyon, McLoyd Canyon, Slickhorn Canyon, Road Canyon, Lime Canyon, and North and South Mule Canyons). Recreational stock (horses, pack animals, etc.) would not be allowed in canyons requiring permits. 	<p>Cedar Mesa Cultural Special Recreation Management Area (375,739 acres) (Map 38), formerly the Grand Gulch Plateau SRMA, would be managed the same as Alternative B, except for the following:</p> <ul style="list-style-type: none"> Campfires allowed on mesa tops only; fire pan required. Available for commercial and/or private use of woodland products including on-site collection of dead wood for campfires (outside WSAs and canyons bottoms). <p>Pets and Stock Same as Alternative A with these exceptions:</p> <ul style="list-style-type: none"> If resources or the visitors' experiences are adversely impacted, pets and or stock animals may be limited or prohibited in canyons requiring permits. Limitations on stock use would be identical to Alternative A with the exception that stock day use would be limited to 1 party per day per trailhead in all canyons requiring permits (except Grand Gulch and McLoyd). Stock would be limited to 8 animals. 	<p>Cedar Mesa Cultural Special Recreation Management Area (375,739 acres) (Map 39), formerly the Grand Gulch Plateau SRMA, would be managed the same as Alternative C, except for the following:</p> <p>Pets and Stock Same as Alternative A with the exceptions:</p> <ul style="list-style-type: none"> If resources or the visitors' experiences are adversely impacted, pets and or stock animals may be limited or prohibited. People with pets would be required to conform to stipulations described in Alternative A. Stock limitations would be the same as Alternative A. 	<p>Cedar Mesa Cultural Special Recreation Management Area (375,739 acres) (Map 37), formerly the Grand Gulch Plateau SRMA, would be managed according to guidelines stipulated below:</p> <ul style="list-style-type: none"> Where livestock grazing is permitted mitigation activities may be implemented if cultural resources are determined to be at risk. Available for watershed, range, and wildlife improvements and vegetation treatments on lands without wilderness characteristics (acreage). On lands with wilderness characteristics, maintenance of existing improvements is allowed, no new improvements will be allowed. Mesa tops and canyons closed to campfire use. Unavailable for commercial and/or private use of woodland products including on-site collection of dead wood for campfires. Open to dispersed camping, except in areas where cultural resources are at risk. Permits will be Limited (25 people total) for day hikes and overnight camping to prevent cultural site damage. Lands without wilderness characteristics will be managed as VRM Class III and IV. Lands with wilderness characteristic will be managed as VRM Class I. <p>Pets and Stock Same as Alternative A with the following exceptions:</p> <ul style="list-style-type: none"> Pets would not be allowed in canyons requiring permits. (Grand Gulch and its tributaries), Fish Canyon, Owl Canyon, McLoyd Canyon, Slickhorn Canyon, Road Canyon, Lime Canyon, and North and South Mule Canyon). Recreational stock (horses, pack animals, etc.) would not be allowed in canyons requiring permits. 	<p>The Cedar Mesa SRMA (407,098 acres) (Map 40), formerly the Grand Gulch Plateau SRMA, would include three Recreation Management Zones focused on more intense recreational use; Grand Gulch National Historic District Recreation Management Zone (37,388), Comb Ridge Recreation Management Zone (30,752 acres) and the McLoyd-Moon House Recreation Management Zone (1,607 acres). More specific or restrictive management is outlined under these three management zones and presented below. Generally, this SRMA would be managed according to the following prescriptions:</p> <ul style="list-style-type: none"> Where livestock grazing is permitted mitigation activities may be implemented if cultural resources are determined to be at risk. Available for watershed, range, and wildlife improvements and vegetation treatments. Campfires allowed on mesa tops only; fire pan required. Available for private and/or commercial use of woodland products including on-site collection of dead wood for campfires. Access to available areas would be limited to designated roads and trails, dependent on cultural Class III surveys and occur outside WSAs and canyon bottoms. Traditional cultural use by Native Americans of woodland products is allowed as long as other resource values are not adversely affected. Open to dispersed camping except in areas where cultural resources are at risk. Managed as VRM Class II, III and IV outside of WSAs and Valley of the Gods ACEC. <p>Pets and Stock</p> <ul style="list-style-type: none"> If resources or the visitors' experiences are adversely impacted, pets and or stock animals may be limited or prohibited in canyons requiring permits. No unauthorized use of existing corrals. <p>Areas for Day Stock Use Only Bullet Canyon from Grand Gulch to Jailhouse Ruin. Two miles upstream Fish Canyon from the confluence with Owl Canyon, McLoyd Canyon to impassable pour-off, and Owl Canyon to Nevill's Arch.</p> <p>Pets No limit or fees for pets. All pets must be collared, leashed, and under human control at all times. No pets are allowed in Slickhorn Canyon or below Collins Canyon in Grand Gulch. Pets are not allowed in or at any alcoves, rock art sites, or ruins. Pets must not harass or harm wildlife. Pets must not harass visitors and other visitors' pets. Pets are not allowed to swim in springs, pot holes, or other natural water sources. Pet waste must be buried in a shallow hole away from trails, campsites, cultural sites, and natural water sources.</p> <p>Stock (horses, llamas, goats, etc.) All commercial and private stock use requires a permit. Within the Grand Gulch NHD 1 stock trip at any one time would be allowed in the area, including day use. Other Cedar Mesa canyons allow 1 overnight stock trip at any one time, and</p>

<p>There are no Recreation Management Zones within the Grand Gulch Plateau SRMA or the Cedar Mesa C-SRMA under Alternatives A–E. However, under the Cultural Resources section of this Chapter, the Grand Gulch NHD is identified as a Cultural Special Management Area and provides management prescriptions for recreation use to protect cultural resources. These management prescriptions have been carried forward from the range of alternatives and included in the Cedar Mesa SRMA Grand Gulch NHD Recreation Management Zone for the Proposed Plan.</p>					<p><u>Cedar Mesa SRMA Grand Gulch NHD Recreation Management Zone (RMZ)</u></p> <ul style="list-style-type: none"> • This area is a RMZ within the SRMA due to its high level of backcountry use and the potential to impact the high density world renowned cultural resources in this area. Restrictions and management prescriptions are intended to minimize conflict between this use and cultural resources. • Grand Gulch National Historic District is within a WSA; WSAs are managed under the IMP. • In addition to the management prescriptions described above for the Cedar Mesa SRMA, Grand Gulch National Historic District (37,388 acres) would be managed with these prescriptions: <ul style="list-style-type: none"> • Unavailable for geophysical activities. • Recommended for withdrawal from locatable mineral entry. • Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Campfires limited to mesa tops only (no campfires in the canyon). • Available for livestock use, except Grand Gulch Canyon and associated tributaries, below Kane Gulch fence to the confluence with the San Juan River (approximately 16,316 acres). • Closed to OHV use. • Designate trails and camping areas as necessary to protect cultural resources. • If cultural or natural resources or the visitors' experiences are impacted, pets and or stock animals may be limited or prohibited in canyons requiring permits. • Non-motorized habitat improvements, watershed improvements, vegetation treatments, including aerial seeding, hand reseeding, planting seedlings, and control of invasive non-native species allowed as long as they do not impact cultural resources based on a site-specific analysis, and are consistent with the IMP.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

	<ul style="list-style-type: none"> • Limitations on numbers of trips may be implemented if cultural resources are impacted.
<p>There are no Recreation Management Zones within the Grand Gulch Plateau SRMA or the Cedar Mesa C-SRMA under Alternatives A–E. However, under the Cultural Resources section of this Chapter, Comb Ridge is identified as a Cultural Special Management Area and provides management prescriptions for recreation use to protect cultural resources. These management prescriptions have been carried forward from the range of alternatives and included in the Cedar Mesa SRMA Comb Ridge Recreation Management Zone for the Proposed Plan.</p>	<p><u>Cedar Mesa SRMA Comb Ridge Recreation Management Zone</u></p> <p>This area is a RMZ within the SRMA due to easy vehicular accessibility, high level of visitation and popularity, and density of significant cultural ruins and rock art. Specific management is needed to resolve conflicts between recreation use and protection of cultural resources. The objective is to manage for heritage tourism and traditional cultural values in a regulated manner.</p> <p>The Cedar Mesa SRMA limitations described above for Mesa Top Day Use, Mesa Top Camping, In Canyon Private/Commercial Day Use, and In Canyon Permitted Overnight Camping do not apply to the Comb Ridge MZ.</p> <p>The following management prescriptions would apply in this RMZ:</p> <ul style="list-style-type: none"> • Designate as VRM Class II • Unavailable for geophysical exploration • ROW avoidance area • Closed to disposal of mineral materials • Oil and gas leasing subject to NSO • OHVs limited to designated routes • Campfires allowed at designated sites only • Private and commercial group size limited to 12 • Comb Wash campground would be developed • In camp areas without toilet, human waste must be packed out • Closed to dispersed camping • Camping limited to designated camp areas and campgrounds, with designated access routes and parking • A permit system would be established for day and overnight use if necessary to protect cultural resources • Trails from parking areas to cultural sites would be designated and signed • Parking for day use would be limited to designated areas • In the Butler Wash area, private group size would be limited to 8 and primitive camp sites would be designated <p>Also in Butler Wash, if necessary, it would be managed as part of the existing Cedar Mesa permits and regulation system, including regulations and permit fees. Groups would view a low impact video at Kane Gulch or Sand Island Ranger Stations when obtaining a permit.</p>
<p>There are no Recreation Management Zones within the Grand Gulch Plateau SRMA or the Cedar Mesa C-SRMA under Alternatives A–E. However, under the Cultural Resources section of this Chapter, the McLoyd Canyon–Moon House areas has been identified as a Cultural Special Management Area and provides management prescriptions for recreation use to protect cultural resources. These management prescriptions have been carried forward from the range of alternatives and included in the Cedar Mesa SRMA McLoyd-Moon House Recreation Management Zone for the Proposed Plan.</p>	<p><u>Cedar Mesa SRMA McLoyd Canyon–Moon House Recreation Management Zone</u></p> <p>McLoyd Canyon–Moon House (1,607 acres) is a RMZ within the SRMA due to its accessibility and the unique architecture of the Moon House ruin. From a scientific perspective, Moon House ruin is world renowned, unique to the region, and is a significant cultural treasure. Restrictions and management prescriptions are intended to minimize conflict between recreational use and cultural resources.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

	<p><u>The Cedar Mesa SRMA limitations described above for Mesa Top Day Use, Mesa Top Camping, In Canyon Private/Commercial Day Use, and In Canyon Permitted Overnight Camping do not apply to the McLoyd Canyon–Moon House RMZ.</u></p> <p>This RMZ occurs within the Fish Creek Canyon WSA; and is managed under the IMP. In addition to this management the following prescriptions would apply:</p> <ul style="list-style-type: none"> • Closed to OHV use. • Develop a cultural resource management plan (CRMP) for McLoyd Canyon–Moon House. • Public access limited via a permit system for day visits. • No more than 36 people allowed to visit Moon House per day. Limitations on visitation may change based on site monitoring of impacts of visitation. • One commercial group per day. The number of people is included in the day use number of 36. • Access to the interior corridor of Moon House ruin is limited to 4 people at any one time. • Visitors would not be allowed to enter the Moon Room and adjoining rooms within Moon House ruin. • Human waste must be packed out. • Camping limited only to the designated primitive camp and park area west of the Snow Flat Road. Camping prohibited outside of this primitive camp area. • Hiking to Moon House site is limited to the designated trail. Hiking to other sites in the RMZ may also be limited to designated trails if determined necessary. • RMZ is closed to pack animals and pets. • Campfires not allowed. • Unavailable for private and/or commercial use of woodland products, including on-site collection of dead wood for campfires. • McLoyd Canyon is closed to overnight use from the head of the canyon to UTM: 607100E, 4143495N. • Utah State Section Township 39S Range 19E, Section 2, is proposed for acquisition. • Develop a site stewardship program to monitor site and possibly develop guided tours.
<p>Dark Canyon SRMA</p>	
<p>GOALS AND OBJECTIVES</p> <p>Provide outstanding recreational opportunities and visitor experiences, while protecting natural and cultural resource values through integrated management between the BLM, USFS and NPS.</p> <p>Provide a primitive, roadless, and undeveloped recreational experience in an essentially unmodified natural environment. Continue to provide a scenic backcountry experience of expansive views from within one of the deepest canyon systems in the region.</p> <p>By the year 2012, manage this SRMA to provide opportunities for visitors to realize personal development and growth, enhanced lifestyle increased local tourism revenue and maintenance of distinct recreation setting character, providing no fewer than 80% of responding visitors and impacted community residents at least a moderate realization of these benefits: (i.e., 3.0 on a probability scale where 1 = not at all, 2 = somewhat, 3 = moderate, 4 = total realization).</p>	

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
Create and allocate an interagency permit and fee system for these canyons as necessary to preserve resources and the visitor experience.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES					
The existing Canyon Basins SRMA would be separated into three new SRMAs: the Dark Canyon SRMA, the Indian Creek SRMA and the Beef Basin SRMA. Management prescriptions for the Dark Canyon SRMA are described below by alternative. The Dark Canyon SRMA would include canyon rims and bottoms for Dark Canyon, Gypsum Canyon, Bowdie Canyon, Lean To Canyon, Palmer Canyon, Lost Canyon, Black Steer Canyon, Young's Canyon, and Fable Valley Canyon. Trailheads and associated parking/camping areas are included within the SRMA boundaries where the canyons are specified as the SRMA. The Dark Canyon WSA overlays the SRMA and would be managed according to the IMP. The SRMA would be unavailable for livestock grazing in the canyons and available to livestock grazing on mesa tops. An Interagency Management Plan would be written in coordination with the contiguous NPS and USFS agencies.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Note: In the current RMP, this area is part of the Canyon Basin's SRMA. The Canyon Basin (214,390) SRMA (Map 36) would include both the proposed Dark Canyon SRMA and the proposed Indian Creek SRMA, and would be managed according to the following stipulations:</p> <ul style="list-style-type: none"> • No group size limit • Commercial permits required • No private permits required • No group limits • No permit fees • No interagency permitting • Little ranger presence • Fires permitted • Dogs permitted • Open dispersed camping permitted • Vehicle use • Closed to OHV use 	<p>Dark Canyon (30,820 acres) (Map 37) would be managed as a SRMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Group size limit would be limited to 10 people for private groups, 12 people for commercial groups. • Implementation of an allocated permit and fee system. • One commercial trip allowed per week. • Fifteen total private users per day. This number could be altered depending upon future visitor impacts. • Camping in designated sites only. • Campfires limited to mesa tops. • Human waste must be packed out. • Unavailable for private and/or commercial collection of woodland products, including on-site collection of dead wood for campfires. • No pets would be allowed. • Closed to OHV use 	<p>Dark Canyon (30,820 acres) (Map 38) would be managed as a SRMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Group size would be limited to 15 people for private and commercial groups. • Three commercial trips would be allowed per week. • Twenty total private users allowed per day. This number may be altered, depending upon future visitor impacts. • If and where necessary, camping would be restricted to designated sites only. • Campfires would be allowed on mesa tops (fire pan required); cook stoves only in canyons. • Unavailable for private and/or commercial collection of woodland products, except for the on-site collection of dead wood for campfires on mesa tops. • If human waste becomes a problem, carrying out waste may be implemented in canyon. • Pets would be allowed on leash and under physical control. • Closed to OHV use 	<p>Dark Canyon (30,820 acres) (Map 39) would be managed as a SRMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Group size limited to 15 people for private and commercial. • Seven commercial trips would be allowed per week. • Dispersed camping would be allowed in canyon and on mesa top. • Campfires would be allowed on mesa tops and in canyons (fire pan required). • Unavailable for private and/or commercial collection of woodland product use, except for on-site collection of dead wood for campfires. • Pets would be allowed on leash and under physical control. • OHV use limited to designated routes 	<p>Dark Canyon (30,820 acres) (Map 37) would be managed as a SRMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Group size limit would be limited to 10 people for private groups, 12 people for commercial groups. • An allocated permit and fee system would be implemented. • One commercial trip would be allowed per week. • Fifteen total private users would be allowed per day. This number could be altered depending upon future visitor impacts. • Camping would be allowed in designated sites only. • Campfires would be limited to mesa tops. • Human waste must be packed out. • Unavailable for private and/or commercial collection of woodland products including on-site collection of dead wood for campfires. • No pets would be allowed. • Closed to OHV use 	<p>Dark Canyon (30,820 acres) (Map 40) would be managed as a SRMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Group size would be limited to 18 people for private and commercial. • Three commercial trips would be allowed per week. • Up to twenty total private users allowed per day. This number may be altered depending upon future visitor impacts. • If and where necessary, camping would be restricted to designated sites only. • Campfires would be allowed on mesa tops) cook stoves only in canyons. • Unavailable for private and/or commercial collection of woodland product use, except for the on-site collection of dead wood for campfires on mesa tops. • If human waste becomes a problem, carrying out waste may be implemented in canyon. • Pets would be allowed on leash and under physical control. • Closed to OHV use.
Indian Creek SRMA					
GOALS AND OBJECTIVES					
Provide outstanding recreational opportunities and visitor experiences while protecting natural and cultural resource values through integrated management between the BLM, NPS, State of Utah, and the Nature Conservancy. Provide for premier rock climbing experiences, outstanding OHV opportunities, scenic vistas, cultural site interpretation at Newspaper Rock, destination camping areas, and a gateway to Canyonlands National Park. By the year 2012, manage this SRMA to provide opportunities for visitors to realize personal development and growth, enhanced lifestyle increased local tourism revenue and maintenance of distinct recreation setting character, providing no fewer than 80% of responding visitors and impacted community residents at least a moderate realization of these benefits: (i.e., 3.0 on a probability scale where 1 = not at all, 2 = somewhat, 3 = moderate, 4 = total realization).					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES					
The existing Canyon Basins SRMA would be separated into three new SRMAs: the Indian Creek SRMA, the Dark Canyon SRMA, and the Beef Basin SRMA. Management prescriptions for the Indian Creek SRMA are described below by alternative. Indian Creek (89,271 acres) would be managed as an SRMA. Indian Creek SRMA includes all of the Indian Creek and Bridger Jack Mesa WSAs and Shay Canyon, Lavender Mesa and Indian Creek ACECs. WSAs are managed under the IMP and ACECs would be managed in accordance with management prescriptions					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>outlined in this plan. Indian Creek SRMA boundary would match the boundary for the Indian Creek Corridor Plan and EA UT-090-00-47 (BLM 2005). Management of the Indian Creek Corridor would be in conformance with the decisions outlined in the Indian Creek Corridor Plan, which includes the following guidelines:</p> <ul style="list-style-type: none"> • Camping would be prohibited in the Indian Creek riparian corridor from Newspaper Rock to approximately 1 mile downstream of the Dugout Ranch. • Camp sites would be removed from the Newspaper Rock area and rehabilitated. • A picnic area would be constructed adjacent to the Newspaper Rock parking area. • Camping along the Bridger Jack Mesa Bench would be limited to designated sites. • A new campground called Shay Mountain Vista Campground would be constructed. • The area would be unavailable for private and/or commercial use of woodland products, including on-site collection of dead wood for campfires. Campers must bring in their own wood for campfires. • Campfires would be restricted to fire rings where fire rings are available. In dispersed camping areas, where fire rings are not available, fires would be subject to "Leave No Trace" standards. No campfires would be allowed in the Lavender Mesa ACEC. • Rock-climbing routes in conflict with cultural sites would be closed. • Camping fees would be charged if deemed necessary to provide needed facilities. • Parking areas would be developed. • Additional camping stipulations and regulations could be implemented if monitoring data shows this is necessary. • If new climbing routes are established, the BLM may designate a footpath to access the base of the climb to protect wildlife/raptors. 					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Canyon Basins SRMA (214,390 acres) (Map 36) Dispersed camping would be allowed in Indian Creek Corridor. The Canyon Basins SRMA would include: the Indian Creek SRMA, the Dark Canyon SRMA, and the Beef Basin SRMA (proposed in Alternatives B & E and the Proposed Plan)</p>	<p>Indian Creek SRMA (89,271 acres) (Map 37) Dispersed camping would not be allowed in the Indian Creek Corridor. Camping would only be allowed in designated sites. Within Shay Canyon portion of this SRMA, the ACEC prescriptions require that hiking be limited to designated trails, except within the side canyons, closed to all camping and campfires are not allowed.</p>	<p>Indian Creek SRMA (89,271 acres) (Map 38) Dispersed camping would be allowed in the Indian Creek Corridor, except within the following designated dispersed camping zones that have been established: Bridger Jack Mesa, Indian Creek Falls, and Creek Pasture. Camping within these zones is limited to designated sites. Within Shay Canyon portion of this SRMA, the ACEC prescriptions require that hiking be limited to designated trails, except within the side canyons, closed to all camping and campfires are not allowed.</p>	<p>Same as Alternative C (Map 39).</p>	<p>Same as Alternative B (Map 37). Within Shay Canyon portion of this SRMA, the ACEC prescriptions require that hiking be limited to designated trails, except within the side canyons, closed to all camping and campfires are not allowed.</p>	<p>Indian Creek SRMA (89,271 acres) (Map 40) Dispersed camping would be allowed in the Indian Creek Corridor, except within the established designated camping zones: Bridger Jack Mesa, Indian Creek Falls, and Creek Pasture. Camping within these zones is limited to designated sites. Where dispersed vehicle camping is allowed, it would only be allowed in previously disturbed areas within 150 feet of designated routes. Within Shay Canyon portion of this SRMA, the ACEC prescriptions require that hiking be limited to designated trails, except within the side canyons, closed to all camping and campfires are not allowed.</p>
White Canyon SRMA					
GOALS AND OBJECTIVES					
<p>Provide outstanding recreational opportunities and visitor experiences, while protecting natural and cultural resource values through integrated management between the BLM and NPS (including the Glen Canyon National Recreation Area and Natural Bridges National Monument).</p> <p>Provide a spectacular canyoneering recreational experience in a popular, world renowned and easily accessible slot canyon; including, backcountry hiking and backpacking, remote camping, cultural site visitation and exploration.</p> <p>By the year 2012, manage this SRMA to provide opportunities for visitors to realize personal development and growth, enhanced lifestyle increased local tourism revenue and maintenance of distinct recreation setting character, providing no fewer than 80% of responding visitors and impacted community residents at least a moderate realization of these benefits: (i.e., 3.0 on a probability scale where 1 = not at all, 2 = somewhat, 3 = moderate, 4 = total realization).</p>					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>Trailheads and associated parking/camping areas are included within the SRMA boundaries where the canyons are specified as the SRMA. The White Canyon SRMA is defined as from rim to rim. Canyons excluded from woodland product use including on-site collection of dead wood for campfire. The Cheesebox Canyon WSA overlays a portion of the White Canyon SRMA; this area would be managed in accordance with the IMP.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>This area was not identified as an SRMA in the 1991 San Juan Resource Area RMP, as amended. These lands are managed</p>	<p>White Canyon (2,828 acres) (Map 37) would be managed as a SRMA with the following prescriptions: • A backcountry allocated permit</p>	<p>White Canyon (2,828 acres) (Map 38) would be managed as a SRMA with the same management prescriptions as Alternative B,</p>	<p>White Canyon (2,828 acres) (Map 39) would be managed as a SRMA with the following prescriptions: • No permit system would be</p>	<p>Same as Alternative B, except for: • VRM Class I • OHV use closed</p>	<p>White Canyon (2,828 acres) (Map 40) would be managed as a SRMA with the same management prescriptions as Alternative B, except for the following: • If human waste becomes a problem, carrying out waste may</p>

<p>according to the 1991 San Juan RMP prescriptions. Designated as VRM Class I OHV use limited to designated routes Unavailable or NSO to oil and gas leasing.</p>	<p>system would be established as necessary to protect resources.</p> <ul style="list-style-type: none"> • Fire pans would be required for mesa tops. • Campfires would not be allowed. • Human waste must be packed out. • Designated as VRM Class I and II • OHV use closed and limited to designated routes • Unavailable and CSU to oil and gas leasing. 	<p>except for the following:</p> <ul style="list-style-type: none"> • If human waste becomes a problem, carrying out waste may be implemented in the canyon. • Cook stoves would only be allowed in canyons. • Campfires would not be allowed in the canyons. • Designated as VRM Class I and II • OHV use closed and limited to designated routes • Unavailable and CSU to oil and gas leasing. 	<p>required.</p> <ul style="list-style-type: none"> • If human waste becomes a problem, carrying out waste may become implemented in the canyon. • Campfires would be allowed on mesa tops and canyons (fire pan required). • Designated as VRM Class I and III • OHV use limited to designated routes • Unavailable and CSU to oil and gas leasing. 	<ul style="list-style-type: none"> • Unavailable to oil and gas leasing. 	<p>be implemented in the canyon.</p> <ul style="list-style-type: none"> • Cook stoves would only be allowed in canyons. • Campfires would not be allowed in the canyons. • Designated as VRM Class I and II. • OHV use closed and limited to designated routes • Unavailable and CSU to oil and gas leasing.
Tank Bench CSMA			Tank Bench SRMA		
<p>There is no Tank Bench SRMA under Alternatives A–E in the Draft RMP EIS. However, under the Cultural Resources section of this Chapter, the Tank Bench Cultural Special Management Area is identified and outlines management prescriptions for recreation use to protect cultural resources. These management prescriptions have been carried forward from the range of alternatives and included in the White Canyon SRMA for the Proposed Plan.</p>			<p>GOALS AND OBJECTIVES</p> <p>Provide outstanding recreational opportunities and visitor experiences while protecting natural and cultural resource values.</p> <p>Tank Bench SRMA provides easy access to a spectacular complex of cultural sites. Provide a safe, natural, well-designed accessible recreational experience for all visitors to enjoy the world renowned cultural resources and scenic values. Use visitor information and interpretation as a primary tool to protect sensitive resources, discourage vandalism, and encourage visitor appreciation of public lands.</p> <p>The BLM would complete a joint recreation/cultural resources management plan (CRMP) for this area based on the RMP.</p>		
			<p>Tank Bench (2,646 acres) (Map 40) would be managed as a SRMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Dispersed hiking allowed; not limited to designated trails. • Area would remain open to domestic pets and pack animals but use may be limited if damage is occurring to cultural resources. • Commercial group size limited to 12 people. • Closed to OHV use. • Livestock use would continue but it may be limited if cultural resources are impacted. • Available for range, wildlife habitat, watershed improvements, vegetation treatments, and other surface-disturbing land treatments if consistent with management plan objectives. • Campfires allowed. • Closed to private and/or commercial use of woodland products (including on-site collection of dead wood for campfires) with the exception of traditional Native American cultural uses, as long as they do not adversely impact other resource values. • Open to disposal of mineral materials and geophysical work. • Available for oil and gas leasing, subject to standard lease terms. • Manage as VRM Class III and IV. 		

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Beef Basin CSMA	Beef Basin SRMA
<p>There is no Beef Basin SRMA under Alternatives A–E in the Draft RMP EIS. However, under the Cultural Resources section of this Chapter, the Beef Basin Cultural Special Management Area is identified and outlines management prescriptions for recreation use to protect cultural resources. These management prescriptions have been carried forward from the range of alternatives and included in the Beef Basin SRMA for the Proposed Plan.</p>	<p>GOALS AND OBJECTIVES</p> <p>Provide outstanding recreational opportunities and visitor experiences while protecting natural and cultural resource values.</p> <p>Provides a popular, remote, backcountry driving experience with primitive camping and cultural site exploration opportunities. Management focus for the SRMA would be heritage tourism, traditional cultural values, and scientific research of prehistoric cultural landscapes.</p> <p>Provide a semiprimitive recreational experience for visitors to enjoy the world renowned cultural resources and scenic values. Use visitor information and interpretation as a primary tool to protect sensitive resources, discourage vandalism, and encourage visitor appreciation of public lands.</p> <p>The BLM would work with USFS and NPS to develop Interagency Recreation Commercial permits.</p> <p>The BLM would complete a joint recreation/cultural resources management plan (CRMP) for the area based on the RMP.</p>
	<p>Beef Basin (20,302 acres) would be managed as a SRMA with the following prescriptions:</p> <ul style="list-style-type: none"> • Available for private and/or commercial use of woodland products (including on-site collection of dead wood for campfires). • Open to disposal of mineral materials under special conditions. • Available for oil and gas leasing subject to timing limitations. • Livestock use would continue but may be limited if cultural resources are impacted. • Available for range, wildlife habitat, watershed improvements, vegetation treatments and other surface-disturbing land treatments if consistent with management plan objectives. • OHV use limited to designated routes. • A car campground would be developed in Ruin Park for primitive camping. • Primitive car camping areas would be designated in Middle Park, House Park, and along Beef Basin Loop Road, as well as other areas as necessary to control impacts to cultural resources. • Until primitive camping areas are designated in this area, dispersed vehicle camping would be allowed in previously disturbed areas within 150 feet of designated routes. • Campfires allowed and would be restricted to fire rings where fire rings are available. In dispersed camping areas, where fire rings are not available, fires would be subject to "Leave No Trace" standards. • Dispersed campsites that impact archaeological sites would be closed. • Cultural site visitation limited to designated trails. • Groups larger than 20 people total would be required to camp in designated areas. Human waste must be packed out. • Manage as VRM Class III

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Extensive Recreation Management Areas (ERMAs)					
<p>GOALS AND OBJECTIVES</p> <p>An ERMA is defined as an administrative unit where recreation management is only one of several management objectives, and where limited commitment of resources is required to provide extensive and unstructured types of recreation activities. Management associated with ERMAs is restricted to custodial actions only.</p> <p>ERMA lands would be managed to provide an undeveloped setting where visitors can disperse and recreate in a generally unregulated manner, as long as the use is consistent with other resource values.</p> <p>The objective of an ERMA is to provide dispersed recreational opportunities consistent with other resource objectives.</p>					
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>Manage all lands within the PA, not within an SRMA (either initially or through subsequent action as described above) as the Monticello Extensive Recreation Management Area</p> <p>Any portions of an ERMA subject to other management prescriptions (i.e., ACEC, WSA, etc.) would be managed according to those prescriptions.</p> <p>Monitor ERMA to determine if more intensive recreational management is required to protect resource values and preserve the recreational experience.</p> <p>Encourage "Leave No Trace" and "Tread Lightly" principles throughout the ERMA.</p> <p>ERMA lands may be designated as SRMAs in the future based on intensity of use and would be analyzed through the plan amendment process.</p> <p>Minimal facilities may be constructed in the ERMA as needed to insure visitor health and safety, reduce user conflict, and protect resources.</p>					
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p>Mesa Top Camping (other than Cedar Mesa):</p> <ul style="list-style-type: none"> • Limit the Bears Ears Road to designated camping only from the intersection of Highway 275 to the USFS boundary. • Limit the Deer Flat Road to designated camping only from the first 4 miles from Highway 275. • Coordinate with Glen Canyon National Recreation Area on building a campground at Muley Point or pursuing a land exchange for Muley Point in order to develop a campground. 					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Not specified.	Dispersed vehicle camping would be allowed only in previously disturbed areas off of designated routes. If use is such that undue environmental impacts are taking place, the BLM would close and rehabilitate damaged areas.	Dispersed vehicle camping would be allowed within 150 feet of the centerline of designated route on each side. If use is such that undue environmental impacts are taking place, the BLM would close and rehabilitate damaged areas. Dispersed camping would be encouraged in previously disturbed areas.	Dispersed vehicle camping would be allowed 300 feet of the centerline of the road on each side. If use is such that undue environmental impacts are taking place, the BLM would close and rehabilitate damaged areas. Dispersed camping would be encouraged in previously disturbed areas.	Dispersed vehicle camping would be allowed only in previously disturbed areas off of designated routes, except in non-WSA lands with wilderness characteristics since the routes would be closed. If use is such that undue environmental impacts are taking place, the BLM would close and rehabilitate damaged areas.	Within the ERMA Dispersed vehicle camping would be allowed only in previously disturbed areas within 150 feet of designated routes (on each side of a centerline). If use is such that undue environmental impacts are taking place, BLM would close and rehabilitate damaged areas. This use would not include areas within WSAs (389,444 acres) or non-WSA areas with wilderness characteristics (88,871 acres), WSR corridors, ACECs, or T&E/special status species habitats. Where monitoring identifies resource impacts, future implementation level plans could consider designation of specific camp sites.
General Policy for Issuance and Management of Special Recreation Permits (SRPs) in SRMAs and ERMAs					
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>There would be no competitive mechanized or motorized events in WSAs in accordance with IMP.</p> <p>Under all alternatives, SRPs would be issued as a discretionary action as a means to help meet management objectives, control visitor use, protect recreational and natural resources, and provide for the health and safety of visitors. All SRPs would contain standard stipulations appropriate for the type of activity and may include additional stipulations (see Appendix E: Recreation) necessary to protect lands or resources, reduce user conflicts, or minimize health and safety concerns.</p>					
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p>SRPs would be used to manage different types of recreation associated with commercial uses, competitive events, organized groups, vending, and special areas. These recreation uses can include, for example, large group events, river guide services, and commercial recreation activities.</p> <p>The BLM would follow the 43 CFR 2930, October 1, 2004, the National Guidelines on Cost Recovery (Federal Register, Volume 67, October 1, 2002), and the Utah Special Recreation Permit Cost Recovery Policy (Utah IM 2004-036).</p> <p>In accordance with the BLM's Priorities for Recreation and Visitor Services Work Plan (May 2003, as amended), commercial SRPs would also be issued as a mechanism to provide a fair return for the commercial use of public lands.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Commercial use of any kind requires a permit.	<p>Criteria for requiring an SRP</p> <ul style="list-style-type: none"> • Any commercial use. • Day use organized group or event of more than 25 people in ERMA. 	<p>Criteria for requiring an SRP</p> <ul style="list-style-type: none"> • Any commercial use. • Non-mechanized/non-stock day use organized group or event of more than 50 people in ERMA. 	<p>Criteria for requiring an SRP</p> <ul style="list-style-type: none"> • Any commercial use. • Non-mechanized/non-stock day use organized group or event of more than 75 people in ERMA. 	<p>Criteria for requiring an SRP</p> <ul style="list-style-type: none"> • Any commercial use. • Day use organized group or event of more than 25 people in ERMA. 	<p>Criteria for requiring an SRP</p> <ul style="list-style-type: none"> • Any commercial use. • Non-mechanized/non-stock day use organized group or event of more than 50 people in ERMA. • Non-mechanized/non-stock overnight with group or event of

	<p>(rutting), unless it can be shown that the animals are not present in a specific project location or the activity can be conducted so the animals are not adversely impacted.</p> <ul style="list-style-type: none"> No commercial motorized or mechanized events or tours in crucial antelope habitat restrictions April 15–June 30. No commercial motorized or mechanized events or tours in crucial deer and elk winter range November 1–May 15. Group size for commercial motorized events/tours limited to 2 groups of 12 vehicles per route per day. Special OHV events limited to 350 total vehicles and approved OHV event routes. Balloon Festival limited to 35 balloons with their associated support vehicles. Commercial hiking tours in Comb Wash and Butler Wash limited to 10 individuals. A permit system would be established for commercial day and overnight use. Commercial camping limited to designated areas. Commercial hiking to cultural sites limited to designated trails and human waste must be packed out. Ropes and other climbing aides not allowed to access cultural sites. Commercial guides using dogs to hunt/pursue mountain lion and black bears would not operate in areas where dogs are prohibited (Map 72). No commercial motorized or mechanized use in Cedar Mesa ACEC. 	<p>the activity can be conducted so the animals are not adversely impacted.</p> <ul style="list-style-type: none"> No commercial motorized or mechanized events or tours allowed in crucial antelope habitat restrictions May 1–June 15. No commercial motorized or mechanized events or tours allowed in crucial deer and elk winter range November 15–April 15. Special OHV events limited to 350 total vehicles and approved OHV event routes. 	<p>in a specific project location or the activity can be conducted so the animals are not adversely impacted.</p> <ul style="list-style-type: none"> No commercial motorized or mechanized events or tours allowed in crucial antelope habitat restrictions May 15–June 15. No commercial motorized or mechanized events or tours allowed in crucial deer and elk winter range December 15–March 31. Group size for commercial motorized events/tours limited to 2 groups of 25 vehicles per route per day. Special OHV events limited to 350 total vehicles and approved OHV event routes. Balloon Festival limited to 35 balloons with their associated support vehicles. 	<p>crucial bighorn sheep lambing and rutting areas from April 1 to July 15 (lambing) and from October 15–December 31 (rutting), unless it can be shown that the animals are not present in a specific project location or the activity can be conducted so the animals are not adversely impacted.</p> <ul style="list-style-type: none"> No commercial motorized or mechanized events or tours in crucial antelope habitat restrictions April 15–June 30. No commercial motorized or mechanized events or tours in crucial deer and elk winter range November 1–May 15. Group size for commercial motorized events/tours limited to 2 groups of 12 vehicles per route per day. Special OHV events limited to 350 total vehicles and approved OHV event routes. Balloon Festival limited to 35 balloons with their associated support vehicles. Commercial hiking tours in Comb Wash and Butler Wash limited to 10 individuals. A permit system would be established for commercial day and overnight use. Commercial camping limited to designated areas. Commercial hiking to cultural sites limited to designated trails, and human waste must be packed out. Ropes and other climbing aides not allowed to access cultural sites. Commercial guides using dogs to hunt/pursue mountain lion and black bears would not operate in areas where dogs are prohibited. No commercial motorized or mechanized use in Cedar Mesa ACEC. 	<p>present in a specific project location or the activity can be conducted so the animals are not adversely impacted.</p> <ul style="list-style-type: none"> No commercial motorized or mechanized events or tours allowed in crucial antelope habitat restrictions May 1–June 15. No commercial motorized or mechanized events or tours allowed in crucial deer and elk winter range November 15–April 15. Special OHV events limited to 350 total vehicles and approved OHV event routes. Group size for commercial motorized events/tours limited to 2 groups of 12 vehicles per route per day. Balloon Festival limited to 35 balloons with their associated support vehicles. Commercial hiking tours in Comb Wash and Butler Wash limited to 12 and 8 individuals (respectively). A permit system would be established for commercial day and overnight use. Commercial camping limited to designated areas. Commercial hiking to cultural sites limited to designated trails and human waste must be packed out. Ropes and other climbing aides not allowed to access cultural sites. Commercial guides using dogs to hunt/pursue mountain lion and black bears (Map 72) would not operate in areas where dogs are prohibited. No commercial motorized or mechanized cross country use in Cedar Mesa SRMA.
Competitive Events					
<p>MANAGEMENT COMMON TO ALL ALTERNATIVES Motorized/mechanized competitive events would be authorized consistent with OHV designations.</p>					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Motorized and mechanized competitive events would not be permitted in WSAs.					
RIPARIAN RESOURCES					
GOALS AND OBJECTIVES					
<p>Manage riparian resources for desired future conditions, ensuring ecological diversity, stability, and sustainability, including the desired mix of vegetation types, structural stages, and landscape/riparian/watershed function and provide for native and special status plant, fish, and wildlife habitats.</p> <p>Manage riparian areas for properly functioning condition (PFC) and ensure stream channel morphology and functions are appropriate to the local soil type, climate, and landform.</p> <p>Avoid or minimize the destruction, loss or degradation of riparian, wetland and associated floodplains, and preserve and enhance natural and beneficial values.</p> <p>Public lands would be managed in accordance with laws, executive orders, and regulations on floodplain and wetland areas to reduce resource loss from floods and erosion.</p> <p>The BLM would take appropriate actions to maintain water quality in streams within Monticello PA to meet state and federal water quality standards, including designated beneficial uses and anti-degradation requirements.</p>					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>Oil and gas leasing would be NSO in riparian areas.</p> <p>The BLM would follow Utah's Standards for Rangeland Health and Guidelines for Grazing and Recreation Management (BLM 1997) to achieve riparian PFC.</p> <p>No new surface-disturbing activities would be allowed within active floodplains or within 100 meters of riparian areas unless it can be shown that: a) there are no practical alternatives or, b) all long-term impacts can be fully mitigated or, c) the activity will benefit and enhance the riparian area.</p> <p>BLM guidelines would be followed as appropriate for managing riparian areas (See Technical Reference 1737-6: Riparian Area Management as amended) and Utah Riparian Management Policy.</p> <p>All floodplains and riparian/aquatic areas would be managed in accordance with Executive Orders 11988 and 11990, Sections 303 and 404 of the Clean Water Act, the Endangered Species Act, the BLM Riparian Area Management Policy, and the Utah guidelines for implementing BLM riparian area management policy.</p> <p>Floodplains and riparian/aquatic areas would be:</p> <ul style="list-style-type: none"> • Subject to fire suppression to protect riparian habitat. • Excluded from private and/or commercial use of woodland products, except for Native American traditional purposes as determined on site-specific basis; limited on-site collection of dead wood for campfires would be allowed as per Woodlands section. • Available for habitat, range, and watershed improvements and vegetation treatments described in 1991 Vegetation EIS (as amended). • Excluded from surface disturbance by mechanized or motorized equipment (except as allowed above) and from structural development (unless there is no practical alternative or the development would enhance riparian/aquatic values). <p>Unnecessary multiple social foot trails in riparian/floodplain areas would be minimized. Social foot trails in Road Canyon, Fish Creek, and Mule Canyon would be closed to protect riparian resources.</p> <p>The BLM would follow/implement the Southwest Willow Flycatcher Recovery Plan as appropriate.</p> <p>Monitoring and management strategies and restrictions would be developed as necessary to meet or maintain PFC.</p> <p>Cottonwood and willow harvest would be allowed for Native American ceremonial uses only, through a permit system. Restrictions on this harvest would be implemented as necessary to achieve or maintain PFC.</p> <p>No camping would be allowed within 200 feet of isolated springs or water sources.</p> <p>Pipeline Crossings</p> <p>Pipeline crossings of perennial, intermittent, and ephemeral stream channels should be constructed to withstand 100-year floods to prevent breakage and subsequent accidental contamination of runoff during high-flow events. Surface crossings must be constructed high enough to remain above stream flows at each crossing, and subsurface crossings must be buried deep enough to remain undisturbed by scour throughout passage of the peak flow. Hydraulic analysis would be completed in the design phase by the project proponent to eliminate potential environmental degradation associated with pipeline breaks at stream crossings to avoid repeated maintenance of such crossings. Specific recommendations regarding surface and subsurface crossings are found in Guidance for Pipeline Crossings (see Appendix F).</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>BLM would act to avoid degradation of stream banks or aquatic habitats and loss of riparian vegetation.</p> <p>Special conditions found in the 1991 San Juan RMP (BLM 1991a, page 98) for floodplains and riparian/aquatic areas would be implemented.</p>	<p>Close Harts Canyon from private land to Yancy's Fence to OHV and mechanized use. Close routes in other selected riparian areas considered Functioning at Risk if site-specific analysis determines that OHV use is contributing to riparian degradation.</p> <p>Restrict Harts Canyon, Shay Canyon ACEC, and Indian Creek from Kelly Ranch vicinity to Forest Service to livestock trailing only, not</p>	<p>Same as Alternative B.</p>	<p>Same as Alternative A.</p>	<p>Same as Alternative B, except non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, as unavailable for OHV use, as ROW exclusion areas, as unavailable for disposal of mineral materials, as unavailable for private and commercial woodland harvest, as VRM Class I, and as proposed for withdrawal from mineral entry.</p>	<p>Note: Close Harts Canyon from private land (Seeps) to Yancy's Fence (T30S, R22E, Section 8) to OHV and mechanized use⁵.</p> <p>Close routes in other selected riparian areas considered Functioning at Risk if site-specific analysis determines that OHV use is contributing to riparian degradation.</p> <p>Restrict Harts Canyon, Shay Canyon ACEC and Indian Creek from Kelly Ranch vicinity to Forest Service to livestock trailing only, not grazing. Moki Canyon and Lake Canyon would be restricted to trailing only, except in the spring and fall for up to 1 to 2 weeks to gather livestock prior to moving to and from these areas.</p> <p>Develop seasonal restrictions, closures, and/or forage utilization</p>

⁵ This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

	<p>grazing. Moki Canyon and Lake Canyon would be restricted to trailing only, except in the spring and fall for up to 1 to 2 weeks to gather livestock prior to moving to and from these areas.</p> <p>Develop seasonal restrictions, closures, and/or forage utilization limits on grazing in riparian areas considered Functioning at Risk.</p> <p>Temporarily close riparian areas considered Functioning at Risk to dispersed motorized camping until PFC is restored.</p>				<p>limits on grazing in riparian areas considered Functioning at Risk.</p> <p>Temporarily close riparian areas considered Functioning at Risk to dispersed motorized camping until PFC is restored.</p>
SOIL AND WATER RESOURCES					
GOALS AND OBJECTIVES					
<p>Manage soils and water resources to maintain watershed health, thereby insuring ecological diversity and sustainability.</p> <p>Provide for favorable conditions of water flow (quality, quantity, and timing), and maintain stable and efficient stream channels as required and provide for fish and wildlife habitat, recreation, and livestock.</p>					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>Manage all floodplains and riparian/wetlands in accordance with Executive Orders 11988 and 11990, Sections 303 and 404 of the Clean Water Act, and the Endangered Species Act.</p> <p>Maintain satisfactory watershed conditions as indicated by maintenance of riparian PFC and Standards for Rangeland Health and Guidelines for Grazing Management (BLM 1991a) and Guidelines for Grazing and Standards for Public Health and Guidelines for Recreation Management for BLM Lands in Utah (Appendix E).</p> <p>Manage public lands consistent with the Colorado River Salinity Control Act.</p> <p>Comply with Utah's state water quality standards.</p> <p>Collaborate with San Juan County, the State of Utah, tribal governments, and local municipalities on management of municipal watersheds to meet local needs.</p> <p>Maintain or improve soil quality and long-term soil productivity through the implementation of Standards for Rangeland Health and Guidelines for Grazing Management (BLM 1997) and other soil protection measures.</p> <p>Manage uses to minimize and mitigate damage to soils.</p> <p>Maintain and/or restore overall watershed health and reduce erosion, stream sedimentation, and salinization of water.</p> <p>Watershed Health</p> <p>Modify the BMPs and vegetation management as appropriate to meet water quality standards and maintain watershed function (Montezuma Creek, Indian Creek [the USFS boundary to Newspaper Rock], Johnson Creek [and tributaries from confluence with Recapture Creek to headwaters], and Recapture Reservoir).</p> <p>Assess watershed function using Utah's Standards for Rangeland Health, riparian PFC, and state water quality standards.</p> <p>Where Utah's Standards for Rangeland Health are not met due to the impairment of biological soil crusts, apply guidelines from Biological Soil Crusts: Ecology and Management (BLM 2001b, as revised), if consistent with the management decisions of this plan.</p> <p>Reduce tamarisk where appropriate using allowable vegetation treatments (refer to vegetation section for treatment acreages).</p> <p>Sensitive Soils</p> <p>Any proposed activities that would be located in sensitive soils (e.g., hydric, saline, gypsiferous, or highly erodible soils, (Maps 41–47) would incorporate BMPs and other mitigation measures to minimize soil erosion and maintain soil stability. Site-specific mitigation measures and other additional mitigation measures required to protect soil resources and maintain soil productivity, would be determined in site-specific NEPA analysis.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Protect and manage soil resources to maintain or increase soil productivity as needed.</p>	<p>If surface-disturbing activities cannot be avoided on slopes between 21% and 40%, an erosion control plan would be required. The plan must be approved by the BLM prior to construction and maintenance and include the following:</p> <ul style="list-style-type: none"> • An erosion control strategy • The BLM accepted and/or approved survey and design 	<p>If surface-disturbing activities cannot be avoided on slopes between 21% and 40%, an erosion control plan would be required. The plan must be approved by the BLM prior to construction and maintenance and include the following:</p> <ul style="list-style-type: none"> • An erosion control strategy • The BLM accepted and/or approved survey and design <p>For slopes greater than 40%, no surface disturbance would be allowed unless it is determined that it</p>	<p>If surface-disturbing activities cannot be avoided on slopes greater than 40%, a plan would be required. An erosion control plan would be required.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

		would cause undue or unnecessary degradation to pursue other placement alternatives. An erosion control plan would be required.			
SPECIAL DESIGNATIONS—AREAS OF CRITICAL ENVIRONMENTAL CONCERN					
GOALS AND OBJECTIVES FOR ALL ACECS					
Designate, modify, and manage areas as ACECs where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, other natural systems or processes, or to protect life and safety from natural hazards.					
ALKALI RIDGE ACEC—Relevance and Importance Value: Cultural Resources					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Alkali Ridge ACEC (39,202 acres) (Map 50) : Would be designated as a Cultural ACEC. It contains a National Historic Landmark (2,340 acres) and would be managed with the following management prescriptions:</p> <ul style="list-style-type: none"> Where riparian areas overlap this ACEC, the special conditions for floodplain and riparian/aquatic areas would take precedence. Requirements of appropriate regulations would be met. All cultural properties eligible for the NRHP, would be surrounded by an avoidance area sufficient to allow permanent protection. If cultural resources or their avoidance areas cannot be avoided, appropriate mitigation would be applied, ranging from limited testing to extensive excavation. In any given situation, mitigation would be designed to fit the specific circumstances and reviewed by the SHPO and the Advisory Council on Historic Preservation. Available for mineral leasing (Category 1). Available for geophysical work. Available for the disposal of mineral materials. Available for locatable mineral entry with an approved plan of operations. Retained in public ownership and not classified, segregated, or withdrawn from entry. Available for private and commercial use of woodland 	<p>Alkali Ridge would be designated as an ACEC (39,196 acres) (Map 51) and would be managed the same as Alternative A, except for the following changes in management prescriptions:</p> <ul style="list-style-type: none"> Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. Watershed improvements allowed. Livestock use may be restricted if cultural resources are being impacted. No surface-disturbing vegetation treatments. Any treatment must avoid cultural sites by sufficient margin as to have no impact. Managed as VRM Class IV. 	<p>Alkali Ridge would be designated as ACEC (39,196 acres) (Map 52) and would be the same as Alternative A, except for the following changes in management prescriptions:</p> <ul style="list-style-type: none"> Available for woodland harvest, limited to designated routes. Off-road travel would only be allowed in chained areas. If woodland product use is impacting cultural resources, woodland product use may be confined to specific areas within Alkali Ridge. Available for watershed improvements. Livestock may be restricted if cultural resources are being impacted. Vegetation treatments would avoid cultural sites wherever possible to prevent impacts. Access routes used for vegetation treatments would be reclaimed to prevent future use. Non-surface-disturbing treatments would be preferred. Managed as VRM Class IV. 	<p>Alkali Ridge would not be designated as an ACEC. The area would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> Available for woodland harvest, limited to designated routes. Available for watershed improvements. Livestock use would conform to Rangeland Health Standards. Vegetative treatments would avoid eligible cultural sites and NHL. Managed as VRM Class IV. Available for mineral leasing under standard stipulations Available for geophysical work. Available for the disposal of mineral materials. Available for locatable mineral entry with an approved plan of operations. Retained in public ownership and not classified, segregated or withdrawn from entry. Subject to conditional fire suppression. OHV use limited to designated roads and trails. Campfires allowed. Available for wildlife habitat improvement. Surface disturbance limited to what can be successfully established within 5 years after project completion. 	<p>Same as Alternative B.</p>	<p>Alkali Ridge would be designated as ACEC (39,196 acres) (Map 53) and would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> Where the BLM authorized officer determines that avoidance of direct and indirect impacts to historic properties is not feasible (e.g., avoidance may cause unacceptable damage to other public land resources or affect valid existing rights) and adverse effects may occur, the BLM would resolve those effects through development of appropriate mitigation measures and consultation under Section 106 of the National Historic Preservation Act as outlined in the regulations as 36 CFR 800. Additional measures such as fencing, camouflaging, sound muffling, etc. may be necessary to further avoid indirect and direct impacts caused by surface-disturbing activities. Management will emphasize maintaining the relevant and important cultural and historic values within the ACEC. When siting facilities, the primary objective will be avoidance of direct and indirect impacts to resources on, or eligible for listing on, the NRHP (historic properties). Avoidance may require that a facility be moved farther than allowed under standard lease terms and conditions. Siting may require coordination among the BLM, State Historic Preservation Officer, and Utah Division of Oil Gas and Mining to ensure consistency with all applicable well spacing requirements. All cultural properties eligible for the NRHP, would be surrounded by an avoidance area sufficient to allow permanent protection. In any given situation, mitigation would be designed to fit the specific circumstances and reviewed by the SHPO and if necessary, the Advisory Council on Historic Preservation. Available for geophysical exploration. Available for the disposal of mineral materials. Available for locatable mineral entry with an approved plan of operations. Retained in public ownership and not classified, segregated, or withdrawn from entry. Campfires allowed. Available for wildlife habitat improvement. A Cultural CRMP consistent with the goals and objectives of this RMP would be written for Alkali Ridge ACEC and would not require a plan amendment to RMP.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>products.</p> <ul style="list-style-type: none"> • Available for livestock use. • Available for land treatments or other range improvements. • Subject to conditional fire suppression. • OHV use limited to existing roads and trails. • Managed as VRM Class III. • Campfires allowed. • Available for wildlife habitat improvement. • Surface disturbance limited to what can be successfully established within 5 years after project completion. 					<ul style="list-style-type: none"> • Available for watershed improvements. • Available for private and/or commercial use of woodland harvest, of which access would be limited only to designated routes. If woodland product use is impacting cultural resources, woodland product use may be confined to specific areas within Alkali Ridge. • Livestock may be restricted if cultural resources are being impacted. • Managed as VRM Class III. • Available for mineral leasing under controlled surface use. • Available for vegetation treatments. Access routes used for vegetation treatments would be reclaimed to prevent future use. Non-surface-disturbing treatments would be preferred. • Appropriate management for wildland fire in accordance with the Moab District Fire Plan. • OHV use limited to designated roads and trails.
<p>In the Alkali Ridge National Historic Landmark (Contained within the Alkali Ridge ACEC) (2,340 acres) management would be the same as the Alkali Ridge ACEC above,, except that all cultural resources would be avoided by 100 feet.</p>	<p>In the Alkali Ridge National Historic Landmark (Contained within the Alkali Ridge ACEC) (2,146 acres), management would be:</p> <ul style="list-style-type: none"> • Available for oil and gas leasing subject to NSO. • All mechanized/motorized traffic limited to designated routes. • Campfires not allowed. • Unavailable for private and/or commercial use of woodland products including on-site collection of dead wood for campfires. • Available for watershed improvements. • Open to livestock use with restrictions if cultural resources become impacted. • No surface-disturbing vegetation treatments. Any treatment must avoid cultural sites by sufficient margin as to have no adverse impact. • Unavailable for geophysical work. • Unavailable for disposal of mineral materials. • Recommended for withdrawal from locatable mineral entry. • Surface disturbance allowed for emergency fire suppression. • Recreation use limited if cultural resources become impacted. • Climbing aids such as ropes not allowed for access into cultural 	<p>In the Alkali Ridge National Historic Landmark (Contained within the Alkali Ridge ACEC) (2,146 acres), management would be the same as for Alternative B, except for:</p> <ul style="list-style-type: none"> • Appropriate Management Response to fire. • Available for geophysical exploration that meets the definition of "casual use" as defined 43 CFR 3150. 	<p>In the Alkali Ridge National Historic Landmark (Contained within the Alkali Ridge ACEC) (2,146 acres), management would be the same as Alternative C.</p>	<p>In the Alkali Ridge National Historic Landmark (Contained within the Alkali Ridge ACEC) (2,146 acres), management would be the same as Alternative B.</p>	<p>In the Alkali Ridge National Historic Landmark (Contained within the Alkali Ridge ACEC) (2,146 acres), management would be:</p> <ul style="list-style-type: none"> • Available for oil and gas leasing subject to NSO. • All mechanized/motorized traffic limited to designated routes. • Campfires not allowed. • Unavailable for private and/or commercial use of woodland products including on-site collection of dead wood for campfires. • Available for watershed improvements. • Appropriate Management Response to fire in accordance with the Moab District Fire Plan. • Open to livestock use with restrictions if cultural resources become impacted. • No surface-disturbing vegetation treatments. Any treatment must avoid cultural sites by sufficient margin as to have no adverse impact. • Available for geophysical exploration that meets the definition of "casual use" as defined 43 CFR 3150.b) <i>Casual use</i> means activities that involve practices which do not ordinarily lead to any appreciable disturbance or damage to lands, resources and improvements. For example, activities which do not involve use of heavy equipment or explosives and which do not involve vehicular movement, except over established roads and trails are casual use. • Unavailable for disposal of mineral materials. • Recommended for withdrawal from locatable mineral entry. • Surface disturbance allowed for emergency fire suppression. • Recreation use limited if cultural resources become impacted. • Climbing aids such as ropes not allowed for access into cultural sites/ruins. • ROW avoidance area. • Managed as VRM Class III.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

sites/ruins.					
BRIDGER JACK MESA (Mesa Top Only) ACEC—Relevance and Importance Value: Near Relict Vegetation					
Bridger Jack Mesa ACEC lies entirely within a WSA and will be managed under the IMP, unless more restrictive management is prescribed. Management under the IMP will provide for the protection for near-relict vegetation.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Bridger Jack Mesa ACEC (6,260 acres) (Map 50), is designated as an ACEC for Range Management Program/Near-relict Vegetation, and would be managed with the following management prescriptions:</p> <ul style="list-style-type: none"> • Unavailable for mineral leasing • Available for geophysical exploration. • Unavailable for the disposal of mineral materials. • Available for locatable mineral entry with approved plan of operations, subject to stipulations precluding surface use of the mesa top, insofar as possible. • Retained in public ownership and not classified, segregated, or withdrawn from entry. • Excluded from livestock grazing, including grazing by saddle stock and pack animals allowed for access. • Excluded from land treatments or other improvements, except for test plots and facilities necessary for study of the near-relict plant communities. • Closed to OHV use. • Subject to conditional fire suppression. • Managed to limit recreation use if vegetation resources are being damaged. • Semiprimitive nonmotorized (SPNM) ROS class. • Excluded from private or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Excluded from wildlife habitat improvements. • Excluded from watershed control structures. • Surface disturbance limited to what can be successfully 	<p>Bridger Jack Mesa would be designated as ACEC (6,225 acres). (Map 51), The prescriptions are the same as Alternative A, except for the 35 acre boundary change.</p>	<p>Bridger Jack Mesa would not be managed as an ACEC. Bridger Jack Mesa WSA would be managed according to the IMP, except for the following:</p> <ul style="list-style-type: none"> • Unavailable for livestock grazing, including grazing by saddle stock and pack animals allowed for access. • Unavailable for private and/or commercial use of woodland products, except for the limited on-site collection of dead wood for campfires. 	<p>Bridger Jack Mesa would not be designated as an ACEC. The prescriptions are the same as Alternative C.</p>	<p>Bridger Jack Mesa would be designated as ACEC (6,225 acres) (Map 51). The prescriptions are the same as Alternative B.</p>	<p>Bridger Jack Mesa would not be managed as an ACEC. Bridger Jack Mesa WSA would be managed according to the IMP, except for the following:</p> <ul style="list-style-type: none"> • Unavailable for livestock grazing, including grazing by saddle stock and pack animals allowed for access. • Unavailable for private and/or commercial use of woodland products, including on-site collection of dead wood for campfires. • Campfires would be restricted to fire rings, where available. If not available, subject to "Leave No Trace" principles. • Bridger Jack Mesa area would be managed as part of the Indian Creek Special Recreation Management Area (SRMA) described in the Recreation section of this Chapter.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>established within 5 years after project completion.</p> <ul style="list-style-type: none"> Excluded from surface disturbance by mechanized or motorized equipment, except helicopter access for scientific study and heliportable equipment, insofar as legally possible. Excluded from improvements for wildlife habitat, watershed, or vegetative treatments. 					
BUTLER WASH NORTH ACEC—Relevance and Importance Value: Scenic					
Butler Wash North ACEC lies within the Butler Wash WSA and will be managed under the IMP, unless more restrictive management is prescribed. Management under the IMP will provide for the protection of scenic values.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Butler Wash ACEC (17,464 acres) (Map 50) is designated as an ACEC for scenic values and is managed with the following management prescriptions:</p> <ul style="list-style-type: none"> Managed under the special conditions developed for ROS-P class areas. Closed to mineral leasing. Closed to mineral leasing Available for geophysical work. Unavailable for disposal of mineral materials. Available for mineral entry with an approved plan of operations. Retained in public ownership and not classified, segregated, or withdrawn from entry. Excluded from private and commercial use of woodland products, except for limited on-site collection of dead wood for campfires. Available for livestock use. Closed to OHV use. Managed to limit recreation use if scenic values are being damaged. Managed as VRM Class I. 	<p>The Butler Wash North ACEC (17,365 acres) (Map 51) would be designated as a ACEC and would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> Managed as VRM Class I. Closed to mineral leasing. Closed to mineral leasing. Unavailable for disposal of mineral materials. Retained in public ownership and withdrawn from entry. Closed to private and/or commercial use of woodland products, except for limited on-site collection of dead wood. Available for livestock use but may be limited if cultural resources are being impacted. Managed to limit recreation use if scenic values are being damaged. The BLM would seek to acquire state in-holdings in this ACEC. Closed to OHV use. 	<p>The Butler Wash North area would not be designated as an ACEC, but would be managed under the IMP. Additional management prescriptions include:</p> <ul style="list-style-type: none"> Retained in public ownership. Unavailable for private and/or commercial use of woodland products, with the exception of the limited on-site collection of wood for campfires. Available for livestock use but may be limited if cultural resources are impacted. Closed to OHV use. Managed as VRM Class I 	<ul style="list-style-type: none"> Same as Alternative C, except for OHV use is limited to designated roads and trails (ways). 	<p>Same as Alternative B.</p>	<p>Butler Wash North area would not be designated as an ACEC but would be managed under the IMP. Management prescriptions include:</p> <ul style="list-style-type: none"> Retained in public ownership. Unavailable for private and/or commercial use of woodland products, with the exception of the limited on-site collection of dead wood for campfires. Available for livestock use but may be limited if cultural resources are impacted. Closed to OHV use. Managed as VRM Class I.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

CEDAR MESA ACEC—Relevance and Importance Values: Fish and Wildlife, Cultural and Scenic					
<p>Note: In the 1991 San Juan RMP, the Cedar Mesa ACEC was described as protecting values for Recreation/Visual (VRM) because these two programs were combined and managed under the Recreation program. Since that time, the two programs have been separated and are now managed under their own resource management program. Scenic is considered a relevant value under ACEC evaluation processes, however, Recreation is not. Therefore, any existing ACECs that are brought forward in this plan will not include Recreation as a value. Management for recreational values would be managed as an SRMA under the Recreation program.</p>					
<p>Portions of the Cedar Mesa ACEC lie within 4 WSAs (Maps 87–90): Mule Canyon, Grand Gulch ISA Complex Fish Creek Canyon, and Road Canyon. Where the ACEC overlies these WSAs, the ACEC would be managed under the IMP, unless more restrictive management is prescribed.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Cedar Mesa ACEC (295,336 acres) (Map 50) is designated as an ACEC for cultural and scenic values. Recreation/Primitive Area/Natural Area values would be maintained and would continue to be managed under the existing Grand Gulch Plateau Cultural and Recreation Management Plan and Recreation/Scenic programs with the following management prescriptions:</p> <ul style="list-style-type: none"> • Where riparian areas overlap Cedar Mesa ACEC, the special conditions for floodplains and riparian/aquatic areas would take precedence. • The ROS special conditions include both P and SPNM classes apply, and would be managed for these classes. ROS P-class areas would be managed as NSO. • If cultural resources or their avoidance areas cannot be avoided, appropriate mitigation would be applied, ranging from limited testing to extensive excavation. • In any given case, mitigation would be designed to fit the specific circumstances and reviewed by the SHPO and the Advisory Council on Historic Preservation. The Cedar Mesa Management Plan developed for the ACEC would guide site protection, data recovery, and all other necessary cultural management activities. • Revegetation for surface disturbance would be limited to what can be successfully established within 5 years after project completion. • Available for mineral leasing (Category 1), except within WSAs where it is closed. 	<p>Cedar Mesa ACEC (306,742 acres) (Map 51) would continue to be managed as a ACEC (same as Alternative A) with the following additional prescriptions:</p> <ul style="list-style-type: none"> • Available for livestock use with special conditions to protect at-risk cultural resources. • Available for watershed, range, habitat improvements and vegetation treatments. • Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Campfires limited to mesa tops, would be closed if there are impacts to cultural sites. • Closed to dispersed camping. • Designated parking areas adjacent to designated routes. • Limited number of recreation permits issued for day hikes and overnight camping as necessary to prevent cultural site damage from over-visitation. • Overnight campers must pack out their human waste. • Managed as VRM Class III (except for WSAs within the boundary of the ACEC which would be managed as VRM Class I). <p>Grand Gulch Special Emphasis Area</p> <ul style="list-style-type: none"> • Same as Alternative A. • Intersection of Cedar Mesa ACEC and the Scenic Highway Corridor ACEC <p>The Scenic Highway Corridor ACEC would not be designated under this alternative. Management would be in accordance with the Cedar Mesa ACEC.</p>	<p>Cedar Mesa area would not be designated as an ACEC. It would be managed as a Cultural Special Recreation Management (CSRMA) area (375,734 acres) described under the Recreation section in this Chapter. In addition, there would be two Cultural Special Management Areas (CSMAs) (McLloyd Canyon–Moon House and Grand Gulch NHD) with restrictive management for the protection of cultural resources, described under the Cultural Resource section of this Chapter. The WSAs (209,619 acres) would be managed according to the IMP.</p>	<p>Cedar Mesa area would not be designated as an ACEC, same as Alternative C.</p>	<p>Cedar Mesa area would be designated as an ACEC, It would be managed the same as Alternative B, except for non-WSA lands with wilderness characteristics (Map 33), which would be managed as unavailable for mineral leasing, closed to OHV use, ROW exclusion areas, closed to disposal of mineral materials, unavailable for private and commercial woodland harvest, VRM Class I, and proposed for withdrawal from mineral entry.</p>	<p>Cedar Mesa area would not be designated as an ACEC. The area would be managed as a Special Recreation Management Area (SRMA) (407,098 acres) described in the Recreation section of this Chapter. It would include three Recreation Management Zones (RMZs) (Grand Gulch NHD, McLloyd Canyon- Moon House and Comb Ridge) that emphasize management of recreation users for the protection of cultural resources.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<ul style="list-style-type: none"> ● Surface use limited by special conditions. ● Available for geophysical exploration. ● Available for disposal of mineral materials, except within WSAs where it is closed. ● Available for mineral entry with an approved plan of operations. ● Available for livestock use. ● Available for land treatments or other range improvements. ● Available for wildlife habitat improvements. ● Subject to conditional fire suppression with motorized suppression methods used only if necessary to protect life or property. ● Excluded from surface disturbance by mechanized or motorized equipment. ● OHV use limited to designated roads/trails. ● Available for private and commercial use of woodland products in designated areas with designated access, except that on-site collection of dead fuelwood for campfires would be allowed throughout the area. <p><u>Grand Gulch Special Emphasis Area</u></p> <p>Contained within the Cedar Mesa ACEC; would be managed as:</p> <ul style="list-style-type: none"> ● Closed to mineral leasing (Category 4). ● Not available for geophysical exploration. ● Unavailable for disposal of mineral materials. ● Retained in public ownership and classified as segregated from entry (a Secretarial withdrawal would be requested). ● Excluded from private and commercial use of woodland products, except for limited on-site collection of dead wood for campfires. ● Available for livestock use, except Grand Gulch itself, below Kane Gulch fence to the

<p>confluence with the San Juan River, 11,200 acres.</p> <ul style="list-style-type: none"> • Designated as closed to OHV use. • Managed to limit recreation use if cultural resources or scenic values are being damaged. • Managed as VRM Class I. • Intersection of Cedar Mesa ACEC and the Scenic Highway Corridor ACEC. <p>Where these two ACECs intersect along U-95 and U-261, that portion would be managed as:</p> <ul style="list-style-type: none"> • Available for mineral leasing subject to NSO. • Managed as VRM Class I. 					
<p align="center">DARK CANYON ACEC—Relevance and Importance Values: Scenic and Fish and Wildlife</p> <p>Note: In the 1991 San Juan RMP, the Dark Canyon ACEC was described as protecting values for Recreation/Visual (VRM) because these two programs were combined and managed under the Recreation program. Since that time, the two programs have been separated and are now managed under their own resource management program. Scenic is considered a relevant value under ACEC evaluation processes, however, Recreation is not. Therefore any existing ACECs that are brought forward in this plan will not include Recreation as a value. Management for recreational values would be handled under the Recreation program, specifically SRMAs.</p>					
<p>Dark Canyon ACEC lies entirely within the Dark Canyon WSA (Maps 87–90) and partially within the Dark Canyon SRMA (Maps 36–40). WSAs are managed under the IMP, unless more restrictive management is prescribed.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Dark Canyon ACEC (61,660 acres) (Map 50) would continue to be designated as an ACEC for Recreation/Natural Area and Visual/VRM values, and would be maintained and managed with the following management prescriptions:</p> <ul style="list-style-type: none"> • Unavailable for mineral leasing. • Unavailable for geophysical work. • Unavailable for disposal of mineral materials. • Retained in public ownership • Recommended for mineral withdrawal • Excluded from private and commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Unavailable for livestock use except in Fable Valley, where livestock trailing and emergency grazing (drought or severe winter) would be allowed. • Closed to OHV use. • Managed as VRM Class I with projects that meet these visual 	<p>Dark Canyon (61,660 acres) (Map 51) would be designated as a ACEC, and would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> • Unavailable for oil and gas leasing. • Unavailable for geophysical exploration. • Unavailable for disposal of mineral materials. • Retained in public ownership and recommended for withdrawal from mineral entry. • Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires on mesa tops. • Campfires limited to mesa top with fire pan (no campfires in canyons). • Human waste to be packed out. • Unavailable for livestock use except in Fable Valley, where livestock trailing and emergency grazing (severe winter) would be allowed. • Closed to OHV use. 	<p>Dark Canyon would not be managed as an ACEC.</p> <p>Dark Canyon WSA would be managed according to the IMP with the following additional restrictions:</p> <ul style="list-style-type: none"> • Campfires limited to mesa top with fire pan (no campfires allowed in canyon). • Excluded from private and/or commercial use of woodland products, except for on site collection of dead wood for fires on mesa tops. • Unavailable for livestock grazing except in Fable Valley, where livestock trailing and emergency grazing (severe winter) would be allowed. • Closed to OHV/mechanized use. • Managed to limit recreation use if wildlife habitat or scenic values are being damaged. • Subject to appropriate fire management response with habitat-disturbing suppression methods used only if necessary to protect life or property. • The Dark Canyon Wild and Scenic suitable river segment 	<p>Dark Canyon would not be managed as an ACEC. Same as Alternative C.</p>	<p>Dark Canyon (61,660 acres) (Map 51) would be designated as a ACEC, Same as Alternative B.</p>	<p>Dark Canyon would not be managed as an ACEC. Dark Canyon WSA would be managed according to the IMP and the Dark Canyon SRMA management prescriptions outlined in the Recreation section of this chapter. The WSA and SRMA would be closed to OHV use.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>standards allowed.</p> <ul style="list-style-type: none"> Managed to limit recreation use if cultural resources or scenic values are being damaged. Subject to conditional fire suppression, with motorized suppression methods used only if necessary to protect life or property. 	<ul style="list-style-type: none"> Managed as VRM Class I with projects that meet these visual standards allowed. Managed to limit recreation use if wildlife habitat or scenic values are being damaged. Subject to conditional fire suppression, with motorized suppression methods used only if necessary to protect life or property. Improvements conditionally allowed for wildlife habitat, watershed, and vegetative treatments that meet VRM Class I and IMP management. 	<p>would be recommended for mineral withdrawal.</p>			
HOVENWEEP ACEC—Relevance and Importance Values: Scenic, Habitat, and Cultural					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Hovenweep ACEC (1,798 acres) (Map 50). would continue to be managed as an ACEC for Cultural and Habitat Management values with two special emphasis zones. The following management prescriptions would apply:</p> <p>General Area Exclusive of Special Emphasis Zones</p> <ul style="list-style-type: none"> Where riparian areas overlap Hovenweep ACEC, the special conditions for floodplains and riparian/aquatic areas would take precedence. Within Hovenweep ACEC, cultural properties eligible for the NRHP would be avoided by 100 feet. Cultural properties eligible for the NRHP would be surrounded by an avoidance area sufficient to allow permanent protection. If cultural resources or their avoidance areas cannot be avoided, appropriate mitigation would be applied, ranging from limited testing to extensive excavation. In any given case, mitigation would be designed to fit the specific circumstances and reviewed by the SHPO and the Advisory Council on Historic Preservation. A Hovenweep National Monument Cooperative Management Strategy (1987) 	<p>Hovenweep would be designated as an ACEC (2,439 acres) (Map 51). and would be managed the same as Alternative A with the addition of 641 acres contiguous with the existing ACEC and east of Hovenweep National Monument</p> <p>The ACEC, exclusive of special emphasis zones, would be managed the same as the general area with the following changes to stipulations:</p> <ul style="list-style-type: none"> Cultural properties eligible for the NRHP would be avoided as necessary to provide permanent protection. This would be implemented on a case-by-case basis. No new routes designated in this ACEC. No surface-disturbing habitat, watershed, or vegetation treatments. Any treatment must avoid cultural sites by sufficient margin as to avoid adverse impact. Available for mineral leasing with standard stipulations. 	<p>Hovenweep would be designated as an ACEC (2,439 acres) (Map 52). and would be managed the same as Alternative A with the addition of 641 acres contiguous with the existing ACEC and east of Hovenweep National Monument</p> <p>The ACEC, exclusive of special emphasis zones, would be managed the same as the general area with the following changes to stipulations:</p> <ul style="list-style-type: none"> Available for watershed improvements and vegetative treatments as long as cultural sites are not impacted. Emphasis would be on non-surface-disturbing vegetation treatments. Available for mineral leasing with standard stipulations. 	<p>Hovenweep would not be designated as an ACEC. Management prescriptions for this area would be the same as the surrounding lands and include but are not limited to the following prescriptions:</p> <ul style="list-style-type: none"> Available for watershed improvements and vegetative treatments as long as cultural sites are not impacted. Emphasis would be on non-surface-disturbing vegetation treatments. Managed as VRM Class III and IV. Available for disposal of mineral materials. Available for mineral leasing with standard stipulations. 	<p>Hovenweep would be designated as an ACEC (2,439 acres) (Map 51). and would be managed the same as Alternative B.</p>	<p>Hovenweep would be designated as an ACEC (2,439 acres) (Map 53). with two special emphasis zones. The following management prescriptions would apply:</p> <p>General Area Exclusive of Special Emphasis Zones</p> <ul style="list-style-type: none"> Management will emphasize maintaining the relevant and important cultural and historic values. When siting facilities, the primary objective will be avoidance of direct and indirect impacts to resources on or eligible for listing on the NRHP (historic properties). Avoidance may require that a facility be moved farther than allowed under standard lease terms and conditions. Siting may require coordination among BLM, State Historic Preservation Officer, and Utah Division of Oil Gas and Mining to ensure consistency with all applicable well spacing requirements. Where the BLM authorized officer determines that avoidance of direct and indirect impacts to historic properties is not feasible (e.g., avoidance may cause unacceptable damage to other public land resources or affect valid existing rights) and adverse effects may occur, the BLM would resolve those effects through development of appropriate mitigation measures and consultation under Section 106 of the National Historic Preservation Act as outlined in the regulations as 36 CFR 800. Additional measures such as fencing, camouflaging, sound muffling, etc. may be necessary to further avoid indirect and direct impacts caused by surface-disturbing activities. Within Hovenweep ACEC, cultural properties eligible for the NRHP would be avoided by 100 feet. Cultural properties eligible for the NRHP would be surrounded by an avoidance area sufficient to allow permanent protection. In any given case, mitigation would be designed to fit the specific circumstances and reviewed by the SHPO, and if necessary, the Advisory Council on Historic Preservation. A Hovenweep National Monument Cooperative Management Strategy (1987) helps to guide site protection, data recovery,

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>helps to guide site protection, data recovery, and all other necessary cultural management activities.</p> <ul style="list-style-type: none"> • Available for mineral leasing (Category 2). • Available for geophysical exploration. • Unavailable for disposal of mineral materials. • Available for mineral entry with an approved plan of operation. • Available for livestock use. • Subject to conditional fire suppression. • OHV use limited to designated roads/trails. • Excluded from private or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Open for improvement in habitat, watershed and vegetation treatments. • Managed as VRM Class III. <p><u>Visual Emphasis Zone (880 acres)</u> Surrounds the west, south and east sides of Hovenweep National Monument and would be managed in accordance with the general prescriptions and with the following special prescriptions:</p> <ul style="list-style-type: none"> • NSO for mineral leasing. • Excluded from watershed and grazing (vegetative) treatment improvement. • Managed as VRM Class III. <p><u>Cajon Pond Emphasis Zone (Habitat)</u> Approximately 1 acre fenced exclusion area in the northern part of the ACEC. It would be managed in accordance with the general prescriptions and with the following special prescriptions:</p> <ul style="list-style-type: none"> • Mineral leasing would be in accordance with a controlled timing stipulation during the shorebird and waterfowl courtship and nesting season of March 1–June 30. • Excluded from livestock use. 					<p>and all other necessary cultural management activities.</p> <ul style="list-style-type: none"> • A Cultural CRMP consistent with the goals and objectives of this RMP would be written for Hovenweep ACEC, if necessary, and would not require a plan amendment to RMP • Available for mineral leasing subject to minor constraints (CSU). • Available for geophysical exploration. • Unavailable for disposal of mineral materials. • Appropriate management for wildland fire in accordance with the Moab District Fire Plan. • Available for mineral entry with an approved plan of operation. • OHV use limited to designated roads/trails. • Excluded from private or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Improvements for habitat, watershed and vegetation treatments could be considered. • Livestock use may be restricted if cultural resources are impacted. • Managed as VRM Class III. <p><u>Visual Emphasis Zone (880 acres)</u> Surrounds the west, south, and east sides of Hovenweep National Monument and would be managed in accordance with the general prescriptions and with the following special prescriptions:</p> <ul style="list-style-type: none"> • NSO for mineral leasing. • Excluded from watershed and grazing (vegetative) treatment improvement. • ROW avoidance area. • Managed as VRM Class II. • Livestock use may be restricted if cultural resources are impacted. <p><u>Cajon Pond Emphasis Zone (Habitat)</u> Approximately 1 acre fenced exclusion area in the northern part of the ACEC. It would be managed in accordance with the general prescriptions and with the following special prescriptions:</p> <ul style="list-style-type: none"> • Mineral leasing would also be in accordance with a controlled timing stipulation during the shorebird and waterfowl courtship and nesting season of March 1–June 30. • Excluded from livestock use.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

INDIAN CREEK ACEC—Relevance and Importance Value: Scenic					
Note: In the 1991 San Juan RMP, Indian Creek ACEC was described as protecting values for Recreation/Visual (VRM) because these two programs were combined and managed under the Recreation program. Since that time, the two programs have been separated and are now managed under their own resource management programs. Scenic is considered a relevant value under ACEC evaluation processes, however, recreation is not. Therefore any existing ACECs that are brought forward in this plan will not include recreation as a value. Management for recreational values would be handled under the recreation program, specifically SRMAs.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Indian Creek ACEC (8,510 acres) (Map 50) covers an area adjacent to Canyonlands National Park, falls within Canyon Basins SRMA. Portions of the Indian Creek ACEC lie within portions of the Indian Creek WSA, which would be managed under the IMP. The ACEC would be managed to maintain scenic quality with the following prescriptions:</p> <ul style="list-style-type: none"> • Almost all the ACEC would be in ROS P-class areas. • All vegetation must be with native species naturally occurring in the vicinity. • Available for mineral leasing with stipulations to prevent surface occupancy (Category 3) NSO; however, the are manager would grant an exception to the NSO stipulation in the event it is determined through and EA or EIS, is necessary, with the adoption and use of appropriate mitigation measures, that the project would meet visual quality standards for the area. • Available for geophysical exploration. • Unavailable for disposal of mineral materials. • Available for mineral entry with an approved plan of operations. • Retained in public ownership. • Excluded from private and commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Closed to OHV use. • Managed to limit recreation use if scenic values are being damaged. • Managed as VRM Class I. • Subject to conditional fire suppression, with motorized suppression methods used only 	<p>Indian Creek (8,510 acres) (Map 51) would be designated as a ACEC. It would be managed the same as Alternative A with the following changes:</p> <ul style="list-style-type: none"> • Recommended for withdrawal from mineral entry. • Campfires are restricted to fire rings where fire rings are available. • Excluded from on-site collection of dead wood for campfires. 	<p>Indian Creek (3,908 acres) (Map 52) would be designated as an ACEC. The WSA would be eliminated from within the boundary. Management would be the same as Alternative B, except OHV use would be limited to designated roads and trails.</p>	<p>Indian Creek would not be designated as an ACEC. Management prescriptions for this area would be the same as the surrounding lands. Recreational restrictions are described under the Indian Creek SRMA in this Chapter. Other management in this area would include, but is not limited to:</p> <ul style="list-style-type: none"> • OHV use limited to designated roads and trails. • Mineral leasing subject to standard stipulations and minor constraints. • Open to mineral material sales. • Managed as VRM Class III. 	<p>Indian Creek (8,510 acres) (Map 51) would be designated as a ACEC. Same as Alternative B, except for non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, as unavailable for OHV use, as ROW exclusion areas, as unavailable for disposal of mineral materials, as unavailable for private and commercial woodland harvest, as VRM Class I, and as proposed for withdrawal from mineral entry.</p>	<p>Indian Creek (3,908 acres) (Map 53) would be designated as a ACEC and would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> • Managed as VRM Class I. • Available for mineral leasing subject to No Surface Occupancy (NSO). • Unavailable for disposal of mineral materials. • Available for geophysical work if VRM Class I can be met. • Unavailable for private and/or commercial use of woodland products, except for limited on-site collection of dead wood for campfires. • Available for livestock use. • Closed to OHV use. • All revegetation must be with native species naturally occurring in the vicinity. • Managed to limit recreation use if scenic values are being damaged. • Retained in public ownership and recommended for withdrawal from mineral entry. • ROW avoidance area.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

LAVENDER MESA (Mesa Top Only) ACEC—Relevance and Importance Value: Relict Vegetation					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Lavender Mesa ACEC (Map 50). Grazing Management Program, Relict Vegetation, (649 acres): Would be maintained and would continue to be managed with the following management prescriptions:</p> <ul style="list-style-type: none"> • Managed to provide a baseline for rangeland studies through research and experiments and to allow for SPNM recreation. • Managed as ROS SPNM class. • Available for mineral leasing with an approved plan of operations, subject to stipulations precluding surface use of the mesa top insofar as possible (NSO). • Available for geophysical work. • Unavailable for disposal of mineral materials. • Available for mineral entry with an approved plan of operations, subject to stipulations precluding surface use of the mesa top insofar as possible. • Retained in public ownership and not classified, segregated, or withdrawn from entry. • Excluded from private or commercial use of woodland products, including limited on-site collection of dead wood for campfires. • Unavailable for livestock grazing, including grazing by saddle stock and pack animals allowed for access. • Excluded from land treatments or other improvements, except for test plots and facilities necessary for study of relict plant communities. • Excluded from wildlife habitat improvements. • Excluded from watershed control structures. • Subject to conditional fire suppression. • Closed to OHV use. 	<p>Lavender Mesa (649 acres) (Map 51) would continue to be designated as a ACEC, and would be managed with the same management prescriptions as the Alternative A, except for the following changes:</p> <ul style="list-style-type: none"> • Non-surface-disturbing vegetative treatment allowed to control invasive species and for rehabilitation of disturbed surfaces. • Managed as NSO for oil and gas leasing. • Available for locatable mineral entry with approved plan of operations (for the sides of the mesa, not the top), subject to stipulations protecting vegetation on the mesa top. • No campfires allowed. • Managed to limit recreation use if vegetation communities are being adversely impacted. • Helicopter access allowed for scientific study and heliportable equipment. • Managed as VRM Class II. 	<p>Lavender Mesa (649 acres) (Map 52) would continue to be designated as a ACEC and would be managed with the same management prescriptions as Alternative A, except for the following changes:</p> <ul style="list-style-type: none"> • Excluded from land treatments or other improvements, except for test plots and facilities necessary for study of the plant communities, and restoration/reclamation activities. • Managed as NSO for oil and gas leasing. • Available for locatable mineral entry with approved plan of operations, subject to stipulations protecting vegetation on the mesa top. • No campfires allowed. • Managed to limit recreation use if vegetation communities are being adversely impacted. • Geophysical exploration allowed if it does not adversely impact vegetation communities. • Managed as VRM Class II. • Helicopter access allowed for scientific study and heliportable equipment. 	<p>Lavender Mesa would not be designated as an ACEC and would be managed the same as the surrounding area.</p> <ul style="list-style-type: none"> • Mechanized/motorized travel limited to designated routes. However, it should be noted that the area is inaccessible to motorized travel or grazing. • Helicopter access allowed for scientific study and heliportable equipment. • Managed as VRM Class III. • Unavailable for private and/or commercial use of woodland products including limited on-site collection of dead wood for campfires. 	<p>Lavender Mesa would continue to be designated as an ACEC (Map 51). It would be managed the same as Alternative B except for non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, closed to OHV use, ROW exclusion areas, unavailable for disposal of mineral materials, unavailable for private and commercial woodland harvest, VRM Class I, and proposed for withdrawal from mineral entry.</p>	<p>Lavender Mesa (649 acres) (Map 53) would continue to be designated as an ACEC and would be managed with the same management prescriptions as Alternative A, except for the following changes:</p> <ul style="list-style-type: none"> • Excluded from land treatments or other improvements, except for test plots and facilities necessary for study of the plant communities, and restoration/reclamation activities. • Managed as NSO for oil and gas leasing. • Closed to disposal of mineral materials • Available for locatable mineral entry with approved plan of operations, subject to stipulations protecting vegetation on the mesa top. • No campfires allowed. • Managed to limit recreation use if vegetation communities are being adversely impacted. • Geophysical exploration allowed if it does not adversely impact vegetation communities. • Managed as VRM Class II. • Helicopter access allowed for scientific study and heliportable equipment. • ROW avoidance area. • Retained in public ownership. • Excluded from private or commercial use of woodland products, including limited on-site collection of dead wood for campfires. • Unavailable for livestock grazing, including grazing by saddle stock and pack animals allowed for access. • Excluded from wildlife habitat improvements. • Excluded from watershed control structures. • Appropriate management response to wildland fire in accordance with the Moab District Fire Plan. • Closed to OHV use.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<ul style="list-style-type: none"> Managed to limit recreation use if cultural resources or scenic values are being damaged. Excluded from surface disturbance by mechanized or motorized equipment, except helicopter access for scientific study and heliportable equipment, insofar as possible. 					
LOCKHART BASIN ACEC—Relevance and Importance Values: Scenic and Cultural					
Lockhart Basin ACEC overlays the Indian Creek WSA (6,870 acres). WSAs are managed under the IMP, unless more restrictive management is prescribed.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>There is not an existing ACEC for Lockhart Basin. A portion of the potential Lockhart Basin ACEC area includes the Indian Creek existing ACEC. Refer to the Indian Creek ACEC (Alternative A) for management prescriptions.</p>	<p>Lockhart Basin (47,783) (Map 51) acres would be designated as a ACEC and would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> Managed as VRM Class I. Available for mineral leasing subject to NSO. Exemptions may be granted on a case-by-case basis if site-specific NEPA determines that VRM Class I can be met. Surface-disturbing activities would be prohibited. Exemptions may be granted on a case-by-case basis if site-specific NEPA determines that VRM Class I can be met. Available for geophysical exploration if VRM Class I can be met. Unavailable for disposal of mineral materials. Retained in public ownership and recommended for withdrawal from mineral entry. Available for livestock use. Pursue acquisition of state in-holdings in this ACEC. Open for campfires. Unavailable for woodland product use except for limited on-site collection of dead wood for campfires. 	<p>Lockhart Basin would not be designated as an ACEC. It would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> Managed as VRM Class II and III. Available for mineral leasing subject to timing limitations and controlled surface use in Bighorn Sheep area, and Standard lease terms in remaining area. Retained in public ownership. Available for livestock use. Open for campfires. Unavailable for woodland product use except for limited on-site collection of dead wood for campfires. 	<p>Same as Alternative C.</p>	<p>Lockhart Basin (47,783) (Map 51) acres would be designated as a ACEC and would be managed the same as Alternative B except for the non-WSA lands with wilderness characteristics. These lands would be managed as unavailable for mineral leasing, closed for OHV use, ROW exclusion areas, unavailable for disposal of mineral materials, unavailable for private and commercial woodland harvest, VRM Class I, and proposed for withdrawal from mineral entry.</p>	<p>Lockhart Basin would not be designated as an ACEC. It would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> Available for mineral leasing subject to timing limitations and controlled surface use in Bighorn Sheep area, and Standard lease terms in remaining area. Retained in public ownership. Available for livestock use. Managed as VRM Class II and III. OHV use limited to designated roads and trails Open for campfires. Unavailable for woodland product use except for limited on-site collection of dead wood for campfires. Where the ACEC intersects with the Colorado River Segment 2, it would be managed as VRM Class II, NSO for mineral leasing. Where the ACEC intersects Colorado River Segment 3, it would be managed as VRM II, unavailable for mineral leasing, closed to OHV use, and recommended for withdrawal from locatable mineral entry.
SAN JUAN RIVER ACEC—Relevance and Importance Values: Scenic, Cultural, Fish and Wildlife, Natural Systems and Processes, and Geologic Features					
A Cultural Resources Management Plan would be written for the San Juan River.					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan

See Recreation section in this Chapter under Cedar Mesa SRMA.</p>	<p>Valley of the Gods (22,863 acres) (Map 53) would be designated as an ACEC and would be managed with the following prescriptions:</p> <ul style="list-style-type: none"> • Managed as VRM Class I. • Unavailable for mineral leasing. • Closed to the disposal of mineral materials. • Available for mineral entry with an approved plan of operations. • Available for vegetation treatments when consistent with VRM Class 1. • Unavailable for private and/or commercial use of woodland products. • The BLM would pursue acquisition of state in-holdings in this ACEC. • OHV use limited to designated roads and trails • ROW exclusion area. • No campfires allowed.
SPECIAL DESIGNATIONS—WILD AND SCENIC RIVERS					
<p>GOALS AND OBJECTIVES</p> <p>Review all eligible rivers to determine suitability for congressional designation into the National Wild and Scenic Rivers System (NWSRS). To the extent of the BLM's authority (limited to BLM lands within the river corridor), maintain and enhance the free-flowing character, preserve and enhance the ORVs, and allow no activities within the river corridor that would alter the tentative classification of those</p>					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

river segments determined suitable for congressional designation into the NWSRS until Congress acts on the designation.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>River segments found suitable and/or recommended for designation would be managed in accordance with the Wild and Scenic Rivers Act to protect the free-flowing nature of the river/segment, the tentative classification level, and to prevent impairment of the outstandingly remarkable values within 0.25 mile from high water mark on each side of the river not to exceed 320 acres per mile. On the San Juan River the area would be 0.25 mile from high water mark on the north side not to exceed 160 acres per mile. On the San Juan River, the BLM has jurisdiction on the lands north of the river; and the Navajo Nation has jurisdiction on the southern side of the river. The BLM would coordinate with the Navajo Nation in developing consistent management of the river.</p> <p>The White Canyon had a river segment found eligible in the 1991 San Juan Resource Management Plan. There were 30 miles from the Manti-La Sal National Forest boundary to the Glen Canyon National Recreation Area that were studied at that time. A new eligibility evaluation was conducted in 2004 (Appendix H, page 80), which determined this segment did not meet the eligibility criteria outlined in BLM policy due to a lack of intermittent or perennial flow. For this reason it was not carried forward for suitability study into this RMP revision.</p> <p>Management prescriptions for designated WSRs are listed in the BLM Manual 8351, WSRs—Policy and Program Direction for Identification, Evaluation, and Management (BLM 1993b) by tentative classification: wild, scenic, and recreational.</p> <p>The BLM would work with state, local, and tribal governments, and other federal agencies, in a state-wide study, to reach consensus regarding recommendations to Congress for the inclusion of rivers in the National Wild and Scenic Rivers System. Besides applying consistent criteria across agency jurisdictions, the joint study would avoid piecemealing of river segments in logical watershed units in the state. The study would evaluate, in detail, the possible benefits and effects of designation on the local and state economies, agricultural and industrial operations and interests, outdoor recreation, natural resources (including the outstandingly remarkable values for which the river was deemed suitable), water rights, water quality, water resource planning, and access to and across river corridors within, and upstream and downstream from the proposed segment(s). Actual designation of river segments would only occur through congressional action or as a result of Secretarial decision at the request of the governor in accordance with provisions of the Wild and Scenic Rivers Act (the Act). The BLM will work with the state, local, and tribal governments, and the agencies involved to coordinate its decision making on WSR issues and to achieve consistency wherever possible.</p> <p>The BLM recognizes that water resources on most river and stream segments within the State of Utah are already fully allocated. Before stream segments that have been recommended as suitable under this Proposed Plan are recommended to Congress for designation, the BLM will continue to work with affected local, state, federal, and tribal partners to identify in-stream flows necessary to meet critical resource needs, including values related to the subject segment(s). Such quantifications would be included in any recommendation for designation. The BLM would then seek to jointly promote innovative strategies, community-based planning, and voluntary agreements with water users, under State law, to address those needs.</p> <p>Should designations occur on any river segment as a result of Secretarial or congressional action, existing rights, privileges, and contracts would be protected. Under Section 12 of the Act, termination of such rights, privileges, and contracts may happen only with the consent of the affected non-federal party. A determination by the BLM of eligibility and suitability for the inclusion of rivers on public lands to the National Wild and Scenic Rivers System does not create new water rights for the BLM. Federal reserved water rights for new components of the Wild and Scenic Rivers System are established at the discretion of Congress. If water is reserved by Congress when a river component is added to the National Wild and Scenic Rivers System, it would come from water that is not appropriated at the time of designation, in the amount necessary to protect features, which led to the river's inclusion into the system. The BLM's intent would be to leave existing water rights undisturbed and to recognize the lawful rights of private, municipal, and state entities to manage water resources under state law to meet the needs of the community. Federal law, including Section 13 of the Act and the McCarren Amendment (43 United States Code [U.S.C.] 666), recognizes state jurisdiction over water allocation in designated streams. Thus, it is the BLM's position that existing water rights, including flows apportioned to the State of Utah interstate agreements and compacts, including the Upper Colorado River Compact, and developments of such rights would not be affected by designation or the creation of the possible federal reserved water right. The BLM would seek to work with upstream and downstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values for which affected river segments were designated.</p>					
Colorado River Segment 1 (Maps 54 and 55)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Recommendation: This segment of the Colorado River was not evaluated for eligibility in the 1991 San Juan RMP (see Segments 2 and 3 below).	Recommendation: Suitable—Recreational Size: 352 acres Location: Northern-most Monticello PA boundary, east side of Colorado River (1 mile north of Potash land) south of private land. Total river miles: 6.2 BLM river miles: 2.2 This segment would be managed with the following prescriptions: <ul style="list-style-type: none"> VRM Class III. Available for oil and gas leasing subject to standard lease terms, except for floodplains and riparian corridors, which would be managed as available for oil and gas leasing subject to NSO. 	Recommendation: Not suitable.	Recommendation: Not suitable.	Same as Alternative B.	Recommendation: Not suitable.
Colorado River Segment 2 (Maps 54 and 55)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Recommendation: The Colorado River was determined eligible in the 1991 San Juan RMP; suitability was not evaluated at that time. Location: From state lands near	Recommendation: Suitable—Scenic. Size: 880 acres Location: State lands near river	Recommendation: Suitable—Scenic. Size: 880 acres Location: State lands near river mile	Recommendation: Not suitable. SPECIAL DESIGNATIONS—WILDERNESS STUDY AREAS (MAP 56)					
GOALS AND OBJECTIVES					
Manage FLPMA Section 603 WSAs in a manner that does not impair their suitability for congressional designation into the National Wilderness Preservation System.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>All lands studied during the FLPMA Section 603 wilderness review will continue to be managed in a manner that does not impair their suitability for congressional designation in accordance with FLPMA Section 603(c), subject to valid existing rights. Actions may be allowed on a case-by-case basis only where the BLM determines that such action would not impair the lands' wilderness suitability.</p> <p>The Monticello FO manages 13 WSAs [389,444 acres as identified in the Statewide Report to Congress and (386,027 GIS acres)]: Mancos Mesa (51,440 acres), Grand Gulch ISA Complex (105,520), Road Canyon (52,420), Fish Creek Canyon (46,440), Mule Canyon (5,990), Cheesebox Canyon (15,410), Dark Canyon ISA Complex (68,030), Butler Wash (24,190), Bridger Jack Mesa (5,290), Indian Creek (6,870), South Needles (160), Squaw and Papoose Canyons (6,676), Cross Canyon (1,008).</p> <p>Only Congress can release a WSA from wilderness consideration. Should any WSA, in part or in whole, be released from wilderness consideration, examine proposals in the released area on a case-by-case basis for consistency with the goals and objectives of the RMP decisions. Actions inconsistent with RMP goals and objectives would be deferred until completion of requisite plan amendments. Because the management direction of the released land would continue in accordance with the goals and objectives established in the RMP, no separate analysis is required in this LUP to address resource impacts if any WSAs are released by Congress.</p> <p>Within the area managed by the Monticello FO, there is an area totaling 2,155 acres contiguous to the Butler Wash WSA that was studied as a boundary variation during the wilderness review mandated by Congress in FLPMA Sections 603(a) and (b). These lands were addressed in the Utah BLM Statewide Wilderness Final EIS (November, 1990) and were recommended for congressional wilderness designation in the Utah Statewide Wilderness Study Reports (October, 1991). This recommendation was forwarded by the President of the United States to Congress in 1993. The lands would continue to be managed in a manner that does not impair their suitability for congressional designation in accordance with FLPMA Section 603(c). Subject to valid existing rights, the only case-by-case actions that would be considered would be those where it is determined that wilderness suitability would not be adversely impacted. Lands within this administratively endorsed area are not under IMP management. This RMP would make decisions to protect those lands until Congress acts.</p> <p>WSAs are managed in a manner consistent with the Interim Management Policy for Lands Under Wilderness Review (IMP) (BLM 1995). The only decisions related to WSA management that would be made in this plan are VRM, OHV designations, and conditional use of specific ways. Any ways established for use through this planning effort must have been previously identified during the initial wilderness inventory.</p> <p>WSA management prescriptions, as stipulated in the IMP, would take precedence over other management prescriptions throughout this RMP, unless the other management prescriptions are more restrictive.</p> <p>Only Congress can release a WSA from wilderness consideration. Actions inconsistent with RMP goals and objectives would be deferred until completion of requisite plan amendments. Should any WSA, in part or in whole, be released by Congress from wilderness consideration, proposals in the released area would be examined on a case-by-case basis for consistency with the goals and objectives of the RMP decisions. Because the management direction of the released land would continue in accordance with the goals and objectives established in the RMP, there is no separate analysis required in this LUP to address resource impacts if any WSAs are released.</p> <p>Where vehicle ways would remain available for motorized use within WSAs, such use could continue on a conditional basis. Use of the existing routes in the WSAs ("ways" when located within WSAs—see Glossary) could continue as long as the use of these ways does not impair wilderness suitability, as provided by the IMP. If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or noncompliance are found through monitoring efforts to impair the area's suitability for wilderness designation, the BLM would take further action to limit use of the ways or close them. The continued use of these ways, therefore, is based on user compliance and nonimpairment of wilderness values.</p>					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Manage to a VRM Class I objectives. Manage OHV use as (Map 58): <ul style="list-style-type: none"> • Mancos Mesa: closed • Dark Canyon ISA: closed • Grand Gulch ISA: closed and limited • Fish Creek Canyon: closed and limited • Road Canyon: closed and limited • Mule Canyon: limited • Cheesebox Canyon: limited 	Designated as VRM Class I. Landmarks (structures) along the Old Spanish National Historic Trail would be identified for historic integrity and interpreted only if the action would not impact the values at the site. Segments of the Hole in the Rock Trail would be identified and evaluated for historic integrity and appropriate use. Landmark (structures, features) would be interpreted only if the action would not impact the values of the site/landmark

⁶ This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

SPECIAL STATUS SPECIES					
GOALS AND OBJECTIVES					
<p>Maintain, protect, and enhance habitats (including but not limited to designated critical habitat) of federally listed Threatened, Endangered, or Candidate plant or animal species to actively promote recovery to the point that they no longer need protection or prevent the listing of species under the Endangered Species Act.</p> <p>Maintain, protect, and enhance habitats of the BLM State Director's sensitive plant and animal species to ensure that actions requiring authorization or approval by the BLM are consistent with the conservation needs of special status species and do not contribute to the need to list any special status species, either under provisions of ESA or other provisions in the BLM Manual 6840 (BLM 2001c).</p> <p>Develop and implement conservation measures to minimize long-term habitat fragmentation through avoidance and site-specific reclamation to provide habitat quality and quantity adequate to fulfill the life history requirements and to support a natural diversity of species.</p>					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>Threatened and Endangered species conservation measures and lease notices would be used for all surface-disturbing activities to comply with the Endangered Species Act, and the BLM Manual 6840, Special Status Species Management. See Appendix A, B and Q. These species include: California Condor, Mexican Spotted Owl, Southwestern Willow Flycatcher, Yellow-Billed Cuckoo, Bonytail, Colorado Pikeminnow, Humpback Chub, Razorback Sucker, Black-Footed Ferret and Navajo Sedge.</p> <ul style="list-style-type: none"> • Appendix A includes stipulations applicable to Oil and Gas leasing and other surface-disturbing activities regarding the 10 listed and candidate species (Maps 91, 92, and 93). • Appendix B provides wildland fire protection/management measures for special status species. • Appendix Q provides the finalized conservation measures and BMPs for T&E species resulting from programmatic Section 7 Consultation with USFWS (2007). <p>Oil and gas and mineral development BMPs would be used, including minimizing roadbed width and footprint size, co-location of facilities, etc., to minimize habitat fragmentation.</p> <p>The BLM would continue to use the lease notices that the BLM and USFWS agreed to (Appendix A).</p> <p>Inventories and monitoring studies would be conducted in order to determine special status plant and animal species locations, potential habitat, population dynamics, and existing and potential threats.</p> <p>The protection of species and potential and/or occupied habitat for special status species would be considered and implemented prior to any authorization or action by the BLM that could alter or disturb such habitat.</p> <p>No management action would be permitted on BLM lands that would jeopardize the continued existence of species that are listed, proposed for listing, or candidates for listing under the Endangered Species Act.</p> <p>The BLM would follow and implement the guidelines and management recommendations presented in species recovery or conservation plans (as updated), or alternative management strategies developed in consultation with USFWS.</p> <p>The BLM would support and implement where possible current and future sensitive species Conservation Agreements, including the Colorado River Cutthroat Trout Conservation Agreement and Strategy and Conservation Agreement for the roundtail chub, bluehead sucker, and flannelmouth sucker.</p> <p>The BLM would continue to work with USFWS and others to ensure that plans and agreements are updated to reflect the latest scientific data.</p> <p>The BLM would work cooperatively with USFWS and UDWR to obtain and/or maintain maps of current occupied and potential habitats for special status species.</p> <p>The BLM would work with the UDWR to implement the Utah Wildlife Action Plan (UDWR 2005) to coordinate management decisions that would conserve native species and prevent the need for additional listings.</p> <p>Translocations of population augmentation of special status species would be allowed to aid in conservation and recovery efforts. Necessary habitat manipulations and monitoring would be implemented to ensure successful translocation efforts.</p> <p>The BLM would implement and follow the guidelines in the Colorado River Fishes Recovery and Implementation Program (as updated).</p> <p>Implement the BLM's Guidance for the Management of Sagebrush Plant Communities for Sage-grouse Conservation and the BLM's National Sage-grouse Habitat Conservation Strategy.</p> <p>Consistent with RMP goals and objectives, the following plans or best available scientific information would be utilized and applied, as needed, as part of implementing the BLM's National Sage-grouse Habitat Conservation Strategy: Strategic Management Plan for Sage-grouse (BLM 2004d), WAFWA Conservation Assessment of Greater Sage-grouse and Sagebrush Habitats (Connelly et al. 2004), and the Gunnison Sage-grouse Rangewide Conservation Plan (2005, as revised).</p> <p>The Gunnison Sage-grouse Conservation Easement (320 acres) would be managed as outlined in the easement to protect and enhance habitat for sage-grouse. The easement is in perpetuity, even as ownership changes.</p> <p>Retain potential/occupied special status species habitat in federal ownership. Acquisition of potential/occupied special status species habitat would be high priority. These acquired/exchanged lands would be managed according to BLM land management prescriptions for special status species.</p> <p>Any nonessential routes developed for a project located in special status species habitat would be closed and rehabilitated when the project is complete.</p> <p>Raptor management would be guided by the use of Best Management Practices for Raptors and Their Associated Habitats in Utah (Appendix M), utilizing seasonal and spatial buffers, as well as mitigation, to maintain and enhance raptor nesting and foraging habitat, while allowing other resource uses.</p> <p>The BLM would implement and follow the Finalized Conservation Measures and Best Management Practices for Bald Eagle and Threatened and Endangered Species of Utah from the Land Use Plan Programmatic BAs and Section 7 Consultation (2007, as revised) (Appendix Q).</p> <p>Gunnison Prairie dogs</p> <p>Site-specific analysis would be conducted to determine presence or absence of prairie-dog colonies within potential/occupied habitat (Map 72). Colonies would be protected from surface-disturbing activities with the use of Best Management Practices, standard oil and gas lease terms (60 days/200 meters rule), Conditions of Approval, and Standard Operating Procedures. Site-specific analysis would mitigate impacts from other BLM-authorized activities.</p>

A permit system would be implemented. 	<ul style="list-style-type: none"> OHV use would be limited to the designated route to the end of the State Section (T37S R20E Section 16) year-round (approximately 3.8 miles). The canyon would be closed year-round from west boundary of the state section to the end of the route at the National Forest boundary. Group size limited to 12 vehicles and two groups per day. A permit system would be implemented. 	<ul style="list-style-type: none"> OHV use limited to the designated route year-round. Commercial motorized use limited to 12 vehicles and up to 2 trips a day. Private OHV group size would be unlimited. 	<ul style="list-style-type: none"> Area would be closed to OHV use. Group size (for nonmechanized, nonmotorized) would be limited to 10 individuals and two groups per day. A permit system would be implemented. 	<p>Note: <i>In Arch Canyon, OHV use would be limited to the designated route up to the national forest boundary, a total of 8 miles one way. Organized and commercial groups would be required to obtain a Special Recreation Use Permit. This permit would allow access on the designated route up to the National Forest boundary except from March 1 through August 31. During this period, access would be limited to 7.5 miles of the designated route. Therefore, during this period motorized access would not be allowed within 0.5 miles of the National Forest boundary.</i>⁷</p>
TRAVEL MANAGEMENT					
<p>GOALS AND OBJECTIVES</p> <p>The BLM would provide opportunities for a range of motorized recreation experiences on public lands while protecting resources and minimizing conflicts among various users. All BLM lands would be designated as open, limited, or closed. Seasonal restrictions can be applied to the limited category. Any fire, military, emergency, or law enforcement vehicle being used for emergency or administrative purposes is exempt from OHV decisions. OHV vehicle use would be managed in accordance with the BLM's National OHV strategy.</p>					
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>Through future implementation level planning, designated routes would be categorized as mechanized only (bicycles), single-track motorized (dirt bikes), or two-track motorized (four-wheelers, jeeps), or available to all vehicles, or any combination of these categories. Adjustments of these categories would be made based on recreational demand and potential conflict. All nonmotorized travel would be allowed on designated routes unless otherwise prohibited. Mechanized travel (bicycles) would be limited to designated roads and trails. There would be no exceptions that allow for cross-country travel for game retrieval or antler gathering in areas designated as limited or closed. OHV use for game retrieval would adhere to all OHV classifications in all alternatives.</p>					

⁷ This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>BLM Back Country Byways and National Recreation Trails may be designated in the future, as deemed appropriate, with site-specific environmental analysis. Appendix N outlines the processes and procedures for making modifications to the travel plan designated route network. The BLM, in preparing its RMP designations and its implementation-level travel management plans, is following policy and regulation authority found at: 43 C.F.R. Part 8340; 43 C.F.R. Subpart 8364; and 43 C.F.R. Subpart 9268. Where the authorized officer determines that OHVs are causing or would cause considerable adverse impacts, the authorized officer shall close or restrict such areas. The public would be notified. The BLM could impose limitations on types of vehicles allowed on specific designated routes if monitoring indicates that a particular type of vehicle is causing disturbance to the soil, wildlife habitat, cultural or vegetative resources, especially by off-road travel in an area that is limited to designated routes. Where routes would remain available for motorized use within WSAs, such use could continue on a conditional basis. Use of the existing routes in the WSAs ("ways" when located within WSAs—see Glossary) could continue as long as the use of these routes does not impair wilderness suitability, as provided by the IMP (BLM 1995). If Congress designates the area as wilderness, the routes will be closed. In the interim, if use and/or noncompliance are found through monitoring efforts to impair the area's suitability for wilderness designation, the BLM would take further action to limit use of the routes, or close them. The continued use of these routes, therefore, is based on user compliance and nonimpairment of wilderness values.</p>					
OHV Area Designations					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
<p>Open to OHV use: 611,310 acres (Map 58) Squaw Canyon and Cross Canyon WSAs are within this acreage but would not be open for OHV use unless and until Congress releases them from WSA status. This would require a plan amendment.</p>	<p>Open to OHV use: 0 acres (Map 59)</p>	<p>Open to OHV use: 2,311 acres (Map 60)</p>	<p>Open to OHV use: 2,311 acres (Map 61)</p>	<p>Open to OHV use: 0 acres (Map 62)</p>	<p>Open to OHV use: 0 acres</p>
<p>Limited use with seasonal restrictions: 540,260 acres To protect the following:</p> <ul style="list-style-type: none"> • bighorn sheep lambing and rutting areas • antelope fawning areas • deer winter ranges <p>Limited to existing roads and trails: 570,390 acres To protect cultural, scenic, and recreational values:</p> <ul style="list-style-type: none"> • Alkali Ridge ACEC • Scenic Highway Corridor ACEC • Most SPNM-class areas <p>Limited to Designated Roads and Trails: 218,780 acres To protect cultural, scenic, and recreational values:</p> <ul style="list-style-type: none"> • Cedar Mesa ACEC (partial) • Hovenweep ACEC • Pearson Canyon hiking area • Shay Canyon ACEC • SPNM-class areas in SRMAs • Road corridors adjacent to SPNM-class areas • Developed recreation sites • Floodplains, riparian/aquatic 	<p>Limited to designated routes: 1,359,417 acres Mountain bike use would be limited to the same designated routes as OHV travel.</p>	<p>Limited to designated routes: 1,362,142 acres (Map 60) Mountain bike use would be limited to the same designated routes as OHV travel.</p>	<p>Limited to designated routes: 1,780,807 acres (Map 61) Mountain bike use would be limited to the same designated routes as OHV travel.</p>	<p>Limited to designated routes: 812,679 acres (Map 62) Mountain bike use would be limited to the same designated routes as OHV travel.</p>	<p>* Limited to designated routes: 1,388,191 acres (Maps 63 and 64): <i>Mountain bike use would be limited to the same designated routes as OHV travel.⁸</i></p>

Special Stipulation Areas within the Limited to Designated Routes Category					
Arch Canyon (to protect wildlife)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Area open to OHV use. Seasonal stipulations March 1–August 31 for Mexican Spotted Owl.	<ul style="list-style-type: none"> Area would be closed to OHV use. Group size (for nonmechanized, nonmotorized) limited to 10 individuals and two groups per day. A permit system would be implemented. 	<ul style="list-style-type: none"> OHV use would be limited to the designated route to the end of the State Section (T37S R20E Section 16) year-round (approximately 3.8 miles). The canyon would be closed year-round from west boundary of the state section to the end of the route at the National Forest boundary. Group size limited to 12 vehicles and two groups per day. There would be no limits on nonmechanized, nonmotorized group size. A permit system would be implemented. 	<ul style="list-style-type: none"> OHV use would be limited to designated route year-round. Commercial motorized use would be limited to 12 people per trip and up to 2 trips per day. Private OHV group size would be unlimited. 	<ul style="list-style-type: none"> Area would be closed to OHV use. Group size (for nonmechanized, nonmotorized) would be limited to 10 individuals and two groups per day. A permit system would be implemented. 	<ul style="list-style-type: none"> *OHV use would be limited to the designated route up to the USFS boundary year-round, at total of 8 miles one way.¹² *Organized and commercial groups are required to obtain a Special Recreation Use Permit. This permit would allow access on the designated route up to the *National Forest boundary except March 1–August 31. During this period, access would be 7.5 miles of the designated route. Motorized access would not be allowed within 0.5 miles of the national forest boundary.¹³
McLoyd Canyon–Moon House (for Cultural Protection)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
See also Cultural section.	The "way" D4798, which is within Fish Creek WSA, would be closed to motorized use.	No motorized travel would be allowed on northern section of road (approximately 500 feet) D4798, which crosses onto BLM land (and lies within Fish Creek WSA) at the northern State Section boundary.	Travel would be allowed on Road D4798 and would be limited to the designated route (which lies within the Fish Creek WSA).	The "way" D4798, which is within Fish Creek WSA, would be closed to motorized use.	No motorized travel would be allowed on northern section of road (approximately 500 feet) D4798, which crosses onto BLM land (and lies within Fish Creek WSA) at the northern State Section boundary.
Nonmechanized (e.g., Hiking, Equestrian, and Backpacking)					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
Nonmechanized travel is not restricted on public lands except where limited or prohibited to protect specific resource values, provide for public safety, or maintain an identified opportunity. Provide opportunities for nonmechanized travel (hiking) on all routes open to mechanized use. Manage routes identified in each alternative to exclude motorized and mechanized use and provide opportunities for nonmechanized travel independent of motorized and mechanized routes.

¹³ This is an implementation-level decision that cannot be protested under the planning regulations. Please see the cover letter for further information.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>Limit nonmechanized travel on specific lands to designated routes for resource protection purposes.</p> <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p>Manage the following trails for nonmechanized use:</p> <ul style="list-style-type: none"> • Open to foot travel: Kane Gulch, Todie Canyon, Bullet Canyon, Shieks Canyon, Government Trail, Collins Canyon, Slickhorn Canyon, Point Lookout Canyon, Grand Gulch (from junction to San Juan River), Fish Canyon, Owl Canyon, Road Canyon, McLoyd Canyon, Lime Creek Canyon, North Mule Canyon, South Mule Canyon, Lower Mule Canyon from Comb Wash, Mule Canyon or Cave Canyon Towers, Arch Canyon, Johns Canyon, Honaker Trail, Keeley Trail, Dark Canyon (Sundance Trail), Fable Valley Trail, Salt Creek Mesa Trail, Butler Ruin Interpretative Trail, Sand Island Petroglyph Trail, Shay Canyon Petroglyph Trail, Newspaper Rock Trail, Salvation Knoll Trail, Monarch Cave Trail, Fish Mouth Trail, Cold Springs Trail, Procession Panel Trail, Wolf Man Panel Trail, Moon House Trail, Ball Room Cave Trail. • Open for Stock overnight use: Kane Gulch, Government Trail, Collins Canyon, Grand Gulch (from Kane Gulch to the junction of Collins Canyon; no stock below Collins Canyon), Fish Canyon (from Comb Wash to confluence with Owl Canyon), Road Canyon, Lime Creek Canyon, Lower Mule Canyon from Comb Wash, Arch Canyon, Johns Canyon, Salt Creek Mesa Trail. • Open for stock day use: Bullet Canyon (from Grand Gulch to Jailhouse Ruin), Fish Canyon (2 miles above the confluence with Owl Canyon), Owl Canyon (to Neville's Arch), Road Canyon, McLoyd Canyon (to the impassible pour-off), Lime Creek Canyon, Salt Creek Mesa Trail, Monarch Cave Trail, Fish Mouth Trail, Cold Springs Trail, Procession Panel Trail, Wolf Man Panel Trail. <p>Nonmechanized routes may be added through subsequent planning at the activity plan level on a case by case basis.</p> <p>Indian Creek Climbing Trails would include the following: Bridger Jack Mesa, Super Crack Buttress, Cat Wall, Broken Tooth Wall, Scarface, and Battle of the Bulge.</p>
<p>VEGETATION</p>
<p>GOALS AND OBJECTIVES</p> <p>Manage vegetation resources for desired future conditions, as determined by site-specific BLM objectives and rangeland functionality and health, thereby ensuring ecological diversity, stability, and sustainability, including the desired mix of vegetation types, structural stages, and landscape/riparian/watershed function, and provide for native plant, fish, and wildlife habitats.</p> <p>Provide sustainable forage for livestock and wildlife with a plant community that incorporates and meets the standards for rangeland health.</p> <p>Provide opportunities for plant material gathering (seed collection, plant collection, etc.) of various vegetation types while protecting other resources.</p> <p>Maintain existing vegetative treatment areas as appropriate.</p> <p>Sustain the integrity of the sagebrush steppe community type to provide the amount, continuity, and quality of habitat that is necessary to maintain sustainable populations of sage-grouse and other sagebrush obligate species.</p> <p>Control invasive and non-native weed species and prevent the introduction of new invasive species through the implementation of a comprehensive weed program, including coordination with partners; prevention and early detection; education; inventory and monitoring; and principles of integrated weed management.</p> <p>Control invasive and non-native weed species and prevent the introduction of new invasive species through the implementation of the BLM National Strategy and Action Plan as outlined in documents such as, "Pulling Together: National Strategy for Invasive Plant Management Initiative" and "Partners Against Weeds" (1994).</p> <p>Control insect pest species as necessary to protect vegetation resources in conjunction with Animal and Plant Health Inspection Service (APHIS).</p>
<p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>Areas that meet Utah's Rangeland Health Standards would be open to seed gathering and plant collection, including commercial seed gathering.</p> <p>Seed gathering would be managed according to Utah BLM guidance for Seed Collection Policy and Pricing (as amended).</p> <p>1.3.1 Guidance for Addressing Sagebrush Habitat Conservation (November, 2004) as described in the BLM's National Sage-grouse Habitat Conservation Strategy (WO-IM-2005-024) would be implemented.</p> <p>Necessary vegetation information would be gathered and monitoring continued to assess if planning objectives are being met.</p> <p>Invasive and non-native weed species (as identified in Table 3.59, Invasive and Noxious Weeds of San Juan County) would be controlled, and the infestation and spread of new invasive species prevented through cooperative agreements, implementing the principles in BLM weed management policies and action plans.</p> <p>Poisonous plant species would be controlled as necessary based on site-specific needs.</p> <p>Cooperating agreements with other federal, state, local, and private organizations would be developed to control invasive non-native species, control insect pest species, and implement fuels vegetation treatments and WUI risk assessments and management.</p> <p>Prevention measures (SOPs and mitigation measures) from the 2007 ROD Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States PEIS (and associated document) would be incorporated. Those BMPs are located in Appendix B and mitigation measures in Table 2 of that ROD.</p> <p>Upland areas would be managed to achieve DFC.</p> <p>Unnecessary social footpath trails would be minimized throughout the PA.</p> <p>Pack stock and riding stock users on BLM-administered land would be required to use certified weed-free feed.</p> <p>Restoration/rehabilitation activities would be required to use certified weed-free seed mixes, mulch, fill, etc.</p> <p>The power washing of equipment used for permitted uses may be required to help control noxious weeds.</p> <p>Continue implementation of noxious weed and invasive species control actions as per national guidance and local weed management plans in cooperation with state, federal, affected counties, adjoining private land owners and other partners or interests directly affected.</p> <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p>Implement 30,000 to 50,000 acres of vegetation treatments in Fire Regime Condition Class III areas over a 15-year period.</p> <p>The following sagebrush communities would be prioritized for treatment: Harts Draw, Beef Basin, Black Mesa, Alkali, Mustang, Cedar Point, Shay Mesa, and all areas with Gunnison Sage-grouse habitat.</p> <p>Treat greasewood in Comb Wash, Butler Wash, Montezuma, East Canyon, Indian Creek, South and North Cottonwood Wash, and Cross Canyon to improve ground cover, biodiversity, and water quality.</p>

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
Maintain existing land treatments and provide new land treatments; apply RMP stipulations and special conditions through NEPA documentation (232,130 acres).	Maintain an estimated 1,000 acres/year of existing land treatments and implement new vegetation treatments to restore ecosystem health, functioning condition, etc. in the following vegetation cover types: <ul style="list-style-type: none"> • sagebrush 1,000 acres/year • weed treatments 3,000 acres/year • pinyon-juniper 2,000 acres/year • riparian 500 acres/year • greasewood 100 acres/year 	Maintain an estimated 1,500 acres/year of existing land treatments and implement new vegetation treatments to restore ecosystem health, functioning condition, etc. in the following vegetation cover types: <ul style="list-style-type: none"> • sagebrush 1,500 acres/year • weed treatments 3,000 acres/year • pinyon-juniper 3,000 acres/year • riparian 100 acres/year • greasewood 200 acres/year 	Maintain an estimated 2,000 acres/year of existing land treatments and implement new vegetation treatments to restore ecosystem health, functioning condition, etc. in the following vegetation cover types: <ul style="list-style-type: none"> • sagebrush 2,000 acres/year • weed treatments 3,000 acres/year • pinyon-juniper 4,000 acres/year • riparian 100 acres/year • greasewood 200 acres/year 	Same as Alternative B except for non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, closed to OHV use, proposed for withdrawal from mineral entry, ROW exclusion area, unavailable for disposal of mineral materials, unavailable for private and commercial woodland harvest, unavailable for land treatments, and managed as VRM Class I, Land treatments would be maintained with non-surface-disturbing techniques.	Maintain an estimated 1,500 acres/year of existing land treatments and implement new vegetation treatments to restore ecosystem health, functioning condition, etc. in the following vegetation cover types: <ul style="list-style-type: none"> • sagebrush 1,500 acres/year • weed treatments 3,000 acres/year • pinyon-juniper 3,000 acres/year • riparian 100 acres/year • greasewood 200 acres/year
VISUAL RESOURCE MANAGEMENT (VRM)					
<p>GOALS AND OBJECTIVES</p> <p>Designate VRM classes. Manage activities consistent with VRM management class objectives.</p> <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES</p> <p>All permitted activities would have to comply with VRM management class objectives, unless a waiver, exemption, or modification is granted by the Authorized Officer. WSAs would be managed as VRM Class I. Allow for recreational viewing platforms and special recreation facilities in all high scenic areas. VRM classifications need to match Minimum Impact Criteria.</p> <p>MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES</p> <p>Visual resources would be managed as the VRM inventory class (see Maps 66–71) unless specified otherwise in the management prescriptions. In areas available for oil and gas leasing subject to standard lease terms or available to oil and gas leasing subject to Timing and CSU, visual resources would be managed as VRM Class III or IV (depending on inventory) unless otherwise specified in the management prescriptions. Areas that inventory as VRM Class II but are in areas that are available for oil and gas leasing subject to standard lease terms or available to oil and gas leasing subject to Timing and Controlled Surface Use would be managed as VRM Class III unless otherwise specified in the management prescriptions below. Wild segments of a WSR would be managed as VRM Class I. Scenic segments of a WSR would be managed as VRM Class II. Recreation segments of a WSR would be managed as the same VRM class as surrounding land. Visual Impact analysis would use GIS technology.</p>					
(Lists below are not meant to be inclusive. See Maps 66–71)					
Alternative A (No Action)	Alternative B	Alternative C (Preferred)	Alternative D	Alternative E	Proposed Plan
371,575 acres would be managed as VRM Class I (Map 66). <ul style="list-style-type: none"> • The Monticello FO manages 13 WSAs (389,440 acres): Mancos Mesa (51,440 acres), Grand Gulch ISA Complex (37,810), Road Canyon (52,420), Fish Creek Canyon (46,440), Mule Canyon (5,990), Cheesebox Canyon (15,410), Dark Canyon ISA Complex (62,040), Butler Wash (22,030), Bridger Jack Mesa (5,290), Indian Creek (6,870), South Needles (160), 	497,668 acres would be managed as VRM Class I (Map 67). WSAs (same as Alternative A). Potential ACECs: <ul style="list-style-type: none"> • Butler Wash North • Dark Canyon • Lockhart Basin • Valley of the Gods • Indian Creek • San Juan River Sections 3 and 5 WSRs: <ul style="list-style-type: none"> • San Juan River Sections 3 and 5 	425,179 acres would be managed as VRM Class I (Map 68). WILDLIFE AND FISHERIES RESOURCES

GOALS AND OBJECTIVES

Maintain, protect, and enhance habitats to support natural wildlife diversity, reproductive capability, and a healthy, self-sustaining population of wildlife and fish species.
 Recognize crucial and nonfragmented habitats as management priorities.
 Maintain or improve vegetation condition and/or avoid long-term disturbance in habitat sites for wildlife and fish species.
 Minimize long-term habitat fragmentation as much as possible through avoidance and site-specific reclamation to provide habitat quality and quantity adequate to fulfill the life history requirements and to support a natural diversity of species.
 Maintain and enhance aquatic and wildlife resources, and provide for biological diversity of plants and wildlife resources while ensuring healthy ecosystems.

MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES

Migratory Birds

Comply with the Migratory Bird Treaty Act and implement the Executive Order 13186 ("Responsibilities of Federal Agencies to Protect Migratory Birds") during all activities to protect habitat for migratory birds. Management would emphasize birds listed on the current USFWS "Birds of Conservation Concern" (2002 or as updated), and Partners-in-Flight priority species (as updated). As specific habitat needs and population distribution to Birds of Conservation Concern and Partners-in-Flight priority species the Partners-In-Flight Avian Conservation Strategy (UDWR, 2000, as updated) priority species are identified, the BLM would use adaptive management strategies to further conserve habitat and avoid impacts to these species.
 During nesting season for migratory birds (May 1–July 30), avoid or minimize surface-disturbing activities and vegetative-altering projects and broad-scale use of pesticides in identified occupied priority migratory bird habitat.
 Prioritize the maintenance and/or improvement of lowland riparian, wetlands, and low and high desert scrub communities, which are the four most important and used habitat types by migratory birds in the Monticello PA.
 Prevent the spread of invasive and non-native plants, especially cheatgrass, salt cedar, and Russian olive. Strive for a dense understory of native species with a reduction in salt cedar and improvement of cottonwood and willow regeneration.
 As a supplement to comply with Executive Order 13186, the Bird Habitat Conservation Areas identified in the Coordinated Implementation Plan for Bird Conservation in Utah (2005, or as updated), would receive priority for conducting bird habitat conservation projects through cooperative funding initiatives such as the Intermountain West Joint Venture.
 Land-use decisions that contain migratory birds and their habitats would consider the goals and objectives established in respective bird conservation strategies: bird conservation plans and Utah wildlife action plan.
 Management of habitat for species conservation will incorporate statewide conservation strategies.

Raptors

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

<p>Raptor management would be guided by the use of Best Management Practices for Raptors and Their Associated Habitats in Utah (Utah BLM 2006, Appendix M), utilizing seasonal and spatial buffers, as well as mitigation, to maintain and enhance raptor nesting and foraging habitat, while allowing other resource uses.</p> <p>Cooperate with utility companies, UDWR, and USFWS to prevent electrocution of raptors.</p> <p>Temporarily close areas (amount of time depends on species) near raptor nests to rock climbers or other activities if activity may result in nest abandonment.</p> <p><u>Bighorn Sheep</u></p> <p>Five mesa tops (56,740 acres) within the crucial bighorn sheep habitat have been identified as areas of potential conflict between bighorn and activities that cause surface disturbance resulting in permanent loss of bighorn sheep habitat. Bighorn sheep habitat improvement projects would be prioritized in these areas.</p> <p>Livestock grazing and associated range improvement projects would not be allowed on the five mesa tops.</p> <p>Any future proposal for a change in kind of livestock from cattle to sheep in crucial desert bighorn sheep habitat would be denied in order to prevent competition for forage and the transmission of disease from domestic to wild sheep.</p> <p>Adhere to the recommendations in the BLM Bighorn Sheep Rangeland Management Plan (BLM 1993c, as revised); and the Utah BLM Statewide Desert Bighorn Sheep Management Plan, 1996 (as revised), where practicable.</p> <p><u>Introduction, Transplantation, Augmentation, and Reestablishment</u></p> <p>The BLM would continue to cooperate with and provide support to UDWR in reintroducing native fish and wildlife species into historic or suitable ranges, as determined appropriate through case-by-case NEPA analysis.</p> <p>Introduction, transplantation, augmentation, and re-establishment of both native and naturalized species would be considered and would include but may not be limited to pronghorn, desert bighorn sheep, wild turkey, beaver, chukar, Colorado River cutthroat trout, and Endangered Colorado River fish species.</p> <p><u>Animal Damage Control</u></p> <p>Predator management would continue to be coordinated with APHIS and UDWR, and would be conducted utilizing the guidance provided by the existing MOU with APHIS.</p> <p><u>Habitat Improvements and Protection</u></p> <p>In areas lacking proper water distribution or natural water sources, allow for installation of precipitation catchments (guzzlers) or the development of springs on rangelands.</p> <p>Adhere to BLM fence standards to allow wildlife movement when fences are being developed or maintained.</p> <p>Wildlife habitat objectives would be considered in all reclamation activity. Priority would be given to meeting Standards for Rangeland Health and Guidelines for Grazing Management (BLM 1997).</p> <p>Adhere to the recommendations in the BLM Habitat Management Guides for the American Pronghorn Antelope (1980 as revised), wherever practicable.</p> <p>Ground-disturbing and permitted activities carried out in all seasonal wildlife protection areas would be subject to special conditions regulating use during certain seasons. These seasonal conditions would not impact maintenance and operation activities for mineral production or hunting during a recognized hunting season established by the UDWR.</p> <p>Recognize 17,300 acres as allotted to wildlife (parts of the slopes of Peter's Canyon and East Canyon).</p> <p>Ground-disturbing actions in crucial habitats would be avoided where practical. Where unavoidable disturbances are required, the BLM would follow BLM Washington Office Guidance (IM 2005-069) on application of compensatory measures.</p> <p><u>Seasonal Wildlife Protection Areas</u></p> <p>In addition to any other special conditions that may be in effect, crucial big game habitats are subject to special conditions regulating use during certain seasons. These seasonal conditions would not impact maintenance and operation activities for mineral production or hunting during a recognized hunting season established by the UDWR.</p> <p>See Appendix A, Stipulations Applicable to Oil and Gas Leasing and Other Surface Disturbing Activities, for exceptions, modifications and waivers that can be applied by the Authorized Officer, on a case-by-case basis for a myriad of reasons outlined in the appendix.</p> <p><u>Off-site Mitigation</u></p> <p>The BLM will approach compensatory mitigation on an "as appropriate" basis where it can be performed on site, and on a voluntary basis where it is performed off-site, or, in accordance with current guidance.</p> <p><u>Habitat Boundaries</u></p> <p>Minor adjustments to crucial wildlife habitat boundaries periodically made by the UDWR would be accommodated through plan maintenance.</p>					
Alternative A (No Action) (see rows below for species)	Alternative B (see rows below for species)	Alternative C (Preferred) (see rows below for species)	Alternative D (see rows below for species)	Alternative E (see rows below for species)	Proposed Plan (see rows below for species)
Unspecified.	<p>Special conditions for the seasonal wildlife protection areas include all land-use authorizations, with the exception of woodland harvest, would be required to conform to seasonal, noise, and disturbance restrictions outlined below.</p> <p>Closed to the following uses during the established season:</p> <ul style="list-style-type: none"> • No oil and gas exploration, drilling and production activities or geophysical work. • No permitted or commercial OHV use. • No use of pyrotechnics, shooting, 	Same as Alternative B, except permitted or commercial OHV use may be limited in number of participants and duration depending on the event.	Same as Alternative B, except all land-use authorizations, with the exception of woodland harvest, would be required to conform to seasonal and noise and disturbance restrictions outlined below.	Same as Alternative B.	<p>Special conditions for the seasonal wildlife protection areas include the following:</p> <ul style="list-style-type: none"> • All land-use authorizations, with the exception of woodland harvest, would be required to conform to seasonal, noise, and disturbance restrictions outlined below • Closed to the following uses, among others, (refer to Appendix A) during the established season: • No oil and gas exploration, drilling and production activities or geophysical work. • Permitted or commercial OHV use may be limited in number of participants and duration depending on the event. • No use of pyrotechnics, shooting, etc. during permitted filming because of noise impacts. • No use of low-flying aircraft.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

	etc. during permitted filming because of noise impacts. • No use of low-flying aircraft.				
Bighorn Sheep Lambing and Rutting Areas					
Part of the 329,750-acre bighorn crucial habitat area (Map 78) falls in ROS classes P and SPNM. The following special conditions are in addition to the ROS special conditions, which take precedence. Crucial bighorn sheep habitat would be closed to certain surface uses during the lambing season (April 1–July 15) and the rutting (mating) season (October 15–December 31). During these periods, no oil and gas leasing activities, geophysical work, or OHV use may take place. Mining activities during these periods would require an approved plan of operations. Any future proposal for a change in kind of livestock from cattle to sheep in crucial desert bighorn sheep habitat would be denied in order to prevent competition for forage and the transmission of disease from domestic to wild sheep.	Adhere to special conditions (above) on 453,388 acres (Map 79) from April 1 to July 15 for lambing, and from October 15 to December 31 for rutting.	Adhere to special conditions (above) on 415,395 acres (Map 80) from April 1 to June 15 for lambing, and on 453,390 acres from October 15 to December 15 for rutting.	Adhere to special conditions (above) on 299,009 acres (Map 81) from April 1 to June 15 for lambing, and October 15 to December 15 for rutting.	Same as Alternative B.	Adhere to special conditions (above and Appendix A) on 453,388 acres (Map 82) from April 1 to June 15 for lambing, and from October 15 to December 15 for rutting.
Pronghorn Fawning Area					
The antelope crucial habitat area (Map 78) would not subject to the ROS special conditions. Use within the 12,960-acre crucial antelope habitat would be closed to certain surface uses during the fawning season (May 15–June 15). During this period, no oil and gas leasing activity, geophysical work, or OHV use may take place. Mining activities during this period would require an approved plan of operations.	Adhere to special conditions (above) on 29,365 acres (Map 79) from May 1 to June 15.	Adhere to special conditions (above) on 29,365 acres (Map 80) from May 1 to June 15.	Adhere to special conditions (above) on 13,961 acres (Map 81) from May 1 to June 15.	Same as Alternative B.	Adhere to special conditions (above and Appendix A) on 29,365 acres (Map 82) from May 1 to June 15.
Grazing Management in Pronghorn Ranges					
No current prescription.	Spring grazing (April 15–June 15) would be eliminated in allotments within antelope habitat and livestock utilization levels would not exceed 50% or current year's growth to encourage forb production and provide adequate cover for newborn fawns. This would include the following grazing allotments: Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, Tank Draw, and Hart Draw.	Current livestock-grazing prescriptions would continue and, where opportunities exist, would be adjusted to enhance forb production on pronghorn ranges. This would include the following grazing allotments: Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, Tank Draw, and Hart Draw.	Prescriptive livestock grazing would be used to favor forb production on pronghorn ranges. This would include the following grazing allotments: Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, Tank Draw, and Hart Draw.	Same as Alternative B.	Current livestock-grazing prescriptions would continue and, where opportunities exist, would be adjusted to enhance forb production on pronghorn ranges. This would include the following grazing allotments: Mail Station, Upper Mail Station, Dry Valley/Deer Neck, Lone Cedar, Tank Draw, and Hart Draw.

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

Deer Winter Range					
Part of the deer crucial winter range areas fall in ROS class SPNM. The following special conditions are in addition to the ROS special conditions, which take precedence. Use within the 197,550-acre crucial deer winter habitat areas (Map 73) would be closed to certain surface uses during periods of crucial winter use (December 15–April 30). During this period, no oil and gas leasing activities, geophysical work, or OHV use may take place. Mining activities during this period would require an approved plan of operations. Certain sagebrush parks within crucial deer winter range areas (9,800 acres) have been identified as providing a concentrated food source for wintering deer. Large-scale sagebrush removal could cause a substantial loss of winter forage. The areas fall within various ROS classes; the following special conditions, which take precedence, are in addition to the ROS special conditions: Land treatments would be considered on a case-by-case basis.	Adhere to special conditions (above) on 785,921 acres (Map 74) from November 1 to May 15.	Adhere to special conditions (above) on 266,406 acres (Map 75) from November 15 to April 15.	Adhere to special conditions (above) on 182,315 acres (Map 76) from December 1 to April 15.	Same as Alternative B.	Adhere to special conditions (above and Appendix A) on 383,098 acres (Map 77) from November 15 to April 15.
Elk Winter Range					
No identified crucial elk habitat.	Adhere to special conditions (above) on 191,173 acres (Map 79) from November 1 to May 15.	Adhere to special conditions (above) on 97,471 acres (Map 80) from November 15 to April 15.	Adhere to special conditions (above) on 62,484 acres (Map 81) from December 1 to April 15.	Same as Alternative B.	Adhere to special conditions (above and Appendix A) on 97,471 acres (Map 82) from November 15 to April 15.
WOODLANDS (Maps 83–86)					
GOALS AND OBJECTIVES					
<p>Manage woodlands for Desired Future Condition (DFC), ensuring ecological diversity, stability, and sustainability (including the desired mix of structural stages and landscape/watershed functions), and provide for native plant and wildlife habitats.</p> <p>Provide woodland products on a sustainable basis to meet local needs where such use does not limit the accomplishment of goals for the management of other resources.</p> <p>Provide opportunities for pine nut gathering on a sustainable basis while protecting other resources.</p> <p>Encourage, where feasible, the harvest of woodland products in areas of proposed or existing vegetative treatments to lessen the need for additional treatment or land disturbance, and in areas that need restoration for ecological benefits (for example, <i>Pinus edulis</i>). Use the document, "Recommended Old-Growth Definitions and Description, USDA Forest Service Southwestern Region (Sept. 1992)."</p> <p>Identify, maintain, and restore forest and woodland old-growth stands to a pre-fire suppression condition. The Monticello FO would adopt the USFS old growth definitions and identification standards as per the USFS document "Characteristics of Old-Growth Forests in the Intermountain Region (April 1993)" in instances where the area of application in the previous document doesn't apply (for example, pinyon pine).</p>					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ALTERNATIVES					
<p>Implement the Healthy Forest Initiative and the Healthy Forest Restoration Act of 2003.</p> <p>Follow National BLM Forest Health and Forest Management Standards and Guidelines to assess conditions and guide management decisions for woodland resources.</p> <p>Prioritize treatment in high-value/high-risk areas (WUI, developed recreation facilities including campgrounds, FRCC III).</p> <p>Allow live woodland harvest in areas with pinyon pine and juniper encroachment with focus on the restoration of the sagebrush steppe community.</p> <p>Fuel treatment projects would allow for harvest of woodland products.</p> <p>Permits for private and/or commercial use of woodland products would continue to be issued to the public, consistent with the availability of woodland products and the protection of other resource values.</p> <p>Cottonwood and willow harvest would be allowed for Native American ceremonial uses only by permit. Restrictions on this permitted harvest would be implemented as necessary to achieve or maintain Proper Functioning Condition (PFC), and to maintain or</p>					

Table 2.1. Summary Table of the Proposed Plan and All Alternatives

improve threatened and endangered species/special status species (TES/SSS) habitat.					
MANAGEMENT COMMON TO THE PROPOSED PLAN AND ALL DRAFT RMP ACTION ALTERNATIVES					
Harvest woodland products (per table below) subject to the following exceptions:					
<ul style="list-style-type: none"> Exclude from woodland product use except for limited on-site collection of dead wood for campfires in all WSAs, Arch Canyon, Alkali Ridge NHL, Grand Gulch NHD (mesa top), Beef Basin, Fable Valley, Comb Ridge SRMA (south of Highway 95), San Juan River SRMA and in the Proposed Plan, the 5 non-WSA areas with wilderness characteristics (Map 34) (Dark Canyon, Mancos Mesa, Nokai Dome West, Nokai Dome East and Grand Gulch) carried forward to protect those values. For Alternative E, all non-WSA lands with wilderness characteristics (Map 33) would not be available for woodland product use. Exclude from all woodland product use, including on-site collection of dead wood for campfires, all developed recreation sites, livestock/wildlife enclosures, cultural sites, Indian Creek Corridor, McLoyd Canyon–Moon House Ruin, Cedar Mesa SRMA (in-canyon), and Grand Gulch NHD (in canyon). Exclude floodplains, riparian/aquatic areas from woodland product use except for limited on-site collection of driftwood for campfires, and uses for Native American ceremonial purposes as determined on site-specific basis. Limitations on off-road travel for wood gathering would be modified as necessary to maintain long-term sustainability or facilitate wood gathering where resource impacts are not a concern. 					
Permits would be limited and/or areas closed, as necessary, to maintain sustainability and protect resources.					
Alternative A (No Action) Map 83	Alternative B Map 84	Alternative C (Preferred) Map 85	Alternative D Map 85	Alternative E Map 86	Proposed Plan Map 85
Zones in Field Office considered for private and/or commercial use of woodland products: East Canyon; Harts Draw; Salt Creek Mesa; Dark Canyon Plateau; White Canyon; Cedar Mesa; North Comb Ridge; South Cottonwood; and Montezuma Watershed (Maps 83–86).					
Areas not identified in zones below, or not restricted in Management Common To All, would be available for private use of woodland products limited to designated routes and available to pinyon pine nut gathering.					
East Canyon Zone was not addressed in the 1991 San Juan Resource Area RMP, as amended.	East Canyon (64,559 acres) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood. Peter's Point Seasonal restriction on private and/or commercial use of woodland products in the deer and elk winter range from November 1 to May 15. Big Indian, East Canyon, Peters Canyon Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood.	East Canyon (64,559 acres) Peter's Point Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood. Big Indian, East Canyon, Peters Canyon Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood.	East Canyon (64,559 acres) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood. Peter's Point Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood. Big Indian, East Canyon, Peters Canyon Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood.	East Canyon (64,559 acres) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood. Peter's Point Same as Alternative B. Big Indian, East Canyon, Peters Canyon Same as Alternative B.	East Canyon (64,559 acres) (Including Peter's Point Big Indian, East Canyon, Peters Canyon, NE of Monticello, and South Canyon) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood.
NE of Monticello, South Canyon (Part of East Canyon Zone) was not addressed in the 1991 San Juan Resource Area RMP, as amended.	NE of Monticello, South Canyon (Part of East Canyon Zone) Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood.	NE of Monticello, South Canyon (Part of East Canyon Zone) Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood. 	products in the deer and elk winter range from November 1 to May 15.	products with permitted off-road travel to collect wood.	products with permitted off-road travel to collect wood.		
Dark Canyon Plateau Zone was not addressed in the 1991 San Juan Resource Area RMP, as amended.	Dark Canyon Plateau (23,288 acres) Seasonal restriction on private and/or commercial use of woodland products in the deer and elk winter range from November 1 to May 15.	Dark Canyon Plateau (23,288 acres) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes and permitted off-road travel in chained areas to collect wood.	Dark Canyon Plateau (23,288 acres) Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood.	Dark Canyon Plateau (2,015 acres) Same as Alternative B.	Dark Canyon Plateau (23,288 acres) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes and permitted off-road travel in chained areas to collect wood.
White Canyon Zone was not addressed in the 1991 San Juan Resource Area RMP, as amended.	White Canyon (255,267 acres) Wooden Shoe, Deer Flat, Horse Flat (extending out toward Jacob's Chair, Pinyon Point) Seasonal restriction on private and/or commercial use of woodland products in the deer and elk winter range from November 1 to May 15, and Bighorn sheep lambing and rutting areas from October 15–December 31, and April 1–July 15. Moss Back Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood. Grand Flats Seasonal restriction on private and/or commercial use of woodland products in the deer and elk winter range November 1–May 15, and in bighorn sheep habitat April 1–July 15.	White Canyon (255,267 acres) Wooden Shoe, Deer Flat, Horse Flat (extending out toward Jacob's Chair, Pinyon Point) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes and permitted off-road travel in chained areas to collect wood. Moss Back Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood. Grand Flats Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood.	White Canyon (255,267 acres) Wooden Shoe, Deer Flat, Horse Flat (extending out toward Jacob's Chair, Pinyon Point) Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood. Moss Back Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood. Grand Flats Available to private and/or commercial use of woodland products with permitted off-road travel to collect wood.	White Canyon (177,587 acres) Wooden Shoe, Deer Flat, Horse Flat (extending out toward Jacob's Chair, Pinyon Point) Same as Alternative B. Moss Back Same as Alternative B. Grand Flats Same as Alternative B.	White Canyon (255,267 acres) Wooden Shoe, Deer Flat, Horse Flat (extending out toward Jacob's Chair, Pinyon Point) Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes and permitted off-road travel in chained areas to collect wood. Moss Back and Grand Flats Available to private and/or commercial use of woodland products with permitted off-road travel within 150 feet of designated routes to collect wood.
Cedar Mesa Zone was not addressed in the 1991 San Juan Resource Area RMP, as amended.	Cedar Mesa (outside of WSA) (0 acres) Closed.	Cedar Mesa (outside of WSA) (65,807 acres) Available to private and/or commercial use of woodland products, limited to designated routes, dependent on cultural Class III surveys.	Cedar Mesa (outside of WSA) (65,807 acres) Available to private and/or commercial use of woodland products, limited to designated routes, dependent on cultural Class III surveys. In the interim of designating woodland harvest areas and associated cultural surveys, woodland use is open and travel limited to designated/existing routes.	Cedar Mesa (outside of WSA) (0 acres) Closed.	Cedar Mesa (outside of WSA) (65,807 acres) Available to private and/or commercial use of woodland products, however, vehicles must remain on designated routes (no cross county travel). Additional routes may be identified for wood harvest dependent on cultural Class III surveys. In the interim of designating woodland harvest areas and completing associated cultural surveys, woodland harvest is allowed and travel is limited to designated routes.
North Comb Ridge Zone was not addressed in the 1991 San Juan Resource Area RMP, as amended.	North of Highway 95 (North Comb) (5,670 acres) Available to private and/or commercial use of woodland products, limited to designated routes, dependent on cultural Class III surveys.	North of Highway 95 (North Comb) (5,833 acres) Available to private and/or commercial use of woodland products, limited to designated routes, dependent on cultural Class III surveys.	North of Highway 95 (North Comb) (5,833 acres) Available to private and/or commercial use of woodland products, limited to designated routes, dependent on cultural Class III surveys. In the interim of designating woodland harvest areas	North of Highway 95 (North Comb) (5,666 acres) Same as Alternative B.	North of Highway 95 (North Comb) (5,833 acres) Available to private and/or commercial use of woodland products, however, vehicles must remain on designated routes (no cross county travel). Additional routes may be identified for wood harvest dependent on cultural Class III surveys. In the interim of designating woodland harvest areas and completing associated cultural surveys, woodland harvest is allowed and travel is limited to

Additional routes may be identified for wood harvest dependent on cultural Class III surveys. In the interim of designating woodland harvest areas and completing associated cultural surveys, woodland harvest is allowed and travel is limited to designated routes.</p>

2.2 SUMMARY OF IMPACTS

Table 2.2 provides a comparative summary of the environmental impacts associated with each alternative. The BLM evaluated the environmental impacts that would result from the implementation of the various management decisions proposed under the five alternatives described above. Alternative A (No Action), a continuation of the existing 1991 San Juan RMP, is presented for comparison to the action alternatives.

Impacts are defined as modifications to the existing environment brought about by implementing an alternative. Impacts can be beneficial or adverse, result from the action directly or indirectly, and can be long-term, short-term, or cumulative in nature. Direct impacts are caused by the action and occur at the same time and place. Indirect impacts are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable (CEQ 1508.8). Cumulative impacts are impacts on the environment that result from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions (CEQ 1508.7). If impacts are not discussed, the analysis has indicated that none would occur or their magnitude would be negligible. Impacts from actions to be carried out under more than one alternative are discussed under the first applicable alternative. Cumulative impacts are discussed in Chapter 4 for all of the resources instead of under each resource section.

THIS PAGE INTENTIONALLY LEFT BLANK

Table 2.2. Summary of Impacts

AIR QUALITY						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Fire Management	Short-term air quality impacts include and increase in PM2.5 particulate and CO2 emissions specific to the burn area and locations downwind. Long-term, direct air-quality impacts include a general increase in airborne particulate materials from the burn site as a result of ash dispersion and transport.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Minerals and Energy Resources	Impacts of mineral extraction management decisions on air quality under Alternative A would maintain existing levels of use without additional constraints and not exceed NAAQS.	Impacts of mineral extraction management decisions under Alternative B would result in a reduction of approximately 9% in opportunities for oil and gas extraction as compared to Alternative A, with impacts on NAAQS similar to or slightly lower than Alternative A.	Impacts of mineral extraction management decisions under Alternative C would result in an increase of approximately 1% in opportunities for oil and gas extraction as compared to Alternative A, with impacts on NAAQS similar to Alternative A.	Impacts of mineral extraction management decisions under Alternative D would result in an increase of approximately 1% in opportunities for oil and gas extraction as compared to Alternative A, with impacts on NAAQS similar to Alternative A.	Impacts of mineral extraction management decisions under Alternative E would result in a reduction of approximately 26% in opportunities for oil and gas extraction as compared to Alternative A, with impacts on NAAQS similar to or lower than Alternative A.	Impacts of mineral extraction management decisions under the Proposed Plan would result in an increase of approximately 1% in opportunities for oil and gas extraction as compared to Alternative A, with impacts on NAAQS similar to Alternative A.
Recreation	Minor, short-term, adverse air quality impacts from OHVs, automobiles, and other combustion	Impacts to air quality resulting from Alternative B would be less than Alternative A due to	Under Alternative C, recreation management decisions would result in minor additional	Under Alternative D, recreation management decisions would result in minor	Under Alternative E, recreation management decisions would result in additional	Under the Proposed Plan, recreation management decisions would result in minor additional

Table 2.2. Summary of Impacts

	exhaust sources. Projected air quality constituents of concern specific to recreational use would include particulate matter (PM10 and PM2.5), hydrocarbons and combustion by-products. Long-term, beneficial impacts from prescriptions that improve road surfaces, limit vegetation disturbances, and reduce OHV and other vehicle use.	additional constraints on motorized recreation.	constraints to motorized vehicle use as compared to Alternative A. Adverse impacts to air quality similar to Alternative A.	additional constraints to motorized vehicle use as compared to Alternative A. Adverse impacts to air quality similar to Alternative A.	constraints to motorized vehicle use as compared to Alternative A, specifically for areas that contain non-WSA areas with wilderness characteristics. Adverse impacts to air quality similar to or slightly smaller than Alternative A.	constraints to motorized vehicle use as compared to Alternative A. Adverse impacts to air quality similar to Alternative A.
CULTURAL RESOURCES						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Cultural Resources	Long-term, adverse impacts to cultural resources from the lack of restrictions on surface disturbance, OHV use, and other recreational uses, but with beneficial impacts from protection of high site-density areas on 37,433 acres in Grand Gulch Special Emphasis Area.	Same impacts as Alternative A, except additional beneficial impacts on 98,348 acres of high site-density areas from special protection of cultural resources. Long term, beneficial impacts from limiting OHV use to designated routes.	Same impacts as Alternative B.	Same impacts as Alternative B.	Same as Alternative B, except additional beneficial impacts from protection of 582,357 acres of non-WSA lands with wilderness characteristics	Same as Alternative B, except additional beneficial impacts from protection of 88,871 acres of non-WSA lands with wilderness characteristics
Fire Management	Potential for negligible to minor adverse impacts on cultural resources from	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	wildland fire on 33,556 acres of high and moderate site-density. Negligible impacts on cultural resources from restrictions on fuels reduction treatments within NRHP-eligible sites.					
Health and Safety	Minor, adverse, long term impacts to historic mine structures from AML site remediation.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Livestock Grazing	Improved stability of cultural sites in the Comb Wash side canyons from grazing unavailability. Long-term, adverse impacts to cultural resources outside of these areas (90% of areas with high site-density and 94% with moderate site density) where sites may be impacted by livestock trampling or brushing against structures and/or rock art.	Improved stability of cultural sites from grazing unavailability in selected allotments. Long-term, moderately beneficial impacts from grazing restrictions. Potential long-term adverse impacts outside of these areas where sites may be impacted by livestock trampling.	Same impacts as Alternative B.	Same impacts as Alternative A,	Same as Alternative B.	Same as Alternative B.
Mineral and Energy Resources	Potential long-term, adverse impacts within 417 acres of high site density lands and 313 acres of medium site density lands. Adverse impacts from	Same impacts as Alternative A, except that fewer acres (338 acres) in high and medium (298 acres) site density areas would potentially be disturbed by minerals	Same impacts as Alternative A, except that slightly fewer acres (381 acres) in high site density areas and 391 acres in medium site-density areas could	Same as Alternative A, except that slightly fewer acres (391 acres total) in high site density areas are projected for disturbance associated with	Same as Alternative B, except that fewer acres (327 acres total) in high and medium (192 acres total) site density areas are projected for disturbance	Same as Alternative A, except that slightly fewer acres (393 acres total) in high site density areas are projected for disturbance associated with

	geophysical exploration on 886 acres.	development. Same geophysical impacts as Alternative A.	be impacted by minerals development. Slightly greater geophysical impacts than Alternative A from impacts to 903 acres.	minerals development. More acres (330 total) in medium site density areas are projected for disturbance under Alternative D.	associated with minerals development.	minerals development. Fewer acres (299 total) in medium site density areas are projected for disturbance. Slightly greater geophysical impacts than Alternative A from impacts to 903 acres
Non-WSA lands with Wilderness Characteristics	Same impacts to cultural resources within these areas as discussed under other resources, as non-WSA lands with wilderness characteristics would not be protected under this alternative.	Same impacts to cultural resources as discussed under Alternative B resources, as non-WSA lands with wilderness characteristics would not be protected under this alternative.	Same impacts to cultural resources as discussed under Alternative C resources, as non-WSA lands with wilderness characteristics would not be protected under this alternative.	Same impacts to cultural resources as discussed under Alternative D resources, as non-WSA lands with wilderness characteristics would not be protected under this alternative.	582,360 acres protected as non-WSA lands with wilderness characteristics, which does not allow surface-disturbing activities or OHV access.	Same impacts to cultural resources as discussed under Alternative E, five units would be managed to protect wilderness characteristics for a total of 88,871 acres.
Paleontology	Minor to moderate, long-term, beneficial impacts from protections afforded to paleontologically sensitive geologic formations. Minor, adverse impacts to sites from fossil collection.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Recreation	Impacts are the same as described for cultural resource management decisions because of program overlap.	Impacts are the same as described for cultural resource management decisions because of program overlap.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B, except that there would be a negligible increase in adverse impacts because of larger commercial group sizes allowed in high site-density

Table 2.2. Summary of Impacts

						areas.
Riparian Resources	Negligible to minor, beneficial impacts to cultural resources from restrictions on surface-disturbing activity within riparian and floodplain areas.	Same impacts as Alternative A, except additional beneficial impacts from additional restrictions on OHV use and livestock grazing by reducing opportunities for surface disturbances.	Same impacts as Alternative B.	Same impacts as Alternative A.	Same impacts as Alternative B.	Same as Alternative B.
Special Designations, ACECs	Alkali Ridge ACEC Long-term beneficial impacts to cultural resources within the 39,202-acre ACEC from the use of disturbance avoidance buffers around known sites. Long-term, adverse impacts from allowable surface-disturbing activities in areas outside of known sites.	Alkali Ridge ACEC Same as Alternative A for the 39,196-acre ACEC, but with greater long-term beneficial impacts and decreased potential for long-term adverse impacts from restrictions on surface disturbances.	Alkali Ridge ACEC Same as Alternative A for this 39,196-acre ACEC, but with slightly greater long-term beneficial impacts and decreased opportunities for long-term adverse impacts from OHV travel restrictions for woodland harvesting.	Alkali Ridge ACEC Same as Alternative A, but with less long-term benefits and greater potential for long-term adverse impacts because of fewer restrictions on surface-disturbing activities.	Alkali Ridge ACEC Same as Alternative B.	Alkali Ridge ACEC Same as Alternative A for the 39,196-acre ACEC, but with greater long-term beneficial impacts and decreased potential for long-term adverse impacts from restrictions on surface disturbances.
	Bridger Jack Mesa ACEC Long-term, beneficial impacts from protection under WSA land status.	Bridger Jack Mesa ACEC Same as Alternative A.	Bridger Jack Mesa ACEC This area would not be designated as an ACEC.	Bridger Jack Mesa ACEC This area would not be designated as an ACEC.	Bridger Jack Mesa ACEC Same as Alternative A.	Bridger Jack Mesa ACEC This area would not be designated as an ACEC.
	Butler Wash North ACEC Same as Bridger Jack Mesa ACEC above.	Butler Wash North ACEC Same impacts as Alternative A.	Butler Wash North ACEC This area would not be designated as an ACEC.	Butler Wash North ACEC This area would not be designated as an ACEC.	Butler Wash North ACEC Same as Alternative A.	Butler Wash North ACEC This area would not be designated as an ACEC.
	Cedar Mesa ACEC	Cedar Mesa ACEC	Cedar Mesa ACEC	Cedar Mesa ACEC	Cedar Mesa ACEC Same as Alternative B,	Cedar Mesa ACEC

Table 2.2. Summary of Impacts

	Long-term, beneficial impacts within 295,336-acre area from designated OHV use, specific protection of at-risk cultural resources, and areas managed for scenic quality and non-motorized uses.	Long-term, beneficial impacts from limiting day use and overnight camping to protect cultural resources within 306,742-acre area.	This area would not be designated as an ACEC.	This area would not be designated as an ACEC.	except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics.	This area would not be designated as an ACEC.
	Dark Canyon ACEC Long-term, beneficial impacts from protection under WSA land status.	Dark Canyon ACEC Same as Alternative A.	Dark Canyon ACEC This area would not be designated as an ACEC.	Dark Canyon ACEC This area would not be designated as an ACEC.	Dark Canyon ACEC Same as Alternative A.	Dark Canyon ACEC This area would not be designated as an ACEC.
	Hovenweep ACEC Impacts would be same as Cedar Mesa ACEC.	Hovenweep ACEC Impacts same as Alternative A.	Hovenweep ACEC Impacts same as Alternative A.	Hovenweep ACEC ACEC would not be established, with increased potential for adverse, long-term impacts from minerals development, vegetation treatment projects, and recreational activities, including OHV use.	Hovenweep ACEC Same as Alternative B.	Hovenweep ACEC Impacts same as Alternative A, except potentially beneficial impacts from management of visual protection zone as VRM Class II.
	Indian Creek ACEC Long-term beneficial impacts to cultural resources from management decisions that would limit surface disturbances and close the area to OHV use.	Indian Creek ACEC Impacts same as A	Indian Creek ACEC Impacts same as B, except that the ACEC would be reduced in area by 54%.	Indian Creek ACEC The ACEC would not be established, with increased potential for long-term adverse impacts to cultural resources that lie outside of WSAs from lack of specific resource protections. Beneficial impacts	Indian Creek ACEC Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics.	Indian Creek ACEC Impacts same as B, except that ACEC would be reduced in area by 54%. Potential beneficial impacts from designation of ROW avoidance area.

Table 2.2. Summary of Impacts

				on cultural resources from designated OHV use.		
	<p>Lockhart Basin ACEC The area would not be managed as an ACEC. Long-term, beneficial impacts on cultural resources from VRM II surface disturbance restrictions, prohibitions on woodcutting, and closure of the area to OHV use.</p>	<p>Lockhart Basin ACEC Impacts to resources and users same as A, but to a greater degree, from designation as a 47,783-acre ACEC and restrictions on surface disturbance under VRM I objectives.</p>	<p>Lockhart Basin ACEC Not designated as an ACEC. Increased potential for adverse impacts from mineral leasing, livestock grazing, and OHV use on designated routes in VRM III areas.</p>	<p>Lockhart Basin ACEC Impacts same as Alternative C.</p>	<p>Lockhart Basin ACEC Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics.</p>	<p>Lockhart Basin ACEC Impacts same as Alternative C.</p>
	<p>Lavender Mesa ACEC Designated as a 649-acre ACEC, with long-term, beneficial impacts on cultural resources from protection of visual, cultural, and natural resources.</p>	<p>Lavender Mesa ACEC Impacts same as Alternative A.</p>	<p>Lavender Mesa ACEC Impacts same as Alternative A.</p>	<p>Lavender Mesa ACEC The ACEC would not be established, with increased potential for long-term, adverse impacts from unrestricted surface-disturbing activities.</p>	<p>Lavender Mesa ACEC Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics.</p>	<p>Lavender Mesa ACEC Impacts same as Alternative A, but with greater long-term beneficial impacts and decreased potential for long-term adverse impacts from restrictions on surface disturbances.</p>
	<p>Shay Canyon ACEC Management of the 3,561-acre ACEC for cultural conservation, with long-term, beneficial impacts from protective buffers around cultural resources that are eligible for the NRHP, management under VRM I</p>	<p>Shay Canyon ACEC Managed as a 119-acre ACEC, with long-term beneficial impacts from surface disturbance prohibitions, closed to camping, and grazing restrictions. Long term, beneficial impacts in areas closed or limited to</p>	<p>Shay Canyon ACEC Impacts identical to Alternative B.</p>	<p>Shay Canyon ACEC Long-term, adverse impacts on cultural resources from management under VRM III objectives, open to livestock grazing, and subject to fuels and watershed treatments.</p>	<p>Shay Canyon ACEC Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics.</p>	<p>Shay Canyon ACEC Same as Alternative B but with potential beneficial impacts from designation as a ROW avoidance area.</p>

Table 2.2. Summary of Impacts

	conditions, exclusion of private and commercial woodland harvesting, and conditional fire suppression. Potential for long-term, adverse impacts from minerals activities, and livestock grazing. Adverse impacts from open OHV use.	OHV routes.				
	San Juan River ACEC The area would be managed as a 15,100-acre ACEC, with impacts same as the San Juan River SRMA.	San Juan River ACEC Managed as a 7,590-acre ACEC, with long-term, beneficial impacts on cultural resources from actions that limit or restrict surface disturbances and provide for closure of areas to protect specific cultural sites.	San Juan River ACEC Impacts the same as Alternative B.	San Juan River ACEC No designation of ACEC, with impacts same as Alternative B. Greater surface disturbance would be allowable, with greater potential for long-term, adverse impacts to cultural resources.	San Juan River ACEC Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics..	San Juan River ACEC Impacts the same as Alternative B except for ACEC would be reduced by 43%. Potential beneficial impacts from designation of Segments 1, 2 and 3 as ROW avoidance areas.
	Valley of the Gods ACEC Managed as 31,387-acre ACEC under VRM I objectives, with long term, beneficial impacts from limitations on surface disturbances. Potential for long-term adverse impacts from livestock grazing, woodland harvesting, and minerals activities, and OHV	Valley of the Gods ACEC Managed as a 22,863-acre ACEC, with impacts same as A. Slightly increased beneficial impacts to cultural resources within the smaller ACEC from closure to woodland harvesting.	Valley of the Gods ACEC Impacts same as Alternative B.	Valley of the Gods ACEC No designation of an ACEC and management under VRM III would have potential for long-term, adverse impacts to cultural resources through greater allowance of surface-disturbing activities than under any other alternative.	Valley of the Gods ACEC Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics.	ACEC Impacts the same as Alternative B but with potential beneficial impacts from designation as ROW exclusion areas.

Table 2.2. Summary of Impacts

	use.					
Special Designations, WSRs	WSR Colorado Segments Negligible impact on cultural resources from prohibitions on surface disturbances.	WSR Colorado Segments Long-term, beneficial impact on cultural resources from management of Segments 2 and 3 under VRM I and II, and from closure of Segment 3 to OHV use.	WSR Colorado Segments Impacts same as Alternative B.	WSR Colorado Segments Increased potential for long-term, adverse impacts to cultural resources from a lack of special restrictions on surface-disturbing activities.	WSR Colorado Segments Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics in Segments 2 and 3..	WSR Colorado Segments Impacts same as Alternative B.
	WSR San Juan River Segments Long-term, beneficial impacts to cultural resources from management under VRM I restrictions on surface-disturbing activities.	WSR San Juan River Segments Long-term beneficial impacts on cultural resources from implementation of NSO stipulations and restrictions on mineral disposal and geophysical work.	WSR San Juan River Segments Long-term adverse impacts to cultural resources from not designating the area as suitable and subsequent increases in surface-disturbing activities.	WSR San Juan River Segments Same as Alternative C.	WSR San Juan River Segments Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics in Segments 3 and 4..	WSR San Juan River Segments Same as Alternative C but additional beneficial impacts from closure to leasing and OHV use, and designation as VRM Class I and ROW exclusion area in Segment 5
	WSR All Other Segments Long-term adverse impacts from not evaluating river segments for suitability and not implementing restrictions on surface-disturbing activities.	WSR All Other Segments Long-term beneficial and adverse impacts from management under VRM II and III, and application of Standard or NSO oil and gas leasing stipulations.	WSR All Other Segments Long-term adverse impacts from not designating rivers segments as suitable and implementing related restrictions on surface-disturbing activities.	WSR All Other Segments Same as Alternative C.	WSR All Other Segments Same as Alternative B, except additional beneficial impacts from decreased surface disturbances of non-WSA lands with wilderness characteristics in Dark Canyon, Fable Valley and Indian Creek.	WSR All Other Segments Same as Alternative C.
Special Designations, WSAs	387,410 acres would be protected to meet the non-impairment criteria of the IMP,	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	which limits surface-disturbing activities and access.					
Special Status Species	Long-term beneficial impacts from spatial buffers with restrictions on surface-disturbing activities and vegetation treatments.	Impacts as Alternative A, except slightly more beneficial impacts from increased spatial buffers.	Greater long term, beneficial impacts than Alternatives A and B from increased spatial buffers.	Impacts same as Alternative A.	Impacts same as Alternative B.	Similar long-term beneficial impact on as Alternatives B and C because of the similar buffer areas and restrictions .
Travel Management	Long-term, beneficial impacts to cultural resources on 142,008 acres of high site-density area that is closed to OHV use. Long-term adverse impacts to cultural resources on 423,619 acres open to OHV use in high site-density areas.	Long-term, beneficial impacts to cultural resources on 238,879 acres of high site density area that is closed to OHV use, and 325,669 acres of high site-density where OHV use is limited to designated routes.	Long-term, beneficial impacts to cultural resources on 234,890 acres of high site density area that is closed to OHV use and 750,153 acres limited to designated routes.	Long-term, beneficial impacts on cultural resources from limiting OHV use to designated routes on 985,043 acres in high site-density areas.	Same as Alternative B except that 474,291 acres of high site-density lands would be beneficially closed to OHV use.	Same as Alternative B except that 234,604 acres of high site-density lands would be beneficially closed to OHV use.
Vegetation	Impacts same as Fire Management because treatments and impacts are the same.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Visual Resources	Long-term, beneficial impacts on cultural resources from protection of 395,797 acres of high site-density and 330,313 acres of medium site-density under VRM Class I and Class II designations. Potentially adverse impacts to cultural resources on lands designated as VRM	Long-term, beneficial impacts on cultural resources from management of 431,797 acres in high site-density and 315,022 acres of medium site-density under VRM Class I and II, with slightly more benefit than Alternative A. Adverse impact to cultural resources	Long-term, beneficial impacts on cultural resources from management of 324,539 acres of high site-density and 242,876 acres of medium site-density under VRM Class I and II. Slightly less beneficial impacts than Alternative A from designation of 1,225,915 acres as	Long-term, beneficial impacts from management of 237,057 acres of high site-density and 162,201 acres of medium site-density under VRM Class I and II designations. Slightly higher benefit than Alternative A. Long term, adverse impacts from	Long-term, beneficial impacts on cultural resources from management of 565,528 acres of high site-density and 544,314 acres of medium site-density under VRM Class I and II objectives. Slightly higher benefit than Alternatives A and B. Adverse impact to cultural resources	Long-term, beneficial impacts on cultural resources from management of 351,283 acres in high site-density and 299,745 acres of medium site-density under VRM Class I and II, with slightly less benefit than Alternative A.

Table 2.2. Summary of Impacts

	Class III and IV (1,054,681 acres).	from designation of 1,034,813 acres as VRM Class III and IV.	VRM Class III and IV.	designation of 1,383,860 acres as VRM Class III and IV.	from designation of 671,828 acres as VRM Class III and IV.	
Wildlife and Fisheries Resources	Negligible impacts on cultural resources from seasonal restrictions.	Same as Alternative A, but with moderate long-term, beneficial impacts from on minor restrictions on OHV use and minerals development.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.
Woodlands	Long-term, direct and indirect adverse impacts to cultural resources on 464,446 acres of high site-density and 392,559 acres of medium site-density from a lack of restrictions on woodland harvesting and related OHV use.	Slightly less long-term adverse impacts than Alternative A from designating 307,179 acres in high site density areas and 504,391 acres in medium density areas as open to woodland harvesting, with limited restrictions on related OHV travel. Long-term beneficial impacts to cultural resources in areas closed to woodland harvesting, especially in the Cedar Mesa CRSMA.	Impacts same as Alternative B, from designating 367,319 acres of high site-density and 229,492 acres of medium site-density as available for woodland harvesting.	Same as Alternative C.	Similar to Alternative B, except fewer acres (241,712 total) of high site density lands and 129,498 acres of medium site-density would be open to woodland harvesting, with greater long-term beneficial impact to cultural resources from less opportunity for surface disturbances.	Similar to Alternative A, except more acres (507,753 total) of high site density lands and 333,708 acres of medium site-density would be open to woodland harvesting. However, potential beneficial impact to cultural resources from woodlands management decisions under the Proposed Plan would probably be lower than those anticipated for Alternative A because the Proposed Plan imposes greater travel restrictions and requirements for cultural-resource inventories.
FIRE MANAGEMENT						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan

Table 2.2. Summary of Impacts

Air Quality	All prescribed burns would be in accordance with applicable air quality regulations and the Smoke Management MOU, which could impact the size and timing of fire management activities. Limitations would not substantially reduce the effectiveness of fire management or increase fire risk.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Cultural Resources	Restrictions on pinyon-juniper treatments on 26,902 acres to protect cultural resources would adversely increase fuel loading, slightly increasing the risk of wildland fire. Restrictions on woodland harvesting on 26,915 acres to protect would adversely increase fuel loading in pinyon-juniper and confer, unless other treatments were used.	Adverse impacts on fire management on 46,042 acres from fire management restrictions in pinyon-juniper and prohibitions on treatments in the 37,388-acre Grand Gulch Historic District to protect cultural resources. Restrictions on woodland harvesting on 79,163 acres to protect would adversely increase fuel loading in pinyon-juniper and confer. Adverse restrictions on fuels management would be the greatest under this alternative and Alternative E.	Same types and acres of potential fire management treatments as Alternative A, but with additional beneficial impacts from additional 26,902 acres available for fire management in pinyon-juniper. Restrictions on woodland harvesting on 45,703 acres to protect would adversely increase fuel loading in pinyon-juniper and confer as compared to Alternative A.	Similar impacts as Alternative C, as restricted acreages are similar.	Same impacts as Alternative B as restricted acreages are the same.	Same impacts as Alternative C, but with slightly decreased fire risk from lack of woodland harvesting prohibitions on treatments on 20,302 acres in Beef Basin.

Table 2.2. Summary of Impacts

Fire Management	5,000-10,000 acres per year of prescribed fire and non-fire treatments would beneficially reduce fuels and lessen wildfire severity in the long term.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Lands and Realty	Beneficial, but minor, risk reduction of accidental fire starts due to limits on the number of people and vehicles associated with filming, and on the use of pyrotechnics and explosives.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Mineral and Energy Resources	Adverse, but minor, increase in fire risks from creation of additional WUI areas.	Impacts similar to Alternative A, but slightly greater.	Impacts similar to Alternative A, but slightly greater..	Same as Alternative A. but slightly greater. Alternative D has the greatest amount of land available for surface-disturbing mineral extraction	Same as Alternative A. but less, as Alternative E has the least amount of land available for surface-disturbing mineral extraction	Impacts similar to Alternative A, but slightly greater.
Non-WSA Lands with Wilderness Characteristics	Negligible impacts to fire management, as non-WSA lands with wilderness characteristics would not be protected (with no prohibitions on fuel load reductions and treatments.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Adversely increased risks of fire from prohibitions on treatments and fuel load reductions on 582,360 acres of non-WSA lands with wilderness characteristics	Adversely increased risks of fire from prohibitions on treatments and fuel load reductions on 88,871 acres of non-WSA lands with wilderness characteristics
Recreation	Adverse, but minor, impacts from risks of human-caused fire in campgrounds and from dispersed	Same as Alternative A, but with additional adverse impacts from 495,825 acres of SRMAs unavailable	Same as Alternative A, but with additional adverse impacts from 120,091 acres of SRMAs unavailable	Same as Alternative A, but with additional adverse impacts from 120,091 acres of SRMAs	Same as Alternative B.	Same as Alternative C

Table 2.2. Summary of Impacts

	camping campfires, and increased number of WUI areas and developed recreation areas, would reduce the number of acres available for wildland fire use and be unavailable for woodland harvest.	for woodland harvest. SRP requirements for 15+ OHV/vehicles would provide some opportunity for wildfire education as compared to Alternative A.	for woodland harvest. SRP requirements for 25+ OHV/vehicles would provide some opportunity for wildfire education as compared to Alternative A.	unavailable for woodland harvest.		
Special Designations	Adverse impacts from additional fuel loading that would increase the risk of wildland fire from restrictions on vegetation treatments over 386,027 acres in WSAs and 7,099 acres in ACECs; and woodland harvest prohibitions on 114,461 acres of pinyon-juniper and conifer areas in ACECs.	Adverse impacts from additional fuel loading that would increase the risk of wildland fire from restrictions on vegetation treatments over 386,027 acres in WSAs and 59,079 acres in ACECs; and woodland harvest prohibition in 353,858 acres of pinyon-juniper and conifer areas in ACECs. Adverse restrictions on fuels management would be the greatest under this alternative and Alternative E.	Reduced risks of fuel loading from fewer vegetation treatments restrictions on treatments (386,027 acres in WSAs and 608 acres in ACECs); woodland harvest prohibitions in 49,998 acres of pinyon-juniper and conifer areas of ACECs.	Reduced risks of fuel loading from fewest restrictions on fuel treatments (386,027 acres of WSAs and 0 acres in ACECs); woodland harvest prohibitions in 47,285 acres of pinyon-juniper and conifer areas. Adverse restrictions on fuels management would be the least under this alternative.	Same impacts as Alternative B.	Same impacts as Alternative C, but slightly increased except woodland harvest would be prohibited on 107,507 acres of pinyon-juniper and conifer areas of ACECs.
Travel	Adverse, impacts from risks of human-caused fire on 611,310 acres open to cross country travel, due to inadvertent fire starts	Beneficial, impacts by prohibiting all cross country travel, limiting OHV use to existing and designated routes and closing 423,698 acres of	Beneficial impacts by limiting to cross country travel to 2,331 acres and closing 418,667 acres of trails to OHV use.	Impacts similar to C, but not as beneficial as no routes would be closed.	Impacts similar to Alternative B, except 970,435 acres of routes would be closed. This alternative would have the most	Beneficial impacts by limiting to cross country travel to 97 acres and closing 393,909 acres of trails to OHV use.

Table 2.2. Summary of Impacts

	from motorized vehicles.	trails to OHV use.			beneficial impacts on fire management.	
HEALTH AND SAFETY						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Health and Safety	Hazardous material health and safety risks from mineral exploration and development on 69% of the PA open to standard and special mineral leasing stipulations.	Same as Alternative A, as 70% of PA would open to minerals exploration and development.	Same as Alternative A, except 76% of PA open to standard and special leasing would create minimal additional risks to health and safety.	Same as Alternative C, as approximately 78% of PA would be open to standard and special minerals leasing stipulations, with activities that could cause risks to health and safety.	Permitted standard and special minerals leasing on 43% of PA would moderately reduce the potential risks to health and safety from minerals exploration and development activities.	Same as Alternative A, as approximately 69% of the PA would open to mineral exploration and development.
LANDS AND REALTY						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Lands and Realty	Not addressed in current RMP	Application of the minimum impact criteria for filming permits would facilitate use of public lands for this purpose while protecting other resources and meeting the resource goals and objectives of the RMP by streamlining the permit application and encouraging the use of previously approved locations that meet the minimal impact criteria.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.
Lands and Realty	Not addressed in current RMP.	Wind and solar energy development would be permissible; best management	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.

Table 2.2. Summary of Impacts

		practices from the Final Wind Energy Programmatic EIS would be stipulated in ROW grants. Implementation would allow Monticello PA lands to be used for alternative energy and communications uses, but BMPs could add to the cost to site and construct facilities.				
Lands and Realty	120,800 acres of ROW exclusion and 253,790 acres of avoidance areas would restrict ROW placement, limit future access, increase energy supply costs, or delay the availability of communication services.	Impacts similar to Alternative A, but greater as there would be 416,612 acres of proposed ROW exclusion areas and 125,105 acres of ROW avoidance areas.	Impacts similar to Alternative A, but greater as there would be 395,329 acres of ROW exclusion areas and 39,323 acres of ROW avoidance areas.	Impacts less than Alternative A, as there would be 86,853 acres of ROW exclusion areas and 14,175 acres of ROW avoidance areas.	Impacts similar to Alternative A, but greater as there would be 974,463 acres of ROW exclusion, and 53,915 acres of ROW avoidance.	Impacts similar to Alternative A, but greater as there would be 493,400 acres of ROW exclusion areas and 66,108 acres of ROW avoidance areas.
Lands and Realty	132,380 acres would be recommended for mineral withdrawal, resulting in potentially fewer opportunities for mineral resource development and less production and supply of mineral resources.	Impacts similar to Alternative A, but greater, as 251,710 acres are recommended for mineral withdrawal.	Impacts similar to Alternative A, but slightly less, as 121,912 acres are recommended for mineral withdrawal.	Impacts similar to Alternative A, but less, as 46,131 acres are recommended for mineral withdrawal.	Impacts similar to Alternative A, but much greater, as 834,070 acres are recommended for mineral withdrawal.	Impacts similar to Alternative D, but slightly greater, as 50,665 acres recommended for mineral withdrawal.
LIVESTOCK GRAZING						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan

Table 2.2. Summary of Impacts

Cultural Resources	Long term, beneficial impacts from Comb Ridge, Tank Bench, Beef Basin, and Grand Gulch National Historic District beneficially open to grazing (except Grand Gulch Canyon and associated tributaries). Minor impacts from acres unavailable to grazing within Grand Gulch Special Emphasis Area.	Same impacts as Alternative A.	Same as Alternative A	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Fire Management	Short-term, adverse impacts on livestock grazing in treated areas. Long-term, beneficial impacts from reduced risk of fire and improved forage productivity.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Health and Safety	Negligible impacts on livestock grazing in the short-term. Reclamation of mine sites could beneficially expand grazing opportunities in the long-term.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Lands and Realty	Land exchanges and sales could adversely decrease forage in AUMs available to livestock, but acquisitions could beneficially increase acres and AUMs	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	available for livestock. Short-term loss of AUMs from construction activities. Long term loss of AUMs and forage acres from facility construction.					
Livestock Grazing	Adverse impacts to grazing from existing and proposed areas unavailable for livestock grazing.	Same impacts as Alternative A, except additional areas would be designated as unavailable for livestock grazing.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.
Minerals and Energy Resources	Surface-disturbing activities on 699 total acres under this alternative could lead to long term, adverse losses of AUMs and acres available to livestock grazing.	Same impacts as Alternative A, except surface disturbances would total 636 acres.	Minor, adverse impacts from surface disturbances totaling 710 acres.	Long term, adverse impacts from surface disturbances totaling 721 acres.	Same as Alternative A, except surface disturbances would total 519 acres.	Same as Alternative C.
Non-WSA Lands with Wilderness Characteristics	Negligible impacts to livestock grazing.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Long term, beneficial impacts to livestock grazing on 582,357 acres of lands with non-WSA wilderness characteristics from no surface disturbances to vegetation, and no OHV disturbances.	Same as Alternative A.
Recreation	Negligible impacts from grazing prohibitions within Pearson Canyon and developed recreation sites. Beneficial impacts from allowed grazing in San Juan River SRMA and the	Same as Alternative A, except adverse impacts from timing restrictions in San Juan River SRMA riparian areas.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.

Table 2.2. Summary of Impacts

	Cedar Mesa CSRMA.					
Riparian Resources	Short term, adverse decrease in the acres and AUMs available to livestock from exclusion, seasonal closure, and forage limitations to improve riparian areas. Long-term beneficial impacts from increase in acres and/or AUMs available to livestock after riparian rehabilitation.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Soil and Water Resources	Short term and long term decreases in acres or AUMs available to livestock from mitigation to improve damaged soils.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Special Designations, ACECs	Long term, adverse impacts to grazing from unavailable acreages in ACECs.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Special Designations, WSRs	Minor impacts to livestock grazing from prohibitions or limits on livestock structure construction and fencing.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Special Designations, Wilderness	Minor impacts to livestock grazing from prohibitions or limits on livestock structure construction and fencing.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

Travel Management	Long term, adverse impacts from 611,310 acres open to cross-country OHV use from noise disturbances, and reduction of vegetation/forage productivity.	Long term, beneficial impacts from reduction of noise impacts and surface disturbances to forage. No acres would be managed as open to OHV use.	Same as Alternative B, except approximately 2,311 acres would be managed as open to cross-country OHV use.	Same as Alternative C; 2,311 acres would be managed as open to cross-country OHV use.	Same as Alternative C; 2,311 acres would be managed as open to cross-country OHV use.	Same as Alternative B. No acres would be managed as open to OHV use.
Vegetation	Short-term, adverse impacts on livestock grazing in areas that are closed following vegetation treatments (232,130 acres). Long-term, beneficial impacts from improved forage conditions and productivity.	Same as Alternative A, but to a lesser degree, treatments on approximately 152,000 acres over 20 years.	Same as Alternative A, but to a lesser degree, treatments on approximately 186,000 acres over 20 years.	Same as Alternative A, from treatments impacts to 226,000 acres over 20 years.	Same as Alternative B.	Same as Alternative B; treatments on approximately 186,000 acres over 20 years
MINERALS AND ENERGY RESOURCES						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Minerals and Energy Resources, Open to Leasing	Approximately 1,238,230 acres (69.4% of BLM lands) would be beneficially open under standard and special stipulations.	Approximately 1,241,910 acres would be open under standard and special stipulations. This decision would result in a more beneficial impact to minerals resources compared to A, as 0.3% more acres would be open to leasing.	Approximately 1,348,973 acres would be open under standard and special stipulations. This decision would result in a more beneficial impact compared to A, as 8.9% more acres would be open to leasing.	Approximately 1,383,283 acres would be open under standard and special stipulations. This decision would result in a more beneficial impact compared to A, as 11.7% more acres would be open to leasing.	Approximately 758,929 acres would be open under standard and special stipulations. This decision would result in an adverse impact to minerals resources, compared to A, as 26.9% fewer acres would be open to leasing.	Approximately 1,224,911 acres would be open under standard and special stipulations. This decision would be less beneficial to minerals resources compared to A, as 13,319 acres less would be available for leasing.
Minerals and Energy Resources, Oil and Gas Wells	An average of 73 RFD-predicted oil and gas wells would be drilled over the next fifteen years.	An average of 66 RFD-predicted oil and gas wells would be drilled over the next fifteen years, with adverse impacts	An average of 74 RFD-predicted oil and gas wells would be drilled over the next fifteen years, with beneficial impacts	An average of 75 RFD-predicted oil and gas wells would be drilled over the next fifteen years, with beneficial	An average of 54 RFD-predicted oil and gas wells would be drilled over the next fifteen years, with adverse impacts	An average of 72 RFD-predicted oil and gas wells would be drilled over the next fifteen years, with adverse impacts

Table 2.2. Summary of Impacts

		compared to A, as 9.6% fewer wells would be drilled.	compared to A, as 1.4% more wells would be drilled.	impact compared to A, as 2.7% more wells would be drilled.	compared to A, as 26.0% fewer wells would be drilled.	compared to A, as 1.4% less wells would be drilled.
Minerals and Energy Resources, Geophysical	Approximately 559 linear miles of source line would be conducted over the next fifteen years.	Approximately 507 linear miles of source line would be conducted over the next fifteen years, with long term, adverse impacts compared to A, as 10.4% fewer linear miles of source line would be conducted.	Approximately 573 linear miles of source line would be conducted over the next 15 years, with long term, beneficial impacts compared to A, as 1.9% more linear miles of source line would be conducted.	Approximately 585 linear miles of source line would be conducted over the next fifteen years, with long term, beneficial impacts compared to A, as 4.3% more linear miles of source line would be conducted.	Approximately 380 linear miles of source line would be conducted over the next fifteen years, with long term, adverse impacts compared to A, as 32.0% fewer linear miles of source line would be conducted.	Approximately 556 linear miles of source line would be conducted over the next fifteen years, with impacts similar to Alternative A..
Minerals and Energy Resources, Locatable	Approximately 1,675,057 acres (93.8% of BLM lands) would be open to mineral entry.	Approximately 1,527,656 acres would be open to mineral entry. This decision would result in an adverse impact compared to A, as 8.8% fewer acres would be open.	Approximately 1,682,865 acres would be open to mineral entry. This decision would result in a beneficial impact compared to A, as 0.5% more acres would be open.	Approximately 1,739,389 acres would be open to mineral entry. This decision would result in a beneficial impact compared to A, as 3.8% more acres would be open.	Approximately 1,015,384 acres would be open to mineral entry. This decision would result in an adverse impact compared to A, as 39.4% fewer acres would be open.	Approximately 1,734,458 acres would be open to mineral entry. This decision would result in a beneficial impact compared to A, as 3.4 % more acres would be open.
Minerals and Energy Resources, Salable	Approximately 1,389,256 acres (77.8% of BLM lands) would be open to mineral material disposal.	Approximately 1,241,906 acres would be open to mineral material disposal. This decision would result in an adverse impact compared to A, as 10.6% fewer acres would be open.	Approximately 1,358,968 acres would be open to mineral material disposal. This decision would result in an adverse impact compared to A, as 2.2% fewer acres would be open.	Approximately 1,383,277 acres would be open to mineral material disposal. This decision would result in an adverse impact compared to A, as 0.4% fewer acres would be open.	Approximately 758,931 acres would be open to mineral material disposal. This decision would result in an adverse impact compared to A, as 45.4% fewer acres would be open.	Approximately 1,348,968 acres would be open to mineral material disposal. This decision would result in an adverse impact compared to A, as 2.9 % fewer acres would be open.
Lands and Realty,	Long-term, adverse	Impacts same as	Impacts same as	Impacts same as	Impacts same as	Impacts same as

Table 2.2. Summary of Impacts

Recommendations for withdrawal from mineral entry	impacts on approximately 132,380 acres (7.4% of planning area) recommended for withdrawal from mineral entry.	Alternative A, except approximately 251,710 acres (14.0% of PA) would be recommended for withdrawal from mineral entry.	Alternative A, except approximately 121,912 acres (6.8% of PA) would be recommended for withdrawal from mineral entry.	Alternative A, except approximately 46,131 acres (2.6% of PA) would be recommended for withdrawal from mineral entry.	Alternative A, except approximately 834,070 acres (46.9% of PA) of non-WSA lands with wilderness characteristics would be managed as exclusion areas for ROWs, which would have adverse impacts on mineral production and access for exploration.	Alternative A, except approximately 50,665 acres (2.8% of PA) would be recommended for withdrawal from mineral entry.
Non-WSA Lands with Wilderness Characteristics	No impacts to mineral and energy resources as non-WSA lands with wilderness characteristics are not protected under this alternative.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Adverse impacts from making approximately 582,357 acres of non-WSA lands with wilderness characteristics (or 32.6% of BLM lands) unavailable to mineral resource development.	Adverse impacts from making approximately 88,871 acres of non-WSA lands with wilderness characteristics (or 5.0% of BLM lands) unavailable to mineral resource development.
Recreation, San Juan River SRMA	Non-riparian areas in the 10,203-acre SRMA are open subject to Standard and Special Stipulations.	The entire 10,203-acre SRMA—not just riparian areas—would be subject to NSO. This decision results in an adverse impact compared to A.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.
Recreation, Cedar Mesa SRMA	The areas of the 375,734-acre CSRMA that are outside WSAs would be subject to Standard, Special, and NSO stipulations.	The areas of the 375,734-acre CSRMA outside WSAs would be subject to Standard and Special stipulations, with beneficial, long term impacts, compared to A.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.
Soil and Water	Long term, adverse	Same impacts as A,	Same as Alternative	Same impacts as A,	Same impacts as A,	Same impacts as A,

Table 2.2. Summary of Impacts

Resources, Sensitive Soils	impacts from a minimum of 1,063,019 acres of sensitive soils with medium and high limitations available for development, requiring BMPs and mitigation.	except a minimum of 1,049,158 acres of sensitive soils with medium and high limitations would be available for development.	A.	except a minimum of 1,069,495 acres of sensitive soils with medium and high limitations would be available for development.	except a minimum of 659,170 acres of sensitive soils with medium and high limitations would be available for development.	except a minimum of 1,063,652 acres of sensitive soils with medium and high limitations would be available for development.
Soil and Water Resources, Slopes over 20%	N/A	Long-term, adverse impacts from 21–40% steep slope and > 40% slopes requiring plans and/or no surface disturbances.	Impacts same as Alternative B, except >40% slopes would not allow surface disturbances unless project re-siting is problematic.	Long-term, adverse impacts from >40% slopes that would require a plan.	Same as Alternative B.	Same as Alternative C.
Special Designations, ACECs	Long-term, adverse impacts from approximately 119,397 acres (6.7% of planning area) closed or NSO due to ACEC designation.	Long-term, adverse impacts from approximately 87,567 acres (26.7% fewer acres of planning area than Alternative A) closed or NSO due to ACEC designation.	Long-term, adverse impacts from approximately 76,764 acres (35.7% fewer acres of planning area than Alternative A) closed or NSO due to ACEC designation.	Long-term, beneficial impacts to minerals as no acres would be closed or subject to NSO due to ACEC designation.	Long-term, adverse impacts from approximately 38,668 acres (67.6% fewer acres of planning area than Alternative A) closed or NSO due to ACEC designation.	Long-term, adverse impacts from approximately 74,429 acres (37.6% fewer acres of planning area than Alternative A) closed or NSO due to ACEC designation.
Special Designations, WSRs	N/A	Long-term, adverse impacts from Closed or NSO leasing on approximately 11,040 acres) due to WSR recommendations.	Long-term, adverse impacts from Closed or NSO leasing on approximately 3,968 acres due to WSR recommendations.	Long-term, beneficial impacts to minerals from no acres lands Closed or NSO due to WSR recommendations.	Same as Alternative B.	Long-term, adverse impacts from Closed or NSO leasing on approximately 6,736 acres) due to WSR recommendations
Wildlife,, Days that Limitations Are in Effect	Adverse impacts from limitations on speed and schedule for minerals activities for approximately 273 days of the year for seasonal restrictions.	Same as Alternative A.	Impacts same as Alternative A, except limitations would be in effect for approximately 243 days of the year.	Same as Alternative C.	Same as Alternative A.	Same as Alternative C.
Vegetation, Protection of Relict	Minor, adverse impacts from	Same as Alternative A.	Same as Alternative A.	Long-term, beneficial impacts to minerals	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

and Near-relict Vegetation	protection of 662 acres of relict and near-relict vegetation.			from no protection of relict and near-relict vegetation.		
Visual Resources, VRM I Designation	Long-term, adverse impacts from designation of approximately 371,575 acres (20.9% of planning area) as VRM I, with surface disturbance limits on minerals activities.	Same as Alternative A, except approximately 497,668 acres (33.9%) would be designated as VRM I.	Same as Alternative A, except approximately 425,179 acres (14.4%) would be designated VRM I.	Same as Alternative A, except approximately 390,424 acres (5.1%) would be designated as VRM I.	Same as Alternative A, except approximately 998,370 acres (56.0%) would be designated as VRM I.	Same as Alternative A, except approximately 422,989 acres (24.0%) would be designated as VRM I.
NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Non-WSA Lands with Wilderness Characteristics	No actions prescribed specifically for the protection non-WSA lands with wilderness characteristics.	No actions prescribed specifically for the protection non-WSA lands with wilderness characteristics.	No actions prescribed specifically for the protection non-WSA lands with wilderness characteristics.	No actions prescribed specifically for the protection non-WSA lands with wilderness characteristics.	582,360 acres in 29 non-WSA lands with wilderness characteristics would be managed with emphasis on protection of wilderness characteristics	88,871 acres in 5 non-WSA lands with wilderness characteristics would be managed with emphasis on protection of wilderness characteristics.
Minerals	470,590 acres of non-WSA lands with wilderness characteristics would remain open to leasing under standard or timing and controlled surface use stipulations. Up to 37 wells could be drilled over the next 15 years disturbing 355 acres.	485,010 acres of non-WSA lands with wilderness characteristics would remain open to leasing under standard or timing and controlled surface use stipulations. Up to 38 wells could be drilled over the next 15 years disturbing 365 acres.	548,350 acres of non-WSA lands with wilderness characteristics would remain open to leasing under standard or timing and controlled surface use stipulations. Up to 39 wells could be drilled over the next 15 years disturbing 374 acres.	582,360 acres of non-WSA lands with wilderness characteristics would remain open to leasing under standard or timing and controlled surface use stipulations. Up to 37 wells could be drilled over the next 15 years disturbing 355 acres.	All 582,360 acres of non-WSA lands with wilderness characteristics would be closed to leasing. However, 4,440 acres are currently exist in 10 of the non-WSA lands with wilderness characteristics, and would allow for development. Possibility of development in the Monument Upwarp development area.	460,093 acres of non-WSA lands with wilderness characteristics would remain open to leasing under standard or timing and controlled surface use stipulations. Up to 39 wells could be drilled over the next 15 years disturbing 374 acres.

Table 2.2. Summary of Impacts

					Generally, the wilderness characteristics of all non-WSA lands with wilderness characteristics would be protect.	
Visual Resources	262,340 acres in all or parts of 25 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives, limiting surface disturbance and protecting the natural characteristics of the areas.	219,267 acres in all or parts of 23 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives, limiting surface disturbance and protecting the natural characteristics of the areas.	125,370 acres in all or parts of 20 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives, limiting surface disturbance and protecting the natural characteristics of the areas.	6,350 acres in parts of 4 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives, limiting surface disturbance and protecting the natural characteristics of the areas.	582,360 acres in all of 29 non-WSA lands with wilderness characteristics would be managed by VRM Class I objectives, limiting surface disturbance and protecting the natural characteristics of the areas.	195,205 acres in all or parts of 20 non-WSA lands with wilderness characteristics would be managed by VRM Class I and Class II objectives, limiting surface disturbance and protecting the natural characteristics of the areas.
Travel Management	140,600 acres of non-WSA lands with wilderness characteristics would be "open" to cross country motorized travel, resulting in potential surface disturbance and degradation of the natural characteristics of these areas. 388,390 acres "limited" to 410 miles of designated routes. The presence and noise of vehicle use would diminish opportunities for solitude and conflict with primitive	547,290 acres "limited" to 258 miles of designated routes. The presence and noise of vehicle use would diminish opportunities for solitude and conflict with primitive recreation activities. 35,070 acres "closed" to motorized vehicle use, protecting the natural characteristics and opportunities for solitude and primitive recreation.	552,960 acres "limited" to 348 miles of designated routes. The presence and noise of vehicle use would diminish opportunities for solitude and conflict with primitive recreation activities. 29,400 acres "closed" to motorized vehicle use, protecting the natural characteristics and opportunities for solitude and primitive recreation.	20 acres in Indian Creek non-WSA lands with wilderness characteristics would be "open" to cross country travel with impacts as described under Alternative A. 582,340 acres "limited" to 410 miles of designated routes. The presence and noise of vehicle use would diminish opportunities for solitude and conflict with primitive recreation activities.	582,360 acres "closed" to motorized vehicle use, protecting the natural characteristics and opportunities for solitude and primitive recreation.	88,871 acres "limited" to 175 miles of designated routes in non-WSA lands with wilderness characteristics managed to protect those characteristics. 488,891 acres "limited" to 173 miles in non-WSA lands with wilderness characteristics managed for other resource values and uses. The presence and noise of vehicle use would diminish opportunities for solitude and conflict with primitive recreation activities.

Table 2.2. Summary of Impacts

	recreation activities. 53,370 acres “closed” to motorized vehicle use, protecting the natural characteristics and opportunities for solitude and primitive recreation.					4,598 acres “closed” to motorized vehicle use in non-WSA lands with wilderness characteristics managed for other resource values and use, protecting the natural characteristics and opportunities for solitude and primitive recreation.
Woodlands	Wood cutting prohibited on 361,616 acres in all or portions of 24 non-WSA lands with wilderness characteristics protecting the natural characteristics of the areas by preventing surface disturbance associated with wood cutting. Wood cutting permitted on 220,744 acres, degrading the natural characteristics of the affected non-WSA lands with wilderness characteristics and opportunities for both solitude and primitive recreation.	Wood cutting prohibited on 387,090 acres in all or portions of 24 non-WSA lands with wilderness characteristics protecting the natural characteristics of the areas by preventing surface disturbance associated with wood cutting. Wood cutting permitted on 195,270 acres, degrading the natural characteristics of the affected non-WSA lands with wilderness characteristics and opportunities for both solitude and primitive recreation.	Wood cutting prohibited on 350,380 acres in all or portions of 24 non-WSA lands with wilderness characteristics protecting the natural characteristics of the areas by preventing surface disturbance associated with wood cutting. Wood cutting permitted on 231,980 acres, degrading the natural characteristics of the affected non-WSA lands with wilderness characteristics and opportunities for both solitude and primitive recreation.	Wood cutting prohibited on 363,706 acres in all or portions of 24 non-WSA lands with wilderness characteristics protecting the natural characteristics of the areas by preventing surface disturbance associated with wood cutting. Wood cutting permitted on 218,654 acres, degrading the natural characteristics of the affected non-WSA lands with wilderness characteristics and opportunities for both solitude and primitive recreation.	Wood cutting prohibited on 582,360 acres in all 24 non-WSA lands with wilderness characteristics protecting the natural characteristics of the areas by preventing surface disturbance associated with wood cutting. Without presence and noise of people, vehicles, and chainsaws, opportunities for both solitude and primitive recreation would be protected.	Wood cutting prohibited on 88,871 acres in 5 non-WSA lands with wilderness characteristics managed to protect those characteristics. 274,835 acres in all or portions of 24 non-WSA lands with wilderness characteristics managed for other resource values and uses would also be closed. Closing areas to wood cutting would protect the natural characteristics of the areas by preventing surface disturbance associated with wood cutting. Wood cutting permitted on 218,654 acres, degrading the natural characteristics of the affected non-WSA lands with

Table 2.2. Summary of Impacts

						wilderness characteristics and opportunities for both solitude and primitive recreation.
Special Designations	Designation of 7 ACECs and the recommendation of 2 segments for WSR designation would provide protection of the wilderness characteristics of 22 non-WSA lands with wilderness characteristics.	Designation of 10 ACECs and the recommendation of 3 segments for WSR designation would provide protection of the wilderness characteristics of 15 non-WSA lands with wilderness characteristics.	Designation of 5 ACECs and the recommendation of a segment for WSR designation would provide protection of the wilderness characteristics of 8 non-WSA lands with wilderness characteristics.	No ACECs would be designated and no WSRs would be recommended, offering no additional protection of the wilderness characteristics of non-WSA lands with wilderness characteristics.	Same as Alternative B.	Same of Alternative C.
PALEONTOLOGY						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Lands and Realty	Adverse impacts from increased public access and surface-disturbing activities, and beneficial impacts from land acquisition and stewardship. No specified restrictions on land-use authorizations.	Impacts same as those described in Alternative A, with more acres excluded from land-use authorizations.	Impacts same as those described in Alternative A, with more acres excluded from land-use authorizations.	Impacts same as those described in Alternative A, with more acres excluded from land-use authorizations.	Impacts same as those described in Alternative A, with more acres excluded from land-use authorizations than any of the alternatives.	Impacts same as those described in Alternative A, with more acres excluded from land-use authorizations.
Livestock Grazing	Adverse impacts from livestock trampling causing damage or destruction of surface fossils. Highest potential for impacts due to least acres unavailable for livestock grazing. Would manage 128,098 acres as	Adverse impacts and restrictions same as Alternative A, but to a lesser degree with an additional 13,062 acres unavailable to livestock grazing..	Adverse impacts and restrictions same as Alternative A, but to a lesser degree with an additional 8,163 acres unavailable to livestock grazing.	Adverse impacts and restrictions same as Alternative A, but to a lesser degree with an additional 4,010 acres unavailable to livestock grazing.	Same as Alternative B.	Adverse impacts and restrictions same as Alternative A, but to a lesser degree with an additional 13,718 acres unavailable to livestock grazing.

Table 2.2. Summary of Impacts

	unavailable to grazing.					
Minerals and Energy Resources	Adverse impacts from damage or destruction of Paleontological resources from surface disturbance, particularly in Class 3, 4/5, and 5 lands. Lands open to minerals development would include 865,559 acres of Class 3, 4/5, and 5 paleontologically sensitive geologic units.	Adverse impacts same as Alternative A, but to a somewhat greater degree due to 20,111 more acres of Class 3, 4/5, and 5 lands open to minerals development than under Alternative A.	Adverse impacts same as Alternative A, but to a greater degree due to 87,911 more acres of Class 3, 4/5, and 5 lands open to minerals development than under Alternative A.	Adverse impacts same as Alternative A, but to a greater degree due to 120,747 more acres of Class 3, 4/5, and 5 lands open to minerals development than under Alternative A.	Adverse impacts same as Alternative A, but to a lesser degree due to 98,299 less acres of Class 3, 4/5, and 5 lands open to minerals development than under Alternative A.	Adverse impacts same as Alternative A, but to a greater degree due to 459,995 more acres of Class 3, 4/5, and 5 lands open to minerals development than under Alternative A.
Non-WSA Lands with Wilderness Characteristics	No impacts to paleontological resources, as non-WSA lands with wilderness characteristics would not be protected under this alternative.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Surface disturbance restrictions on 582,357 acres to protect non-WSA lands with wilderness characteristics would have greater beneficial impacts on sensitive resources than under Alternative A.	Same as Alternative E, except 88,871 acres would be managed to protect non-WSA lands with wilderness characteristics.
Recreation	Adverse impacts include damage or destruction of important surface fossils from motorized vehicles, illegal collection, and vandalism. Beneficial impacts from regulated recreational use and awareness programs. This	Impacts same as Alternative A with lower potential for adverse impacts and more potential beneficial impacts due to increased restrictions on recreational activities.	Impacts same as Alternative A, with lower potential for adverse impacts and more potential beneficial impacts due to increased restrictions on recreational activities.	Impacts same as Alternative A, with lower potential for adverse impacts and more potential beneficial impacts due to a high number of restrictions on recreational activities.	Impacts same as Alternative A, with the lowest potential for adverse impacts due to increased restrictions on recreational activities and surface disturbance compared to the other alternatives.	Impacts same as Alternative A, with lower potential for adverse impacts and more potential beneficial impacts due to a high number of restrictions on recreational activities.

Table 2.2. Summary of Impacts

	alternative would provide the fewest restrictions on recreational activities.					
Special Designations	Potential adverse impacts include increased public access, unlawful collection or vandalism of sensitive resources, increased vehicle access, and surface-disturbing actions. Potential beneficial impacts from restrictions on public access and surface-disturbing activities. Alternative A would have limited restrictions on both commercial and recreational access. Additionally, 171,736 acres of Class 3 units, 141,790 acres of Class 4/5 units, and 93,985 acres of Class 5 units would lie within ACECs	Potential impacts same as Alternative A, but with greater beneficial impacts from increased restrictions on access to sensitive paleontological resources compared to Alternative A including 68,427 more acres in ACECs as Class 3, 4/5, and 5 units.	Potential impacts same as Alternative A, but with greater restrictions on surface-disturbing actions, and commercial and recreational access than Alternative A including 343,141 fewer acres in ACECs as Class 3, 4/5, and 5 units.	Potential impacts same as Alternative A, but with somewhat greater restrictions on surface-disturbing actions, and commercial and recreational access than Alternative A, including zero acres in ACECs as Class 3, 4/5, and 5 units.	Potential impacts same as Alternative A, but with the greatest beneficial restrictions on access and surface-disturbing actions of any of the alternatives.	Same as Alternative C.
Travel Management	Potentially adverse, direct and indirect impacts from surface-disturbing actions, and increased public access resulting in unlawful collection, vandalism, or destruction of sensitive resources. Alternative A would	Potential impacts same as Alternative A, but to lesser degree due to greater restrictions on travel and public access compared to Alternative A with 147,268 more acres closed to OHV use.	Potential impacts same as Alternative A, but to lesser degree due to greater restrictions on travel and public access compared to Alternative A with 142,237 more acres closed to OHV use.	Potential impacts same as Alternative A, but with zero acres closed to OHV use.	Potential impacts same as Alternative A, but to a lesser degree due to the greatest level of restrictions on travel and public access compared to Alternative A with 694,005 more acres closed to OHV use.	Potential impacts same as Alternative A, but to lesser degree due to greater restrictions on travel and public access compared to Alternative A with 117,465 more acres closed to OHV use.

Table 2.2. Summary of Impacts

	open the most acreage to travel and public access.					
Woodlands	Adverse impacts include surface disturbance during harvest and road construction, and increased OHV access and access to sensitive resources. There would be limited restrictions on woodlands harvesting under Alternative A with the potential impacts on 662,223 acres of Class 3, 4/5, and 5 units.	Adverse impacts same as Alternative A, but to a lesser degree due to greater seasonal restrictions, limits and closures for woodland harvesting. Potential impacts on 254,712 fewer acres of Class 3, 4/5, and 5 units than Alternative A.	Adverse impacts same as Alternative A, but to a lesser degree due to increased seasonal restrictions, limits and closures for woodland harvesting. Potential impacts on 167,389 fewer acres of Class 3, 4/5, and 5 units than Alternative A.	Adverse impacts same as Alternative A, but to somewhat lesser degree from seasonal restrictions, limits, and closures to woodland harvesting. Potential impacts on fewer acres than Alternative A, but greater impacts than the other alternatives.	Adverse impacts same as Alternative A, but to lesser degree than any of the alternatives due to limited acreage available for harvesting, and restrictions on surface disturbance to protect wilderness characteristics.	Adverse impacts same as Alternative A, but to a lesser degree due to increased seasonal restrictions, limits and closures for woodland harvesting. Potential impacts on 167,388 fewer acres of Class 3, 4/5, and 5 units than Alternative A.
RECREATION						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Air Quality	Long-term, beneficial impacts on recreation-related scenic quality from management decisions that would limit smoke, haze, and other pollutants.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Cultural Resources	Long-term, substantially adverse impacts to recreation resources in Comb Ridge, Tank Bench, and Beef Basin from lack of restrictions. Long-term, adverse impacts to recreation from access	Long-term, beneficial impacts to recreation resources in the Comb Ridge, Tank Bench, Beef Basin, and McLoyd Canyon-Moon House CSMA, in Grand Gulch Historic District from decisions to prevent resource degradation,	Management action impacts for Comb Ridge, Tank Bench, Beef Basin, and McLoyd Canyon-Moon House same as Alternative B.	Short term, beneficial impacts from reduced restrictions from not managing Comb Ridge, Tank Bench, and, Beef Basin as CSMA, but long term, adverse impacts on resource and users from	Same as Alternative B, except more beneficial impacts from surface disturbance restrictions in 18,514 (39%) in Comb Ridge CSMA from protection of non-WSA wilderness characteristics areas.	Same as Alternative B, except Comb Ridge, Beef Basin, and McLoyd Canyon-Moon House managed as zones within Cedar Mesa SRMA, for cultural/recreation resource protection.

Table 2.2. Summary of Impacts

	restrictions to the McLoyd Canyon-Moon House. Managing the Grand Gulch Historic District for primitive recreation would have beneficial impacts on non-mechanized or specialized users, and adverse impacts on other user groups.	and from management under SRMA plans. Impacts to user groups would be variable (see Recreation section in text for analysis of impacts to user groups).		conflicts and user degradation. Impacts to McLoyd Canyon-Moon House same as Alternative B. Impacts to Grand Gulch Historic District same as Alternative C.		
Fire Management	Short-term, adverse impacts on all recreational user groups from loss of recreation opportunities in treated areas. Long-term, beneficial impacts from reduced risk of fire, improved wildlife habitat and vegetation (with greater opportunities for wildlife viewing).	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Health and Safety	Short-term health and safety risks to recreational users in those areas where hiking, OHV use, and target shooting are in close proximity to hazardous materials and AML sites. Reclamation of AML mine sites would beneficially expand recreational opportunities in the	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	long-term.					
Lands and Realty	Short-term, beneficial impacts on non-mechanized, specialized, river floating, and mountain biking users from prohibitions on pyrotechnics and explosives use during filming. Long-term, beneficial impacts from protection of natural resources for recreation during filming.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Livestock Grazing	Long-term, beneficial impacts on recreation resources and non-mechanized users from areas unavailable for livestock grazing. Negligible impacts on other recreation resource users.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Minerals and Energy Resources	Impacts on recreation resources would be minor, but adverse because of potential scenic quality degradation from predicted 73 wells and a total of 2,436 acres of disturbance caused by oil and gas, geophysical, salable, locatable minerals activities (0.14% of the FO).	Same as Alternative A, except that 66 wells predicted with total surface disturbances of 2,281 acres from all minerals activities (0.13% of the FO).	Same as Alternative A, except that 74 wells predicted with total surface disturbances of 2,464 acres from all minerals activities (0.14% of the FO).	Same as Alternative A, except that 75 wells predicted with total surface disturbances of 2,496 acres from all minerals activities (0.14% of the FO).	Same as Alternative A, except that 54 wells predicted with total surface disturbances of 2,131 acres from all minerals activities (0.13% of the FO). Reduced impacts from an additional 582,360 acres protected from minerals-related surface disturbances within areas with non-WSA wilderness	Same as Alternative E, except that 72 wells predicted with total surface disturbances of 2,446 acres from all minerals activities (0.13% of the FO), with 88,871 acres protected from minerals-related surface disturbances within areas with non-WSA wilderness

Table 2.2. Summary of Impacts

					characteristics.	characteristics.
Non-WSA Lands with Wilderness Characteristics	Negligible impacts to recreation resources and uses as non-WSA lands with wilderness characteristics are not protected under this alternative.	Same as Alternative A	Same as Alternative A	Same as Alternative A	Long-term, beneficial impacts on recreation resources and opportunities for non-mechanized, motorized, scenic driving, and mountain biking groups from preservation of 165,831 acres for non-WSA wilderness characteristics within the SRMAs, and 491,628 acres within the ERMA. Long-term, adverse impacts on competitive, motorized and mountain biking events in these areas.	Long-term, beneficial impacts on recreation resources and opportunities for non-mechanized, and OHV users from protection of non-WSA lands with wilderness characteristics within 13,600 acres in SRMAs, and allowed OHV use.
Paleontology	Paleontological management decisions would have negligible impacts on recreation.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Recreation	San Juan River SRMA Short-term, beneficial impacts from timing stipulations and reserved campsites along river in the 15,100-acre SRMA. Long-term, adverse impacts from lack of resource protection and continued intense river use, and motorized boating.	San Juan River SRMA Long-term, beneficial impacts on river experience from reduced crowding by reducing commercial use (beneficial impacts on private users, adverse impacts on commercial users), from limited vehicle camping, from additional campsites	San Juan River SRMA Commercial floating, vehicle camping impacts as under Alternative B. Vehicle camping, impacts as under B. Motorized boating impacts as under A. Adverse impacts from 33% reduction in SRMA, compared to the No Action (9,859-acre SRMA under	San Juan River SRMA Impacts same as Alternative A for river users. Designated camping impacts as under Alternative B. Adverse impacts from 58% reduction in SRMA size (6,365-acre SRMA under Alternative D).	San Juan River SRMA Same as Alternative B, except that 4,124 acres of non-WSA lands with wilderness characteristics lie within the proposed SRMA, which would beneficially increase protection of resources and benefit non-mechanized river users.	Same as Alternative C.

Table 2.2. Summary of Impacts

		on Navajo Reservation (subject to MOU). Limited camping would have adverse impacts on non-river-floating users. An adverse reduction in size of the SRMA by 30% compared to the No Action (10,203-acre SRMA under Alternative B).	Alternative C).			
	Cedar Mesa (Grand Gulch Plateau) SRMA Long-term, beneficial impacts on resources and non-mechanized users in the 385,000-acre Grand Gulch SRMA from designated campsites, pet controls, no campfires, limited group size.	Cedar Mesa C-SRMA (375,739 acres) Same as Alternative A, except managed as 375,739-acre Cedar Mesa Cultural SRMA, pets excluded from specified areas, no woodland harvesting or collecting. Long-term, beneficial impacts from permitted camping and day use.	Cedar Mesa C-SRMA (375,739 acres) Same impacts as Alternative B, except pet control would be same as A. Short-term adverse impacts to stock users, but long-term benefits from resource preservation.	Cedar Mesa C-SRMA (375,739 acres) Management decisions and impacts same as Alternative C, except that pets and stock would be prohibited or limited if causing adverse impacts to recreation resources.	Cedar Mesa C-SRMA (375,739 acres) Same as Alternative B, except 109,700 acres (29%) within the proposed C-SRMA would be protected for preservation of non-WSA wilderness characteristics, with benefits to non-mechanized users and adverse impacts to mechanized users in this area.	Cedar Mesa SRMA (407,098 acres) Same as Alternative B, except 13,600 acres in SRMA manage for protection of non-WSA lands with wilderness characteristics, benefiting non-mechanized and mechanized users.
	Dark Canyon SRMA Managed under the 214,390-acre Canyon Basin SRMA. Long-term, adverse impacts to resources from unlimited group sizes, dogs and vehicles, dispersed camping, campfires, and minimal ranger presence. Long-term,	Dark Canyon SRMA (30,820 acres) Short- and long-term, beneficial impacts on resources from limits on users per day, designated campsites, limits on campfires (mesa tops), waste management, pet restrictions, and	Dark Canyon SRMA (30,820 acres) Impacts same as Alternative B, but decreased long-term, beneficial impacts by increased group size and numbers.	Dark Canyon SRMA (30,820 acres) Impacts same as Alternative A from unrestricted dispersed camping, permitted large and numerous commercial groups, unrestricted use of campfires, no designated	Dark Canyon SRMA (30,820 acres) Same as Alternative B, except for additional beneficial impacts from protection of 2,522 acres (8%) to preserve non-WSA wilderness characteristics.	Dark Canyon SRMA (30,820 acres) Same as Alternative C.

Table 2.2. Summary of Impacts

	adverse impacts to users from over-crowding, user conflicts, loss of recreational opportunities.	prohibitions on firewood collecting. Short-term, adverse impacts on users from group size and number limits, but long-term, beneficial impacts from improved backcountry opportunities.		campsites, and unrestricted firewood collection.		
	Indian Creek SRMA Managed as part of the 214,390-acre Canyon Basins SRMA. Long-term, adverse impacts on resources and resource users from unlimited, unrestricted user group sizes, minimal monitoring of surface disturbances, unrestricted camping and use of campfires, potential degradation of cultural-recreational resources, and unrestricted presence of pets.	Indian Creek SRMA (89,721 acres) Short- and long-term, beneficial impacts on resources from designated camping, prohibitions on dispersed camping, prohibitions on wood gathering, and adaptive management to preserve resources. Short-term, beneficial impacts on resource users from additional recreational facilities. Long-term, beneficial impacts on users from management decisions that address the increasing popularity and recreational use of the area.	Indian Creek SRMA (89,721 acres) Same as Alternative B.	Indian Creek SRMA (89,721 acres) Same as Alternative B.	Indian Creek SRMA (89,721 acres) Same as Alternative B, except 47,393 acres in SRMA managed for protection of non-WSA lands with wilderness characteristics, with beneficial impacts on non-mechanized users and adverse impacts on OHV and mountain biking users.	Indian Creek SRMA (89,721 acres) Same as Alternative C.
	White Canyon SRMA Area not managed as an SRMA. Long-term, adverse impacts from unrestricted private	White Canyon SRMA (2,828 acres) Short-term and long-term, beneficial impacts from fire pan	White Canyon SRMA (2,828 acres) Same as Alternative B.	White Canyon SRMA (2,828 acres) Long-term, adverse impacts from lack of permit system to limit	White Canyon SRMA (2,828 acres) Same as Alternative B, except 2,092 acres would be managed for	White Canyon SRMA (2,828 acres) Same as Alternative B.

Table 2.2. Summary of Impacts

	and commercial use, open camping and campfires.	use, permit system, primitive campground development, prohibitions on campfires in-canyon.		resource use and visitation. Long-term, beneficial impacts from developed campsites, fire pan use.	protection of non-WSA lands with wilderness characteristics (this management would not change level of beneficial impacts).	
	ERMA No specified management decisions. Long-term, beneficial impacts to resources and users from adaptive management to protect resources.	ERMA Long-term, beneficial impacts from adaptive management, limits on dispersed vehicle camping, camping limited to designated sites along Bears Ears Road and Deer Flat Road, and coordination with Glen Canyon Rec Area on campground construction.	ERMA Same as Alternative B, except allowing dispersed vehicle camping within 150 of roadways would have long-term, adverse impacts on resources from surface disturbances.	ERMA Same as Alternative C, except that dispersed vehicle camping allowed within 300 feet of roadways.	ERMA Same as Alternative B, except 416,526 acres management for protection of non-WSA lands with wilderness characteristics in the ERMA would have more beneficial impacts on non-mechanized users and more adverse impacts on mechanized users.	ERMA Same as Alternative B, except dispersed camping allowed within 150 feet of road. Management of 75,271 acres of non-WSA lands with wilderness characteristics in the ERMA would have beneficial impacts on mechanized and non-mechanized users.
	Special Recreation Permits (SRPs) Long-term, beneficial impacts from stipulations in the permit that would ensure that resources were not adversely impacts.	Special Recreation Permits (SRPs) Same as Alternative A.	Special Recreation Permits (SRPs) Same as Alternative A.	Special Recreation Permits (SRPs) Same as Alternative A.	Special Recreation Permits (SRPs) Same as Alternative B, but reduced beneficial impacts from fewer opportunities for commercial, specialized recreation in non-WSA lands with wilderness characteristics.	Special Recreation Permits (SRPs) Same as Alternative A.
Riparian Resources	No specific management decisions would affect recreation, but current adverse impacts would have long-term recreation opportunity-degrading impacts on hiking, trail	Riparian management decisions would have long-term, beneficial impacts on recreation by excluding livestock in specified riparian areas, closing areas to OHV use, and	Same as Alternative B.	Same as Alternative A.	Same as Alternative B.	Same as Alternative B.

Table 2.2. Summary of Impacts

	use, wildlife viewing, sightseeing, and camping.	closing functioning at risk areas to motorized camping. Short-term, adverse impacts on recreational opportunities until riparian area were restored.				
Soil and Water Resources	Soils and watershed management decisions are unspecified, but impacts on recreation would be negligible.	No specific management action impacts on recreation, but erosion control planning and mitigation on steep slopes would have long-term, beneficial impacts on recreation-related scenic quality.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.
Special Designations	Alkali Ridge ACEC (39,202 acres) Beneficial, long-term impacts from resource preservation and/or mitigation of disturbances.	Alkali Ridge ACEC (39,196 acres) Long-term, beneficial impacts from cultural resource management plan, and prohibitions on surface-disturbing activities that might threaten the area's cultural resources.	Alkali Ridge ACEC (39,196 acres) Same as Alternative A, except that a management plan would be prepared and limits placed on surface disturbances, which would have beneficial impacts on recreation.	Alkali Ridge ACEC Not designated as an ACEC. The impacts would be adverse in the long-term because surface disturbances would not be limited, visual quality would be adversely affected and adverse for sightseeing opportunities.	Alkali Ridge ACEC (39,196 acres) Same as Alternative B.	Alkali Ridge ACEC (39,196 acres) Same as Alternative C.
	Bridger Jack Mesa ACEC (6,260 acres) Long-term, beneficial, impacts on recreation resources and non-mechanized users.	Bridger Jack Mesa ACEC (6,225 acres) Same as Alternative A.	Bridger Jack Mesa ACEC Impacts to the area would be the same as Alternative A because the area lies within a	Bridger Jack Mesa ACEC Same as Alternative C.	Bridger Jack Mesa ACEC (6,225 acres) Same as Alternative A.	Bridger Jack Mesa ACEC Same as Alternative C.

Table 2.2. Summary of Impacts

	Long-term, adverse impacts on motorized OHV, mountain biking, specialized, and scenic driving user groups within the ACEC because it lies within a WSA.		WSA; but the area would not be designated as an ACEC.			
	Butler Wash North ACEC (17,464 acres) Long-term, beneficial impacts on non-mechanized users from maintenance of wilderness values, but long term adverse impacts on mechanized and specialized users from prohibitions on surface disturbances because the ACEC lies within a WSA.	Butler Wash North ACEC (17,365 acres) Same as Alternative A.	Butler Wash North ACEC Impacts to the area would be the same as Alternative A because the area lies within a WSA; but the area would not be designated as an ACEC.	Butler Wash North ACEC Same as Alternative C.	Butler Wash North ACEC (17,365 acres) Same as Alternative B.	Butler Wash North ACEC Same as Alternative C.
	Cedar Mesa ACEC (295,336 acres) Short-term, adverse impacts from rangeland and wildlife improvement projects, and fire suppression. Long-term, adverse impacts from potential minerals resource exploration and development. Long-term, beneficial impacts from designated OHV use, protection of cultural resources, and areas	Cedar Mesa ACEC (306,742 acres) Long-term, beneficial impacts from waste management, prohibitions on dispersed camping, and limiting day use and overnight camping to protect cultural resources. Long-term, adverse impacts on recreation users from reduced recreational opportunities.	Cedar Mesa ACEC Long-term beneficial impacts same as Alternative B from management as a 375,739-acre SRMA, but the area would not be designated as an ACEC. Long-term adverse impacts same as Alternative B, but to a lesser degree, because the area would be open to dispersed camping opportunities.	Cedar Mesa ACEC Same as Alternative C.	Cedar Mesa ACEC (306,742 acres) Same impacts as Alternative B, but more beneficial to non-mechanized recreation, from protection of 60,049 acres of non-WSA lands with wilderness characteristics within the ACEC.	Cedar Mesa ACEC Same as Alternative C.

Table 2.2. Summary of Impacts

	managed for scenic quality and non-motorized uses.					
	<p>Dark Canyon ACEC (61,660 acres) Dark Canyon lies entirely within a WSA, so there would be long-term, beneficial impacts on non-mechanized users from maintenance of wilderness values, but long term adverse impacts on mechanized and specialized users from prohibitions on surface disturbances.</p>	<p>Dark Canyon ACEC (61,660 acres) Same as Alternative A.</p>	<p>Dark Canyon ACEC Impacts to the area would be the same as Alternative A because the area lies within a WSA; but the area would not be designated as an ACEC.</p>	<p>Dark Canyon ACEC Same as Alternative C.</p>	<p>Dark Canyon ACEC (61,660 acres) Same as Alternative A.</p>	<p>Dark Canyon ACEC (61,660 acres) Same as Alternative C.</p>
	<p>Hovenweep ACEC (1,798 acres) Impacts would be similar to Cedar Mesa ACEC. Beneficial opportunities for mechanized recreation, wildlife viewing, and cultural interpretation. Long term, adverse impacts from minerals development on sightseeing opportunities, cultural, and wildlife viewing.</p>	<p>Hovenweep ACEC (2,439 acres) Same as Alternative A.</p>	<p>Hovenweep ACEC (2,439 acres) Same as Alternative B.</p>	<p>Hovenweep ACEC The ACEC would not be established. Adverse impact to recreation in the short- and long-term from minerals development, watershed and vegetation treatment projects, impacts to cultural resources. Long-term, beneficial impacts for OHV users and non-motorized trail users. Adverse impacts on users seeking remoteness, solitude, and naturalness.</p>	<p>Hovenweep ACEC (2,439 acres) Same as Alternative B.</p>	<p>Hovenweep ACEC (2,439 acres) Same as Alternative A.</p>

Table 2.2. Summary of Impacts

	<p>Indian Creek ACEC (8,510 acres) Managed to protect visual quality, management decisions would permit minimal surface disturbances and closed to OHV use, with long-term, beneficial impacts on recreation resources. Variable impacts on recreation users: beneficial impacts on non-mechanized and scenic drivers; adverse impacts on mechanized users from limited recreational opportunities.</p>	<p>Indian Creek ACEC (8,510 acres) Same impacts as Alternative A.</p>	<p>Indian Creek ACEC (3,908 acres) Same impacts as Alternative B on recreation resources, but reduced degree of beneficial impacts on resources and users because the ACEC would be reduced in area by 46% in comparison to Alternative A. This alternative would beneficially increase opportunities for OHV use along designated trails and routes in the ACEC. The reduced size of the ACEC would likely create user conflicts between mechanized and non-mechanized users.</p>	<p>Indian Creek ACEC The ACEC would not be established, with no emphasis on managing the area for scenic quality except those areas that lie within WSAs. Adverse, long-term impacts on recreation resources that lie outside of WSAs from lack of resource protection. Variable impacts on resource users: non-mechanized and scenic drivers would be adversely impacted; mechanized, specialized users would benefit in the short-term. Long-term, adverse impacts on all users from user conflicts, resource degradation, and crowding.</p>	<p>Indian Creek ACEC (8,510 acres) Same as Alternative A, but to a greater degree, because, 30% of the ACEC (3,887 acres) would be protected to preserve lands with non-WSA wilderness characteristics: more adverse impacts to mechanized users from OHV prohibitions; more beneficial impacts to non-mechanized users from increased opportunities for solitude, remoteness.</p>	<p>Indian Creek ACEC (3,908 acres) Same impacts as Alternative A for non-mechanized recreation, but same as Alternative C for mechanized uses, for impacts from resource use conflicts within the smaller ACEC.</p>
	<p>Lockhart Basin ACEC The area would not be managed as an ACEC. Long-term, beneficial impacts on recreation resources from VRM I designation, prohibitions on woodcutting and OHV</p>	<p>Lockhart Basin ACEC (47,783 acres) Long term, beneficial impacts to resources and to non-mechanized users from maintained high scenic quality as VRM Class I, and adverse impacts o mechanized users</p>	<p>Lockhart Basin ACEC Not designated as an ACEC, and managed as VRM Class II and VRM Class III. Adverse impacts to recreation resources because the area would be open to mineral leasing,</p>	<p>Lockhart Basin ACEC Same as Alternative C.</p>	<p>Lockhart Basin ACEC (47,783 acres) Same as Alternative B, except to a greater beneficial degree for non-mechanized users and greater adverse impacts to motorized OHV users, from management of 45% of the ACEC (21,298</p>	<p>Lockhart Basin ACEC Same as Alternative C.</p>

Table 2.2. Summary of Impacts

	<p>use in the Indian Creek ACEC (6,870 acres) and WSA portions of the basin. Long-term, adverse impacts on OHV users, but beneficial impacts on scenic drivers, non-motorized, and non-mechanized users. Long term, adverse impacts to non-mechanized users outside of the ACEC/WSA areas within the basin from reduced opportunities for solitude, remoteness, and quiet.</p>	<p>from limited opportunities.</p>	<p>livestock grazing in VRM III areas. Long-term, adverse impacts to all recreation groups from degradation of scenic quality in VRM Class III areas. Short-term, beneficial impacts to OHV users, but long-term, adverse impacts from resource degradation in VRM III areas.</p>		<p>acres) for preservation of lands with non-WSA wilderness characteristics.</p>	
	<p>Lavender Mesa ACEC (649 acres) Long-term, beneficial impacts on recreation resources from protection of visual, cultural, and natural resources. Negligible impacts on mechanized recreation users because the area is inaccessible. Beneficial impacts on non-mechanized and specialized users (climbers) from preservation of an undeveloped recreation area.</p>	<p>Lavender Mesa ACEC (649 acres) Same as Alternative A.</p>	<p>Lavender Mesa ACEC (649 acres) Same as Alternative A.</p>	<p>Lavender Mesa ACEC The ACEC would not be established. Long-term, adverse impacts to recreation resources from unrestricted surface-disturbing activities. Long-term, adverse impacts on non-mechanized and specialized users from lack of protection-related management decisions that would allow resource degradation.</p>	<p>Lavender Mesa ACEC (649 acres) Same as Alternative A., except the area would also be managed for protection of its non-WSA wilderness characteristics.</p>	<p>Lavender Mesa ACEC (649 acres) Same as Alternative C.</p>

Table 2.2. Summary of Impacts

	<p>Scenic Highway Corridor ACEC (70,017 acres) Long term, beneficial impacts to scenic drivers and scenic quality preservation along the motor routes within the ACEC. Long term, adverse impacts to OHV and mountain bikers from limited opportunities along the corridor.</p>	<p>Scenic Highway Corridor ACEC Under this alternative the ACEC would not be designated, with long term, beneficial impacts from reduced restrictions on activities within the corridor.</p>	<p>Scenic Highway Corridor ACEC Same as Alternative B.</p>	<p>Scenic Highway Corridor ACEC Same as Alternative B.</p>	<p>Scenic Highway Corridor ACEC Same as Alternative B.</p>	<p>Scenic Highway Corridor ACEC Same as Alternative B.</p>
	<p>Shay Canyon ACEC (3,561 acres) Minor impacts on resources from actions that limit OHV use, protect scenic quality (as VRM Class I), and from protection of cultural resources. Minor impacts on resource users because opportunities would be available for mechanized and non-mechanized users.</p>	<p>Shay Canyon ACEC (119 acres) The ACEC would be managed as a 119-acre area to conserve cultural resources. Impacts on recreation resource would be beneficial in the long-term because surface disturbances would be prohibited. Impacts on all recreation use would be adverse in the long-term from limitations imposed to protect cultural resources, and from a substantial reduction of ACEC area that would limit and constrain recreational opportunities.</p>	<p>Shay Canyon ACEC (119 acres) Same as Alternative B.</p>	<p>Shay Canyon ACEC The ACEC would not be established. Managed under VRM Class III objectives, limited OHV use, livestock grazing, fuels and watershed treatments that would have long-term, adverse impacts on resources. Short-term, beneficial impacts on mechanized and non-mechanized users from expanded opportunities, but long-term, adverse impacts on users from resource degradation through lack of protection</p>	<p>Shay Canyon ACEC (119 acres) Same as Alternative B, except that 99 acres (83% of the ACEC) would be managed for protection of non-WSA lands with wilderness characteristics. Reduced adverse impacts from prohibitions on OHV, which be better able to accommodate allowed recreational activities in the small area.</p>	<p>Shay Canyon ACEC (119 acres) Same as Alternative B.</p>

Table 2.2. Summary of Impacts

				prescriptions.		
	<p>San Juan River ACEC The area would not be designated as an ACEC, but impacts would be the same as the San Juan River SRMA impacts (described above) because the area would continue to be managed as the San Juan River SRMA (15,100 acres).</p>	<p>San Juan River ACEC (7,590 acres) Long-term, beneficial impacts on resources from decisions that limit or restrict surface disturbances. Long-term, adverse impacts on motorized, mountain biking, non-mechanized users from reduced recreational opportunities. Negligible impacts on river users.</p>	<p>San Juan River ACEC (7,590 acres) Same as Alternative B.</p>	<p>San Juan River ACEC The ACEC would not be designated, but impacts would be same as Alternative B because of similar management decisions to protect recreational resources and allow similar range of recreational opportunities.</p>	<p>San Juan River ACEC (7,590 acres) Same as Alternative B, except 2,155 acres of non-WSA lands with wilderness characteristics (28% of the ACEC) would be managed to limit surface disturbances.</p>	<p>San Juan River ACEC (4,321 acres) Same as Alternative B.</p>
	<p>Valley of the Gods ACEC The 31,387-acre area would not be designated an ACEC, but continued to be managed as a Special Emphasis Area within the Cedar Mesa ACEC. Long term, beneficial impacts through limitations on surface disturbances, and management under VRM I objectives. Long-term, beneficial impacts on non-mechanized, mechanized, and scenic drivers because opportunities would be available.</p>	<p>Valley of the Gods ACEC (22,863 acres) Impacts would be same as A because of VRM I objectives for the area.</p>	<p>Valley of the Gods ACEC (22,863 acres) Same as Alternative B.</p>	<p>Valley of the Gods ACEC No designation as an ACEC. VRM III management objectives would allow long-term, adverse impacts to resources, with long-term, adverse impacts to scenic drivers, non-motorized, and non-mechanized users from diminished recreational opportunities.</p>	<p>Valley of the Gods ACEC (22,863 acres) Same as Alternative B, except 20,743 acres in ACEC (91% of ACEC) managed for protection of non-WSA lands with wilderness characteristics.</p>	<p>Valley of the Gods ACEC (22,863 acres) Same as Alternative B.</p>
	WSR Colorado	WSR Colorado	WSR Colorado	WSR Colorado	WSR Colorado	WSR Colorado

Table 2.2. Summary of Impacts

	<p>Segments Impacts on segment #1 would be beneficial in the long-term from restrictions to preserve ORVs, with beneficial, long-term impacts on all users because opportunities would continue to be available. Impacts on Segment #2 and #3 would be the same as for #1 above.</p>	<p>Segments Impacts on segment #1 would be beneficial in the long-term from preservation of ORVs. Impacts on specialized, mountain biking, non-mechanized, river users, and motorized users would be beneficial because opportunities would be available for recreation. Potential adverse impacts from resource use conflicts within the narrow river segment. Impacts on Segment #2 would be same as #1 above. Impact to Segment #3 would have long-term, beneficial impacts on resources and non-mechanized users, but long-term, adverse impacts on mountain biking and motorized users from reduced opportunities.</p>	<p>Segments Recommended as not suitable, the impacts on segment #1 resources and users would be adverse in the long-term from reduced protection from surface disturbances. Impacts to Segment #2 would be same as Alternative B, except that motorized use would create user conflicts and diminish the non-mechanized user experience. Impacts to Segment #3 would be same as Alternative B, except that motorized use would create user conflicts and diminish the non-mechanized river user experience.</p>	<p>Segments All segments would be recommended as not suitable, with long-term, adverse impacts on recreation from lack of resource protection and allowed surface disturbances.</p>	<p>Segments Same as Alternative B.</p>	<p>Segments Same as Alternative C because of non-suitability recommendation.</p>
	<p>WSR Indian Creek Segment Not evaluated for eligibility, but impacts on recreation would continue to be beneficial through</p>	<p>WSR Indian Creek Segment Long-term, beneficial impacts on resources and resource users because ORVs would be protected, while</p>	<p>WSR Indian Creek Segment Recommended as not suitable. Long-term, adverse impacts on resources from likely degradation of ORVs.</p>	<p>WSR Indian Creek Segment Recommended as not suitable. Same as Alternative C.</p>	<p>WSR Indian Creek Segment Same as Alternative B, except that additional resource protection along 0.6 miles of river corridor to protect</p>	<p>WSR Indian Creek Segment Recommended as not suitable. Same as Alternative C.</p>

Table 2.2. Summary of Impacts

	management decisions under the current RMP, with a range of beneficial recreational opportunities for mechanized and non-mechanized users.	allowing recreation opportunities for motorized, non-motorized, and mountain bike users. Long term, adverse impacts from potential resource user conflicts.	Impacts on users would be long-term and adverse from degradation of resources and reduction in recreational opportunities.		areas with non-WSA lands with wilderness characteristics.	
	WSR Fable Valley Segment Not evaluated for eligibility, but its location within a WSA ensures that impacts on recreation resources and non-mechanized recreation would be beneficial in the long term. Long-term, adverse impacts on mechanized user groups from WSA IMP restrictions on mechanized use and surface disturbances.	WSR Fable Valley Segment Recommended suitable, with same impacts as Alternative A from location within a WSA.	WSR Fable Valley Segment Recommend not suitable, but same impacts as Alternative A from location within a WSA.	WSR Fable Valley Segment Recommend not suitable, but same impacts as Alternative A from location within a WSA.	WSR Fable Valley Segment Same as Alternative B.	WSR Fable Valley Segment Same as Alternative C.
	WSR Dark Canyon Segment Not evaluated for eligibility, but its location within a WSA ensures that impacts on recreation resources and non-mechanized recreation would be beneficial in the long term. Long-term, adverse impacts on	WSR Dark Canyon Segment Recommended suitable, with same impacts as Alternative A from location within a WSA.	WSR Dark Canyon Segment Same as Alternative B.	WSR Dark Canyon Segment Recommend not suitable, but same impacts as Alternative A from location within a WSA.	WSR Dark Canyon Segment Same as Alternative B.	WSR Dark Canyon Segment Same as Alternative B.

Table 2.2. Summary of Impacts

	mechanized user groups from WSA IMP restrictions on mechanized use and surface disturbances.					
	<p>WSR San Juan River Segments Segment #1 not evaluated for eligibility, with impacts same as Colorado River Segment #1. Segment #2 recommended as eligible, with limited OHV use, VRM I objectives, and withdrawn mineral entry would have long-term, beneficial impacts on resources and all users because opportunities would continue to be available for mechanized and non-mechanized users. Segments #3, #4, and #5 would have same impacts as #2.</p>	<p>WSR San Juan River Segments Segment #1 recommended as suitable, managed as VRM III, NSO for minerals. Impacts to recreation would be negligible to minor because no recreation ORVs were found during eligibility study. Segment #2 recommended as suitable, with long-term, beneficial impacts on recreation resources and users. Increased use would create the potential for user conflicts between mechanized and non-mechanized users. Segment #3 recommended as suitable, with VRM I management, closed to OHV use, and mineral withdrawal that would have long-term, beneficial impacts on resources. Impacts on users would be variable:</p>	<p>WSR San Juan River Segments All segments recommended as not suitable. Segment #1 Impacts same as Alternative B. Segment #2 adverse, long-term impacts because eligibility study determined that the segment has Wild ORVs. Impacts on users would be adverse in the long-term because of likely resource degradation and diminished recreation opportunities. Segment #3 Impacts same as Segment #2. Segment #4 Impacts same as Segment #2. Segment #5 Impacts same as Segment #2.</p>	<p>WSR San Juan River Segments All segments recommended as not suitable. Segment #1 Impacts same as Alternative C. Segment #2 Impacts same as Alternative C. Segment #3 Impacts same as Alternative C. Segment #4 Impacts same as Alternative C. Segment #5 Impacts same as Alternative C.</p>	<p>WSR San Juan River Segments Same as Alternative B.</p>	<p>WSR San Juan River Segments Segment #1 recommended as not suitable. Impacts same as Alternative C. Segment #2 recommended as not suitable. Impacts same as Alternative C. Segment #3 recommended as not suitable. Impacts same as Alternative C. Segment #4 recommended as not suitable. Impacts same as Alternative C. Segment #5 recommended as suitable. Impacts same as Alternative B.</p>

Table 2.2. Summary of Impacts

		OHV users would be adversely affected by lack of opportunities, but river floaters and non-mechanized users would benefit. Segment #4 recommended as suitable, and would have impacts same as Segment #2. Segment #5 recommended as suitable, and would have impacts same as Segment #3.				
	WSR Arch Canyon Segment Not evaluated for eligibility. Impacts same as Indian Creek segment.	WSR Arch Canyon Segment Recommended as suitable, with same as Indian Creek.	WSR Arch Canyon Segment Recommended as not suitable. Same as Indian Creek segment.	WSR Arch Canyon Segment Recommended as not suitable. Same as Indian Creek segment.	WSR Arch Canyon Segment Same as Alternative B.	WSR Arch Canyon Segment Same as Alternative C.
	WSR White Canyon Determined to be eligible. Beneficial, long-term impacts on recreation and users from resource protection and continued recreational opportunities.	WSR White Canyon Recommended as not suitable. Negligible impacts on recreation because of proposed SRMA under this alternative to protect recreation resources and opportunities.	WSR White Canyon Same as Alternative B.	WSR White Canyon Same as Alternative B.	WSR White Canyon Same as Alternative B.	WSR White Canyon Same as Alternative B.
	WSAs Current impacts on recreation and users would not change because past and future status would not change until congressional	WSAs Same as Alternative A.	WSAs Same as Alternative A.	WSAs Same as Alternative A.	WSAs Same as Alternative A.	WSAs Same as Alternative A.

Table 2.2. Summary of Impacts

	release: adverse impacts on mechanized recreation to preserve wilderness values; beneficial impacts on non-mechanized users from continued opportunities.					
Special Status Species	Negligible impacts on recreation.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Travel Management	<p>OHV Acres open to cross-country travel and acres designated as limited to designated routes OHV use would be beneficial to mechanized users, but adverse in the long-term for non-mechanized users and resources from resources degradation and intensifying resource use conflicts.</p> <p>Special Stipulation Areas Long-term, adverse impacts from OHV exclusion and access within McLoyd Canyon-Moon House site. Long-term, beneficial impacts from restricting travel in Arch Canyon by preserving wildlife viewing opportunities;</p>	<p>OHV Short- and long-term, beneficial impacts to resources from eliminated OHV cross-country travel and restrictions to designated routes, and reduction in user conflicts. Beneficial impacts on non-mechanized, mountain biking, and river floaters from closed or designated routes. Long-term, adverse impacts on motorized OHV groups from elimination of Open OHV areas.</p> <p>Special Stipulation Areas Impacts to McLoyd Canyon-Moon House same as Alternative A, but long-term, beneficial impacts to resource</p>	<p>OHV Same as Alternative B, except that long-term, adverse impacts would occur within 2,311 acres designated as Open to OHV use.</p> <p>Special Stipulation Areas Impacts to McLoyd Canyon-Moon House same as Alternative B. Impacts to Arch Canyon same as Alternative A.</p>	<p>OHV Resource impacts same as Alternative B. Long-term, adverse impacts on motorized OHV cross-country use from substantial reduction in area, but increased opportunities for designated route OHV recreation.</p> <p>Special Stipulation Areas Impacts to McLoyd Canyon-Moon House same as Alternative A. Impacts to Arch Canyon resources same as Alternative C.</p>	<p>OHV All OHV travel within non-WSA lands with wilderness characteristics would be prohibited, with long-term, substantially adverse impacts on motorized OHV, mountain biking and competitive (specialized) motorized users from reduced opportunities. Long-term, beneficial impacts on non-mechanized users from increased areas closed to motorized users.</p> <p>Special Stipulation Areas Same as Alternative B.</p>	<p>OHV Same as Alternative B.</p> <p>Special Stipulation Areas Impacts within McLoyd Canyon-Moon House site same as Alternative B. Beneficial impacts within Arch Canyon for mechanized and non-mechanized users, but long term, adverse impacts from user conflicts between mechanized and non-mechanized users.</p>

Table 2.2. Summary of Impacts

	likelihood for adverse impacts from proximity of non-mechanized and mechanized users within the canyon.	preservation. Long-term, adverse impacts to mechanized recreation from closing Arch Canyon to OHV use by reducing recreational opportunities; beneficial impacts to non-mechanized users..				
Vegetation Management	Impacts same as Fire Management because treatments and impacts are the same.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Visual Resources	Long-term, beneficial protection-related impacts on recreation resources and related scenic quality preservation, and long-term, beneficial impacts on all resource user groups from designation of 371,575 acres as VRM Class I and 355,112 acres as VRM II (41% of the PA).	497,668 acres designated under VRM Class I (33% more than Alternative A) and 250,641 acres as VRM II, with impacts same as Alternative A, but to a greater degree. Approximately 42% of the planning area would be managed for high scenic quality.	425,179 acres designated under VRM Class I (14% more than Alternative A) and 132,001 as VRM II, with long-term, adverse impacts to recreation from 10% less protection of scenic quality than Alternative A. Approximately 31% of the planning area would be managed for high scenic quality.	390,424 acres designated under VRM Class I (5% more than Alternative A) and 8,838 acres as VRM II, with long-term, adverse impacts to recreation from a 19% reduction in scenic quality protection than Alternative A. High scenic quality would be protected on 22% of the PA.	998,370 acres designated as VRM I (269% more acreage than Alternative A), including areas designated as VRM Class I to protect non-WSA wilderness characteristics, with long-term, beneficial impacts on scenic resources. This alternative would protect scenic quality under VRM Class I and II management objectives on 62% of the PA.	424,989 acres managed under VRM Class I objectives (3% more than Alternative A) and 228,041 acres managed under VRM Class II to protect scenic quality on 37% of the PA, with adverse impacts to recreation from a 5% reduction in higher levels of scenic quality protection than Alternative A.
Wildlife and Fisheries Resources	Seasonal closing of wildlife habitat would have short-term, adverse impacts on motorized OHV recreation to protect	Short-term, adverse restrictions on all commercial or permitted OHV use within crucial wildlife habitat.	Same as Alternative B, except that 135 miles of commercial and permitted OHV routes would be affected.	Same as Alternative A.	Same as Alternative B.	Same as Alternative B.

Table 2.2. Summary of Impacts

	crucial habitat.	Approximately 512 miles of OHV routes would be affected.				
Woodlands	Long-term, adverse noise and visual impacts on non-mechanized, some motorized OHV, specialized, scenic driving, and mountain biking groups from intrusive OHV and chainsaw noise impacts, trash, OHV surface disturbances, and remnants of woodland harvesting.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
RIPARIAN RESOURCES						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Fire Management	Fuels management treatments on approximately 5,000 to 10,000 acres annually would be adverse in the short-term from increased sedimentation and runoff from prescribed burn surface disturbances. Long-term beneficial impacts from reduction in wildland fire risk and establishment of a more natural fire return interval.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Lands and Realty	Beneficial impacts from ROW exclusions	Beneficial impacts from ROW exclusions	Beneficial impacts from ROW exclusions	Beneficial impacts from ROW	Beneficial impacts from ROW exclusions	Beneficial impacts from ROW exclusions

Table 2.2. Summary of Impacts

	on 120,800 acres that would limit surface and vegetation disturbances and changes in hydrology.	on 416,612 acres that would limit surface and vegetation disturbances and changes in hydrology.	on 434,652 acres that would limit surface and vegetation disturbances and changes in hydrology.	exclusions on 401,028 acres that would limit surface and vegetation disturbances and changes in hydrology.	on 1,028,378 acres that would limit surface and vegetation disturbances and changes in hydrology.	on 559,509 acres that would limit surface and vegetation disturbances and changes in hydrology.
Livestock Grazing	The total riparian area open to grazing would be 17,600 acres; unavailable acreage would be 2,400 acres. Beneficial impacts from resource protection and enhancement through proper herd management. Proper livestock grazing would benefit riparian systems by ensuring recruitment of riparian plant species. Riparian exclosures would protect and enhance riparian vegetation. Overall, Alternative A has the fewest riparian areas unavailable for livestock grazing compared to all other alternatives. Compliance with Standard 2 would minimize adverse impacts to riparian areas by requiring changes in grazing management wherever monitoring	17,200 riparian acres would be open to grazing; 2,800 would be unavailable. Seasonal restrictions, closures, and/or forage utilization limits on grazing in riparian areas, especially those Functioning at Risk. The closure of riparian areas to grazing would protect riparian vegetation, as described under A. Alternative B provides the largest number of riparian acres excluded from grazing, which would have more long-term, beneficial impacts on riparian resources in those excluded areas than Alternative A.	Same as Alternative B.	Alternative D would have 18,020 acres open and 2,380 acres unavailable to livestock grazing. There would be no seasonal restrictions, closures, and/or forage utilization limits on grazing riparian areas Functioning At Risk, therefore fewer reductions in adverse impacts would occur, as compared to Alternatives B and C. This alternative would have impacts the same as Alternative A.	Same as Alternative B.	Same as Alternative B.

Table 2.2. Summary of Impacts

	shows degradation of riparian areas when PFC in not achieved.					
Minerals	Oil and gas development would be managed with NSO mineral leasing stipulations in riparian areas. The Monticello FO would follow BLM guidelines for managing riparian areas (Technical Reference 1737-6, as updated) and Utah Riparian Management Policy. All floodplains and riparian/wetlands would be managed in accordance with Executive Orders 11988 and 119900, Sections 303 and 404 of the Clean Water Act, and the ESA. These orders would protect riparian resources and floodplains from surface disturbance and vegetation removal. No new surface-disturbing activities will be allowed within 100 meters of riparian/wetlands unless it can be shown that: a) there are no practical alternatives or, b) all	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A	Same as Alternative A

Table 2.2. Summary of Impacts

	long term impacts can be fully mitigated or, c) the activity will benefit and enhance the riparian area.					
Non-WSA Lands with Wilderness Characteristics	No impacts to riparian resources in these lands from special management to protect non-WSA lands with wilderness characteristics because no lands would be managed to protect their wilderness characteristics.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Beneficial impacts to riparian resources from protection of wilderness characteristics on 582,360 acres from closure to minerals, OHV travel, ROW permitting, and through management under VRM Class I objectives.	Same as Alternative E, except managing 88,871 acres with slightly less protective stipulations.
Recreation	Short term and Long-term, adverse impacts to riparian resources from dispersed recreation-related and OHV-caused stream bank vegetation trampling; soil compaction, sedimentation, erosion, and indirect spread of invasive species. Impacts mitigated by BLM through recreation guidelines and stipulations to protect riparian resources.	Similar to Alternative A, but with less adverse impacts from increased restrictions on recreation in riparian areas, riparian areas closed to OHV use, limits on river use, and other recreation restrictions that would protect riparian resources.	Recreation actions would provide more protection to riparian resources than Alternatives A and D, but less than Alternatives B and E.	Similar to Alternative A.	Same as Alternative B, except that restrictions on OHV use would be greater, with fewer potential impacts to riparian areas from OHV use.	Same as Alternative C, except that no areas would be open to OHV use and more areas would be limited to designated routes.
Riparian Resources	Long-term, beneficial impacts on riparian resources from NSO stipulations, grazing and rangeland health	Similar to Alternative A, with additional closures for areas at risk of degradation.	Same as Alternative B.	Same as Alternative A.	Same as Alternative B.	Same as Alternative B.

Table 2.2. Summary of Impacts

	standards, and floodplain protection.					
Soil and Water Resources	Indirect, long term, adverse impacts from sedimentation and soil erosion on riparian because of a lack of steep-slope surface disturbances restrictions.	Long-term, beneficial indirect impacts from surface disturbance restrictions on slopes >40% slopes (approximately 87,456 acres).	Same as Alternative B, except surface-disturbing activities would not be permitted on slopes greater than 40% unless determined that it would cause undue or unnecessary degradation to pursue other placement alternatives.	Same as Alternative B, except the impacts of soils and watershed management decisions would require a plan including an erosion control strategy, survey, and design for development of land with a slope greater than 40%.	Same as Alternative B.	
Special Designations	Long-term, adverse impacts from minerals activities within ACECs through vegetation trampling and removal, habitat fragmentation, and invasive species infestation. Long-term, beneficial impacts from OHV motorized-use protection, and protection within WSAs.	Long-term, beneficial protection within WSAs, ACECs, and W&SR segments, from OHV limitations, and limits on vegetation treatments.	Same as Alternative B, but with slightly less protective management within ACECs.	Impacts the same as Alternative A.	Same as Alternative B, except that riparian areas in 109,206 acres of ACECs in non-WSA lands with wilderness characteristics would be managed with additional protective restrictions on woodland harvest, mineral entry, surface disturbance, and ROWs.	Same as Alternative B, except that riparian areas in 25,410 acres of ACECs in non-WSA lands with wilderness characteristics would be managed with additional protective restrictions on woodland harvest, mineral entry, surface disturbance, and ROWs.
Special Status Species	Long-term, beneficial impacts to riparian areas, from protection of special status species habitat.	Same as Alternative A, except additional beneficial impacts from limiting OHV use to a designated route near T37S, R20E, Section 16.	Same as Alternative B.	Same as Alternative B.	Same as Alternative B.	
Vegetation	No impacts on riparian resources because no	Adverse, direct and indirect short term impacts from	Impacts same as B, except treatment of 400 (80%) fewer	Same as Alternative C.	Same as Alternative B.	Same as Alternative C.

Table 2.2. Summary of Impacts

	vegetation treatments are proposed in riparian areas.	vegetation treatments causing increased runoff and sedimentation due to loss of vegetative cover. Long-term, beneficial impacts from riparian condition improvement after treatments. This would be 500 (100%) more acres of riparian treatment than under Alternative A.	acres of riparian habitat than under Alternative B.			
Visual Resources	Under Alternative A, 12,200 acres of riparian habitat would be beneficially protected under VRM Class I and II objectives.	Same as Alternative A, except 1,000 fewer acres (11,200 total acres) of riparian habitat would be protected.	Same as Alternative A, except 8,600 acres of riparian habitat would be beneficially protected under VRM Class I and II objectives.	Under Alternative D, 5,300 acres of riparian habitat would be beneficially protected under VRM Class I and II objectives. This alternative would provide the least benefit to riparian resources.	Same as Alternative B, except more riparian area would be beneficially protected under VRM Class I and II objectives than any of the other alternatives (13,704 acres of riparian habitat).	Under the Proposed Plan, 10,835 acres of riparian habitat would be beneficially protected under VRM Class I and II objectives.
Wildlife and Fisheries Resources	Long-term, direct benefits to riparian resources from maintenance and/or improvement of lowland riparian and wetlands habitats. Some loss of riparian vegetation from elk grazing.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Woodlands	Potential adverse impacts from vegetation disturbance, reduction	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	or loss of woody shrub and canopy vegetation in riparian habitat from permitted harvesting of cottonwood and willow for ceremonial purposes.					
SOCIOECONOMICS						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Cultural Resources	Long-term, adverse impacts to cultural resource-related tourism revenue from minimal restrictions and protection of cultural resources (37,433 acres).	A 162% increase (98,348 acres) in protected cultural resources could beneficially increase cultural resource-related tourism. Increased quality and quantity of cultural sites would likely have long-term beneficial impacts on the local economy as compared to Alternative A.	Impacts same as Alternative B, except reduced protection for the Tank Bench areas could have adverse impacts on tourism and connections to the cultural heritage of the area.	Impacts same as Alternative A, except acreage subject to special management considerations increased by 5% (38,995 acres).	Same as Alternative B, except that areas designated as NSO would be closed in the Comb Ridge.	Impacts same as Alternative B, except reduced protection for the Tank Bench areas could have adverse impacts on tourism and connections to the cultural heritage of the area
Livestock Grazing	No changes in existing socioeconomic conditions (employment, sales tax revenue, culture).	Same as Alternative A, except a 0.7% reduction in acres available for grazing and a 0.08% reduction in AUMs. This is not likely to impact social conditions, jobs or income.	Similar to Alternative B, as AUMs are identical but there is a 6.3% increase in acres available for grazing.	Same as Alternative A, but with a 0.01% reduction in acres and 0.02% reduction in AUMs	Same as Alternative B.	Same as Alternative A, except a 0.7% reduction in acres available for grazing and a 0.08% reduction in AUMs. This is not likely to impact social conditions, jobs or income.
Minerals	Long-term, beneficial economic impacts to local communities from employment,	Same as Alternative A, except total well potential would differ by only 7 wells (73	Same as Alternative A, except the total well potential would differ by only one well	Same as Alternative A, except total well potential would differ by only 2 wells (73	Same as Alternative A, with the well potential differing by 19 wells (73 wells under	Same as Alternative A, except the total well potential would differ by only one well

Table 2.2. Summary of Impacts

	taxes, royalties, bonus payments and annual rent payments from minerals development: Estimated annual revenue from oil and gas development: 5 oil wells-\$251,225 and 5 natural gas wells-\$312,350.	wells under Alternative A and 66 wells under B)	(73 wells under Alternative A and 74 under Alternative C).	wells under Alternative A and 75 wells under Alternative D).	Alternative A and 54 wells under Alternative E). Estimated annual revenue from oil and gas development: 3 oil wells - \$150,735 and 3 natural gas wells - \$187,410.	(73 wells under Alternative A and 72 under the Proposed Plan).
Non-WSA Lands with Wilderness Characteristics	No impacts, as no non-WSA lands with wilderness characteristics would be managed for wilderness characteristics.	No impacts, as no non-WSA lands would be managed for wilderness characteristics.	No impacts, as no non-WSA lands would be managed for wilderness characteristics	No impacts, as no non-WSA lands would be managed for wilderness characteristics.	Management prescriptions for 582,357 acres of non-WSA lands with wilderness characteristics has some potential for positive impacts on local economy with the potential for some socioeconomic losses due to restricted activities in these areas.	Same as Alternative E, but to a lesser extent as managing for 5 units and 88,871 acres.
Recreation and Travel Management	No changes in current socioeconomic trends (\$35.5 million in spending and 1,083 jobs in 2003).	Minor, adverse impacts on socioeconomics from decreased group/trip sizes within SRMAs, resulting in fewer visitors. Long-term, beneficial impacts on non-motorized activities would be greater than under Alternative A, but less than under Alternative E.	Similar impacts to Alternative A, with greater potential for increased visitation and economic contributions to local economy than Alternative B. Reduced potential relative to Alternative A for long-term, adverse social impacts due to user conflicts, crowding, and degradation to	Similar to Alternative A, except for a slightly greater potential benefit to short-term economic conditions as group, trip, and use limits would be least restrictive under this alternative. Reduced potential relative to Alternative A for long-term, adverse social	Minor, adverse impacts on socioeconomics from decreased group/trip sizes within SRMAs, resulting in fewer visitors. Long-term, beneficial impacts on non-motorized activities would be greatest under this alternative. Minor adverse economic impacts on	Similar impacts to Alternative A, with greater potential for increased visitation and economic contributions to local economy than Alternative B. Reduced potential relative to Alternative A for long-term, adverse social impacts due to user conflicts, crowding, and degradation to

Table 2.2. Summary of Impacts

		Reduction in OHV open acreage to zero would have potentially adverse social impacts on those OHV users desiring an unrestricted motorized experience.	the environment Reduction in OHV open acreage to 2311 acres would have potentially adverse social impacts on those OHV users desiring an unrestricted motorized experience	impacts due to user conflicts, crowding, and degradation to the environment, but greater potential for such adverse effects than Alternatives B, C or E. Reduction in OHV open acreage to 2311 acres would have potentially adverse social impacts on those OHV users desiring an unrestricted motorized experience.	businesses and individuals relying on development (especially minerals) of public lands for their livelihoods. Potential economic benefits to those individuals and businesses catering to groups or individuals desiring more primitive recreation experiences. Reduction in OHV open acreage to zero would have potentially adverse social impacts on those OHV users desiring an unrestricted motorized experience.	the environment. Reduction in OHV open acreage to 97 acres would have potentially adverse social impacts on those OHV users desiring an unrestricted motorized experience.
Special Designations	Negligible economic impacts from anticipated level of minerals development and OHV access. No W&SR designation beneficial to minerals development but potential adverse impacts to revenues generated from river user groups.	Impacts same as Alternative A, except adverse impacts to mineral development and subsequent economic revenue would be slightly greater with 521,141 acres (7% increase compared to Alternative A) proposed as ACECs. Adverse impacts to mineral development from seasonal prohibitions of SRPs in ACECs. Long-term, adverse impacts from	Impacts similar to Alternative A, with 76,764 acres of proposed ACECs. Long-term beneficial and adverse impacts same as B for WSRs, but more beneficial for minerals development and less beneficial for recreation users. Opportunities for tourism-based revenue as a result of the designations would be less than	Beneficial minerals-related impacts, as Alternative D would not recommend ACEC or WSR designations.	ACECs— Impacts same as Alternative B, with 521,141 acres (7% increase compared to Alternative A) proposed as ACECs and same amount of W&SR designations.	Impacts similar to Alternative C, with 74,403 acres of proposed as ACECs. Long-term beneficial and adverse impacts similar to B for WSRs, but more beneficial for minerals development and less beneficial for recreation users as 62% fewer miles are recommended Opportunities for tourism-based revenue as a result of

Table 2.2. Summary of Impacts

		designating 92.4 miles as recommended for W&SR status, limiting minerals development. Long-term, beneficial impacts from revenue generated from river user groups.	Alternative B.			the designations would be less than Alternative B.
Visual Resources	Adverse impacts to socioeconomics would be negligible to minor given the amount of VRM III and IV lands (over 1 million acres) open for mineral development and the small amount of wells projected to be drilled over the life of the plan (76 wells).	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A, though fewer acres of VRM III and VRM IV.	Same as Alternative A.
SOIL AND WATER RESOURCES						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Air Quality	No impacts to soils and water resources.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Cultural Resources	Adverse impacts to soils and water resources from watershed treatments and limited controls on disposal of human waste, pets and livestock, and other soil disturbing activities. Long-term, adverse impacts of cultural	Same as Alternative A, except 78,012 acres would be protected as designated CSMAs, with fewer adverse impacts to soils and water resources than Alternative A due to greater restrictions on human waste, pets and livestock.	Adverse impacts to soils and water resources same as Alternative A with same restrictions as Alternative B, except a smaller area would be designated as CSMAs. This alternative would have fewer short- and long-term adverse impacts on soils and	Adverse impacts on soils and water resources same as Alternative A, but to a greater degree. This alternative would have fewer short- and long-term adverse impacts than Alternative A, but greater impacts than Alternatives B	Adverse impacts on soils and water resources same as Alternative A with same restrictions as Alternative B, except the Comb Ridge and Beef Basin CSMAs would also be closed to oil and gas leasing, new improvements for range/wildlife/watersheds and OHV use. This	Same as Alternative C.

Table 2.2. Summary of Impacts

	decisions on soils and water resources would be partially mitigated due to the closure of the Grand Gulch Special Emphasis area to surface-disturbing activities (37,433 acres).		water resources than Alternative A, but greater impacts than Alternative B.	and C.	alternative would provide greater protection for soils and water resources than any other alternative.	
Fire Management	Short-term, adverse impacts on soils and water resources due to increased sedimentation and run-off in areas where vegetation has been treated, with long-term beneficial impacts due to reduced fuel loading and reduced fire risk.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Health and Safety	Short term, beneficial impacts on soils and water resources where Abandoned Mine Lands (AMLs) are rehabilitated; long term, beneficial impacts on soils and water resources by reducing the detrimental impacts of AML water drainage.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Lands and Realty	No impacts to soils and water resources.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Livestock Grazing	Long-term, beneficial impacts from livestock grazing reductions on	Long-term, beneficial impacts from seasonal restrictions,	Same as Alternative B.	Same as Alternative A.	Same as Alternative B.	Same as Alternative C.

Table 2.2. Summary of Impacts

	23,200 acres of soils with limitations.	closures, and/or forage utilization limits on grazing in riparian areas, especially those Functioning at Risk. Alternative B would exclude grazing on 26,200 acres, which would have greater long-term, beneficial impacts than Alternative A.				
Minerals and Energy Resources	Short-term and long-term, adverse impacts from minerals disturbances from loss of vegetative cover, sedimentation of surface waters and loss of soil productivity. Under Alternative A, the following approximate acreages of sensitive soils would be open for mineral leasing and potential adverse impacts: 77,600 acres of highly wind erodible soils; 15,000 acres of highly water erodible soils; 217,300 acres of reclamation sensitive soils, and a total 1,585 acres estimated surface disturbance from mineral development and exploration.	Same impacts as Alternative A, except: 74,000 acres of highly wind erodible soils; 15,100 acres of highly water erodible soils; 276,930 acres of reclamation sensitive soils would be open for mineral leasing. A total of 3,300 more wind erodible; 200 less water erodible; and 37,500 less reclamation sensitive soils would be closed compared to Alternative A. Total estimated surface disturbance from mineral development and exploration would be 155 fewer acres than under Alternative A. An additional 851 acres of surface disturbance would occur over 15 years	Same impacts as Alternative A, except: 83,476 acres of highly wind erodible soils; 16,443 acres of highly water erodible soils; and 311,700 acres of reclamation sensitive soils would be open for mineral leasing. A total of 5,800 less wind erodible, 15,568 more water erodible, and 19,100 less acres of reclamation sensitive soils would be closed compared to Alternative A. Total estimated surface disturbance from mineral development and exploration would be 28 more acres than under Alternative A. An additional 851 acres of surface disturbance would occur over 15 years	Same impacts as Alternative A, except: 84,700 acres of highly wind erodible soils; 17,000 acres of highly water erodible soils; and 314,800 acres of reclamation sensitive soils would be open for mineral leasing. A total of 21,600 less wind erodible acres, 2,100 less water erodible, and 22,300 less acres of reclamation-limited soils would be closed compared to Alternative A. Total estimated surface disturbance from mineral development and exploration would be 60 more acres than under Alternative A. An additional 851	Same impacts as Alternative A, except: 29,732 acres of highly wind erodible soils; 7,878 acres of highly water erodible soils; 196,031 acres of reclamation sensitive soils would be open for mineral leasing. A total of 47,769 more wind erodible, 7,028 more water erodible, and 96,491 more acres of reclamation sensitive acres would be closed compared to Alternative A. Total estimated surface disturbance from mineral development and exploration would be 476 fewer acres than under Alternative A. An additional 851 acres of surface disturbance would occur over 15 years	Same impacts as Alternative A, except: 72,573 acres of highly wind erodible soils; 14,570 acres of highly water erodible soils; and 274,712 acres of reclamation sensitive soils would be open for mineral leasing. A total of 4,916 more wind erodible, 11,034 more water erodible, and 17,812 more acres of reclamation sensitive soils would be closed compared to Alternative A. Total estimated surface disturbance from mineral development and exploration would be 28 more acres than under Alternative A. An additional 851 acres of surface

Table 2.2. Summary of Impacts

		due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres).	due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres).	acres of surface disturbance would occur over 15 years due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres).	due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres).	disturbance would occur over 15 years due to the development of uranium and vanadium (300 acres), placer gold (10 acres), limestone (50 acres), sand and gravel (360), building stone (113 acres), and clay (18 acres).
Non-WSA Lands with Wilderness Characteristics	No effect on soil and water resources as no actions are prescribed to protect the wilderness characteristics of non-WSA lands with wilderness characteristics.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	A total of 582,360 acres of non-WSA lands would be managed to maintain their wilderness characteristics, with long-term beneficial impacts to soils and water resources.	Same as Alternative E, except 5 units (88,871 acres) would be managed to maintain, protect and improve wilderness characteristics.
Paleontology	Negligible impacts to soils and water resources.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Recreation	Potential short- and long-term impacts to soils and water resources associated with recreation activities include damage to streambanks and associated vegetation, soil compaction, increased erosion, and sedimentation of surface waters.	Impacts same as Alternative A, except to a lesser degree, from restrictions on recreation-related soil and water resource impacts within SRMAs.	Same as Alternative B.	Same as Alternative B, except more adverse, long term impacts from fewer restrictions and limits on recreational use.	Same as Alternative B, except that no OHV travel would be allowed within non-WSA lands with wilderness characteristics (582,360 acres).	Same as Alternative B except that OHV travel would be limited to designated routes within non-WSA lands with wilderness characteristics (88,871 acres).

Table 2.2. Summary of Impacts

Riparian Resources	Long-term, beneficial protection of soils and water resources from NSO in riparian areas, management to achieve riparian PFC, and no new surface-disturbing activities allowed within active floodplains or within 100 meters of riparian areas.	Same as Alternative A, except selected areas would be closed to motorized use and livestock trailing, which would result in minor beneficial reductions in impacts to soils and water resources.	Same as Alternative B.	Same as Alternative A.	Same as Alternative B.	Same as Alternative B.
Soil and Water Resources	There would be no additional impacts under Alternative A.	Long-term, beneficial impacts from prohibitions on steep-slope surface-disturbing activities (slopes >40%), and erosion control designs and plans for slopes between 21 and 40%. These measures would reduce erosion and sedimentation relative to Alternative A.	Long-term, beneficial impacts from restrictions on surface disturbance on slopes >40% unless it were determined that it would cause undue or unnecessary degradation to pursue other placement alternatives. These measures would reduce erosion and sedimentation relative to Alternative A.	Adverse impacts same as A, but to a lesser degree, from required plans and erosion control strategies for slopes >40%. Under Alternative D, the impacts of soils and watershed management decisions on soils resources would require a plan including an erosion control plan. These measures would reduce erosion and sedimentation relative to Alternative A.	Same as Alternative B, except there would be additional restrictions on surface-disturbing activities in non-WSA lands with wilderness characteristics. Overall impacts to soils and water resources would be less adverse under Alternative E than under any of the alternatives.	Same as Alternative C.
Special Designations	Long-term, adverse impacts from mineral leasing, geophysical work, mineral material disposal, mineral entry, woodland harvesting, vegetation treatments, grazing,	Impacts same as Alternative A, except with fewer adverse impacts within ACECs from greater surface disturbance restrictions. ACEC designation would	Impacts same as Alternative B, but to a greater degree from an increase in allowable surface-disturbing activities. ACEC designation would result in the	Long-term, adverse impacts from allowed surface disturbance impacts to soils and water. No special designations or zero acres of sensitive soils are protected,	Same as Alternative B.	Same as Alternative C.

Table 2.2. Summary of Impacts

	and OHV use within ACECs. A total of 113,000 acres of sensitive soils would be within designated ACECs, wherein impacts to soil and water resources would be reduced.	result in the protection of 7,385 more acres of sensitive soils than under Alternative A.	protection of 98,000 fewer acres of sensitive soils than under Alternative A.	which is 113,000 fewer acres than Alternative A. This alternative would have the least protections for sensitive soils of the alternatives.		
Special Status Species	Long-term, beneficial impacts to soils and water from special status species habitat protection.	Beneficial impacts same as Alternative A, except to a greater degree, due to more acres of protected habitat for special status species that would protect soils and water resources.	Beneficial impacts same as Alternative B, except to a lesser degree due to fewer acres of protected habitat for special status species.	There would be negligible beneficial impacts compared to Alternative A, as this alternative would have the fewest acres with surface disturbance restrictions in special status species habitat, with the greatest potential for long-term, adverse impacts on soils and water resources of the alternatives.	Same as Alternative B.	Same as Alternative C.
Travel Management	Potential short- and long-term impacts to soils and water resources associated with travel management decisions include damage to streambanks and associated vegetation, soil compaction, increased erosion, and sedimentation of surface waters. A total of 285,700 acres of	Impacts same as Alternative A, except a total of 63,900 acres would be open to OHV use on designated routes, which is 221,800 fewer acres of sensitive soils open than under Alternative A.	Same as Alternative B, except 64,400 acres of sensitive soils would be open to OHV use on designated routes, which is 221,300 fewer acres of sensitive soils open than under Alternative A.	Same as Alternative B, except 64,500 acres of sensitive soils would be open to OHV use, mostly limited to designated routes, which is 221,200 fewer acres of sensitive soils open than under Alternative A.	Same as Alternative B, except no OHV travel would be permitted in non-WSA lands with wilderness characteristics (582,360 acres), which is 296,660 more acres of closed or limited OHV use than Alternative A.	Same as Alternative B, except 64,400 acres of sensitive soils would be open to OHV use on designated routes, which is 221,300 fewer acres of sensitive soils open than under Alternative A.

Table 2.2. Summary of Impacts

	sensitive soils would be closed to OHV use or limited to designated routes.					
Vegetation	Short-term adverse impacts from vegetation treatment-related increased erosion and water runoff. Long-term, beneficial impacts from reduced soil compaction, erosion, and sedimentation through increase in native vegetation cover, and a reduction of invasive weed species. Existing vegetation treatments would occur on 232,100 acres.	Fewer short-term adverse impacts and fewer long-term beneficial impacts than Alternative A on soils and water resources than Alternative A from treatments on 7,600 acres/year, with 118,100 fewer acres of vegetation treatment over the LOP than Alternative A. Alternative B would have fewer short-term adverse impacts and long-term beneficial impacts to soils and water resources than Alternative A	Same as Alternative B, except 9,300 acres would be open to vegetation treatments each year to restore ecosystem health, with 92,600 fewer acres of vegetation treatment over the LOP than Alternative A. Alternative C would have fewer short-term adverse impacts and long-term beneficial impacts to soils and water resources than Alternative A, more than Alternatives B and E.	More long-term beneficial impacts from vegetation treatments on soils and water resources under Alternative D than under Alternatives B or C due to 11,300 acres/year targeted for vegetation treatment, with 62,600 fewer acres of vegetation treatment over the LOP than Alternative A.	Same as Alternative B, except for wilderness characteristics lands where no new land treatments would be allowed.	Same as Alternative C.
Visual Resources	Under Alternative A, 192,136 acres of sensitive soils would be managed as VRM Class I and II, with the second greatest level of beneficial, long-term protection for soils and water resources due to an increase in surface-disturbing restrictions under VRM Class I and II objectives.	Under Alternative B, 186,102 acres of sensitive soils, 6,034 fewer acres than Alternative A, would be managed as VRM Class I and II, with the third greatest long-term, beneficial impacts from surface disturbance restrictions.	Same impacts as Alternative B, except 146,582 acres of sensitive soils, 45,554 fewer acres than Alternative A, would be managed as VRM Class I and II with beneficial impacts from surface disturbance restrictions.	Greatest potential for adverse impacts due to 87,832 acres of sensitive soils, 104,304 fewer acres than Alternative A, managed as VRM Class I and II to restrict surface disturbances.	Under Alternative E, 293,059 acres of sensitive soils, 100,923 more acres than Alternative A, would be managed as VRM Class I and II, with the greatest potential long-term, beneficial impacts from surface disturbance restrictions.	Same impacts as Alternative B, except 176,987 acres of sensitive soils, 15,149 fewer acres than Alternative A, would be managed as VRM Class I and II with beneficial impacts from surface disturbance restrictions.
Wildlife and Fisheries	Maintenance and/or	Same as Alternative	Same as Alternative	Same as Alternative	Same as Alternative A.	Same as Alternative

Table 2.2. Summary of Impacts

Resources	improvement of wildlife and fisheries habitats would have indirect, beneficial impacts by ensuring the ecological functions of these systems, including soils and water within lowland riparian and wetland areas, and low and high desert scrub communities.	A.	A.	A.		A.
Woodlands	Under Alternative A, 1,309,894 acres would be open to woodland harvest, with the highest risk of adverse, long-term impacts to soils and water resources from vegetation loss and surface disturbances by motorized OHV and foot traffic during harvesting.	Adverse impacts same as Alternative A, except to a lesser degree due to 579,820 (44%) fewer acres open to woodland harvest than under Alternative A. This alternative would have fewer adverse impacts on soils and water resources than Alternative A, but greater impacts than Alternative E.	Adverse impacts same as Alternative A, except to a lesser degree due to 467,956 (36%) fewer acres open to woodland harvest than under Alternative A.	Same as Alternative C.	Adverse impacts same as Alternative A, except to a lesser degree due to 761,417 (58%) fewer acres open to woodland harvest than under Alternative A. This alternative would have the least adverse impacts on soils and water resources of the alternatives.	Adverse impacts same as Alternative A, except to a lesser degree due to 471,955 (36%) fewer acres open to woodland harvest than under Alternative A.
SPECIAL DESIGNATIONS						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Special Designations	Management of 513,457 acres as ACECs, but under prescriptions that would generally not be as beneficially protective of ACEC values as Alternatives	521,141 acres managed as ACECs, with long term protection of relevant and important values. 92.4 miles of river segments would be recommended	Smallest area (76,764 acres) of the Monticello Planning Area managed as ACECs, except for Alternative D. Alternative C would be more protective of	Long-term, adverse impacts to relevant and important values resulting from no ACEC management. No river segments would be recommended	Impacts the same as Alternative B, except additional long-term, beneficial impacts to relevant and important ACEC values from protection of 109,206 acres of non-WSA	Same effects on ACEC values as described for Alternative C except for 73,495 acres. 35.7 miles of river segments would be recommended

Table 2.2. Summary of Impacts

	B and E. River segments determined eligible in the 1991 San Juan RMP would be protected. WSAs would be managed to protect their wilderness values.	suitable for wild and scenic river designation, protecting free-flowing rivers, outstandingly remarkable river values, and river classification. WSA impact same as Alternative A.	ACEC values than Alternatives D, but less protective than Alternatives A, B, or E. 18.4 miles of river recommended suitable for wild and scenic river designation, protecting the free-flowing condition of the rivers, outstandingly remarkable river values, and river classification. WSA impacts same as Alternative A.	suitable for wild and scenic river designation. Thus, no protection of free-flowing condition, outstandingly remarkable river values, or river classification. WSA impacts same as Alternative A.	lands with wilderness characteristics. Wild and scenic river suitability recommendations and impacts same as Alternative B. WSA impacts same as Alternative A.	suitable for wild and scenic river designation, protecting free-flowing rivers, outstandingly remarkable river values, and river classification. WSA impact same as Alternative A
All Other Resources	Impacts to specially designated areas from other resource management decisions are discussed under the applicable resources' analysis of impacts.					
SPECIAL STATUS SPECIES						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Air Quality	No impacts to special status species.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Cultural Resources	Long-term, adverse impacts from cultural resource decisions include disturbance of wildlife, trampling of sensitive plants, and introduction of invasive species. These impacts would be partially mitigated by the closure of Grand Gulch NED (37,433 acres) to	Same as Alternative A, except there would be fewer impacts under Alternative B due to the designation of SRMAs and associated restrictions on surface-disturbing activities. Adverse impacts to special status species from	Same total acreage and impacts as Alternative B, except more surface-disturbing activities and visitors would be permitted in these areas than Alternative B, with overall impacts less than under Alternative A.	No acres would be designated as special management areas, which would have greater short-term and long-term, adverse impacts than Alternatives B and C, but fewer impacts than Alternative A.	Impacts same as Alternative B.	Impacts same as Alternative B.

Table 2.2. Summary of Impacts

	surface-disturbing activities such as woodland products gathering, mineral leasing, OHV use, and vegetation treatments.	surface-disturbing activities and other human disturbances under Alternative B would be considerably reduced from Alternative A due to restrictions on surface disturbances and use within the designated CSMAs, SRMA, and the 37,388 acres Grand Gulch National Historic District.				
Fire Management	Short-term adverse impacts from surface disturbance associated with fuels treatments, including trampling and crushing, habitat alteration, and introduction of invasive species. Long-term beneficial impacts would also occur due to reduced fuel loading, reduced fire risk, and diversified habitat on 5,000-10,000 acres/year.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Health and Safety	Potential adverse loss of special status bat habitat. Clean-up of hazardous spills and abandoned mines would help mitigate the adverse effects of	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	water contamination on TES fish species.					
Lands and Realty	In areas where ROWs would be authorized, there could be long-term direct, adverse impacts on special status species habitat where installation would occur. These impacts would result from vegetation crushing and removal associated with construction and habitat fragmentation. Short-term direct impacts could result from noise disturbances. Long-term indirect adverse impacts could result from the potential introduction of invasive plant species by construction equipment and building personnel. 374,590 acres would be avoided or excluded from ROW development.	Same as Alternative A, except 541,717 acres would be avoided or excluded from ROW development.	Same as Alternative A, except 434,652 acres would be avoided or excluded from ROW development.	Same as Alternative A, except 401,028 acres would be avoided or excluded from ROW development.	Same as Alternative A, except 1,028,378 acres would be avoided or excluded from ROW development.	Same as Alternative A, except 549,408 acres would be avoided or excluded from ROW development.
Livestock Grazing	Adverse impacts include trampling, reduced forage and cover, reduced habitat quality and biodiversity, and introduction of invasive species.	Adverse and beneficial impacts same as Alternative A, except 141,160 acres would be unavailable for grazing.	Adverse and beneficial impacts same as Alternative A, except 136,261 acres would be unavailable for grazing.	Adverse and beneficial impacts same as Alternative A, except 132,108 acres would be unavailable for grazing.	Same as Alternative B.	Adverse and beneficial impacts same as Alternative A, except 141,816 acres would be unavailable for grazing.

Table 2.2. Summary of Impacts

	Under Alternative A, 128,098 acres would be unavailable for grazing.					
Minerals and Energy Resources	Adverse impacts from mineral development and exploration include direct mortality, surface disturbance, habitat degradation, and habitat fragmentation. Oil and gas leasing would include 161,941 acres of special status species habitat closed or NSO to oil and gas leasing and mineral entry.	Adverse impacts same as Alternative A, except fewer acres of special status species habitat would be impacted than under Alternative A: Oil and gas leasing would include 207,303 acres of special status species habitat closed or NSO to oil and gas leasing and mineral entry..	Adverse impacts same as Alternative A, except more acres of special status species habitat would be impacted than under Alternative A. Oil and gas leasing would include 150,211 acres of special status species habitat closed or NSO to oil and gas leasing and mineral entry.	Adverse impacts same as Alternative A, except more acres of special status species habitat would be impacted than under Alternative A: Oil and gas leasing would include 146,962 acres of special status species habitat closed or NSO to oil and gas leasing and mineral entry.	Adverse impacts same as Alternative A, except fewer acres of special status species habitat would be impacted than under Alternative A: Oil and gas leasing would include 389,521 acres of special status species habitat closed or NSO to oil and gas leasing and mineral entry..	Adverse impacts same as Alternative A, except fewer acres of special status species habitat would be impacted than under Alternative A: Oil and gas leasing would include 169,142 acres of special status species habitat closed or NSO to oil and gas leasing and mineral entry..
Non-WSA Lands with Wilderness Characteristics	No impacts to special status species as non-WSA lands with wilderness characteristics are not protected under this alternative.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Long-term, beneficial impacts to species from restricted surface disturbances to habitat within 582,357 acres of non-WSA lands with wilderness characteristics.	Same as Alternative E, except managed for 5 units that protect wilderness characteristics.
Paleontology	No impacts to special status species.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Recreation	Long-term, adverse impacts from human presence, noise, and surface disturbance associated with mechanized and dispersed recreation on 361,972 acres of federally listed species habitat within	Long-term, adverse impacts same as Alternative A, except with increased protection for special status species and 180,032 fewer acres of federally listed species habitat within SRMAs than under	Long-term, adverse impacts on TES species would be similar to Alternative A. Approximately 5% fewer visitors would be allowed in SRMAs and camping would be limited to designated areas in	Long-term, adverse impacts same as Alternative A, except this alternative would have the most acres of potential special status species habitat subject to adverse impacts from recreation.	Same as Alternative B.	The impacts to TES species would be the same as under Alternative C.

Table 2.2. Summary of Impacts

	SRMAs.	Alternative A. In addition, approximately 25% fewer visitors would be allowed in SRMAs than under Alternative A.	more SRMAs than under Alternative A.	Adverse impacts would be greater than Alternative A, even with 184,576 fewer acres of federally listed species habitat within SRMAs.		
Riparian Resources	Short-term adverse impacts to special status plant and fish species could occur from vegetation treatments. Long-term beneficial impacts include reduced weeds and restoration of native vegetation.	In addition to the impacts described under Alternative A, this alternative would provide a reduction in adverse impacts on TES species by closing OHV routes in riparian areas, closing areas to livestock grazing, seasonal restrictions, and setting forage use limits.	Impacts same as Alternative B with fewer adverse impacts to special status species and habitats than Alternatives A.	Impacts same as Alternative A.	Same as Alternative B.	Impacts same as Alternative B with fewer adverse impacts to special status species and habitats than Alternatives A.
Socioeconomics	No impacts to special status species.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Soil and Water Resources	Adverse impacts include habitat loss or degradation from erosion in upland habitats, and sedimentation and contamination of special status fish habitats. Alternative A would have the greatest potential for adverse impacts on special status species habitat due to limited surface disturbance restrictions on steep	Impacts same as Alternative A, except surface-disturbing activities would be prohibited on slopes >40%, with erosion control measure required on 21 to 40% slopes. Impacts would be less than Alternative A.	Impacts same as Alternative A, with greater potential for adverse impacts on slopes >40% than Alternatives B and E. Impacts would be less than Alternatives A and D.	Impacts same as Alternative A, except surface-disturbing activities would be prohibited on slopes >40%, with erosion control measure required on 21 to 40% slopes. Impacts would be less than Alternative A.	Same as Alternative B, except for non-WSA lands with wilderness characteristics would be managed as unavailable for mineral leasing, as unavailable for OHV use, as ROW exclusion areas, as unavailable for disposal of mineral materials and woodland harvest, and would be managed as VRM Class I, and as proposed for	Same as Alternative C.

Table 2.2. Summary of Impacts

	slopes.				withdrawal from mineral entry.	
Special Designations	Beneficial impacts within 492,077 acres designated as ACECs, with long-term adverse impacts on areas available to mineral leasing within ACECs, and impacts associated with permitted woodland harvesting, open OHV use, livestock grazing, and vegetation treatments.	Impacts same as Alternative A, except 521,142 acres of designated ACECs with fewer acres available for oil and gas leasing than Alternative A. Overall fewer impacts than Alternative A due to more acres subject to surface disturbance restrictions.	Impacts same as Alternative A, except 76,764 acres of designated ACECs with fewer acres available for oil and gas leasing than Alternative A. Overall greater impacts than Alternative A due to fewer acres subject to surface disturbance restrictions.	No acres designated as ACECs and limited restrictions on surface disturbances to special status species habitat. Overall greater impacts than Alternatives A, B, C and E.	Same as Alternative B.	Impacts same as Alternative A, except 74,429 acres of designated ACECs with fewer acres available for oil and gas leasing than Alternative A. Overall greater impacts than Alternative A due to fewer acres subject to surface disturbance restrictions.
Special Status Species	Long-term, beneficial impacts on species from restrictions, protective measures, and spatial and seasonal buffers to preserve species habitat.	Impacts same as Alternative A, except Alternative B would provide more acres of protected habitat for special status species.	Impacts same as Alternative A, except Alternative C would provide more acres of protected habitat for special status species than Alternative A.	Impacts same as Alternative A, except Alternative D would protect the fewest acres of special status species habitat from surface disturbance with greater potential impacts than any of the alternatives.	Same as Alternative B.	Same as Alternative B.
Travel Management	Adverse impacts include surface and noise disturbance, crushing of individual plants and animals, habitat, and introduction of invasive species. Adverse impacts would be reduced by the closure of 276,430 acres to	Impacts same as Alternative A, except 147,268 acres more closed to OHV use than Alternative A and fewer associated adverse impacts to special status species and their habitat.	Impacts same as Alternative A, except 142,237 acres more closed to OHV use than Alternative A.	Impacts same as Alternative A, except no acres closed to OHV use and the greatest potential long-term adverse impacts to special status species from travel of any of the Alternatives.	Same as Alternative B.	Impacts same as Alternative A, except 117,465 acres more closed to OHV use than Alternative A and fewer associated adverse impacts to special status species and their habitat.

Table 2.2. Summary of Impacts

	OHV use. Beneficial impacts from fewer miles of available OHV trails due to reduced potential for habitat fragmentation.					
Vegetation	Short-term adverse impacts include trampling and removal of habitat, and collection of sensitive plant species on 15,475 acres open to vegetation treatments per year. Beneficial impacts from habitat improvements and control of invasive and weedy species.	Adverse impacts same as Alternative A, except 7,875 (51%) fewer acres of vegetation treatments per year, and greater beneficial impacts on species and habitat due to treatment of specific vegetation communities compared to unfocused treatment under Alternative A.	Adverse impacts same as Alternative A, except to a lesser degree due to 6,175 (40%) fewer acres of vegetation treatments per year. Long-term beneficial impacts would be less than Alternative A due to unfocused treatments occurring on fewer acres.	Adverse impacts same as Alternative A, expect to a lesser degree due to 4,175 (27%) fewer acres of vegetation treatments per year. Long-term beneficial impacts would be greater than under Alternatives B or C due to more targeted vegetation treatments.	Same as Alternative B, except 582,357 acres would have restrictions on vegetation treatments, with fewer short-term adverse impacts than Alternative A, and more long-term beneficial impacts due to habitat protection for special status species.	Adverse impacts same as Alternative A, expect to a lesser degree due to 4,175 (27%) fewer acres of vegetation treatments per year. Long-term beneficial impacts would be greater than under Alternatives B or C due to more targeted vegetation treatments.
Visual Resources	Under Alternative A 726,687 acres would be subject to VRM Class I or II restrictions, with long-term beneficial impacts to special status species due to restrictions on surface-disturbing activities.	Impacts same as Alternative A, except 21,622 (3%) more acres subject to VRM Class I or II restrictions, and greater protection from surface-disturbing activities than Alternative A.	Impacts same as Alternative A, except 169,507 (23%) less acres subject to VRM Class I or II restrictions and less protection from surface-disturbing activities than Alternative A.	Impacts same as Alternative A, except 327,426 (45%) less acres subject to VRM Class I or II restrictions, and the least protection from surface-disturbing activities of the alternatives	Impacts same as Alternative A, except 383,161 (53%) more acres subject to VRM Class I or II restrictions than Alternative A and the greatest protection for special status species habitats.	Impacts same as Alternative A, except 75,657 (10%) more acres subject to VRM Class I or II restrictions than Alternative A and greater protection for special status species and habitats.
Wildlife and Fisheries Resources	Long-term, beneficial impacts from seasonal restrictions in migratory bird habitat, and maintenance and improvements to riparian, wetland, and desert scrub habitats.	Long-term, beneficial impacts same as Alternative A, but to a greater degree because 558,041 acres of special status species habitat would have seasonal restrictions for big	Long-term, beneficial impacts same as Alternative A, but to a greater degree because 326,804 acres of special status species habitat would have seasonal restrictions for big	Long-term, beneficial impacts same as Alternative A, but to a greater degree because 341,637 acres of special status species habitat would have seasonal restrictions	Same as Alternative B.	Long-term, beneficial impacts same as Alternative A, but to a greater degree because 447,024 acres of special status species habitat would have seasonal restrictions for big

Table 2.2. Summary of Impacts

	Long-term, beneficial impacts on 249,651 acres of special status species habitat due to seasonal restrictions for big game.	game, and more acres would be subject to special wildlife conditions than under Alternative A.	game, and more acres would be subject to special wildlife conditions than under Alternative A.	for big game, and more acres would be subject to special wildlife conditions than under Alternative A.		game, and more acres would be subject to special wildlife conditions than under Alternative A.
Woodlands	Adverse impacts include removal or alteration of habitat, noise, trampling and crushing during harvesting, and surface disturbance. Beneficial impacts from reduced potential for wildfire and enhancement of understory habitats. 1,309,894 acres would be open to woodland harvest and wood gathering and pose the greatest potential disturbance to special status species in woodland habitats.	Impacts same as Alternative A, except to a lesser degree due to 730,075 (56% fewer) acres open to woodland harvest and wood gathering, and fewer potential long-term benefits from wildfire reduction than Alternative A.	Impacts same as Alternative A, except to a lesser degree due to 841,938 (36% fewer) acres open to woodland harvest and wood gathering, and fewer potential long-term benefits from wildfire reduction than Alternative A.	Same as Alternative C.	Same as Alternative B with additional protections on 582,357 acres of non-WSA lands with wilderness characteristics, which would be closed to woodland harvesting and wood gathering, and provide reduced surface disturbances in special status species habitat.	Impacts same as Alternative A, except to a lesser degree due to 837,939 acres (36% fewer) acres open to woodland harvest and wood gathering, and fewer potential long-term benefits from wildfire reduction than Alternative A.
TRAVEL MANAGEMENT						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Air Quality	Minor, short-term adverse impacts from reroutes or travel delays for dust abatement.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Cultural Resources	Long-term, adverse impacts from closure of 500 feet of the McLoyd Canyon-	Long-term, adverse impacts from OHV exclusion from Tank Bench and from the	Impacts in Tank Bench same as Alternative B.	Long-term, beneficial impacts to travel from access to Tank Bench and McLoyd	Same as Alternative B.	Same as Alternative B for Tank Bench and McLoyd Canyon-

Impacts same as discussed under Recreation and Riparian.	Impacts same as discussed under Recreation and Riparian.	Impacts same as discussed under Recreation and Riparian.
Travel Management, OHV	Long-term, beneficial impacts from designated Open OHV (611,310 acres) and Limited to Designated or existing routes travel areas, and access to Arch Canyon. Adverse impacts to OHV use on 276,430 acres in Closed areas.	Long-term, adverse impacts from no designated Open OHV areas, and Arch Canyon closure to OHV travel, and 423,698 acres Closed to OHV use.	Similar to Alternative B, except beneficial impacts from 2,311 acres designated Open to OHV use. Adverse impacts to travel from 418,667 acres Closed to OHV use.	Minor impacts on travel from no OHV Closed areas, and OHV access to Arch Canyon. Beneficial impacts from 2,311 acres designated Open to OHV use.	Same as Alternative B, except 582,360 acres within non-WSA lands with wilderness characteristics would be Closed to OHV travel. Adverse impacts to travel from a total of 970,436 acres Closed to OHV travel, and no areas designated as Open to OHV travel.	Adverse impacts from closing 393,895 acres to OHV use. Impacts on travel within Arch Canyon same as Alternative A.
Travel Management, Non-mechanized	Long-term, beneficial impacts from no restrictions on non-mechanized travel,	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	and travel opportunities that exclude motorized and mountain biking travel to reduce user conflicts.					
Travel Management, Roads	Negligible impacts to travel from no road closures, and unrestricted travel along B- and D-Class roads.	Long-term, adverse impacts from 15 miles of B- and 780 miles of D-Class road closures to resolve resource use conflicts.	Long-term, adverse impacts from 17 miles of B- and 316 miles of D-Class road closures to resolve resource use conflicts.	Long-term, adverse, minor impacts from 17 miles of B- and 45 miles of D-Class road closures to resolve resource use conflicts.	Same as Alternative B, except decisions for the 582,360 acres within non-WSA lands with wilderness characteristics would close 179 miles of D-Class roads.	Same as Alternative C. Beneficial impacts from allowed OHV travel along designated routes in the 88,871 acres of non-WSA lands with wilderness characteristics.
Travel Management, Scenic Byways and Backways	Long-term, beneficial impacts from management for high-quality travel opportunities along these routes.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Vegetation	Same impacts as discussed under Fire Management because treatments are the same.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Wildlife and Fisheries Resources	Negligible to minor impacts from lack of restrictions on travel except for restrictions on cross-country OHV travel within bighorn sheep crucial habitat.	Short-term, adverse impacts from seasonal restrictions in wildlife crucial habitat for commercial and permitted travel. No impacts on private travel.	Same as Alternative B.	Same as Alternative A.	Same as Alternative B.	Same as Alternative B.
Woodlands	Negligible impacts on travel from unspecified actions.	Short-term, adverse impacts on commercial OHV use from route closures to	Same as Alternative B, to protect cultural and other sensitive resources.	Same as Alternative B, to protect cultural and other sensitive resources.	Long-term, adverse impacts from prohibitions on OHV road travel within	Same as Alternative B, with additional minor impacts on travel within non-WSA

		protect wildlife species.			areas with non-WSA wilderness characteristics and from prohibitions on woodland harvesting.	lands with wilderness characteristics
VEGETATION						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Air Quality	No impacts to vegetation resources.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Cultural Resources	Long-term, adverse impacts of cultural resource decisions on vegetation would be partially mitigated by closure of the Grand Gulch Special Emphasis area to surface-disturbing activities such as woodland harvesting, mineral leasing, OHV use, and mechanized or mechanical surface disturbance (including vegetation treatments). These restrictions would limit vegetation-harming surface disturbance associated with these activities on 37,387 acres.	Fewer short- and long-term adverse impacts than under Alternatives A, C or D, due to restrictions on surface-disturbing activities on 62,567 acres of designated CSMA. This alternative would have fewer adverse impacts on vegetation than Alternatives A, C and D.	Same beneficial surface disturbance restrictions and impacts as under Alternative B, except some CSMA would have fewer restrictions on surface-disturbing activities than Alternatives B and E, but greater restrictions than Alternatives A and D. This alternative would have fewer short- and long-term adverse impacts than Alternative A and D, but more than Alternatives B and E.	Same impacts as Alternative C, except fewer areas would be managed as CSMA. Overall, this alternative would have fewer short- and long-term adverse impacts than Alternative A, but more than Alternatives B, C and E.	Same as B, except more short- and long-term beneficial impacts from vegetation resource preservation within Comb Ridge to preserve non-WSA lands with wilderness characteristics.	Same as Alternative C, except that two SRMA and two MZs within the Cedar Mesa SRMA would be established. Adverse impacts to vegetation from surface disturbance under the Proposed Plan would be greater than under Alternatives B and C but less than under Alternative A.
Fire Management	Surface-disturbing fuels treatments on 5,000 to 10,000 acres/year would have long-term beneficial and short-term adverse impacts	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.

Table 2.2. Summary of Impacts

	on vegetation communities in treated areas. Thinning vegetation and treating areas for weeds would benefit vegetation by removing competition from weedy natives and invasive species. Short-term, adverse impacts include trampling and crushing of individual plants during treatment.					
Health and Safety	No impacts to vegetation resources.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Lands and Realty	Under Alternative A, construction of roads, pipelines, wind power generators, solar power generators, and communication towers would result in adverse impacts to vegetation from removal of individual plants and other surface disturbances, which can lead to the introduction of weedy plant species. 132,380 acres would be withdrawn from mineral entry, while 120,800 acres and 253,790 acres would be exclusion and avoidance areas, respectively, for	There would be fewer adverse impacts on vegetation resources under this alternative than Alternative A due to restrictions on ROWs for wind and solar energy development in WSAs, WSR corridors, VRM Class I and II areas, ACECs, raptor and migratory bird habitat, and special status species habitat. Overall, Alternative B would have fewer adverse impacts on vegetation resources than Alternatives A, C or D. 251,710 acres would be withdrawn	Adverse impacts would be same as under Alternative A due to increased surface disturbance associated with ROWs in ACECs, VRM Class II and III areas, and non-federally listed sensitive species habitat. Overall, Alternative C would have fewer impacts on vegetation resources than Alternatives A and D, but more than B and E. 121,912 acres would be withdrawn from mineral entry, while 395,329 acres and 39,323 acres	Alternative D would have greater adverse impacts on vegetation resources than Alternative A due to more acres of surface disturbance associated with ROWs than would occur under any of the other alternatives. 46,131 acres would be withdrawn from mineral entry, while 386,853 acres and 14,175 acres would be exclusion and avoidance areas, respectively, for ROWs.	Same impacts as Alternative B, except ROWs would be prohibited in non-WSA lands with wilderness characteristics, which would reduce long-term, adverse impacts to vegetation more than any of the other alternatives. 834,070 acres would be withdrawn from mineral entry, while 974,463 acres and 53,915 acres would be exclusion and avoidance areas, respectively, for ROWs.	Impacts would be similar to the alternatives except that 50,665 acres would be withdrawn from mineral entry, while 416,115 acres and 133,293 acres would be exclusion and avoidance areas, respectively, for ROWs.

Table 2.2. Summary of Impacts

	ROWs.	from mineral entry, while 416,612 acres and 125,105 acres would be exclusion and avoidance areas, respectively, for ROWs.	would be exclusion and avoidance areas, respectively, for ROWs.			
Livestock Grazing	Beneficial impacts from 17,300 acres allotted to wildlife on the slopes of Peter's Canyon and East Canyon, which would help maintain native vegetation in those areas due to the lower grazing impact of lower numbers of wildlife than livestock.	Same impacts as Alternative A, except allotment closures would exclude more acreage from grazing than any of the other alternatives, which would have long-term, beneficial impacts on native vegetation in excluded areas.	Same as Alternative B, except the Mule Canyon Allotment south of U-95 would be unavailable. This alternative would have similar impacts as Alternative B, and lower impacts than Alternative A.	Alternative D would have the smallest area excluded from grazing and, therefore greater adverse impacts to vegetation.	Same as Alternative B.	Same as Alternative C.
Minerals and Energy Resources	Approximately 73 wells drilled (701 acres of surface disturbance), 886 acres of short-term impacts from geophysical exploration, and infrastructure construction with direct adverse impacts on vegetation. There would be approximately 851 acres of surface disturbance total for 15 years as a result of uranium, vanadium, placer gold, limestone, sand and gravel, building	Impacts would be the same as Alternative A, except there would be approximately 66 wells and 634 acres of disturbance (10% fewer acres than under Alternative A), and 794 acres of adverse impacts from geophysical exploration (10% fewer acres than under Alternative A). Acres of disturbance for uranium, vanadium, placer gold, limestone, sand and gravel, building stone, and clay activities would be the same as under	Impacts would be the same as Alternative A, except there would be approximately 74 wells and 710 acres of disturbance (1% more than under Alternative A), and 904 acres of adverse impacts from geophysical exploration (2% more than under Alternative A). Acres of disturbance for uranium, vanadium, placer gold, limestone, sand and gravel, building stone, and clay activities would be the same as under Alternative A.	Impacts would be the same as Alternative A, except there would be approximately 75 wells and 720 acres (2% more than under Alternative A), and 924 acres of surface disturbance from geophysical exploration (4% more than under Alternative A). Acres of disturbance for uranium, vanadium, placer gold, limestone, sand and gravel, building stone, and clay activities would be the same as under	Same as Alternative B, except for long term, beneficial impacts from mineral leasing prohibitions on 582,357 acres of non-WSA lands with wilderness characteristics. Alternative E would have the most acres closed or NSO to oil and gas leasing, and the least negative impacts on vegetation resources of the alternatives. Acres of disturbance for uranium, vanadium, placer gold, limestone, sand and gravel, building stone, and	Impacts would be the same as Alternative A, except there would be approximately 72 wells and 688 acres (2% less than under Alternative A), and 904 acres of surface disturbance from geophysical exploration (2% more than under Alternative A). Acres of disturbance for uranium, vanadium, placer gold, limestone, sand and gravel, building stone, and clay activities would be the same as under Alternative A. Overall, the Proposed

Table 2.2. Summary of Impacts

	stone, and clay activities. Overall, the second fewest number of acres of native vegetation would be impacted by minerals development under this alternative.	Alternative A. Alternative B would have fewer adverse impacts than Alternative A and greater impacts than Alternative E.	Overall, this alternative would have greater adverse impacts to vegetation than Alternatives A, B and E, and slightly fewer impacts than Alternative D.	Alternative A. This alternative would have greater adverse impacts to vegetation than any of the alternatives.	clay activities would be the same as under Alternative A.	Plan would have greater adverse impacts to vegetation than Alternative A.
Non-WSA Lands with Wilderness Characteristics	No impacts to vegetation, as non-WSA lands with wilderness characteristics are not protected under this alternative.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Long-term, beneficial impacts from resource preservation on 582,357 acres. Long-term and short-term, adverse impacts from prohibitions on mechanical treatment of vegetation and harvesting to reduce fire risks and invasive species spread.	Same as Alternative E, except 5 units (88,871 acres) would be managed to protect their wilderness characteristics.
Paleontology	Short-term adverse impacts on vegetation due to trampling.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Recreation	Alternative A would have the second most acres of native vegetation subject to adverse impacts associated with recreation activities of the alternatives and the Proposed Plan.	Alternative B would have the fewest user/days per year and number of visitors per day of the alternatives and the Proposed Plan, which would reduce trampling of native vegetation and introduction of weedy plant species associated with human presence. This alternative would have greater long-term, beneficial	Impacts same as Alternative B, but to a less beneficial degree, due to fewer restrictions on surface disturbances to vegetation.	Same impacts as C, but to a less beneficial degree due to fewer restrictions on surface disturbances to vegetation.	Same impacts as Alternative B, except protection of non-WSA lands with wilderness characteristics would beneficially limit or prohibit surface disturbances to vegetation within SRMAs. This alternative would have the least impacts on vegetation of the alternatives and the Proposed Plan.	Impacts same as Alternative C except that group size limits would be greater in Cedar Mesa and Dark Canyon SRMAs and special Management Zones would be established in Comb Ridge, Beef Basin, and McLoyd Canyon-Moonhouse within the Cedar Mesa SRMA.

Table 2.2. Summary of Impacts

		impacts and fewer adverse impacts on vegetation than any of the other alternatives and the Proposed Plan.				
Riparian Resources	Vegetation treatments would have both beneficial and adverse impacts on vegetation in riparian habitat. Beneficial impacts would include reduction of weed populations and the restoration of diverse native vegetation. Adverse impacts would include crushing and removal of native vegetation during the treatment process.	If determined to be the cause, OHV routes in selected riparian areas would be closed if riparian areas are found to be Functioning at Risk. In addition, some riparian areas would be unavailable for grazing, while others would be subject to seasonal restrictions and forage utilization limits if found to be Functioning At Risk. These restrictions would reduce adverse impacts to riparian vegetation. This alternative would have fewer impacts on vegetation than Alternatives A and D.	Same as Alternative B.	Same as Alternative A.	Same as Alternative B, except surface-disturbing activities would be limited or prohibited in non-WSA lands with wilderness characteristics. This alternative would have the greatest beneficial impacts and least adverse impacts on riparian vegetation of the alternatives.	Same as Alternative C.
Socioeconomics	No impacts to vegetation resources.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Soil and Water Resources	Long-term, adverse impacts on vegetation due to limited restrictions on surface disturbances on steep slopes.	Long-term, beneficial impacts on vegetation from prohibitions on surface-disturbing activities on slopes >40%, and erosion control designs and plans for surface-	Long-term, beneficial impacts on vegetation due to restrictions on surface disturbance on slopes >40%, unless it were determined that it would cause undue or	Impacts same as A, but to a less adverse degree due to required plans and erosion control strategies for slopes >40%, which would help mitigate	Same as Alternative B, except surface-disturbing activities would be limited or prohibited in non-WSA lands with wilderness characteristics. This alternative would have	Same as Alternative C.

This alternative would have greater adverse impacts on vegetation than Alternatives B, C, and E, but fewer impacts than Alternative A.</p>	<p>the least adverse impacts on vegetation of the alternatives.</p>	
Special Designations	<p>Long-term, adverse impacts to vegetation within ACECs from surface disturbances related to mineral leasing, geophysical work, mineral material disposal and mineral entry. Other adverse impacts would include woodland harvesting, vegetation treatments, livestock grazing and open OHV use.</p>	<p>The increased number of acres designated as ACECs and decrease in allowable surface-disturbing activities under this alternative would result in fewer long-term, adverse impacts on vegetation resources than would occur under Alternatives A, C, and D.</p>	<p>Alternative C would have limited ACEC designation and more acres subject to surface-disturbing activities than Alternatives A, B, and E, but fewer adverse impacts than Alternative D.</p>	<p>No ACECs would be designated under Alternative D. This alternative would have the greatest long-term, adverse impacts to vegetation from the increase in permitted surface disturbances of any of the alternatives and the Proposed Plan.</p>	<p>Same impacts as Alternative B, except there would be beneficial, long-term impacts on vegetation due to restrictions on surface-disturbing activities in non-WSA lands with wilderness characteristics within designated ACECs.</p>	<p>The Proposed Plan would designate more acreage as ACECs than Alternatives C and D, but less than Alternatives A, B, and E. Therefore, more acres would be subject to surface-disturbing activities under the Proposed Plan than under Alternatives A, B, and E. However, fewer acres would be subject to these activities than under Alternatives C and D.</p>
Special Status Species	<p>Alternative A would specify acres of protected habitat for special status species, which would also protect vegetation resources. This alternative would provide the least</p>	<p>Alternative B would provide the most acres of protected habitat for special status species, which would indirectly provide protection for vegetation in special status species</p>	<p>Alternative C would provide fewer protected acres of habitat for special status species habitat, and vegetation therein, than Alternatives B and E, but would</p>	<p>Alternative D would provide fewer protected acres of special status species habitat, and the vegetation therein, than Alternatives B, C, and E, but would</p>	<p>Same as Alternative B, except there would be beneficial, long-term impacts on vegetation due to restrictions on surface-disturbing activities in non-WSA lands with wilderness characteristics. This</p>	<p>Same as Alternative B, except that within 0.6 miles of active sage-grouse strutting grounds oil and gas leasing would be subject to NSO restrictions. The construction of power</p>

Table 2.2. Summary of Impacts

	beneficial protection of the alternatives.	habitat. This alternative would provide greater beneficial protections and have the lower adverse impacts on vegetation than Alternatives A, C, and D.	have greater protections in place than Alternatives A and D.	have greater protections in place than Alternative A.	alternative would have the fewest adverse impacts on vegetation of the alternatives.	lines, wind power turbines, or other above ground structures would be avoided within 4 miles of active Gunnison sage-grouse strutting grounds from May 16 - March 19. Overall, the Proposed Plan would result in fewer impacts to vegetation than under Alternative A.
Travel Management	This alternative would have 276,430 acres closed to OHV use. These closures would eliminate OHV related surface disturbance to native vegetation in closed areas.	Alternative B would close 423,582 acres to OHV use, which is 135,502 acres (47%) more than Alternative A. This alternative would have the fewer adverse impacts on vegetation associated with travel than Alternatives A, C, and D.	Alternative C would close 418,549 acres to OHV use, which is 130,469 acres (45%) more than Alternative A. This alternative would have fewer adverse impacts on vegetation associated with travel than Alternatives A and D, but greater impacts than B and E.	This alternative would have no closures to OHV use, which is 276,430 acres less than under Alternative A. This alternative would have the greatest adverse impacts on vegetation from travel of any of the alternatives.	Same as Alternative B, except there would be 582,356 additional acres closed to OHV use in non-WSA lands with wilderness characteristics. This alternative would have the least adverse impacts on vegetation due to 694,006 (251%) more acres closed to OHV use than Alternative A.	The Proposed Plan would close 393,895 acres to OHV use, which is 117,465 acres (42%) more than under Alternative A.
Vegetation	15,475 acres vegetation treatments per year. This alternative would have short-term, adverse impacts on vegetation due to the large acreage open to disturbances associated with widespread, unspecified vegetation	Under Alternative B, 7,600 acres of vegetation treatments/year represent a 51% reduction in annual treatments compared to A. This alternative would provide the least long-term benefits and fewer adverse impacts to vegetation, due to	Impacts same as Alternative B, except 9,300 acres would be treated/year. This alternative would provide greater long-term benefits to vegetation than Alternatives A, B, and E, due to a greater number of acres receiving targeted vegetation treatment.	Under Alternative D, 11,300 acres would be open to vegetation treatments/year with potentially greater long-term beneficial impacts on vegetation resources than would occur under Alternatives A, B, C and E due to a greater number of	Same as Alternative B, except no surface-disturbing land treatments would be permitted in non-WSA lands with wilderness characteristics. This alternative would have the least short-term adverse impacts, but limited long-term benefits to vegetation of the alternatives.	Same as Alternative C.

Table 2.2. Summary of Impacts

	treatments. Long-term, beneficial impacts would include reduced competition with exotic species.	targeted treatments over a smaller area, than Alternatives A, C and D.		acres receiving targeted vegetation treatment.		
Visual Resources	Minor, short-term, adverse impacts to vegetation in VRM I and II areas from restrictions on surface disturbance, and long-term, beneficial impacts to vegetation under VRM III and IV objectives. Alternative A would have the smallest area subject to VRM Class I restrictions on surface disturbances and the largest area subject to VRM Class II restrictions of the alternatives.	Impacts same as A, except this alternative would have a larger area subject to VRM Class I surface disturbance restrictions (with long-term, beneficial impacts on vegetation resources under these VRM classes) than Alternative A. Alternative B would have more area subject to VRM III and less area under VRM II and IV restrictions than Alternative A.	Impacts same as A, except this alternative would have a larger area subject to VRM Class I and III surface disturbance restrictions, and a smaller area subject to VRM Class II restrictions than Alternative A. Alternative C would have the largest area subject to class IV restrictions of the alternatives.	Impacts same as A, except this alternative would have a larger area subject to VRM Class I, III and IV restrictions, and a smaller area subject to VRM Class II restrictions than Alternative A. Alternative D would have the largest area subject to VRM Class III restrictions and the second largest areas subject to class IV restrictions of the alternatives.	Same as Alternative B, except additional protection of acreage within non-WSA lands with wilderness characteristics under VRM I would have long-term, beneficial impacts on vegetation resources. This alternative would have the most acres managed as VRM I of the alternatives.	The Proposed Plan would designate 422,989 acres as VRM Class I (14% more than under Alternative A). VRM Class II designations would apply to 228,041 acres (35% less than under Alternative A). VRM Class III designations would apply to 507,583 acres (21% more than under Alternative A). Finally, VRM Class IV designations would apply to 623,002 acres (2% less than under Alternative A).
Wildlife and Fisheries Resources	Beneficial impacts on vegetation from habitat protection and mitigation of surface disturbances to vegetation: 247,938 acres subject to bighorn sheep special conditions; 13,954 acres of pronghorn habitat; and 180,089 acres of protected deer winter range.	Beneficial impacts same as A, but to a greater degree due to increased mitigation potential for the adverse impacts of surface-disturbing activities on vegetation resources, including: 83% more acres subject to bighorn sheep special wildlife conditions; 110% more acres of protected pronghorn	Beneficial impacts same as A, but to a greater degree due to increased mitigation potential for the adverse impacts of surface-disturbing activities on vegetation resources, including: 21% more acres subject to bighorn sheep special wildlife conditions; 110% more acres of protected pronghorn	Beneficial impacts same as A, but to a greater degree due to increased mitigation potential for the adverse impacts of surface-disturbing activities on vegetation resources, including: 26% fewer acres subject to bighorn sheep special wildlife conditions; same number of acres of	Same as Alternative B.	Under the Proposed Plan there would be 205,071 more acres subject to bighorn sheep special wildlife conditions, 15,401 more acres of protected pronghorn habitat, 195,803 more protected deer habitat, and 93,104 more acres of elk habitat subject to special conditions than under Alternative

Table 2.2. Summary of Impacts

		habitat; 330% more protected deer habitat; and 184,248 more acres of protected elk habitat than Alternative A.	habitat; 45% more protected deer habitat; and 93,104 more acres of protected elk habitat than Alternative A.	protected pronghorn habitat; 17% fewer protected deer habitat; and 60,103 more acres of protected elk habitat than Alternative A.		A. Because of these differences, the Proposed Plan would provide greater protection for vegetation resources in the wildlife protection areas of the Monticello FO than Alternative A, but would be more likely to adversely affect vegetation resources than Alternatives B and E.
Woodlands	Short-term, adverse impacts on 1,147,407 acres of the pinyon-juniper vegetation open to woodland harvesting, include trampling and removal of native trees. Long-term, indirect impacts include the potential introduction of weedy, non-native species during wood harvesting operations.	Impacts same as Alternative A, except impacts would be on 504,666 acres of pinyon-juniper vegetation (56% fewer acres open to harvest than Alternative A). This alternative would have the fewest acres open to the adverse impacts of woodland harvest.	Impacts same as Alternative A, except impacts would be on 597,086 acres of pinyon-juniper vegetation open to woodland product harvest (48% fewer acres open to harvest than under Alternative A).	Same as Alternative C.	Same as Alternative B, except that no woodland product harvest would be allowed in non-WSA lands with wilderness characteristics. This would result in the fewest acres open to surface-disturbing activities that would have long term, adverse impacts on vegetation resources.	Same as Alternative C.
VISUAL RESOURCE MANAGEMENT						
VRM Class	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
VRM I (Very low impacts to scenic quality allowed)	371,575 acres	497,668 acres	425,179 acres	390,424 acres	998,370 acres	422,989 acres
VRM II (Low impacts to scenic quality)	355,112 acres	250,641 acres	132,001 acres	8,838 acres	111,478 acres	228,041 acres

WILDLIFE AND FISHERIES RESOURCES						
Resource	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Proposed Plan
Wildlife and Fisheries Resources	Long-term beneficial impacts to wildlife from seasonal wildlife protection areas: 329,750 acres of bighorn sheep habitat, 12,960 acres pronghorn habitat, and 197,550 acres mule deer habitat (540,260 acres total).	Beneficial impacts same as Alternative A, but to a greater degree, from proposed 453,388 acres of protection areas for bighorn sheep habitat, 29,365 acres pronghorn habitat, 785,921 acres mule deer habitat, and 191,173 acres elk habitat (total of 1,459,847).	Impacts same as Alternative A, but to a greater degree from proposed habitat protection areas: 415,395 (lambing) and 453,390 (rutting) acres for bighorn sheep, 29,365 acres for pronghorn, 266,406 acres for mule deer, and 97,471 acres for elk habitat (total of 808,637 acres).	Beneficial impacts same as Alternative A from proposed seasonal wildlife protection areas: 299,009 acres desert bighorn sheep, 13,961 acres for pronghorn, 182,315 acres for mule deer, and 62,484 acres for elk (total of 557,769 acres subject to special wildlife conditions).	Impacts same as Alternative B.	Beneficial impacts same as Alternative A, but to a greater degree, from proposed 453,388 acres of protection areas for bighorn sheep habitat, 29,365 acres pronghorn habitat, 383,098 acres mule deer habitat, and 97,471 acres elk habitat (total of 963,322 acres is more than A, but less than E).
Cultural Resources	Long-term adverse impacts of cultural resource decisions on wildlife resources from restrictions on habitat improvements, watershed improvements, and vegetation treatments. Beneficial impacts on wildlife from restrictions on	Beneficial impacts same as Alternative A, but to a greater degree, due to greater restrictions on surface-disturbing activities.	Beneficial impacts same as Alternative A, except woodland gathering and harvesting, and vegetation treatments would be allowed. Alternative C would have fewer adverse impacts on wildlife than Alternative A due to greater restrictions on	Adverse impacts same as Alternative A, but to a greater degree, and beneficial impacts to a lesser degree than Alternative A.	Impacts same as Alternative B, but to a greater degree due to increased restrictions on surface-disturbing activities.	Beneficial impacts same as Alternative A, except that surface-disturbing activities such as woodland gathering and harvesting, and vegetation treatments would be allowed. The Proposed Plan would have fewer adverse impacts on wildlife than

Table 2.2. Summary of Impacts

	surface-disturbing activities including woodland gathering and harvesting, minerals leasing, and OHV use and restrictions on visitor numbers and activities.		surface-disturbing activities.			Alternative A due to greater restrictions on surface-disturbing activities.
Fire Management	Fuels treatments would have short-term adverse impacts to wildlife species from habitat disturbance and removal, and long-term beneficial impacts due to reduced fuel loading, reduced fire risk, and diversified habitat.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.	Same as Alternative A.
Lands and Realty	Lands and realty decisions would result in adverse surface disturbance, causing loss of wildlife habitat, habitat fragmentation, direct disturbance to wildlife during construction and maintenance, potentially introduce invasive species, and/or wildlife to avoid areas that were previously considered viable habitat. Beneficial impacts would include areas excluded from surface-disturbing	Impacts same as Alternative A, except that Alternative B would exclude more areas from wind or solar energy exploration and development, thereby having fewer adverse impacts than Alternative A. Under Alternative B 416,612 acres would be ROW exclusion areas, while 125,105 acres would be ROW avoidance areas. 251,710 acres would be withdrawn from	Impacts same as Alternative B, except that fewer areas would be excluded from wind or solar energy exploration and development. Under Alternative C 395,329 acres would be ROW exclusion areas, while 39,323 acres would be ROW avoidance areas. 121,912 acres would be withdrawn from mineral entry.	Impacts same as Alternative B, except fewer exclusions from wind or solar energy exploration and development. Alternative D would result in more adverse impacts to wildlife in the short- and long-term than any other alternative. Under Alternative D 386,853 acres would be ROW exclusion areas, while 14,175 acres would be ROW avoidance areas. 46,131 acres would be withdrawn	Impacts same as Alternative B, except that non-WSA lands with wilderness characteristics would also be excluded from ROWs for wind or solar energy exploration and development. Alternative E would be more beneficial to wildlife than all other alternatives since it prescribes more exclusions than any other alternative. Under Alternative E 974,463 acres would be ROW exclusion	Under the Proposed Plan the impacts of lands and realty decisions on wildlife and fisheries resources would be the same as under Alternatives A, B, C, D, and E except that 416,115 acres would be ROW exclusion areas, while 133,293 acres would be ROW avoidance areas. 50,665 acres would be withdrawn from mineral entry.

Table 2.2. Summary of Impacts

	activities and mitigation measures that accompany surface-disturbing activities. Under Alternative A 120,800 acres would be ROW exclusion areas, while 253,790 acres would be ROW avoidance areas. 132,380 acres would be withdrawn from mineral entry.	mineral entry.		from mineral entry.	areas, while 53,915 acres would be ROW avoidance areas. 834,070 acres would be withdrawn from mineral entry.	
Livestock Grazing	The exclusion of livestock from sensitive habitats (such as riparian areas and zones with limited soils) would beneficially impact wildlife species by maintaining more native plant forage and cover. Where livestock grazing is allowed there would be adverse long-term impacts on wildlife due to competition with wildlife for forage, possible trampling of individual animals or nests, and susceptibility to invasion by noxious weeds. Under all alternatives grazing would continue to be excluded from 118,424 acres, and 17,300 acres in	Alternative B prescribes the largest area unavailable for livestock grazing and therefore would have the greatest beneficial impacts on native vegetation and wildlife habitat.	Alternative C is the same as Alternative B, except that Mule Canyon would be open to grazing north of U-95. Alternative C would have fewer adverse impacts to wildlife than Alternative A, but greater impacts than Alternatives B and E.	Alternative D is the same as Alternative B, except fewer acres would be unavailable to grazing, but with greater restrictions on grazing than Alternative A.	Same as Alternative B.	Same as Alternative C.

Table 2.2. Summary of Impacts

	Peter's Canyon and East Canyon would be allotted to wildlife.					
Minerals and Energy Resources	Surface disturbance due to mineral development would degrade and fragment wildlife habitat, and displace wildlife. Leasable mineral development would impact 699 acres of primarily pinyon-juniper and desert shrub habitats, 886 acres of wildlife habitats adversely impacted by geophysical exploration in the short term, and 1,652,743 acres open to locatable minerals activities under standard stipulations.	Impacts same as Alternative A, but to a lesser degree. Leasable mineral development would adversely impact 636 acres of primarily pinyon-juniper and desert shrub habitats, 794 acres of wildlife habitats adversely impacted in the short term by geophysical exploration, and 1,521,656 acres open to locatable minerals activities under standard stipulations.	Impacts same as Alternative A, but to a greater degree, from leasable mineral development that would impact 710 acres of primarily pinyon-juniper and desert shrub habitats, 903 acres of wildlife habitats temporarily impacted by geophysical exploration, and by 1,637,688 acres open to locatable minerals activities under standard stipulations.	Impacts same as Alternative A, but to a greater degree, from leasable mineral development that would impact 721 acres of primarily pinyon-juniper and desert shrub habitats, 924 acres of wildlife habitats temporarily impacted by geophysical exploration, and 1,737,999 acres open to locatable minerals activities under standard stipulations.	Impacts same as Alternative A, but to a lesser degree, from leasable mineral development that would impact 518 acres of primarily pinyon-juniper and desert shrub habitats, 591 acres of wildlife habitats temporarily impacted by geophysical exploration, and 1,521,656 acres open to locatable minerals activities under standard stipulations.	Impacts same as Alternative A, but to a lesser degree, from leasable mineral development that would impact 688 acres of primarily pinyon-juniper and desert shrub habitats. Impacts would be to a greater degree due to: 903 acres of wildlife habitats temporarily impacted by geophysical exploration, and 1,734,458 acres open to locatable minerals activities under standard stipulations.
Recreation	Adverse impacts to wildlife species and their habitats from recreation, include noise disturbance, vehicle traffic, trampling of native vegetation, and other human-related disturbances. Where designated, SRMAs would reduce adverse impacts to wildlife by restricting recreation or reducing dispersed	Adverse impacts same as Alternative A, but to a lesser degree due to greater restrictions on surface-disturbing activities in SRMAs.	Adverse impacts same as Alternative A, but to a lesser degree, due to greater restrictions on surface-disturbing activities in SRMAs.	Adverse impacts same as Alternative A, but to a greater degree, due to fewer restrictions on surface-disturbing activities. Overall, this alternative would have the most acres of native vegetation and potential wildlife habitat subject to adverse impacts associated with	Adverse impacts same as Alternative A, but to a lesser degree, due to greater restrictions on surface-disturbing activities. Overall, Alternative E would be most beneficial to wildlife because it prescribes the greatest restrictions, of all alternatives and the Proposed Plan, on surface-disturbing activities.	Adverse impacts same as Alternative A, but to a lesser degree, due to greater restrictions on surface-disturbing activities in SRMAs.

Table 2.2. Summary of Impacts

	recreational activities.			recreation activities.		
Riparian Resources	Under all alternatives riparian areas would be managed as NSO for oil and gas leasing but open to mineral entry and disposal of mineral materials (though not in active floodplains or within 100 meters of riparian areas). Livestock grazing would be allowed in riparian areas under all alternatives. The long-term adverse impacts of these activities would be mitigated by management in accordance with laws, executive orders, and regulations on floodplains and wetlands.	Impacts same as Alternative A, but to a lesser degree, due to prescriptions limiting OHV use, livestock grazing, and motorized camping.	Same as Alternative B.	Same as Alternative A.	Same as Alternative B.	Same as Alternative B.
Soil and Water Resources	Under all alternatives, soils and watershed decisions would comply with Utah's Standards for Rangeland Health and Guidelines for Grazing and Recreation. All floodplains and riparian/wetlands would be managed in accordance with Executive Order 11988. There would	Adverse impacts same as Alternative A, but to a lesser degree since unavoidable surface-disturbance on slopes between 21 and 40% would require a plan (with an erosion control strategy and approved survey and design). Also, surface-disturbing activities would not be permitted on slopes	Adverse impacts same as Alternative B and E, but to a greater degree since surface-disturbing activities would not be permitted on slopes greater than 40% unless it determined that it would cause undue or unnecessary degradation to pursue other placement alternatives.	Adverse impacts same as Alternative A, but to a greater degree since surface-disturbing activities would not be ruled out for slopes of any grade and a plan would only be required for slopes greater than 40%. This alternative would have more adverse impacts on vegetation resources	Same as Alternative B.	Same as Alternative C.

Table 2.2. Summary of Impacts

	be no slope restrictions on allowable disturbance under Alternative A.	greater than 40% (excluding 87,599 acres of land in the Monticello PA).	Unavoidable surface-disturbing activities on slopes between 21 and 40% would require a plan (with an erosion control strategy and approved survey and design).	and therefore wildlife resources than any other alternative.		
Special Designations	<p>The designation of ACECs and WSR segments would have long-term beneficial impacts on wildlife species and their habitats because ACECs and WSR segments limit or prohibit surface-disturbing activities, decreasing the potential for damage to native vegetation or avoidance behavior in individual animals.</p> <p>The designation of ACECs and WSR segments would also have long-term adverse impacts on wildlife where protective management prohibits habitat or watershed improvements or vegetation treatments.</p> <p>Under Alternative A, 10 of the 12 proposed</p>	Beneficial impacts same as Alternative A but to a greater degree since all 12 of the proposed ACECs would be designated and managed as ACECs and all 12 river segments reviewed for WSR status would be recommended as suitable.	Beneficial impacts same as Alternative A but to a lesser extent since 7 of the 12 proposed ACECs would be designated and managed as ACECs and 4 of the 12 river segments reviewed for WSR status would be recommended as suitable.	<p>Under Alternative D none of the ACECs would be designated and managed as ACECs and none of the river segments reviewed for WSR status would be recommended as suitable.</p> <p>Alternative D would result in more adverse impacts to wildlife than any other alternative and the Proposed Plan since there are fewer restrictions on surface-disturbing activities under this alternative.</p>	Same as Alternative B.	Beneficial impacts same as Alternative A but to a lesser extent since 7 of the 12 proposed ACECs would be designated and managed as ACECs and 4 of the 12 river segments reviewed for WSR status would be recommended as suitable.

Table 2.2. Summary of Impacts

	ACECs would continue to be managed as ACECs and 6 of 12 river segments reviewed for WSR status would be recommended as suitable.					
Special Status Species	Under all alternatives no management actions would be permitted on public lands that would jeopardize the continued existence of plant or animal species that are listed, officially proposed, or candidates for listing as Threatened or Endangered and the BLM would commit to current and future conservation agreements, management plans, and recovery plans. These actions would have long-term beneficial impacts on wildlife that share habitat with targeted special status species.	Beneficial impacts same as Alternative A, but to a greater degree since Alternative B would provide more acres of protected habitat for special status species than any other alternative and the Proposed Plan.	Beneficial impacts same as Alternative A, but to a greater degree since Alternative C would provide more acres of protected habitat for special status species than Alternative A (but fewer acres than Alternatives B and E).	Beneficial impacts same as Alternative A, but to a lesser degree since Alternative D would provide the fewest number of acres of surface disturbance restrictions in special status species habitat, resulting in a greater potential for adverse impacts on wildlife in special status species habitat.	Same as Alternative B.	Beneficial impacts same as Alternative A, but to a greater degree since the Proposed Plan would provide more acres of protected habitat for special status species than Alternative A (but fewer acres than Alternatives B, C, and E).
Travel Management	OHV use has short- and long-term adverse impacts on wildlife by causing damage to vegetation used as wildlife	Adverse impacts same as Alternative A, but to a much lesser degree. Under Alternative B: zero acres would be	Adverse impacts same as Alternative A, but to a lesser degree. Under Alternative C: 2,311 acres would be	Adverse impacts same as Alternative A, but to a lesser degree. Under Alternative D: 2,311 acres would	Adverse impacts same as Alternative A, but to a much lesser degree. Under Alternative E: zero acres would be open to OHV use;	Adverse impacts same as Alternative A, but to a lesser degree. Under the Proposed Plan: 0 acres would

Table 2.2. Summary of Impacts

	forage and cover, as well as causing noise. Habitat fragmentation and degradation and the spread of noxious weeds also result from OHV use. Under Alternative A: 611,310 acres would be open to OHV use; 540,260 acres would be limited to designated routes with seasonal restrictions; 570,390 would be limited to existing roads and trails; 218,780 acres would be limited to designated roads and trails; and 276,430 acres would be closed to OHV use.	open to OHV use; 1,359,417 acres would be limited to designated routes; and 423,698 acres would be closed to OHV use.	open to OHV use; 1,362,142 acres would be limited to designated routes; and 418,667 acres would be closed to OHV use. Designated 'ways' would be established in corridors leading to trailheads.	be open to OHV use; 1,780,807 acres would be limited to designated routes; and 0 acres would be closed to OHV use.	812,679 acres would be limited to designated routes; and 970,436 acres would be closed to OHV use.	be open to OHV use; 1,388,191 acres would be limited to designated routes, and 393,895 acres would be closed to OHV use. Designated 'ways' would be established in corridors leading to trailheads.
Vegetation	Under Alternative A, 15,475 acres would be open to vegetation treatments each year. This is substantially greater than under any of the other alternatives. There are more short-term adverse impacts associated with Alternative A because of the large number of acres open to trampling and disturbance associated with widespread, less	Under Alternative B, 7,600 acres would be open to vegetation treatments each year, which is 51% fewer acres of treatment than under Alternative A. Overall, this alternative is likely to have more beneficial short-term impacts on wildlife and habitat than Alternative A due to fewer, short-term, adverse impacts associated with habitat disturbance, and the	Impacts same as Alternative B, but to a greater degree. Under Alternative C, 9,300 acres would be open to vegetation treatments each year, which is 40% fewer acres of treatment than under Alternative A.	Impacts same as Alternative B, but to a greater degree. Under Alternative D, 11,300 acres would be open to vegetation treatments each year, which is 27% fewer acres of treatment than under Alternative A.	Same as Alternative B.	Same as Alternative C.

Table 2.2. Summary of Impacts

	targeted, vegetation treatments, and seed gathering and plant collection activities.	increased likelihood of successful vegetation treatments due to the concentration of efforts in specified vegetation communities outlined under this alternative.				
Visual Resource Management	<p>VRM Classes I and II are generally more beneficial to wildlife since they result in less surface disturbance than VRM Classes III and IV. However, in some cases VRM Class I or II can have adverse impacts on wildlife by limiting or prohibiting habitat and watershed improvements and vegetation treatments.</p> <p>Under Alternative A: VRM Class I: 371,575 acres (21%) VRM Class II: 355,112 acres (20%) VRM Class III: 416,806 acres (23%) VRM Class IV: 637,875 acres (36%)</p>	<p>Impacts same as Alternative A, but to a greater degree, due to increased acreage managed as VRM Classes I and II.</p> <p>Under Alternative B: VRM Class I: 497,668 acres (28%) VRM Class II: 250,641 acres (14%) VRM Class III: 426,350 acres (24%) VRM Class IV: 608,463 acres (34%)</p>	<p>Impacts same as Alternative A, but to a lesser degree due to decreased acreage managed as VRM Class II.</p> <p>Under Alternative C: VRM Class I: 425,179 acres (24%) VRM Class II: 132,001 acres (7%) VRM Class III: 531,920 acres (30%) VRM Class IV: 693,995 acres (39%)</p>	<p>Impacts same as Alternative A, but to a lesser degree due to decreased acreage managed as VRM Class II.</p> <p>Under Alternative D: VRM Class I: 390,424 acres (22%) VRM Class II: 8,838 acres (<1%) VRM Class III: 692,741 acres (39%) VRM Class IV: 691,119 acres (39%)</p>	<p>Impacts same as Alternative A, but to a greater degree due to increased acreage managed as VRM Classes I and II. Under Alternative E: VRM Class I: 998,370 acres (56%) VRM Class II: 111,478 acres (6%) VRM Class III: 264,369 acres (15%) VRM Class IV: 407,459 acres (23%)</p>	<p>Impacts same as Alternative A, but to a lesser degree due to decreased acreage managed as VRM Classes I and II. Under the Proposed Plan: VRM Class I: 422,989 acres (24%) VRM Class II: 228,041 acres (13%) VRM Class III: 507,583 acres (28%) VRM Class IV: 623,002 acres (35%)</p>
Woodlands	Short- and long-term adverse on 1,309,894 acres impacts from harvesting from wildlife habitat loss,	Adverse impacts same as Alternative A, but to a lesser degree since fewer acres would be open	Adverse impacts same as Alternative A, but to a lesser degree since fewer acres would be open	Adverse impacts same as Alternative A, but to a lesser degree since fewer acres would be open	Adverse impacts same as Alternative A, but to a lesser degree since fewer acres would be open to woodland	Same as Alternative C.

2.3 ALTERNATIVES CONSIDERED BUT ELIMINATED FROM ANALYSIS

This section provides a summary of those alternatives the BLM initially considered but later eliminated, and the justifications for their dismissal from further evaluations.

2.3.1 LIVESTOCK GRAZING

Action: The PA would be unavailable for livestock grazing.

Rationale for Elimination: An alternative that proposes to close the entire PA to grazing would not meet the purposes and needs of this RMP/Draft EIS. NEPA requires that agencies study, develop, and describe appropriate alternatives to recommended courses of action in any proposal that involves unresolved conflicts concerning alternative uses of available resources. No issues or conflicts have been identified during this land-use planning effort, which requires the complete elimination of grazing within the PA for their resolution. Where appropriate, closures and adjustments to livestock use have been incorporated into the alternatives on an allotment or area basis to address issues identified in the LUP. Since the BLM has considerable discretion, through its grazing regulations, to determine and adjust stocking levels, seasons-of-use, and grazing management activities, and to allocate forage to uses of the public lands in LUPs, the analysis of an alternative to entirely eliminate grazing is not needed.

An alternative that proposes to close the entire PA to grazing would also be inconsistent with the intent of the Taylor Grazing Act (TGA), which directs the BLM to provide for livestock use of BLM lands, to adequately safeguard grazing privileges, to provide for the orderly use, improvement, and development of the range, and to stabilize the livestock industry dependent upon the public range.

The FLPMA requires that public lands be managed on a "multiple use and sustained yield basis" (FLPMA Section 302 [a] and Section 102 [7]) and includes livestock grazing as a principal or major use of public lands. While multiple use does not require that all lands be used for livestock grazing, complete removal of livestock grazing on the entire PA would be arbitrary and would not meet the principle of multiple use and sustained yield.

Livestock grazing is and has been an important use of the public lands in the PA for many years, and is a continuing government program. Although the Council on Environmental Quality (CEQ) guidelines for compliance with NEPA require that agencies analyze Alternative A (the No Action Alternative) in all EISs, for the purposes of this NEPA analysis, Alternative A is to continue the status quo, which includes livestock grazing (CEQ Forty Most Asked Questions, Question 3). For this reason and those stated above, a no-grazing alternative for the entire PA has been dismissed from further consideration in this LUP.

2.3.2 TRAVEL MANAGEMENT

Action: Travel on roads would be eliminated based upon a model that uses distances from roads so as to protect solitude and remoteness.

Rationale for Elimination: An alternative that proposes to close the roads based on this model in the PA would not meet the purposes and needs of this RMP/Draft EIS. No issues or conflicts have been identified during this land-use planning effort that requires this particular method for

determining which roads would be designated and which areas would remain open, limited, or closed to cross-country travel. Since the BLM has considerable discretion through its regulations, the analysis of an alternative to close roads based on this model is not needed. The BLM did consider the idea of remoteness and solitude and provided protection for these values in a reasonable range of alternatives. Alternative E protects non-WSA lands with wilderness characteristics by closing these lands to OHV travel. Additionally, Alternative B closes all WSAs to OHV use. Instead, the BLM chose to take a hard look at each route and measure the purpose and need for that particular route against resource conflicts.

This methodology was presented in the travel report and was the basis for the range of alternatives for travel management.

2.3.3 ENLARGE CANYONLANDS NATIONAL PARK

Action: Enlarge Canyonlands National Park to include Lockhart Basin.

Rationale for Elimination: An alternative that proposes to enlarge Canyonlands National Park to include Lockhart Basin has been proposed many times in the media and discussion with interested groups. However, no complete serious proposal has ever been brought forward. This would not meet the purposes and needs of this RMP/Draft EIS. No issues or conflicts have been identified during this land-use planning effort that requires this particular method for determining which roads would be designated and which areas would remain open, limited, or closed to cross country travel.

2.3.4 NO LEASING ALTERNATIVE

Action: During scoping and/or the comment period for the Draft RMP/EIS, it was suggested that the BLM should address a "No-Leasing Alternative" because the "No-Leasing Alternative" is the equivalent of the "No Action Alternative" that must be analyzed in all EISs.

Rationale for Elimination: The "No-Leasing Alternative" in an RMP revision is actually an action alternative because where lands have already been leased, the no-action for NEPA purposes continues to allow for (honor) valid existing rights. Proposing a "No-Leasing Alternative" would require revisiting existing leases and either buying them back from the lessee, or allowing them to expire on their own terms. The first option (buying back), is outside the scope of any RMP. This is a political decision that the BLM has no authority to undertake in planning. As a result, the BLM does not regularly include a "No-Leasing Alternative."

The purpose and need for the LUP is to identify and resolve potential conflicts between competing resource uses rather than to eliminate a principle use of the public lands in the Monticello FO Area. Leasing of the public lands for oil and gas exploration and production is required by the Mineral Leasing Act of 1920, as amended, and the BLM's current policy is to apply the least restrictive management constraints to the principal uses of the public lands necessary to achieve resource goals and objectives. A field office-wide "No-Leasing Alternative" would be an unnecessarily restrictive alternative for mineral exploration and production on the public lands.

The National Environmental Policy Act (NEPA Section 102 [E]) requires that agencies *"study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available*

resources." No issues or conflicts have been identified during this land-use planning effort, which requires the complete elimination of oil and gas leasing within the planning area for their resolution. The BLM's Land Use Planning Handbook (BLM MANUAL Rel. 1-1693), Appendix C. item H. requires that LUPs identify areas as open or unavailable for leasing.

Given the potential range of decisions available in the Draft RMP/Draft EIS, the analyzed alternatives include no leasing for certain areas; but a field office-wide "No-Leasing Alternative" is not necessary in order to resolve issues and protect other resource values and uses.

As mentioned above, a "No-Leasing Alternative" should not be confused with the "No Action Alternative" for purposes of NEPA compliance. Leasing and No Leasing on the public lands has previously been analyzed in several NEPA documents. In 1973, the Department of Interior published the Final Environmental Impact Statement on the Federal Upland Oil and Gas Leasing Program (USDI, 1973). The proposed action was to lease Federal lands for production of oil and natural gas resources. Alternatives included the No Action Alternative, which at initiation of the program was "No Leasing." To supplement that EIS, the BLM prepared a series of Environmental Assessments (then titled "Environmental Analysis Records or EARs") including the 1975 Oil and Gas Program Environmental Analysis Record (EAR), 1975 which addressed oil and gas leasing for the public lands in the Monticello FO area. Alternatives again included the No Action or "No Leasing" alternative. The outcome was a category system for leasing which categorized all public and USFS lands into four groups: 1) open to leasing with standard lease stipulations, 2) Special Stipulations to address special concerns, 3) No surface occupancy and 4) No Leasing. Since completion of the EAR in 1975 oil and gas leasing in the Monticello FO Area has been an ongoing federal program under the established categories.

The Council on Environmental Quality (Section 1502.14[d] of NEPA) requires the alternatives analysis in an EIS to "include the alternative of no action", but explains that there are two distinct interpretations of "no action" that must be considered, depending on the nature of the proposal being evaluated. "The first situation might involve an action such as updating a land management plan where ongoing programs initiated under existing legislation and regulations will continue, even as new plans are developed. In these cases "no action" is "no change" from current management direction or level of management intensity. To construct an alternative that is based on no management at all would be a useless academic exercise. Therefore, the "no action" alternative may be thought of in terms of continuing with the present course of action until that action is changed." (CEQ Forty Most Asked Questions, Question 3). Therefore, for the Monticello Proposed Plan/Final EIS, the "No-Action Alternative" is to continue the status quo, which is to lease under the oil and gas stipulations (formerly categories) established in the San Juan RMP.

2.3.5 LIVESTOCK GRAZING ADJUSTMENTS ALTERNATIVE

Action: During scoping and comment on the Draft EIS it was suggested that the BLM consider adjustments to livestock numbers, livestock management practices, and the kind of livestock grazed on allotments within the Monticello FO to benefit wildlife and protect and promote land health including soils, hydrologic cycles and biotic integrity.

Rationale for Elimination: BLM policy regarding adjustments to the levels of livestock use authorized is to monitor and inventory range conditions under existing stocking levels and make adjustments to livestock use as indicated by this data to help assure that Rangeland Health

Standards (RHS) and resource objectives are met. Regulations at 43 CFR 4130.3 require that the terms and conditions under which livestock are authorized "ensure conformance with the provisions of subpart 4180" (Standards for Rangeland Health) and further that "livestock grazing use shall not exceed the livestock carrying capacity of the allotment." It would be inappropriate and unfeasible to estimate and allocate the available forage, design specific management practices and determine if changes to the kind of livestock are necessary for each allotment in the Monticello FO or in the area as a whole in the RMP/EIS. Such changes would not be supportable considering the type and amount of data required and the analysis necessary to make such changes.

According to BLM policy decisions regarding authorized livestock use levels and the terms and conditions under which they are managed is an implementation decision (H-1610-1, Appendix C, Page 15). The BLM assesses RHS, conducts monitoring and inventories, and evaluates this data on a periodic basis, normally on an allotment and/or watershed basis. After NEPA analysis, necessary changes to livestock management and implementation of Utah's Guidelines for Rangeland Management are implemented through a proposed decision in accordance with 43CFR 4160. These decisions determine the exact levels of use by livestock in conformance with the LUP and to meet resource objectives and maintain or enhancing land health. For these reasons this alternative has been dismissed from further consideration in this land use plan revision."

1.0 INTRODUCTION, PURPOSE, AND NEED

The Federal Land Policy and Management Act of 1976 (FLPMA) directs the Bureau of Land Management (BLM) to develop and periodically revise its Resource Management Plans (RMPs), which guide management of BLM-administered public lands. The BLM Field Office (FO) in Monticello, Utah, is revising the San Juan RMP, which was last updated in 1991. The new RMP, called the Monticello RMP, will provide planning guidance for public lands managed by the Monticello FO in San Juan and Grand Counties in southeastern Utah.

The Monticello planning area (PA) includes approximately 4.5 million acres of private, State of Utah, Indian reservation, national forest, national park, and BLM-administered public lands. Within the PA, BLM manages approximately 1.8 million surface acres and nearly 2.5 million subsurface acres. The Monticello PA lies almost entirely within San Juan County, with a small portion in southern Grand County. The Proposed Plan was crafted from the five alternatives presented in the Draft RMP/Draft Environmental Impact Statement (EIS) released to the public for a 90-day comment period on November 2, 2007.

1.1 PURPOSE AND NEED FOR THE PLAN

1.1.1 PURPOSE

The purpose of the RMP is to provide a comprehensive framework for BLM management of public lands within the PA and allocation of resources pursuant to the multiple-use and sustained-yield requirements of the FLPMA, which stipulates that the BLM "develop, maintain, and when appropriate, revise land-use plans" (43 United States Code [U.S.C.] 1712 [a]). Revising the plan has allowed the BLM to reevaluate, with public involvement, existing conditions, resources, and uses and determine how to allocate resources and make management decisions that balance uses against resource protection. The planning process identified a reasonable range of possible management alternatives in the DEIS. This Proposed RMP/Final Environmental Impact Statement (FEIS) describes and evaluates the Proposed Plan. The DEIS disclosed and assessed the direct, indirect, and cumulative impact of reasonably foreseeable future actions resulting from the management decisions in each alternative as required by the National Environmental Policy Act (NEPA), its implementing regulations, and other applicable law. The analysis of the alternatives in the draft is also carried forward into this FEIS.

The resulting Monticello RMP will establish consolidated guidance, updated objectives, and management actions for BLM-administered public lands in the PA. The RMP will be comprehensive in nature and will address issues that have been identified through agency, interagency, and public scoping, as well as respond to comments on the DEIS.

1.1.2 NEED

The plan revision is necessary to allow the BLM to review the management of public lands comprehensively and inventory their resources and, with public involvement, to make decisions for managing those lands and their resources and allocating present and future uses. The revised plan will incorporate new information, changes in resources and their uses, and new policies, guided by multiple-use and sustained-yield principles in the FLPMA.

A Special Evaluation Report, completed in 2001 by the BLM, showed that a revision to the 1991 RMP was necessary to address changes in resource uses such as increased visitation, different types of recreation activities, and the growing demand for energy development. The guidance and regulations of several resource programs have changed since the 1991 RMP was approved, and these changes need to be considered and implemented.

1.2 DESCRIPTION OF THE MONTICELLO FO PLANNING AREA

Of the approximate 4.5 million acres in the Monticello PA in southeastern Utah, the Monticello FO administers 1,785,127 surface acres of public lands (see Map 1) and nearly 2.5 million subsurface acres. The Monticello PA lies primarily within San Juan County, although a small portion extends into Grand County to the north.

The Monticello PA includes within its boundaries a number of national parks, national monuments, and lands administered by the U.S. Forest Service (USFS). Canyonlands National Park lies along the northwestern portion of the PA boundary; Natural Bridges National Monument lies in its southwestern part; and a large unit of the Manti-La Sal National Forest lies in the center. Land ownership within the PA consists primarily of large blocks of BLM-administered public land interspersed with smaller, privately owned tracts and land owned by the State of Utah School and Institutional Trust Lands Administration (SITLA). The McCracken Split Estate is jointly administered by the BLM and the Bureau of Indian Affairs (BIA), and all of the land south of the San Juan River is Navajo Nation Reservation. Table 1.1 shows land ownership and corresponding acreages within the Monticello PA.

Table 1.1. Land Ownership within the Monticello PA

Ownership	Acres
BLM	1,785,127
Navajo Nation Reservation	1,270,060
Ute Reservation *	8,416
National Park Service (NPS)	528,565
Private	353,516
SITLA	202,318
USFS	319,933
Total	4,467,935

*This acreage does not include Ute allotments or interspersed tribal lands in the South Cottonwood or Allen Canyon area. These acreages are included in the private land total.

Source: BLM 2004a.

The Monticello PA is known for its topographic diversity, extraordinarily striking landforms, and scenic attractions. It contains a wide variety of cultural and paleontological resources with numbers and concentrations of sites exceeding those found elsewhere in the region. The topography is defined largely by high mountains, steep escarpments and ridges, and incised canyons, which are primarily a product of eroded sandstones and exposed igneous intrusions, such as the Abajo and La Sal Mountains. Elevations vary from approximately 3,700 feet above sea level near Lake Powell to over 11,000 feet in the Abajo Mountains. Much of the Monticello PA provides habitat for desert bighorn sheep, pronghorn, Rocky Mountain elk, and mule deer. Numerous raptor species, including bald eagles and peregrine falcons, also live in the area. Fish

species that inhabit the rivers and waterways include humpback chub, Colorado squawfish, and razorback sucker.

Historical and traditional land uses within the Monticello PA, such as livestock grazing, hard-rock mining, and energy and mineral development, continue to be widely practiced. Energy and mineral resources include oil, natural gas, uranium, vanadium, and building stone. However, recreational activities, such as backpacking, off-highway vehicle (OHV) use, and sightseeing, are becoming increasingly popular within the PA. Recreational resources provide opportunities for public enjoyment as well as revenue for businesses in and adjacent to the Monticello PA.

1.3 PLANNING PROCESS

The FLPMA requires the BLM to use land-use plans (LUPs) as tools by which "present and future use is projected." The FLPMA's implementing regulations for planning, (43 CFR Part 1600), state that LUPs are a preliminary step in the overall process of managing public lands, "designed to guide and control future managements actions and the development of subsequent, more detailed and limited scope plans for resources and uses." Public participation and input are important components of land-use planning. The Monticello FO initiated the process by publishing a notice of intent (NOI) in the Federal Register on June 4, 2003.

The RMP planning process can be broken down into the following nine steps:

- Step 1 Scoping and identifying issues, concerns, and opportunities
- Step 2 Development of planning criteria/legislative constraints
- Step 3 Collection of inventory data and information
- Step 4 Analysis of the Management Situation (AMS)
- Step 5 Formulation of alternatives
- Step 6 Estimation of effects of alternatives
- Step 7 Selection of preferred management plan. This step includes preparation and public distribution of the Draft RMP/EIS.
- Step 8 Selection of the RMP; this step involves preparation and public distribution of the Proposed RMP/Final EIS
- Step 9 Monitoring and evaluation

The major documents produced during the RMP preparation process include the following:

- Preplanning Analysis
- Scoping Report
- Analysis of the Management Situation (AMS)
- Draft RMP/EIS, which included the Preferred Alternative
- Proposed RMP/Final EIS
- Record of Decision (ROD) and approved RMP

1.3.1 SCOPING AND IDENTIFYING ISSUES, CONCERNS, AND OPPORTUNITIES FOR DEVELOPMENT OF THE DRAFT ALTERNATIVES AND PROPOSED PLAN

Public scoping is a process designed to meet the public-involvement requirements of the FLPMA and NEPA. Public input helps focus management analysis and actions. During scoping, concerns are raised, and important issues are prioritized for analysis. Information gathered is carefully considered and used to develop land-use allocations or alternative management plans to protect natural, historical, or cultural resource values and provide recreational and commercial opportunities. This process includes working closely with cooperating agencies (state and local governments and other federal agencies) and soliciting input from interested organizations and individuals on issues, concerns, needs, and resource uses, development, and protection.

The scoping period for the Monticello RMP began on June 4, 2003, with publication of the NOI in the Federal Register and ended on January 31, 2004. Scoping included scheduled public meetings in six communities (Green River, Moab, Monticello, Blanding, and Salt Lake City, Utah; and Grand Junction, Colorado). In addition to the meetings, comments were solicited from the public via a website, mail, and staff, who traveled to popular recreation locations within the PA. For the Monticello planning process, comments from the public were categorized in one of three ways:

- Issues to be addressed in the Monticello RMP;
- Issues to be addressed through policy or administrative action (and therefore not addressed in the RMP); and
- Issues beyond the scope of the RMP.

During scoping, all stakeholders were given the opportunity to voice concerns, identify issues, and nominate Areas of Critical Environmental Concern (ACECs). Additionally, discussions with BLM resource specialists identified management concerns. All the information obtained was used to define the relevant issues to be addressed in a broad range of alternative management scenarios. The environmental impacts of these alternatives were analyzed and addressed in the DEIS and are carried forward into this document along with the Proposed Plan.

The RMP revision process provides the BLM, its cooperators, and the public the opportunity to resolve resource-management conflicts or concerns and respond to opportunities that fulfill the BLM's multiple-use, resource-management mission. Such issues may be identified as local, state, or national, or they may reflect conditions specific to the Monticello PA. Here are the planning issues that are addressed in the Monticello RMP.

1.3.1.1 CULTURAL RESOURCES

The planning area is known for its extraordinarily high density of cultural resources, particularly Anasazi sites, many of which are yet to be recorded. Changes in legislation governing the cultural resource management on federal lands or associated with federal projects have been implemented since the publication of the 1991 RMP. Other laws and regulations regarding tribal-government sovereignty and orientation between governments did not exist during development of the 1991 RMP. Cultural resources provide a direct link between Native Americans and their past, and they request protection for these resources.

The RMP provides an opportunity to enhance cultural-resource management within the PA and address tribal concerns and values in compliance with new requirements. Issues include the following:

- Conflicts between OHV use and other forms of recreation with the need for protection of cultural resources as required by the National Historic Preservation Act (NHPA, Section 106);
- Need for an OHV travel plan limiting use to designated trails to prevent impact to cultural resources;
- Impact on cultural resources created by increasing demand for access to public lands;
- Need for additional access to public lands by Native Americans for their traditional uses and practices;
- Resolution of the increasing conflict between other land uses (such as recreation activities, livestock grazing, woodcutting, and energy exploration and development) and protection and preservation of cultural resources;
- Protection of sensitive cultural resources;
- National Historic Trails management (Old Spanish National Historic Trail and Hole in the Rock Trail) in compliance with enabling legislation to protect the historic resource; and
- Revise existing management actions on Butler Wash, Cedar Mesa, and Hovenweep ACECs, and limit recreation use that has adverse effects on cultural resources.

1.3.1.2 MINERALS AND ENERGY RESOURCES

There are a number of concerns regarding the level of oil, natural gas, and hard-rock mining activities within the planning area:

- Resolving the impact of surface disturbances from mineral exploration and development on other resources and uses (particularly cultural and visual resources, wildlife, and recreation) while remaining in compliance with federal energy policies
- Improving mitigation standards for reclamation and restoration following mineral development;
- Making oil and natural gas development compatible with dispersed and remote recreational opportunities;
- Identifying areas which require mineral withdrawal to resolve conflicts between resource development and special protection for cultural and water resources, wildlife habitat, unique geologic formations, or high scenic values;
- Making development of alternative energy resources compatible with other resource decisions;
- Determining social and economic impacts of mineral development on the governments and citizens of the counties within the Monticello PA;
- Determining social and economic impacts of mineral development on a PA that contains extraordinary scenic and visual resources;
- Determining impacts of mineral development (nighttime lighting) on the quality of the scenic and wilderness experience;

- Managing and developing oil and natural gas resources on the McCracken Split Estate; consider mitigation which will foster energy production while protecting other resource values and uses;
- Managing and developing oil and natural gas resources in Lockhart Basin to limit impact on the outstanding scenic values of the area, as viewed from both within the basin and adjacent public lands and national parks.

1.3.1.3 NON-WILDERNESS STUDY AREA (WSA) LANDS WITH WILDERNESS CHARACTERISTICS

Management of non-WSA lands with wilderness characteristics is being considered in this land-use planning process for those lands that the BLM has determined have wilderness characteristics. Pursuant to the FLPMA and the *Land-use Planning Handbook* (BLM 2005a), the BLM may not establish new WSAs, but may consider managing non-WSA lands with wilderness characteristics through land-use planning, and has the option to manage such lands in a way that would maintain, protect, or preserve some or all of those characteristics. This may include protecting certain lands in their natural condition and providing outstanding opportunities for solitude and primitive and unconfined types of recreation.

1.3.1.4 RECREATION

Recreation use in the Monticello PA has continued to grow in popularity since the approval of the 1991 RMP. The wide range of recreational opportunities available and the spectacular scenery, both within the PA and in the nearby national parks and monuments, draws many visitors to the area. With the number of visitors continuing to grow, recreation activity is expanding deeper into the backcountry, and resource and user conflicts are becoming more common, intense, and difficult to manage. Recreation resource issues to be addressed in the planning process include:

- Managing OHV use by developing a travel plan with maps showing motorized (single-track vehicles, ATVs, jeeps, etc.) and nonmotorized (equestrian, hiking, biking) travel trail systems to identify recreation opportunities, prevent conflicts among recreation users, and minimize adverse impacts to sensitive resources (cultural resources, wildlife and their habitat, etc.);
- Developing specific management plans for high-use areas, including Dark Canyon, Cedar Mesa, Hole in the Rock, the San Juan River, and the Colorado River, that manage use, provide opportunities, and minimize conflicts with other resource values and uses;
- Developing management plans for the Special Recreation Management Areas (SRMAs) and manage actions within the Extensive Recreation Management Area (ERMA) that provide the desired activities, settings, experiences, and benefits (benefits-based management) consistent with the objectives of recreation management;
- Resolving recreation-related human health and safety problems, including hazardous road conditions, disposal of human waste, and protection of water quality;
- Managing visitors to adjacent national parks and monuments who use public lands in the Monticello PA (visitor management is needed to maintain desired environments and facilities, resolve conflicts among users and minimize impacts to other resources);

- Alleviating impacts of other resource uses on recreation opportunities, including motorized and nonmotorized travel, livestock grazing, mineral development, and fire management;
- Instituting a private permit system to promote the optimum recreation experience and resolve issues caused by growing recreation use;
- Resolving conflicts between private and commercial river users and establish use limits to enhance recreation experiences and protect other resource values; and
- Minimizing impacts of increasing backcountry recreation use on other resource values and reduce tension among recreation users.

1.3.1.5 SPECIAL DESIGNATIONS

The existing RMP does not reflect the current level of use and the demands on certain resources, including ACECs, Wild and Scenic Rivers (WSRs), and WSAs within the Monticello PA. The regulations and BLM's policy require that consideration be given to designation and protection of ACECs during land-use planning. Section 5(d) of the Wild and Scenic Rivers Act directs federal agencies involved in planning the water use and development of water and related land resources to consider their potential for national wild, scenic and recreational river areas. The Monticello FO will review all current special designations, as well as other lands within the PA that meet special-designation criteria, and determine the appropriate management for them.

The WSAs in the PA were created under FLPMA Section 603 and continue to be managed in accordance with the Interim Management Policy and Guidelines for Lands under Wilderness Review (IMP) to protect their values. This planning process, however, will establish OHV categories (closed or limited) and VRM class objectives within WSAs. No new WSAs will be established, and no existing ones will be altered. The only planning designations made for WSAs will be to determine OHV categories and VRM class objectives.

Concerns about designation and management of special areas encompass issues that pertain to all other resources, depending on the location. Issues and concerns in these areas include pressures from increased visitation and resource development on cultural resources, biodiversity, and habitat and access questions. If special designation is required to protect sensitive resources, the plan considers how these restrictions impact development of minerals and other surface-disturbing activities?

1.3.1.6 TRAVEL

Since the existing RMP was approved, travel within the Monticello PA has increased. Travel access and use levels are creating conflicts with natural and cultural resources and among different forms of travel (motorized, nonmotorized, non-mechanized, and OHVs). The BLM's guidance for OHV use and travel has changed, and policy requires that comprehensive travel-management planning address all travel modes and conditions, as well as the travel needs of all resource programs administered by the Monticello FO. Travel-related issues include:

- Creating a travel plan with maps showing motorized and nonmotorized use;
- Defining OHV categories compatible with other resource decisions;

- Resolving OHV use conflicts and identifying recreation opportunities, preventing conflicts among recreation users, and minimizing adverse impacts to sensitive resources (cultural and riparian resources, wildlife and their habitat, etc.);
- Resolve conflicts among groups, such as nonmotorized and motorized users, river runners and OHV users, and commercial and private users, and regulating OHV use and camping; and
- Incorporating the BLM OHV national strategy and Utah OHV strategy into planning efforts.

1.3.1.7 VISUAL RESOURCE MANAGEMENT (VRM) CLASS DESIGNATIONS

Visual resource management (VRM) class designations are a planning concern, especially considering the diversity of landscapes in the Monticello PA. The 1991 RMP does not address cumulative impacts of recreational activities, livestock grazing, and oil and gas exploration and development on visual resources. Also the 1991 RMP does not reflect increases in recreation visitation or changes in visitor use patterns, which ultimately intensify encroachment into scenic areas. Issues related to VRM include the following:

- Reviewing and establishing VRM class designations that reflect changes in recreation visitation and other resource uses;
- Studying the impact of increasing OHV use on landscapes and visual resources throughout the PA and limit OHV use to roads and trails; and
- Investigating the impact of mineral development (nighttime lighting) on landscapes in remote areas.

1.3.1.8 WILDLIFE AND FISHERIES RESOURCES

The current RMP does not reflect modifications in crucial habitat boundaries, habitat fragmentation, or raptor protection guidelines. The various goals, objectives, and management plans for wildlife and their habitat in the 1991 plan need to reflect these changes. This planning process will establish desired future conditions and address wildlife and fisheries concerns, including the following:

- Addressing impacts of other resource uses (e.g., livestock grazing, recreation activities, OHV use) on wildlife and their habitat;
- Protecting riparian habitat;
- Investigating the impact of increased recreation use, primarily camping and OHVs, on riparian areas;
- Increasing quality habitat for fish;
- Determining the impact of other resource uses on wildlife habitat fragmentation;
- Protecting sage-grouse habitat along with other resource uses of public lands and explore the possibility of buffer zones around leks;
- Establishing seasonal restrictions on mineral extraction and visitor use to protect species during sensitive periods;
- Assessing the impact of fire management on wildlife habitat and populations;

- Discovering the causes for the decline in bighorn sheep and pronghorn populations and new habitat areas;
- Protecting new habitat areas, particularly for Lockhart Basin bighorn sheep;
- Investigating the impact of drought on the declining quality of existing wildlife habitat; and
- Assessing the impact of increasing antler-collection activities (presence and noise of people and vehicles, cross-country OHV travel, and related surface and vegetation disturbance) on wildlife populations and their habitat.

1.3.1.9 OTHER ISSUES, CONCERNS, AND OPPORTUNITIES

In addition to the issues already identified for resolution in this planning process, Appendix C of the BLM's *Land-use Planning Handbook* (BLM 2005a) requires that a variety of other decisions be made. The following is a brief description of these issues, concerns, and opportunities. For a more detailed discussion, please refer to the scoping report (BLM 2004b).

Air quality within the Monticello PA may be impacted by increases in vehicle emissions, as well as smoke from prescribed and naturally caused wildland fires and other surface-disturbing activities.

The planning process provides the opportunity to incorporate the Utah LUP amendment for fire and fuels management into the RMP.

The RMP will identify lands for retention, disposal, and acquisition. The plan will designate utility corridors and communication sites, as well as lands to avoid and restrict rights-of-way (ROWs).

The RMP will address areas available and unavailable for livestock grazing.

The RMP will establish watershed objectives for the PA and address issues such as sensitive soils; biological soil crusts; soil erosion, salinity, and sedimentation; priority watersheds; floodplains; water quality; and pollution.

The RMP will identify and update special-status species habitat within the PA and establish objectives to manage that habitat for species which include the Mexican Spotted Owl, Southwestern Willow Flycatcher, Western Yellow-billed Cuckoo, and Gunnison Sage-grouse. Also included is the protection of aquatic and riparian habitat for these and other listed and candidate species.

Some resource uses (e.g., grazing, mineral development, OHV use, and recreation) can impact the natural function and condition of watersheds. A healthy cover of perennial vegetation stabilizes the soil, increases infiltration, prevents runoff, provides clean water to adjacent streams, and minimizes noxious-weed invasion. The RMP will establish objectives to protect, maintain, and restore upland and riparian vegetation.

The RMP will address a number of woodland issues, including forest health, fuel loading, human-caused wildland fire risks and hazards, desired woodland composition and function, and forest needs/harvesting.

1.3.1.9.1 ISSUES ADDRESSED THROUGH ADMINISTRATIVE OR POLICY ACTION

Policy or administrative actions include those implemented by the BLM because they are standard operating procedures; because federal law, rule, or regulation requires them; or because they are BLM policy. Administrative actions do not require a planning decision to be implemented.

The following issues raised during scoping are addressed by administrative actions:

- Compliance with existing laws and policies (e.g., FLPMA, NEPA, Endangered Species Act (ESA), American Antiquities Act, Clean Air Act, National Historic Preservation Act);
- Education, enforcement/prosecution, vandalism, and volunteer coordination;
- Consistency with existing federal, state, and local plans;
- Cultural resource management, which includes up-to-date inventories, nondisclosure of sensitive sites, proposal of cultural sites for the National Register of Historic Places, and Native American consultation;
- Management of existing WSAs, which will continue under the IMP (BLM 1995) except for planning decisions, related to VRM class and OHV categories, which will be made in this RMP. Only Congress can release a WSA from consideration. Should all or part of a WSA be released from consideration, proposals in the released area would be examined on a case-by-case basis for consistency with the goals and objectives of the RMP decisions. Actions inconsistent with RMP goals and objectives would be deferred until completion of requisite plan amendments. Because a plan amendment would be required, there is no separate analysis in this LUP to address resource impacts if any WSAs are released.
- Completion of the inventory of riparian and wetland areas and the use of monitoring and mitigation to help protect these resources;
- Recreation-management public outreach and education, including a comprehensive sign system and maps;
- Administration of existing mineral leases, permits, and other authorized uses;
- Wildlife and biodiversity monitoring;
- Air quality monitoring;
- Mitigation measures for approved, site-specific projects;
- Noxious weeds control;
- Establishment of forage use levels, on a site-specific basis, to maintain rangeland health;
- Allocation of forage between livestock and wildlife and the application of specific management practices on allotments within the PA;
- Eligibility standards for specially designated areas;
- Coordination with local, state, and federal agencies; and
- Cooperation with user groups.

1.3.1.9.2 ISSUES ELIMINATED FROM DETAILED ANALYSIS BECAUSE THEY ARE BEYOND THE SCOPE OF THE PLAN

Issues beyond the scope of the RMP planning process include all those that do not relate to RMP decisions. They include decisions that are not under the jurisdiction of the Monticello FO or that the BLM cannot resolve as part of the planning process. Issues identified in this category include the following:

- The State of Utah and San Juan and Grand counties may hold valid existing ROWs in the planning area pursuant to Revised Statute (RS) 2477, Act of July 28, 1866, Chapter 262, 8, 14 Stat. 252, 253, *codified at* 43 USC 932. On October 21, 1976, Congress repealed R.S. 2477 through passage of FLPMA. This RMP does not adjudicate, analyze, or otherwise determine the validity of claimed ROWs. However, nothing in the RMP extinguishes any valid ROW, or alters in any way the legal rights the state and counties have to assert and protect RS 2477 rights or to challenge in federal court or other appropriate venue any use restrictions imposed by the RMP that they believe are inconsistent with their rights.
- No new WSAs will be established, and no existing ones will be altered.
- Elimination of grazing, mineral development, and OHV use on all public lands;
- Regulation of activities and uses beyond the jurisdiction of the BLM;
- Revision of existing laws, policies, and regulations;
- Availability of funding and personnel to manage programs, including law enforcement; and
- Consideration of alternative energy sources as substitutes for mineral development.

1.3.2 DEVELOPMENT OF PLANNING CRITERIA

Planning criteria are the constraints that guide and direct the RMP planning process, determine the way the planning team approaches alternative development, and help in selecting the Preferred Alternative. These criteria are based on appropriate laws, regulations, and policy, as well as public participation and coordination with cooperating agencies, other federal agencies, state and local governments, and Indian tribes. The planning criteria ensure that the RMP is consistent with the identified issues and concerns and that unnecessary data collection and analyses are avoided.

The planning criteria developed during the preplanning analysis for the Monticello RMP include the following:

- The RMP would recognize valid existing rights, including water rights.
- Decisions made in the RMP would apply only to public lands and resources managed by the BLM.
- The BLM would make all possible attempts to ensure that its management prescriptions and actions are as consistent as possible with other planning jurisdictions (both federal and nonfederal), subject to applicable law and policy.
- Management plans would focus on the relative values of resources.

- The BLM would use the most current scientific information, research, technologies, and results of inventorying, monitoring, and coordination to determine appropriate local and regional management strategies to enhance or restore impaired ecosystems.
- Management of WSAs would continue under the IMP (BLM 1995). Should Congress release all or part of a WSA from consideration, resource management would be consistent with the revised RMP, subject to other constraints on the relevant lands. Should the need arise, the BLM may consider amending the plan consistent with applicable law.
- Utah BLM Standards for Rangeland Health and Guidelines for Grazing Management (adopted in 1997), and Guidelines for Recreation Management (adopted in 2001) would continue to be implemented. The standards and guidelines would apply to all alternatives analyzed in this EIS.
- Decisions regarding OHV use would be consistent with the BLM's National OHV Strategy.
- VRM class designations would be analyzed and modified to reflect present conditions and future needs. Areas where specific land uses need to be modified or restricted to resolve conflicts would be identified.
- Sensitive watersheds would be identified, and watershed conditions would be determined. Emphasis would be placed on watersheds identified as high priority in conjunction with other cooperators such as the Utah State Division of Water Quality and the Colorado River Basin Salinity Control Forum.
- Baseline reasonable foreseeable development scenarios would be prepared based on historical, existing, and projected levels for selected resource programs.
- Planning would include preserving, conserving, and enhancing of important historical, cultural, paleontological, and natural components of public-land resources. Native American tribal coordination would be maintained to identify sites, areas, and objects important to their cultural and religious heritage.
- Endangered-species recovery goals would be addressed and would including plans to reintroduce endangered and other species. In accordance with the Interagency Memorandum of Agreement on the ESA regarding Section 7 consultation, the BLM would jointly prepare a programmatic consultation agreement with the U. S. Fish and Wildlife Service (USFWS).
- The socioeconomic impacts of the alternatives would be analyzed.
- Vegetation management objectives or desired future conditions would be developed for all parts of the PA.

1.3.3 COLLECTION OF INVENTORY DATA AND INFORMATION

Monticello FO resource specialists have collected inventory data and resource information to provide the basis for preparing the RMP. When available, new information will be used in analyzing the EIS alternatives and making planning decisions.

Geographic information systems (GIS) have been and will be used throughout the EIS analysis to store, display, and analyze resource information and data, including acreage calculations, site locations, maps, and areas of potential conflicts over resource use. After completion and approval of the RMP, this GIS information will continue to be used for resource management

and activity and project planning, and additional updated resource data will continue to be collected and entered into the GIS.

Other documents prepared to help guide the development of this RMP include the following:

- The Mineral Potential Report (BLM 2005b)
- The Scoping Report (BLM 2004b)
- Analysis of the Management Situation (BLM 2005c)
- Reasonably Foreseeable Development Scenario for Oil and Gas (BLM 2005d)
- ACEC Evaluations for Existing and Nominated ACECs (BLM 2005e)
- Wild and Scenic River Report (BLM 2004c)
- Non-WSA Lands with Wilderness Characteristics Evaluations (BLM 2007a)

1.3.4 ANALYSIS OF THE MANAGEMENT SITUATION (AMS)

The AMS describes the existing status and management of resources and facilities within the Monticello PA. It provides an analysis of the management programs administered by the Monticello FO, assesses the capability of resources to meet current demands, and assesses the adequacy of current management practices. Where no management concerns or conflicts are identified, current management practices are carried forward into the Proposed RMP. Any identified problems or concerns involving resource allocations, land use, or management practices are resolved through this EIS process. Copies of the AMS for the current planning process are available for public review at the Monticello FO and the BLM Utah state office in Salt Lake City.

1.3.5 PREPARATION OF THE DRAFT RESOURCE MANAGEMENT PLAN (DRMP) AND DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)

The draft stage of the RMP comprises alternative formulation, analysis, impacts disclosure, and selection of a Preferred Alternative.

The No-Action Alternative described in the DEIS is management under the current RMP, plus subsequent planning documents and amendments. As required by CEQ regulations, alternative actions are formulated to represent a reasonable range of management options that emphasize certain uses or resource values over others under the multiple-use and sustained-yield mandate of the FLPMA to achieve certain goals or objectives (see Section 1.3.1., Scoping and Identifying Issues, Concerns, and Opportunities). The NEPA requires the BLM to analyze and disclose the effects of the various alternatives. Based on that analysis, the BLM identified and recommended Alternative C as the Preferred Alternative. This is documented in the Draft RMP/EIS, which was distributed to the public for review and comment from November 2, 2007, to February 14, 2008.

1.3.6 SELECTION OF THE PROPOSED RESOURCE MANAGEMENT PLAN (PRMP)/FINAL ENVIRONMENTAL IMPACT STATEMENT (FEIS)

Following review and analysis of public and internal comments and further coordination with the Cooperating Agencies on the Draft RMP/EIS, the BLM has made adjustments as warranted and has crafted a Proposed RMP. In developing the Proposed RMP and FEIS, an alternative in its entirety or a combination of components of the various alternatives presented may be brought forward. Regulations (43 CFR §§1610.3-2(e) and 1610.5-2, respectively), provide, prior to the

approval of the Proposed RMP, a 60-day period for the governor of Utah to make a "consistency review" and a 30-day period for "any person who participated in the planning process and has an interest which is or may be adversely affected by the approval" of the Proposed RMP/Final EIS to protest to the BLM director. These two periods will run concurrently upon release of the PRMP/FEIS.

1.3.7 MONITORING AND EVALUATION

Monitoring is the repeated measurement of activities and conditions over time. Evaluation is a process in which the plan and monitoring data are reviewed to see if management goals and objectives are being met and if management direction is sound. Monitoring data gathered over time are examined and used to draw conclusions on whether management actions are meeting stated objectives, and if not, why. Conclusions are used to make recommendations on whether to continue current management or determine changes needed in management practices to meet objectives.

Two types of monitoring tied to the planning process include implementation and effectiveness monitoring. Land-use plan monitoring is the process of (1) tracking the implementation of land-use planning decisions and (2) collecting and assessing data/information necessary to evaluate the effectiveness of land-use planning decisions. The two types of monitoring are described below.

- **Implementation Monitoring:** Implementation monitoring is the most basic type of monitoring and simply determines whether planned activities have been implemented in the manner prescribed by the plan. Some agencies call this compliance monitoring. This monitoring documents BLM's progress toward full implementation of the LUP decision. There are no specific thresholds or indicators required for this type of monitoring.
- **Effectiveness Monitoring:** Effectiveness monitoring is aimed at determining if the implementation of activities has achieved the desired goals and objectives. Effectiveness monitoring asks the question: Was the specified activity successful in achieving the objective? This requires knowledge of the objectives established in the RMP as well as indicators that can be measured. Indicators are established by technical specialists in order to address specific questions and thus avoid collection of unnecessary data. Success is measured against the benchmark of achieving desired future conditions established by the plan.

Regulations (43 CFR 1610.4-9) require that the proposed plan establish intervals and standards, as appropriate, for monitoring and evaluation of the plan, based on the sensitivity of the resource decisions involved. Progress in meeting the plan objectives and adherence to the management framework established by the plan is reviewed periodically. The Council on Environmental Quality (CEQ) regulations implementing NEPA state that agencies may provide for monitoring to assure that their decisions are carried out and should do so in important cases (40 CFR 1505.2[c]). To meet these requirements, the BLM will review the plan on a regular schedule in order to provide consistent tracking of accomplishments and provide information that can be used to develop annual budget requests to continue implementation.

Land-use plan evaluations will be used by BLM to determine if the decisions in the RMP, supported by the accompanying NEPA analysis, are still valid. Evaluation of the RMP will generally be conducted every five years per BLM policy, unless unexpected actions, new

information, or significant changes in other plans, legislation, or litigation triggers an evaluation. Land-use plan evaluations determine whether decisions are being implemented, whether mitigation measures are satisfactory, whether there are significant changes in the related plans of other entities, whether there are new data of significance to the plan, and whether decisions should be changed through amendment or revision. Evaluations will follow the protocols established by the BLM Land-use Planning Handbook H-1601-1 in effect at the time the evaluation is initiated. Specific monitoring and evaluation needs are identified by resource/uses throughout Chapter 2.

1.4 RELATIONSHIP TO OTHER POLICIES, PLANS, AND PROGRAMS

This planning process must recognize the many ongoing programs, plans, and policies that are being implemented in the Monticello PA by other land managers and government agencies. The BLM will seek to be consistent or complementary with other management actions whenever possible. Plans and policies that need to be considered during the Monticello planning effort are outlined below.

1.4.1 STATE OF UTAH PLANS

- SITLA cooperative agreement and other plans
- Canyonlands Natural History Association cooperative agreement
- Regional plans of the Utah Department of Transportation (UDOT)
- State of Utah plans relating to wildlife habitat and watershed management
- Utah's State Comprehensive Outdoor Recreation Plan (SCORP)
- Utah's Smoke Management Plan
- Utah's State Implementation Plan
- Utah's Nonpoint Source Management Plan
- Utah's Sensitive Species List
- Utah's List of Impaired Waters (303 d)
- Utah's Water Resources Planning for the Future
- Utah's Water Plan: Southeast Colorado River Basin
- Utah's Rules for Edge of the Cedars State Park Museum and Gooseneck State Park
- Utah's Big Horn Sheep Statewide Management Plan
- San Juan Elk Management Plan
- Statewide Management Plan for Elk

1.4.2 COUNTY LAND-USE PLANS

- San Juan County, Utah: San Juan County Master Plan (2008)
- Grand County, Utah: Grand County General Plan Update (2004)

1.4.3 OTHER FEDERAL PLANS

- Canyonlands National Park Natural Resource Management Plan (1994)
- Canyonlands National Park General Management Plan (1974)
- Canyonlands National Park Backcountry Management Plan (1984, 1995)

- Manti–La Sal National Forest Land and Resource Management Plan (1986)
- Strategic Plans for Glen Canyon National Recreation Area and Rainbow Bridge National Monument (2005, 2007)
- Hovenweep National Monument Plan (draft)
- Glen Canyon NRA Grazing Management Plan (1999)
- Glen Canyon NRA Minerals Management Plan (1980)
- Cooperative Management Strategies: Hovenweep National Monument, Colorado–Utah (1987)
- Canyon of the Ancients Monument-Resource Management Plan (draft)
- San Juan–San Miguel Resource Management Plan (1986)
- Moab Resource Management Plan (draft)
- Richfield Resource Management Plan (draft)
- Grand Staircase-Escalante National Monument Management Plan (2000)

1.4.4 ENERGY POLICY AND CONSERVATION ACT (EPCA)

In May 2001, the Comprehensive National Energy Policy was issued, which directed the secretary of the interior to "...examine land status and lease stipulation impediments to federal oil and gas leasing, and review and modify those where opportunities exist (consistent with the law, good environmental practice and balanced use of other resources)" (NEPDG 2001).

Under this directive, the assistant secretary of the Interior for Lands and Minerals Management delivered to Congress an inventory of U.S. oil and gas resources in five western basins, as well as the extent and nature of any restrictions or impediments to their development. This report was prepared at the request of Congress under the provisions of the 2000 Energy Policy and Conservation Act (EPCA) (BLM 2003a).

In April 2003, the BLM specified four EPCA integration principles, as follows:

- Environmental protection and energy production are both desirable and necessary objectives of sound land management and are not to be considered mutually exclusive priorities.
- The BLM must ensure appropriate accessibility to energy resources necessary for the nation's security while recognizing that special and unique non-energy resources can be preserved.
- Sound planning will weigh relative resource values, consistent with the FLPMA.
- All resource impacts, including those associated with energy development and transmission will be mitigated to prevent unnecessary or undue degradation (BLM 2003a).

1.4.5 MEMORANDUM OF UNDERSTANDING (MOU) BETWEEN THE U.S. DEPT. OF THE INTERIOR AND U.S. DEPT. OF AGRICULTURE: IMPLEMENTATION OF SECTION 225 OF THE ENERGY POLICY ACT OF 2005 REGARDING GEOTHERMAL LEASING AND PERMITTING

The purpose of this MOU is to facilitate interagency coordination and establish policies and procedures to implement Section 225 of the Energy Policy Act of 2005, Public Law 109-58 (hereinafter, the Act). Section 225 requires the coordination of geothermal leasing and permitting

on public lands and National Forest Service (NFS) lands between the secretaries of the interior and agriculture.

1.4.6 MEMORANDUM OF UNDERSTANDING (MOU) BETWEEN THE U.S. DEPT. OF THE INTERIOR BUREAU OF LAND MANAGEMENT AND U.S. DEPT. OF AGRICULTURE FOREST SERVICE

The purpose of this MOU is to establish joint BLM and USFS policies and procedures for managing oil and gas leasing and operational activities pursuant to oil and gas leases on NFS lands, consistent with applicable law and policy. The MOU was signed in 2006 for the purpose of efficient, effective compliance with statutory and regulatory requirements. The MOU establishes the roles of the USFS and the BLM in processing applications for permits to drill and review of subsequent operations.

1.4.7 MEMORANDUM OF UNDERSTANDING (MOU) BETWEEN THE U.S. DEPT. OF THE INTERIOR BUREAU OF LAND MANAGEMENT AND NATIONAL PARK SERVICE

The purpose of this MOU is to establish joint BLM and National Park Service policies and procedures for administer livestock grazing leases, subject to the values and purposes of Glen Canyon NRA lands.

1.4.8 OIL SHALE AND TAR SANDS LEASING PROGRAMMATIC EIS (PEIS)

The Monticello FO contains areas of tar sands. This resource has been, and currently is, available for lease under the Combined Hydrocarbon Leasing Act of 1981 and in accordance with the decisions in the existing BLM LUPs/amendments.

These major tar-sand resources lie only in Utah within 11 designated special tar-sands areas (STSAs) managed by the BLM Vernal, Price, Richfield, and Monticello FOs. One of these STSAs lies within the Grand Staircase–Escalante National Monument, where leasing is prohibited. The Monticello FO manages one of the remaining 10 STSAs.

When the Monticello RMP revision was initiated in 2002, there was no reasonable foreseeable development expectation for tar sands. The mineral report identified this resource but did not expect any leasing or development due to prevailing and anticipated economic factors.

After the start of this RMP revision, Congress enacted the Energy Policy Act of 2005. Section 369 of the Energy Policy Act requires the Secretary of the Interior to "complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with an emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming." On December 13, 2005, the BLM published a NOI in the Federal Register initiating a Programmatic Environmental Impact Statement (PEIS) to support a commercial oil-shale and tar-sands leasing program on federal lands in these three states.

In light of this statutory requirement, all decisions related to tar-sands leasing in this RMP are being deferred to the ongoing PEIS on oil-shale and tar-sands leasing. In the event that the ROD on the final PEIS on oil shale and tar sands is issued before one for the Monticello Proposed RMP/Final EIS, the decisions in the oil-shale and tar-sands ROD will be incorporated into the Monticello RMP.

Combined hydrocarbon and tar-sand leasing in the STSAs will also be deferred to the PEIS. Additional opportunities for public involvement and comment will occur when the draft of the PEIS becomes available. Site-specific requirements will be addressed in future NEPA analysis for particular project applications after the PEIS is completed. This RMP will, however, develop allocation decisions for conventional oil and gas leasing in the STSAs.

1.4.9 THE ENERGY POLICY ACT OF 2005 AND THE WESTERN ENERGY CORRIDOR

An interagency West-wide energy corridor PEIS is currently being developed to implement Section 368 of the Energy Policy Act of 2005 (Energy Right-of-way Corridors on federal land). The final West-wide energy corridor PEIS will amend RMPs in the western U.S., providing decisions to address numerous energy corridor issues, including the utilization of existing corridors (with enhancements and upgrades) and the identification of new ones, supply and demand considerations, and compatibility with other corridor and project-planning efforts. It is likely that the identification of corridors in the West-wide energy corridor PEIS will affect the Monticello PA. Consequently, the decisions in the ROD on the final West-wide energy corridor PEIS will be incorporated into the Monticello RMP.

1.4.10 ENDANGERED SPECIES RECOVERY PLANS

- The Recovery Implementation Plan for the Endangered Fish Species in the Upper Colorado River Basin (USFWS 1987)
- Bonytail Chub Recovery Plan (USFWS 1984, 1990a, 2002a)
- Humpback Chub Recovery Plan (USFWS 1979, 1990a, 2002b)
- Colorado Pikeminnow Recovery Plan (USFWS 1978, 1990, 1991, 2002c)
- Mexican Spotted Owl Recovery Plan (USFWS 1995)
- Razorback Sucker Recovery Plan (USFWS 1999, 2002d)
- Final Recovery Plan for the Southwestern Willow Flycatcher (USFWS 2002e)

1.4.11 EXISTING EISS

- Utah Combined Hydrocarbon Leasing Regional Final EIS (1984)
- Utah BLM Statewide Wilderness EIS (1990)
- Programmatic EIS on Wind Energy Development on BLM-administered Lands in the Western United States (BLM 2005f)
- Final Environmental Impact Statement Vegetation Treatment on BLM Lands in Thirteen Western States and associated Records of Decision (1991).
- Final Vegetation Treatments on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement and Associated Record of Decision (2007).
- Final Vegetation Treatments on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Report (2007).

1.4.12 OTHER BLM PLANS

- Red Canyon/White Canyon Habitat Management Plan (1990)
- Beef Basin Habitat Management Plan (1992)

- Hatch Point Habitat Management Plan (1976)
- Fire Management Plan Amendment (2005)
- San Juan County Landfill Plan Amendment (1995)
- Montezuma Creek River Basin Study (1992)
- Grand Gulch Plateau Cultural and Recreation Area Management Plan (1993)
- Indian Creek Corridor Plan (2005)
- East Canyon Allotment Management Plan (1993)
- Tank Draw Allotment Management Plan (1993)
- Gunnison Sage-grouse Range-wide Conservation Plan (2005)

1.5 DESCRIPTION OF THE PROPOSED PLAN

This section provides a brief description of the Proposed Plan, which presents opportunities to use and develop resources within the planning area while ensuring resource protection. The Proposed Plan would provide for continued access to and development of resources with stipulations and mitigation to protect natural and cultural resources.

As identified in Table 2.1, key resource decisions on public lands include but are not limited to the following:

- **Air Quality:** Work cooperatively with state, federal, and tribal entities in developing air quality assessment protocols to address cumulative impacts and regional air quality issues.
- **Cultural Resources:** Authorizations for land and resource use would comply with Section 106 of the National Historic Preservation Act (NHPA), consistent with and subject to the objectives established in the RMP for the proactive use of cultural properties in the public interest. Consultations with Native American tribes would occur to identify, protect, and maintain access for areas of traditional and religious use that include but are not limited to burials, rock art, traditional use areas, religiously active areas, and sacred sites.
- **Fire Management:** Adopts the comprehensive Utah LUP amendment for fire and fuels management of September 2005, which addresses activities associated with ESR, prevention/mitigation, fuels treatment, wildfire use, suppression, and priorities.
- **Health and Safety:** Ensures that human health and safety concerns on the public lands are appropriately mitigated if it is determined hazardous materials waste (including abandoned mines) are present.
- **Lands and Realty:** Defines exclusion and avoidance areas for ROWs and outlines processes for filming, Recreation and Public Purposes (R&PP), trespass resolution, access, easements, land tenure adjustments, transportation, and utility corridors and withdrawals.
- **Livestock Grazing:** Manages grazing according to Standards for Rangeland Health and Guidelines for Grazing Management. Maintains lands currently unavailable for livestock grazing (due to vegetation, recreation, wildlife, or other concerns) and existing land treatments. Also addressed is utilization, unavailable areas, preference relinquishment, season of use and forage. Makes 1,621,515 acres available to grazing and 134,277 acres unavailable to grazing.
- **Minerals:** Provides for a variety of mineral exploration and development activities.

- **Mineral Entry:** Maintains 1,734,458 acres as available to mineral entry and recommends 50,665 acres for withdrawal from mineral entry
- **Mineral Disposal:** Makes 624,734 acres available with standard terms and conditions and 724,234 acres available with special conditions.
- **Oil and Gas Leasing:** Open with standard terms and conditions 495,431 acres; open with moderate terms and conditions (controlled surface use and timing limitations) 732,476 acres; open with no surface occupancy 50,942 acres; and closed to leasing 491,553 acres.
- **Non-WSA Lands with Wilderness Characteristics:** Manages 88,871 acres for wilderness characteristics in Dark Canyon (11,540 acres), Mancos Mesa (30,068 acres), Nokai Dome West (14,988 acres), Nokai Dome East (18,618 acres), and Grand Gulch (13,657 acres).
- **Paleontology:** In areas where surface disturbance, either initiated by BLM or by other land users, may threaten substantial or noteworthy fossils, BLM would follow its policy per *Paleontology Resources Management Manual and Handbook 8370-1* (BLM 1998a) to assess any threat and mitigate damage.
- **Recreation:** Outlines guidelines, general decisions, existing/future facilities, launch limits, commercial/private allocations, visitor services, campsites, campfires, wood collection, non-boating use, grazing, watershed, pet/stock animals and general policies regarding SRPs (commercial and competitive). Approximately 562,824 acres are included within 7 SRMAs: San Juan River (9,859 acres); Dark Canyon (30,820 acres); White Canyon (2,828 acres); Tank Bench (2,646 acres); Beef Basin (20,302 acres); Indian Creek (89,271 acres); and Cedar Mesa (407,098 acres), which includes management zones for Grand Gulch NHL (37,388 acres), Comb Ridge (38,012 acres), and McLoyd Canyon–Moon House (1,607 acres).
- **Riparian:** Develops strategies and restrictions necessary to meet or maintain Proper Functioning Condition (PFC). Develops seasonal restrictions, closures, and/or forage utilization limits on grazing in riparian areas considered "functioning at risk." Temporarily closes riparian areas considered functioning at risk to dispersed motorized camping until PFC is restored.
- **Soil and Water:** Emphasizes management of watershed health and sensitive soils by addressing surface-disturbing activities and slope limits.
- **Special Designations:** Designates, modifies, and manages areas as ACECs where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, other natural systems or processes, or to protect life and safety from natural hazards. Approximately 73,492 acres are included within seven ACECs: 1) Alkali Ridge (Cultural) 39,196 acres; 2) Hovenweep (Cultural) 2,439 acres; 3) Indian Creek (Scenic) 3,905; 4) Lavender Mesa (Relic Vegetation) 649 acres; 5) San Juan River (Scenic, Cultural, Wildlife, & Natural Systems) 4,321 acres; 6) Shay Canyon (Cultural) 119 acres; and 7) Valley of the Gods (Scenic) 22,863 acres.
- **Special Designations:** Identifies eligible WSR segments that would be managed according BLM Manual 8351, Wild and Scenic Rivers–Policy and Program Direction for Identification, Evaluation, and Management. Approximately 35.7 miles are included within four eligible WSR segments: Colorado River Segment 2 (5.5 miles/880 acres);

Colorado River Segment 3 (6.5 miles/1,040 acres); Dark Canyon (6.4 miles/2,048 acres); and San Juan River Segment 5 (17.3 miles/2,768 acres).

- **Special Designations:** Manages 13 WSAs (391,599 acres): Mancos Mesa (51,440 acres), Grand Gulch ISA Complex (105,520 acres), Road Canyon (52,420 acres), Fish Creek Canyon (46,440 acres), Mule Canyon (5,990 acres), Cheesebox Canyon (15,410 acres), Dark Canyon ISA Complex (68,030 acres), Butler Wash (24,190 acres), Bridger Jack Mesa (5,290 acres), Indian Creek (6,870 acres), South Needles (160 acres), Squaw and Papoose Canyons (6,676 acres), and Cross Canyon (1,008 acres)..
- **Special Status Species:** Avoidance and minimization measures would be used for all surface-disturbing activities to comply with the ESA, the BLM state director's sensitive plant and animal species, and the BLM Manual 6840, Special Status Species Management.
- **Travel Management:** Designates 1,388,191 acres as "limited to designated routes," and 393,895 acres as "closed." Special seasonal stipulations are applied to Arch Canyon and the last portion of the route past the state section to McLoyd Canyon–Moon House would be closed.
- **Vegetation:** Manages seed gathering, identifies vegetation treatments, and controls invasive and non-native weed species.
- **Visual Resource Management:** Activities would comply with VRM management class objectives, unless a waiver, exemption, or modification is granted. Designates PA as Class I (422,989 acres), Class II (228,041 acres), Class III (507,583) acres, and Class IV (623,002 acres).
- **Wildlife and Fisheries:** Discusses protocols for introduction, transplantation, augmentation, reestablishment, animal damage control, habitat improvement/protection, seasonal areas, off-site mitigation and habitat boundaries.
- **Woodlands:** Identifies zones for private/commercial use of woodland products, prioritizes treatments in high value/risk areas and continues permits.

1.6 SUMMARY OF CHANGES FROM DRAFT RMP/EIS TO THE PROPOSED PLAN RMP/FINAL EIS

The Draft RMP/EIS was released to the public on November 2, 2007, which initiated a 90-day comment period. Comments were received from the public, cooperators, and other interested parties. See Chapter 5, Consultation and Coordination, for details of the public comment process.

As a result of public comment and internal review of the Draft RMP/EIS, the BLM has formulated the Proposed Plan in the Proposed RMP/Final EIS. The Proposed Plan/RMP consists of a combination of all the alternatives. Changes regarding the Proposed Plan and draft alternatives focused on adjustments in order to address public concerns while continuing to meet the BLM's legal and regulatory mandates. Changes are a result of the following:

- Adjustments to decisions;
- clarifications and cross-tracking to better explain the management proposed in the Draft RMP/EIS;
- updates to information;
- updates to maps; and

- minor corrections, including typographical errors.

A few of the decision changes in the Proposed Plan are outside of the range of alternatives, but are not significant changes that require substantive new analysis. Discussion of these changes is provided below.

1.6.1 SUMMARY OF CHANGES TO DECISIONS BETWEEN THE PREFERRED ALTERNATIVE (DRAFT EIS) AND THE PROPOSED PLAN (FINAL EIS)

- The decisions in the alternatives brought forward have not changed from the Draft RMP, except for minor clarifications and cross-tracking.
- **Air Quality:** New information concerning coordination efforts, responsibilities, and State of Utah requirements concerning air quality emissions has been added to the Common to All section.
- **Cultural Resources:** All Cultural Special Management Areas (CSMA) have been renamed as Special Recreation Management Areas (SRMAs) or Recreation Management Zones (RMA) within SRMAs and moved to the Recreation section of Chapter 2. Name changes include the following:
 - Comb Ridge CSMA = Comb Ridge RMZ within the Cedar Mesa SRMA
 - Tank Bench CSMA = Tank Bench SRMA
 - Beef Basin CSMA = Beef Basin SRMA
 - McLoyd Canyon–Moon House CSMA = McLoyd Canyon–Moon House RMZ within the Cedar Mesa SRMA
 - Grand Gulch National Historic District CSMA = Grand Gulch National Historic District RMZ within the Cedar Mesa SRMA.

No decisions have changed; they have just been moved over to the Recreation section under the SRMAs.

- **Historic Trails:** This whole section has been moved under the Special Designations section.
- **Lands and Realty:** The Common to All portion has been reworded to clarify differences between FLPMA Section 203 and 206 land disposals. The ROW Avoidance and Exclusion areas have been listed out in the Proposed Plan for clarity. Acreage has been adjusted from Alternative C (Preferred Alternative) because five areas outside of WSAs with wilderness characteristics have been added to the Avoidance areas. In addition, the Comb Ridge RMZ, Valley of the Gods ACEC, Indian Creek ACEC, and the Dark Canyon wild and scenic river segment were not carried into the Proposed Plan as mineral withdrawal recommendations.
- **Livestock Grazing:** Language on voluntary relinquishment has been clarified to mirror existing BLM policy. Acreage calculated as unavailable to grazing has been increased by a few thousand acres due to GIS calculations. No decisions have changed.
- **Mineral Resources:** Acreages for lands that are available for leasing under standard lease terms, minor constraints (CSU and TL), major constraints (NSO), and unavailable for leasing have been modified due to a myriad of decisions brought forward into the Proposed Plan from within the range of alternatives. Most notable are the five areas

carried forward to protect their wilderness characteristics (88,871 acres); four of the five areas would be unavailable to leasing, and one would be NSO.

- **Non-WSA Lands with Wilderness Characteristics:** Five areas have been brought forward from Alternative E into the Proposed Plan to protect, preserve and maintain their wilderness characteristics (88,871 acres). There were no non-WSA lands identified for management of those values in the Preferred Alternative (Alternative C) in the Draft RMP/EIS. Various management prescriptions have been selected in the Proposed Plan to protect the wilderness characteristics.
- **Recreation:** New prescriptions for Recreation under the Common to All portion of this resource have been added and cross-tracked from the Cultural Section because they are pertinent to the recreation user.
 - The Cedar Mesa Cultural Special Recreation Management Area has been renamed the Cedar Mesa Special Recreation Management Area consistent with existing policy and handbook guidance. Three Recreation Management Zones (RMZs) have been identified within the Cedar Mesa SRMA. These RMZs were identified as Cultural Special Management Areas (CSMAs) in the Cultural Resources section of the Draft RMP alternatives. In the Proposed Plan, they are now the Comb Ridge RMZ, McLoyd Canyon–Moon House RMZ, and the Grand Gulch National Historic District RMZ within the Cedar Mesa SRMA. The Cedar Mesa SRMA gained acreage as a result of adding the Comb Ridge RMZ. All management prescriptions have been carried over from the Cultural Resources section, and no new prescriptions were included.
 - The Tank Bench SRMA and Beef Basin SRMA have been added to the Recreation Section. These areas and their prescriptions were transferred over from the Cultural Resources section where they were identified as Cultural Special Management Areas in the Draft RMP. This is basically a formatting change, and no new decisions have been added based on these changes.
 - In the Dark Canyon SRMA, the limit on group size numbers has been increased from 15 in the Preferred Alternative (Alternative C) to 18 in the Proposed Plan. Although this is outside the range of alternatives, it is a minimal change of three persons and would have negligible, if any, impact on the analysis or other decisions in this plan. This change was in response to public comment on industry standards for group size.
 - Within the decision space for the Extensive Recreation Management Area, the Proposed Plan clarified that off-road camping within 150 feet of designated routes would not be allowed in WSAs, non-WSA lands with wilderness characteristics (88,871 acres), wild and scenic river corridors, ACECs, and threatened and endangered species habitat. In addition, the limitations on commercial recreational events were cross-tracked and carried into this section from the Cultural Resources section.
- **Soil and Water Resources:** A new guidance statement was added concerning the application of best management practices and mitigation when working in sensitive soil areas in order to be in conformance with current policy.
- **Special Designations:** ACECs

- Alkali Ridge ACEC: Clarified coordination responsibilities with the SHPO, provided more guidance for cultural mitigation, changed the VRM classification from VRM IV (Alternative C) to VRM III (Proposed Plan), changed oil and gas leasing category to minor constraints (CSU). Changing the leasing category appears to be outside of the range of alternatives, however, the No Action Alternative (Alternative A), was incorrectly displayed as open with standard lease terms. The existing San Juan Resource RMP maps all show the Alkali Ridge area to be under a CSU stipulation. This does not affect the analysis to any extent, however, because existing laws, rules, and regulations would require surface-disturbing activities to be mitigated in accordance with Section 106 of the NHPA, and the CSU stipulation basically reiterates the importance of protecting the cultural resources in the area. The CSU stipulation does not preclude leasing or other surface-disturbing activities in this area. In addition, it was clarified in the Proposed Plan that off-road travel for wood collection would not be allowed in this culturally sensitive area until future level III cultural inventories are completed. In the National Historic District of this ACEC, clarification was added for the term “casual use” for geophysical activities. In addition, it was clarified that campfires would not be allowed in this area.
- Hovenweep ACEC: Clarified coordination responsibilities with the SHPO, provided more guidance for cultural mitigation, changed the VRM classification in the 880 acre visual emphasis zone from VRM III (Alternative C) to VRM II (Proposed Plan). Although this is outside of the range of alternatives, the affect of this change is minimal because this area is and continues to be under a No Surface Occupancy (NSO) leasing stipulation, where surface-disturbing activities are limited.
- In the prescriptions for Bridger Jack Mesa ACEC, Lavender Mesa ACEC, Indian Creek ACEC, Shay Canyon ACEC, and Valley of the Gods ACEC, management decisions have been carried forward and cross-tracked from other portions of the RMP for clarification. The Indian Creek ACEC has changed from an OHV-limited area to closed to OHV use in the Proposed Plan.
- The San Juan River ACEC has been decreased in size because Segment 5 of the San Juan River has been excluded from the ACEC management and added as a wild and scenic river segment under its own management prescriptions in the Proposed Plan. A decision has been added to the ACEC section on livestock grazing that was cross-tracked with the San Juan River SRMA.
- **Special Designations: Wild and Scenic Rivers**
 - The San Juan River wild and scenic river segment 5 (17.3 miles) has been brought forward as a wild-suitable river segment in the Proposed Plan. It would no longer be part of the San Juan River ACEC.
 - Clarification was added in the Common to All section to reiterate that the White Canyon river segment no longer meets the eligibility criteria for wild and scenic river consideration and was not carried forward into the Draft or Proposed Plan.
- **Special Designations: Wilderness Study Areas**
 - Clarification of the two decisions needed for WSAs during this planning process were clearly displayed for both VRM and OHVs.

- **Special Status Species:** Moved much of the specific information on threatened and endangered species into Appendix A, B, and Q. Provided a policy statement concerning the Gunnison prairie-dog and added a map displaying its habitat in the Map section. Changed the year-round habitat seasonal restrictions for the Gunnison Sage-grouse from 6 miles to 4 miles in accordance with the regional Gunnison Sage-grouse plan.
 - In the Mexican Spotted Owl habitat in Arch Canyon, changed the OHV open route distance from 3.8 miles in the Preferred Alternative (Alternative C) to 8 miles (to the Forest Service boundary) in the Proposed Plan (with seasonal restrictions for organized and commercial groups).
- **Travel Management:** The Indian Creek and Butler Wash areas that were open to cross-country use (2,311 acres) in the Preferred Alternative (Alternative C) would be limited to designated roads and trails in the Proposed Plan.
 - The Arch Canyon route, which was limited to 3.8 miles for OHV use in the Preferred Alternative (Alternative C), is changed to allow for OHV use for 8 miles (to the Forest Service boundary) in the Proposed Plan (with seasonal restrictions for organized and commercial groups).
 - Numerous changes in acreages have been made to all three categories (open, closed, and limited) due to the changes made throughout Chapter 2 between the Draft Preferred Alternative and the Proposed Plan.
 - The seven ways in the WSAs that would be limited to designated roads and trails in the Preferred Alternative (Alternative C) have been removed from this section in the Proposed Plan. This is because the Proposed Plan would close all ways in Mancos Mesa, and some remaining routes (four or fewer) in the three WSAs in Cedar Mesa would have temporary, conditional use to limited to trail heads until such time as they can be relocated outside of the WSAs. They would not be “designated” under the Travel Plan.
- **Visual Resource Management:** Minor changes to the VRM acreage appear between the Preferred Alternative (Alternative C) and the Proposed Plan, but these are GIS glitches, and all VRM Class I areas remain the same. Changes between VRM Class II and III are attributed to a myriad of changes between the Draft and the Proposed Plan. Only changing the 880 acres in the Hovenweep visual sensitive zone from a VRM III to a VRM II is outside the range of alternatives, and as noted above is not a significant change because the areas was already under an NSO for oil and gas leasing, and also has other restrictive management commensurate with a VRM Class II objective.
- **Wildlife and Fisheries Resources:** Crucial big game habitat boundaries increased in size between the Preferred Alternative (Alternative C) in the Draft and the Proposed Plan. In August 2005, the UDWR changed its wildlife habitat classification system. Prior to 2005, the UDWR classification system distinguished between "critical" habitat (an area that provides for biological and/or behavioral requisites necessary to sustain the existence and/or perpetuation of a wildlife population) and "high value" habitat (an area that provides for intensive use by the species). The UDWR has been criticized for using the term "critical," as the same term refers to habitat federally designated by the USFWS as required by the Endangered Species Act (ESA).
 - In previous BLM planning efforts, mitigation decisions (usually timing stipulations) for impacts to the UDWR's "critical" habitats have been integrated

into the planning process. The BLM rarely incorporated management decisions in its RMPs for "high value" habitats. The UDWR changed its classification system to include "critical" habitat with "high value" habitat, in part to accommodate the limitations of having classifications that were of no practical value to land managers. The new term "crucial" habitat is defined by the UDWR as "habitat on which the local population of a wildlife species depends for survival because there are no alternative ranges or habitats available. Crucial habitat is essential to the life-history requirements of a wildlife species. Degradation or loss of crucial habitat will lead to significant declines in the wildlife population in question."

- Crucial habitat boundaries appear larger on the wildlife maps in this Proposed Plan because they are a combination of the UDWR's old "critical" habitat and "high value" habitat, with some minor modifications. Timing stipulations for each of the species now apply to the whole crucial habitat area. It is important to note, however, that the application of waivers, exceptions, and modifications, as outlined in Appendix A, will be taken into consideration and used where/when applicable for all surface-disturbing activities in these areas. The range of alternatives in the Draft RMP/Draft EIS considered both of the UDWR's old classifications of critical and high-value habitat. Minor boundary modifications have been made by the UDWR prior to incorporating them into crucial habitat boundaries. Because this information was taken into consideration and analyzed in the draft, these minor changes are not considered significant in terms of resource uses and/or analysis in this Proposed Plan, and therefore a supplement to this EIS is not necessary for this purpose.
- References to Appendix A have been added to emphasize the waiver, exception, and modification language that applies to the timing stipulation for these species.
- **Woodlands:** Clarification was added that the non-WSA lands with wilderness characteristics would not be open to woodcutting. In both the North Comb Ridge Woodcutting Zone and the Montezuma Watershed Woodcutting Zone, clarification was added that off-road travel would not be allowed for woodcutting until future Class III surveys for cultural resources have been completed. Vehicles must stay on designated routes only

1.6.2 CLARIFICATIONS

In addition to the modifications to the Proposed Plan, information has been updated and language clarified in the Proposed RMP/Final EIS in response to questions and comments received on the Draft RMP/EIS. Major clarifications are:

- Identified implementation-level decisions by placing them in italics and asterisking with a footnote.
- **Health and Safety:** Added prescriptions for human health and safety and hazardous materials with associated narratives.
- **Minerals:** Added statement on Best Management Practices (BMPs) under Oil and Gas Leasing.
- **Riparian:** Clarified Management Common to All regarding new surface-disturbing activities to be consistent with BLM riparian policy.

- **Recreation under SRMAs:** Provided additional rationale for the goals and objectives for each SRMA. Clarified that Dark Canyon SRMA would be managed under IMP since it is entirely within the Dark Canyon WSA.
- **Special Status Species:** Removed management prescriptions for individual species under Management Common to All (MCA) because these are listed in Appendix A, B, and Q.
- **Vegetation:** Clarified goals for vegetation management.
- **Lands and Realty:** Clarified "reasonable access" to SITLA lands and that BLM will prioritize SITLA land exchange proposals.
- Cross-tracked decisions from different resource sections of Chapter 2 and brought them forth into appropriate sections for better understanding of the area's management.
- Made numerous minor changes to language and presentation of the information for better internal and public understanding of the decisions.
- Reorganized and reformatted Appendix A to add clarity to the stipulations for surface disturbance.
- Augmented Appendix H to include the threats to relevance and importance criteria for the potential ACECs.

1.6.3 UPDATES TO DATA

- The Executive Summary and Chapter 1 have been updated to reflect the Proposed Plan.
- Chapter 2 includes the Proposed Plan as well as all of the Draft Alternatives from the Draft EIS.
- Information was added to Chapters 3 and 4 on global climate change.
- Added air quality data from Canyonlands National Park to Chapter 3.
- Included baseline information on SITLA lands to describe how they interrelate with public lands.
- The Utah State University social survey results were added as an Appendix R.
- Socioeconomic data were updated from the year 2000 to the year 2007. Added updated data on socioeconomics, including severance taxes and property taxes. Added wage distribution for recreation jobs in the socio-economic sections of Chapters 3 and 4.
- The Bald Eagle was removed from Threatened and Endangered Species headings
- Updated conservation measures from the USFWS were added to the Appendices A, B and Q
- A new Appendix T was added to include a letter from State of Utah outlining special requirements for reducing potential impacts on air quality.
- Chapter 4 has been updated to reflect the new analysis for the Proposed Plan
- Chapter 5 has been updated to include county and state consistency tables as well as other pertinent plans. It also includes a description of the process used for assessing public comments, comments provided by Cooperating Agencies and BLM responses, as well as other public comments that required changes to the Proposed Plan. Reference is made to a compact disc (CD) that provides all substantive public comments and BLM response to those comments. The CD provides two databases: one sorted by commenter name and the other sorted by resource concern.

1.6.4 MAP CHANGES

Most of the maps have had some corrections made to them. Many were in the legend to better clarify the information that was being put forth. Other changes have been made due to internal review and cross-checking and finding discrepancies between the written decisions in Chapter 2 and how those decisions were displayed on the maps through a GIS effort. Added all new maps to portray the allocation decision for the Proposed Plan, Two new map themes not included in the DRMP and added to the Proposed Plan include: 1) ROW Avoidance and Exclusion Areas for the Proposed Plan and 2) Gunnison prairie-dog Habitat.

In addition to the above changes, adjustments were made to correct typographical or grammatical errors, add references, and clarify wording. Changes of this nature are not listed above.

1.6.5 RATIONALE FOR CHANGES AND FINDING OF INSIGNIFICANCE

The BLM has made numerous changes between the Draft RMP/EIS and Proposed RMP/Final EIS. These changes are described above and detailed in Appendix S. The BLM has prepared this appendix to document whether changes between the Draft RMP/EIS and the Proposed RMP/Final EIS resulted in a significant change in circumstances or conditions, or whether the Proposed RMP/Final EIS contains different information from that which was presented to the public in the Draft RMP/EIS. Finally, the BLM wanted to confirm that the majority of changes made to the Proposed RMP/Final EIS fall within the range of alternatives presented and analyzed in the Draft RMP/EIS. As noted in Section 1.1.2.1, four decisions in the Proposed Plan fall outside the range of alternatives but are not significant changes for the reasons provided above. These changes include increasing group size numbers from 15 to 18 in the Dark Canyon SRMA, making the Alkali Ridge ACEC open to leasing under minor constraints versus standard lease terms to further protect the significant cultural resources of the ACEC, changing the VRM classification in the 880 acre Hovenweep visual sensitive zone from a Class III objective to a Class II objective, and increasing the crucial habitat boundary acreage to be in concert with the UDWR. None of these changes meet the test of significance.

The regulation controlling whether or not a supplement is required is found at 40 CFR 1502.9(c), which provides that agencies:

- Shall prepare supplements to either draft or final environmental impact statements if (1) the agency makes substantial changes in the proposed action that are relevant to environmental concerns, or (2) there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impact;
- May also prepare supplements when the agency determines that the purposes of the Act will be furthered by doing so;
- Shall adopt procedures for introducing a supplement into its formal administrative record, if such a record exists; and
- Shall prepare, circulate, and file a supplement to a statement in the same fashion (exclusive of scoping) as a draft and final statement unless alternative procedures are approved by the Council.

All changes to the Monticello Draft RMP/Draft EIS were made in response to public comment and/or internal review. The majority of the changes were editorial and/or format changes made to add clarity to the document. In some cases, alternatives presented in the Draft RMP/Draft EIS

were modified in the PRMP to reflect technical corrections and data updates. In other cases, such as in Chapter 3, Affected Environment, incorporation of updated information was necessary to refine the analysis in Chapter 4, Environmental Consequences of Proposed Plan and All Alternatives, that was incomplete or needed augmentation.

None of the changes described above and further detailed in Appendix S meet the regulatory definition for significance in 40 CFR 1508.27(a) and (b). These regulations require an agency preparing a NEPA document to review the changes for significant new circumstances or information relevant to environmental concerns and bearing on the Proposed Plan or its impacts, using context and intensity as the trigger for significance. The BLM has reviewed each substantive change through this regulatory standard and has determined that none of the changes, individually or collectively, require a supplement to this Final EIS.

1.7 NEXT STEPS: COMPLETE RECORD OF DECISION (ROD) AND APPROVED PLAN

The publication of the ROD and approved RMP completes the RMP planning process. Substantial changes to the proposed plan, due to the governor's review or a protest resolution, will be published and subject to public review prior to final approval. The ROD will include appeal provisions for any implementation decisions in the approved RMP. Monitoring and evaluation are an ongoing step in the planning process.

THIS PAGE INTENTIONALLY LEFT BLANK

5.0 CONSULTATION AND COORDINATION

5.1 INTRODUCTION

During the planning and decision-making process for this Monticello Proposed Resource Management Plan (PRMP)/Final Environmental Impact Statement (FEIS), the Bureau of Land Management (BLM) made formal and informal efforts to consult and coordinate with other federal agencies and state and local governments, Native American tribes, and the interested public, in accordance with the requirements of the National Environmental Policy Act (NEPA), the Federal Land Policy Management Act (FLPMA), and all applicable Council on Environmental Quality (CEQ) and Department of Interior regulations, policies, and procedures. NEPA, FLPMA, and applicable regulations and policy require that all federal agencies involve the interested general public in their decision-making, consider reasonable alternatives to the Preferred Alternative/Proposed Plan, and prepare environmental documents that disclose the potential impacts of the Preferred Alternative/Proposed Plan and the reasonable alternatives.

Public involvement, consultation, and coordination have been at the heart of the planning process leading to the Monticello PRMP/FEIS to ensure that (1) the most appropriate data have been gathered and employed for the analyses and (2) agency and public sentiment and values are considered and incorporated into decision making. This was accomplished through Federal Register notices, formal public and informal meetings, individual contacts, news releases, planning bulletins, the planning website, and public comments and responses there to on the Draft RMP/EIS.

The BLM initiated the planning process on June 4, 2003 by publishing in the Federal Register a Notice of Intent (NOI) to conduct land-use planning for the Monticello Field Office (Monticello FO). The NOI invited the participation of the affected and interested agencies, organizations, and members of the general public in determining the scope of and the significant issues to be addressed in the planning alternatives and analyzed in the EIS. Scoping remained open until January 31, 2004. As part of the resource inventory, members of the interdisciplinary (ID) team formally and informally contacted various relevant agencies to request data to supplement the BLM's existing resource database.

On November 2, 2007, the BLM published in the Federal Register a Notice of Availability (NOA) of the Draft RMP/EIS to announce and solicit public comments on the alternatives and impacts and effects of those alternatives on the human environment. The BLM distributed to relevant agencies and the interested public the Draft RMP/EIS for review and comment. The comment period ended February 8, 2008. The comments and the BLM's responses there to are addressed in this Proposed RMP/Final EIS (PRMP/FEIS or Proposed Plan). Likewise, the BLM will publish an NOA to announce the Proposed Plan and Final EIS.

The following sections of this chapter describe the public involvement, consultation, and coordination process, including key consultation and coordination activities undertaken to prepare a comprehensive PRMP/FEIS for the Monticello FO.

5.2 CONSULTATION AND COORDINATION WITH TRIBES, STATE AND LOCAL GOVERNMENTS, AND FEDERAL AGENCIES

In the development of this PRMP/FEIS, the BLM is required to consult and coordinate with other federal agencies, state and local government agencies and officials, both elected and appointed, and federally recognized Native American tribes. More specifically, federal law, including FLPMA, NEPA, the National Historic Preservation Act of 1966 (NHPA) (16 United States Code [U.S.C.] 470 et seq.), the Fish and Wildlife Coordination Act (16 United States Code [U.S.C.] 661 et seq.), the Endangered Species Act of 1973 (ESA) (16 United States Code [U.S.C.] Sec 1531 et seq.), and other applicable laws, regulations, policies, and executive orders, direct BLM to coordinate and consult with Native Americans, the State Historic Preservation Office (SHPO), the U.S. Fish and Wildlife Service (USFWS), and the Environmental Protection Agency (EPA) during the planning/NEPA decision-making process. This section documents the specific consultation and coordination efforts undertaken by the BLM throughout the entire process of developing the PRMP/FEIS.

Coordination with other agencies and consistency, to the extent possible, with other plans were accomplished through frequent communications, meetings, and cooperative efforts among the BLM planning and ID team and involved federal, state, and local agencies and organizations. The cooperating agencies that were formally involved assisted the BLM throughout the planning process in the development of the PRMP/FEIS.

Cooperating agencies that have participated in the development of the Monticello land-use planning process consist of: State of Utah and San Juan County. In addition to the cooperating agencies, the Monticello FO held meetings with and sought the input of other agencies that have land management jurisdiction within or adjacent to the planning area. Agencies include the U.S. Fish and Wildlife Service, the U.S. National Park Service (NPS), the U.S. Forest Service (USFS), and adjoining BLM field offices, including Durango, Montrose, and Moab, and the BLM Utah state office.

5.2.1 NATIVE AMERICAN CONSULTATION

Protective measures for culturally sensitive Native American resources are established through consultation and coordination with the appropriate Native American tribes or entities. Pursuant to NEPA, NHPA, FLPMA, the American Indian Religious Freedom Act (AIRFA), Executive Order 13007, and BLM Manuals 8160, *Native American Coordination and Consultation*, and H-8160-1, *General Procedural Guidance for Native American Consultation*, the BLM has engaged in consultation with Native American representatives throughout the planning process. The applicable laws and guidance require that the consultation record demonstrates, "that the responsible manager has made a reasonable and good faith effort to obtain and consider appropriate Native American input in decision making" (H8160-1, 2003:4). Recommended procedures for initiating the consultation process include project notification, preferably by certified mail, follow-up contact (i.e., telephone calls), and meetings when appropriate (H8160-1, 2003:15). Native American consultation is an ongoing process that will continue after the PRMP/FEIS is completed.

Native American organizations were invited to participate at all levels of the planning process for the RMP. The BLM state director notified tribes of the BLM's intent to prepare the RMP and the Monticello and Moab Field Offices jointly invited tribes to consult regarding the entire range of cultural and natural resource issues.

As part of the RMP/EIS scoping process, by letter dated August 1, 2003, then Utah State Director Sally Wisely initiated consultation for land-use planning with 35 tribal organizations (Table 5.1). In the letter, the BLM requested information regarding any concerns the organizations might have within the planning areas, specifically requested input concerning the identification and protection of culturally significant areas and resources located on lands managed by the Moab and Monticello field offices, and offered the opportunity for meetings. Between November 2003 and May 2004, all 35 tribal organizations were contacted by SWCA ethnographer Molly Molenaar, under contract with and on behalf of the BLM, to 1) ensure that the appropriate tribal contact had received the consultation letter and 2) determine the need for additional or future consultation for the study areas identified in the consultation letter. Meetings were arranged when requested.

In consulting with tribes or tribal entities under the NHPA, the BLM emphasized the importance of identifying historic properties having cultural significance to tribes [commonly referred to as Traditional Cultural Properties (TCPs)]. The BLM held meetings with 12 tribal organizations between December 2003 and May 2004, but no TCPs were identified (Table 5.2). However, potential TCPs were identified during a records review and discussed in the AMS prepared in 2004. An ethnographic overview was prepared concurrently with the EIS that also discusses potential TCPs associated with local tribes. The BLM was represented at most of these meetings by the Field Office manager and archaeologist from both the Moab and Monticello field offices along with the representative from SWCA. During these meetings, tribal organizations were invited to be a cooperating agency in the development of the land-use plan; however, none of the tribal organizations the BLM came into contact with requested to be a cooperating agency.

Several tribal organizations requested that an additional meeting be held after the Draft RMP/EIS alternatives were prepared. The Monticello FO mailed a draft copy of the range of alternatives to 12 tribal organizations in December 2005. In 2006 and 2007, the Monticello FO manager and archaeologist, assisted by the SWCA ethnographer, participated in a second round of meetings with five tribes (Table 5.3). At these meetings, the Draft RMP/EIS alternatives were discussed with special emphasis on cultural resource issues. A copy of the Monticello Draft RMP/EIS was mailed to the tribal organizations listed in Table 5.2. Consultation with interested tribes is ongoing. In April 2003, the BLM extended an invitation to meet with tribal organizations regarding the PRMP/FEIS.

5.2.2 COOPERATING AGENCY INVOLVEMENT

The Monticello FO extended cooperating agency status to state and local agencies with regard to the Monticello land-use planning effort. The State of Utah and San Juan County signed MOUs to establish cooperating agency status in January 2003 and April 2003, respectively.

NEPA requires that the BLM work closely with cooperating and other responsible trustee state agencies in preparing an EIS. The cooperating agencies participated in meetings to assist the Monticello FO with socioeconomics, WSR suitability, ACEC relevance and determination, travel plans, and the development of alternatives (Chapter 2) for the RMP. These meetings occurred between March 2003 and March 2006. A draft of the alternatives was sent to the cooperating agencies in November 2007 for review and comment before the release of the Draft RMP/EIS.

The BLM has continued to involve the cooperating agencies in addressing comments raised during the public comment period for the Draft RMP/EIS and in developing the Proposed Plan from the Draft EIS alternatives.

5.2.3 STATE AGENCY COORDINATION

According to NEPA requirements, the lead agency (the BLM) must formally consult with responsible and trustee agencies in determining whether to prepare an EIS. The primary tool for this coordination is the preparation of the draft alternatives (Chapter 2) for review by state agencies, and subsequently the preparation of the Draft RMP/EIS. A draft was sent to the State of Utah Department of Natural Resources in November 2007 and distributed to the following agencies: The Utah Division of Oil, Gas and Mining; Utah Division of Wildlife Resources (UDWR); Utah State Parks and Recreation; Utah Geological Survey; the SHPO, and the School and Institutional Trust Lands Administration (SITLA). The State of Utah, SHPO Officer has also been involved in developing the Proposed Plan for Alkali Ridge and Hovenweep ACECs.

The Mineral Potential Report and the Reasonably Foreseeable Development scenario for oil and gas regarding the Monticello planning area were prepared in cooperation with the Utah Geological Survey.

5.2.4 COUNTY COORDINATION

Grand County declined to participate as a Cooperating Agency because of the small amount of county acreage within the Monticello Planning Area. However, some Grand County Council members attended various planning meetings during the development of the RMP. Numerous discussions and meetings were held with representatives from San Juan County. Overall, San Juan County actively participated in the development of the Proposed Plan. Table 5.4 specifically brings forward the county plans and corresponding county positions or goals related to the management of the public lands.

5.2.5 CONSULTATION AND COORDINATION WITH OTHER FEDERAL AGENCIES

In developing the Proposed RMP/FEIS, the BLM coordinated with numerous other federal agencies. There are legal requirements for consultation with some federal agencies. The consultation and coordination efforts are described below.

5.2.5.1 U.S. FISH AND WILDLIFE SERVICE

The actions proposed in this document require consultation with the USFWS. These actions have met any consultation/coordination requirements that may exist pursuant to the Fish and Wildlife Coordination Act.

The BLM and the USFWS are continuing close coordination for Endangered Species Act (ESA) compliance of all aspects of the Monticello RMP/EIS.

The USFWS and the UDWR have been consulted regarding the effects of the Draft RMP/EIS on species listed pursuant to the ESA. Endangered species protections include compliance with existing ESA requirements.

In July 2004, the BLM requested assistance from the USFWS in identifying threatened, endangered, proposed, and candidate plant and animal species that may be located in the Monticello planning area. A letter was sent by the BLM state office to the Service initiating informal consultation for the Monticello planning efforts. The Service responded in lists of species that may be present in or may be affected by projects in the subject project area. Tables 3.53 to 3.55 present a comprehensive list of sensitive species that may be present in the project area and indicates whether they could be affected by the proposed and alternative actions. The results of this consultation have been incorporated into this RMP/EIS.

This PRMP constitutes a Biological Assessment (BA), which has been provided to the USFWS for review and comment. The BLM determined that the implementation of the PRMP/FEIS is "not likely to adversely affect" /or/ "may affect" the 10 species on which this consultation occurred. The USFWS may concur with the BLM's determination via memorandum, or prepare a biological opinion, which advises the BLM on the actions that must be taken to protect federally listed special status species.

5.2.5.2 ENVIRONMENTAL PROTECTION AGENCY

The BLM provided the EPA with a copy of the Draft RMP/EIS and the EPA has submitted comments on this document. The EPA rated the document as Environmental Concerns-Insufficient Information, "EC-2." The EPA expressed concern that the actual and potential environmental impacts associated with visual and travel/recreation management issues the BLM faces will not be adequately mitigated under the Preferred Alternative, and that a number of actions need to be included in the FEIS. The EPA also had concern for a lack of information associated with the BLM's analysis of air quality impacts. Additional analysis and information addressing these concerns have been included in Chapter's 2 and 4 of the PRMP/FEIS based on EPA comments.

5.2.5.3 OTHER AGENCY INVOLVEMENT/COORDINATION

In addition to the cooperating agencies, the Monticello FO has held meetings with and sought the input of other agencies that have land management jurisdiction within or adjacent to the planning area. Agencies include the NPS, the USFS, and adjoining BLM field offices, including Durango, Montrose, and Moab, and the BLM Utah state office also provided input.

5.3 CONSISTENCY WITH OTHER PLANS

The BLM's planning regulations require that resource management plans be consistent with officially approved or adopted resource-related plans of other federal agencies, state and local governments, and Indian tribes, so long as the guidance and resource management plans are also consistent with the purposes, policies, and programs of federal law and regulations applicable to public lands.

The 43 United States Code (U.S.C.) 1712(c) (9) states that the Secretary of the Interior (through the land-use plans of the federal agencies under it) shall "coordinate the land-use inventory, planning, and management activities of or for such lands with the land-use planning and management programs of other federal departments and agencies and of the States and local governments within which the lands are located." It further states that "the Secretary shall assure that consideration is given to those State, local, and tribal plans that are germane in the development of land-use plans for public lands [and] assist in resolving, to the extent practical, inconsistencies between Federal and non-Federal Government plans..." This language does not require the BLM to adhere to or adopt the plans of other agencies or jurisdictional entities, rather to give consideration to these plans and make an effort to resolve inconsistencies to the extent practical.

The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management which are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-federal government plans be resolved to the extent practical (FLPMA, Title II, Section 202 [c][9]). As a consequence, an inconsistency that cannot be resolved or reconciled will exist where state and local plans conflict with federal law.

Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the FEIS/PRMP, so state and local governments have a complete understanding of the impacts of the PRMP on state and local management options. A consistency review of the PRMP with the state and county master plans is included in Table 5.4. In addition, the relevant goals, objectives or policies of a county are often equivalent to an activity or implementation level decision and not a land-use plan decision. The very specific county goals would be addressed in any subsequent BLM activity or implementation level decision.

Table 5.4 outlines the planning consistency of the Proposed Plan with the approved management plans, land-use plans, and controls of other agencies with jurisdiction in or adjacent to the planning area. The authorized officer will continue to collaborate with federal agencies, state and local governments, and Native American tribes on implementation of the RMP and on pursuing consistency with other plans and will move toward integration of such plans to the extent that they are consistent with federal laws, regulations, and policy directives. Additional discussion is contained in Chapter 1.

Table 5.4 Plan Consistency Review

Master Plan	Consistent	Partially Consistent	Not Consistent	Discussion
San Juan County Master Plan (2008)				
Public Access	✓			San Juan County has strong opinions regarding public access and its impact on economic stability in the county. The county claims all roads and trails over public land constructed prior to Oct. 21, 1976. Supports working with the BLM to develop off-road trails for ATV use and bikes.
Recreation and Tourism	✓			Support for increased recreational activity on public lands, however, agency needs to acknowledge and aggressively address the impact that recreation has on the county's essential services (i.e., law enforcement, emergency services, water and waste management, and search and rescue).
Wilderness	✓			County does not support designation of large wilderness areas but will accept areas that meet the criteria of wilderness in the 1964 Wilderness Act. The county plan (Appendix E) includes the county's preferred alternative for wilderness designation.
Wild and Scenic Rivers	✓			Statement that any special land-use classifications or designations should include analysis of adverse economic impact on local economy and stability of communities and commitment to adequate mitigation.
Threatened and Endangered Species	✓			Statement that any special land-use classifications or designations should include analysis of adverse economic impact on local economy and stability of communities and commitment to adequate mitigation.
Areas of Critical Environmental Concern	✓			Statement that any special land-use classifications or designations should include analysis of adverse economic impact on local economy and stability of communities and commitment to adequate mitigation.

Table 5.4 Plan Consistency Review

Master Plan	Consistent	Partially Consistent	Not Consistent	Discussion
Socioeconomics	✓			States that social and economic environment (of the communities most impacted by public land-use decisions) needs to be included in environmental review.
Wildlife	✓			States that forage allocations between livestock and wildlife should be balanced and based upon fair and equitable assumptions. San Juan County is not in favor of and will generally oppose introduction of exotics or species not native to the area.
Land Tenure Adjustments		✓ Acquisition of State inholdings within the McLoyd Moonhouse SRMA and Valley of the Gods ACEC		States that public land acreage currently owned and managed by federal and State agencies is sufficient for the public interest. Supports a "no net loss of private" and no expansion of National parks position relative to federal-state property exchanges and transfers. (No net loss refers to both acreage and value.) Also, no net increase of public lands within San Juan County.
Water Resources	✓			Supports protection of limited water resources by promoting efficient use and management.
Grand County General Plan Update 2003				
Strong Economy	✓			Supports multiple use of public lands including continued recreation uses and oil and gas exploration and development.
Watersheds	✓			County will work to protect watersheds from activities and uses that are injurious to them and adopt policies that enhance and restore them.

Table 5.4 Plan Consistency Review

Master Plan	Consistent	Partially Consistent	Not Consistent	Discussion
Land Tenure Adjustments	✓			<p>Supports BLM/SITLA exchanges that result in protection of watersheds, protection of lands important for recreational or other economic values, protection from development with a net increase in county cost for infrastructure and public services, or consolidation of land ownership patterns to reduce fragmentation. These provisions are consistent with the exchange criteria in the plan.</p> <p>Supports general retention of federal lands in Grand County. Increases in federal lands should not be at the expense of county revenues and should offer clear benefit to county residents. This is consistent with BLM policy to gain county support in land tenure adjustments.</p>
Travel Management	✓			Recognizes that allowing open, cross-country travel by mechanized vehicles is no longer an appropriate management practice. Supports more restrictive travel designations limiting mechanized travel to designated roads and trails and a "no new tracks" policy.
ACECs	✓			Encourages identification and conservation of areas with unaltered plant communities and soils through ACEC designations.
Wilderness	✓			Supports recommendation for wilderness adopted by the Grand County Council in 1995. Will follow State of Utah's recommendation concerning wilderness designation where consistent with the interests of the people of Grand County
Wild and Scenic Rivers	✓			Will participate and promote cooperation in planning and administration of WSR designations.
Reintroduction of Animal Species	✓			Grand County would participate in evaluation of feasibility and advisability of reintroductions.

Table 5.4 Plan Consistency Review

Master Plan	Consistent	Partially Consistent	Not Consistent	Discussion
San Juan County Amendment to Master Plan (8/2002)				
All-Terrain Vehicle Plan	✓			Establishes an all-terrain transportation plan, on developed trails within the county, as an opportunity for increased recreational use and economic benefit to the county.

Table 5.5 summarizes the planning consistency of the Proposed Plan with the State of Utah's Code 63j-4-401.

Table 5.5 Consistency with State of Utah Code 63j-4-401

Resource	State of Utah Code 63j-4-401	Proposed Plan
ACECs	It is the policy of the State of Utah to withhold support for ACEC designation unless or until relevant and important values or significant natural hazards are clearly identified and the area requires special management protections not afforded by normal multiple-use management. ACECs should be no larger than necessary and management should be no more restrictive than necessary to prevent irreparable damage to relevant and important values or protect human safety. To the extent allowed by federal law, management prescriptions should comport with the plans and policies of the state and of the county where the proposed designation is located. These prescriptions should not result in management equivalent to that afforded congressionally designated wilderness areas.	<p>The potential ACECs brought forward for designation into the Proposed Plan have gone through a rigorous and stringent process in accordance with FLPMA, the planning regulations at 43 CFR 1600, Land Use Planning Handbook (H- 1601-1), and in accordance with BLM Manual 1613 and ACEC Policy and Procedures Guidelines (45 FR 57318). Appendix S outlines the process the ID team underwent to determine whether a nominated ACEC had relevance and/or importance values. The size of the proposed ACECs is limited only to the area(s) of geography where the relevance and importance values are manageable to protect and prevent irreparable damage. In the Proposed Plan, the potential ACECs generally do not have redundant special designations and/or other existing protections applied.</p> <p>The potential ACECs carried forward into the Proposed Plan necessitate an ACEC designation because special management protection is necessary (outside of normal multiple-use management) to specifically protect the relevance and importance values within the areas identified. The special management prescriptions that have been proposed are narrowly tailored to protect the identified relevant and important values; none of which are recognized as wilderness resources. For these reasons, the potential ACEC</p>

Table 5.5 Consistency with State of Utah Code 63j-4-401

Resource	State of Utah Code 63j-4-401	Proposed Plan
		decisions carried forward into the Proposed Plan are considered by the BLM to be consistent with Utah Code 63j-4-401.
Wild and Scenic Rivers	<p>It is the policy of the State of Utah that federal land managers should refrain from applying a non-impairment management standard to river segments inventoried as "eligible" for inclusions in the national WSRs and all eligible segments should promptly be evaluated for suitability. The State of Utah will work with federal land managers to identify suitable segments and work towards a recommendation to congress for designation where careful analysis: (1) identifies and evaluates regionally significant segments, (2) addresses the impact designation will have on physical, biological, and economic resources, (3) demonstrates that suitable segments have water present and flowing at all times, and (4) not interfere with water resources development.</p> <p>Interim management of suitable segments should not interfere with development of valid existing water rights, including development of waters apportioned to the State under all interstate compacts or agreements, including the Bear River Compact and the Upper Colorado River Compact. To the extent allowable by federal law and where not in conflict with state law or policy, interim management of suitable segments and congressional recommendations for designation should be consistent with plans and policies of the county or counties where the river segment is located.</p>	<p>The State of Utah has worked as a Cooperating Agency throughout this planning process and has been intimately involved with the BLM's WSR planning process. The state has assisted Field Office specialists to help determine eligibility findings for each of the river segments, and has provided social and economic expertise and advice as the BLM determined which eligible segments to carry forward as suitable into the Proposed Plan. The BLM has committed to working cooperatively among federal, State, and local governments and communities during the post-planning WSR study phase when statewide recommendations for inclusion of river segments into the National WSRs System would go forward to Congress. Prior to this post-planning phase, the BLM would work with affected partners to help identify in-stream flows necessary to protect the outstandingly remarkable values for which the subject river segments were found suitable via this planning process. Thus, because there are no effects of this planning decision on valid existing rights, and because suitability findings in this planning process do not create new water rights for the BLM, the land-use planning WSR suitability determinations are found by the BLM to be consistent with the Utah Code 63j-4-401.</p>
Grazing	<p>It is the policy of the State of Utah that the citizens of the state are best served by applying multiple-use and sustained-yield principles in public land-use planning and management. Public lands should continue to produce food and fiber, and the rural character and landscape should be preserved through a healthy and active agricultural and grazing industry. Land management plans should maximize forage availability</p>	<p>Grazing decisions carried forward into the Proposed Plan are considered by the BLM to be consistent with Utah Code 63j-4-401. Proposed Plan decisions on public lands would continue to promote a healthy active grazing industry. Forage allocations for livestock and wildlife are fully allocated on public lands. Numerous RMP decisions under other identified resources allow for the restoration and maintenance of</p>

Table 5.5 Consistency with State of Utah Code 63j-4-401

Resource	State of Utah Code 63j-4-401	Proposed Plan
	<p>for domestic livestock and wildlife use. The state favors active management to restore and maintain rangeland health, increase forage, and improve watershed for the mutual benefit of local communities, domestic livestock, and wildlife.</p> <p>Adjustments in AUM levels may occur as required by range and watershed conditions, based on scientific, on-the-ground analysis. Grazing AUMs should be placed in suspension where range conditions will not sustain the current level of AUMs or where necessary to protect range and watershed health. Any suspended AUMs should be returned to active use when range conditions improve. The state generally opposes forced relinquishment or forced retirement of grazing AUMs but will continue to recognize voluntary relinquishments and retirements agreed to prior to RMP revisions.</p>	<p>rangeland and watershed health. For example, the Proposed Plan provides the umbrella to allow implementation-level actions for hazardous fuel reductions, fire rehabilitation, vegetation treatments, riparian improvements, range and wildlife habitat improvements, UPCD projects—including Healthy Lands Initiative projects, seed collection, etc. Minor, if any, adjustments to current permitted livestock AUMs are made in the Proposed Plan. Prior voluntary relinquishments and/or retirements have been recognized.</p>
<p>Wilderness Characteristics</p>	<p>It is the policy of the State of Utah to oppose management of public lands as wilderness except where congress designates lands as wilderness. Under State policy and FLPMA's multiple-use mandate, BLM ascribed management prescriptions for non-WSA lands inventoried as possessing wilderness characteristics should take into account the long-term needs of future generations for renewable and non-renewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife, and fish. Designation as VRM Class I, closure to oil and gas leasing, withdrawal from mineral entry, and closure to motorized and mechanized use affords protections comparable to those associated with formal wilderness designation and should be avoided for non-WSA lands with wilderness characteristics. Non-WSA lands with wilderness characteristics should be managed in a manner consistent with the multiple-use, sustained yield standard that applies to BLM lands other than congressionally designated wilderness or WSAs.</p>	<p>The Proposed Plan identifies certain "non-WSA lands with wilderness characteristics" in order to protect, preserve, and maintain their wilderness characteristics. The BLM recognizes that it cannot, through the planning process, designate these lands as WSAs nor is it possible to manage them in accordance with IMP. For example, there is no provision to meet the "non-impairment criteria" mandated in IMP for WSA management. However, in following Section 201 of FLPMA, the BLM has maintained its wilderness inventory and has determined that lands previously found not to possess wilderness characteristics during the FLPMA Section 603 inventory process in the late 1970s and early 1980s, now have been determined to possess them. The focus of management in the areas carried forward in the Proposed Plan is to primarily provide for an experience of solitude and primitive recreation. This is enhanced by maintaining the naturalness of the geographic areas. However, management prescriptions do not mirror those for WSAs or designated</p>

Table 5.5 Consistency with State of Utah Code 63j-4-401

Resource	State of Utah Code 63j-4-401	Proposed Plan
		<p>wilderness since these two management objectives are sufficiently dissimilar that imposing similar prescriptions would not allow the BLM to meet the planning objectives outlined in the Draft RMP/Draft EIS. WSAs and designated wilderness are rights-of-way exclusion areas, closed to fluid mineral leasing by law, and do not allow for surface-disturbing activities. In comparison, lands with wilderness characteristics have no set management by either law, rule, regulation, or policy. The Proposed Plan would allow for surface-disturbing activities where and when they are compatible with enhancing management objectives identified in the Proposed Plan.</p> <p>In order to ensure that the BLM's planning decisions regarding the management of wilderness characteristics are consistent with Utah law, potential adjustments may be made in the Record of Decision to nomenclature. This editorial change would not affect management or goals and objectives.</p>
<p>RS-2477 Assertions</p>	<p>The State of Utah will defend its interest, and that of its political subdivisions, in rights-of-way accepted under the self-effectuating grant process set forth in Revised Statute 2477 (repealed by the Federal Land Policy and Management Act of 1976) and <i>SUWA v. BLM</i>, 425 F.3d 735 (10th Cir. 2005). The State of Utah expects and requests the BLM to fully consider all information concerning individual rights-of-way submitted to BLM. Further, the State of Utah expects and requests BLM's consideration of this information as part of the preparation and implementation of Resource Management or Management Framework Plans, and preparation or implementation of Transportation Plans as part of the ongoing inventory of resources on the public lands.</p>	<p>The Proposed Plan makes no commitments with respect to any valid existing rights, particularly those concerning RS-2477. Chapter 1 of this land-use plan states that resolution of this issue is outside the purview and scope of public lands planning efforts and must be adjudicated by a court of law or other legal means. Therefore, nothing in this plan extinguishes any valid rights-of-way or alters, in any way, the legal rights of the State of Utah to assert RS-2477 rights or to challenge any use restrictions imposed by the RMP that they believe are inconsistent with their rights.</p>

The Monticello FO RMP is consistent with the following agency plans: Manti-LaSal National Forest Management Plan, Monument Valley Navajo Indian Reservation, Glen Canyon National

Recreation Area Management Plan, Canyonlands National Park General Management Plan, Hovenweep National Monument Plan (draft), Natural Bridges National Monument Management Plan, Edge of the Cedars State Park Plan, and Gooseneck State Park Plan. Comments were not received to indicate inconsistency of these plans with the Draft RMP.

5.4 PUBLIC OUTREACH AND PARTICIPATION

Public outreach and participation in the land-use planning process began with the publication of the Notice of Intent (NOI) to plan in the Federal Register and will be ongoing up until the Record of Decision for the Monticello RMP. Public outreach and participation has included public meetings, development of a mailing list, planning bulletins, newspaper articles, a RMP website, and workshops. It has also included informal meetings with individuals, groups, and organizations.

5.4.1 NOTICE OF INTENT TO PLAN AND SCOPING

This planning process began on June 4, 2003 with the publication in the Federal Register of a Notice of Intent (NOI) to plan. The NOI announced the BLM's intent to conduct land-use planning for the public lands administered by the Monticello FO by preparing an RMP and associated EIS. The NOI began what is known as the scoping process and invited the general public as well as other federal agencies, state and local governments, and Indian tribes to identify potential issues and submit concerns regarding the intended planning effort. In addition to the NOI, the BLM provided the public with planning bulletins, and newspaper articles. Through all this outreach, the public was notified of public meetings and the BLM requested information regarding planning criteria, resources, nominations for Areas of Critical Environmental Concern, nominations for WSRs, and proposals for route designations. Public service announcements on the radio were also used to inform the public about open house public meetings. The BLM distributed planning bulletins to all interested agencies, organizations, and individuals along with any other entity that requested to be included on the mailing list.

The scoping period began June 4, 2003, and ended January 31, 2004. The BLM relied on various public outreach methods for the scoping process, including six open houses in different communities (see Table 5.5), a mobile "comment cruiser" which visited 12 locations, a website with provision for emailing comments, and an invitation for the public to provide written comments via letters. In its Scoping Report, completed in July 2004, the Monticello FO provided an analysis of the information received. The Scoping Report is available at the Monticello FO, or online at the Monticello RMP website. The BLM received 6,138 comment letters with 19,437 comments identified in these letters and emails. Comments from the six open houses totaled 1,250, and the "comment cruiser" gathered 200 comments, resulting in a grand total of 20,887 comments. It should be noted that the Scoping Report covers both the Moab and Monticello field offices. The information received during the scoping period was utilized to establish the scope of the RMP/EIS.

Blanding, UT	October 22, 2003	87
Salt Lake City, UT	November 13, 2003	96
Total		319

5.4.2. MAILING LIST

As directed by 43 CFR 1610.2(d), the BLM has established and maintained a list of "individuals and groups known to be interested in or affected by a resource management plan." This list was initially developed from the Monticello FO mailing list and supplemented/updated throughout the planning process. Scoping meeting participants were given the option to be added to the mailing list. In addition, individuals were able to add themselves to the project mailing list by registering on the project website, as well as through requests to be placed on the mailing list by contacting the BLM.

The mailing list was used during the distribution of planning bulletins and postcards throughout the planning process. Postcards were mailed to the entire list, announcing the availability of the Draft RMP/EIS and the Proposed RMP/Final EIS. There are currently over 850 individuals, organizations, and agencies included on the mailing list.

5.4.3 PLANNING BULLETINS

Planning bulletins were developed to keep the public informed about the Monticello land-use planning process. They were provided to the public included on the mailing list for the Monticello RMP. The planning bulletins were also posted on the website for the Monticello RMP.

- The **first planning bulletin** (6/30/03) announced the intention of the BLM Monticello FO to prepare a Resource Management Plan. It also included preliminary planning issues, a request for nominations of Areas of Critical Environmental Concern (ACEC) and WSRs, an announcement of public scoping meeting, and information on how to participate in the land-use plan process.
- The **second planning bulletin** (11/1/03) provided information regarding the preliminary review of river segments found eligible for consideration as WSRs. The public was invited to provide comments on the findings.
- The **third planning bulletin** (11/17/03) requested route data from the public to be considered in the alternatives for route designation in the Travel Plan.
- The **fourth planning bulletin** (5/7/04) provided the preliminary planning criteria for public comment and review.

- The **fifth planning bulletin** (7/9/04) provided the results of the public scoping process and included the issues to be addressed in the plan.
- The **sixth planning bulletin** (2/21/06) provided the results of the ACEC review process.

5.4.4 WEBSITE

Information regarding the Monticello land-use plan was made available to the public on the Monticello RMP website. This website is currently found at <http://www.blm.gov/ut/st/en/fo/monticello/planning.html>. The website serves as a virtual repository for documents related to development of the Monticello RMP including news releases and bulletins, background documents, schedule, the land-use planning process, preliminary issues, maps, photos, and the draft and final RMP/EIS. The documents are available in Adobe Portable Document Format (PDF) to ensure that they are available to the widest range of users. During the scoping period, the website allowed members of the public to add themselves to the project mailing list or to submit comments/concerns to be considered in the scoping process. In addition, during the public comment period on the Draft RMP/EIS, the website served as one of the ways in which the public could submit comments.

5.4.5 SOCIOECONOMIC WORKSHOPS

With the purpose of engaging in a collaborative decision-making process, the BLM held a workshop with the local government leaders, industry experts, and stakeholders from San Juan County that focused on the socioeconomic conditions of the region. This specialized group was assembled with the help of county officials for the purpose of promoting an open discussion about regional social and economic patterns. This meeting held on May 6, 2003, in Monticello, provided an opportunity for the BLM to understand existing conditions and to lay the framework for the analysis of socioeconomic impacts.

5.4.6 NOTICE OF AVAILABILITY OF THE DRAFT RMP/EIS

On November 2, 2007, the BLM and EPA published a Notice of Availability in (NOA) the Federal Register that marked the beginning of the formal 90-day public comment period. The Draft RMP/EIS states that the BLM is revising its current land-use plan and proposes several alternative ways of managing public lands within the Monticello planning area. The Draft RMP/EIS was designed to provide a comprehensive look at the impacts to natural and cultural resources from various planning alternatives. The formal 90-day public comment period ended on February 8, 2008. The BLM provided hard copies of the Draft RMP/EIS directly to cooperating agencies, other federal, state, and local agencies, tribal representatives, the Utah BLM Resource Advisory Committee members, public libraries, and elected officials. Also, hard copies and CDs were made available to the public upon request, and the Draft RMP/EIS was placed on the Monticello RMP website and in its public room at the BLM Utah state office. Additionally, the BLM widely distributed newspaper and radio press releases regarding the availability of the Draft RMP/EIS.

5.4.7 NOTICE OF AVAILABILITY OF THE FINAL RMP/EIS

The BLM and EPA will publish a Notice of Availability in the Federal Register which will mark the beginning of the protest period and concurrent Governor's Consistency Review period.

5.4.8 PUBLIC MEETINGS

Five open houses were held during the 90-day comment period for the Draft RMP/EIS. The open house locations, dates, and attendance are provided in Table 5.6. The locations, dates, and times of the open houses were announced to approximately 858 people included on the mailing list via a postcard. Press releases in local and regional newspapers and radio spots supplemented the mailing. In addition, the locations, dates, and times of the open houses were posted on the Monticello RMP website.

Table 5.7 Open House Locations, Dates, and Attendance

Location	Date	Attendance
Monticello, Utah	January 8, 2008	20
Moab, Utah	January 9, 2008	30
Salt Lake City, Utah	January 10, 2008	19
Blanding, Utah	January 16, 2008	36
Montezuma Creek, Utah	January 17, 2008	16
Total		121

The open houses were geared to provide information to the public on the content of the Draft RMP/EIS as well as to provide guidance on commenting on the document and answer questions. Each open house included a PowerPoint presentation that provided an overview of the planning process and a comparison of major elements contained in the alternatives. Attendees were then encouraged to visit with BLM representatives and managers regarding questions or concerns about the Draft RMP/EIS. The public was provided with the opportunity to submit written comments at the open houses.

5.5 PUBLIC COMMENTS ON THE MONTICELLO DRAFT RMP/EIS

5.5.1 PROCESS AND METHODOLOGY

According to National Environmental Policy Act (NEPA), the BLM is required to identify and formally respond to all substantive public comments received during the comment period for the Draft RMP/EIS. The BLM developed a systematic process for responding to comments to ensure all substantive comments were tracked and the content seriously considered. A description of this process follows.

First, the BLM developed a **coding structure** to help sort comments into logical groups by topics and issues. Codes were derived from resources covered in the Draft EIS or by common issues. Submissions (letters, emails, faxes, etc) were given a unique identifier for tracking

purposes and then each submission was carefully reviewed to capture all comments, more description of this process is set forth below. All comments received can be tracked to the original submission.

Second, the BLM created a **Comment Database**. For each comment in a unique submission, the BLM captured the name and address of the Commenter, assigned a code to the comment, and captured the text of all comments.

The coding and comment database processes aimed at assisting the ID team in determining if the substantive issues raised by the public warranted modification of one or more of the alternatives or further analysis of issues and impacts. With the information provided through the public review process, the BLM reconsidered the draft alternatives, made changes as appropriate, and developed the PRMP/FEIS. Factual or grammatical errors, which led to a change in text are not summarized but were incorporated into the PRMP/FEIS.

Finally, the BLM used the comment database to prepare a narrative summary of the substantive comments. Opinions, feelings, and preferences for one element or one alternative over another, and comments of a personal and/or philosophical nature were all read, analyzed, and considered, but not included in the summary because such comments are not substantive in nature.

5.5.2 COMMENT ANALYSIS

During the 90-day public comment period for the Monticello Draft RMP/EIS, the Monticello FO received written comments by mail (205), fax, email (18,869), website, and submitted directly at the public meetings or to the Monticello FO. All faxed comments were duplicated via email. This amounted to over 19,000 comment submissions. Many of the submissions were non-substantive form letters (letters containing identical or nearly identical text submitted by a number of individuals) in which there were six different types. Outside the form letters, there were 1,624 unique submissions, of which 131 submissions contained substantive comments. These submissions amounted to about 980 comments. Additional submissions were received after the close of the comment period on February 8, 2008. However, none of the late submissions raised substantially new issues or concerns not already addressed by comments received before the deadline.

Where warranted, the BLM responded to substantive comments by making revisions to the PRMP/FEIS (text changes). If no change was warranted, the BLM responded to the substantive comment in writing. The BLM responded to all substantive comments and, in many cases, also responded to non-substantive comments in order to clarify a point or position.

The comments received from cooperating agencies and the BLM responses are provided in Tables 5.9a and 5.9b. Tables 5.10a through 5.10aa provide the comments and responses by resource category that resulted in a change to the PRMP/FEIS. All comments and the BLM responses are provided in the compact disc (CD) attached to the PRMP/FEIS.

The BLM considered every comment in the analysis process, whether it came repeatedly from many people with the same message(s) or from a single person raising a technical or personal

point. In analyzing comments, the BLM emphasized the content of the comment rather than the number of times a comment was received.

Respondents invested considerable time and effort to submit comments on the Draft RMP/EIS. Comments covered a wide spectrum of thoughts, opinions, ideas, and concerns. The commonly addressed themes include: travel, recreation, special designations (ACECs, WSRs), wilderness values, Special Status Species, and minerals/energy development.

While each comment was diligently considered, the comment analysis involved determining whether a comment was substantive or non-substantive in nature.

According to NEPA, the BLM is required to identify and formally respond to all substantive public comments. On the basis of the Council on Environmental Quality's (CEQ) regulations, a substantive comment does one or more of the following:

- Questions, with a reasonable basis, the accuracy of the information and/or analysis in the EIS.
- Questions, with a reasonable basis, the adequacy of the information and/or analysis in the EIS.
- Presents reasonable alternatives other than those presented in the Draft EIS that meet the purpose and need of the proposed action and addresses significant issues.
- Questions, with a reasonable basis, the merits of an alternative or alternatives.
- Causes changes in or revisions to the proposed action.
- Questions, with a reasonable basis, the adequacy of the planning process itself.

The NEPA handbook identifies the following types of comments:

- **Comments on the Adequacy of the Analysis:** Comments that express a professional disagreement with the conclusions of the analysis or assert that the analysis is inadequate are substantive in nature but may or may not lead to changes in the PRMP/FEIS. Interpretations of analyses should be based on professional expertise. Where there is disagreement within a professional discipline, a careful review of the various interpretations is warranted. In some cases, public comments may necessitate a reevaluation of analytical conclusions. If, after reevaluation, the BLM does not think that a change is warranted, the response should provide the rationale for that conclusion.
- **Comments Which Identify New Impacts, Alternatives, or Mitigation Measures:** Public comments on a Draft EIS that identify impacts, alternatives, or mitigation measures that were not addressed in the draft are substantive. This type of comment requires the BLM to determine if it warrants further consideration. If it does, the BLM must determine whether the new impacts, new alternatives, or new mitigation measures should be analyzed in either the FEIS; a supplement to the Draft EIS; or a completely revised and recirculated Draft EIS.
- **Significance Determinations:** Comments that directly or indirectly question, with a reasonable basis, determinations regarding the significance or severity of impacts are substantive. A reevaluation of these determinations may be warranted and may lead to

changes in the FEIS. If, after reevaluation, the BLM does not think that a change is warranted, the response should provide the rationale for that conclusion.

- **Non-Substantive Comments** simply state a position in favor of, or against, an alternative or a management action proposed in an alternative; merely agree or disagree with BLM policy; provide information not directly related to issues or impact analyses, or otherwise express an unsupported personal preference or opinion. For additional clarification, types of non-substantive comments are as follows:
- **Expressions of Personal Preferences or Opinion:** Comments that express personal preferences or opinions on the proposals are non-substantive and thus do not require further agency action. This includes comments in favor of or against the proposed action or alternatives, comments that only agree or disagree with BLM policy, or comments that raise, debate, or question a point of fact or policy. However, such comments are summarized whenever possible and brought to the attention of the BLM.

The BLM has reviewed and considered all comments. Non-substantive comments, including personal preferences and opinions, may be considered by the decision maker as he or she chooses the final agency's proposed action, but they generally will not affect the analysis.

The results of the comment analysis were important to the development of the PRMP/FEIS. From the nearly 19,000 comment submissions that BLM received on the Draft RMP/EIS, it extracted approximately 980 individual substantive comments. The BLM has presented these comments and the BLM responses in the CD attached to the PRMP/FEIS. A list of the businesses, government agencies, and organizations that submitted substantive comments are provided below in Table 5.8.

THIS PAGE INTENTIONALLY LEFT BLANK

5.5.3 SUMMARY OF PUBLIC COMMENTS

During the public comment period for the Draft RMP/EIS, comments were received from government agencies, organizations, businesses, and individuals. The greatest number of comments concerned travel management, wildlife, Special Status Species, air quality, cultural resources, and recreation, in this order. Commenters focused on their own definitions of "multiple use" and "balance among resource uses and natural resource values." Comments ranged from those urging the BLM to impose maximum restrictions on resource uses to those expressing dissatisfaction with the restrictions imposed in the Preferred Alternative of the Draft RMP/EIS.

Travel management comments included a desire for either restricting travel in the Monticello PA or increasing the acreage available for travel within the Monticello PA. There were also many requests for clarification of what types of motorized travel would be permitted or restricted in areas, such as OHVs, mountain bikes, etc.

Wildlife comments ranged from stating that the habitat protection for animals was not enough and more needed to be designated to the proposed acreage was too large and would be too restricting on other resource development. Special status species comments had similar themed comments on sage-grouse buffers. Commenters also requested more information and explanation of analysis of the reasoning behind BLM's decisions for special status species habitat designations.

Air quality comments primarily focused on two main issues. First, commenters questioned the adequacy and analysis of the data used in the Draft RMP/EIS. Second, commenters desired clarification on what agency has the authority to manage air quality for the Monticello PA.

Many commenters addressed the impact analyses on various resources. Those commenters who alleged deficiencies in the impact analysis often were comparing the preferred alternative not to the No Action alternative (as required by the Council on Environmental Quality), but rather to the Commenter's version of an ideal environment.

The interest of the public in the management of BLM lands in the Monticello planning area was manifested in the number and complexity of the submissions received.

5.5.4 PUBLIC COMMENTS AND RESPONSES

The following tables present a subset of the comments received by the Monticello BLM during the comment period. The first set of tables (Tables 5.9a and 5.9b) provides all the comments submitted by the three Cooperating Agencies –the State of Utah and San Juan County. These tables are organized by the commenter name, commenter ID number, comment number, the resource category being addressed, the comment text, the BLM's response, and whether the comment resulted in a change in the document. The second set of tables (Tables 5.10a through 5.10aa) provide the comments that resulted in a change to the document. These tables include similar information to that provided in the first set of tables except they are grouped by resource category.

All comments received during the public comment period are available on a CD accompanying this document. This CD contains two tables in Adobe Portable Document Format (PDF). Both tables have the following columns: Commenter Name, Commenter ID Number, Comment Number, Resource Category, Comment Text, Response to Comment, and if it required a change in the document. The first table is sorted and grouped by Commenter Type and the second table is sorted and grouped by resource.

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
004	1	TRR	The State requests that the listing on page 1–15 of the DEIS be amended to include the plans and policies indicated by Utah Code Section 63-38d-401, et seq., and that BLM carefully consider consistency with this state's law.	<p>Page 1-15 lists pertinent state and county plans. The State identified no specific plans or policies which have been omitted.</p> <p>The BLM is aware that there are specific County and State plan decisions relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, the BLM is bound by Federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with County plans, to the maximum extent possible by law, and inconsistencies between Federal and non-Federal government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where State and local plans conflict with Federal law there will be an inconsistency that cannot be resolved or reconciled.</p> <p>Thus, while County and Federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the FEIS/PRMP, so that the State and local governments have a complete understanding of the impacts of the PRMP on State and local management options. The BLM will document the required Governor's consistency review in Chapter 5.</p>	Yes
004	2	SOC	The BLM, Monticello Field Office should consider the information presented in the Economic and Business Research Study (Phase I) for oil and gas exploration and production in the Uintah Basin in terms of economic benefits of the oil and gas industry.	The BLM acknowledges the oil and gas study referenced for the Uintah Basin. However, the applicability to Monticello is limited. The Monticello Field Office prepared a Reasonably Foreseeable Development (RFD) scenario for oil and gas development over the next 15 years. The development predicted in the RFD was utilized to generate the economic impacts in the Draft RMP/EIS.	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
004	3	PRP	The BLM should commit to utilizing the State's expedited energy permitting process.	Federal laws, rules, regulations, and policies govern the procedures for processing all Federal projects.	No
004	4	SCO	The state requests that BLM commit to either work toward the energy efficiency goals as outlined in the Governor's May 30, 2006 Executive Order or coordinate alternative energy efficiency increases with the Governor's Energy Advisor.	Any policy changes or coordination between the state and the BLM to improve energy efficiency would be administrative and are outside the scope of the land use planning process.	No
004	5	OTH	The Draft RMP/EIS does not include a discussion on the nature or type of threat of "irreparable damage" or the regional significance of relevant and important values in its review. BLM misinterprets irreparable damage when reviewing and analyzing ACECs in the Draft RMP/EIS. The ACEC tool was intended by Congress to be limited to only those instances where irreparable damage would be caused without designation. Most surface disturbing actions can eventually be repaired.	<p>The potential ACECs brought forward for designation into the Proposed Plan have gone through a rigorous and stringent process in accordance with FLPMA, the planning regulations at 43 CFR 1600, Land-use Planning Handbook (H- 1601-1), and in accordance with BLM Manual 1613 and ACEC Policy and Procedures Guidelines (45 FR 57318). Appendix H outlines the process the interdisciplinary team underwent to determine whether a nominated ACEC had relevance and/or importance values. The size of the proposed ACECs is limited only to the area(s) of geography where the relevance and importance values are manageable to protect and prevent irreparable damage to these resources.</p> <p>The potential ACECs carried forward into the Proposed Plan necessitate an ACEC designation because special management protection is necessary (outside of normal multiple-use management) to specifically protect the relevance and importance values within the areas identified. The special management prescriptions that have been proposed are narrowly tailored to protect the identified relevant and important values. For these reasons, the potential ACEC decisions carried forward into the Proposed Plan are considered by BLM to be consistent with Utah Code 63j-4-401.</p> <p>A rationale for designating or not designating ACECs in the Preferred Alternative of the DRMP/EIS is found in Appendix H of the PRMP. Relevant text has been added to Appendix H of the PRMP/FEIS, which lists the threats to each proposed ACEC. These threats could result in irreparable damage to the</p>	Yes

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>area proposed for ACEC designation.</p> <p>The ACEC evaluation appendix was modified, and a section added to Chapter 2 discussing threats to the relevant and important ACEC values; however, whether the threats currently exist does not preclude a potential ACEC from being considered in the action alternatives. All nominated areas, where the BLM has determined to have relevant and important values, are identified as potential ACECs and are addressed in the action alternatives. Threats to relevant and important values are likely to vary by alternative. The PRMP/FEIS was revised from the draft document to better address potential threats and impacts associated with each alternative.</p> <p>On August 27, 1980, the BLM promulgated final ACEC guidelines (45 Federal Register 57318) clarifying the term "protects" – "To defend or guard against damage or loss to the important environmental resources of a potential or designated ACEC. This includes damage that can be restored over time and that which is irreparable. With regard to a natural hazard, protect means to prevent the loss of life or injury to people, or loss or damage to property." Thus, BLM is to consider the potential for both reparable and irreparable damage when protecting important historic, cultural, or scenic values; fish and wildlife resources; or other natural systems through ACEC designation. This interpretation is consistent with FLPMA's legislative history and implementing policy.</p> <p>Section 2 of the guidelines clarifies that ACECs are special places within the public lands. It states: "In addition to establishing in law such basic protective management policies that apply to all the public lands, Congress has said that 'management of national resource lands [public lands] is to include giving special attention to the protection of ACECs, for the purpose of ensuring that the most environmentally</p>	

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			important and fragile lands will be given early attention and protection' (Senate Report 94-583, on FLPMA). Thus, the ACEC process is to be used to provide whatever special management is required to protect those environmental resources that are most important, i.e., those resources that make certain specific areas special places, endowed by nature or man with characteristics that set them apart. In addition, the ACEC process is to be used to protect human life and property from natural hazards."	
004	6	ACE The BLM must explain the need for "special" management for the ACEC and explain how this management is not duplicative of other normal BLM management or protections afforded by other state or federal laws.	The special management for an ACEC is in reality a package of management protections applied to an area specifically to protect its relevant and important values. The BLM can only apply those protections that are within its authority.	No
004	7	GRA The state discourages permanent closure of grazing allotments and encourages the reinstatement of suspended AUMs when rangeland conditions permit.	The BLM does not propose the permanent closure of allotments or portions thereof. However, certain allotments or areas may not be available for grazing over the next 15 years. These areas considered as not available are spread by alternative. Subsequent revisions of the land use plan may consider opening these areas to livestock grazing. Reinstatement of suspended AUMs and adjustment of available active AUMs will be considered during the site specific grazing permit renewal process, which will analyze forage productivity, grazing capacities, and vegetative trend in relation to sustainable grazing practices in accordance with the Standards for Rangeland Health (pg. 2-16). The vast majority (93%) of the Monticello Planning Area is available for livestock grazing. For those limited number of allotments and areas shown on pages 2-16 through 2-18 of the DRMP/DEIS the BLM is proposing that other uses of the BLM land are the highest and best use of these areas. Both FLPMA and BLM's Land Use Planning Handbook authorize BLM to close specific areas to livestock grazing to place an emphasis on these areas for other purposes or values, such as wildlife use, watershed protection, and recreation. As	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				indicated by the variable uses of the BLM lands, as shown in the proposed action, it is BLM's intention to emphasize "multiple use" of the public lands within the planning area.	
004	8	GRA	The state encourages flexible livestock grazing time (duration) and timing (season of use).	As stated in the Draft EIS / RMP, grazing would be managed on an allotment basis according to the Guidelines for Livestock Grazing Management to meet the Standards for Rangeland Health (see Appendix D), including duration and adjustment in season of use. An allotment's associated 10-year term Grazing Permit outlines the season of use and livestock numbers. A yearly Grazing Application allows flexibility in relation to annual forage production that must meet these Standards for Rangeland Health and be pre-approved by the authorized officer.	No
004	9	GRA	The Final RMP should contain and rely on a robust monitoring program and BLM should work with the state, grazing permittees, and conservation organizations to actively monitor and record grazing use data, wildlife populations, and range conditions.	BLM will follow its policy which includes an active monitoring program with full coordination/consultation with grazing permittees, affected state agencies and conservation organizations.	No
004	10	SSS	The BLM should only employ the term "critical habitat" when referring to the legal habitat designations for endangered and threatened species under the ESA.	The term critical has been reserved to Threatened and Endangered (T &E) species. Corrections in the text have been made in the PRMP/FEIS. For non-T&E species the BLM relied on the UDWR crucial habitat designations.	Yes
004	11	WL	The state requests that the BLM use the "crucial habitat" designations mapped by the DWR solely as descriptive wildlife habitat designations, not as automatic exclusion zones for other multiple uses.	BLM has changed the document to use the crucial habitat designations of UDWR. Use of these habitat polygons does not automatically exclude other uses. Appendix A outlines exceptions, modifications and waivers that will be used when applicable for all surface disturbing activities in these areas.	Yes
004	12	WL	The state requests that habitat designations not be altered from alternative to alternative.	As required by NEPA, the BLM considered a range of alternatives. For non-special status species the alternatives varied by the size of the habitat and the timing restrictions. The management of habitat is consistent with the goals and objectives of each alternative. In the Draft RMP/EIS, Alt B has a timing limitation for what is	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			referred to as "winter habitat." This habitat actually includes both crucial and high value winter habitats. These habitats, although not separated in the draft, have been properly described in the PRMP/FEIS.	
004	13	AQ	The state suggests initiating a coordinated approach to assessing and protecting air quality in Utah by working with federal, state, tribal and local agencies to identify and address air quality concerns.	No
004	14	AQ	The state encourages BLM to request oil and gas operators apply best available control technology (BACT).	Yes
004	15	AQ	The state encourages BLM to adopt emission standards for compressor engines consistent with the Draft Four Corners Air Quality Task Force Report and impose those standards as lease conditions and conditions of approval for all new APDs.	No
004	16	AQ	Future air quality analysis should include modeling with the following factors: 1) oil and gas proponents should assume that leasing and exploration will result in full field development, 2) air quality analyses should be cumulative and include not only planned development but existing omission sources, 3) air quality analyses should be based on anticipated worst-case meteorological conditions for each dispersion scenario, 4) air quality analyses should address compliance/attainment with all applicable air quality-related requirements and standards, and 5) air quality analysis should specifically address impacts to sensitive visual resources and other air quality-related values.	No
004	17	WSR	The State believes that the BLM should disclose the reasons and rationale for determinations of eligibility and suitability for	No

Table 5.9.a. Public Comments and Responses: State of Utah

		<p>proposed additions to the National Wild and Scenic River System, and to fully meet the requirements of state and federal law in doing so.</p>	<p>eligibility review process including the identification of outstandingly remarkable values as well as the Suitability Considerations by eligible river segments. The BLM complied with all applicable Federal laws, regulations, and policies in the Wild and Scenic Rivers Study Process.</p> <p>Appendix H, beginning on page H-91 gives detailed information on tentative classification of eligible wild and scenic segments and suitability considerations.</p>	
004	18	WSR <p>The State is concerned that Wild and Scenic River designations may limit water development by communities for future growth, limit industrial and agricultural growth, and reduce funding for the Colorado River Salinity Control program.</p>	<p>The Wild and Scenic Rivers Act implies a Federal reserved water right; however, it must be the minimal amount necessary for purposed of the Act, it must be adjudicated through State processes, and it would be junior to existing water rights. The amount of Federal right will vary from river to river, depending on the river's flows, the un-appropriated quantities in the river, and the values for which the river is being protected. There is no effect whatsoever on water rights on in -stream flows related to suitability findings made in a land use plan decision, barring Congressional action. Even if Congress were to designate rivers in the National Wild and Scenic Rivers System, any such designation would have no affect on existing, valid water rights. Section 13 (b) of the Wild and Scenic Rivers Act states that jurisdiction over waters is determined by established principles of law. In Utah, the state has jurisdiction over water. Although the Wild and Scenic Rivers Act implies a federal reserved water right for designated rivers, it doesn't require or specify any amount, and instead establishes that only the minimum amount for purpose of the Act can be acquired. Because the State of Utah has jurisdiction over water, BLM would be required to adjudicate the right as would any other entity, by application through state processes. Thus, for Congressionally designated rivers, BLM may assert a federal reserved water right to appurtenant and inappropriate water with a priority date as of the date of designation (junior to all existing rights), but only in</p>	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>the minimum amount necessary to fulfill the primary purpose of the reservation. In practice, however, federal reserved water rights have not always been claimed if alternative means of ensuring sufficient flows are adequate to sustain the outstandingly remarkable values.</p> <p>During the suitability phase of the Wild and Scenic River process, San Juan County as well as the State of Utah and SITLA, were asked to supply information on uses, "including reasonably foreseeable potential uses of the area and related waters, which would be enhanced, foreclosed, or curtailed if the area were included in the national system of rivers, and the values which could be foreclosed or diminished if the area is not protected as part of the national system." (The Preliminary Eligibility Determination of Wild and Scenic Rivers, BLM, 2003). The preliminary eligibility determination summarizes suitability input by the public as well as local communities. Suitability decisions were made considering the results of this input.</p> <p>In 1994, Public Law 98-569 amended the Colorado River Basin Salinity Control Act and directed the Secretary to develop a comprehensive program for minimizing salt contributions from lands administered by BLM and to provide a report on this program to the Congress and the Advisory Council. BLM's Colorado River Basin Salinity Control program is designed to provide the best management practices (BMP) of the basic resource base. Successes with the resource base will translate to improved vegetation cover, better use of onsite precipitation, and stronger plant root systems. In turn, a more stable runoff regime and reduced soil loss should result, thus benefiting water quality of the streams in the Colorado River Basin including the San Juan River. In Section 1(b) of the Wild and Scenic Rivers Act, Congress states that one of the objectives of the Act is to protect the water quality of designated rivers. Congress further specified that the river-</p>	

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>administering agencies cooperate with the EPA and state water pollution control agencies to eliminate or diminish water pollution (Section 2). Comparing the two, it is clear that the Wild and Scenic Rivers Act and the Colorado River Basin Salinity Control Act are not only complementary of one another, but share the same objective with regard to water quality. The Wild and Scenic Rivers Act directs the Secretary of the Interior or any government agency to prohibit any loan, grant, license, or otherwise construction of any water resources project that would have a direct effect on the values for which such river designation was established. The law also states that it cannot preclude licensing of, or assistance to, developments below or above a wild, scenic, or recreational river area or on any stream tributary thereto that will not invade the area or unreasonably diminish the scenic, recreational, and fish and wildlife values present in the area on the date of designation of a river as a component of the National Wild and Scenic Rivers System. However, projects intended to comply with the Colorado River Salinity Control Act are those that would generally benefit stream segments instead of affecting or unreasonably diminishing its values including water quality.</p>	
004	19	WSR The state is concerned about suitability findings for those streams where there are significant water diversions upstream.	<p>According the "Wild and Scenic River Review in the State of Utah Process and Criteria for Interagency Use" (July 1996), Congress has allowed for the existence of some human modification of a riverway, the presence of impoundments or major dams above or below a segment under review (including those that may regulate the flow regime through the segment). The existence of minor dams, diversion structures, and rip-rap within the segment shall not by themselves render a reach ineligible.</p>	No
004	20	WSR The State is concerned that the Draft RMP/EIS does not state the authority for protection of river segments while studies conducted under the Wild and Scenic Rivers Act are underway.	<p>Section 5 (d) of the Wild and Scenic Rivers Act requires that Federal land management agencies make wild and scenic river considerations during land use planning. Two stages of</p>	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>review are involved. Eligibility is an inventory, solely involving river values. Suitability involves consideration of manageability and resource conflicts.</p> <p>As per BLM Manual 8351-Wild and Scenic Rivers-Policy and program .32 C, all eligible rivers are considered in the EIS for the planning effort as to their suitability for congressional designation into the National Wild and Scenic Rivers System. With any suitability determination made in the RMP, the free-flowing, outstandingly remarkable values, and tentative classification of rivers would continue to be protected until Congress makes a decision on designation.</p> <p>The Preliminary Eligibility Determination of Wild and Scenic Rivers (BLM, 2003) describes the authorities for the Wild and Scenic Rivers Study Process.</p>	
004	21	WC	<p>The State asks BLM to provide a detailed explanation of the rationale and authority for management of lands solely because of wilderness characteristics, and why such management does not circumvent the provisions of the statutorily required wilderness review process.</p> <p>The BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from the Federal Land Policy and Management Act (FLPMA) Section 202 (U.S.C. § 1712). This section of the BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. § 1712(c)(2)). Further FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use...." FLPMA, Section 1039(c) (43 U.S.C. § 1702(c)). FLPMA intended the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, amongst the various resources in a way that provides use for current and future</p>	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>generations.</p> <p>The Norton-Leavitt Agreement recognizes that nothing in the Agreement shall be construed to diminish the Secretary's authority under FLPMA to manage a tract of land that has been dedicated to a specific use.</p> <p>IM 2003-275-Change 1 which is a direct outcome of the Norton-Leavitt Agreement states, "the BLM may consider information on wilderness characteristics along with information on other uses and values when preparing land use plans." The IM goes on to say "considering wilderness characteristics in the land use planning process may result in several outcomes including, but not limited to, ...emphasizing the protection of some or all of the wilderness characteristics as a priority over other multiple uses" (although the area will not be designated as a WSA). The IM also states "typically, resource information contained in the BLM wilderness inventories was collected to support a land use planning process. Public wilderness proposals represent a land use proposal. In either case the BLM is authorized to consider such information in preparation of a land use plan amendment or revision."</p> <p>In September 2006, Judge Benson, whose court approved the Norton-Leavitt Agreement, stated that the Agreement did not strip the BLM of its powers to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs.</p>	
004	22	WC	<p>The BLM should give strong consideration to recommendations submitted by local government and not manage lands to protect wilderness character where such management would, in the opinion of local governments, be contrary to the interests of local residents.</p> <p>Secs. 103, 201, and 202 of the Federal Land Policy and Management Act (FLPMA) direct the BLM to take into account the national interest as well as the local interest. In accordance with FLPMA and BLM rules, regulations, and policies, the BLM must provide management for all resources and resource uses on public lands.</p>	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				Strong consideration was given to local governments. San Juan County is a cooperating agency in the entire land use planning process including in the development of alternatives where non-WSA areas with wilderness characteristics were considered.	
004	23	WC	BLM should consider the existence of inholdings and valid existing rights (VER) where development of inholdings or VER may compromise management and protection of areas with wilderness characteristics.	Valid existing rights are considered Administrative Actions by the BLM and do not require a specific planning decision to implement. As noted in Chapter 1 under Planning Criteria and as outlined in the BLM's Land Use Planning Manual (Section 1601.06G), all decisions made in land use plans and subsequent implementation decision are subject to valid existing rights. The BLM will work with and subject to the agreement of holders of valid existing rights to modify proposed actions or activities to reduce the effect of the actions or activities on resource values and uses. These modifications may be necessary to maintain the choice of alternatives being considered during land use plan development and implementation, and may include appropriate stipulations, relocations, redesigns, or delay of proposed actions.	No
004	24	WC	The state strongly suggests BLM give serious consideration to San Juan County's new field information concerning areas asserted by BLM to have wilderness characteristics.	As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and on-site reviews. This included specific field inspections, Interdisciplinary team review of data such as range files, County and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999-2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process. The BLM is confident of the high-standard approach used to inventory the public lands and stands by its findings, particularly the findings, which involved wilderness characteristics inventory maintenance.	No
004	25	SOC	BLM's decisions on how to manage its lands directly affect	Non-BLM lands could be indirectly impacted by RMP	Yes

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod	
		Utah's ability to manage state trust lands to provide revenue for public schools and other beneficiary institutions. The state believes the Draft RMP fails to adequately address two issues, 1) the impact of BLM management decisions on state trust lands, and 2) the need for a substantially more robust program for land tenure adjustments between the BLM and the State of Utah.	<p>decisions both positively and negatively. The analysis in Chapter 4 of the PRMP/FEIS has been modified accordingly. For specifics regarding the impacts on mineral revenue, please refer to response to comment 120-101.</p> <p>The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.</p>		
004	26	TRV	<p>The RMP should specifically state that: 1) SITLA will be permitted continued access to trust lands where motorized access is currently available; 2) SITLA may undertake reasonable maintenance activities of existing access across BLM lands; and 3) existing access routes to state trust lands will not be closed without approval by SITLA and the state.</p>	<p>The travel plan provides restrictions to the public for recreational purposes, but does not restrict uses permitted or authorized by the BLM. State inholdings may or may not currently have access, depending upon whether or not existing vehicle routes lead to them. Under different alternative scenarios, existing routes may be proposed to closure. BLM policy, as required by the Cotter decision (State of Utah v. Andrus, 10/1/79), is that "the state must be allowed access to the state school trust lands so that those lands can be developed in a manner that will provide funds for the common school..." This decision confined the issue of access to situations directly involving economic revenues generated for the school trust. The recreation restrictions do not prohibit the State from reasonable access to its lands for economic purposes through separate permit authorization as specified by the Cotter decision. Routes to state sections may not have been identified for recreation purposes due to resource conflicts or actual route conditions.</p>	No
004	27	TRV	<p>The state urges the BLM to consider San Juan County's transportation map and to make BLM's transportation plan consistent with the county desires to keep roads and routes</p>	<p>The BLM under its multiple use mandate has considered the needs of a wide variety of recreationists in the DRMP/EIS alternative formulation. The BLM analyzed each travel route</p>	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
		open.	according to its purpose and need weighed against potential resource conflicts. This process is detailed in Appendix N of the DRMP/EIS. As described in Appendix N, the BLM's travel plan formulation involved numerous meetings of an interdisciplinary team (including vegetation, soils, wildlife and cultural resource specialists). Potential resource conflicts were identified, their extent evaluated, and then weighed against purpose and need for the particular route BLM feels that the range of alternatives reasonably covers options including roads to be closed and left open under discussion. The DEIS/RMP provides five alternatives that consist of no action, emphasis of protection and preservation of natural resources, balance between commodity production and protection of natural resources, and emphasis of commodity production and extraction. These alternatives provide a broad range of management actions to address the issues raised during scoping.	
004	28	AA The DEIS does not address consistency between neighboring jurisdictions' management objectives.	It was the intent in the development of the RMP/DEIS to be consistent with management objectives in the adjoining Moab BLM Planning Area where appropriate. This same intent was not necessarily applied to other neighboring jurisdictions. In some cases, the opportunity to develop consistency became apparent during scoping, comment periods and various interagency coordination meetings. Section 5.3 in the FEIS, (Consistency With Other Plans), addresses the consistency issue.	Yes
004	29	PRP The state encourages the BLM to contact all neighboring state, federal, and tribal agencies and collaboratively identify all other significant reasonably foreseeable activities to be considered as part of the analysis.	The Reasonably Foreseeable Development Scenario (RFD) for Oil and Gas is the best example of this process. Future foreseeable development for oil and gas was identified and analyzed for other land ownerships (non-BLM administered lands) within the Planning Area. Reasonably foreseeable activities for other resources on non-BLM administered lands were not identified unless they were brought up during scoping and comment periods.	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
004	30	MOG	The RFD for fluid minerals does not clearly state whether its projections are limited to exploration, or include possible subsequent development based on likely discoveries.	The RFD includes projections for development and production activity. Page 1, 3rd paragraph, states "It was assumed that 59% of the wells drilled would be productive...It is also reasonable to assume that the number of wells to be abandoned...will equal approximately one-half the number of wells going into production." Page 2, paragraph 1, states "RFD ...is a long-term projection of oil and gas exploration, development, production, and reclamation activity." The narrative on Pages 13 and 14 of the RFD describes the associated disturbances which were factored into the average acreage of surface disturbance per well (9.6 acres), including areas needed for associated production activities such as gas production facilities, oil storage tanks, gathering/injection pipelines and roads.	No
004	31	MOG	The state encourages BLM to prepare a detailed transportation system use analysis as part of the RFD, similar to the UDOT's "Analysis of Freight Traffic Associated with Oil and Gas Development in the Uinta Basin."	The BLM acknowledges that a transportation system use analysis can be a useful tool in assessing impacts from oil and gas development. However, the benefit of a transportation analysis is much greater for areas such as the Uintah Basin which have a high level of current and projected oil and gas activity. In comparison, the projected activity levels for the Monticello Field Office are relatively low. The Monticello Field Office prepared a Reasonably Foreseeable Development (RFD) scenario for oil and gas development over the next 15 years. The development predicted in the RFD was utilized to generate the economic impacts in the Draft RMP/EIS as detailed on pg. 4-340 through 4-344.	No
004	32	WR	The State Engineer recommends that the BLM consider the impact its actions may have on water rights in general and non-BLM water rights in particular.	On page 1-12 of the DRMP/DEIS under Planning Criteria, the BLM states 1) the planning process would recognize the existence of valid existing rights, and 2) the BLM would adhere to all applicable laws (including state and local laws). The text has been edited to ensure that water rights are recognized as valid existing rights.	Yes
004	33	WC	The BLM inconsistently applied road data between the 1999	The Wilderness Study Area Interim-Management Policy ("IMP"	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
		inventory and the 2007 WC review.	<p>or "WSA handbook") applied to inventories conducted prior to 2004. In 2004 BLM settled ongoing litigation with the State of Utah (known now as the Utah v. Norton Settlement Agreement). The IMP emphasized the difference between roads and "ways." A road was considered an impact on wilderness characteristics and needed to be excluded from the inventory unit. A "way" however, was not considered in and of itself a sufficient impact on naturalness to disqualify all or part of an inventory unit.</p> <p>Inventories conducted post-2004 applied current policy, which is based on IM 275-2003, Change 1 which emphasizes naturalness and does not distinguish roads from ways. The BLM has evaluated wilderness characteristics since 2004 on the basis of impacts to naturalness which could include both roads and ways.</p>	
004	34	WC The BLM should not consider undeveloped leases and potential for future development when it determines whether areas possess wilderness characteristics. The possibility of future development is irrelevant. It is only appropriate to consider this information when deciding whether to protect areas found to possess wilderness characteristics.	As part of its wilderness characteristics inventory maintenance, the BLM used a combination of field knowledge, ID Team review, og-wells GIS data, Reasonable Foreseeable Development (RFD) data, range allotment files, and a review of BLM and San Juan County (SJ CO) GIS data, including 2006 high resolution aerial photographs. RFDs were used to assist in determining what impacts were on the ground at the time of the 2007 Wilderness Character Review process to help determine naturalness. RFDs were not used to determine potential future scenarios for Oil and Gas Development. RFDs (potential Oil and Gas Development Scenarios) were used in determining what units would be managed for wilderness characteristics in the FEIS. This process allows the ID team to look at all resources during wilderness characteristics inventory maintenance. The BLM findings are described in the 2007 WCR process and are available as part of the administrative record in the Monticello BLM Field Office. The BLM stands by its findings of its wilderness characteristics inventories and WCR process.	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
004	35	WC	The BLM needs to consider the new information on roads (2007) to reevaluate the findings of the 1999/2003 wilderness inventory.	The 2003 Revision Document for the Monticello Field Office made adjustments to Wilderness Inventory Areas based on county road data, none of which differs from the current county inventory. BLM stands by its 1999/2003 data.	No
004	36	WC	The BLM should clarify whether Grand Gulch WC area, units A and B, possess outstanding opportunities for solitude or primitive and unconfined type of recreation as required. If BLM relies on the existence of outstanding opportunities within the contiguous WSA to satisfy this requirement then BLM should clarify how these requisite values can be satisfied at another location.	The wilderness character review process used specific guidelines in determining whether or not the areas possessed wilderness character. Appendix O briefly discusses the criteria used in this process. These areas are not the same as Wilderness or Wilderness Study Areas. The documents relevant to the wilderness character review process in 2007 are available at the Monticello Field Office, on the Monticello web site and in the administrative record.	No
004	37	WC	The BLM should clarify whether the National Forest system roadless area adjacent to the Hammond Canyon WC area has been administratively endorsed for wilderness. If no, then BLM should explain the apparent departure from the 5,000 acre minimum size standard.	The National Forest Service area in question has not been determined by that agency to possess wilderness characteristics (itself a BLM term), and its adjacency is irrelevant. Although the unit does not officially meet the 5,000 acre size requirement, and it is not contiguous to lands that possess Wilderness Characteristics, it is bordered on the east side by Ute Tribal Lands and on the west side by USFS Roadless Lands, which significantly limits motorized use. The 4, 702 acres identified in Hammond Canyon consist of only public lands administered by the BLM and does not include any USFS Roadless Lands and was found to possess wilderness characteristics.	No
004	38	WC	The review form for the Upper Red Canyon WC area notes "much of the mining activity in the area is still visible in the form of audits or waste dumps." Also, opportunities for solitude or primitive and unconfined type of recreation are not described as being outstanding in character. Please clarify 1) the standard applied to determine the existence of naturalness and, 2) whether Upper Red Canyon WC area possesses the requisite outstanding opportunities for solitude or primitive and unconfined type of recreation.	As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and on-site reviews. This included specific field inspections, Interdisciplinary team review of data such as range files, County and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999-2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process. The BLM is confident of the high-standard approach used to inventory the	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				<p>public lands and stands by its findings, particularly the findings, which involved wilderness characteristics inventory maintenance.</p> <p>The ID team during the 2007 Wilderness review determined the surface disturbances noted in the 1979 inventory have naturally rehabilitated. Mining activity in the area while still visible is not considered to be a substantial impact to the naturalness of the area. With minimal evidence of continued human disturbances, opportunities for solitude can be found throughout the area.</p>	
004	39	WC	The opportunities for solitude or a primitive and unconfined type of recreation in the White Canyon WC area are not described as being outstanding in character. Please clarify whether opportunities must be outstanding in nature and whether the White Canyon WC area possesses these requisite values.	The 2007 wilderness character review examined 15 areas in the White Canyon area and found 3 of those areas to possess wilderness characteristics. The files relevant to the wilderness character review from 2007 are available in the administrative record and will provide specific information on the values of those areas reviewed.	No
004	40	WC	The review forms for the Bridger Jack Mesa, Indian Creek (A, B, C), White Canyon #8 and White Canyon #9 WC's indicate that outstanding opportunities for solitude are not present within the units themselves, but exist within contiguous WSAs, national parks, or wilderness inventory areas. Please clarify how the existence of requisite values can be satisfied by adjacent lands.	The ID team during the 2007 Wilderness review determined "Because of their size, opportunities for solitude or primitive recreation is limited, but exist when considered with the contiguous WIA and the AE lands within CNP."	No
004	41	AQ	The air quality analysis assumed all new compressors would operate at a NOx emission rate of 0.7 g/hp-hr (pg. 4-17). How will the BLM ensure this projection for newly permitted compressors?	This figure (0.7 g/hp-hr) was used as an analysis assumption and is based on the best available control technology. Air quality impacts would be analyzed for specific proposed oil and gas development on a case by case basis during the NEPA process. Air quality emission restrictions can be imposed at that time.	No
004	42	AQ	It appears that the air quality related analysis assumes all compressors used in natural gas development will be gas-fired. Please clarify how BLM will require utilization of compressor technology consistent with this assumption.	BLM assumed the use of gas-fired compressor for the purpose of the air resources analyses for the RMP. BLM would probably not prescribe a particular mitigation measure, such as gas-fired compressor. Rather, BLM would consider requiring the project proponent to demonstrate that potential	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				direct impacts would be less than levels-of-concern, as set by BLM.	
004	43	AQ	The section entitled Impacts of Mineral Decisions on Air Quality under Alternative A discusses emissions from multiple sources and notes that emissions from each source are well below applicable NAAQS. BLM relies on this statement as basis for each alternative, noting that impacts would be the same or similar to Alternative A. It is unclear how BLM equates additional emissions to anticipated ambient conditions.	Please see revised air resources section in Chapter 4. BLM would consider using a quantitative approach to estimate potential concentrations for a project-specific EIS associated with a proposed project.	Yes
004	44	VRM	Chapter 3 discusses visibility in Class I areas. No comparable analysis is contained in chapter 4. The state recommends BLM include a careful analysis of impacts to visibility.	In Chapter 4, impacts to each resource are analyzed by the primary resource. For instance, Table 4.13. Impacts to Cultural Resources under Alternative A includes a reference to visual resource impacts to cultural resources and so on through all alternatives for all resources.	No
004	45	GRA	Please clarify at pp. 2-17 and 4-75 why allotments would be unavailable for livestock grazing for the next 15 years. Please clarify if using the term "unavailable" reflects a decision to temporarily suspend, or permanently retire grazing.	Areas are to be made unavailable for grazing due to potential conflicts with other resources or uses (wildlife habitat, primitive recreation, vegetation, cultural, etc), areas being unsuitable for feasible grazing practices (lack of water/forage, inaccessibility, etc.), and permittee requests. Unavailable refers to these areas not being authorized for livestock grazing during the next 15 years.	No
004	46	GRA	There is an apparent discrepancy in the number of acres unavailable for livestock grazing under all alternatives as indicated on pages 2-16 and 4-254 (note: page numbers have changed since the last draft). Please resolve.	Acreages for particular areas may vary slightly due to the differences in shapefiles for GIS calculations. The correct acreage figure is 128,098 acres to remain unavailable for grazing. Additional acres unavailable for grazing are added to this figure in each alternative. Acreage corrections have been made in the FEIS.	Yes
004	47	GRA	Under the No Action Alternative, the BLM would make an additional 20,361 acres unavailable for livestock grazing. Please clarify why the No Action Alternative involves a change in current management.	The No Action Alternative implements a previous court decision pending final determination in RMP revision that closed grazing in several Comb Wash side canyons (Mule Canyon south of U-95, Arch, Fish, Owl, and Road). This decision closed 16,599 acres (pg. 2-92) (20,361 is incorrect). These acres are included in acres closed under the No Action	Yes

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				Alternative, thus no change in current management (see pg. 4-70). The statement of additional acres unavailable on page 4-254 is incorrect as these acres are already included in the No Action Alternative acres. These errors have been corrected in the FEIS.	
004	48	LAR	ES.4 (of the DEIS)– Planning Issues – Issue 8 (page ES-3 of DEIS), and; Section 1.3.1. – Scoping and Identifying Issues, Concern and Opportunities (Page 1-4). The discussions in these sections should contain detailed reference to the issue of inheld state lands within special areas such as WSAs, ACECs, and lands managed for wilderness characteristics. Priority should be given to resolving this issue.	It is not necessary to have this specific language stated in the description of the issue. Please refer to response to comment 004-52.	No
004	49	MOG	Section 1.3.2 – Development of Planning Criteria (page 1-11). The BLM states that the RMP will "apply only to public lands and, resources managed by the BLM." The BLM should reconsider whether it can impose its standard on split estate lands where it does not own the surface.	Information regarding leasing and development on split estate lands is found at the following Washington Office website: www.blm.gov/bmp/Split_Estate.htm . Instruction Memorandum No. 2003-202 outlines the policy, procedures and conditions for approving oil and gas operations on split-estate lands. In particular, the BLM will not consider an Application for Permit to Drill or a Sundry Notice administratively or technically complete until the Federal lessee or its operator certifies that an agreement with the surface owner exists, or until the lessee or its operator complies with Onshore Oil and Gas Order No. 1. Compliance with Onshore Oil and Gas Order No. 1 requires the Federal mineral lessee or its operator to enter into good-faith negotiations with the private surface owner to reach an agreement for the protection of surface resources and reclamation of the disturbed areas, or payment in lieu thereof, to compensate the surface owner for loss of crops and damages to tangible improvements, if any. In addition, the BLM will invite the surface owner to participate in the onsite inspection and will take into consideration the needs of the	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>surface owner when reviewing the Application for Permit to Drill. The BLM will offer the surface owner the same level of surface protection BLM provides on Federal surface (Instruction Memorandum No. 89-201).</p> <p>Table 2.1, Page 2-18 (last paragraph) clarifies BLMs intent concerning management of split estate lands in the Monticello Field Office. On split estate lands, lease stipulations would consist only of those necessary to comply with non-discretionary federal laws, such as the Endangered Species Act. Discretionary measures to mitigate impacts to other resources, such as visual and wildlife, would not be applied as a lease stipulation but would be developed during site specific environmental analysis and would be attached as conditions of approval (COA) in consultation with the surface owner and consistent with lease rights.</p>	
004	50	SOC	<p>Section 1.4.4 – Energy Policy and Conservation Act. None of the alternatives adequately analyze the impacts from formally or effectively eliminating mineral development in lands subject to Special Designations, in terms of loss of revenue to the United States, State of Utah, local governments and Utah's school trust under EPCA.</p>	No
004	51	TRV	<p>Table 2-1 – Summary Table of Alternatives – Lands and Realty. It should be noted under all alternatives that, pursuant to Utah v. Andrus, BLM is obligated to grant reasonable access to the State of Utah and its grantees to school trust lands. In furtherance of this obligation, no existing roads providing access to trust lands should be closed without the consent of SITLA.</p>	Yes
004	52	LAR	<p>Section 3.6.2.1 – Land Tenure Adjustments and Section 3.6.2.1.2 – Exchanges. These paragraphs should specifically</p>	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
		reference the need for Federal acquisition of State school trust lands that are captured by Federal reservations and withdrawals such as wilderness study areas will be a priority, in accordance with applicable BLM policy guidance. In addition State selection should be mentioned as an equally preferred method of land disposition as land exchanges.	<p>use planning decision.</p> <p>The federal Land Policy and Management Act (FLPMA) Section 203 requires the BLM to use the land use planning process to identify lands for disposal through sales. Identifying lands for Section 203 sale requires the BLM to meet certain criteria set out specifically in the statute.</p> <p>FLPMA allows the BLM to identify lands that would be available for exchange (both disposal and acquisition) more generally. The DRMP/EIS has identified lands generally available for exchange, including identifying State lands that are currently available for acquisition. The DRMP/EIS does not contain a schedule or prioritize these lands, but the BLM understands that State in-lieu and other exchanges are a high priority for the State and for the BLM.</p>	
004	53	SOC	Section 4.3 – Environmental Consequences of the Proposed Plan and All Alternatives. The state comments that BLM decisions to withdraw mineral lands from leasing in WSAs, areas with wilderness characteristics, ACECs, and other areas directly affects the economic viability of state trust lands inholdings in those areas, particularly for oil and gas.	No
004	54	SOC	Section 4.1.2 – Assumptions and Methodology for Mineral Development. The RFD must address the fact that BLM withdrawals and special designations directly affect development of oil and gas on SITLA lands. The BLM should assume that, in addition to the loss of oil and gas wells on BLM lands, there will be an additional loss of wells on SITLA lands in proportion to the amount of SITLA land within the proposed special designation under each alternative.	Yes

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>Non-BLM lands could be indirectly impacted by RMP decisions both positively and negatively. The analysis in Chapter 4 of the PRMP/FEIS has been modified accordingly to reflect the impacts in Alternative E on SITLA inholdings of the discretionary closures of public lands. The number of oil and gas wells foregone on SITLA lands, and the loss of revenue from SITLA wells foregone have been calculated and added to the analysis in Chapter 4.</p>	
004	55	<p>LAR Section 4.3.5 – Lands and Realty. The first paragraph of Section 4.3.5.1 (Impacts Common to the Proposed Plan and All Alternatives) incorrectly states that acres within WSAs, the Grand Gulch Special Emphasis area, NSO areas, and areas closed to oil and gas leasing will be excluded to new ROWs. In addition, BLM should note that since such ROWs and accompanying development could degrade wilderness characteristics in WSAs, acquisition of inheld state trust lands by land exchange will be a priority of BLM.</p>	<p>Narrative has been added to the text on these pages to clarify that the BLM has an obligation to grant reasonable access to inheld State lands in WSAs subject to Utah v. Andrus and the Interim Management Policy.</p> <p>Current BLM Utah State Policy is to give priority to State of Utah exchanges and such exchanges do not require a land use planning decision. Please refer to response to comment 004-52.</p>	Yes
004	56	<p>SOC Section 3.13-Socioeconomics (pgs 3-96). BLM decisions to withdraw mineral lands from leasing (WSAs, etc.) directly affect the economic viability of state trust lands inholdings. This should be acknowledged appropriately in the discussion of socioeconomic impacts.</p>	<p>The decision to manage lands as WSAs was made initially in the Federal Land Policy and Management Act (1976). Lands to be managed as WSAs in the State of Utah were identified in the 1980's. Any state trust land inholdings created by WSA management is beyond the scope of this plan.</p> <p>Those state land inholdings that are excluded from leasing as a result of the current planning effort have been specifically analyzed in the Socioeconomic section of Chapter 4. Please also refer to response to comment 004-54.</p>	Yes
004	57	<p>TRV Section 3.17.3 – Issues. Certain existing routes that provide the only physical access to trust lands sections would not be "Designated Routes," and motorized access on such routes would be terminated. The Draft RMP fails to address the impact of these closures on the economic value of the affected trust lands.</p>	<p>The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition,</p>	Yes

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.	
004	58	LAR	Appendix C Lands and Realty: C.1 Tracts Identified for Disposal. The disposal land list is inadequate to meet the need for BLM to acquire all state trust lands in existing WSAs as well as proposed special designations. The state identified specific lands in these areas to be added to the disposal list.	Current BLM Utah State Policy is to give priority to State of Utah exchanges and such exchanges do not require a land use planning decision. Please refer to response to comments 004-52, 004-55,	No
004	59	CUL	The state suggests that the BLM develop a specific ongoing program to identify and target identification efforts under Section 110 of the National Historic Preservation Act.	These type of actions are administrative and do not require land use planning decisions to accomplish.	No
004	60	CUL	The state recommends the BLM undertake a final check to ensure that other potential areas of high cultural resource densities or values are examined for potential conflicts. The MFO should use techniques such as GIS, existing site databases.	On pg. 4-28, a model of cultural resource site density is described that was used to predict potential impacts to cultural resources. This model identified high, medium, and low site densities and this information was used to quantify the impacts. For site specific actions the BLM conducts a Class III cultural survey as appropriate.	No
004	61	CUL	The state suggests enhancing and strengthening the density analyses utilized in the Draft RMP/EIS. These techniques could be significantly enhanced and strengthened in implementation of the Final Plan for high cultural resource value areas which include Arch Canyon, Recapture Wash, and Montezuma Canyon.	The BLM will continue to enhance the inventory and density techniques for high cultural value areas identified in the final plan. As prescribed in Table 2.1, Management Common to All Action Alternatives, the BLM will continue to identify areas for special protection of cultural resources and develop specific cultural resource management plans for those areas. These type of actions are administrative and do not require land use planning decisions to accomplish.	No
004	62	CUL	Please clarify why Arch Canyon, Recapture Wash, and Montezuma Canyon have not been proposed for specific management consideration. The state recommends that these areas be considered for CSMA designation.	BLM considers these areas to possess important cultural values and will address issues in these areas with cultural special management plans as described under Management Common to All Action Alternatives. Please refer to response to comments 004-59 and 004-61.	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
004	63	CUL	The RMP proposes avoidance areas around National Register-eligible cultural resources and specific 100-foot buffers (page 4-284 and 4-385). The state recommends that rather than stipulations of a standard avoidance distance that the RMP stipulate that avoidance areas will be established that will be sufficient to protect the resources from direct and indirect impacts.	The intent of BLM is not to require a specific 100-foot buffer around National Register-eligible sites but to require an avoidance distance sufficient to protect cultural resources. The final RMP/EIS will refer to the 100-foot buffer only under Alternative A since that is the current management prescription. BLM will add narrative to the proposed RMP to clarify that a specific avoidance distance will not be required.	Yes
004	64	CUL	It is unclear from the RMP what protective measures are proposed under the various alternatives for Hovenweep National Monument, Square Tower (and potentially Cajon) Unit(s). Please clarify how potential visual impacts to the setting, feeling, and association of these units, particularly from solid and/or fluid minerals leasing and/or development, will be managed.	Under Alternatives B and C, the Hovenweep ACEC would be expanded 620+ acres from Alternative A, to a total of 2,418 acres. The management prescriptions under Alternatives B and C would be the same as Alternative A (the 620+ acre addition would be managed as the "General Area Exclusive of Special Emphasis Zones"). Table 2.1 has been revised to clarify the specific prescriptions that apply to the 620+ acre expansion. The 880 acre visual protection zone around the Monument has been carried forward in the FEIS under an NSO lease category. The total acreage shown on pg. 239 under Alternatives B and C for the Hovenweep ACEC should be 2,418 acres. BLM will correct the error.	Yes
004	65	CUL	With exception of the Alkali Ridge NHL, the Alkali Ridge area is listed under all alternatives as open for oil and gas development with either standard conditions or timing/controlled surface use conditions. The area appears to go from VRM Class III to VRM Class IV under all alternatives. The change in VRM Class appears to have the potential to result in adverse effects which will need to be analyzed during consultation on the RMP under Section 106 of the NHPA.	BLM understands its requirement to consult with the SHPO on the RMP and will comply. VRM class will remain as Class III for Alkali Ridge ACEC in the PRMP.	Yes
004	66	CUL	The Stipulation in Appendix A (Page A-5) for the Alkali Ridge area reiterates that an avoidance area will be established, but does not note whether this area will include consideration of indirect and cumulative as well as direct impacts to cultural resources.	BLM has reconsidered the stipulations for the Alkali Ridge ACEC and has rewritten them to include consideration of direct and indirect impacts to cultural resources.	Yes

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
004	67	CUL	The RMP rightly notes that the decisions have potential to cause adverse effects to cultural resources. These potential adverse effects may need to be addressed via mitigation during consultation of the RMP under Section 106 of the NHPA.	Please refer to response to comment 004-65	No
004	68	CUL	Table 2.1 (Page 2-8). The state encourages BLM to clarify the purposes and types of land treatments that could be authorized in the Comb Ridge CSMA, specifically whether land treatments modify the NSO stipulation as well as what VRM class would apply to this area.	<p>The Comb Ridge CSMA will be carried forward into the Proposed RMP as a recreation management zone within the Cedar Mesa Special Recreation Management Area (SRMA).</p> <p>Most of the management prescriptions proposed for the Comb Ridge CSMA will apply to the Comb Ridge recreation management zone. Future activities within the recreation management zone would be required to comply with those management prescriptions, including NSO and VRM II management objectives.</p> <p>Appendix A in the proposed RMP lists stipulations, including NSO and VRM II, that apply to surface disturbing activities within specific areas of the Monticello Field Office. The stipulations do not apply to non-surface disturbing activities as defined in the appendix. It is conceivable that non-surface disturbing activities could be allowed in the Comb Ridge recreation management zone. That determination would be made through site specific analysis of the proposal.</p>	Yes
004	69	CUL	Table 2.1 (Page 2-9). The area identified as "Butler Wash East of Comb Ridge" is not mapped like the other CSMA's. Please clarify whether this CSMA is mapped as part of the Comb Ridge CSMA and how large the Butler Wash East of Comb Ridge CSMA would be.	<p>The area identified as the "Butler Wash East of Comb Ridge" is part of the Comb Ridge SRMA. That part of the SRMA east of Comb Ridge was distinguished from the remaining area because it required separate prescriptions to address special management needs.</p> <p>The Comb Ridge SRMA will be carried forward into the proposed RMP as a recreation management zone within the Cedar Mesa Special Recreation Management Area (SRMA). Please refer to response to comment 004-68.</p>	No
004	70	CUL	The BLM notes in the RMP/DEIS on pages 4-284 and 4-385, that preservation-related management decisions would avoid	Buffers around cultural sites are not specifically defined but stated as "sufficient to allow for complete avoidance of the	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
			cultural resource impacts by incorporating a buffer around sensitive areas. Please clarify what resources BLM intends to protect with buffers.	cultural resource" to prevent direct and most indirect impacts. The avoidance distance would be specific to the disturbing action. Please refer to response to comment 004-63.	
004	71	SOC	The royalty payments for oil reported on page 3-113 exceed the sale value by more than one million dollars. Please verify and explain this anomaly.	BLM agrees that the production and royalty information on page 3-113 is confusing as presented. The information has been clarified and any erroneous figures have been corrected in the proposed RMP.	Yes
004	72	REC	It is unclear in Chapter 3 whether ROS classifications are carried forward as part of the action alternatives and whether ROS classifications will change by alternative.	The Recreational Opportunity Spectrum (ROS) will not be carried forward in any of the action alternatives. A statement has been added to Section 3.11.2.1 clarifying this. Management decisions will be based on special designations such as SRMAs, ACECs, National Historic designations, WSAs, ISAs, ERMAs, Wild and Scenic River recommendations, Non-WSA lands with wilderness characteristics, etc.	Yes
004	73	REC	Please clarify whether the BLM intends to require permits and payment of fees in order to travel across SRMAs where the intended destination is on state land. Also, BLM should clarify how it intends to manage non-recreational use of SRMAs and non-BLM inholdings within SRMAs.	Travel through SRMAs to state land and non-recreational use of SRMAs would be managed as administrative use and fees would not be charged.	No
004	74	MOG	The Draft RMP/DEIS for both the Kanab and Richfield field offices assess cumulative timing limitations and their impact on oil and gas exploration and development for each alternative by classifying BLM administered lands into one of seven categories (i.e., Standard lease terms, controlled surface use, cumulative timing limits less than three months in duration, cumulative timing limits between three and six months in duration, cumulative timing limits between six and nine months in duration, areas subject to NSO stipulations, and areas unavailable for leasing). The state strongly encourages BLM to complete a similar analysis as part of the Monticello RMP/EIS and for all other RMPs within the State of Utah.	In accordance with IM 2003-233, lease stipulation categories used by the Monticello Field Office are consistent with the Uniform Format for Oil and Gas Lease Stipulations prepared by the Rocky Mountain Regional Coordinating Committee in March 1989.	No
004	75	OTH	Given the scale of available mapping, it is often difficult to	BLM has considered the interaction between management	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod	
		reconcile interactions between management prescriptions. The state encourages BLM to carefully review and consider interactions between management stipulations as it formulates the Final RMP and eliminate incompatible requirements and improve mapping detail.	prescriptions and has attempted to make prescriptions compatible.		
004	76	VRM	To protect the viewshed in the area surrounding Goosenecks State Park, the state recommends changing the VRM Class from VRM Class III to VRM Class II, changing the oil and gas leasing to NSO and closing the area to mineral material disposal.	The BLM, in developing the PRMP/FEIS, can chose management actions from within the range of the alternatives presented in the DRMP/DEIS and create a management plan that is effective in addressing the current conditions in the planning area based on FLPMA's multiple-use mandate. BLM feels that the range of alternatives reasonably covers the options. For any proposals for leasing, all surrounding uses would be considered and analyzed in a site specific NEPA document. BLM feels this would adequately protect sensitive or scenic areas as those resources would be taken into consideration.	No
004	77	TRR	The state suggests the designation of training trails to control off-trail riding and indiscriminate OHV use around some dispersed camp areas and trailheads.	As stated in the Draft RMP/EIS (pg. 2-54) routes may be modified through subsequent implementation planning on a case by case basis. No specific trails or suggestions for "training trails" were submitted during the scoping period. After the RMP is completed and on a site specific basis, the BLM could consider training trails near dispersed camp sites in areas designated in the limited or open to OHV category. The BLM will consider the commenter's recommendation.	No
004	78	LAR	The RMP should recognize the opportunity to purchase rights-of-way across properties owned by SITLA to avoid having designated OHV routes closed in the future by the sale of these lands.	As noted in MCA Alternatives (Easements, pg. 2-15), easements would be acquired from willing landowners and the State of Utah to gain access to public lands or placement of facilities on non-public lands, and acquire easements to accomplish resource objectives.	No
004	79	TRV	It is unclear in Map 51(of the DEIS) whether or not routes shown in brown within the closed areas are open or closed. The state recommends that all of these routes remain open and the	The routes within the "Closed" areas are those that would remain open to vehicle use. These routes are either major county roads or access routes to trail heads or State lands.	Yes

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
			map and its legend be modified.	The map has been modified to clarify this point.	
004	80	TRR	The section of the Piute Pass OHV trail that passes by the "Chocolate Drop" is closed in the plan. This section should be left open to maintain the integrity of the signed and mapped trail. Also a right-of-way across the SITLA property should be acquired to ensure continued public access.	This portion of the route is not designated in the plan due to a resource conflict within the route. BLM would make future route adjustments based on access needs, recreational opportunities, and resource constraints. These activities would be analyzed at the site-specific activity planning level.	No
004	81	TRR	The OHV users in the Monticello/Blanding area have worked to identify and preserve many loop trails on Public lands such as Bridger Jack, Jacob's Chair, Piute Pass and a large loop trail called Canyon Rim Riders Trail. The Utah State Parks would like to see these trails left open and opportunities preserved to complete missing sections.	Based upon the requirements of NEPA, the BLM used a systematic interdisciplinary approach fully considering physical, biological, economic, and social aspects of management actions for the range of alternatives. Plan accompanying the DRMP/EIS. The BLM would make future route adjustments based on access needs, recreational opportunities, and resource constraints. These activities would be analyzed at the site-specific activity planning level.	No
004	82	TRR	Under Management Common to All Action Alternatives (page 2-54), closures and restrictions are the options listed for dealing with adverse impacts caused by OHVs. The state believes mitigation should be the first option considered and applied where appropriate.	The Federal regulations at 8341.2(a) state "the authorized officer shall immediately close the areas affected to the types of vehicle causing the adverse affect." This does not preclude further analysis to determine a final course of action.	No
004	83	TRV	Table ES 1 – OHV Categories by Alternative. The BLM should ensure that access to remote irrigation facilities like diversions, gates, and canals are preserved.	These type of actions are administrative and do not require land use planning decisions to accomplish. The OHV category designations do not apply to administrative uses.	No
004	84	WSR	Table 3.50 – Individual Eligible Wild and Scenic River(s) Segments. In determining suitability, the rights of irrigators to divert flow from these rivers and streams need to be fully protected and considered.	Barring congressional action, there is no effect on water rights or instream flows related to suitability findings made in a land use plan decision. Even if Congress were to designate rivers into the National Wild and Scenic Rivers System, any such designation would have no effect on existing water rights. Section 13(b) of the Wild and Scenic River Act states that jurisdiction over waters is determined by established principles of law. In Utah, the State has jurisdiction over water. Although the Wild and Scenic Rivers Act implies a federal reserved water right for designated rivers, it does not require or specify any amount, and as noted above, confirms that Utah has	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>jurisdiction over water rights. The BLM would be required to adjudicate the water right, in the same manner as any other entity, by application through state processes. Thus, for congressionally designated rivers, BLM may assert a federal reserved water right for appurtenant and unappropriated water with a priority date as of the date of designation (junior to all existing rights), but only in the minimum amount necessary to fulfill the primary purpose of the reservation.</p> <p>The Draft RMP/EIS states that the BLM would not seek water rights as part of a suitability determination made in the Record of Decision for the RMP.</p> <p>Please refer to response to comments 004-17, 004-18, 004-19, and 004-20.</p>	
004	85	WR Potential dam locations are shown on Map 46 (of the DEIS). The state assumes that the potential to construct dams in these areas has been preserved in the RMP but it is hard to tell from the maps and text whether or not this is the case. BLM should clarify by adding language to appropriate sections.	Potential dam locations were included on Map 46 as a factor related to potential eligibility for wild and scenic river designation. It was later determined that these potential dam sites did not affect the eligibility classification so this information has been removed from the map. Any future proposal for dam construction would be assessed on a case-by-case basis regardless of whether such information is listed in the RMP.	Yes
004	86	VRM The state objects if the Draft RMP does not make information supporting the VRM inventory class determinations available for review. The state also objects if the rationale for each VRM management class is not presented, nor is the impact on resources fully disclosed in the analysis of impacts.	The BLM will consider the commenter's recommendation to include information supporting the VRM inventory class determinations and the rationale for each VRM management class. BLM feels that the impacts of visual management on resources was fully disclosed for each resource in Chapter 4.	No
004	87	VRM The state has concerns that the BLM's identification of VRM inventory classes has led to a self-effectuating class protection scheme, rather than a source of information to be considered within the proposed resource use allocation schemes within each of the Draft's alternatives.	VRM inventory was completed in the late 1970s and early 1980s. These inventory classes were not changed. Management classes were subject to intensive discussions by an interdisciplinary team of BLM resource specialist using their best expertise and seeking the best compromises among resources to carry out BLM's mandate for multiple use and	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				sustained yield while protecting resource values including visual resources. BLM disagrees with the commenter's statement regarding a self-effectuating class protection scheme and stands by its decisions and analysis.	
004	88	WL	The state requests that the BLM not alter habitat designations from alternative to alternative. The proper description of crucial winter habitats should occur regardless of alternative. The alternatives should then describe different levels of impact to these habitats.	Please refer to response to comments 004-11 and 004-12.	No
004	89	WL	The Monticello RMP should be consistent with the newly developed Utah Wildlife Action Plan (UWAP). As a cooperator in developing this plan, the BLM should acknowledge it as the guideline for sensitive species management in the State of Utah.	On page 2-51 (of the DEIS), it states the "BLM would work with the UDWR to implement the Utah Comprehensive Wildlife Conservation Strategy to coordinate management decisions that would conserve native species and prevent the need for additional listings." This reference has been changed from the Utah Comprehensive Wildlife Conservation Strategy to the Utah Wildlife Action Plan.	Yes
004	90	SSS	UDWR intends to investigate the status of the Spotted ground squirrel, Stephens' woodrat and the Silky pocket mouse and would welcome mention of cooperation from the BLM in the RMP.	These species are included in the Utah Wildlife Action Plan. Please refer to response to comment 004-89.	No
004	91	SSS	Devils Canyon appears to be a unique habitat for the Acorn woodpecker and deserves special consideration.	Although there is not specific mention of Devils Canyon and the Acorn woodpecker, this area and species would be considered on a site-specific basis. Please refer to response to comment 004-89.	No
004	92	WL	Alternative C. The state encourages the BLM not to permit the use of toxicants to control prairie dogs except within 100 m of irrigated fields and pastures.	The use of toxicants to control prairie dogs would be considered on a site-specific basis and the state would be consulted at such a time.	No
004	93	WL	Alternative C. To protect western Yellow-billed Cuckoos and Southwestern Willow Flycatcher's habitat, the BLM should make a commitment in the RMP to locate designated campsites between Montezuma Creek and Bluff so that riparian wildfires	Fire pans are currently required along the river and BLM does follow all fire ordinances. The BLM is planning on developing a San Juan River Plan in the future and designated campsites would be considered during this site specific document.	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
			are less likely to be started by campfires.		
004	94	VEG	The UDWR believes that desirable non-native plants should never be categorically excluded from use on western rangelands and encourages BLM not to exclude use of non-native plants in the Monticello RMP.	On pg. 3-159 it states "for revegetation purposes, the use and perpetuation of native species is a priority, except for instances when non-intrusive, non-native species are more ecologically or economically feasible." This policy under the Draft EIS / RMP allows use of non-native plant species where deemed appropriate on a site specific basis.	No
004	95	WL	The BLM needs to address how to avoid, reduce, and mitigate impacts from uranium mining on wildlife and their habitat in the RMP because voluntary mitigation efforts will be inadequate.	The BLM does not rely exclusively on voluntary mitigation to address impacts from uranium mining. Section 302 of FLPMA requires the BLM to prevent unnecessary or undue degradation of the public lands. Regulations at 43 CFR Subpart 3809 establish procedures and standards to ensure that operators and mining claimants meet this responsibility for operations authorized by the mining laws. All operations must meet the performance standards at 43 CFR 3809.420 including, measures to rehabilitate fisheries and wildlife habitat and measures to prevent adverse impacts to threatened or endangered species, and their habitat. Site specific environmental analysis is done for proposed mining operations and appropriate mitigation measures are attached as conditions of approval. Consistent with the mining laws, operations and post-mining land use must comply with the RMP management prescriptions (table 2.1., Page 2-19).	No
004	96	WL	The BLM should refer to the USFWS document Interim Guidelines to Avoid and Minimize Wildlife Impacts from Wind Turbines and consult with UDWR and USFWS about future wind energy development.	Future wind energy projects would be analyzed on a site specific basis and consultation with UDWR and USFWS would be done at that time. As stated in table 2.1 page 2-16, "Authorization of wind energy development would incorporate best management practices and provision contained in the Wind Energy Programmatic EIS, once this document becomes final."	No
004	97	WL	The state recommends that the BLM develop a long-term plan for mineral extraction and wildlife mitigation within the area	According to Washington Office Instruction Memorandum 2005-069, the BLM may identify off-site mitigation opportunities to address impacts of the project proposal, but is	No

Table 5.9.a. Public Comments and Responses: State of Utah

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
			covered by this RMP.	not to carry them forward for detailed analysis unless volunteered by the applicant.	
004	98	WL	The state recommends that the RMP require adequate mitigation (including off-site mitigation where appropriate) in all mineral leases that result in long-term impacts to crucial wildlife habitats.	The state cites no specific failures in the DRMP/EIS concerning onsite mitigation of impacts to crucial wildlife habitats. BLM's policy for the use of compensatory offsite mitigation for authorizations issued in the oil and gas program is contained in IM No. 2005-069. That policy states that the BLM will approach compensatory mitigation "on a voluntary basis where it is performed offsite." In its NEPA analysis, the BLM may identify other offsite mitigation opportunities to address impacts of the project proposal but should not carry them forward for detailed analysis unless volunteered by the applicant. Omission of discussion in the land use plan does not prohibit consideration of offsite mitigation at the project development phase.	No
004	99	WL	The state requests that this RMP consider impacts to hunting and fishing from energy development.	Hunting and fishing is considered a recreational activity and although it is not specifically mentioned; the impacts to hunting and fishing from energy development is discussed under 4.3.10.3.8 Impacts of Mineral Decisions on Recreation.	No

Table 5.9.b. Public Comments and Responses: San Juan County

007	1	PRP	The County asks BLM to consider its statutory responsibility under FLPMA toward consistency of its land use plans with State and local plans.	The BLM is aware that there are specific County and State plan decisions relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, the BLM is bound by Federal law. The FLPMA	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>requires that the development of an RMP for public lands must be coordinated and consistent with County plans, to the maximum extent possible by law, and inconsistencies between Federal and non-Federal government plans be resolve to the extent practical (FLPMA, Title II Sec. 202 ©(9)). As a consequence, where State and local plans conflict with Federal law there will be an inconsistency that cannot be resolved or reconciled.</p> <p>Thus, while County and Federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the FEIS/PRMP, so that the State and local governments have a complete understanding of the impacts of the PRMP on State and local management options. The BLM will document the required Governor's consistency review in Chapter 5.</p>	
007	2	AA The BLM's interpretation of the Multiple Use mandate where all uses occur someplace but not together is flawed. Landscapes can be managed so that a broad spectrum of resource uses can create social, economic and ecological wealth simultaneously. Multiple use management results in benefits to various resources. For example, grazing can be a tool to benefit wildlife and their habitats.	In developing land use plans, the BLM is mandated by FLPMA to observe the principles of multiple use and sustained yield. FLPMA defines multiple use as "the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people.....the use of some land for less than all of the resources, a combination of balanced and diverse resource uses that takes into account the long term needs of future generations for renewable and nonrenewable resources....with consideration given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output."	No
007	3	PRP More emphasis should be placed on monitoring the plan decisions both to measure the results of the plan and to insure	The Federal regulations at 43 CFR 1610.4-9 require that land use plans establish intervals and standards and evaluations	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod	
		that actions are taken to incorporate any changes needed. Watershed function, livestock use, recreation, OHV use and wildlife populations are uses that should be monitored more closely. The plan should have greater flexibility to adapt to changing conditions.	based on the sensitivity of the resource decisions involved. The Record of Decision (ROD) for the RMP will commit to a monitoring plan the specifics of which will be developed subsequent to the signing of the ROD.		
007	4	PRP	San Juan County asks for more cooperation and collaboration with local, state, and federal agencies (as well as interest groups) in actions and decisions within the Field Office. Misunderstandings could then be worked out in advance -- in the field rather than the courtroom. Within the framework of this RMP, the BLM should provide more opportunities to facilitate cooperative relationships and foster better collaboration efforts.	The State of Utah and San Juan County are cooperating agencies involved in the preparation of the RMP. The BLM has involved the cooperating agencies in all aspects of the land use planning process including participation in the interdisciplinary team meetings. Cooperation and collaboration will continue on site specific projects after the RMP is completed and this does not require a plan decision to accomplish.	No
007	5	WR	San Juan County feels more emphasis should be placed on sustaining and developing healthy watersheds. The functionality of watersheds underlies all resources values. The best way to improve the functionality of watersheds is by increasing the ground cover. Well managed grazing is one of the best, most economical, large scale tools for increasing ground cover.	The BLM actively supports efforts to improve watersheds. The BLM is a partner in the Healthy Lands Initiative for Utah. The RMP, under all action alternatives, specifies the treatment of 30,000 to 50,000 acres over a 15 year period to restore ecosystem health and functioning condition (p. 2-58 of the DEIS). The RMP, under all alternatives, also specifies that grazing would be managed according to the Guidelines for Livestock Grazing Management to meet the Standards for Rangeland Health. Implementation of these standards would improve watershed health and functioning condition.	No
007	6	GRA	San Juan County supports livestock grazing in a prescriptive manner to accelerate progress toward improved rangeland health and reduction of catastrophic fire. The BLM should reassess timing and season of use for grazing.	The BLM Land Use Planning Handbook (H-1601-1) requires the BLM to identify lands available or nonavailable for livestock grazing. This is the only planning decision within the RMP. Decisions concerning timing and season of use are made on an allotment basis using the Standards for Rangeland Health and Guidelines for Grazing Management.	No
007	7	GRA	San Juan County feels that social/economic analysis for livestock grazing is inadequate, as many allotments have been reduced or closed. The county urges BLM to look at grazing on a watershed basis vs. an allotment basis so that livestock	Only one entire allotment is to be closed to grazing and that is the Dodge Canyon allotment (1598 BLM acres). This allotment has been in voluntary non-use for many years so there would be no change in the grazing situation from formal closing of	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
		operations would have opportunities to be more profitable but also to benefit wildlife and other resources.	<p>the allotment to grazing in the PRMP. Other areas to be excluded from grazing are parts of allotments, not entire allotments. In all cases, these areas have not been used by livestock for many years so there would be no real change to the permittee or the on-ground situation from exclusion of livestock.</p> <p>BLM agrees that using a watershed perspective is important and may allow more flexibility in managing livestock operations for a wider range of benefits. This type of management can be used at the activity planning level regardless of whether it is so stated in the RMP. However individual allotments would still have to be considered as the building blocks to such an approach because of the tie of grazing preference to individual allotments.</p>	
007	8	TRV Table 2.1 at page 2-56 indicates the amount of "Open B-Class Roads" and Open D-Class Road" varies across alternatives. Please clarify the authority under which BLM would designate county roads, and what happens to a class B, C, or D road if BLM chooses not to designate it.	<p>It is beyond the scope of this document to make determinations on R.S.2477 claims. In the Tenth Circuit Court decision – SUWA v. BLM – September 8, 2005, the court noted that ultimately deciding who holds legal title to an interest in real property, including R.S.2477 right of way, "is judicial, not an executive, function." 425 F.3d at 752. Chapter one of the DEIS states at 1.3.3 ISSUES BEYOND THE SCOPE OF THE PLAN Settlement of R.S. 2477 (i.e., right-of-way) claims. The State of Utah and San Juan County may hold valid existing rights-of-way in the PA according to Revised Statute (R.S.) 2477, Act of July 28 1866, chapter 262, 8, 14 Stat. 252, 253, codified at 43 U.S.C. 932. On October 21, 1976, Congress repealed R.S. 2477 by passing the FLPMA. This RMP does not adjudicate, analyze, or otherwise determine the validity of claimed rights-of-way. However, nothing in the RMP extinguishes any valid right-of-way or alters in any way the legal rights the state and counties may have to assert and protect R.S. 2477 rights or challenge in federal court or other appropriate venues.</p> <p>Routes are coincident merely meaning that in a comparison</p>	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			that they appeared on both the County's list of routes as well as those identified by BLM.	
007	9	TRV Any closure of a state or county road within BLM administered lands will require assent of all parties with an interest in the road. BLM should carefully coordinate travel management with local governments and take care to avoid impinging upon the state's legal interests in public roads.	San Juan County was a cooperator in the development of the Travel plan. Each route was discussed with the County planner along with BLM resource specialists. As in the past, no route closures would be done without consultation and agreement with San Juan County officials, as has been done in the past.	No
007	10	TRV Access is of major concern to San Juan County. The County has been working with the BLM to get a road maintenance agreement which conforms to the 10th Circuit ruling.	BLM is as eager as the County to develop a Road Maintenance Agreement (RMA) between the two which satisfies the 10th Circuit Court 2005 ruling as well as both the County and BLM. However, a RMA would be developed and implemented after the signing of the RMP and not addressed nor will they be decided in the RMP DEIS.	No
007	11	SCO The State of Utah has a reversionary interest in any roads that may have been granted to the state and local government pursuant to R.S. 2477. Abandonment of the right-of-way by both entities is necessary for a complete resolution for any particular road.	It is beyond the scope of this document to make determinations on R.S.2477 claims. In the Tenth Circuit Court decision – SUWA v. BLM – September 8, 2005, the court noted that ultimately deciding who holds legal title to an interest in real property, including R.S.2477 right of way, "is judicial, not an executive, function." 425 F.3d at 752. Chapter one of the DEIS states at 1.3.3 ISSUES BEYOND THE SCOPE OF THE PLAN Settlement of R.S. 2477 (i.e., right-of-way) claims. The State of Utah and San Juan County may hold valid existing rights-of-way in the PA according to Revised Statute (R.S.) 2477, Act of July 28 1866, chapter 262, 8, 14 Stat. 252, 253, codified at 43 U.S.C. 932. On October 21, 1976, Congress repealed R.S. 2477 by passing the FLPMA. This RMP does not adjudicate, analyze, or otherwise determine the validity of claimed rights-of-way. However, nothing in the RMP extinguishes any valid right-of-way or alters in any way the legal rights the state and counties may have to assert and protect R.S. 2477 rights or challenge in	No

Table 5.9.b. Public Comments and Responses: San Juan County

				federal court or other appropriate venues.	
007	12	TRR	San Juan County supports Alt C for travel management. The county wants the BLM to highlight specific prescriptions to promote responsible use, such as areas that would be highlighted for OHV use, maps, signing, kiosks etc. In addition, BLM assumes that all impacts are the result of OHVs and does not mention impacts to other resources, such as wildlife, from hikers, mountain bikers, and other recreationists.	In the FEIS, the travel plan selected is similar to Alternative C with some corrections to the map. Zero acres would be open to cross country travel by OHVs as opposed to 2,311 acres in Alternative C. Approximately 8 miles in Arch Canyon is designated for motorized travel up to the USFS boundary as opposed to 3.8 miles in Alternative C. The creation of OHV use designation maps, placement of signs and kiosks, etc. would be accomplished during the implementation phase of the travel plan and is discussed in detail on page N-32, section N.15. Environmental consequences of alternatives such as "other recreationalist" and wildlife can be found in Chapter 4.	No
007	13	WL	The BLM erroneously uses the term critical habitat for wildlife habitat that does not apply to endangered species act. The term crucial habitat is used too loosely; UDWR uses crucial habitat as descriptive designations. They are not intended to mislabel resource concerns and result in a limitation of compatible uses. San Juan County disputes the acreage identified for crucial elk and deer winter range in San Juan County and submits information from Dr. Charles Kay in that regard.	The critical habitat term has been changed to crucial in the final RMP/EIS. The UDWR is the jurisdictional agency for wildlife management within the State. The BLM relied on the expertise of this agency for delineating wildlife habitats, estimating population numbers, and recommending wildlife restrictions.	Yes
007	14	WL	The BLM cites Sawyer et al. (2006) as the basis for its discussion of deer and elk habitat fragmentation, including maps 61 thru 65 and 69 thru 72. The county contacted the lead author of the study for his response to the study's applicability in San Juan County. Based on the author's written comments the county questions BLMs use of the referenced study. The county suggests that fragmentation maps for deer and elk along with the references thereto be removed and not included in the final RMP/EIS. The misuse of this scientific study raises questions about other	The fragmentation analysis is not an attempt to quantify specific impacts from site specific project but is presented to analyze the degree of habitat fragmentation under each alternative. GIS models were based on the BLM's best available information. These models address fragmentation differences between alternatives on a landscape level. The BLM acknowledges that the study may not fit the situation entirely as stated in Section 4.3.19.3.21, "The impacts of habitat fragmentation on various animal species are difficult to quantify. Even with site-specific, peer-reviewed ecological	No

Table 5.9.b. Public Comments and Responses: San Juan County

		<p>studies, particularly the Desert Sheep Habitat Fragmentation Analysis based on Singer et al. (2001) as presented in Table 4.216 on page 4-600. The county cautions BLM about using scientific studies inappropriately.</p>	<p>research on the impacts to particular wildlife species from habitat fragmentation, many variables that contribute to the severity of the impacts to nearby wildlife remain difficult to predict."</p>	
007	15	<p>WC</p> <p>Managing Non-WSA Lands for so-called wilderness characteristics violates FLPMA, Utah Code 63-38d-401(6)(b), the San Juan County master plan, the Norton-Leavitt Agreement and other agreements.</p> <p>The county asks the BLM to provide a detailed explanation of the rationale and authority for management of lands solely because of WC, and why such management does not circumvent the provisions of the statutorily required wilderness review process.</p>	<p>The BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from the Federal Land Policy and Management Act (FLPMA) Section 202 (U.S.C. § 1712). This section of the BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. § 1712(c)(2)). Further FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use...." FLPMA, Section 1039(c) (43 U.S.C. § 1702(c)). FLPMA intended the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, amongst the various resources in a way that provides use for current and future generations.</p> <p>The Norton-Leavitt Agreement recognizes that nothing in the Agreement shall be construed to diminish the Secretary's authority under FLPMA to manage a tract of land that has been dedicated to a specific use.</p> <p>IM 2003-275-Change 1 which is a direct outcome of the Norton-Leavitt Agreement states, "the BLM may consider information on wilderness characteristics along with information on other uses and values when preparing land use plans." The IM goes on to say "considering wilderness</p>	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>characteristics in the land use planning process may result in several outcomes including, but not limited to, ...emphasizing the protection of some or all of the wilderness characteristics as a priority over other multiple uses" (although the area will not be designated as a WSA). The IM also states "typically, resource information contained in the BLM wilderness inventories was collected to support a land use planning process. Public wilderness proposals represent a land use proposal. In either case the BLM is authorized to consider such information in preparation of a land use plan amendment or revision."</p> <p>In September 2006, Judge Benson, whose court approved the Norton-Leavitt Agreement, stated that the Agreement did not strip the BLM of its powers to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs.</p>	
007	16	WC The BLM inconsistently applied road data between the 1999 inventory and the 2007 WC review.	<p>The Wilderness Study Area Interim-Management Policy ("IMP" or "WSA handbook") applied to inventories conducted prior to 2004. In 2004 BLM settled ongoing litigation with the State of Utah (known now as the Utah v. Norton Settlement Agreement). The IMP emphasized the difference between roads and "ways." A road was considered an impact on wilderness characteristics and needed to be excluded from the inventory unit. A "way" however, was not considered in and of itself a sufficient impact on naturalness to disqualify all or part of an inventory unit.</p> <p>Inventories conducted post-2004 applied current policy, which is based on IM 275-2003, Change 1 which emphasizes naturalness and does not distinguish roads from ways. The BLM has evaluated wilderness characteristics since 2004 on the basis of impacts to naturalness which could include both roads and ways.</p>	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
007	17	WC	The BLM should not consider undeveloped leases and potential for future development when it determines whether areas possess wilderness characteristics. The possibility of future development is irrelevant. It is only appropriate to consider this information when deciding whether to protect areas which have been found to possess wilderness characteristics.	As part of its wilderness characteristics inventory maintenance, the BLM used a combination of field knowledge, ID Team review, og-wells GIS data, Reasonable Foreseeable Development (RFD) data, range allotment files, and a review of BLM and San Juan County (SJ CO) GIS data, including 2006 high resolution aerial photographs. RFDs were used to assist in determining what impacts were on the ground at the time of the 2007 Wilderness Character Review process to help determine naturalness. RFDs were not used to determine potential future scenarios for Oil and Gas Development. RFDs (potential Oil and Gas Development Scenarios) were used in determining what units would be managed for wilderness characteristics in the FEIS. This process allows the ID team to look at all resources during wilderness characteristics inventory maintenance. The BLM findings are described in the 2007 WCR process and are available as part of the administrative record in the Monticello BLM Field Office. The BLM stands by its findings of its wilderness characteristics inventories and WCR process.	No
007	18	WC	The BLM needs to consider the new information on roads (2007) to reevaluate the findings of the 1999/2003 wilderness inventory and discuss any changes to BLM's 1999/2003 determination of WC that result from more recent route information and intrusion information.	The 2003 Revision Document for the Monticello Field Office made adjustments to Wilderness Inventory Areas based on county road data, none of which differs from the current county inventory. BLM stands by its 1999/2003 data. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and on-site reviews. This included specific field inspections, Interdisciplinary team review of data such as range files, County and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999-2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process. The BLM is confident of the high-standard approach used to inventory the public lands and stands by its findings, particularly the findings, which involved wilderness characteristics inventory	No

			maintenance.	
007	19	PRP San Juan County is opposed to "layering" of restrictive land use designations such as ACECs or SRMAs over WSAs or Wild and Scenic Rivers.	<p>"Layering" is planning. Under FLPMA's multiple use mandate, BLM manages many different resource values and uses on public lands. Through land use planning BLM sets goals and objectives for each of those values and uses, and prescribes actions to accomplish those objectives. Under the multiple use concept, BLM doesn't necessarily manage every value and use on every acre, but routinely manages many different values and uses on the same areas of public lands. The process of applying many individual program goals, objectives, and actions to the same area of public lands may be perceived as "layering." BLM strives to ensure that the goals and objectives of each program (representing resource values and uses) are consistent and compatible for a particular land area. Inconsistent goals and objectives can lead to resource conflicts, failure to achieve the desired outcomes of a land use plan, and litigation. Whether or not a particular form of management is restrictive depends upon a personal interest or desire to see that public lands are managed in a particular manner. All uses and values cannot be provided for on every acre. That is why land use plans are developed through a public and interdisciplinary process. The interdisciplinary process helps ensure that all resource values and uses can be considered together to determine what mix of values and uses is responsive to the issues identified for resolution in the land use plan. Layering of program decisions is not optional for BLM, but is required by the FLPMA and National BLM planning and program specific regulations.</p> <p>FLPMA directs BLM to manage public lands for multiple use and sustained yield (Section 102(a)(7)). As a multiple-use agency, the BLM is required to implement laws, regulations and policies for many different and often competing land uses and to resolve conflicts and prescribe land uses through its land use plans. BLM's Land Use Planning Handbook requires</p>	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>that specific decisions be made for each resource and use (See, Appendix C, Planning Handbook "H-1601-1"). Specific decisions must be included in each of the alternatives analyzed during development of the land use plan. As each alternative is formulated, each program decision is overlaid with other program decisions and inconsistent decisions are identified and modified so that ultimately a compatible mix of uses and management prescriptions result.</p> <p>SRMAs are not restrictive of resource uses but rather are utilized to control recreation use. Several SRMAs overlay other designations such as WSAs, ACECs and wild and scenic river segments, but the management proposed in each is for differing purposes and is not incompatible.</p>	
007	20	<p>ACE</p> <p>The Draft RMP/EIS does not include a discussion on the nature or type of threat of "irreparable damage" or the regional significance of relevant and important values in its review. BLM misinterprets irreparable damage when reviewing and analyzing ACECs in the Draft RMP/EIS. The ACEC tool was intended by Congress to be limited to only those instances where irreparable damage would be caused without designation. Most surface disturbing actions can eventually be repaired.</p> <p>The BLM must explain the need for "special" management for the ACEC and explain how this management is not duplicative of other normal BLM management or protections afforded by other state or federal laws.</p>	<p>The ACEC evaluation appendix (Appendix H) was modified, and a section added discussing threats to the relevant and important ACEC values; however, whether the threats currently exist does not preclude a potential ACEC from being considered in the action alternatives. All nominated areas, where the BLM has determined to have relevant and important values, are identified as potential ACECs and are addressed in the action alternatives. Threats to relevant and important values are likely to vary by alternative.</p> <p>On August 27, 1980, the BLM promulgated final ACEC guidelines (45 Federal Register 57318) clarifying the term "protects" – "To defend or guard against damage or loss to the important environmental resources of a potential or designated ACEC. This includes damage that can be restored over time and that which is irreparable. With regard to a natural hazard, protect means to prevent the loss of life or injury to people, or loss or damage to property." Thus, BLM is to consider the potential for both reparable and irreparable damage when protecting important historic, cultural, or scenic values; fish</p>	Yes

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>and wildlife resources; or other natural systems through ACEC designation. This interpretation is consistent with FLPMA's legislative history and implementing policy.</p> <p>Section 2 of the guidelines clarifies that ACECs are special places within the public lands. It states: "In addition to establishing in law such basic protective management policies that apply to all the public lands, Congress has said that 'management of national resource lands [public lands] is to include giving special attention to the protection of ACECs, for the purpose of ensuring that the most environmentally important and fragile lands will be given early attention and protection' (Senate Report 94-583, on FLPMA). Thus, the ACEC process is to be used to provide whatever special management is required to protect those environmental resources that are most important, i.e., those resources that make certain specific areas special places, endowed by nature or man with characteristics that set them apart. In addition, the ACEC process is to be used to protect human life and property from natural hazards."</p>	
007	21	VRM The County objects if the Draft RMP does not make information supporting the VRM inventory class determinations available for review. The County also objects if the rationale for each VRM management class is not presented, nor is the impact on resources fully disclosed in the analysis of impacts.	The VRM inventory was completed in the late 1970s and early 1980s. These inventory classes were not changed. Management classes were subject to intensive discussions by an interdisciplinary team of BLM resource specialist using their best expertise and seeking the best compromises among resources to carry out BLM's mandate for multiple use and sustained yield while protecting resource values including visual resources. BLM disagrees with the commenter's statement regarding a self-effectuating class protection scheme and stands by its decisions and analysis.	No
007	22	VRM The County has concerns that the BLM's identification of VRM inventory classes has led to a self-effectuating class protection scheme, rather than a source of information to be considered	Please refer to response to comment 7-21.	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
		within the proposed resource use allocation schemes within each of the Draft's alternatives.		
007	23	AA In the analysis of the impacts for the Draft RMP/EIS, almost all the impacts are attributable to OHV use, oil and gas use, and, to some extent, grazing. The underlying theme is that these 3 things are the cause of all negative impacts and if they are eliminated or controlled then everything else is taken care of. The BLM should consider cheat grass and juniper encroachment, invasive weed problems, and catastrophic fires. The BLM should utilize livestock to control invasive plants.	In the Draft RMP/EIS, surface disturbing activities are considered potential negative impacts to natural and cultural resources. On page A-1, surface disturbing activities are defined. Surface disturbing activities include, among many other things, oil and gas development and cross country OHV use. Neither grazing nor vehicle travel on vehicular routes are defined as surface disturbing activities. The BLM has addressed cheat grass, juniper encroachment, invasive weeds and catastrophic fires. On pg. 2-50 in decisions common to all action alternatives, the BLM specifies controlling and reducing invasive and noxious weed species. Vegetation treatments areas for pinyon-juniper area are identified on pg. 2-14. The PRMP/FEIS adopts the Utah Fire Plan, which seeks to prevent catastrophic fires. On an allotment basis, Standards for Rangeland Health and Guidelines for Grazing Management could be utilized to control invasive species on any given allotment.	No
007	24	SOC San Juan County commends the BLM for the effort that has been expended to better understand and portray socioeconomic impacts in this DRMP. This has been a weakness in previous plans. San Juan County encourages BLM to use studies done by Utah's universities to enhance this information such as the social survey undertaken by USU and the economic studies done by the U of U. Every NEPA action in the RMP should include a discussion on socioeconomic conditions and fully disclose all impacts.	The BLM has reviewed the Utah State University survey of rural counties conducted by the State of Utah. The BLM received preliminary data for San Juan County after completion of the Draft RMPM/EIS. The BLM has incorporated findings in chapter 3 of the PRMP/FEIS as appropriate. In addition, an appendix has been added to the PRMP/FEIS which summarizes the results of this study. The recent research undertaken by the University of Utah's Bureau of Economic and Business Research on oil and gas activities in San Juan County is not yet complete. The unexpected death of the primary researcher has slowed this effort. The BLM has extensively utilized data provided by the	Yes

Table 5.9.b. Public Comments and Responses: San Juan County

				Utah Division of Oil, Gas and Mining in its economic analyses of the contributions of various industries. On a broad land use planning level, the BLM has disclosed the socioeconomic impacts from various resource actions as discussed in Chapter 4 of the DRMP/EIS. It is not practical to separate out the socioeconomic impacts of the many of the specific resource decisions specified in the plan.	
007	25	LAR	There is no mention of Ute Indian lands in Table 1.1 on pg. 1-2.	That error has been corrected in the PRMP/FEIS.	Yes
007	26	WC	San Juan County is opposed to any non- WSA wilderness designations described in 1.3.1.3, Non-Wilderness Study Areas (WSA) Lands with Wilderness Characteristics on pg. 1-6.	The commenter's preference is noted.	No
007	27	CUL	Pg. 2-8 and 2-9 - The management prescriptions for the Comb Ridge CSMA are more restrictive for Alternative C than Alternative B with regard to group size. The County questions how limits on group size and restrictions on collection of firewood for campfires can be enforced.	The restrictions on group size have been eliminated in the PRMP and collection of firewood for campfires is not restricted in the PRMP. Therefore, enforcement is not an issue.	No
007	28	CUL	Pg. 2-11 - The County requests BLM's rationale for the limits of people per day, numbers in rooms and numbers in corridors proposed for McLoyd Canyon-Moon House CSMA. How will compliance be accomplished?	The limits for people per day, numbers in rooms and numbers in corridors in the McLoyd Canyon-Moon House area are based on the results of a condition assessment that was conducted for the Moon House Complex. This condition assessment was conducted by the National Park Service, Archaeological Site Conservation Program, Mesa Verde National Park. The limits are designed to protect the site from threats caused by uncontrolled visitation. Such threats include damage to existing intact plaster walls and damage to structural elements such as walls and floors that are already weakened by visitation and other natural factors. Compliance will be accomplished through establishment of a site stewardship program for the site, information about visiting the site that will be provided at the Kane Gulch Ranger Station, and through patrols by BLM rangers and law enforcement.	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
007	29	CUL	Pg. 2-12 - The Hole-in-the-Rock trail is one of regional and national importance and yet is basically ignored in the DRMP. The BLM should consider assistance from other individuals, organizations, and government entities that have an interest in interpreting and protecting the trail.	The BLM does consider assistance from other individuals, organizations, and government entities who may have an interest in the Hole in the Rock Trail. In Table 2.1, page 2-12, Historic Trails, under Management Common to All Alternatives, it states that the Hole in the Rock Trail would be managed for Heritage Tourism in consultation with the Utah State Historic Preservation Office and Native American Tribes, as well as interested stakeholder groups.	No
007	30	FIR	Pg. 2-13 (note: page numbers have changed since the last draft) The Prescott National Forest has used goats in critical WUI areas to successfully reduce fuels. Is the BLM planning to use goats/sheep as a fuel treatment? If so, where and how?	The Finding of No Significant Impact and Decision Record for the Utah Land Use Plan Amendment for Fire and Fuels Management (UT-USO-04-01) signed in September of 2005 identifies maximum treatment acres and authorizes fuels treatment activities for the Monticello Field Office. The Land Use Plan Amendment, the associated USFW Biological Opinion, and the Resource Protection Measures developed to minimize or avoid resource impacts from fire management actions are incorporated into this RMP. The LUP Amendment incorporated new fire management policy, guidance and directives for BLM-administered lands in Utah, although detailed information regarding fire management goals and objectives was provided in a programmatic Fire Management Plan (FMP). The FMP covers field offices administered by an individual fire district such as the Moab Fire District which oversees fire management for the Monticello Field Office. The LUP Amendment for Fire and Fuels states (Chapter 1, page 1-11) that the [EA] is limited to planning-level analyses and that site-specific analysis of resources such as air, water, soil, and cultural is conducted for individual fire management planning and implementation actions. Public comment was solicited for the LUP Amendment as well as for the Moab Fire District FMP. The EA process also involved collaboration between the public, the BLM and other governmental and local agencies. The LUP Amendment states (Chapter 2, page 2-10) that acreages identified for fire management [in the LUP	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			Amendment and as carried through in the RMP] are broad guidelines useful for the development of field office Fire Management Plans (FMP), and are not "assumed to be quotas, targets or exact limitations." The FMP covering the Monticello Field Office does include descriptions of individual Fire Management Units (FMUs) for the vegetative communities within the field office, and outlines general fire management goals for each of those FMUs. The programmatic EA for the FMP (UT-063-04-02, UT-060-2005-042) analyzed the overall direct, indirect and cumulative impacts of fire management goals and objectives. Individual vegetation treatment methods, potential impacts from treatments, and the number of acres proposed for a treatment in a vegetative community or communities would be detailed and analyzed at a project-level basis in a site-specific NEPA document.	
007	31	AA The Health and Safety section seems rather weak. Is abandoned mine lands the only health and safety concern in the Monticello Field Office?	The goal for the Health and Safety section states that the BLM would manage hazardous risks on public lands to protect the health and safety of public land users and stewards, protect natural and environmental resources, minimize future hazardous and related risks, costs and liabilities, and mitigate physical hazards in compliance with all applicable laws, regulations and policies. Statements were added under this section to include all physical hazards, hazardous materials and hazardous wastes for mitigation and management common to all alternatives.	Yes
007	32	GRA Under Livestock Grazing, Management Common to All Alternatives, the statement "Modify and implement existing Allotment Management Plans...that require such action" is unclear. Please clarify intent and need.	The intent is to use an AMP where appropriate as the vehicle to implement grazing management actions which would facilitate maintaining or achieving Standards for Rangeland Health. Not all allotments would need an AMP to accomplish this goal. Those listed are existing AMPs and those allotments where new AMPs would be most effective.	No
007	33	GRA Please furnish rationale and authority to allocate 17,300 acres	This is an allocation recommended by the Grazing Advisory Board in the 1960s or early 1970s which was approved in a	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
			to wildlife (parts of Peter's Canyon and East Canyon).	previous Management Framework Plan (Land Use Plan) and has been in effect since that time. The rationale was that these steep slopes and benchlands along the edges of these canyons were better suited to wildlife use than domestic livestock. The authority is in the Taylor Grazing Act, Grazing Regulations and Land Use Planning Regulations.	
007	34	GRA	San Juan County policy is against the relinquishment or retirement of grazing rights in favor of conservation, wildlife and other uses. Please clarify BLM's goals in encouraging relinquishment and what mechanism would be used to retire grazing rights.	BLM does not encourage relinquishment of grazing preference. BLM policy recognizes the prerogative of a grazing permittee to voluntarily relinquish his grazing preference. As stated on Pg. 2-17 of the DEIS, once relinquished, the preference is still available for application for preference for grazing by livestock unless BLM determines that the lands are better used for other purposes. If the latter is the case, discontinuation of grazing would be made by amendment to the RMP. Even so, discontinuance would not be permanent but would be subject to reconsideration during subsequent revision or amendment of the RMP.	No
007	35	REC	Pg. 2-21(note: page numbers have changed since last draft). The county is concerned that the BLM establishes SRMAs to charge fees without providing facilities.	BLM policy directly ties the charging of fees to the level of facilities provided. Recreational site fee establishment is out of the scope of this document.	No
007	36	REC	Pg. 2-22 (note: page numbers have changed since last draft). The BLM should insure that providing facilities and services for other agencies doesn't take away from management needs that occur on BLM lands. In particular, the NPS Needles District should provide camping facilities for its visitors within the NP since there is ample room for facilities and because the NPS has a larger budget.	The BLM priority is to provide facilities and services for BLM public land users.	No
007	37	CUL	Pg. 2-25 (note: page numbers have changed since last draft). The one goal listed for the Cedar Mesa Cultural SRMA is "Integrate management between the BLM and NPS to provide outstanding recreational opportunities and visitor experiences while protecting natural and cultural resource values." The County feels there is little shared recreational opportunities	Although opportunities may be limited, the BLM will strive to integrate management between the BLM and NPS to provide outstanding recreational opportunities and visitor experiences while protecting natural and cultural resource values when possible.	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
			across the BLM/NPS common boundary because of topography and other factors. Also, there is nothing to address this goal in Appendix E Recreation, or Chapter 4.		
007	38	PRP	Pg. 2-25 (note: page numbers have changed since last draft). The maps for Cedar Mesa Cultural SRMA and ACEC for Valley of the Gods overlap. Please clarify the management of this area to avoid the layering of protection.	In the FEIS, this overlap does not exist.	No
007	39	AA	The BLM should resolve inconsistencies in the Draft RMP/EIS. For instance, on page 4-266, reference is made to "Section 3.10.4.2." However the County could find no Section 3.10.4.2. Likewise on page 4-267, reference is made to recreational trends in Section 3.10.4 but that section discusses paleontological resources.	These inconsistencies have been corrected in the PRMP.	Yes
007	40	REC	Pg. 2-29 (note: page numbers have changed since last draft). The first bullet concerning camping under management common to all alternatives seems to be in conflict with Alternatives A, C, and D. Please clarify.	The second part of the first bullet under Management Common to All Action Alternatives stating "Camping outside of the riparian corridor within this area would be limited to designated campsites only" is incorrect. Camping management prescriptions vary with each alternative. A change has been made in the document. The camping management prescription for the proposed plan is: Dispersed camping would be allowed in the Indian Creek Corridor, except within the established designated camping zones: Bridger Jack Mesa, Indian Creek Falls, and Creek Pasture. Camping within these zones is limited to designated sites.	Yes
007	41	REC	Pg. 2-29 (note: page numbers have changed since last draft). The county encourages BLM to address the safety issue in Indian Creek caused by rock climbers who park and obstruct traffic within the narrow highway corridor.	Chapter 2, page 2-29 states management of the Indian Creek Corridor would be in conformance with the guidance outlined in the Indian Creek Corridor Plan. Bullet number 10 listed under the guidelines states "parking areas would be developed."	No
007	42	WL	Pg. 2-29 (note: page numbers have changed since last draft). In	In areas, such as Indian Creek and Bridger Jack Mesa where	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod	
		some instances such as Bridger Jack Mesa, timing and other restrictions apply to OHVs to protect wildlife/raptors but the same restrictions do not apply to rock climbers. The county requests BLM to clarify this apparent inconsistency.	there are rock climbers; BLM conducts annual raptor surveys and have closed portions of the climbing areas to protect raptors. On Page 2-60 in Table 2.1 it states to "Temporarily close areas (amount of time depends on species) near raptor nests to rock climber or other activities if activity may result in nest abandonment."		
007	43	WL	Pg. 2-31 (note: page numbers have changed since last draft). San Juan County feels that restrictions imposed in wildlife areas are excessive and not supported by best science. In particular, road use should be allowed unless impacts can be shown.	All surface restrictions imposed in wildlife areas have exceptions, modifications, and waiver languages that allows for flexibility and use of current situations and science when making a site-specific decision (see Appendix A).	No
007	44	WR	Pg. 2-33 (note: page numbers have changed since last draft). San Juan County feels that more emphasis on watersheds is needed in the RMP.	Please refer to response to comment 007-5.	No
007	45	PRP	Pg. 2-34 (note: page numbers have changed since last draft). San Juan County is opposed to any layering of ACEC's over WSAs.	Please refer to response to comment 007-19.	No
007	46	ACE	Pg. 2-34 (note: page numbers have changed since last draft). San Juan County feels that, with exception of the National Historic Landmark (2,146 acres), the Alkali Ridge ACEC does not meet the requirements necessary to qualify as an ACEC and that the area can be protected within the framework of current laws and regulations. The County urges BLM to not manage this area as an ACEC but choose Alternative D in the final RMP.	Please refer to response to comment 007-20.	No
007	47	PRP	Pg. 2-37 (note: page numbers have changed since last draft). San Juan County cannot support the designation of the Butler Wash North ACEC due to its layering over a WSA. However, the County would support Alternative C if the WSA was not included as part of the ACEC.	In the FEIS, the Butler Wash North area would not be designated as an ACEC but would be managed under the IMP.	No
007	48	ACE	Pg. 2-37 (note: page numbers have changed since last draft). The statement "Portions of the Cedar Mesa ACEC lie within 8	A correction has been made in the document showing that 3 WSAs and 1 ISA lie within the Cedar Mesa ACEC.	Yes

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
		<p>WSAs" under Management Common to All Alternatives should be clarified because according to all of the maps there are only 4 WSAs. San Juan County recommends that BLM avoid layering of protective designations.</p>	<p>"Layering" is planning. Under FLPMA's multiple use mandate, BLM manages many different resource values and uses on public lands. Through land use planning BLM sets goals and objectives for each of those values and uses, and prescribes actions to accomplish those objectives. Under the multiple use concept, BLM doesn't necessarily manage every value and use on every acre, but routinely manages many different values and uses on the same areas of public lands. The process of applying many individual program goals, objectives, and actions to the same area of public lands may be perceived as "layering." BLM strives to ensure that the goals and objectives of each program (representing resource values and uses) are consistent and compatible for a particular land area. Inconsistent goals and objectives can lead to resource conflicts, failure to achieve the desired outcomes of a land use plan, and litigation. Whether or not a particular form of management is restrictive depends upon a personal interest or desire to see that public lands are managed in a particular manner. All uses and values cannot be provided for on every acre. That is why land use plans are developed through a public and interdisciplinary process. The interdisciplinary process helps ensure that all resource values and uses can be considered together to determine what mix of values and uses is responsive to the issues identified for resolution in the land use plan. Layering of program decisions is not optional for BLM, but is required by the FLPMA and National BLM planning and program specific regulations.</p> <p>FLPMA directs BLM to manage public lands for multiple use and sustained yield (Section 102(a)(7)). As a multiple-use agency, the BLM is required to implement laws, regulations and policies for many different and often competing land uses and to resolve conflicts and prescribe land uses through its land use plans. BLM's Land Use Planning Handbook requires</p>	

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				that specific decisions be made for each resource and use (Planning Handbook "H-1601-1"). Specific decisions must be included in each of the alternatives analyzed during development of the land use plan. As each alternative is formulated, each program decision is overlaid with other program decisions and inconsistent decisions are identified and modified so that ultimately a compatible mix of uses and management prescriptions result.	
007	49	PRP	Pg. 2-37 (note: page numbers have changed since last draft). San Juan County cannot support any of the alternatives for the Cedar Mesa area because of the layering of ACEC and C-SRMA over WSA. The County would support Alternative C if the ACEC and C-SRMA are removed from the WSA and management is in accordance with the IMP in those areas.	In the FEIS, the ACEC and the C-SRMA are not being carried forward. The area will be managed as a SRMA and it will contain WSAs. See also refer to response to comment 007-48.	No
007	50	ACE	Pg. 2-37 (note: page numbers have changed since last draft). Management prescriptions for the Cedar Mesa ACEC under Alternative C are unclear. For instance the County cannot determine rather activities such as geophysical work, disposal of mineral materials, or mineral entry are available.	The text of the PRMP has been changed to clarify the management prescriptions.	Yes
007	51	TRV	Pg. 2-40 (note: page numbers have changed since last draft). The OHV open area is not included under Alternative C for the Indian Creek ACEC. This seems to be an oversight since it is addressed in other portions of the plan. The County supports Alternative C for this area provided the OHV open area is included.	The Indian Creek open to OHV area is not to be confused with the Indian Creek ACEC. The ACEC was established to maintain visual resources and it has been closed to OHV use since its establishment and is to remain that way in Alternative C. The ACEC was never included in the 2214 acres in the Indian Creek area that is open to OHV use in certain alternatives.	No
007	52	WSR	Pg. 2-45 (note: page numbers have changed since last draft). San Juan County feels that a W&SR designation in Dark Canyon is unnecessary because current management for the WSA already protects the ORVs. W&SR status for this segment would be confusing and would present unnecessary management problems and associated costs.	The Wild and Scenic River suitability process and the WSA process differ. The outstandingly remarkable values found along Dark Canyon differ from the wilderness values found within the WSA. It is very common for rivers within Wilderness Areas to be designated as Wild and Scenic Rivers by Congress.	No
007	53	WL	Pg. 2-54 and 2-56 (note: page numbers have changed since	Comment noted. The proposed travel plan has been adjusted.	Yes

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod	
		<p>last draft). San Juan County is opposed to any alternative in the Monticello RMP/EIS which closes any portion of the Arch Canyon road. Reasons for the County's opposition include: 1) the Flannelmouth Sucker is not found above the State Section (T. 37 S., R. 10 E., Section 16). Therefore there is no justification to close the Arch Canyon road to protect this species above the State Section; 2) The stream is in proper functioning condition and BLM surveys have found no evidence that the Flannelmouth Sucker is being impacted by the road or its use; 3) The two primary reasons for listing the MSO, as described by the USFWS in its final rule dated August 31, 2004, are not major threats in the portion of Arch Canyon located on BLM lands; 4) In its final rule, the USFWS also described important habitat conditions for the MSO, all of which are much more prevalent on the Forest Service lands than on the BLM lands; 5) The portion of Arch Canyon on BLM land is near the fringe of the habitat for the MSO as mapped by the USFWS and would appear not to be as important for the survival of the owl; 6) The BLM is proposing to allow hikers unrestricted access in Arch Canyon.</p> <p>The county requests an explanation of BLM's rationale for allowing hikers to hike and camp both on the road and throughout the canyon and cliffs while proposing to close the road to OHV use.</p>	<p>Even if the flannelmouth sucker is not found above the state section, it does not preclude management of the stream and watershed above the fish since activities that happen upstream will directly impact fish that live downstream.</p> <p>The endangered species act does not preclude the protection of species simply because the proposed action is not included as one of the primary reason for the need of a species to be listed.</p> <p>Arch Canyon is included in the Designated Critical Habitat for Mexican Spotted Owls and habitat evaluations have determined that Arch Canyon is suitable habitat for Spotted Owls.</p> <p>As stated in table 2.1 on Page 2-54, the BLM also analyzed a permit system to restrict the number of hikers in Alternative B and C.</p>		
007	54	VEG	<p>Pg. 2-57 (note: page numbers have changed since last draft). The first goal under vegetation should include livestock as well.</p>	<p>The document has been revised to include vegetative goals in relation to livestock management.</p>	Yes
007	55	WL	<p>Pg. 2-60 (note: page numbers have changed since last draft). San Juan County cannot support any of the management alternatives for wildlife because of it's concerns on crucial habitat acreage. The County would welcome an opportunity to discuss this with BLM and see if adjustments can be made.</p>	<p>Please refer to response to comment 007-13.</p>	No
007	56	WD	<p>Pg. 2-62 (note: page numbers have changed since last draft). Opportunities for woodland harvest under Alternatives A, B, C</p>	<p>The RMP has been revised that allows woodland harvesting in areas not identified as a harvesting zone, thus increasing</p>	Yes

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod	
		and D are 73%, 41%, 47% and 31%, respectively. San Juan County is concerned about the drastic reductions in lands available for woodland harvest and the impact on citizens who depend on these woodland products, especially on Cedar Mesa and other areas where Native Americans have traditionally gathered wood. The county suggests that the BLM give this use more consideration in the final RMP.	available localities. Areas of historic woodland harvest will essentially continue to be available. Areas closed to woodland harvest are typically limited to areas devoid of woodlands, sites with no access to woodland products, Wilderness Study Areas, and riparian communities. The RMP language for Cedar Mesa and the Montezuma Watershed on page 2-63, Alternatives C and D, has been revised to allow the continuation of existing woodland harvest until a woodland management plan is implemented that includes a cultural Class III surveys in woodland harvesting boundaries.		
007	57	REC	Section 3.11.2.1 – It is unclear whether the BLM is carrying ROS into the new RMP. ROS is described in the current plan and on Map 35 but there is no other analysis across alternatives. However, it appears that the primitive designation is used in effect to create "defacto wilderness" and VRM I areas smaller than 5,000 acres. BLM needs to clarify use of ROS in the Draft RMP.	The Recreational Opportunity Spectrum (ROS) has not be carried forward in any of the action alternatives. A statement has been added to Section 3.11.2.1 clarifying this. Management decisions will be based on special designations such as SRMAs, ACECs, National Historic designations, WSAs, ISAs, ERMAs, Wild and Scenic River recommendations, Non-WSA lands with wilderness characteristics, etc.	Yes
007	58	WL	Section 3.20.2.1 – It is generally agreed that in southeast Utah the limiting factor for mule deer is summer range, not winter range as stated by BLM. The county suggests that BLM correct this in the Final RMP.	The sentence, "Winter range is often considered a limiting factor for mule deer" has been removed and replaced with the following clarification: "In the summer months, mule deer populations could be limited during years where there is little rainfall, water availability, and summer forage which reduces fawning success. In the winter months, insufficient quantity or quality of habitat or deep snow results in heavy concentration of deer on winter ranges, increasing the spread of disease, reduction in population, and fawning success."	Yes
007	59	WL	Section 3.20.2.1. The county points out that BLM's statement that "Within the Monticello PA, there has been a loss/die-off of sagebrush habitat due to drought and insect infestations" is only partially correct. The county references Charles E. Kay's studies in Beef Basin which show that sagebrush loss/die off is due primarily to deer overgrazing. Overgrazing by deer can also stress sagebrush and make it more susceptible to drought and	The sentence has been modified to: "Within the Monticello PA, there has been a loss/die-off of sagebrush habitat due to drought, insect infestations, and overgrazing."	Yes

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
			insects.		
007	60	WL	Table 3.61 – The county requests BLM's justification for tripling the deer population given the condition of the crucial habitat in Beef Basin and Harts Draw.	Please refer to response to comment 007-13.	No
007	61	WL	Section 3.20.2.4 – The county agrees with BLM's description of Desert bighorn sheep habitat. However, based on that description, the county questions how BLM can reconcile the large acres of thick pinyon-juniper areas included as crucial Bighorn Sheep habitat (Map 54 and 78 thru 82 of the DEIS).	Please refer to response to comment 007-13.	No
007	62	WL	Tables 4.235, 4.236, 4.237 and 4.238 show huge acreage of pinyon-juniper that will be protected for special wildlife conditions for deer, elk, pronghorn, and bighorn sheep. The BLM should reconcile why special conditions exist in this area given that the encroachment of pinyon-juniper has resulted in the loss of crucial habitat for these species.	Please refer to response to comment 007-13.	No
007	63	AA	Pg. 4-561 (note: page numbers have changed since last draft). The BLM refers to Section 4.3.19.2.6 but that section does not exist in the document.	The PRMP has been changed to correct this error. The sections referenced should be Sections 4.3.19.3.6, Impacts of Cultural Resource Decisions on Wildlife and Fisheries and 4.3.19.3.12, Impacts of Recreation Decisions on Wildlife and Fisheries.	Yes
007	64	AA	Pg. 4-593 (note: page numbers have changed since last draft). The BLM refers to Section 4.3.19.2.15, Impacts of Habitat Fragmentation. That section is found at 4.3.19.3.21.	The text of the PRMP has been corrected.	Yes
007	65	WC	Managing non-WSA Lands for wilderness characteristics under Alternative E would: 1) Violate Federal Law, BLM Policy, and the State of Utah/Department of Interior Settlement Agreement of 2003; 2) Clash with State and Local Policies and Plans for managing those lands and thus violate the consistency requirement of FLPMA Section 202 (c)(9); and 3) Arbitrarily and capriciously ignore the documentation and information submitted by San Juan County which show that the subject lands lack true wilderness character.	The BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from the Federal Land Policy and Management Act (FLPMA) Section 202 (U.S.C. § 1712). This section of the BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
			<p>202(c)(2) (43 U.S.C. § 1712(c)(2)). Further FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use...." FLPMA, Section 1039(c) (43 U.S.C. § 1702(c)). FLPMA intended the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, amongst the various resources in a way that provides use for current and future generations.</p> <p>The Norton-Leavitt Agreement recognizes that nothing in the Agreement shall be construed to diminish the Secretary's authority under FLPMA to manage a tract of land that has been dedicated to a specific use.</p> <p>IM 2003-275-Change 1 which is a direct outcome of the Norton-Leavitt Agreement states, "the BLM may consider information on wilderness characteristics along with information on other uses and values when preparing land use plans." The IM goes on to say "considering wilderness characteristics in the land use planning process may result in several outcomes including, but not limited to, ...emphasizing the protection of some or all of the wilderness characteristics as a priority over other multiple uses" (although the area will not be designated as a WSA). The IM also states "typically, resource information contained in the BLM wilderness inventories was collected to support a land use planning process. Public wilderness proposals represent a land use proposal. In either case the BLM is authorized to consider such information in preparation of a land use plan amendment or revision."</p> <p>In September 2006, Judge Benson, whose court approved the Norton-Leavitt Agreement, stated that the Agreement did not</p>

		<p>some day be included in the National Wild and Scenic River System. Congress conferred no such interim management authority on the BLM. The County recommends that any such statements be substituted with appropriate language indicating that management will be in accordance with the principles of multiple use and sustained yield until such time as Congress may designate for inclusion in the National WSR system.</p>	<p>review are involved. Eligibility is an inventory, solely involving river values. Suitability involves consideration of manageability and resource conflicts.</p> <p>As per BLM Manual 8351-Wild and Scenic Rivers-Policy and Program, Section .32C, all eligible rivers are considered in the EIS for the planning effort as to their suitability for congressional designation into the National Wild and Scenic Rivers System. With any suitability determination made in the ROD for the FEIS/PRMP, the free-flowing, outstandingly remarkable values, and tentative classification of rivers would continue to be protected until Congress makes a decision on designation.</p>	
007	68	<p>WSR</p> <p>Any statements in the DRMP/EIS which purports to prohibit impoundments, diversions, channelizations and rip-rapping on any river segment in San Juan County are particularly offensive to Utah State water law and water rights.</p>	<p>The Wild and Scenic Rivers Act implies a Federal reserved water right; however, it must be the minimal amount necessary for purposes of the Act, it must be adjudicated through State processes, and it would be junior to existing water rights. The amount of Federal right will vary from river to river, depending on the river's flows, the un-appropriated quantities in the river, and the values for which the river is being protected. There is no effect whatsoever on water rights on in -stream flows related to suitability findings made in a land use plan decision, barring Congressional action. Even if Congress were to designate rivers in the National Wild and Scenic Rivers System, any such designation would have no affect on existing, valid water rights. Section 13 (b) of the Wild and Scenic Rivers Act states that jurisdiction over waters is determined by established principles of law. In Utah, the state has jurisdiction over water. Although the Wild and Scenic Rivers Act implies a federal reserved water right for designated rivers, it doesn't require or specify any amount, and instead establishes that only the minimum amount for purpose of the Act can be acquired. Because the State of Utah has jurisdiction over water, BLM would be required to adjudicate the right as would any other entity, by application</p>	No

Table 5.9.b. Public Comments and Responses: San Juan County

				<p>through state processes. Thus, for Congressionally designated rivers, BLM may assert a federal reserved water right to appurtenant and unappropriated water with a priority date as of the date of designation (junior to all existing rights), but only in the minimum amount necessary to fulfill the primary purpose of the reservation. In practice, however, federal reserved water rights have not always been claimed if alternative means of ensuring sufficient flows are adequate to sustain the outstandingly remarkable values.</p> <p>During the suitability phase of the Wild and Scenic River process, San Juan County as well as the State of Utah and SITLA, were asked to supply information on uses, "including reasonably foreseeable potential uses of the area and related waters, which would be enhanced, foreclosed, or curtailed if the area were included in the national system of rivers, and the values which could be foreclosed or diminished if the area is not protected as part of the national system." Appendix H summarizes suitability input by the public as well as local communities. Suitability decisions were made considering the results of this input.</p>	
007	69	WSR	San Juan County's position is that no river segments on BLM lands in the Monticello Field Office planning area should be recommended as suitable for Congressional classification and designation in the W&SR system.	The Wild and Scenic Rivers Act (WSRA) of 1968, Congress established legislation to protect and preserve designated rivers throughout the United States in their free-flowing condition. Section 5(d)(1) of the WSRA directs federal agencies to consider the potential for national wild, scenic, and recreational river areas in all planning for the use and development of water and related land resources. A full range of alternatives for Wild and Scenic River designation are proposed in the DRMP. The Wild and Scenic River Study Process and a list of authorities and guidelines can be found in Appendix H, beginning on page H-67.	No
007	70	GRA	San Juan County is concerned with any language in the DRMP/EIS that would accept whatever wildlife herd number objective the UDWR may give to BLM, if accepting that herd	BLM works cooperatively with UDWR to provide habitat for wildlife herd objective levels which are set by UDWR and the wildlife boards (on which BLM has a representative) in an	No

Table 5.9.b. Public Comments and Responses: San Juan County

Record ID & Comment Number	Resource Category	Comment Text	Response to Comment	Doc Mod
		<p>number means BLM has to place more active use livestock AUMs in suspension. The County feels that BLM has an obligation to tell the UDWR to reduce it's herd size objectives in order to allow the restoration of all suspended use AUMs back to active use AUMs for livestock, as guaranteed by the Taylor Grazing Act.</p>	<p>open public process.</p> <p>As provided for in FLPMA, the Secretary has the discretion, in the land use planning process, to modify levels of use including livestock grazing. While it is the goal of the BLM to enhance rangeland health while providing for domestic sources of minerals, food, timber and fiber, there is no requirement in the Taylor Grazing Act (TGA) or other applicable law for the BLM "to allow the restoration of all suspended use AUMs back to active use AUMs for livestock" to the detriment of other uses of the public lands. According to FLPMA, BLM is to manage for "multiple uses" which best meet the present and future needs of the American people without permanently impairing the productivity of the land.</p>	
007	71	<p>GRA</p> <p>Utah Code Section 63-38d-401 prohibits permanent closure of grazing allotments and conversion of livestock AUMs to wildlife or other uses. The County is concerned that any decision to diminish grazing AUMs for any reason other than rangeland conditions is contrary to state law and is inconsistent with San Juan County public land policy and plans.</p> <p>When considering non-use, transfers of AUMs, suspensions of use or reductions of livestock AUMs, relinquishments or retirements, BLM decisions should be scientifically based on range conditions or rangeland health standards. Suspensions or reductions in AUMs should be temporary and should be restored to livestock use when rangeland conditions improve and not converted to wildlife or other use.</p>	<p>BLM is not permanently closing grazing allotments. BLM is determining that certain areas will be unavailable for livestock grazing for the next 15 years. These determinations may be reconsidered at any time and changed by amending the RMP or during revision of the RMP.</p> <p>The BLM is aware that there are specific County and State plan decisions relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, the BLM is bound by Federal law. FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with County plans, to the maximum extent possible by law, and that inconsistencies between Federal and non-Federal government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). Thus while County and Federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the PRMP/FEIS, so that the State and local governments have a complete understanding of the impacts of the PRMP on State and local</p>	No

Record ID & Comment Number		Resource Category	Comment Text	Response to Comment	Doc Mod
				management options. A consistency review of the PRMP with the State and County Master Plans is included in Chapter 5.	
007	72	GRA	Transfer of AUMs to wildlife violates the Taylor Grazing Act and FLPMA and would require amending Presidential Executive Orders 6910 and 6964 which withdrew public lands as chiefly valuable for grazing.	The Monticello RMP determines the allowable uses of the public lands as provided for in FLPMA. FLPMA states in Section 202(a) that land use planning provides for the use of the public lands "regardless of whether such lands previously have been classified, withdrawn, set aside, or otherwise designated for one or more uses." FLPMA further provides in Section 202(e) the authority to issue management decisions which implement newly developed or revised land use plans. BLM is not proposing to change the Grazing Districts set up under the Taylor Grazing Act and no change to Presidential Executive Orders 6910 and 6964 is needed. The Secretary has the discretion under FLPMA to use the land use planning process to close areas to grazing, change levels of use, or to devote the land to another public purpose in accordance with the relevant land use plan. Under FLPMA, BLM is to manage for "multiple uses" which best meets the present and future needs of the American people without permanently impairing the productivity of the land. The combinations of uses proposed in the Draft RMP/EIS are varied and diverse across the planning area taking into consideration the current and future needs of the public. This is consistent with both FLPMA and the TGA. The RMP does not propose to transfer AUMs from livestock to wildlife but reflects BLMS desire to manage for multiple uses of the public lands and, where appropriate, limit livestock grazing to emphasize other uses of BLM lands.	No

State of Utah	4	28	The DEIS does not address consistency between neighboring jurisdictions' management objectives.	It was the intent in the development of the RMP/DEIS to be consistent with management objectives in the adjoining Moab BLM Planning Area where appropriate. This same intent was not necessarily applied to other neighboring jurisdictions. In some cases, the opportunity to develop consistency became apparent during scoping, comment periods and various interagency coordination meetings. Section 5.3 in the FEIS, (Consistency With Other Plans), addresses the consistency issue.
San Juan County	7	31	Pg. 2-14 (note: page numbers have changed since the last draft). The Health and Safety section seems rather weak. Is abandoned mine lands the only health and safety concern in the Monticello Field Office?	The goal for the Health and Safety section states that the BLM would manage hazardous risks on public lands to protect the health and safety of public land users and stewards, protect natural and environmental resources, minimize future hazardous and related risks, costs and liabilities, and mitigate physical hazards in compliance with all applicable laws, regulations and policies. Statements were added under this section to include all physical hazards, hazardous materials and hazardous wastes for mitigation and management common to all alternatives.
San Juan County	7	39	The BLM should resolve inconsistencies in the Draft RMP/EIS. For instance on page 4-266, reference is made to "Section 3.10.4.2." However the county could find no Section 3.10.4.2. Likewise on page 4-267, reference is made to recreational trends in Section 3.10.4 but that section discusses paleontological resources.	These inconsistencies have been corrected in the PRMP.
San Juan County	7	63	The BLM refers to Section 4.3.19.2.6 but that section does not exist in the document.	The PRMP has been changed to correct this error. The sections referenced should be Sections 4.3.19.3.5, Impacts of Cultural Resource Decisions on Wildlife and Fisheries and 4.3.19.3.10, Impacts of Recreation Decisions on Wildlife and Fisheries.
San Juan County	7	64	The BLM refers to Section 4.3.19.2.15, Impacts of Habitat Fragmentation on Wildlife. That section is found at 4.3.19.3.19	The text of the PRMP has been corrected.

		on page 4-742.	
Southern Utah Wilderness Alliance	26 89	The DRMP failed to analyze the impacts of climate change to the resources of the MFO, especially on the Colorado Plateau.	<p>A growing body of scientific evidence supports the concern that global climate change will result from the continued build-up of greenhouse gases in the atmosphere. While uncertainties remain, particularly in the area of exact timing, magnitude and regional impacts of such changes, the vast majority of scientific evidence supports the view that continued increases in greenhouse gas emissions will lead to climate change. This information was added to the PRMP/FEIS.</p> <p>The EPA has not developed regulatory protocol or emission standards regarding global climate change. When these protocols and standards are available, the BLM will analyze potential effects to global warming in the NEPA documentation prepared for site-specific projects. All information to this effect was added to the PRMP/FEIS.</p>
	29 2	On page 4.624, Volume 2, there is a reference to the cumulative impacts on livestock and grazing from the "adjacent Ashley National Forest." I am not aware of any such national forest adjacent to the Monticello PA.	This error has been corrected in the FEIS.
	29 5	"The trade and service sector employees (sic) a large amount of people..." This should read "employs," not "employees." (Reference: pg. 3-107, Vol. 1, under "Shift in Regional Economic Activity," second paragraph).	This misspelling has been corrected in the FEIS.
	29 13	The list of ID team members (Reference pg. H-70, Vol. 3) did not include a law enforcement representative, yet the DRMP addresses "protection" and "enforcement" including drawing conclusions about what levels of protection given areas and/or resources need. There are no charts showing levels of law enforcement incidents, either by area or resource. This data would have been particularly valuable in determining the need for extra protection for cultural areas, route designation, ACEC nominations, and various other resource impacts, etc.	Monticello's law enforcement officers did participate in ID Team meetings and provided expertise in travel planning, cultural resources, recreation uses, woodland harvest and other matters. The list of preparers has been changed in the FEIS to correct this omission. A report of law enforcement incidents is out of scope for this document but incidents were part of the knowledge base of the law enforcement officers.

IPAMS(Independent Petroleum Assc of Mountain State	55 4	Maps 23 -27, which identify areas to be leased with NSO stipulations, do not clearly delineate the NSO areas. For example, there are approximately 40,000 acres in Alkali Ridge, and 2,146 acres are designated as NSO. However, it is impossible to tell if the acreage is scattered throughout the Alkali Ridge area, or within a contained portion of it. Operators are unable to analyze the impacts of the DRMP without that information, and therefore, unable to comment on how that NSO stipulation affects their operations.	Maps have been corrected in the FEIS and Chapter 2 describes which special designation areas are subject to NSO.
CrownQuest	62 94	Appendix A sets forth stipulations applicable to oil and gas leases in Table A.1. Many of the stipulations set forth in Appendix A, however, are not identified as restrictions on leases in Chapter 2, Table 2.1. The BLM must resolve discrepancies between the stipulations identified in Appendix 2.1 and those identified in Table 2.1. To the extent the BLM attempts to impose stipulations that are not identified in Appendix 2.1, it must analyze the impacts of these stipulations on other resource values in Chapter 4.	Any discrepancies between Appendix A and Chapter 2 have been resolved in the PRMP/FEIS.
Pamela Baker	102 1	On page 2-30 at the top under Alternative C is there a "not" missing? Otherwise the message is contradictory. Same on page 2-40 under Alternative C at the bottom of the page.	The sentence on page 2-30 at the top under Alternative C has been changed for clarification. It now reads "Dispersed camping would be allowed in the Indian Creek Corridor, except within the following designated camping zones that have been established: Bridger Jack Mesa, Indian Creek Falls, and Creek Pasture. Camping within these zones is limited to designated sites." Page 2-40 of the DEIS was incorrect as this prescription did not apply to the ACEC but to the SRMA.
Pamela Baker	102 2	On page 2-23 and 2-24 there are blank boxes under Alternative E. Should these all be "Same as Alternative B"?	These errors have been corrected in the FEIS. Alternative E should read "Same as Alternative B."
Adonia Ripple	148 1	Global climate change is one of the most serious challenges facing the world, yet the DRMP completely ignores climate change. Glen Canyon Institute	222 1	<p>The Secretary of the Interior, who oversees the BLM, considers global climate change so important that he has created a special Interior Department Climate Change Task Force to consider this pervasive issue. This action shows that even the Bush administration - which has actively weakened many environmental laws - cannot ignore the potential impacts of climate change. There is growing scientific evidence that climate change will have major impacts on the hydrology and ecosystems of the Monticello planning area and the entire West. For example, a February 2007 National Research Council report concludes that climate change is altering the hydrology of the Colorado River Basin. This has been reiterated most recently in an article in Science magazine that identifies that considerable change will occur to the climate and hydrologic processes that impact the Colorado Plateau. Moreover, many activities proposed by the BLM, such as oil, gas, and mineral extraction, ORV use, and livestock grazing, emit greenhouse gases that promote climate change. Despite this, other than one oblique reference to fire (p. 4-11), the Monticello DRMP completely ignores climate change. This calls into question the entire basis of this plan, which is meant to provide management guidance for the next 20 years.</p> <p>Changes Needed in the Final Resource Management Plan</p> <ol style="list-style-type: none"> 1. Significantly revise the DRMP to address climate change across all resource and management categories and on all levels. 2. Include a full analysis of the potential impacts of climate change on the natural resources of the planning area, including soils, precipitation and water flows, vegetation, wildlife and wildlife habitat, and aquatic communities. 3. Include a full analysis of the potential impacts on climate change of emissions of greenhouse gases resulting from current and potential consumptive activities such as oil and gas, 	<p>A growing body of scientific evidence supports the concern that global climate change will result from the continued build-up of greenhouse gases in the atmosphere. Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
Environmental Protection Agency Region 8	1	7	EPA supports increasing the size of Hovenweep ACEC but is concerned that this would result in changing the existing oil and gas leasing stipulation from NSO and TL/CSU to open with standard stipulations. This change in stipulations would likely negate the intended protection provided under the ACEC designation.	The 880 acre visual protective zone is NSO in the proposed plan. Cajon Pond would remain as TL. The remainder of the ACEC would be classified as Controlled Surface Use stipulations for oil and gas leasing. Under Alternatives B and C, the Hovenweep ACEC would be expanded 620+ acres from Alternative A, to a total of 2,418 acres. The management prescriptions under Alternatives B and C would be the same as Alternative A (the 620+ acre addition would be managed as the "General Area Exclusive of Special Emphasis Zones"). Table 2.1., pg. 2-39 will be revised to clarify the specific prescriptions that apply to the 620+ acre expansion. The total acreage shown on pg. 239 under Alternatives B and C for the Hovenweep ACEC should be 2,418 acres. BLM will correct the error. The existing BLM/NPS (1987) Cooperative Management Strategies will be added to the DRMP/DEIS references. This agreement defines VRM and NSO for visual zones.
San Juan County	7	20	The Draft RMP/EIS does not include a discussion on the nature or type of threat of "irreparable damage" or the regional	The ACEC evaluation appendix (Appendix H) was modified, and a section added discussing threats to the relevant and

Table 5.10.b. Comments Requiring a Change in the Document: ACE – Areas of Critical Environmental Concern

Committer Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>significance of relevant and important values in its review. BLM misinterprets irreparable damage when reviewing and analyzing ACECs in the Draft RMP/EIS. The ACEC tool was intended by Congress to be limited to only those instances where irreparable damage would be caused without designation. Most surface-disturbing actions can eventually be repaired.</p> <p>The BLM must explain the need for "special" management for the ACEC and explain how this management is not duplicative of other normal BLM management or protections afforded by other state or federal laws.</p>	<p>important ACEC values; however, whether the threats currently exist does not preclude a potential ACEC from being considered in the action alternatives. All nominated areas, where the BLM has determined to have relevant and important values, are identified as potential ACECs and are addressed in the action alternatives. Threats to relevant and important values are likely to vary by alternative.</p> <p>On August 27, 1980, the BLM promulgated final ACEC guidelines (45 Federal Register 57318) clarifying the term "protects" – "To defend or guard against damage or loss to the important environmental resources of a potential or designated ACEC. This includes damage that can be restored over time and that which is irreparable. With regard to a natural hazard, protect means to prevent the loss of life or injury to people, or loss or damage to property." Thus, BLM is to consider the potential for both reparable and irreparable damage when protecting important historic, cultural, or scenic values; fish and wildlife resources; or other natural systems through ACEC designation. This interpretation is consistent with FLPMA's legislative history and implementing policy.</p> <p>Section 2 of the guidelines clarifies that ACECs are special places within the public lands. It states: "In addition to establishing in law such basic protective management policies that apply to all the public lands, Congress has said that 'management of national resource lands [public lands] is to include giving special attention to the protection of ACECs, for the purpose of ensuring that the most environmentally important and fragile lands will be given early attention and protection' (Senate Report 94-583, on FLPMA). Thus, the ACEC process is to be used to provide whatever special management is required to protect those environmental resources that are most important, i.e., those resources that make certain specific areas special places, endowed by nature or man with characteristics that set them apart. In addition, the</p>

Table 5.10.b. Comments Requiring a Change in the Document: ACE – Areas of Critical Environmental Concern

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
			ACEC process is to be used to protect human life and property from natural hazards."
San Juan County	7 48	Pg. 2-37 - The statement "Portions of the Cedar Mesa ACEC lie within 8 WSAs" under Management Common to All Alternatives should be clarified because according to all of the maps there are only 4 WSAs. San Juan County recommends that BLM avoid layering of protective designations.	<p>A correction has been made in the document showing that 3 WSAs and 1 ISA lie within the Cedar Mesa ACEC.</p> <p>"Layering" is planning. Under FLPMA's multiple use mandate, BLM manages many different resource values and uses on public lands. Through land use planning BLM sets goals and objectives for each of those values and uses, and prescribes actions to accomplish those objectives. Under the multiple use concept, BLM doesn't necessarily manage every value and use on every acre, but routinely manages many different values and uses on the same areas of public lands. The process of applying many individual program goals, objectives, and actions to the same area of public lands may be perceived as "layering." BLM strives to ensure that the goals and objectives of each program (representing resource values and uses) are consistent and compatible for a particular land area. Inconsistent goals and objectives can lead to resource conflicts, failure to achieve the desired outcomes of a land use plan, and litigation. Whether or not a particular form of management is restrictive depends upon a personal interest or desire to see that public lands are managed in a particular manner. All uses and values cannot be provided for on every acre. That is why land use plans are developed through a public and interdisciplinary process. The interdisciplinary process helps ensure that all resource values and uses can be considered together to determine what mix of values and uses is responsive to the issues identified for resolution in the land use plan. Layering of program decisions is not optional for BLM, but is required by the FLPMA and National BLM planning and program specific regulations.</p> <p>FLPMA directs BLM to manage public lands for multiple use</p>

Table 5.10.b. Comments Requiring a Change in the Document: ACE – Areas of Critical Environmental Concern

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
				and sustained yield (Section 102(a)(7)). As a multiple-use agency, the BLM is required to implement laws, regulations and policies for many different and often competing land uses and to resolve conflicts and prescribe land uses through its land use plans. BLM's Land Use Planning Handbook requires that specific decisions be made for each resource and use (Planning Handbook "H-1601-1"). Specific decisions must be included in each of the alternatives analyzed during development of the land use plan. As each alternative is formulated, each program decision is overlaid with other program decisions and inconsistent decisions are identified and modified so that ultimately a compatible mix of uses and management prescriptions result.
San Juan County	7	50	Pg. 2-37 - Management prescriptions for the Cedar Mesa ACEC under Alternative C are unclear. For instance the County cannot determine rather activities such as geophysical work, disposal of mineral materials, or mineral entry are available.	The text of the PRMP has been changed to clarify the management prescriptions.
	29	10	On pg. 3-127, Vol. 1, the total number of existing ACEC acres under the 1991 RMP is listed at 513,452. On pg. ES-6, Vol. 1, and again on pg. 2-4, Vol. 1, the total number of existing ACEC acreage is 488,616, a difference of 24,836 acres. Is there overlap in ACECs or is the agency unaware of exactly how much is already designated as ACECs?	This inconsistency has been corrected in the FEIS with the correct acreage figure.
Lynell Schalk	29	32	Valley of the Gods ACEC: There is no mention of OHV and non-motorized/mechanical use prescriptions under Alternatives B, C, D, and E.	Under the proposed plan the Valley of the Gods would be designated as a Scenic ACEC. The Travel Plan will designate this area as limited to designated roads and trails. Motorized use and mechanized use would be restricted to designated roads and trails. Foot travel is allowed throughout the ACEC.
Bluff Landowners Coalition	48	6	Valley of the Gods ACEC: Why is this existing ACEC being reduced by nearly 10,000 acres (Alternative B and C)? It is a world class scenic area and should be provided additional protection, not less so (Reference: pg. 2-45, Vol. 1). There is also no mention of OHV	Valley of the Gods was a special emphasis area with the Cedar Mesa ACEC and was never an ACEC in its own right under Alternative A. The Valley of the Gods ACEC boundary was made to be coincident with the Road Canyon WSA to avoid unnecessary overlap. Additionally, the area estimates for

Table 5.10.b. Comments Requiring a Change in the Document: ACE – Areas of Critical Environmental Concern

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		and non-motorized/mechanized use prescriptions under Alternatives B, C, D, and E. Are mountain bikers and other nonmotorized wheeled vehicles allowed indiscriminate cross-country travel here?	<p>the 1991 RMP were made without the use of GIS, and may be inaccurate.</p> <p>OHV use is to be on designated roads and trails in Alternatives B, C, D and E. This has been clarified in the PRMP.</p> <p>Under the proposed plan the Valley of the Gods would be designated as a Scenic ACEC. The Travel Plan will designate this area as limited to designated roads and trails. Motorized use and mechanized use would be restricted to designated roads and trails. Foot travel is allowed throughout the ACEC. See Map 63 for the travel plan for this area.</p> <p>The WSA area not part of the ACEC under the proposed plan will be managed within the management prescription of the IMP. This area would not be open to motorized or mechanized use.</p>

Table 5.10.c. Comments Requiring a Change in the Document: AQ – Air Quality

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment	
Environmental Protection Agency Region 8	1	1	Several references in Section 4.4.1 refer to projected air pollutant concentrations as being well below National Ambient Air Quality Standards. The commenter found projected concentrations in Table 3-8 of the Draft Analysis of Management Situation (AMS) but not in the Draft RMP/EIS. The DRMP/EIS does not describe in detail the methods used to calculate the projected concentrations. EPA recommends that BLM disclose this information in the Final RMP/EIS.	The methods used to calculate the projected concentrations of pollutants are included in the PRMP/FEIS. The BLM analyzed potential impacts by a qualitative emissions-based approach. BLM estimated potential emissions from BLM activities within the planning area. The State of Utah provided emissions from permitted sources.
Environmental Protection Agency Region 8	1	2	The air quality analysis omits potential impacts to ozone, visibility and deposition. The planning area encompasses and is near class I National Park Service airsheds. Ozone is of	Analyses of impacts on ozone, visibility, and deposition are included in Chapter 4 of the PRMP/FEIS. Please see updated descriptions of current ozone concentrations, visibility and

		particular concern because of the potential emissions of volatile organic compounds and oxides of nitrogen from sources in the area including oil and gas development.	atmospheric deposition in Chapter 3, Section 3.2.2, 3.2.4, and 3.2.5.
Environmental Protection Agency Region 8	1 3	The RMP makes general estimates of air quality impacts due to various activities but does not describe nor calculate the projected concentrations for any of the alternatives. EPA recommends that BLM disclose projected NAAQS and visibility pollutant concentrations in the FEIS. EPA recommends that the FEIS contain wording from the Rawlins BLM DRMP/EIS, which used a comparative, emissions-based approach: "As project-specific developments are proposed, quantitative air quality analysis would be conducted for project-specific assessments performed pursuant to NEPA."	The BLM's draft air resources guidance states that quantitative dispersion modeling is inappropriate in the absence of detailed emission data, especially source location information. BLM would consider dispersion modeling for a project-specific EIS associated with a proposed project. Please see chapter 4 Air Quality for the added text.
Environmental Protection Agency Region 8	1 12	Figure 3.3 of the DRMP/EIS presents visibility trend data through 1997. Data through 2005 are now available and should be used in the FEIS.	Data has been added to Chapter 3 giving visibility in Canyonlands National Park from 1990 through 2004.
Environmental Protection Agency Region 8	1 16	Section 4.3.1.2.1.1 includes sources of emissions from various oil and gas activities but it is unclear how drill rig emission sources were included or treated in the emission inventory. The FEIS should reference the more current emission estimates from the UT DAQ's most recent Annual Report (2005). It is also not clear how these existing emission sources are interpreted. BLM should disclose this information in the FEIS.	This section (methodology and emission estimates) was rewritten using AP-42 methodology.
Environmental Protection Agency Region 8	1 17	The AMS Table 3-4 and Figure 3-3 should be updated with more current data.	Section has been updated with more recent data.
National Park Service Intermountain Region	3 3	The EIS refers to projected future emissions from oil and gas sources; these estimates are omitted from the EIS but should be included.	Estimated emissions from BLM activities within the Monticello Planning Area have been added to Chapter 4.
State of Utah	4 14	The state encourages BLM to request oil and gas operators apply best available control technology (BACT).	The application of BACT for oil and gas development has been added to the mitigation section in Chapter 4.

Table 5.10.c. Comments Requiring a Change in the Document: AQ – Air Quality

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
State of Utah	4	43	The section entitled Impacts of Mineral Decisions on Air Quality under Alternative A discusses emissions from multiple sources and notes that emissions from each source are well below applicable NAAQS. BLM relies on this statement as basis for each alternative, noting that impacts would be the same or similar to Alternative A. It is unclear how BLM equates additional emissions to anticipated ambient conditions.	Please see revised air resources section in Chapter 4. BLM would consider using a quantitative approach to estimate potential concentrations for a project-specific EIS associated with a proposed project.
Ute Mountain Ute Tribe	6	9	Tribal members' health could be compromised by air pollution related to uranium and oil and gas development. The White Mesa community is surrounded by BLM lands identified as having moderate potential for uranium development as well as oil and gas development potential. The FEIS needs to more carefully consider the potential impacts to air quality and human health from mineral development.	The analysis related to air quality has been updated in the PRMP/FEIS.
National Parks Conservation Association	44	1	The RMP ignores data from the Canyonlands National Park IMPROVE particle monitor. Table 3.2 sites only the ozone data from this monitor but ignores PM2.5, PM 10, sulfate, nitrate, organics, and elemental carbon. The BLM needs to re-evaluate its findings utilizing existing air quality data and make meaningful analysis of current and future conditions.	These data have been added to Table 3.2 in Chapter 3 of the RMP/FEIS.
National Parks Conservation Association	44	5	The cumulative impacts analysis on air quality fails to adequately address the threats from increased energy development in the area. The Four Corners region is seeing an explosion in oil and gas developments along with proposed coal fired power plants. There are also three new proposed coal fired power plants across the border in Nevada. Additionally, the surrounding BLM regions of Kanab, Moab and Richfield are releasing new resource management plans. Implementation of the Monticello RMP would have impacts that would add to these other past, present and reasonably foreseeable future projects that have not been analyzed. BLM needs to adequately address these impacts and consider reissuing the draft for public review.	BLM has added oil and gas development to the list of activities that contribute to cumulative impacts. Please see section 4.3.24.1.
EOG Resources	60	42	On page 4-10, the BLM assumes that "regulatory [Prevention of	This sentence has been revised to make clear that UDEQ

Table 5.10.c. Comments Requiring a Change in the Document: AQ – Air Quality

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		Significant Deterioration] increment consumption analyses are the responsibility of the state air quality agency (under Environmental Protection Agency [EPA] supervision) and would be conducted where appropriate during the permit process" (emphasis added). Monticello DRMP/EIS, pg. 4-10. The BLM should revise this sentence to clarify that Prevention of Significant Deterioration (PSD) analyses would occur during the process for air emission permits to be obtained from the UDEQ, and not during the process for APDs that are obtained from the BLM/ As the BLM correctly observes on page 4-10, the UDEQ, and not the BLM, has the sole authority to conduct PSD analyses.	permits for air emissions would be obtained.
EOG Resources	60 43	See Monticello DRMP/EIS, pgs. 4-14, 4-17,4-16. As the BLM is aware, the EPA revised the 24 hour NAAQS standard for PM to lower it from 65 ug/m. 71 Fed. Reg. 61144 (Oct. 17, 2006). The new 24 hour PM became effective on December 18, 2006 but states will not actually be required to meet the new 24 hour NAAQS for PM until April 2015, with possible extensions until April 2020. The BLM correctly references the revised standard elsewhere in the Monticello DRMP/EIS. See Monticello DRMP/EIS, pg 3-6, Table 3.2. The BLM should correct the references in Chapter 4 to reflect the new standard to demonstrate that the management prescriptions proposed in the Monticello MP/EIS will not jeopardize compliance with the more conservative standard.	The PRMP/FEIS has been corrected in Chapter 4 on air quality to reflect the new NAAQS standard.
CrownQuest	62 78	When analyzing potential impacts to air quality, the BLM states that the 24-hour National Ambient Air Quality Standard (NAAQS) for PM emissions is 65 ug/m. See Monticello DRMP/EIS, pgs. 4-14, 4-17, 4-16. As the BLM is aware, the EPA revised the 24-hour NAAQS standard for PM to lower it from 65 ug/m to 35 ug/m. 71 Fed. Reg. 61144 (Oct. 17, 2006). The new 24-hour PM became effective on December 18, 2006 but states will not actually be required to meet the new 24-hour NAAQS for PM until April 2015, with possible extensions until	Please refer to response to comment 60-43.

Table 5.10.c. Comments Requiring a Change in the Document: AQ – Air Quality

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		April 2020. The BLM correctly references the revised standard elsewhere in the Monticello DRPM/EIS. See Monticello DRMP/EIS, pg. 3-6, Table 3.2. The BLM should correct the references in Chapter 4 to reflect the new standard to demonstrate that the management prescriptions proposed in the Monticello RMP/EIS will not jeopardize compliance with the more conservative standard. Additionally, the BLM should maintain consistency throughout the document.	
Megan Williams	76 5	The MPA encompasses an area of frequent drought. These conditions can be expected to contribute to particulate matter exposure and visibility impacts in the area. In addition, the area is seeing ozone concentrations that threaten to exceed the 8-hour ozone NAAQS. For the BLM to present alternatives for the MPA that allow significant growth in the emissions that contribute to these existing air quality concerns is extremely shortsighted when one considers the impacts of these air pollutants to human health and the environment. These issues must be dealt with in this resource management plan by ensuring overall air quality compliance throughout the affected areas.	BLM does not have control over drought related particulate emissions. PM emissions related to oil and gas development will be recalculated using AP-42 methodology and compared to existing emissions in Grand and San Juan Counties. The BLM will follow the air quality regulations required by the Department Air Quality, State of Utah.
Megan Williams	76 9	The BLM has not analyzed whether the plan will prevent significant deterioration (PSD) of air quality, as required by the Clean Air Act. The BLM must complete an analysis to determine how much of the incremental amount of air pollution allowed in clean air areas (i.e., PSD increment) has already been consumed in the affected area and how much additional increment consumption will occur due to the proposed development. Without this analysis, the BLM is not ensuring that the air quality in the MPA will not deteriorate more than allowed under the CAA.	The new air quality analysis will calculate total emissions related to the plan using AP-42 methodology. These emissions will be compared to existing emissions. However, concentrations will not be calculated since dispersion modeling will not be used.
Megan Williams	76 11	The NO emissions from compression are based on the assumption that all gas compressors are equipped with the Best Available Control Technology (BACT) with an emission rate of 0.7 grams of NO per horsepower-hour (g/hp-hr). DEIS/RMP at	A discussion of Utah's BACT requirements has been added to the appropriate section.

Table 5.10.c. Comments Requiring a Change in the Document: AQ – Air Quality

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		4-9. There should be a discussion of Utah's BACT requirements and whether BACT would apply to all compressor engines under current state rules. Because BACT determinations are made on a case-by-case basis, there is no guarantee that similar BACT emission limits will necessarily be required for every compressor engine. Therefore, the BLM needs to provide justification that the emission limits assumed for compressor engines will be similar to, and not less stringent, than those assumed for the BLM's Monticello DEIS/RMP inventory.	
Megan Williams	76 13	It is unclear from the SEIS/RMP to what extent the BLM quantified VOC emissions from oil and gas development. On page 4-14 and 4-15 of the DEIS/RMP the BLM discusses NO and CO emissions from flaring but there are few details of these estimates. The BLM must analyze VOC emissions from flaring and from other potential sources (e.g., from dehydration, well completion, leaking well heads and pipes, etc.). The BLM must analyze all sources of VOC emissions from oil and gas development.	AP-42 methodology has been used to quantify VOC emissions associated with oil and gas development in the revised air quality analysis.
Megan Williams	76 14	<p>The Monticello DEIS/RMP Does Not Include a Comprehensive Regional Inventory for Use in Determining Cumulative Air Quality Impacts</p> <p>In addition to a comprehensive inventory of oil and gas activities and other BLM-administered activities in the MPA, the BLM must inventory all pollutants from all other air pollution sources in the planning area as well as all sources expected to impact the same areas impacted by emissions from the planning area. The inventory presented in Table 3.4 of the DEIS/RMP for three sources in San Juan County does not constitute an adequate inventory of sources. The inventory of sources should include state-permitted sources in Utah and surrounding states, Utah Division of Oil, Gas, and Mining and Colorado State Oil and Gas Commission permitted oil and gas wells, the oil shale research, development and demonstration sites in Utah and Colorado as well as all reasonably foreseeable development</p>	<p>A summary of existing emissions in Grand and San Juan County has been updated using 2005 data. This will replace the estimates for 2002 currently in Table 3.4. The units of emissions are in tons/year as reported by the State of Utah. These data can be found at: http://www.airquality.utah.gov/Planning/Emission-Inventory/2005_State/05_State_List.htm</p>

Table 5.10.c. Comments Requiring a Change in the Document: AQ – Air Quality

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		(RFD) sources (e.g., other NEPA projects, proposed power plants, proposed mining operations, future commercial tar sands development, etc.).	
Megan Williams	76 15	<p>Coal-fired power plants can often have significant impacts on a Class I area even when located 200-300 km or more away from that area. Specifically, the following power plants were recently permitted or are proposed in the region:</p> <p>The 1,500 MW Desert Rock power plant in northwest New Mexico (no permit issued yet)</p> <p>The 270 MW Sevier Power Company coal-fired plant in Sigurd, Utah in the Richfield PA (recently permitted)</p> <p>The 950 MW Unit 2 Intermountain Power Project in the central part of Utah near Delta (permit issued)</p> <p>The 600 MW Unit 4 at the Hunter Power Plant (PacifiCorp) in central Utah (no permit issued yet)</p> <p>The 110 MW Unit 2 at the Bonanza Power Plant in Uintah County in northeast Utah (permit issued August 30, 2007)</p> <p>All of these power plants have the potential to impact the same Class I areas that are impacted by the Monticello planning area and, therefore, must be included in the BLM's regional inventory. In addition, the BLM must include in the regional inventory any other new or modified sources, other than power plants, proposed in the region.</p>	Discussion of coal-fired power plants in the region has been added to the discussion of cumulative impacts for air quality.
Megan Williams	76 20	The BLM must also disclose the cumulative hazardous air pollutant (HAP) impacts to the exposed population. The BLM's assessment must be a cumulative one, not just an analysis of the incremental risk associated with the oil and gas projects, which would be imposed on top of existing health risks in the area. It should, at a minimum, include an analysis of the health impacts of the following HAPs associated with oil and gas development; benzene, toluene, ethylbenzene, xylene, n-hexane, 1, 3-butadiene, formaldehyde and secondary	AP-42 has been used to estimate total HAPs emissions and compare to current HAPs emissions in San Juan County. HAPs have been added to the discussion on cumulative impacts.

Table 5.10.c. Comments Requiring a Change in the Document: AQ – Air Quality

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			formaldehyde as well as diesel exhaust.	
Susan Dexter	77	2	To properly assess various alternatives and their impacts, it would be necessary to analyze green house gas emissions associated with each activity (mineral extraction, burning, ORV use, grazing, etc) Furthermore, the analysis would need to include, not just the levels of green house gas increases resulting from the immediate activity, but those of all the activities or processes supporting the activity, including the use of motorized vehicles to transport ORVs to the sites of recreational use; the use of motorized vehicles in grazing activities; the generation of electric power for mining and oil and gas extraction, and so on. These long term cumulative effects are not addressed, whatsoever.	Information on global climate change has been added to the PRMP/FEIS. The degree of specificity requested by the commenter would be purely speculative.

Table 5.10.d. Comments Requiring a Change in the Document: CUL – Cultural Resources

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
Environmental Protection Agency Region 8	1	18	AMS Section 3.3.1 should be corrected to state that while the Uintah and Ouray Indian Reservation is under authority of EPA Region 8, the Navajo Reservation is under the authority of EPA Region 9.	EPA Region 9 has been listed as the authority for the Navajo Reservation.
State of Utah	4	63	The RMP proposes avoidance areas around National Register-eligible cultural resources and specific 100-foot buffers (page 4-284 and 4-385). The state recommends that rather than stipulations of a standard avoidance distance that the RMP stipulate that avoidance areas will be established that will be sufficient to protect the resources from direct and indirect impacts.	The intent of BLM is not to require a specific 100-foot buffer around National Register-eligible sites but to require an avoidance distance sufficient to protect cultural resources. The final RMP/EIS will refer to the 100-foot buffer only under Alternative A since that is the current management prescription. BLM will add narrative to the proposed RMP to clarify that a specific avoidance distance will not be required.
State of Utah	4	64	It is unclear from the RMP (Pages 2-39, 40 and Table 4.18) what protective measures are proposed under the various	Under Alternatives B and C, the Hovenweep ACEC would be expanded 620+ acres from Alternative A , to a total of 2,418

Table 5.10.d. Comments Requiring a Change in the Document: CUL – Cultural Resources

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		alternatives for Hovenweep National Monument, Square Tower (and potentially Cajon) Unit(s). Please clarify how potential visual impacts to the setting, feeling, and association of these units, particularly from solid and/or fluid minerals leasing and/or development, will be managed.	acres. The management prescriptions under Alternatives B and C would be the same as Alternative A (the 620+ acre addition would be managed as the "General Area Exclusive of Special Emphasis Zones"). Table 2.1., pg. 2-39 has been revised to clarify the specific prescriptions that apply to the 620+ acre expansion. The 880 acre visual protection zone around the Monument has been carried forward in the FEIS under an NSO lease category. The total acreage shown on pg. 239 under Alternatives B and C for the Hovenweep ACEC should be 2,418 acres. BLM will correct the error.
State of Utah	4 65	With exception of the Alkali Ridge NHL, the Alkali Ridge area is listed under all alternatives as open for oil and gas development with either standard conditions or timing/controlled surface use conditions. The area appears to go from VRM Class III to VRM Class IV under all alternatives. The change in VRM Class appears to have the potential to result in adverse effects which will need to be analyzed during consultation on the RMP under Section 106 of the NHPA.	BLM understands its requirement to consult with the SHPO on the RMP and will comply. VRM class will remain as Class III for Alkali Ridge ACEC in the PRMP.
State of Utah	4 66	The Stipulation in Appendix A (Page A-5) for the Alkali Ridge area reiterates that an avoidance area will be established, but does not note whether this area will include consideration of indirect and cumulative as well as direct impacts to cultural resources.	BLM has reconsidered the stipulations for the Alkali Ridge ACEC and has rewritten them to include consideration of direct and indirect impacts to cultural resources.
State of Utah	4 68	Table 2.1 (Page 2-8). The state encourages BLM to clarify the purposes and types of land treatments that could be authorized in the Comb Ridge CSMA, specifically whether land treatments modify the NSO stipulation as well as what VRM class would apply to this area.	The Comb Ridge CSMA will be carried forward into the Proposed RMP as a recreation management zone within the Cedar Mesa Special Recreation Management Area (SRMA). Most of the management prescriptions proposed for the Comb Ridge CSMA will apply to the Comb Ridge recreation management zone. Future activities within the recreation management zone would be required to comply with those management prescriptions, including NSO and VRM II management objectives.

Table 5.10.d. Comments Requiring a Change in the Document: CUL – Cultural Resources

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
			<p>Appendix A in the proposed RMP lists stipulations, including NSO and VRM II, that apply to surface disturbing activities within specific areas of the Monticello Field Office. The stipulations do not apply to non-surface disturbing activities as defined in the appendix. It is conceivable that non-surface disturbing activities could be allowed in the Comb Ridge recreation management zone. That determination would be made through site specific analysis of the proposal.</p>
National Trust for Historic Preservation	13 1	<p>The draft RMP shows little commitment to scientific investigation in the field office over 90% of which has never been surveyed. The draft RMP also contains inconsistent management standards for comparable cultural resources and lacks an alternative focused on their protection. The draft RMP proposes to designate and implement nearly 2000 miles of OHV routes without complying with Section 106 of the NHPA, 16 USC 470f, and with little recognition of its obligation to preserve and protect cultural resources pursuant to Section 110 of the NHPA, 16 USC 470h-2.</p>	<p>The BLM does show commitment to scientific investigation and proactive Section 110 inventory. The first goal outlined for Cultural Resources in Table 2.1, Page 2.8 states that the BLM would identify, preserve, and protect important cultural resources. Under the Cultural Resources Section, Table 2.1, Page 2-8, it states that BLM would provide for legitimate field research by qualified scientists and institutions.</p> <p>Line 2 under Cultural Resources Management Actions Common to All Alternatives will be modified to make specific reference to proactive inventory under Section 110 of NHPA and Section 14 of ARPA.</p> <p>Alternative B focused on management prescriptions providing additional protection to various resources including cultural resources. This alternative proposed establishment of special designations on certain areas of high cultural site density with management prescriptions designed to minimize impacts to cultural resources.</p> <p>The BLM will comply with its Section 106 responsibilities as direct by the NHPA regulations and BLM IM-2007-030 (Clarification of Cultural Resource Considerations for Off Highway Vehicle Designation and Travel Management). As described in BLM IM-2007-030, cultural resource inventory requirements, priorities and strategies will vary depending on the effect and nature of the proposed OHV activity and the</p>

Table 5.10.d. Comments Requiring a Change in the Document: CUL – Cultural Resources

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
			<p>expected density and nature of historic properties based on existing inventory information.</p> <p>A. Class III inventory is not required prior to designations that (1) all continued use of an existing route; (2) impose new limitations on an existing route; (3) close and open area or travel route; (4) keep a closed area closed; or (5) keep an open area open.</p> <p>B. Where there is a reasonable expectation that a proposed designation will shift, concentrate or expand travel into areas where historic properties are likely to be adversely affected, Class III inventory and compliance with Section 106, focused on areas where adverse effects are likely to occur, is required prior to designation.</p> <p>C. Proposed designations of new routes or new areas open to OHV use will require Class III inventory of the Area of Potential Effect and compliance with Section 106 prior to designation. Class III inventory of the APE and compliance with Section 106 will also be required prior to identifying new locations proposed as staging areas or similar areas of concentrated OHV use.</p> <p>D. Class II inventory, or development of field testing of a cultural resources probability model, followed by Class III inventory in high potential areas and for specific projects, may be appropriate for larger planning areas for which limited information is currently unavailable.</p> <p>The Monticello field office is developing a strategy for compliance with Section 106 for implementation of the travel plan consistent with BLM policy and budget allocations. The Utah SHPO was consulted on the Travel Plan in the DRMP, and further consultations will take place in relation to the strategy that is currently being developed for compliance with Section 106.</p>

Table 5.10.d. Comments Requiring a Change in the Document: CUL – Cultural Resources

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
National Trust for Historic Preservation	13	14	Under each alternative, BLM would, "in coordination with San Juan County" identify and evaluate historic trail segments for National Register eligibility. BLM must acknowledge that additional parties, Indian Tribes and USHPO have designated roles.	The statement that the commenter is referring to in Cultural Resources, Management Actions Common to All (Table 2.1, Page 2-8) has been modified to include and acknowledge the USHPO, tribes, and other interested stakeholders.
Lynell Shalk	29	9	<p>Cultural Resources - Issues:</p> <p>In the scoping section (Reference: 1.3.1.1 Cultural Resources, pg. 1-4 and 1-5, Vol. 1), the DRMP states that two of the "issues of concern" are:</p> <p>(1) "protection of sensitive cultural resources from vandalism;" and (2) "management of National Historic trails (Old Spanish National Historic Trail and Hole in the Rock Trail) in compliance with the intent of the enabling legislation so that the historic resource is protected."</p> <p>If these are issues to be addressed in the DRMP, then I could find no evidence that they were addressed. In fact, the exact opposite intention shows up a few pages later (Reference: 1.3.2 Issues Addressed Through Administrative or Policy Action, pg. 1-10, Vol. 1), which states that vandalism will be addressed by administrative actions and does not require a "planning decision to be implemented." So why is this listed previously as an issue to be addressed in the DRMP, if in fact, it isn't going to be?</p>	<p>The reviewer is correct in stating that vandalism is mentioned as an issue in Chapter 1, 1.3.1.1, page 1-5 and again in Chapter 1, 1.3.2, page 1-10. Vandalism is an issue addressed through administrative or policy action. The issue of vandalism in Chapter 1, 1.3.1.1, page 1-5 has been removed.</p> <p>Management of The Old Spanish Trail and Hole in the Rock Trail is addressed in Table 2.1, Page 2-12, under Historic Trails, Management Common to All Alternatives.</p>
Lynell Schalk	29	31	San Juan River ACEC: Under Alternatives B, C, and D (Reference: pg. 2-43, Vol. 1), one of the prescriptions is that there will be "no camping in cultural sites." I did not find this prescription anywhere else in the DRMP. Shouldn't all cultural sites be closed to camping? Shouldn't a camping restriction have been listed under the Cultural spread sheet in Vol. 1 under "Management Common to all Alternative?"	A prescription regarding camping within archaeological sites has been added to the Cultural Resources Section, Management Common to All Alternatives (Table 2.1, Page 2.8). No camping will be allowed within cultural sites.
EOG Resources	60	13	EOG objects to the proposal on page 2-8 and 2-9 to designate the Comb Ridge Cultural Special Management Area (CSMA) as available for leasing subject only to NSO stipulations under all	The BLM acknowledges EOG Resources objection to the Comb Ridge area as available for leasing subject to NSO. Map 29 has been changed to reflect the NSO stipulation for

Table 5.10.d. Comments Requiring a Change in the Document: CUL – Cultural Resources

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			the action alternatives. See Monticello DRMP/EIS, pgs. 2-8 - 2-9, Table 2.1. First, EOG notes that although Alternative C proposes the same management as proposed under Alternative B, Map 29 (Oil and Gas Leasing – Alternative C) does not depict the Comb Ridge CSMA area as subject to NSO stipulations. The BLM must revise the management prescriptions on pages 2-8 and 2-9 to be consistent with Map 29.	the Comb Ridge.
CrownQuest	62	16	Additionally, the BLM should define "culturally sensitive areas" in the final Monticello RMP/EIS.	This definition has been added to the PRMP/FEIS.

Table 5.10.e. Comments Requiring a Change in the Document: GRA – Grazing

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
State of Utah	4	46	There is an apparent discrepancy in the number of acres unavailable for livestock grazing under all alternatives as indicated on pages 2-16 and 4-254. Please resolve.	Acreages for particular areas may vary slightly due to the differences in shapefiles for GIS calculations. The correct acreage figure is 128,098 acres to remain unavailable for grazing. Additional acres unavailable for grazing are added to this figure in each alternative. Acreage corrections have been made in the FEIS.
State of Utah	4	47	Under the No Action Alternative, BLM would make an additional 20,361 acres unavailable for livestock grazing. Please clarify why the No Action Alternative involves a change in current management.	The No Action Alternative implements a previous court decision pending final determination in RMP revision that closed grazing in several Comb Wash side canyons (Mule Canyon south of U-95, Arch, Fish, Owl, and Road). This decision closed 16,599 acres (pg. 2-92) (20,361 is incorrect). These acres are included in acres closed under the No Action Alternative, thus no change in current management (see pg. 4-70). The statement of additional acres unavailable on page 4-254 is incorrect as these acres are already included in the No Action Alternative acres. These errors have been corrected in the FEIS.

Table 5.10.e. Comments Requiring a Change in the Document: GRA – Grazing

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
Lynell Schalk	29	7	<p>Grazing Acreage Inconsistency:</p> <p>There are two identical statements made regarding the number of acres "unavailable for livestock grazing for resource protection" within boundary allotments. One indicates 125,356 acres (Reference: pg. 3-41, Vol. 1). The other indicates 137,440 acres. Which is it?</p>	<p>Acreages for particular areas may vary slightly due to the differences in shapefiles for GIS calculations. The correct acreage figure is 128,098 acres to remain unavailable for grazing. Additional acres unavailable for grazing are added to this figure in each alternative. Acreage corrections and inconsistencies have been made in the FEIS.</p>
Lynell Schalk	29	8	<p>Grazing Allotments:</p> <p>Because there is no accompanying map depicting where each of the 75 grazing allotments is located, it is impossible to locate them based on the names used to describe them.</p>	<p>An allotment map with associated names for the Monticello Field Office has been included in the final Resource Management Plan.</p>
Tom Ratcliff	56	2	<p>In the final analysis, your "Livestock Grazing" section is incomplete and inadequate. Real issues of serious range management problems are not disclosed; a significant portion of the workload is dismissed by placement in to "custodial" management. Alternative A makes several grazing management changes, which is good, but which is not "No Action." Specific range management measures needed for range improvement are not disclosed, and in the end, AUM reductions between Alternatives are not significant, ranging from 750 to 940 out of a total program of 78,796 AUMs. (1% decrease at most extreme) The "Livestock Grazing" discussion is simply a justification for continuing business as usual. There is no significant change proposed, nor are there significant differences between Alternatives.</p>	<p>Alternative A is referred to as the "No Action" alternative which means continuation of current management (including action items) under the 1991 RMP.</p> <p>The purpose of the current RMP revision was to update the RMP to provide management consistent with changes that have occurred since completion of the 1991 RMP. Alternatives were designed to provide a range of actions to resolve issues brought out by public scoping and internal review.</p> <p>Please refer to response to comment 058-4.</p>
ECOS Consulting	58	4	<p>The DRMP's range of alternatives for livestock grazing is not adequate and must be expanded to include alternatives that prohibit grazing (0%), allow a small amount of grazing (15-25%), or more grazing (50%), or a lot of grazing (>90%). As proposed -- with most of the area within the Monticello Planning Area open to the widespread soil and vegetation adverse</p>	<p>Alternatives for no livestock grazing and an increased allocation of forage to wildlife and other non-consumptive uses were considered for inclusion in the DRMP/DEIS. However, they were eliminated from further analysis; a discussion concerning these alternatives has been included in Chapter 2 of the PRMP/FEIS, Section 2.3, Alternatives Considered but</p>

		<p>impacts of livestock grazing, probably over 88% or approximately 1,800,000 acres -- it appears that the FLPMA mandates of "multiple use" and "sustained yield" are in jeopardy.</p>	<p>Eliminated from Analysis.</p> <p>It is BLM policy to monitor existing livestock use levels, forage utilization, and the trend of resource condition and make necessary adjustments on an allotment or watershed basis. These actions are activity-based actions and are part of the implementation of an RMP to assure that Rangeland Health Standards are met, as well the other objectives of the RMP. Regulations at 43 CFR 4130.3 require that the terms and conditions under which livestock are authorized "ensure conformance with the provisions of subpart 4180," the Standards for Rangeland Health and further 43 CFR 4130.3-1 require that "livestock grazing use shall not exceed the livestock carrying capacity of the allotment."</p> <p>It would be inappropriate and unfeasible to estimate variable levels of livestock and wildlife use and determine what specific changes to livestock and wildlife numbers and management are appropriate at the RMP planning level. Such changes would not be supportable and need to be made by considering the monitoring data on a site-specific basis. The BLM policy directs that monitoring and inventory data be evaluated on a periodic basis and that change to livestock numbers and management be made through a proposed decision under 43 CFR 4160. These implementation level decisions will be in conformance with the Goals and Objectives of the applicable RMP, and must protect and enhance the conditions and uses of the BLM lands.</p>
Thomas Ratcliff	79 1	<p>You provide no MFO allotments map, so the non-local reader/reviewer has no way to know where these "good allotments" are located!</p>	<p>An allotment map with associated names for the Monticello Field Office has been included in the final Resource Management Plan.</p>
Thomas Ratcliff	79 2	<p>Twenty-nine allotments are in your "improve" category; "may have serious resource conflicts (again undefined)...or resource production below its potential...can be improved, conflicts resolved through changed grazing strategies or range</p>	<p>An allotment map with associated names for the Monticello Field Office has been included in the final Resource Management Plan.</p>

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		improvement projects" (which I assume would be "public investments"). NO MFO allotments map---we can't know where they are since we don't live there and know local place names.	
Thomas Ratcliff	79 3	At 3.7.2.5 you discuss Ecological Status of the allotments rated on a PCN scale. You'll need to correct some errors that occur in Table 3.13. You show 3.6% of your allotments at PCN. 4 allotments of 73 would be 5.5%; 3 allotments would be 4.1%. 3.6% obviously comes from a different data set!	The percentage figures are based upon an acreage total, not allotment. The title to Table 3.13 has been updated to "Percent of Acres within the Monticello FO Boundaries by Ecological Class."
Thomas Ratcliff	79 4	Without a MFO allotments map, we cannot properly evaluate the appropriateness of the prescribed grazing season. Similarly, we cannot determine if dormant season grazing (mid-October thru early March, based on our experience in your country) is occurring in big game winter range, or in other crucial habitat where livestock/big game conflicts most likely occur.	An allotment map with associated names for the Monticello Field Office has been included in the final Resource Management Plan. All grazing that occurs in big game winter range is under a deferred rotation system.
Thomas Ratcliff	79 5	AUM reductions between Alternatives are not significant, ranging from 750 to 940 out of a total program of 78,796 AUMs. (1% decrease at most extreme) The "Livestock Grazing" discussion is simply business as usual. There is no significant change proposed, nor are there significant differences between Alternatives.	<p>An alternative considering the increased allocation of forage to wildlife and other non-consumptive uses was considered for inclusion in the DRMP/DEIS. However, it was eliminated from further analysis; a discussion concerning this alternative has been included in the PRMP/FEIS under Alternatives Considered but Eliminated from Analysis.</p> <p>It is BLM policy to monitor existing livestock use levels, forage utilization, and the trend of resource condition and make necessary adjustments on an allotment or watershed basis. These actions are activity-based actions and are part of the implementation of an RMP to assure that Rangeland Health Standards are met, as well the other objectives of the RMP. Regulations at 43 CFR 4130.3 require that the terms and conditions under which livestock are authorized "ensure conformance with the provisions of subpart 4180," the Standards for Rangeland Health and further 43 CFR 4130.3-1 require that "livestock grazing use shall not exceed the livestock carrying capacity of the allotment."</p> <p>It would be inappropriate and unfeasible to estimate variable</p>

				levels of livestock and wildlife use and determine what specific changes to livestock and wildlife numbers and management are appropriate at the RMP planning level. Such changes would not be supportable and need to be made by considering the monitoring data on a site-specific basis. The BLM policy directs that monitoring and inventory data be evaluated on a periodic basis and that change to livestock numbers and management be made through a proposed decision under 43 CFR 4160. These implementation level decisions will be in conformance with the Goals and Objectives of the applicable RMP, and must protect and enhance the conditions and uses of the BLM lands.
Owen Severance	105	2	The DEIS on page 2-17 opens Dark Canyon to grazing by not carrying this restriction forward in other alternatives. Why?	This was an oversight in the DEIS. Clarification has been added to the PRMP/FEIS specifying that Dark Canyon continues to be unavailable for grazing.
Nick Stevens	115	1	The information in the Draft EIS regarding range management is inadequate. Range allotments are listed however their physical location is not mapped.	An allotment map with associated names for the Monticello Field Office has been included in the final Resource Management Plan.
Linda Peterson	126	1	Under Alternative C you have eliminated grazing and limited livestock use to trailing in at least four or more canyons. (Moki, Harts, Lake and Indian Creek). Grazing is a traditional, historic use of these canyons. The Proposed RMP does not say why you are closing grazing in these canyons. Although the Proposed RMP does address the socio-economic impact of these closures on the livestock industry in San Juan County as a whole. It did not address the adverse economic or management impact that the closures would have on the individual grazing operators. Studies have show that proper grazing techniques can improve resources even in riparian areas. Grazing in these canyons should not be eliminated.	<p>The BLM does not propose the permanent closure of allotments or portions thereof. However, certain allotments may not be available for grazing over the next 15 years. The allotments considered, as not available are spread by alternative. Subsequent revisions of the land use plan may consider opening these areas to livestock grazing.</p> <p>The vast majority (over 98%) of the Monticello Planning Area is available for livestock grazing. For those limited number of allotments shown on page 2-16 of the DRMP/DEIS the BLM is proposing that other uses of the BLM land are the highest and best use of these areas. Both FLPMA and BLM's Land Use Planning Handbook authorizes BLM to close specific areas to livestock grazing to place an emphasis on these areas for other purposes or values, such as wildlife use, watershed protection, and recreation. As indicated by the variable uses of</p>

Table 5.10.e. Comments Requiring a Change in the Document: GRA – Grazing

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
				<p>the BLM lands, as shown in the proposed action, it is BLM's intention to emphasize "multiple use" of the public lands within the planning area.</p> <p>As stated in the DRMP/DEIS (pg. 2-16), for those areas open to livestock grazing, grazing would be managed on an allotment basis according to the Guidelines for Livestock Grazing Management to meet the Standards for Rangeland Health (see Appendix D), including duration and adjustment in season of use. This will provide the manager flexibility to adjust the permitted numbers of livestock, and the season and duration of use on specific allotments after the careful evaluation of monitoring and inventory data in full compliance with appropriate rules and regulations and BLM policy.</p>
Veronica Egan	131	5	Please provide maps with grazing allotment boundaries. It is impossible to determine who is the responsible permittee without this information, and rangeland conditions are generally in "functioning at risk" conditions, at best, on many allotments.	An allotment map with associated names for the Monticello Field Office has been included in the final Resource Management Plan.

Table 5.10.f. Comments Requiring a Change in the Document: LAR – Lands and Realty

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
State of Utah	4	55	Section 4.3.5. – Lands and Realty. The first paragraph of Impacts Common to the Proposed Plan and All Alternatives incorrectly states that acres within WSAs, the Grand Gulch Special Emphasis area, NSO areas, and areas closed to oil and gas leasing will be excluded to new ROWs. In addition, BLM should note that since such ROWs and accompanying development could degrade wilderness characteristics in WSAs, acquisition of inheld state trust lands by land exchange will be a priority of BLM.	<p>Narrative has been added to the text on these pages to clarify that the BLM has an obligation to grant reasonable access to inheld State lands in WSAs subject to Utah v. Andrus and the Interim Management Policy.</p> <p>Current BLM Utah State Policy is to give priority to State of Utah exchanges and such exchanges do not require a land use planning decision. Please refer to response to comment 004-52.</p>
San Juan County	7	25	There is no mention of Ute Indian lands in Table 1.1.	That error has been corrected in the PRMP/FEIS.

Table 5.10.f. Comments Requiring a Change in the Document: LAR – Lands and Realty

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
Utah State Office of Education	31 4	The Planning Issues Identified section should include discussion and detailed reference to the issue of inheld school lands in special designation categories, particularly WSAs, ACECs, and areas to be managed for "wilderness characteristics," and the need to give priority to resolution of the issue.	<p>The BLM does provide for reasonable access to all SITLA lands under all alternatives. Information has been added to Chapter 2, Lands and Realty, that states that reasonable access to state land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the Monticello DRMP/DEIS travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision. Also, please see the revised analysis under Socioeconomics in Chapter 4 of the PRMP/FEIS. Considering lands for WSA or wilderness designation is beyond the scope of BLM's land use planning effort, as identified on pg. 1-12 of the DRMP/DEIS. Those Non-WSA lands that are considered for management of wilderness characteristics were analyzed for the economic effects of that action. For example, on pg. 4-94 of the DRMP/DEIS, the number of oil and gas wells foregone in Alternative B is discussed.</p> <p>The need for the BLM to give priority to state-federal land exchanges has been recognized.</p>
Public Lands Advocacy	35 11	We are also concerned that the DEIS fails to contain maps depicting the location of all ROW exclusion and avoidance areas by alternative. Maps clearly identifying exclusion and avoidance areas by category need to be included in the FEIS. It is also necessary for BLM to fully disclose the impacts these exclusion and avoidance areas will have on existing and future leases by alternative.	In the PRMP/FEIS, a map of exclusion and avoidance areas has been included. The analysis of the impacts these avoidance and exclusion areas would have on other resources is discussed in Chapter 4 of the PRMP/FEIS.
IPAMS(Independent Petroleum Assc of Mountain State	55 3	The BLM does not clearly identify which areas it intends to designate as ROW avoidance areas and which areas it intends to designate as ROW exclusion areas. It is not clear whether the BLM intends to designate lands closed for oil and gas leasing as ROW exclusion areas or ROW avoidance areas. IN Chapter 4, Table 4.25 page 4-65 indicates that areas closed to oil and gas leasing will be designated as ROW exclusion areas,	BLM has made changes in the document to identify these exclusion and avoidance areas and reconcile inconsistencies.

Table 5.10.f. Comments Requiring a Change in the Document: LAR – Lands and Realty

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		while in Chapter 2, page 2-16 it is indicated that areas closed to oil and gas leasing will be designated as ROW avoidance areas. The BLM must reconcile the management prescriptions in Table 2.1 with those set forth in Table 4.25 and clearly identify the ROW avoidance and ROW exclusion areas proposed in the Monticello RMP/EIS. In addition, the DRMP contains inconsistent statements regarding the number of acres that are proposed as ROW exclusion or avoidance areas between Table 4.25 and Table 4.41.	
CrownQuest	62 18	The Monticello DRMP/EIS, contains conflicting information about which areas the BLM intends to designate as avoidance areas and which areas it intends to designate as exclusion areas. On page 2-16, Table 2.1, the BLM identifies areas designated as NSO, unavailable for leasing, or VRM Class I as ROW avoidance areas. In Chapter 4 of the Monticello DRMP/EIS, however, the BLM identifies areas unavailable or closed for leasing as ROW exclusion areas. See Monticello DRPM/EIS, pg 4-65, Table 4.25. The BLM must clearly identify areas it intends to designate as ROW avoidance and exclusion areas, and resolve inconsistencies in the Monticello DRMP/EIS.	The Proposed Plan/Final EIS has a list of avoidance and exclusion areas. Right-of-way (ROW) avoidance and exclusion areas would generally be consistent with the stipulations identified in Appendix A for oil and gas leasing and other surface-disturbing activities. These stipulations have been developed to protect important resource values. Areas identified as NSO are open to oil and gas leasing but surface disturbing activities cannot be conducted on the surface of the land. Access to oil and gas deposits would require horizontal drilling from outside the boundaries of the NSO areas. NSO areas are avoidance areas for ROWs; no ROW would be granted in NSO areas unless there are no feasible alternatives. Areas closed to leasing are ROW exclusion areas.
CrownQuest	62 20	Although the BLM has mapped some ROW exclusion and avoidance areas under different headings, such as oil and gas leasing stipulations, the BLM did not provide maps that exclusively identified all ROW exclusion and avoidance areas.	The Proposed Plan Final EIS contains maps showing the avoidance and exclusion areas.

Table 5.10.g. Comments Requiring a Change in the Document: MLO – Minerals and Energy – Locatable

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
U.S. Fish and Wildlife Service	2	37	Page 4-575 in Table 4.204. The table only depicts the number of acres of surface disturbance for oil and gas development (the following table includes geophysical exploration). Throughout the document, including this section, oil and gas has been included under the "Minerals" section that includes a number of other activities such as coal, tar sands, potash and salt, and uranium. Including acres in the tables for only oil and gas and for exploration within the "Minerals" section underestimates the total number of acres of surface disturbance. Acres of surface disturbance for other "Minerals" activities should be estimated and presented in this section.	Changes have been made to the document to analyze other mineral activities.

Table 5.10.h. Comments Requiring a Change in the Document: MOG – Minerals and Energy – Oil and Gas

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
Southern Utah Wilderness Alliance	26	34	The BLM must consider a no leasing alternative. The current draft of the RMP fails to consider such an alternative. Federal courts have made clear that a no leasing alternative should be a vital component in ensuring that agencies have all possible approaches before them (See, e.g., Bob Marshall Alliance v. Hodel, 852 F.2d 1223, 1228 [9th Cir. 1988]).	The BLM has inserted additional text in the proposed plan to address this issue. Refer to pg. 101, table 2.3, Alternative Elements Eliminated from Detailed Analysis.
Southern Utah Wilderness Alliance	26	82	The BLM must consider a no leasing alternative.	Please refer to response to comment 026-34.
EOG Resources	60	4	Page ES-7 contains Table ES6 which sets forth the numbers of acres that are open to oil and gas leasing with standard terms, open to leasing subject to stipulations, and closed to leasing under each of the alternatives in Monticello DRMP/EIS. Table ES6 represents that 213,288 acres will be open for leasing with	The BLM has revised its acreage calculations to reflect the changed management prescriptions in the proposed plan.

Table 5.10.h. Comments Requiring a Change in the Document: MOG – Minerals and Energy – Oil and Gas

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>standard lease terms and figures elsewhere in the Monticello RMP. For example, on page 4-98, Table 4.41 represents that 213,290 acres will be open for leasing with standard lease terms and 974,463 acres will be closed to leasing under Alternative E. The BLM must reconcile its acreage figures in the final Monticello RMP.</p>	
EOG Resources	60 18	<p>Alternative E, in particular, is inconsistent with the National Energy Policy and Executive Order 13211, 13212, and 13302. The removal of vast areas of land from future oil and gas development and potential restrictions on both leasing and development under Alternative E would significantly restrict regional earnings, jobs, and tax revenue. According to the information presented in the Monticello DRMP/EIS, the adoption of Alternative E would reduce the number of wells that could be drilled in the Monticello RA by over 26% compared to the Alternative A, the No Action Alternative. See Monticello DRMP/EIS, pg. 4-136. Annual revenue from potential oil and gas production would also be reduced under Alternative E. See Monticello DRMP/EIS, pg. 4-344. The BLM cannot adopt an alternative that would reduce economic development, decrease domestic energy supplies, and harm the local tax base.</p>	<p>The DRMP/DEIS in Chapter 4, page 100, states: " In accordance with BLM policy and its recognition of the National Energy Policy and Conservation Act of 2000 (EPCA), as discussed in Chapters 2 and 3, mineral resource development would be allowed throughout the planning area subject to standard terms and conditions, unless precluded by other program prescriptions, as specified in the RMP."</p> <p>The BLM expects that energy resource contributions in the Monticello Field Office will be very small relative to national production or even State production. Moreover, The BLM does not expect to see significant energy development (such as that experienced in Uintah Basin or parts of Wyoming) in the planning area over the life of the plan as described in chapter 4. Therefore, BLM does not expect large (similar to the other areas noted above) socioeconomic benefits or costs from these activities to national, state, or local communities.</p> <p>The BLM has expanded its discussion of fiscal impacts to state and local governments in Chapter 4 of the DRMP/DEIS.</p> <p>See also responses to comments 55-5, 60-52, and 62-64.</p>
CrownQuest	62 11	<p>The BLM references a Memorandum of Understanding between the BLM and the United States Department of Agriculture, Forest Service (Forest Service) establishing joint BLM and Forest Service procedures for managing oil and gas leasing and operational activities. See Monticello DRMP/EIS, pg. 1-16. The BLM should explain in greater detail the purpose and effect of this Memorandum of Understanding</p>	<p>Section 1.4.6 has been revised in the proposed plan to explain the purpose of the MOU in more detail.</p>

Table 5.10.h. Comments Requiring a Change in the Document: MOG – Minerals and Energy – Oil and Gas

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
CrownQuest	62	70	In Section 3.8.1, the BLM identifies "shale" as a "low-energy mud" that occurs throughout the Monticello RA. See Monticello DRMP/EIS, pg 3-46. The BLM asserts that "[no information is available regarding past and present exploration, development, or production within the Monticello RA." The BLM should distinguish between oil shale, from which oil can be extracted, and shale formations, which yield natural gas. Shale formations exist within the Monticello RA. With advances in drilling completion technology, production of natural gas from shale formations is feasible. Additionally, because of the development of highly productive shale formations such as Barnett shale formation in Texas, shale recently has been the subject of increased interest among oil and gas producers.	In its preliminary review of mineral resources, the BLM considered "shale" as an industrial commodity similar to sand and gravel or other crushed stone. However, based on past development (or lack thereof) in the Monticello Field Office it was determined that the use of shale for industrial purposes has been minimal and therefore shale as an industrial commodity was not addressed in the Mineral Potential Report (MPR). Because it was not addressed in the MPR, the BLM has deleted the reference to shale in Section 3.8.1.

Table 5.10.i. Comments Requiring a Change in the Document: MSA – Minerals and Energy – Salable

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
EOG Resources	60	40	In Section 3.8.1, the BLM identifies "shale" as a "low-energy mud" that occurs throughout the Monticello RA. See Monticello DRMP/EIS, pg 3-46. The BLM asserts that "[no information is available regarding past and present exploration, development, or production within the Monticello RA." The BLM should distinguish between oil shale, from which oil can be extracted, and shale formations, which yield natural gas. Shale information exist within the Monticello RA.	In its preliminary review of mineral resources, the BLM considered "shale" as an industrial commodity similar to sand and gravel or other crushed stone. However, based on past development (or lack thereof) in the Monticello Field Office it was determined that the use of shale for industrial purposes has been minimal and therefore shale as an industrial mineral material was not addressed in the Mineral Potential Report (MPR). Because it was not addressed in the MPR, the BLM has deleted the reference to shale in section 3.8.1

U.S. Fish and Wildlife Service	2	26	Page 4-423 (note: page and section numbers have changed since the last draft) in Section 4.3.15.1. In the second line, provide a reference in this section to Table 4.107 on page 4-435; check for similar places in the document for which a reference to another page will provide the reader easy access to further information.	The reference has been added in and BLM will check for other opportunities to reference other sections throughout the document.
U.S. Fish and Wildlife Service	2	34	Page 4-556 (note: page numbers have changed since the last draft) in Section 4.3.19.1. In the first paragraph, the document references Appendix O as providing a list of BMPs for reducing impacts on wildlife resources. Instead, Appendix O discusses wilderness characteristics.	Changes have been made to the document to reflect the appropriate appendix.
State of Utah	4	5	The Draft RMP/EIS does not include a discussion on the nature or type of threat of "irreparable damage" or the regional significance of relevant and important values in its review. BLM misinterprets irreparable damage when reviewing and analyzing ACECs in the Draft RMP/EIS. The ACEC tool was intended by Congress to be limited to only those instances where irreparable damage would be caused without designation. Most surface disturbing actions can eventually be repaired.	<p>The potential ACECs brought forward for designation into the Proposed Plan have gone through a rigorous and stringent process in accordance with FLPMA, the planning regulations at 43 CFR 1600, Land-use Planning Handbook (H- 1601-1), and in accordance with BLM Manual 1613 and ACEC Policy and Procedures Guidelines (45 FR 57318). Appendix H outlines the process the interdisciplinary team underwent to determine whether a nominated ACEC had relevance and/or importance values. The size of the proposed ACECs is limited only to the area(s) of geography where the relevance and importance values are manageable to protect and prevent irreparable damage to these resources.</p> <p>The potential ACECs carried forward into the Proposed Plan necessitate an ACEC designation because special management protection is necessary (outside of normal multiple-use management) to specifically protect the relevance and importance values within the areas identified. The special management prescriptions that have been proposed are narrowly tailored to protect the identified relevant and important values. For these reasons, the potential ACEC decisions carried forward into the Proposed Plan are</p>

Table 5.10.j. Comments Requiring a Change in the Document: OTH – Other

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
			<p>considered by BLM to be consistent with Utah Code 63j-4-401.</p> <p>A rationale for designating or not designating ACECs in the Preferred Alternative of the DRMP/EIS is found in Appendix H of the PRMP. Relevant text has been added to Appendix H of the PRMP/FEIS, which lists the threats to each proposed ACEC. These threats could result in irreparable damage to the area proposed for ACEC designation.</p> <p>The ACEC evaluation appendix was modified, and a section added to Chapter 2 discussing threats to the relevant and important ACEC values; however, whether the threats currently exist does not preclude a potential ACEC from being considered in the action alternatives. All nominated areas, where the BLM has determined to have relevant and important values, are identified as potential ACECs and are addressed in the action alternatives. Threats to relevant and important values are likely to vary by alternative. The PRMP/FEIS was revised from the draft document to better address potential threats and impacts associated with each alternative.</p> <p>On August 27, 1980, the BLM promulgated final ACEC guidelines (45 Federal Register 57318) clarifying the term "protects" – "To defend or guard against damage or loss to the important environmental resources of a potential or designated ACEC. This includes damage that can be restored over time and that which is irreparable. With regard to a natural hazard, protect means to prevent the loss of life or injury to people, or loss or damage to property." Thus, BLM is to consider the potential for both reparable and irreparable damage when protecting important historic, cultural, or scenic values; fish and wildlife resources; or other natural systems through ACEC designation. This interpretation is consistent with FLPMA's legislative history and implementing policy.</p> <p>Section 2 of the guidelines clarifies that ACECs are special places within the public lands. It states: "In addition to</p>

Table 5.10.j. Comments Requiring a Change in the Document: OTH – Other

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
				establishing in law such basic protective management policies that apply to all the public lands, Congress has said that 'management of national resource lands [public lands] is to include giving special attention to the protection of ACECs, for the purpose of ensuring that the most environmentally important and fragile lands will be given early attention and protection' (Senate Report 94-583, on FLPMA). Thus, the ACEC process is to be used to provide whatever special management is required to protect those environmental resources that are most important, i.e., those resources that make certain specific areas special places, endowed by nature or man with characteristics that set them apart. In addition, the ACEC process is to be used to protect human life and property from natural hazards."
Glen Canyon Group, Utah Chapter, Sierra Club	221	7	GLOSSARY in Volume 3 should include many definitions from Attachment B to Appendix N, namely definitions for: Designation, Emergency limitations or closures, Mechanized travel, Motorized travel, and Non-motorized travel. Additional definitions should be added for: Road, Trail, and Route.	The glossary has been updated in the FEIS to include these terms.

National Parks Conservation Association	44	3	Maps 23-27 need to identify all national park units and their boundaries. Otherwise meaningful analysis of oil and gas development upon park resources is difficult to access. All alternatives appear to have standard and special stipulation leasing near or adjacent to park borders including Canyonlands NP, Glen Canyon NRA, Natural Bridges NM and Hovenweep NM.	The map has been updated to show National Park Service units.
BlueRibbin Coalition	54	1	<p>Regarding planning criteria in Section 1.3:</p> <p>The BLM would make all possible attempts to ensure that its management prescriptions and actions are as complementary as possible with other planning jurisdictions (both federal and nonfederal), subject to applicable law and policy.</p> <p>Similar management prescriptions would be considered on adjoining lands to minimize inconsistency. To the extent possible, inventories, planning, and management programs would be coordinated with other federal, state, and local agencies and tribal governments.</p> <p>Chapter 1, page 1-12 (note: page numbers have changed since the last draft)</p> <p>The term "complementary" should be changed to "consistent." BIM's FLPMA mandate is for consistency, not to be "complementary." Changing the term from the well understood term of "consistent" to an undefined term of "complementary" is in poor form. The consistency requirement is extremely important to state and local governments and is considered to be on of the key "pillars" of FLMPA.</p>	The word has been changed to "consistent" in the FEIS.
EOG Resources	60	23	The BLM must clarify the term "site specific NEPA." As the BLM is aware, all agency actions or authorizations are generally subject to the mandates of NEPA. See 42 U.S.C. 4332 (2006). Merely instructing that an action is subject to "site-specific NEPA" does not impose any obligation beyond that already required by federal law. However, NEPA requires that the BLM	The commenter is correct in that an activity proposed on sensitive soils may not necessarily constitute a major federal action requiring an EIS, solely based on its association with a sensitive site. The appropriate level of NEPA analysis is generally determined by the size and type of proposed activity, potential impacts, and resource concerns, as identified in

Table 5.10.k. Comments Requiring a Change in the Document: PRP – Process and Procedure

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			prepare an EIS for any major federal actions that will significantly affect the quality of the human environment. 42 U.S.C. 4332 (2006). The phrase "site specific NEPA" may improperly suggest that all activities in sensitive soils are major federal actions that require preparation of an EIS. The BLM clearly did not intend to impose such an onerous and absurd result that would require the agency to expend significant time and resources before authorizing any activities in sensitive soils. The BLM must revise the phrase to clearly explain the amount of environmental analysis the BLM intended to require, if any, prior to authorizing activities in sensitive soils.	internal and external scoping. This section has been clarified to indicate that additional or site specific mitigation measures necessary to protect sensitive soils would be determined in site specific planning through the "appropriate NEPA process." Also a definition of sensitive soils has been added to the glossary. It was not deemed necessary to define "site-specific planning" in that this term is generally understood to be related to a specific project or group of similar activities.

Table 5.10.l. Comments Requiring a Change in the Document: REC – Recreation

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
State of Utah	4	72	It is unclear in Chapter 3 whether ROS classifications are carried forward as part of the action alternatives and whether ROS classifications will change by alternative.	The Recreational Opportunity Spectrum (ROS) will not be carried forward in any of the action alternatives. A statement has been added to Section 3.11.2.1 clarifying this. Management decisions will be based on special designations such as SRMAs, ACECs, National Historic designations, WSAs, ISAs, ERMAs, Wild and Scenic River recommendations, Non-WSA lands with wilderness characteristics, etc.
San Juan County	7	40	Pg. 2-29 (note: page numbers have changed since the last draft). The first bullet concerning camping under management common to all alternatives seems to be in conflict with Alternatives A, C, and D. Please clarify.	The second part of the first bullet under Management Common to All Action Alternatives stating "Camping outside of the riparian corridor within this area would be limited to designated campsites only" is incorrect. Camping management prescriptions vary with each alternative. A change has been made in the document. The camping management prescription for the proposed plan

Table 5.10.I. Comments Requiring a Change in the Document: REC – Recreation

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
			is: Dispersed camping would be allowed in the Indian Creek Corridor, except within the established designated camping zones: Bridger Jack Mesa, Indian Creek Falls, and Creek Pasture. Camping within these zones is limited to designated sites.
San Juan County	7 57	Section 3.11.2.1 – It is unclear whether the BLM is carrying ROS into the new RMP. ROS is described in the current plan and on Map 35 but there is no other analysis across alternatives. However, it appears that the primitive designation is used in effect to create "defacto wilderness" and VRM I areas smaller than 5,000 acres. BLM needs to clarify use of ROS in the Draft RMP.	The ROS has not been carried forward in any of the action alternatives. A statement has been added to Section 3.11.2.1 clarifying this. Management decisions will be based on special designations such as SRMAs, ACECs, National Historic designations, WSAs, ISAs, ERMAs, Wild and Scenic River recommendations, Non-WSA lands with wilderness characteristics, etc.
Blue Ribbon Coalition	24 12	Arch Canyon does not warrant group size limits, it does not warrant a permit system for groups under 25 under current use levels.	Letters from the USFWS concerning on-going issues with Mexican Spotted Owl habitat in Arch Canyon, and discussions in coordination with BLM and UDWR, are the basis for choices made by the ID team in evaluating draft alternatives for Arch Canyon. For Arch Canyon, the FEIS will not be requiring permits or group size limits for private use for any user group except motorized groups of 50 vehicles or more. Special Recreation Permits will be required for any organized or commercial groups.
Southern Utah Wilderness Alliance	26 85	There is a restriction in Alternative E for car camping of more than 10 vehicles or more than 50 people before an SRP is required. This conflicts directly with the first limitation on group size of 15 people for overnight use in ERMA.	A change has been made in the document.
Lynell Schalk	29 26	The DRMP is inconsistent in its application of the "no pets" rule. In an area as sensitive as the canyons of Cedar Mesa where there has been documented damage by dogs, there should be tighter controls, not the same old ones. It is my understanding that the current requirement that dogs be "under control" in Grand Gulch is not working. They either need to be excluded or	In the proposed plan, a management prescription has been added to exclude pets and stock animals from cultural sites field office wide. It states "Domestic pets and pack animals are not allowed in cultural sites or on archaeological resources as defined in ARPA." Under the Cedar Mesa SRMA, the proposed plan will state "If resources or the visitors'

Table 5.10.I. Comments Requiring a Change in the Document: REC – Recreation

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		on a leash at all times. The leash requirement is generally unenforceable once the owner is out of sight of BLM personnel. There should be exclusion of dogs in Grand Gulch, an area that is already too heavily visited by humans. In other less sensitive areas, dogs should not be allowed in or on archaeological sites.	experiences are adversely impacted, pets and or stock animals may be limited or prohibited in canyons requiring permits."
Broads Healthy Lands	41 12	Section 3.11.2.3 of the DRMP references "a growing level of conflict between motorized and non-motorized users of the planning area (see Section 3.10.4.3 below)." However, no such section exists in the document. Please locate this missing section and include it in the Final RMP.	A correction has been made in the document. It states see Section 3.11.4.3 – User Conflicts.
Bluff Landowners Coalition	48 3	Domestic pets are excluded from Outlaws Canyon/Lower Cottonwood & Butler Wash areas adjacent to our residences/properties under Alt. B, C, and D. The DRMP makes no mention regarding non-motorized/mechanized uses in this area (Reference: pg. 2-9, Vol. 1). Cows and bikes are allowed—including within archaeological sites—based on your proposals. As mountain bikes and cows cause more impacts than domestic pets, where is the sense in this?	The proposed plan will allow domestic pets into Outlaws Canyon/Lower Cottonwood and Butler Wash with the new restriction that they will not be allowed into cultural sites. Section 4.3.8.9.2. – Mechanized Recreational Travel (Mountain Bikes) states the MFO policy on mechanized use. Under the preferred alternative, mountain bikes would only be allowed on routes designated open for motorized use. The proposed plan states, "Available for livestock use but it may be limited if cultural resources are impacted."
EOG Resources	60 20	Cedar Mesa/Grand Gulch Plateau Special Recreation Management Area. On page 2-25, the BLM proposes that under the action alternatives, the "Grand Gulch SRMA would be changed to the Cedar Mesa Cultural Special Recreation Management Area." Map 36, which depicts SRMAs under Alternative A, the No Action Alternative, identifies the Grand Gulch SRMA and not a Cedar Mesa SRMA. Map 36 does not comport with the management action on page 2-25, which suggests that the Cedar Mesa SRMA would still exist under Alternative A. On Maps 37-40, which depict SRMAs under the action alternatives, the BLM identifies a Cedar Mesa SRMA, even though the management prescription on page 2-25 suggests that this area would become the Grand Gulch SRMA. The BLM must review	The proposed plan now eliminates all CSMA's or C-SRMA's and proposed to manage them as SRMA's. The Cedar Mesa C-SRMA is now the Cedar Mesa SRMA and incorporates the Comb Ridge and McLoyd Moonhouse CSRMA's as recreation management zones within the Cedar Mesa SRMA. The acreage for the Cedar Mesa SRMA totals 407,098. The PRMP and FEIS have been updated to reflect these changes. Maps of the proposed SRMA's have been created and will include the new Cedar Mesa SRMA.

Table 5.10.l. Comments Requiring a Change in the Document: REC – Recreation

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			the management prescription on page 2-25 and ensure that Maps 36-40 reflect the proposed management prescription.	
CrownQuest	62	19	The BLM identifies "developed recreation sites" as avoidance areas for ROWs. The BLM should clearly define the term "developed recreation sites" in the Monticello RMP/EIS.	Developed recreation sites both existing and proposed are found on Page 2-22 under Management Common To All Action Alternatives.
Mike Meloy	220	2	Concerning the San Juan River SRMA 4. 3. 10. 3. 10. 1 of the planning document on page 4-261 last paragraph it states: "The land on the south bank of the San Juan River is owned by the Navajo Nation and camping is currently not permitted." This statement is incorrect. The Navajo Nation permits camping on the river.	A change has been made in the document.

Table 5.10.m. Comments Requiring a Change in the Document: RIP – Riparian

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
U.S. Fish and Wildlife Service	2	9	According to Table 2.2, the Wildlife and Fisheries Resources impacts to Riparian Resources include "some loss of riparian vegetation from elk grazing." This impact should also be applied to Cattle Grazing.	The PRMP/FEIS adds: "Compliance with Standard 2 would minimize adverse impacts to riparian areas by requiring changes in grazing management wherever monitoring shows degradation of riparian areas when PFC is not achieved."
U.S. Fish and Wildlife Service	2	10	Beneficial or adverse impacts from beavers on riparian resources are not discussed in Table 2.2.	The oversight has been corrected and added into Table 2.2.
U.S. Fish and Wildlife Service	2	11	Minerals and energy resources are not mentioned as a source of impacts to the Riparian Resources in Table 2.2. Land disturbing activities can affect riparian areas; therefore, adding a no surface occupancy buffer around riparian areas would benefit the riparian resources.	This oversight has been corrected by adding a minerals section to Table 2.2 in the PRMP/FEIS
U.S. Fish and Wildlife Service	2	14	In Section 3.12.1, the first sentence of this section should be revised for clarity as the 1.2% describes the percentage of riparian acres within the BLM administered lands (of ~1.8	The correct figure is 20,912 acres (1.6%) of lands that are riparian and wetland resources within the Monticello PA.

Table 5.10.m. Comments Requiring a Change in the Document: RIP – Riparian

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			million) rather than 1.2% of riparian acres within the Monticello Planning Area. Instead, the BLM administers ~70% of riparian acres in the planning area.	
U.S. Fish and Wildlife Service	2	15	If possible, in Table 3.24, indicate the acres and miles (by drainage) that are administered by the BLM.	The data provided are from a study done in 1990. The mileage and the acreage were calculated by drainage.
Tom Ratcliff	56	3	I have found an interesting issue related to this and other resource areas of discussion in the Draft. Riparian resources are discussed in at least Fire Management 3.4, Riparian Resources 3.12, and Vegetation 3.18 sections of the document, and of course at 4.3.11. Each of those sections has different and conflicting information. For example, Fire says that riparian habitat is "less than 1% of the MPA." Vegetation is more specific at "20,699 acres"... "only 1% of the FO"; Riparian Resources, at 3.12 claims approximately 20,435 acres (1.2%). And now the kicker: At 4.3.11 riparian acres are listed at 28,994, based on a GIS database. By my calculation that is about a 42% error factor over the lower figure.	The acreages and percent have been fixed in the PRMP: 28,944 correct acres/1785127 total acres=1.6% riparian Fire Management 3.4.5.9 – covers approximately 1.6% Riparian Resources 3.12 – The BLM administers approximately 28,944 acres (1.6%) of BLM administered lands of riparian and wetland resources within the Monticello Field Office. Vegetation 3.18.1.4 – Riparian and Wetland Communities. Approximately 28,944 acres of wetland and riparian areas exist in the Monticello FO.
Thomas Ratcliff	79	6	Riparian resources are discussed in at least Fire Management 3.4, Riparian Resources 3.12 and Vegetation 3.18 sections of the document, and of course at 4.3.11. Each of those sections has different and conflicting information. For example, Fire says that riparian habitat is "less than 1% of MPA," Vegetation is more specific at "20,699 acres"... "only 1% of the FO"; Riparian Resources, at 3.12 claims approximately 20,435 acres (1.2%).	Please refer to response to comment 059-3.

Trust			document in the absence of any reference to global climate destabilization. Climate models predict that current trends of higher temperatures and reduced precipitation will continue in the Upper Colorado River Basin leading to a decrease in quantity and quality of river water and severe consequences for human, agricultural uses, wildlife and ecosystems. The MFO has already been affected by the prolonged drought. Soil disturbing activities such as cattle grazing, energy exploration and development and recreation have increased dramatically and these uses destabilize soils. Massive dust storms from soil loss deposit dark-colored dust on mountain snowpacks that absorb heat and melt too soon. Snowmelt storage in watersheds is reduced. The implications of these and other climate effects on management decisions on public lands are not adequately addressed in the DRMP. Modeling and technical information can be accessed from USGS and NOAA.	text in Chapters 3 and 4. Will this be done. A growing body of scientific evidence supports the concern that global climate change will result from the continued build-up of greenhouse gases in the atmosphere. While uncertainties remain, particularly in the area of exact timing, magnitude and regional impacts of such changes, the vast majority of scientific evidence supports the view that continued increases in greenhouse gas emissions will lead to climate change. This information was added to Chapter 3 of the PRMP/FEIS. The EPA has not developed regulatory protocol or emission standards regarding global climate change. When these protocols and standards are available, the BLM will analyze potential effects to global warming in the NEPA documentation prepared for site-specific projects. All information to this effect was added to Chapter 4 of the PRMP/FEIS.

Table 5.10.o. Comments Requiring a Change in the Document: SD – Special Designations

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
CrownQuest	62	83	Under all of the action alternatives, the BLM proposes to designate the Alkali Ridge National Historic Landmark as subject to NSO stipulations and as a ROW Avoidance area. See Monticello DRMP/EIS, pg 2-35, Table 2.1. The BLM entirely fails to address the impacts on this proposed management action on oil and gas development. See Monticello DRMP/EIS, pgs. 4-114, 4-123, 4-132, 4-140. A pipeline borders, and perhaps may cross, the Alkali Ridge National Historic Landmark. The BLM's proposed management of the historic landmark will prevent owners and operators of neighboring oil and gas leases from accessing the pipeline,	Management prescriptions for the ACEC and NHL have been clarified in the PRMP/FEIS to note that exceptions would be granted to allow access to existing utility corridors for maintenance of existing facilities and construction of new facilities. Standard exception language to honor valid existing rights would also apply.

Table 5.10.o. Comments Requiring a Change in the Document: SD – Special Designations

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		thereby impairing development of the leases. The BLM must analyze the impacts of the proposed management.	

Table 5.10.p. Comments Requiring a Change in the Document: SOC – Socioeconomics

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
State of Utah	4 25	BLM's decisions on how to manage its lands directly affect Utah's ability to manage state trust lands to provide revenue for public schools and other beneficiary institutions. The state believes the Draft RMP fails to adequately address two issues, 1) the impact of BLM management decisions on state trust lands, and 2) the need for a substantially more robust program for land tenure adjustments between the BLM and the State of Utah.	<p>Non-BLM lands could be indirectly impacted by RMP decisions both positively and negatively. The analysis in Chapter 4 of the PRMP/FEIS has been modified accordingly. For specifics regarding the impacts on mineral revenue, please refer to response to comment 120-101.</p> <p>The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to state land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.</p>
State of Utah	4 54	Section 4.1.2 – Assumptions and Methodology for Mineral Development. The RFD must address the fact that BLM withdrawals and special designations directly affect development of oil and gas on SITLA lands. The BLM should assume that, in addition to the loss of oil and gas wells on BLM lands, there will be an additional loss of wells on SITLA lands in proportion to the amount of SITLA land within the proposed special designation under each alternative.	<p>The RFD is a technical report that makes long term projections of oil and gas exploration, development, production and reclamation activity. It is neither a planning decision nor the "No Action Alternative" in the NEPA document. It provides the baseline projection of future activity assuming all potentially productive areas (including SITLA lands) are open for leasing under standard lease terms and conditions. The only exceptions are those areas designated as closed to leasing by law, regulation or executive order.</p> <p>The BLM acknowledges that closure of adjoining public lands</p>

Table 5.10.p. Comments Requiring a Change in the Document: SOC – Socioeconomics

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
				<p>to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. The closure of WSAs is nondiscretionary, and is beyond the scope of this plan.</p> <p>Non-BLM lands could be indirectly impacted by RMP decisions both positively and negatively. The analysis in Chapter 4 of the PRMP/FEIS has been modified accordingly to reflect the impacts in Alternative E on SITLA inholdings of the discretionary closures of public lands. The number of oil and gas wells foregone on SITLA lands, and the loss of revenue from SITLA wells foregone have been calculated and added to the analysis in Chapter 4.</p>
State of Utah	4	56	Section 3.13 – Socioeconomics. BLM decisions to withdraw mineral lands from leasing (WSAs, etc.) directly affect the economic viability of state trust lands inholdings. This should be acknowledged appropriately in the discussion of socioeconomic impacts.	<p>The decision to manage lands as WSAs was made initially in the Federal Land Policy and Management Act (1976). Lands to be managed as WSAs in the State of Utah were identified in the 1980's. Any state trust land inholdings created by WSA management is beyond the scope of this plan.</p> <p>Those state land inholdings that are excluded from leasing as a result of the current planning effort have been specifically analyzed in the Socioeconomic section of Chapter 4. Please also refer to response to comment 004-54.</p>
State of Utah	4	71	The royalty payments for oil reported on page 3-132 (note: page numbers have changed since the last draft) exceed the sale value by more than one million dollars. Please verify and explain this anomaly.	BLM agrees that the production and royalty information on page 3-132 is confusing as presented. The information has been clarified and any erroneous figures have been corrected in the proposed RMP.
San Juan County	7	24	San Juan County commends the BLM for the effort that has been expended to better understand and portray socioeconomic impacts in this DRMP. This has been a weakness in previous plans. San Juan County encourages BLM to use studies done by Utah's universities to enhance this information such as the social survey undertaken by USU and the economic studies done by the U of U. Every NEPA action in the RMP should include a discussion on socioeconomic conditions and fully disclose all impacts.	<p>The BLM has reviewed the Utah State University survey of rural counties conducted by the State of Utah. The BLM received preliminary data for San Juan County after completion of the Draft RMP/FEIS. The BLM has incorporated findings in chapter 3 of the PRMP/FEIS as appropriate. In addition, an appendix has been added to the PRMP/FEIS which summarizes the results of this study.</p> <p>The recent research undertaken by the University of Utah's Bureau of Economic and Business Research on oil and gas</p>

Table 5.10.p. Comments Requiring a Change in the Document: SOC – Socioeconomics

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment	
			<p>activities in San Juan County is not yet complete. The unexpected death of the primary researcher has slowed this effort. The BLM has extensively utilized data provided by the Utah Division of Oil, Gas and Mining in its economic analyses of the contributions of various industries.</p> <p>On a broad land use planning level, the BLM has disclosed the socioeconomic impacts from various resource actions as discussed in Chapter 4 of the DRMP/EIS. It is not practical to separate out the socioeconomic impacts of the many of the specific resource decisions specified in the plan.</p>	
Utah State Office of Education	31	6	<p>The BLM should assume that in addition to a decline in the number of wells drilled on BLM lands, there will be a proportionate decrease in the number of wells drilled on school trust lands. It can be assumed that a significant number of wells may not be drilled on SITLA lands if Alternatives B or E is adopted. All bonus, rental, and royalty revenues from these wells, at SITLA's royalty rate of 12% would be captured by the RMP decision to adopt Alternative B or E. This could amount to millions of dollars lost to the schools of the state of Utah. The State Board of Education cannot be supportive of any taking of school trust assets.</p>	<p>The potential SITLA revenues lost to Alternative E has been added to the FEIS. See Section 4.3.12.2.5.9. As stated in the EIS, impacts resulting from Alternative B would be similar to A given that the acres open for oil and gas development is greater under B than A by 0.3% and the total well potential differs by only 7 wells over the next 15 years.</p>
EOG Resources	60	5	<p>On page ES-8, the BLM asserts that Alternative B has the "potential for short-term adverse impacts to local economics and business that depend on public land for resource extraction." Elsewhere in the Monticello DRMP/EIS, the BLM defines "short-term impacts" as impacts that "result in changes to the environment that are stabilized or mitigated rapidly." Monticello DRPM/EIS, pg 4-6. In the analysis of the impacts of the alternatives in Chapter 4 of the Monticello DRMP/EIS, the BLM provides no justification to support its assertion that the economic impacts of Alternative B will be "short term."</p>	<p>The sentence on page ES-8 has been rephrased to state: "Alternative B would have potential for adverse impacts to businesses that depend on public lands for resource extraction."</p>
EOG Resources	60	38	<p>Monticello DRMP/EIS, pg 2-113, Table 2.2, This statement is completely unsubstantiated and misleading. The statement</p>	<p>The statement on page 2-113 has been revised to reflect the statement of 4-345.</p>

Table 5.10.p. Comments Requiring a Change in the Document: SOC – Socioeconomics

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>suggests that managing lands for wilderness characteristics under Alternative E may yield positive economic impacts that outweigh the negative economic impacts that will result from closing these lands to other resource uses such as oil and gas development. The analysis set forth in Chapter 4 of the Monticello DRMP/EIS does not support the conclusion that Alternative will yield positive economic benefits. The BLM provides absolutely no evidence to support its speculation that closing non-WSA lands to development will generate revenue for the local economy or, moreover, that any positive effects would offset the revenue lost by closing the area to oil and gas development. In Chapter 4, the BLM admits that it cannot quantify any potential economic impacts from managing additional lands for wilderness characteristics. See Monticello DRMP/EIS, pg. 4-345 ("It is difficult to predict whether the potential socioeconomic gains described above will outweigh the socioeconomic losses which could result from" managing non-WSA lands for wilderness characteristics.). Without such quantification, it is impossible for the BLM to suggest that closing lands for wilderness character may create positive economic impacts that will outweigh lost revenue from other resource uses such as oil and gas development. The BLM must revise its statement on page 2-113 to clearly state that the management prescriptions in Alternative E will result in lost revenue from oil and gas development and other resource uses, and that the BLM cannot determine whether managing lands as wilderness will ultimately yield economic benefits that will outweigh this lost revenue.</p>	
EOG Resources	60 51	<p>The BLM understates the impacts of the ROW exclusion designation under Alternative E. The BLM asserts that designating 582.357 acres of non-WSA lands with wilderness characteristics as ROW exclusion areas as proposed under Alternative E "could potentially have a minor adverse impact on socioeconomics." See Monticello DRMP/EIS, pg. 4-336. The BLM provides no justification for its proposition that impacts</p>	<p>Impacts to ROW exclusions are not expected to be major for the proposed plan based on the fact that the RFD for the overall planning area for oil and gas development is quite low (74 wells over the next 15 years). Alternative E could have increased adverse effects compared to the proposed plan, although not expected to be major given the low potential of mineral occurrence in the area. The proposed plan, as</p>

Table 5.10.p. Comments Requiring a Change in the Document: SOC – Socioeconomics

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			would be "minor." By designating large areas of the resource area as ROW exclusion areas, the BLM makes oil and gas development more difficult and more expensive. The BLM must provide some justification for its assertion that designating these areas as ROW exclusion areas would result in "minor" impacts.	opposed to Alternative E manages far fewer acres as ROW exclusion than Alternative E. Further, existing leases will be granted ROW regardless of alternative selected. The PRMP/FEIS has been revised to further explain existing leases and RFD potential.
CrownQuest	62	72	In Section 3.13.4.2.2, the BLM acknowledges that San Juan has the highest unemployment in the state at 11% and that unemployment in consistently double or triple the state average. See Monticello DRMP/EIS, pg. 3-102. Similarly, in Section 3.13.4.2.3, the BLM acknowledges that per capita personal income in San Juan County has been consistently lower than the state average and was the lowest in the State of Utah in 2003. See Monticello DRMP/EIS, pg. 3-104. Despite these recognitions, many of the prescriptions in the Monticello DRMP/EIS would limit economic activity by restricting access to oil and gas development. The Monticello DRMP/EIS does not properly assess the effects restrictive land management decisions will have on the local economy, and the opportunities denied by severely restricting access to energy resources through a whole range of overlapping restrictions including wilderness-like designation of land, NSO, CSU, VRM, timing limitations, and others.	It is not the BLM's role to create (or decrease) employment opportunities in any one sector of the economy. The role of the DEIS is to assess the impacts of planning decisions have on various affected sectors, if any. The BLM summarizes the minor costs and benefits associated with oil and gas development on local communities in Chapter 4, p. 429-436. The commenter's reference to the impacts such activities have had in other parts of the West is unlikely to apply to the Monticello planning area. The Reasonably Foreseeable Development (RFD) scenario for oil and gas projects that relatively few wells would be drilled, would employ relatively few people, and would produce negligible adverse social impacts. The commenter seems to be confusing the MPA with the large-scale development that has occurred in certain areas. The BLM's analysis is based on the RFD; the commenter has provided no evidence that the RFD is incorrect. Data show that less than 3% of the San Juan County's economy is dependent on oil and gas activities. This corresponds closely to BLM's analysis in Chapter 4.

Table 5.10.q. Comments Requiring a Change in the Document: SOL – Soils

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
CrownQuest	62	35	On pg. 2-49, the BLM proposes the following Management Common to All Alternatives: "Any proposed activities that would	Please refer to response to comment 60-23. In addition: Sensitive soils are determined based on maps and field

Table 5.10.q. Comments Requiring a Change in the Document: SOL – Soils

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>be located in sensitive soils (e.g., hydric, saline, gypsiferous, or highly erodible soils, Maps 41–47) would be subject to site-specific NEPA and would incorporate BMPs and other mitigation measures to minimizing soil erosion and maintain soil stability." See Monticello DRMP/EIS, pg 2-34 Table 2.1. This Management Common to All Alternatives must clarify what is meant by "sensitive soils." The parenthetical phrase following "sensitive soils" does not adequately describe what constitutes a sensitive soil. Similarly, Maps 44–47 do not refer to the types of soils listed in the parenthetical clause in this Management Common to All Alternatives. Although Map 44 depicts areas with "highly saline," "moderately saline," and "low saline" soils. Neither Map 44 nor the Management Common to All Alternatives in Table 2.1 clearly identifies which soils are subject to special management. In the final Monticello RMP/EIS, the BLM must clearly define and map any soils that are managed under specific prescriptions.</p>	<p>verification, as well as field data from research studies, rangeland health assessments, or other monitoring efforts. At this time the BLM does not have an accurate map of all the soils that would meet the criteria for sensitive soils within the planning area. NRCS maps provide broad scale planning soil information that generally must be field verified prior to implementing activities on the ground. This would be done during activity and site specific planning. The maps provided display published soil survey information depicting some of the characteristics that could lead to the determination that a project site may contain sensitive soils, in order to help plan and prioritize field verification efforts within a project planning area. A definition of sensitive soils was added to the glossary.</p>
CrownQuest	62	36 <p>Additionally, the BLM must clarify the term "site-specific NEPA." Merely instructing that an action is subject to "site-specific NEPA" does not impose any obligation beyond that already required by federal law. However, NEPA requires that the BLM prepare an EIS for any major federal actions that will significantly affect the quality of the human environment. 42 U.S.C. 4332 (2006). The phrase "site-specific NEPA" may improperly suggest that all activities in sensitive soils are major federal actions that require preparation of an EIS. The BLM must revise the phrase to clearly explain the amount of environmental analysis the BLM intended to require, if any prior to authorizing activities in sensitive soils.</p>	Please refer to response to comment 60-23.
CrownQuest	62	37 <p>Finally, aside from the management action that proposed activities located in sensitive soils would be subject to "site-specific NEPA and would incorporate BMPs and other mitigation measures to minimize soil erosion and maintain soil stability," the BLM does not appear to identify any other special</p>	The leasing categories were determined based on criteria such as ACEC designations, Floodplains, or Special Status Species habitat or special timing needs for wildlife. Soil characteristics or limiting factors were not used in determining lease categories. Tables 4.67, 4.72, 4.76, 4.80, and 4.84

Table 5.10.q. Comments Requiring a Change in the Document: SOL – Soils

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		management to protect or preserve sensitive soils. In Chapter 4 of the Monticello DRMP/EIS, however, the BLM appears to analyze the imposition of special and NSO leasing stipulations to protect sensitive soils. See Monticello DRMP/EIS, pgs. 4-113 (Table 4.48), 4-122 (Table 4.52), 4-131 (Table 4.56), 4-140 (Table 4.60). The BLM must identify any specific management actions to protect sensitive soils in Table 2.1. Accordingly, the BLM must revise either Table 2.1 or the discussion of impacts in Chapter 4 to clarify which management actions it proposes to protect sensitive soils.	simply list potential acreages of soils with limiting soil characteristics within each of the leasing categories; soil characteristics or criteria were not used to determine leasing categories. However, based on the categories, the amount of "sensitive soils" that are potentially affected in each alternative differs. Language has been added to Chapter 4 to clarify this in Section 4.3.7.4.6. Impacts of Soils and Watershed Decisions on Mineral Resource Development.

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
U.S. Fish and Wildlife Service	2 1	Remove Bald Eagle from Section 2.1.1.5 and check entire document to remove threatened status for Bald Eagle throughout. Recommend including Bald Eagle in wildlife section and retaining Conservation Measures of Appendix Q since the species is still protected by the Migratory Bird Treaty Act and the Eagle Protection Act.	Entire document has been adjusted to correct the status from "threatened" to "special status species." The Bald Eagle is now listed on the BLM and Utah Sensitive Species List and is listed in that section vs. the wildlife section. Conservation Measures will be kept in Appendix Q to continue protection for Bald Eagles.
U.S. Fish and Wildlife Service	2 3	The conservation measures listed in Table 2.1 appear to be paraphrased items from Appendix Q. To avoid confusion, either replicates Appendix Q measures into this table, or at a minimum reference Appendix Q here.	The Conservation Measures listed in Table 2.1 – Special Status Species for Bald Eagle, Mexican Spotted Owl, Southwestern Willow Flycatcher, and Yellow-billed Cuckoo, Colorado River fishes, and California Condor has been removed from this table and will make reference to Appendix Q to avoid confusion.
U.S. Fish and Wildlife Service	2 4	Alternative C reduces the buffer around Gunnison Sage-grouse leks to 0.6 miles. FWS recommends CSU for oil and gas leasing activities within 2.0 miles of leks and that construction of permanent facilities be avoided within a 2.0 miles buffer around	Changes have been made to reflect BLM's suggested guidelines and those found in the Gunnison Sage-grouse Rangewide Plan. The year-round habitat is CSU which would avoid permanent

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		leks, unless it can be shown to not affect sage-grouse.	structures. Other suggested management practices will be implemented and came directly from the Gunnison Sage-grouse Rangewide Conservation Plan, which BLM has committed to implement.
U.S. Fish and Wildlife Service	2 16	Section 3.16. The third line limits additional sensitive species to plants; however, the second paragraph more accurately includes the numerous species of animals also identified as sensitive.	The sentence has been changed to read, "Under the Endangered Species Act, as well as those plant AND ANIMAL species listed or proposed as sensitive by the BLM."
U.S. Fish and Wildlife Service	2 17	Section 3.16.2. In Utah, Mexican Spotted Owl habitat does not include high canopy closure, high stand density and multi-layered canopies of uneven-aged stands.	These habitat descriptions have been removed from this section.
U.S. Fish and Wildlife Service	2 21	Table 4.137. The entire state of Utah is not within the nonessential, experimental boundary of the condor. A small portion of San Juan County is outside of the nonessential, experimental boundary. Update the RMP for accuracy.	The Table 4.106 has been changed to show that the entire state of Utah is not within the nonessential, experimental boundary of the California Condor.
U.S. Fish and Wildlife Service	2 27	Section 4.3.15.1(of the DEIS). In the first paragraph, recovery plans for all species should be referenced here, not just the Southwestern Willow Flycatcher plan.	Other recovery plans have been added and referenced.
U.S. Fish and Wildlife Service	2 30	Section 4.3.15.3.6.1. Rocky Slopes and Canyons: The statement, "Direct, adverse impacts include short-term disturbance of... special status species resulting from construction and operation noise, and a long-term reduction in habitat from the installation of mineral development infrastructure" should be applied to all habitats and alternatives, not just the rocky slopes and canyons habitat.	The statement has been added into the riparian habitat. The same impacts are discussed in the Desert Shrub, Sagebrush, Perennial Grassland, Pinyon-Juniper Woodland, and Conifer/Mountain Shrub habitats on Page 4-437 although it is not worded exactly the same.
U.S. Fish and Wildlife Service	2 31	Section 4.3.15.2.6.3. The decision that "No Gunnison Sage-grouse habitat would be closed or NSO to mineral entry" does not adequately protect this species. Need to provide additional protection of leks by limiting surface occupancy for minerals and other ground disturbing activities would help preserve sage-grouse.	Changes have been made to the document and the lek habitat will be protected from all surface-disturbing activities by being closed and classified as NSO.
U.S. Fish and	2 32	Section 4.3.15.2.12.2. (of the DEIS) Alternatives B and E would	Adjustments have been made to the alternatives for Gunnison

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
Wildlife Service		result in fewer adverse impacts on Gunnison Sage-grouse and other sagebrush special status species than the preferred alternative. We recommend these be applied to sage-grouse.	Sage-grouse to ensure they are protected according to the Gunnison Sage-grouse Rangewide Conservation Plan.
State of Utah	4	10	The term critical has been reserved to Threatened and Endangered (T &E) species. Corrections in the text have been made in the PRMP/FEIS. For non-T&E species the BLM relied on the UDWR crucial habitat designations.
Grand Canyon Trust	33	3	Under Table 2.1 – Summary Table of Alternative Gunnison Sage Grouse we recommend protection of lek habitat within 2 miles of active strutting grounds and year-round habitat protection within 6 miles of active strutting grounds (Alternatives "B" and "E"). This recommendation is based on USFWS assertion that a 5-mile buffer around lek sites is necessary. The USFWS based their recommendation for sage-grouse on Connelly et al. (2000) "Specifically, for non-migratory populations occupying habitats that are uniformly distributed, protect sagebrush and herbaceous understory within 2 miles of all occupied leks. For non-migratory populations, leks should be considered the center of year round activity and treated as focal points for management activities. For non-migratory populations where sagebrush is not uniformly distributed, suitable habitats should all be protected out to 3.1 miles from all occupied leks. For migratory populations of sage-grouse, breeding habitats within 11.2 miles of active leks should be protected recognizing that birds may move more than 11.2 miles from leks to nest sites."
Public Lands Advocacy	35	8	Entire document has been adjusted to correct the status from "threatened" to "special status species." The Bald Eagle is now listed on the BLM and Utah Sensitive Species List and has been listed in that section vs. the wildlife section. Conservation Measures have been kept in Appendix Q to continue protection for Bald Eagles.

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		Eagle in accordance with the criteria listed in the Bald and Golden Eagle Protection Act. Therefore, the FEIS must recognize that protection of the Bald Eagle is subject only to that described in the Bald and Golden Eagle Protection Act of 1940 and remove the restrictions identified in the DEIS.	
Public Lands Advocacy	35 9	<p>Table 2-1 indicates that sage-grouse lek habitat will be protected within 0.6 miles of an active strutting ground and that new oil and gas leases will be subject to a controlled surface use (CSU) stipulation under Alternative C. Under Alternative B the protection zone would be 2 miles, while under Alternative D it would be .25 of a mile. Additionally, BLM has identified a 6-mile year-round habitat buffer in which oil and gas operators would be required to utilize Suggested Management Practices listed in the Gunnison Sage-grouse Range-wide Conservation Plan. BLM indicates that these restrictions are based upon best available scientific information, i.e., National Sage-grouse Habitat Conservation Strategy: Strategic Management Plan for Sage-grouse (BLM 2004d), WAFWA Conservation Assessment of Greater Sage-grouse and Sagebrush Habitats (Connelly et al. 2004), and the Gunnison Sage-grouse Range-wide Conservation Plan (2005, as revised).</p> <p>In reviewing the DEIS, we can find no description of the documents referenced nor any analysis or justification regarding the need for any buffer zones around strutting grounds in the MFO. Nor can we find any maps that illustrate where restrictions would be imposed, making it impossible to discern the impacts to future oil and gas development. Maps 74 through 77 fail to identify the specific of sage-grouse species depicted and they fail to outline what BLM considers "crucial year-round habitat," as discussed on page 2-53 (note: page numbers have changed since the last draft).</p>	Changes have been made to the proposed plan that make the protection measure more consistent with the Gunnison Sage-grouse Rangewide Conservation Plan as listed in Table 2.1. Changes have also been made to the maps to clearly show where the proposed stipulations would be. Lek sites are not specifically mapped since they do change from year to year and those will be analyzed on a site-specific basis.
Public Lands Advocacy	35 10	In our experience in reviewing RMP DEIS, most BLM office's that manage sage grouse habitat have limited the buffer to .25 mile around active leks. The proposals in Preferred Alternative	Changes have been made to the proposed plan to protect the Gunnison Sage-grouse as suggested in the Gunnison Sage-grouse Rangewide Conservation Plan. This plan was

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>C and Alternative B are excessive and have no supporting scientific foundation. We do not support the unsubstantiated 6-mile year-round radius around Sage grouse leks because it has no scientific basis.</p> <p>The suggested 0.6-mile and 2-mile buffers lack empirical support.</p>	<p>developed with the best available science.</p>
<p>The Nature Conservancy</p>	<p>49 2</p>	<p>We urge that the language in the Final RMP pertaining to the necessary commitment to the protection and sustaining of SSS be stronger.</p> <p>—Under 2.1.1.5 – Special Status Species. The DRMP states that "Land use plan decisions should be consistent with..." various mandates, plans and agreements for T and E species. A stronger and more accurate statement to put into the Final RMP is that "Land use plan decision must be consistent with..." those mandates and agreements etc.</p> <p>—We suggest adding a statement pertaining to allowing and participating in research of threatened and endangered and Sensitive species and their habitats.</p> <p>—"The protection of species and potential and/or occupied habitat for special status species would be considered and implemented prior to any authorization or action by the BLM that could alter or disturb such habitat." While it is fine to consider such SSS habitat protection, the BLM needs to give primacy to the conservation of SSS in such cases -- not necessarily a wholesale halting or precluding of other valid uses of public lands, but fine-scale design of such uses so as to be compatible with the priority of maintaining SSS habitats/occurrences.</p> <p>—A second point states that "No management action would be permitted on BLM lands that would jeopardize the continued existence of species that are listed, proposed for listing, or</p>	<p>Chapter 2 shows the summary of proposed actions. Terms such as "should and would" are appropriate in this chapter since the decision has not been made yet. It is simply proposed.</p> <p>Please refer to Table 2.1 under Management Common to All Alternatives: "Inventories and monitoring studies would be conducted in order to determine special status plant and animal species locations, potential habitat, population dynamics, and existing and potential threats. BLM has added another sentence to this that states, 'Monitoring protocols established by U.S. Fish and Wildlife and Utah Division of Wildlife Resources would be used.'</p> <p>Wording is changed on Page 2-51 to state, "No management action would be permitted on BLM lands that would jeopardize the continued existence of species that are listed, proposed for listing, or candidates for listing under the Endangered Species Act and BLM State Director's sensitive plant and animal species as required by the BLM Manual 6840."</p>

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>candidates for listing under the Endangered Species Act." Give that BLM Manual 6840.06E and the DRMP provide sensitive species with (at least) the same level of protections candidate species, then we would clarify this statement in the Final RMP to be applicable to BLM Sensitive species as well.</p> <p>—A following point states that "Inventories and monitoring studies would be conducted in order to determine special status species locations, potential habitat, population dynamics, and existing and potential threats." However, the DRMP does not specify the use of the appropriate protocols for such inventories and monitoring. A statement should be added indicating that the BLM will use protocols established for individual species.</p> <p>—A following point states that "BLM would support and implement the guidelines and management recommendations presented in species recovery or conservation plans (as updated), or alternative management strategies developed in consultation with USFWS." A stronger and more accurate statement in the Final RMP would be "the BLM will support, follow and implement current and future special status plant and animal species Recovery Plans, Conservation Plans, Strategies, and Agreements..."</p>	
EOG Resources	60	26 Because the Bald Eagle is no longer protected by the Endangered Species Act, the Act does not require the BLM to consult with the USFWS prior to authorizing activities that may affect the Bald Eagle or its habitat. The BLM accordingly must revise these management actions. In light of the Bald Eagle's changed status, the BLM must not impose the restrictive management measures identified on page 2-51 (note: page numbers have changed since the last draft).	Entire document has been adjusted to correct the status from "threatened" to "special status species." The Bald Eagle is now listed on the BLM and Utah Sensitive Species List and has been listed in that section vs. the wildlife section. Conservation Measures have been kept in Appendix Q to continue protection for Bald Eagles.
EOG Resources	60	27 Although Maps 74–77 purport to identify "sage-grouse habitat," these maps are unclear and unhelpful. First, the maps do not specify which species of sage-grouse they identify—Gunnison sage-grouse or greater sage-grouse. Second, the maps do not	As discussed in Chapter 3, there are only Gunnison Sage-grouse within the Monticello Field Office planning area. BLM has revised the sage-grouse maps to define the entire sage-grouse habitat, not just the BLM parcels within the

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment	
		define what the BLM considers "sage-grouse habitat," which could include active strutting ground, "crucial year-round habitat" as defined on page 2-53 (note: page numbers have changed since the last draft). The BLM must revise Maps 74-77 to clearly describe the sage-grouse habitat that is mapped.	habitat.	
EOG Resources	60	28	Under all of the action alternatives, the BLM proposed to prohibit or avoid the construction of "power lines and other tall structures" within various distances of sage-grouse habitat or strutting grounds. See Monticello DRMP/EIS, pg 2-53. EOG objects to this proposed management action, for several reasons. First, the BLM must clarify what "tall structures" it intends to prohibit by providing, for example, a height limit defining what it perceives as "tall." Without such clarification, this management action does not clearly identify for both land managers and users of the public lands what structures are prohibited.	Definition of what tall structures are has been added to the document that says, "Prohibit construction of power lines or other tall structures (structures above 10 feet, such as windmills or buildings) year-round.
EOG Resources	60	30	Under all of the action alternatives, the BLM would prohibit or avoid the construction of new fences within specified distances of active strutting grounds. See Monticello DRMP/EIS, pg. 2-53. The BLM must not prohibit all fences near active strutting grounds. Rather, the BLM should exempt fences around disposal pits associated with oil and gas operations. The Utah Division of Oil, Gas, and Mining requires operators to fence disposal pits to protect wildlife and livestock. See Utah Admin. Code Rule 649-9-3 (2008). The BLM must revise this management action to allow fences around disposal pits or, at a minimum, to provide the BLM with discretion to waive a prohibition against fences where required to protect wildlife and livestock.	Wording has been changed to clarify to uses allowed within the specified distances of active strutting grounds, including NSO for oil and gas leasing activities. Disposal pits associated with oil and gas operation would not be developed within these distances of active strutting grounds, therefore these fences would not need to be exempt.
EOG Resources	60	41	The BLM incorrectly identifies the Bald Eagle, <i>Haliaeetus leucocephalus</i> , as a threatened species in the Monticello DRMP/EIS. See Monticello DRMP/EIS, pg 3-141. The Bald Eagle was removed from the Federal List of Endangered and Threatened Wildlife by the USFWS on July 9, 2007. See 72 Fed. Reg. 37346 (July 9, 2007). Furthermore, the Bald Eagle	Entire document has been adjusted to correct the status from "threatened" to "special status species." Bald Eagle is now listed on the BLM and Utah Sensitive Species List and has been listed in that section vs. the wildlife section. Conservation Measures have been kept in Appendix Q to continue

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>was not listed or identified as a candidate for listing on the USFWS's most recent list of candidate species. See 72 Fed. Reg. 69034 (Dec. 6, 2007). Notably, the Bald Eagle does not appear on the Utah BLM's list of special status species. See State-listed and BLM-listed Sensitive Species, http://www.ut.blm.gov/vernalrmpguide/state_blm_species.htm (last visited January 17, 2008). The BLM should correct the information in the Final EIS and remove the Bald Eagle from its discussion of threatened and endangered species.</p>	<p>protection for Bald Eagles.</p>
EOG Resources	60 48	<p>The area over which the CSU stipulations apply varies by alternative, with Alternatives B and E applying to CSU stipulation within 2 miles of active strutting ground, Alternative C applying to CSU stipulations within 0.6 miles of active strutting ground, and Alternative D applying in CSU stipulation within 0.25 miles of active strutting ground. The BLM does not identify the number of acres that will be subject to the CSU stipulations under the various alternatives.</p>	<p>The acres are identified on Page 2-53 directly under each Alternative. The map in the appendix has been adjusted to make this clearer.</p>
EOG Resources	60 49	<p>In Section 4.3.7.4.8.6, the BLM fails to disclose the significant impacts of its management action to protect migratory bird habitat during nesting season on oil and gas development. See Monticello DRMP/EIS, pg. 4-95 (note: page numbers have changed since the last draft). The BLM has not explained why such restrictions are necessary. These restrictions are not required by the Migratory Bird Treaty Act of 1918, which permits disruptive activities in certain circumstances. 16 U.S.C. 703--712 (2006). The BLM must revise its proposed management action to ensure it is the least restrict necessary to protect the resource.</p>	<p>Although the Executive Order 13186 or the Migratory Bird Treaty Act does not state specifically what type of measures should be taken on surface disturbing activities, it is BLM's responsibility to decide how we are going to protect nesting habitat for migratory bird and by avoiding or minimizing surface disturbing activities during nesting season, the BLM is protecting migratory birds as mandated.</p> <p>By using the term "avoid," the BLM would consider on a case by case basis to allow a surface disturbing project if there is no reasonable alternative. At that time the activity would be done to minimize the impacts to migratory birds. BLM has added the words "or minimize" behind "avoid" to clarify this.</p> <p>As stated in Section 4.3.7.4.8.3, "This in turn would result in impacts on mineral resource development similar to those described for Bald Eagle." Please refer to page 4-92 for a more detailed description of the impacts to oil and gas.</p>

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
CrownQuest	62	42	Despite statements elsewhere in the Monticello DRMP/EIS, the Bald Eagle is not a threatened or endangered species. The Bald Eagle was removed from the Federal List of Endangered and Threatened Wildlife by the United States Fish and Wildlife Service (USFWS) on July 9, 2007. Furthermore, the Bald Eagle was not listed or identified as a candidate for listing on the USFWS's most recent list of candidate species. Finally, the Bald Eagle does not appear on the Utah BLM's list of special status species.	Entire document has been adjusted to correct the status from "threatened" to "special status species." The Bald Eagle is now listed on the BLM and Utah Sensitive Species List and has been listed in that section vs. the wildlife section. Conservation Measures have been kept in Appendix Q to continue protection for Bald Eagles.
CrownQuest	62	43	As part of several of the Bald Eagle management actions listed, the BLM proposes consultation with the USFWS pursuant to Section 7 of the Endangered Species Act. Section 7 consultation is only required when an action may affect a threatened or endangered species. 16 U.S.C. 1536(a) (2006); 50 C.F.R. 402.14(2007). Because the Bald Eagle is no longer protected by the Endangered Species Act, the Act does not require the BLM to consult with the USFWS prior to authorizing activities that may affect the Bald Eagle or its habitat. The BLM accordingly must revise these management actions.	The entire document has been adjusted to correct the status from "threatened" to "special status species." The Bald Eagle is now listed on the BLM and Utah Sensitive Species List and is listed in that section as opposed to the wildlife section. Conservation Measures will be kept in Appendix Q to continue protection for Bald Eagles; consultation is no longer required for Bald Eagles.
CrownQuest	62	46	The Monticello DRMP/EIS does not include any maps indicating the areas subject to restrictions identified on pages 2-53 and 2-54 (note: page numbers have changed since the last draft). Without maps identifying areas subject to Gunnison sage-grouse management, CrownQuest cannot determine the extent to which the BLM's proposed management actions affect CrownQuest's operations. The final Monticello RMP/EIS should include maps depicting the areas subject to Gunnison sage-grouse management restrictions.	Maps have been added to show the Gunnison Sage-grouse management areas.
CrownQuest	62	47	Although Maps 74–76 purport to identify "sage-grouse habitat," these maps are unclear and unhelpful. First, the maps do not specify which species of sage-grouse they identify—Gunnison Sage-grouse or Greater Sage-grouse. Second, the maps do not define what the BLM considers "sage-grouse habitat," which	Maps have been added to show the Gunnison Sage-grouse habitat. The Lek sites are not specifically mapped since the number and location of the sites change from year to year.

Table 5.10.r. Comments Requiring a Change in the Document: SSS – Special Status Species

		could include active strutting ground, "crucial year-round habitat" as defined on pg. 2-53 of the Monticello DRMP/EIS, or "year-round habitat" as defined on pg. 2-53. The BLM must revise Maps 74–76 to clearly describe the sage-grouse habitat that is mapped.	
CrownQuest	62 73	The BLM incorrectly identifies the Bald Eagle, <i>Haliaeetus leucocephalus</i> , as a threatened species in the Monticello DRMP/EIS. See Monticello DRMP/EIS, pg. 3-141. The Bald Eagle was removed from the Federal List of Endangered and Threatened Wildlife by the USFWS on July 9, 2007. See 72 Fed. Reg. 37346 (July 9, 2007). Furthermore, the Bald Eagle was not listed or identified as a candidate for listing on the USFWS's most recent list of candidate species. See 72 Fed. Reg. 69034 (Dec. 6, 2007). Notably, the Bald Eagle does not appear on the Utah BLM's list of special status species. See state-listed and BLM listed Sensitive Species, http://www.ut.blm.gov/vernalrmpguide/state_blm_species.htm (last visited January 17, 2008).	Entire document has been adjusted to correct the status from "threatened" to "special status species." The Bald Eagle is now listed on the BLM and Utah Sensitive Species List and has been listed in that section vs. the wildlife section. Conservation Measures have been kept in Appendix Q to continue protection for Bald Eagles.
CrownQuest	62 84	In Section 4.3.7.4.8.6, the BLM fails to disclose the significant impacts of its management action to protect migratory bird habitat during nesting season on oil and gas development. See Monticello DRMP/EIS, pg. 4-95. The BLM has not explained why such restrictions are necessary. These restrictions are not required by the Migratory Bird Treaty Act of 1918, which permits disruptive activities in certain circumstances. 16 U.S.C. 703-712 (2006). The BLM must revise its proposed management action to ensure it is the least restrict necessary to protect the resource. Furthermore, although the management action proposes to require no surface occupancy in migratory bird habitat during nesting season, the BLM fails to identify where such habitat exists.	Although the Executive Order 13186 or the Migratory Bird Treaty Act does not state specifically what type of measures should be taken on surface disturbing activities, it is the BLM's responsibility to decide how we are going to protect nesting habitat for migratory bird and by avoiding or minimizing surface disturbing activities during nesting season, the BLM is protecting migratory birds as mandated. By using the term "avoid" the BLM would consider on a case by case basis to allow a surface disturbing project if there is no reasonable alternative. At that time the activity would be done to minimize the impacts to migratory birds. The BLM has added the words "or minimize" behind "avoid" to clarify this. A sentence has been added to this section to discuss how these areas will be determined: "Occupied priority migratory bird habitat will be determined with the use of Utah Partners in

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
State of Utah	4	1	The state requests that the listing on page 1-15 of the DEIS be amended to include the plans and policies indicated by Utah Code section 63-38d-401, et seq., and that the BLM carefully consider consistency with this state law.	<p>Page 1-15 lists pertinent state and county plans. The state identified no specific plans or policies which have been omitted.</p> <p>The BLM is aware that there are specific County and State plan decisions relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between Federal and non-Federal government plans be resolve to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with Federal law there will be an inconsistency that cannot be resolved or reconciled.</p> <p>Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the FEIS/PRMP, so that the State and local governments have a complete understanding of the impacts of the PRMP on State and local management options. The BLM will document the required Governor’s consistency review in Chapter 5.</p>
Lynell Schalk	29	19	Each of the 5 alternative travel plan maps most two "Historic Trails," The Hole-in-the-Rock Trail and the Spanish Trail, under the title of "OHV and Travel Plan" (Reference Maps 58–62). These trails are actually drawn onto the Travel Plan map. The reader has to assume that these two historic trails are proposed in all 5 alternatives to be open as OHV roads or trails. Is this what the agency is proposing? None of the four BLM	It is confusing that the two historic trails are shown in their entirety on the OHV and travel plan maps. But, the intent is not to imply that they are open to vehicular use in their entirety. Portions of the trails are open to vehicle use. Some long established, major roads lie atop portions of the old trail systems. The entire historic trails are not open to vehicular use. They have been deleted from the OHV/Travel Plan maps

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			employees I talked to at the Montezuma Creek meeting could explain why this route was depicted on the Travel Plan alternative maps, including the MFO planning coordinator and one of the outdoor recreation planners.	in the FEIS. The references quoted from Chapter 3 – Affected Environment state the current situation not the proposed. The term "Hole in the Rock Trail" has two different meanings. It can refer to the entire pioneer trail—some of which is unknown on the ground. It also refers to the known segment that accesses the actual "Hole in the Rock." The two references can be confusing. The access trail does get intense legitimate use.
Lynell Schalk	29	20	The route of the Hole-in-the-Rock Trail is largely inaccurate as to its plotted location, often miles from where the trail can actually be found on the ground, as well as being plotted where it can no longer be traced. What is most unsettling about the DRMP map is that it shows the Hole-in-the-Rock Trail leading directly into the town of Bluff. There is no evidence on the ground of the trail between Butler Wash and Bluff, yet the BLM has plotted in on its DRMP map.	Please refer to response to comment 29-19.
National Parks Conservation Association	44	2	It is particularly troubling that the BLM has included designated ORV routes that are within the boundaries of Canyonlands National Park. This error needs to be removed. The BLM also needs to address how it will monitor routes it intends to designate that run up to the park boundaries.	The roads in lands administered by the Park Service have been removed from the OHV and travel plan maps. The placement of signs, kiosks, informing and educating the public recreation users as well as monitoring route usage will be implemented after the signing of the RMP and are not addressed nor will they be decided in the RMP process.

Intermountain Region		units be removed from the map.	
State of Utah	4 51	Table 2-1 – Summary Table of Alternatives – Lands and Realty. It should be noted under all alternatives that, pursuant to Utah v. Andrus, the BLM is obligated to grant reasonable access to the State of Utah and its grantees to school trust lands. In furtherance of this obligation, no existing roads providing access to trust lands should be closed without the consent of SITLA.	The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.
State of Utah	4 57	Section 3.17.3 –Issues. Certain existing routes that provide the only physical access to trust lands sections would not be "Designated Routes," and motorized access on such routes would be terminated. The Draft RMP fails to address the impact of these closures on the economic value of the affected trust lands.	The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.
State of Utah	4 79	It is unclear in Map 51 (of the DEIS) whether or not routes shown in brown within the closed areas are open or closed. The state recommends that all of these routes remain open and the map and its legend be modified.	The routes within the "Closed" areas are those that would remain open to vehicle use. These routes are either major county roads or access routes to trail heads or state lands. The map has been modified to clarify this point.
Sierra Club Utah Chapter	17 4	Commenter states: "The relationship of roads and other mechanized routes to weeds, wildlife, cultural sites, wilderness, landscapes resilient to global and local climate change, and a host of other issues must be analyzed."	Chapter 4 is an extensive analysis for weeds, wildlife, cultural sites, wilderness (as well as a "host of other issues") included impacts from all resources uses such as the relationship of roads and other mechanized routes. A growing body of scientific evidence supports the concern that global climate change will result from the continued build-up of greenhouse gases in the atmosphere. While uncertainties remain, particularly in the area of exact timing, magnitude and regional impacts of such changes, the vast

Table 5.10.t. Comments Requiring a Change in the Document: TRV – Travel

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
			<p>majority of scientific evidence supports the view that continued increases in greenhouse gas emissions will lead to climate change. This statement has been added to Chapter 3 of the PRMP/FEIS.</p> <p>The Environmental Protection Agency (EPA) has not developed regulatory protocol or emission standards regarding global climate change. When these protocols and standards are available, the BLM will analyze potential effects to global warming in the NEPA documentation prepared for site-specific projects. A statement to this effect has been added to Chapter 4 of the PRMP/FEIS.</p>
Canyon Country Heritage Association	18 6	Historic trails – Hole in the Rock and Old Spanish Trail are highlighted on all OHV and travel plan maps – assume they are open for OHV use.	<p>It is confusing that the two historic trails are shown in their entirety on the OHV and travel plan maps. But, the intent is not to imply that they are open to vehicular use in their entirety. Portions of the trails are open to vehicle use. Some long established, major roads lie atop portions of the old trail systems. The entire historic trails are not open to vehicular use. These trails have been removed from the travel plan maps to eliminate this confusion.</p> <p>The references quoted from Chapter 3 – Affected Environment state the current situation not the proposed.</p> <p>The term "Hole in the Rock Trail" has two different meanings. It can refer to the entire pioneer trail—some of which is unknown on the ground. It also refers to the known segment that accesses the actual "Hole in the Rock." The two references can be confusing. The access trail does get intense legitimate use.</p>
Utah State Office of Education	31 7	Under the law, as laid out in Utah v. Andrus, the State of Utah and SITLA are entitled to reasonable access across the BLM's lands to all school trust lands, including those within WSAs. That right of access must be recognized in this document or the document will be in violations of the case law. In the Travel Management section, Under the Preferred Alternative	The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified

Table 5.10.t. Comments Requiring a Change in the Document: TRV – Travel

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		(Alternative C), certain existing routes that provide the only physical access to school trust land sections would be deemed not to be "Designated Routes," and motorized access on such lands would be terminated. Under Alternatives B and E, this problem would be magnified exponentially. The conservation alternatives show approximately 728 miles of roads marked for closure. School trust lands will be greatly affected by these road closures.	by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.
Utah State Office of Education	31 8	The draft RMP fails to address the impact of these closures on the economic value of the affected school trust lands in either this section or its section on socioeconomic impacts of the preferred alternative. Under the Takings Clause of the United States Constitution, no road that accesses a school trust land section, within the RMP, should be closed without trustee consent. It is anticipated that SITLA would take the necessary legal action, on behalf of the beneficiary, to prevent such a closure.	The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.
Utah State Office of Education	31 9	The Draft RMP should be amended to specifically state that: (1) Continued motorized administrative access on "non-designated" routes providing access to school trust lands will be permitted to the State of Utah, SITLA, and its permittees and grantees, notwithstanding any closure to the general public; (2) The State of Utah, SITLA, and its permittees and grantees may undertake reasonable maintenance activities to preserve and improve existing access across the BLM lands, after consultation and appropriate environmental review by the BLM; and (3) Existing routes that are the sole access to school trust lands will not be reclaimed without full BLM consultation with, written approval by SITLA, and fair market compensation to the trust after consultation with the State Board of Education and its designated representatives.	The BLM does provide for reasonable access to all SITLA lands under all alternatives. A sentence has been added to Chapter 2, Lands and Realty, Management Common to All Action Alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision.
ECOS Consulting	58 27	Section 4.3.17.2.13 – Impacts of Travel Decisions on Vegetation	This is a mistake in the document and has been changed. Under Alternative A there are 611,310 acres open to cross country travel by OHVs. The remaining 1,171,813 acres is

Table 5.10.t. Comments Requiring a Change in the Document: TRV – Travel

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		Here it is stated: "There are a total of 1,940,740 acres open to OHV use under this alternative, which is more than under any of the other alternatives." How can this many acres be open to OHV use if there is only about 1,800,000 acres within the Monticello Planning Area?	either closed to OHV use or open with restrictions.
Veronica Egan	131	3 Remove the Hole in the Rock Trail from all maps depicting routes open to motorized use. The entire trail is listed on the National Historic Register, and as such must be protected from the damage inflicted by motorized use. The presence of this trail on these maps gives the false impression that it is open to motorized use.	It is confusing that the historic trail is shown in its entirety on the OHV and travel plan maps. But, the intent is not to imply that it is open to vehicular use in its entirety. Portions of the trails are open to vehicle use. Some long established, major roads lie atop portions of the old trail system. The entire historic trail is not open to vehicular use. It has been deleted from the OHV/Travel Plan maps in the FEIS.
Veronica Egan	131	4 Clarify (NPS, USFS) agency boundaries on all maps and determine if the routes that the BLM has specified as open are open on these agencies lands, or not, before placing them on BLM maps.	The roads in lands administered by the Park Service and Forest Service have been removed from the OHV and travel plan maps. The BLM is dealing with routes on their lands only. Both NPS and FS have had opportunity to review the BLM's travel plan designations.
Glen Canyon Group, Utah Chapter, Sierra Club	221	5 Regarding Table ES1 (page ES-5), OHV Categories (acres) by Alternative: How can the total of acres under the No Action Alternative A be over 2.2 million acres when less than 1.8 million acres is managed by the BLM? Adding footnote 3 under Summary Table A on page 2-3 would clarify the matter.	Changes have been made to the document as noted.
Glen Canyon Group, Utah Chapter, Sierra Club	221	6 Summary Table A on page 2-3 should note that the "Miles of Routes Designated" are D roads only. The totals for Alternatives C and D are incorrect.	Changes have been made to the document as noted.

Table 5.10.u. Comments Requiring a Change in the Document: VEG – Vegetation

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
U.S. Fish and Wildlife Service	2	18	Table 3.58. The title suggests cover types in all of the Monticello Planning Area, but they are actually only of the lands administered by the BLM.	The title of Table 3.58 has been changed from the Monticello PA to BLM lands.
U.S. Fish and Wildlife Service	2	24	Page 4-421 in Section 4.3.15.1 (note: page and section numbers have changed since the last draft). In the third paragraph it states "A diverse native community would have the potential to establish...." This statement assumes that natives will successfully reestablish. The document should thoroughly describe the difficulties with nonnative, invasive plant species following surface disturbances that include fire.	This section has been revised to incorporate impacts of non-native, invasive plant species following surface disturbances that include fire.
San Juan County	7	54	Pg. 2-57 (note: page numbers have changed since the last draft). The first goal under vegetation should include livestock as well.	The document has been revised to include vegetative goals in relation to livestock management.
The Nature Conservancy	49	20	The statement that Upland areas would be managed for "desired future condition" is vague because no specific DFC is defined. The glossary defines desired condition as "Description of those factors, which should exist within ecosystems both to maintain their survival and to meet social and economic needs." However, desired condition depends upon personal use or requirements. For example, desired future condition for a rancher may differ vastly from desired condition for mineral exploration or wildlife. Therefore a better management prescription would be to manage according to Interpreting Indicators or Rangeland Health (technical reference 1734-6 2005) and, when appropriate, the complimentary manuals Monitoring Manual for Grassland, Shrubland and Savanna; Volume I and II to determine if goals and objectives are being met.	The definition in the Vegetation section for desired future condition (DFC) has been clarified to "Manage vegetation resources for desired future conditions, as determined by site-specific BLM objectives and rangeland functionality and health, thereby ensuring ecological diversity, stability, and sustainability, including the desired mix of vegetation types, structural stages, and landscape/riparian/watershed function, and provide for native plant, fish, and wildlife habitats." Therefore, DFC is determined by the BLM utilizing Ecological Site Descriptions and managed to meet ecological process and sustain and/or improve rangeland health. The resources of concern identified by the commenter related to livestock grazing do not require a land use planning decision. These resource values are addressed on a site specific allotment basis utilizing Standards for Rangeland Health and Guidelines for Grazing Management.
ECOS Consulting	58	13	In this Monticello DRMP/EIS, the BLM has not provided clear, objective, and measurable "Desired Future Conditions" for each vegetation community in the Monticello Planning Area. There are numerous management activities proposed in this	The definition in the Vegetation section for desired future condition (DFC) has been clarified to "Manage vegetation resources for desired future conditions, as determined by site specific BLM objectives and rangeland functionality and

Table 5.10.u. Comments Requiring a Change in the Document: VEG – Vegetation

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>Monticello DRMP/EIS that will drastically change conditions on the ground throughout the Planning Area, and do not appear to have measurable and objective habitat goals. Livestock grazing is planned to be allowed on over 90% of the Planning Area. Vegetation treatments are proposed on over 20% of the Planning Area. Forestry and woodland products activities are planned over most of the Planning Area. Mining and energy development has the potential to be widespread. OHV use and routes are proposed in over 90% of the Planning Area. All of these activities, and others, can have extensive long-term adverse direct, indirect, and cumulative impacts on the ecosystem. In considering, these impacts, the BLM must precisely define Desired Future Conditions for each vegetation community in order to effectively manage the resources.</p>	<p>health, thereby ensuring ecological diversity, stability, and sustainability, including the desired mix of vegetation types, structural stages, and landscape/riparian/watershed function, and provide for native plant, fish, and wildlife habitats." Therefore, DFC is determined by the BLM utilizing Ecological Site Descriptions and managed to meet ecological process and sustain and/or improve rangeland health.</p> <p>The resources of concern identified by the commenter related to livestock grazing do not require a land use planning decision. These resource values are addressed on a site specific allotment basis utilizing Standards for Rangeland Health and Guidelines for Grazing Management.</p>
ECOS Consulting	58	20 <p>Pages 3-154 through 3-160 (note: page numbers have changed since the last draft): Throughout this section there is no mention of "Desired Future Condition" of these plant communities, yet the BLM will be allowing activities and actively managing as if they knew what future condition they wanted. This is obviously not the case. The BLM must develop detailed "Desired Future Conditions" for each of its major vegetation communities and use these definitions as guides for future management. These definitions must include descriptions of the condition of biological soil crusts, vegetation cover, vegetation diversity, and vegetation structure. This must be done now, before 10–20 years of future planning is committed, before this DRMP/EIS is finalized.</p>	<p>A definition for desired future condition (DFC) has been added to the glossary: "The desired mix of vegetation types, structural stages, and landscape/riparian/watershed function, as determined by management objectives and rangeland functionality and health, that ensures ecological diversity, stability and sustainability to provide for plant, fish and wildlife habitats."</p> <p>Therefore, DFC is determined by the BLM utilizing Ecological Site Descriptions and managed to meet ecological process and sustain and/or improve rangeland health.</p> <p>The resources of concern identified by the commenter related to livestock grazing do not require a land use planning decision. These resource values are addressed on a site specific allotment basis utilizing Standards for Rangeland Health and Guidelines for Grazing Management.</p>
Nature Conservancy Moab Project Office	214	4 <p>The statement that Upland areas would be managed for "desired future condition" is vague because no specific DFC is defined. The glossary defines desired condition as "Description of those factors, which should exist within ecosystems both to maintain their survival and to meet social and economic needs."</p>	Please refer to response to comment 49-20.

Table 5.10.v. Comments Requiring a Change in the Document: VRM – Visual Resource Management

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
Lynell Schalk	29	3	Indian Creek ACEC Alternative B states that it is the "same as Alternative A except..." (Reference: pg. 2-40, Vol. 1). Alternative B then repeats several of the same "prescriptions" as are in Alternative A, i.e. "closed to OHV use," "managed as a VRM Class I," "available for livestock use," "unavailable for disposal of mineral materials," etc. Many of the listed "exceptions" are not exceptions at all, making it doubly difficult for the reader to determine the difference in the alternatives.	The document has been changed to correct duplications between Alternatives A and B.
CrownQuest	62	68	On page 2-114 (note: page numbers have changed since the last draft), the BLM understates the significant economic impacts of the proposed VRM management restrictions under Alternatives B and E. See Monticello DRMP/EIS, pg 2-114, Table 2.2.	Table 2.2 has been changed to more adequately describe the impacts. Analysis of these impacts can be found in Sections 4.3.7.4.9 and 4.3.12.2.10 of the FEIS. Please also refer to response to comment 62-64.

Table 5.10.w. Comments Requiring a Change in the Document: WC – Wilderness Characteristics

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
Southern Utah Wilderness Alliance	26	55	Cheesebox Canyon Unit – The commenter states that the BLM did not properly create accurate boundary lines for this unit, and that it is actually adjacent to a 1999 WIA unit with WC.	The BLM incorrectly stated that this unit is not contiguous to the 1999 WIA unit with WC. It is, in fact, contiguous; however, the unit contains multiple vehicle routes and evidence of mining activity, and thus does not meet the naturalness criteria for wilderness characteristic management. Therefore, the unit is determined to not possess wilderness characteristics.
Southern Utah Wilderness Alliance	26	62	Lockhart Basin Unit, Comment A – The commenter states, "What happened to the BLM's assessment of the Lockhart Basin wilderness character area? It was recently found by the BLM to have reasonable probability of having wilderness character (RPD), but within the DRMP and the background files, this area seems to have slipped through its proper wilderness character identification."	The Lockhart Basin area was found to have reasonable probability of having wilderness character in 2001. That area was not reviewed during the 2007 WCR because of this prior finding. WSAs and the 1999 WIA areas also were not reviewed under the 2007 WCR process. The WC finding has not changed, however it was not one of the areas carried forward for management of wilderness character in the proposed plan. The Lockhart Basin RPD area was inadvertently left off the maps showing non-WSA areas with Wilderness Character in the draft, this oversight has been corrected in the PRMP.
Southern Utah Wilderness Alliance	26	73	Tin Cup Mesa Unit – The commenter states that the "BLM's WCR fails to account the adjoining Squaw and Papoose Canyon WSA is part of the larger Tin Cup Mesa wilderness character unit within the recent WCR."	As part of its wilderness characteristics inventory maintenance, the BLM used a combination of field knowledge, ID Team review, og-wells GIS data, range allotment files, and a review of BLM and San Juan County (SJ CO) GIS data, including 2006 high resolution aerial photographs. This unit was reviewed as a standalone unit due to its overall size (16,000 acres approximately), and thus the fact that it is contiguous to a WSA is not relevant. The BLM findings are described in the 2007 WCR process and are available as part of the administrative record in the Monticello BLM Field Office. The BLM stands by its findings of its wilderness characteristics inventories and WCR process.
Utah State Office of Education	31	5	In the Affected Environment section, it should be stated that to the extent the BLM creates new areas managed for preservation, based on impacts to physical, biological, and cultural resources, such as ACECs or areas managed for	The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. The assumption has been changed to reflect this fact. In Alternative C, the closure of

Table 5.10.w. Comments Requiring a Change in the Document: WC – Wilderness Characteristics

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			<p>"wilderness characteristics," such designation has a direct economic impact on the Utah school trust. For all school trust lands inheld in such areas, it will therefore become necessary to identify and make available lands, and acknowledge that each special designation will require an accompanying land exchange. Failure to provide a necessarily large pool of available economically productive lands for exchange will constitute an unconstitutional taking of the captured lands.</p>	<p>acreage managed as WSA or Wilderness Areas is nondiscretionary and beyond the scope of this plan. Chapter 4 of the PRMP/FEIS has been revised to reflect the impacts in Alternative E on SITLA inholdings of the discretionary closures of public land. It should be noted that under any Alternative, the proposed ACECs are not managed as closed to mineral leasing.</p>
EOG Resources	60	50	<p>On pages 4-153 through 4-155 (note: page numbers have changed since the last draft) the BLM must expressly provide that any special management of non-WSA lands cannot affect existing lease rights. See, e.g., National Wildlife Fed'n. et. Al., 150 IBLA 385, 403 (1999). The BLM may not modify valid existing lease rights through the revision of RMPs.</p>	<p>The land use plan makes decisions for new leasing actions. Valid existing rights (previous leases) are recognized regardless of plan decisions.</p>
CrownQuest	62	65	<p>On page 2-113 (note: page numbers have changed since the last draft), under the resource Non-WSA Lands with Wilderness Characteristics, the BLM explains that managing over a half million acres of public lands for wilderness characteristics under Alternative E is "likely to have positive impacts on local economy with the potential for some socioeconomic losses due to restricted activities in these areas.</p>	<p>The analysis in Chapter 4 has been expanded to address the potential negative impacts of Alternative E on oil and gas development. The BLM believes that the impact would be minor in the context of the RFD, but nonetheless real. Whether the economic benefits from Alternative E will exceed the economic costs is impossible to determine with available data.</p>

U.S. Fish and Wildlife Service	2	25	Page 4-422 in Section 4.3.15.1. In the third paragraph: "The installation of power poles would increase raptor predation...." The "would" should be changed to "may."	The change has been made to the document.
U.S. Fish and Wildlife Service	2	28	Page 4-426 in Section 4.3.15.1 (of the DEIS). In the third paragraph it states: "In occupied priority migratory bird habitat..." The document should describe how this habitat will be delineated.	A sentence has been added to this section to discuss how these areas will be determined. "Occupied priority migratory bird habitat will be determined with the use of Utah Partners in Flight Avian Conservation Strategy, Intermountain West Joint Venture Bird Habitat Conservation Areas, and other migratory bird conservation plans."
U.S. Fish and Wildlife Service	2	36	Page 4-575 in Table 4.204 (of the DEIS) FWS recommends the method be described which was used to calculate the number of acres derived in this table.	An explanation has been added to the bottom of the tables to explain the methods used to calculate the number of acres derived in this table.
State of Utah	4	11	The state requests that the BLM use the "crucial habitat" designations mapped by the DWR solely as descriptive wildlife habitat designations, not as automatic exclusion zones for other multiple uses.	The BLM has changed the document to use the crucial habitat designations of UDWR. Use of these habitat polygons does not automatically exclude other uses. Appendix A outlines exceptions, modifications and waivers that will be used when applicable for all surface disturbing activities in these areas.
State of Utah	4	89	The Monticello RMP should be consistent with the newly developed Utah Wildlife Action Plan (UWAP). As a cooperator in developing this plan, the BLM should acknowledge it as the	This reference has been changed from the Utah Comprehensive Wildlife Conservation Strategy to the Utah Wildlife Action Plan.

Table 5.10.y. Comments Requiring a Change in the Document: WL – Wildlife

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		guideline for sensitive species management in the State of Utah. On page 2-51, it states the "BLM would work with the UDWR to implement the Utah Comprehensive Wildlife Conservation Strategy to coordinate management decisions that would conserve native species and prevent the need for additional listings."	
San Juan County	7 13	The BLM erroneously uses the term critical habitat for wildlife habitat that does not apply to endangered species act. The term crucial habitat is used too loosely; UDWR uses crucial habitat as descriptive designations. They are not intended to mislabel resource concerns and result in a limitation of compatible uses. San Juan County disputes the acreage identified for crucial elk and deer winter range in San Juan County and submits information from Dr. Charles Kay in that regard.	The critical habitat term has been changed to crucial in the final RMP/EIS. The UDWR is the jurisdictional agency for wildlife management within the state. The BLM relied on the expertise of this agency for delineating wildlife habitats, estimating population numbers, and recommending wildlife restrictions.
San Juan County	7 53	Pg. 2-54 and 2-56 (note: page numbers have changed since the last draft).- San Juan County is opposed to any alternative in the Monticello RMP/EIS which closes any portion of the Arch Canyon road. Reasons for the County's opposition include: 1) the Flannelmouth Sucker is not found above the State Section (T. 37 S., R. 10 E., Section 16). Therefore there is no justification to close the Arch Canyon road to protect this species above the State Section; 2) The stream is in proper functioning condition and BLM surveys have found no evidence that the Flannelmouth Sucker is being impacted by the road or its use; 3) The two primary reasons for listing the MSO, as described by the USFWS in its final rule dated August 31, 2004, are not major threats in the portion of Arch Canyon located on BLM lands; 4) In its final rule, the USFWS also described important habitat conditions for the MSO, all of which are much more prevalent on the Forest Service lands than on the BLM lands; 5) The portion of Arch Canyon on BLM land is near the fringe of the habitat for the MSO as mapped by the USFWS and would appear not to be as important for the survival of the owl; 6) The BLM is proposing to allow hikers unrestricted access in	Comment noted. The proposed travel plan has been adjusted. Even if the flannelmouth sucker is not found above the state section, it does not preclude management of the stream and watershed above the fish since activities that happen upstream will directly impact fish that live downstream. The endangered species act does not preclude the protection of species simply because the proposed action is not included as one of the primary reason for the need of a species to be listed. Arch Canyon is included in the Designated Critical Habitat for Mexican Spotted Owls and habitat evaluations have determined that Arch Canyon is suitable habitat for Spotted Owls. As stated in Table 2.1, the BLM also analyzed a permit system to restrict the number of hikers in Alternative B and C.

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>Arch Canyon.</p> <p>The county requests an explanation of the BLM's rationale for allowing hikers to hike and camp both on the road and throughout the canyon and cliffs while proposing to close the road to OHV use.</p>	
San Juan County	7 58	Section 3.20.2.1 – It is generally agreed that in southeast Utah the limiting factor for mule deer is summer range, not winter range as stated by the BLM. The county suggests that the BLM correct this in the Final RMP.	The sentence, "Winter range is often considered a limiting factor for mule deer" will be removed and replaced with the following clarification. "In the summer months, mule deer populations could be limited during years where there is little rainfall, water availability, and summer forage which reduces fawning success. In the winter months, insufficient quantity or quality of habitat or deep snow results in heavy concentration of deer on winter ranges, increasing the spread of disease, reduction in population, and fawning success."
San Juan County	7 59	Pg. 3-164 (note: page numbers have changed since the last draft) – The county points out that the BLM's statement that "Within the Monticello PA, there has been a loss/die-off of sagebrush habitat due to drought and insect infestations" is only partially correct. The county references Charles E. Kay's studies in Beef Basin which show that sagebrush loss/die off is due primarily to deer overgrazing. Overgrazing by deer can also stress sagebrush and make it more susceptible to drought and insects.	The sentence has been modified to: "Within the Monticello PA, there has been a loss/die-off of sagebrush habitat due to drought, insect infestations, and overgrazing."
Lynell Schalk	29 16	What is the date of the statistics used for the desert bighorn sheep population, reference: pg. 3-166, Vol.1 (note: page numbers have changed since the last draft)?	The numbers were given by the Utah Division of Wildlife Resources at the time the plan was being developed in 2005 or 2006. Numbers need to be updated.
ECOS Consulting	58 23	<p>Section 4.3.13.2.5 – Impacts of Wildlife and Fisheries Decisions Common to the Proposed Plan and All Alternatives</p> <p>The BLM must be more specific as to what it means by "maintenance and improvement" of migratory bird habitat. What specific techniques does the BLM plan to use? Have they been</p>	<p>In Section 4.3.13.2.5, the first sentence has been changed to state, "...low and high desert scrub communities, which are four important habitat types used by fish, amphibians, big game, and migratory birds in the Monticello PA."</p> <p>Maintenance and improvement could mean several things and</p>

Table 5.10.y. Comments Requiring a Change in the Document: WL – Wildlife

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		<p>used in the past? If so, what are the specific locations where this has occurred? The BLM must also show an analysis of the needs and effectiveness of "maintenance and improvement" projects. What about the rest of the wildlife; the predators, the large mammals, small mammals, reptiles, amphibians, and other wildlife groups? How about the fish? What are the plans for fish and wildlife habitat improvement? These activities will all have direct, indirect, and cumulative impacts on soils and water resources, but there is no analysis here, no attempt to divulge extent, location, and duration of the impacts of these projects. This is a violation of NEPA.</p>	<p>also corresponds to improvement of vegetative conditions that was evaluated in Sections 4.3.17 (Vegetation Resources) and 4.3.11 (Riparian Resources). The acres of each habitat type that could be completed are analyzed in these sections. Site-specific NEPA would be done and impacts analyzed that would discuss exact location and techniques.</p>
EOG Resources	60 55	<p>On page 4-560 (note: page numbers have changed since the last draft), the BLM states, "Under all alternatives adherence to the Migratory Treat Bird Act [sic] and Executive Order 13186 'Responsibilities of Federal Agencies to Protect Migratory Birds' would have beneficial impacts on migratory birds...." The BLM then discusses its management action that would avoid surface disturbing activities in migratory bird habitat during nesting season. Contrary to the BLM's suggestion, neither the Migratory Bird Treaty Act of 1918 nor Executive Order 13186 requires the BLM to impose this management action. See 16 U.S.C. 703-712 (2006); Exec. Order No. 13,186, 66 Fed. Reg. 3853 (Jan. 17, 2001). The BLM must, at a minimum, revise its statements on page 4-560 to make clear that this management action is inconsistent with the Migratory Bird Treaty Act and Executive Order 13186. EOG urges the BLM to remove this management action from the Monticello RMP/EIS.</p>	<p>Although the Executive Order 13186 or the Migratory Bird Treaty Act does not state specifically what type of measures should be taken on surface disturbing activities, it is the BLM's responsibility to decide how we are going to protect nesting habitat for migratory bird and by avoiding or minimizing surface disturbing activities during nesting season, the BLM is protecting migratory birds as mandated.</p> <p>By using the term "avoid" the BLM would consider on a case by case basis to allow a surface disturbing project if there is no reasonable alternative. At that time the activity would be done to minimize the impacts to migratory birds. The BLM has added the words "or minimize" behind "avoid" to clarify this.</p>
CrownQuest	62 54	<p>On page 2-59 (note: page numbers have changed since the last draft), as Management Common to All Alternatives, the BLM proposes to avoid surface-disturbing activities and vegetative-altering projects in identified occupied migratory bird habitat during migratory bird nesting season. See Monticello DRMP/EIS, Table 2.1. The BLM has not defined or mapped "identified occupied migratory bird habitat." Furthermore, the</p>	<p>The BLM is required to protect habitat for all migratory birds. A sentence has been added to this section to discuss how these areas will be determined. "Occupied priority migratory bird habitat will be determined with the use of Utah Partners in Flight Avian Conservation Strategy, Intermountain West Joint Venture Bird Habitat Conservation Areas, and other migratory bird conservation plans."</p>

Table 5.10.y. Comments Requiring a Change in the Document: WL – Wildlife

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			BLM has not identified any specific species of migratory bird that it aims to protect.	
CrownQuest	62	55	On page 2-60 (note: page numbers have changed since the last draft), as Management Common to All Alternatives, the BLM proposes to apply compensatory measures when ground-disturbing activities occur in crucial habitats. See Monticello DRMP/EIS, Table 2.1. As BLM Washington Office Instruction Memorandum 2005-069 provides, the BLM may only consider off-site mitigation after it has applied best management practices. Furthermore, off-site mitigation must be voluntary on the part of the applicant. Finally, a blanket requirement for off-site mitigation in crucial habitat is entirely inconsistent with the BLM's off-site mitigation policy, which considers off-site mitigation "appropriate when the specific conditions of a proposed project make such mitigation appropriate." See BLM Washington Office Instruction Memorandum 2005-069 (Feb. 1, 2005).	On pg. 2-86, under management common to all with Bighorn Sheep, The sentence was removed the states, "On-site mitigation would be required for projects that disturb or remove forage and browse....forage lost." It is stated on pg. 2-86, under Habitat Improvements and Protection that, the "BLM would follow BLM Washington Office Guidance (IM 2005-069) on application of compensatory measures.
CrownQuest	62	91	On page 4-556 (note: page numbers have changed since the last draft), the BLM states, "Adverse impacts of minerals decisions on wildlife resources would be reduced by the implementation of [Best Management Practices] outlined in Section 2.1 and Appendix O." This statement is problematic for two reasons. First, Appendix O relates to Identification of Wilderness Characteristics on Non-WSA Lands Managed by Monticello BLM and not Best Management Practices (BMPs). Assumedly, the BLM intended to reference Appendix M, which identifies BMPs for Raptors and Their Associated Habitats in Utah.	A change has been made to the document to clarify this issue.
CrownQuest	62	95	On page A-12 (note: page numbers have changed since the last draft), the BLM identifies that a timing limitation (TL) will be applied under Alternative D that prohibits surface disturbing activities or occupancy between April 15 to May 15 for lambing and from November 1 to December 15 for rutting. Table 2.1 identifies the limitation periods as between April 1 to June 15 for	The timing limitation dates have been corrected.

Table 5.10.y. Comments Requiring a Change in the Document: WL – Wildlife

Commenter Name	Record ID & Comment Number	Comment Text	Response to Comment
		lambing and October 15 to December 15 for rutting. See Monticello DRMP/EIS, pg 2-61, Table 2.1; see also Monticello DRMP/EIS, pg 4-134, Table 4.58.	
CrownQuest	62 96	Appendix A identifies the number of acres affected by TL stipulations to protect desert bighorn sheep. The numbers of acres presented in Appendix A are different than those presented in Table 2.1 for Alternatives B, D, and E. Compare Monticello DRMP/EIS, Appx. A pgs. A-11, A-12 (note: page numbers have changed since the last draft), Table A.1 with Monticello DRMP/EIS, pg 2-61, Table 2.1.	The acreage has been corrected.
CrownQuest	62 97	On page A-16 (note: page numbers have changed since the last draft), the BLM identifies a TL that will be applied under Alternative D that prohibits surface disturbing activities between December 15 and March 31. Table 2.1 identifies the limitation period as between December 1 and April 15. See Monticello DRMP/EIS, pg. 2-61, Table 2.1; see also Monticello DRMP/EIS Table 4.58 (note: page numbers have changed since the last draft).	Dates have been corrected.
CrownQuest	62 98	Appendix A identifies the number of acres affected by TL stipulations to protect deer winter range. The numbers of acres presented in Appendix A are different than those presented in Table 2.1 for Alternatives B, D, and E. Compare Monticello DRMP/EIS, Appx. A, pgs. A-15 - A-16, Table A.1 with Monticello DRMP/EIS, pg 2-61, Table 2.1.	Acres have been corrected.
CrownQuest	62 99	On page A-18, the BLM identifies a TL that will be applied under Alternative D that prohibits surface disturbing activities between December 15 and March 31. Table 2.1 identifies the limitation periods as between December 1 and April 15. See Monticello DRMP/EIS, pg. 2-61, Table 2.1; see also Monticello DRMP/EIS, pg 4-134, Table 4.58 (note: page numbers have changed since the last draft).	Dates have been corrected.
CrownQuest	62 100	Appendix A identifies the number of acres affected by TL stipulations to protect elk winter range. The numbers of acres	Acres have been corrected.

			presented in Appendix A are different tat those presented in Table 2.1 for Alternatives B, D, and E. Compare Monticello DRMP/EIS, Appx. A, pgs. A-17 - A-18, Table A.1 with Monticello DRMP/EIS, pg. 2-61, Table 2.1 (note: page numbers have changed since the last draft).	
Mary Moran	145	2	P. 3-171 (note: page numbers have changed since the last draft). Where reptiles of the Monticello Project Area are briefly discussed: "Most turtles are aquatic, although a few live entirely on land." Perhaps a joke, a cut-and-paste error, or something stuck in to see how closely we are reading? I know there a couple naturalized non-native turtle species in southwest Utah (as well as native desert tortoises), but I sure didn't think San Juan County or Grand County had any turtles.	The sentence on turtles was put in by mistake and has been removed.

Table 5.10.z. Comments Requiring a Change in the Document: WR – Water Resources

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
State of Utah	4	32	The state engineer recommends that the BLM consider the impact its actions may have on water rights in general and non-BLM water rights in particular.	In Section 1.3.2, the BLM states 1) the planning process would recognize the existence of valid existing rights, and 2) the BLM would adhere to all applicable laws (including state and local laws). The text has been edited to ensure that water rights are recognized as valid existing rights.
State of Utah	4	85	Potential dam locations are shown on Map 46 (of the DEIS) . The state assumes that the potential to construct dams in these areas has been preserved in the RMP but it is hard to tell from the maps and text whether or not this is the case. The BLM should clarify by adding language to appropriate sections.	Potential dam locations were included on Map 46 as a factor related to potential eligibility for wild and scenic river designation. It was later determined that these potential dam sites did not affect the eligibility classification so this information has been removed from the map. Any future proposal for dam construction would be assessed on a case-by-case basis regardless of whether such information is listed in the RMP.

Table 5.10.aa. Comments Requiring a Change in the Document: WSA – Wilderness Study Areas

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
Southern Utah Wilderness Alliance	26	87	The DRMP/EIS directs readers to see below for miles of route per WSA but this mileage never appears anywhere in the DRMP/EIS.	A change has been made in the document.
Utah State Office of Education	31	3	At the current time, approximately 46,541 surface acres are inheld in Wilderness Study Areas (WSAs) in the MPA. When these lands are added to the 66,515 acres included in the proposed non-WSA lands in the Alternative E, Utah's school trust will be left with approximately 113,056 surface acres within the MPA that cannot produce revenue or that will have reduced revenue potential. In this respect, the Resource Management Plan includes an unconstitutional taking of approximately 57% of the school children's lands within the MPA, and the BLM must include specific provisions in the RMP to adequately compensate the school trust, through exchanges or purchase if the Board of Trustees determines it desires to sell the property so captured.	<p>Non-BLM lands could be indirectly impacted by RMP decisions both positively and negatively. The analysis in Chapter 4 of the PRMP/FEIS has been modified accordingly.</p> <p>The BLM does provide for reasonable access to all SITLA lands under all alternatives. Information has been added to Chapter 2, Lands and Realty, Management Common to all action alternatives, that states that reasonable access to State land would be provided including across BLM lands within avoidance and exclusion areas for rights-of-way as specified by the Cotter decision (Utah v. Andrus, 10/1/79). In addition, the Monticello DRMP/DEIS travel management plan recognizes the requirement to provide access to SITLA lands per the Cotter decision. Also, please see the revised analysis under Socioeconomics in Chapter 4 of the PRMP/FEIS.</p> <p>The need for the BLM to give priority to State-Federal land exchanges has been recognized.</p>
Broads Healthy Lands	41	17	The Collins Spring access road seems to end at the Grand Gulch ISA per the 1999 BLM Inventory, but the TMP shows this road entering the ISA. There is an additional several mile section of road shown on the Alt C map that appears to be on the boundary that does not exist on maps published in the 1999 Inventory. These routes must be removed from the preferred alternative of the final TMP.	The Collins Springs access road the commenter is referring to is proposed to be closed to the public at the ISA boundary. The road outside of the ISA is proposed to remain open in the plan.
Broads Healthy Lands	41	22	Squaw Canyon WSA – Thankfully, the BLM is not proposing any new routes or ways in this WSA. However, you are proposing an extension of a route along the north boundary that does not exist on maps published in the 1999 Inventory. Please	Two existing short sections of routes within the WSA are proposed for closure in Alternative C and not shown on the map. There are no proposed routes or ways within this WSA. The route the commenter recommends for closure is proposed

Table 5.10.aa. Comments Requiring a Change in the Document: WSA – Wilderness Study Areas

Commenter Name	Record ID & Comment Number		Comment Text	Response to Comment
			consider eliminating all but the original well-pad access route.	to remain open in the plan.
Broads Healthy Lands	41	24	Indian Creek WSA – Thankfully, the BLM does not attempt to designate new routes in this WSA. However, the BLM's maps show a new route coming to the north edge of the WSA (within Canyonlands National Park) that should not be reflected in your route designations.	Changes have been made to the Travel Plan (maps 58–62) as suggested by the commenter and the route within the National Park has been removed.

5.6 RECORD OF DECISION

Following publication by the EPA and BLM of a Notice of Availability of the PRMP/FEIS in the Federal Register, there is a 30-day protest period. In addition, a 60-day Governor's Consistency Review period runs concurrently with the the protest period.

The state director will approve the PRMP/FEIS by issuing a public Record of Decision (ROD), which is a concise document summarizing the findings and decisions brought forth from the PRMP/FEIS. However, approval shall be withheld on any portion of a plan being protested until final action has been completed on such protest. Before such approval is given, there shall be public notice and opportunity for public comment on any significant change made to the Proposed Plan.

Management actions specified for the Proposed Alternative in Chapter 2 of the PRMP/FEIS are labeled as follows:

- **Land Use Plan Decisions (P):** These broad-scale decisions guide future land management actions and subsequent site-specific implementation decisions. Land use plan decisions fall into two categories: desired outcomes (goals; standards, including land health standards; and objectives) and allowable uses and actions to achieve outcomes. Proposed land-use plan decisions are protestable to the BLM director.
- **Implementation Decisions (I):** These decisions take action to implement land-use plan decisions on a site-specific basis. They may be incorporated into implementation plans or may exist as stand-alone decisions. When issued, implementation decisions are generally appealable to the Interior Board of Land Appeals as outlined in 43 CFR Part 4.
- **Administrative and Policy Decisions (A):** These decisions are based on law, regulation, and/or policy and do not require a land-use plan decision or implementation decision. They are not protestable or appealable.

5.7 DISTRIBUTION LIST FOR THE PROPOSED RMP/FINAL EIS

A copy of the PRMP/FEIS has been sent to all the entities identified in the distribution list below (Table 5.11). The individuals, groups, organizations, and agencies included in the mailing list for the Monticello RMP will be notified that the PRMP/FEIS is available and a hard copy or compact disc of the document can be provided upon request. In an effort to reduce printing costs, the PRMP/FEIS is also available on the Monticello RMP website at <http://www.blm.gov/ut/st/en/fo/monticello/planning.html/>, the Monticello FO, the public room in the BLM Utah State Office, and the public libraries listed on the distribution list.

5.8 LIST OF PREPARERS

The BLM Monticello FO PRMP/FEIS was written and produced by a team composed of Monticello FO interdisciplinary resource specialists and SWCA Inc., an independent, third-party consulting firm. In accordance with 40 CFR 1506.5(c), SWCA certified that it does not have any financial or other interest in the outcome of the decisions made pursuant to this RMP/EIS. Under the guidance and direction of the BLM, and in collaboration with the cooperating agencies, the team developed alternatives, collected baseline data to be used in the analysis, assessed potential effects of the alternatives, and prepared all the necessary elements of an RMP/EIS with additional participation, comments, and critique from the cooperating agencies and resource specialists with the BLM Utah state office. Table 5.12 lists the name, position, and planning role of the team members associated with preparation of the PRMP/FEIS.

EPA	Environmental Protection Agency
EPCA	Energy Policy and Conservation Act (of 1975)
ERMA	Extended Recreation Management Area
ESA	Endangered Species Act (of 1973)
ESR	Emergency Stabilization and Rehabilitation
FEIS	Final Environmental Impact Statement
FERC	Federal Energy Regulatory Commission
FLPMA	Federal Land Policy and Management Act (of 1976)
FMP	Fire Management Plan
FMZ	Fire Management Zone
FO	Field Office
FR	Federal Register
GAP	Geographical Analysis Program
GIS	Geographic Information Systems
HFRA	Healthy Forests Restoration Act (of 2003)
HMA	Herd Management Area
HMAP	Herd Management Area Plan
HMP	Habitat Management Plan
HUC	Hydrologic Unit Code
IBLA	Interior Board of Land Appeals
IMP	Interim Management Policy
ISA	Instant Study Area
KRCRA	Known Recoverable Coal Resource Area
LTA	Land Tenure Agreement
LUP	Land Use Plan
LWCF	Land and Water Conservation Fund
MBTA	Migratory Bird Treaty Act (of 1918)
MCF	Thousand cubic feet
MMCF	Million cubic feet
MOU	Memorandum of Understanding

MFO	Monticello Field Office
MPA	Monticello Planning Area
MZ	Management Zone
NAAQS	National Ambient Air Quality Standards
NAGPRA	Native American Graves Protection and Repatriation Act (of 1990)
NEPA	National Environmental Policy Act (of 1969)
NHPA	National Historic Preservation Act
NO _x	Nitrogen Oxides
NO ₂	Nitrogen Dioxide
NOA	Notice of Availability (published in the Federal Register)
NOI	Notice of Intent (published in the Federal Register)
NPS	National Park Service
NRA	National Recreation Area
NRHP	National Register of Historic Places
NSO	No Surface Occupancy (a stipulation on an oil and gas lease)
NWSRS	National Wild and Scenic River System
OHV	Off-Highway Vehicle
ORV	Off Road Vehicle (an older acronym, replaced by OHV)
P	Primitive Recreation Opportunity Spectrum Class
PFC	Proper Functioning Condition (of riparian/wetland areas)
PM	Particulate Matter
PM _{2.5}	Particulate Matter (less than 2.5 microns in diameter)
PM ₁₀	Particulate Matter (less than 10 microns in diameter)
R&I	Relevance and Importance
R&PP	Recreation and Public Purposes (Act of 1926)
RAMP	Recreation Area Management Plan
RDCC	(Utah) Resource Development and Coordinating Committee
RFD	Reasonably Foreseeable Development
RHS	Rangeland Health Standards
RMIS	Recreation Management Information System
RMP	Resource Management Plan (BLM land use plan under FLPMA)
ROD	Record of Decision
ROS	Recreation Opportunity Spectrum

ROW	Right of Way
S&G	Standards & Guidelines
SHPO	State Historic Preservation Officer
SITLA	(Utah) School and Institutional Trust Lands Administration
SO _x	Sulfur Oxides
SO ₂	Sulfur Dioxide
SPM	Semiprimitive Motorized Recreation Opportunity Spectrum Class
SPNM	Semiprimitive Nonmotorized Recreation Opportunity Spectrum Class
SRMA	Special Recreation Management Area
SRP	Special Recreation Permit
SWREGAP	Southwest Regional Geographical Analysis Program
T&E	Threatened and/or Endangered (species as per ESA of 1973)
TDS	Total Dissolved Solids
TMDL	Total Maximum Daily Load
TPY	Tons Per Year
UAAQS	Utah Ambient Air Quality Standards
UAC	Utah Administrative Code
UDA	Utah Division of Aeronautics
UDAQ	Utah Department of Air Quality
UDEQ	Utah Division of Environmental Quality
UDOGM	Utah Division of Oil, Gas, and Mining
UDOT	Utah Department of Transportation
UDWaR	Utah Division of Water Resources
UDWQ	Utah Division of Water Quality
UDWR	Utah Division of Wildlife Resources
UGS	Utah Geological Survey
USFWS	United States Fish and Wildlife Service
USC	United States Code
USDA	United States Department of Agriculture
USFS	United States Forest Service
USGS	United States Geological Survey
VRM	Visual Resource Management
WAFWA	Western Association for Fish and Wildlife Agencies

WMA	Wildlife Management Area
WSA	Wilderness Study Area
WSR	Wild and Scenic River(s) (Act of 1973)
WUI	Wildland Urban Interface

THIS PAGE INTENTIONALLY LEFT BLANK

GLOSSARY

Activity Plan: Site-specific plan which precedes actual development. This is the most detailed level of BLM planning.

All-Terrain Vehicle (ATV): A wheeled or tracked vehicle, other than a snowmobile or work vehicle, designed primarily for recreational use or for the transportation of property or equipment exclusively on undeveloped road rights-of-way, open country or other unprepared surfaces.

Allotment: An area of land where one or more livestock operators graze their livestock. Allotments generally consist of BLM lands but may also include other federally managed, state owned, and private lands. An allotment may include one or more separate pastures. Livestock numbers and periods of use are specified for each allotment.

Allotment Categorization: Grazing allotments and rangeland areas used for livestock grazing are assigned to an allotment category during resource management planning. Allotment categorization is used to establish priorities for distributing available funds and personnel during plan implementation to achieve cost-effective improvement of rangeland resources. Categorization is also used to organize allotments into similar groups for purposes of developing multiple use prescriptions, analyzing site-specific and cumulative impacts, and determining trade-offs.

Animal Unit Month (AUM): A standardized measurement of the amount of forage necessary for the sustenance of one cow unit or its equivalent for 1 month. Approximately 800 pounds of forage.

Area of Critical Environmental Concern (ACEC): Areas within the public lands where special management attention is required to: (1) protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or (2) protect life and safety from natural hazards.

Authorized Officer: The Federal employee who has the delegated authority to make a specific decision.

Avoidance Areas: Areas with sensitive resource values where rights-of-way leases, and easements would be strongly discouraged. Authorization made in avoidance areas would have to be compatible with the purpose for which the area was designated and not is otherwise feasible on lands outside the avoidance area.

Best Management Practices (BMPs): A suite of techniques that guide, or may be applied to, management actions to aid in achieving desired outcomes. Best management practices are often developed in conjunction with land use plans, but they are not considered a land use plan decision unless the land use plan specifies that they are mandatory. They may be updated or modified without a plan amendment if they are not mandatory.

Big Game: Large species of wildlife that are hunted, such as elk, deer, bighorn sheep, and pronghorn antelope.

Browse: To browse (verb) is to graze; also, browse (noun) is the tender shoots, twigs, and leaves and shrubs often used as food by livestock and wildlife.

Candidate Species: Any species included in the Federal Register notice of review that are being considered for listing as threatened or endangered by the U.S. Fish and Wildlife Service.

Casual Use: Mining activities that only negligibly disturb federal lands and resources. Casual use generally includes the collecting of geochemical, rock, soil, or mineral specimens using hand tools, hand panning, and nonmotorized sluicing. It also generally includes use of metal detectors, gold spears, and other battery-operated devices for sensing the presence of minerals, and hand battery-operated dry washers. Casual use does not include use of mechanized earth-moving equipment, truck-mounted drilling equipment, suction dredges, motorized vehicles in areas designated as closed to off-road vehicles, chemicals, or explosives. It also does not include occupancy or operations where the cumulative effects of the activities result in more than negligible disturbance.

Closed: Generally denotes that an area is not available for a particular use or uses; refer to specific definitions found in law, regulations, or policy guidance for application to individual programs.

Code of Federal Regulations (CFR): The official, legal tabulation or regulations directing federal government activities.

Collaboration: A cooperative process in which interested parties, often with widely varied interests, work together to seek solutions with broad support for managing public and other lands. This may or may not involve an agency as a cooperating agency.

Competitive Forage: Those forage species utilized by two or more animal species.

Conditions of Approval: Conditions or provisions (requirements) under which an Application for a Permit to Drill or a Sundry Notice is approved.

Conformance: That a proposed action shall be specifically provided for in the land use plan or, if not specifically mentioned, shall be clearly consistent with the goals, objectives, or standards of the approved land use plan.

Conservation Agreement: A formal signed agreement between the U.S. Fish and Wildlife Service or National Marine Fisheries Service and other parties that implements specific actions, activities, or programs designed to eliminate or reduce threats or otherwise improve the status of a species. CA's can be developed at a State, regional, or national level and generally include multiple agencies at both the State and Federal level, as well as tribes. Depending on the types of commitments the BLM makes in a CA and the level of signatory authority, plan revisions or amendments may be required prior to signing the CA, or subsequently in order to implement the CA.

Conservation Strategy: A Strategy outlining current activities or threats that are contributing to the decline of a species, along with the actions or strategies needed to reverse or eliminate such a decline or threats. Conservation strategies are generally developed for species of plants and animals that are designated as BLM Sensitive species or that have been determined by the Fish and Wildlife Service or National Marine Fisheries Service to be Federal candidates under the Endangered Species Act.

Contiguous: Lands or legal subdivisions having a common boundary; lands having only a common corner are not contiguous.

Cooperating Agency: Assists the lead Federal agency in developing an Environmental Analysis or Environmental Impact Statement. The Council on Environmental Quality regulations implementing NEPA defines a cooperating agency as any agency that has jurisdiction by law or special expertise for proposals covered by NEPA. Any tribe of Federal, State, or local government jurisdiction with such qualifications may become a cooperating agency by agreement with the lead agency.

Corridor: A wide strip of land within which a proposed linear facility could be located.

Council on Environmental Quality (CEQ): An advisory council to the President of the United States established by the national Environmental Policy Act of 1969. It reviews Federal programs for their effect on the environment, conducts environmental studies, and advises the president on environmental matters.

Critical Habitat. For listed species. Consists of 1) the specific areas within the geographical area occupied by the species, at the time it is listed in accordance with the provisions of section 4 of the Endangered Species Act, on which are found those physical or biological features (constituent elements) a) essential to the conservation of the species and b) which may require special management considerations or protection; and 2) specific areas outside the geographical area occupied by the species at the time it is listed in accordance with the provisions of section 4 of the Endangered Species Act upon a determination by the Secretary that such areas are essential for the conservation of the species. Designated critical habitats are described in 50 CFR§ 17 and 226.

Crucial Habitat. Habitat on which a species depends for survival because there are no alternative ranges or habitats available.

Crucial Winter Habitat (Range): Parts of the habitat necessary to sustain a wildlife population at critical periods of its life cycle. This is often a limiting factor on the populations, such as breeding habitat, winter habitat, etc.

Cryptobiotic (Cryptogammic) Soils: Biological communities that form a surface layer or crust on some soils. These communities consist of cyanobacteria (blue-green bacteria), micro fungi, mosses, lichens, and green algae and perform many important functions, including fixing nitrogen and carbon, maintaining soil surface stability, and preventing erosion. Cryptobiotic crusts also influence the nutrient levels of soils and the status and germination of plants in the desert. These crusts are slow to recover after severe disturbance, requiring 40 years or more to recolonize even small areas.

Cultural Resources: Nonrenewable elements of the physical and human environment including archeological remains (evidence of prehistoric or historic human activities) and sociocultural values traditionally held by ethnic groups (sacred places, traditionally utilized raw materials, etc.).

Cultural Site: Any location that includes prehistoric and/or historic evidence of human use or that has important sociocultural value.

Cumulative Impact: The impact on the environment that results from the incremental impact of the action when added to other past, present, or reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

Current Habitat: habitat currently occupied by a species during the development of the plan.

Desired Condition: Description of those factors, which should exist within ecosystems both to maintain their survival and to meet social and economic needs.

Desired Future Condition: The desired mix of vegetation types, structural stages, and landscape/riparian/watershed function, as determined by management objectives and rangeland functionality and health, that ensures ecological diversity, stability and sustainability to provide for plant, fish and wildlife habitats.

Development Well: A well drilled within the known or proven productive area of an oil field with expectation of producing oil or gas from the producing reservoir.

Discretionary Closure: Those lands where the BLM has determined that fluid minerals leasing, even with the most restrictive stipulations, would not adequately protect other resources, values, or land uses.

Dispersed/Extensive Recreation: Recreation activities of an unstructured type, which are not confined to specific locations such as recreation sites. Example of these activities may be hunting, fishing, off-road vehicle use, hiking, and sightseeing.

Disturbance Area: Area of influence around a disturbance causing a change in animal behavior such as: leaving the area, increased stress, abandoning young, not breeding, and aberrant behavior.

Drought: Drought is a protracted period of deficient precipitation resulting in extensive damage to crops, resulting in loss of yield.

Easement: A right afforded a person or agency to make limited use of another's real property for access or other purposes.

Endangered Species: A plant or animal species whose prospects for survival and reproduction are in immediate jeopardy, as designated by the Secretary of the Interior, and as is further defined by the Endangered Species Act.

Environmental Assessment (EA): A concise public document that analyzes the environmental impacts of a proposed federal action and provides sufficient evidence to determine the level of significance of the impacts.

Environmental Impact Statement (EIS): A detailed written statement required by the National Environmental Policy Act when an agency proposes a major federal action significantly affecting the quality of the human environment.

Erosion: The wearing away of the land surface by running water, wind, ice, or other geological agents.

Exception: Exemption from a stipulation of a land use authorization on a one-time basis.

Exclusion Area: Areas with sensitive resource values where rights-of-way, leases, and easements would not be authorized.

Extensive Recreation Management Area (ERMA): An area where significant recreation opportunities and problems are limited and explicit recreation management is not required. Minimal management actions related to the BLM's stewardship responsibilities are adequate in these areas.

Fawning Habitat: an area where big game animals usually give birth during a specific time of year.

Federal Land Policy and Management Act of 1976 (FLPMA): Public Law 94-579. October 21, 1976, often referred to as the BLM's "Organic Act," which provides the majority of the BLM's legislated authority, direction, policy, and basic management guidance.

Federal Register: A daily publication, which reports Presidential and Federal Agency documents.

Fire Management Plan: A strategic plan that defines a program to manage wild land and prescribed fires and documents the fire management program in the approved land use plan; the plan is supplemented by operational procedures such as preparedness plans, preplanned dispatch plans, prescribed fire plans, and prevention plans.

Floodplain: The relatively flat area or lowlands adjoining a body of standing or flowing water, which has been or might be covered by floodwater.

Fluid Minerals: Oil and gas resources.

Focus Area: A recreation management zone that emphasizes particular types of recreation activities.

Fossil: Mineralized or petrified form from a past geologic age, especially from previously living things.

Geographic Information System (GIS): A computer system capable of storing, analyzing, and displaying data and describing places on the earth's surface.

Goal: A broad statement of a desired outcome. Goals are usually not quantifiable and may not have established time frames for achievement.

Grandfather (to): To exempt groups or individuals from provisions of laws or regulations because of preexisting conditions, such as exempting mining operations existing before new mining regulations are implemented from provisions of those new regulations.

Grazing System: The manipulation of livestock grazing to accomplish a desired result.

Guidelines: Actions or management practices that may be used to achieve desired outcomes, sometimes expressed as best management practices. Guidelines may be identified during the land use planning process, but they are not considered a land use plan decision unless the plan specifies that they are mandatory.

Habitat: A specific set of physical conditions that surround a species, group of species, or a large community. In wildlife management, the major constituents of habitat are considered to be food, water, cover, and living space.

Habitat Fragmentation: The disruption (by division) of extensive habitats into smaller habitat patches. The effects of habitat fragmentation include loss of habitat area and the creation of smaller, more isolated patches of remaining habitat.

Historic Habitat: habitat occupied by a species prior to the development of this plan.

Impact: A modification of the existing environment caused by an action. These environmental consequences are the scientific and analytical basis for comparison of alternatives. Effects may be either direct, which are caused by the action and occur at the same time and place, or indirect, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable, or cumulative.

Implementation Decisions: Decisions that take action to implement land use plan decisions. They are generally appealable to Interior Board of Land Appeals.

Implementation Plan: A site-specific plan written to implement decisions made in a land use plan. An implementation plan usually selects and applies best management practices to meet land use plan objectives. Implementation plans are synonymous with "activity" plans. Examples of implementation plans include interdisciplinary management plans, habitat management plans, and allotment management plans.

Indian Tribe: Any Indian group in the conterminous United States that the Secretary of the Interior recognizes as possessing tribal status.

Instant Study Area: A natural area formally identified by BLM for accelerated wilderness review by notice published before October 21, 1975.

Interdisciplinary Team: A group of individuals with different training, representing the physical sciences, social sciences, and environmental design arts, assembles to solve a problem or perform a task. The members of the team proceed to a solution with frequent interaction so that each discipline may provide insights to any stage of the problem and disciplines may combine to provide new solutions. The number and disciplines of the members preparing the plan vary with circumstances. A member may represent one or more disciplines or BLM program interests.

Interim Management Policy (IMP): The policy, under which the Bureau of Land Management (BLM) manages wilderness study areas (WSAs), to protect their wilderness characteristics, as required by Section 603(c) of the Federal Land Policy and Management Act (FLPMA). This policy requires BLM to manage WSAs so as not to impair their suitability for preservation as wilderness, until Congress either designates them wilderness or releases them for management of other values and uses.

Irretrievable: An environmental effect caused by an action, or series of actions, that cannot be reversed or undone, until or unless the cause of the effect is removed or the effect is restored or rehabilitated (e.g., inundating a river canyon by construction of a dam, clear cut logging a forest). The loss of production of renewable resources during the life of a land use plan.

Irreversible: An environmental effect caused by an action, or series of actions, that can never be reversed or undone (e.g., removal of minerals from the ground, extinction of a plant or animal species, loss of a cultural resource).

Lambing Habitat: An area where bighorn sheep deliver and nurse young during a specific time of year.

Land Use Allocation: The identification in a land use plan of the activities and foreseeable development that are allowed, restricted, or excluded for all or part of the planning area, based on desired future conditions.

Land Use Plan: A set of decisions that establish management direction for land within an administrative area, as prescribed under the planning provisions of FLPMA; an assimilation of land-use-plan-level decisions developed through the planning process, regardless of the scale at which the decisions were developed.

Land Use Plan Decision: Establishes desired outcomes and the actions needed to achieve them. Decisions are reached using the BLM planning process. When they are presented to the public as proposed decisions, they can be protested to the BLM Director. They are not appealable to Interior Board of Land Appeals.

Leasable Minerals: Those minerals or materials designated as leasable under the Mineral Leasing Act of 1920. They include coal, phosphate, sulfur, potassium, and sodium minerals, and oil, gas, and geothermal.

Lease: (1) A legal document that conveys to an operator the right to drill for or develop oil, gas, or other leasable mineral; (2) the tract of land, on which a lease has been obtained, where producing wells and production equipment are located.

Lease Notice: Provides more detailed information concerning limitations that already exist in law, lease terms, regulations, and operational orders. A Lease Notice also addresses special items the lessee would consider when planning operations, but does not impose new or additional restrictions.

Lease Stipulation: A modification of the terms and conditions on a standard lease form at the time of the lease sale.

Lek: An assembly area where birds, especially sage grouse, carry on display and courtship behavior.

- Limited Roads and Trails Designation:** Designated areas where the use of off-road vehicles is subject to restrictions, such as limiting the number or types of vehicles allowed, dates and times of use (seasonal restrictions), and limiting all use to designated roads and trails. Under the designated roads and trails designation, use would be allowed only on roads and trails that are signed for use. Combinations of restrictions are possible, such as limiting use to certain types of vehicles during certain times of the year.
- Locatable Minerals:** Minerals subject to exploration, development, and disposal by staking mining claims as authorized by the Mining Law of 1872, as amended. This includes deposits of gold, silver, and other uncommon minerals not subject to lease or sale.
- Management Decision:** A decision made by the BLM to manage public lands. Management decisions are made on both land use plan decisions and implementation decisions.
- Management Opportunities:** A component of the analysis of the management situation; actions or management directions that could be taken to resolve issues or management concerns.
- Management Zone (MZ):** Area of special management within a SRMA that may include additional stipulations.
- Mechanized Travel:** Travel by use of a machine either motorized or non-motorized.
- Mineral Entry:** The filing of a claim on public land to obtain the right to any minerals it may contain.
- Mineral Estate:** The ownership of minerals, including rights necessary for access, exploration, development, mining, ore dressing, and transportation operations.
- Mineral Materials:** Materials such as common varieties of sand, stone, building stone, gravel, and clay that are not obtainable under the mining or leasing laws but that can be acquired under the Mineral Materials Act of 1947, as amended. These are also called salable minerals.
- Mineral Reserves:** Known mineral deposits that are recoverable under present conditions but are as yet undeveloped.
- Mineral Withdrawal:** A formal order that withholds federal lands and minerals from entry under the Mining Law of 1872 and closes the area to mineral location (staking mining claims) and development.
- Minimize:** To reduce the adverse impact of an operation to the lowest practical level.
- Mining Claim:** A parcel of land that a miner takes and holds for mining purposes, having acquired the right of possession by complying with the Mining Law of 1872, as amended, and local laws and rules. A single mining claim may contain as many adjoining locations as the locator may make or buy.
- Mitigation Measures:** Methods or procedures that reduce or lessen the impacts of an action.
- Modification:** Changes in the language or provisions of a surface stipulation, either temporarily or permanently.
- Multiple Use:** The management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people; making the most judicious use of the lands for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; the use of some lands for less than all of the resources; a combination of balanced and diverse resource uses that takes into account the long term needs of future generations for renewable and nonrenewable resources, including but not

limited to, recreation, range, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the lands and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or greatest unit output.

National Environmental Policy Act of 1969 (NEPA): An act that encourages productive and enjoyable harmony between man and his environment and promotes efforts to prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; enriches the understanding or the ecological systems and natural resources important to the Nation, and establishes the Council on Environmental Quality.

National Wild and Scenic Rivers System: A system of nationally designated rivers and their immediate environments that have outstanding scenic, recreational, geologic, fish and wildlife, historic, cultural, and other similar values and are preserved in a free-flowing condition. The system consists of three types of river classifications: (1) recreation-rivers or sections of rivers that are readily accessible by road or railroad and that may have some development along their shorelines and may have undergone some impoundments or diversion in the past, (2) scenic-rivers or sections of rivers free of impoundments with shorelines or watersheds still largely undeveloped but accessible in places by roads, and (3) wild-rivers or sections of rivers free of impoundments and generally inaccessible except by trails, with watersheds or shorelines essentially primitive and waters unpolluted.

Non-mechanized Travel: Travel by foot or on an animal.

Neotropical Migratory Birds: Birds that travel to Central America, South America, the Caribbean, and Mexico during the fall to spend the winter and then return to the United States and Canada during the spring to breed. These birds include almost half of the bird species that breed in the United States and Canada.

No Surface Occupancy (NSO): A leasing use constraint that prohibits occupancy or disturbance on all or part of the lease surface to protect special values or uses. Lessees may exploit the fluid mineral resources under the leases restricted by this constraint through use of directional drilling from sites outside the area.

Non-WSA Lands with Wilderness Characteristics: Undeveloped federal land that has been inventoried and/or reviewed by a BLM interdisciplinary team and determined to possess wilderness characteristics such as those listed in section 2(c) of the Wilderness Act of 1964. (See also definition of “Wilderness Characteristics”, below) These lands do not possess special management designations like WSAs or protective management measures such as the IMP.

Noxious Weeds: A plant species designated by Federal or State law as generally possessing one or more of the following characteristics: aggressive and difficult to manage; parasitic; a carrier or host of serious insects or disease; or nonnative, new, or not common to the United States.

Objective: A description of a desired condition for a resource. Objectives can be quantified and measured and, where possible, have established time frames for achievement.

Occupied Habitat: An area occupied by a species during the development of this plan.

Open: Generally denotes that an area is available for a particular use or uses. Refer to specific program definitions found in law, regulations, or policy guidance for application to individual programs.

Off-Highway Vehicle (OHV): Any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) vehicles in official use; and (5) any combat or combat support vehicle when used in times of national defense emergencies.

One-Hundred-Year Flood: A hydrologic event with a magnitude that has a recurrence interval of 100 years.

Open OHV Areas: Designated areas where off-road vehicles may engage in cross country travel.

Operator: Any person who has taken formal responsibility for the operations conducted on the leased lands.

Outstandingly Remarkable River Values: Values between those listed in Section 1(b) of the Wild and Scenic Rivers Act are "scenic, recreational, geological, fish and wildlife, historical, cultural, or other similar values..." Other similar values, which may be considered, include botanical, hydrological, paleontological, or scientific. Professional judgment is used to determine whether values exist to an outstandingly remarkable degree.

Paleontological Resources (Fossils): The physical remains of plants and animals preserved in soils and sedimentary rock formations. Paleontological resources are important for understanding past environments, environmental change, and the evolution of life.

Paleontology: A science dealing with the life forms of past geological periods as known from fossil remains.

Plan of Development: A mandatory plan, developed by an applicant of a mining operation or construction project that specifies the techniques and measures to be used during construction and operation of all project facilities on public land. The plan is submitted for approval to the appropriate Federal agency before any construction begins.

Plan of Operations: A plan for mining exploration and development that an operation must submit to BLM for approval when more than 5 acres a year will be disturbed or when an operator plans to work in an area of critical environmental concern or a wilderness area. A plan of Operations must document in detail all actions that the operator plans to take from exploration through reclamation.

Planning Area: A geographical area, including all land ownerships, for which BLM land use and resource management plans are developed and maintained for the BLM-administered lands within that geographical area.

Planning Criteria: The standards, rules, and other factors developed by managers and interdisciplinary teams for their use in forming judgments about decision making, analysis, and data collection during planning. Planning criteria streamline and simplify the resource management planning actions.

Potential Wild and Scenic River: A flowing body of water or estuary or a section, portion, or tributary thereof, including rivers, streams, creeks, runs, rills, and small lakes.

Prescribed Fire: The introduction of fire to an area under regulated conditions for specific management purposes.

Primitive and Unconfined Recreation: Non-motorized, non-mechanized and undeveloped types of recreational activities.

Production Well: A well drilled in a known field that produces oil or gas.

Project Area: The area of land upon which an operator conducts mining operations, including the area needed for building or maintaining of roads, transmission lines, pipelines, or other means of access.

Project Plan: Detailed survey and design plan.

Public Land: Land or interest in land owned by the United States and administered by the Secretary of the Interior through the BLM, except lands located on the Outer Continental Shelf, and land held for the benefit of Indians, Aleuts, and Eskimos.

Quarry: An open or surface working, usually for the extraction of stone, slate, limestone, etc.

Range Development: A structure, excavation, treatment or development to rehabilitate, protect, or improve lands to advance range betterment.

Rangeland: Land used for grazing by livestock and big game animals on which vegetation is dominated by grasses, grass-like plants, forbs, or shrubs.

Raptor: Bird of prey with sharp talons and strongly curved beaks such as hawks, owls, vultures, and eagles.

Reasonably Foreseeable Development Scenario (RFD): The prediction of the type and amount of oil, gas and other mineral activity that would occur in a given area. The prediction is based on geologic factors, past history of drilling, projected demand for oil and gas, and industry interest.

Record of Decision (ROD): A document signed by a responsible official recording a decision that was preceded by the preparing of an environmental impact statement.

Recreation Opportunity Spectrum: A recreation management tool used to identify existing outdoor recreational opportunities and management potential, based on a combination of three criteria: recreational activity, setting and experience. Although used in the development of the 1991 San Juan RMP, it is not used in the current Monticello RMP.

Recreational River: A wild and scenic river classification that identifies those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines, and that may have undergone some impoundment or diversion in the past.

Relict: A remnant or fragment of the vegetation of an area that remains from a former period when the vegetation was more widely distributed.

Resource: The natural, biological, and cultural components of the environment, including air, soil, water, vegetation, wildlife, minerals, historic and prehistoric (cultural) sites and features, and fossils. Land use plans set goals and objectives for desired outcomes for management of the various resources in a planning area.

Resource Use: Human uses of resources for the social and economic benefit of society, including mining, energy production, livestock production (grazing), recreation (motorized, non-motorized), forest production (timber, fire wood, fence posts), utility corridors (power lines, pipelines, roads), and communication sites. Land use plans identify allowable uses of the public lands and set goals and objectives for desired outcomes for resource uses.

Resource Management Plan (RMP): A land use plan as prescribed by the Federal Land Policy and Management Act which establishes, for a given area of land, land-use allocations, coordination guidelines for multiple-use, objectives and actions to be achieved.

Right-of-Way (ROW): A ROW grant is an authorization to use a specific piece of public land for a specific project, such as roads, pipelines, transmission lines, and renewable energy and communication sites. The grant authorizes rights and privileges for a specific use of the land for a specific period of time.

Riparian Area: A form of wetland transition between permanently saturated wetlands and upland areas. Riparian areas exhibit vegetation or physical characteristics that reflect the influence of permanent surface or subsurface water. Typical riparian areas include lands along, adjacent to, or contiguous with perennially and intermittently flowing rivers and streams, glacial potholes, and the shores of lakes and reservoirs with stable water levels. Excluded are ephemeral streams or washes that lack vegetation and depend on free water in the soil.

Riparian-Functioning at Risk (FAR): Riparian-wetland areas are considered to be in functioning condition, but an existing soil, water, or vegetation attribute makes them susceptible to degradation.

Riparian-Non-Functioning (NF): Riparian-wetland areas that are clearly not providing adequate vegetation, landform, or large wood debris to dissipate stream energy associated with high flows, and thus are not reducing erosion, improving water quality, etc.

Riparian-Properly Functioning Condition (PFC): Riparian/wetland areas are in PFC when adequate vegetation, landform, or woody debris is present to: dissipate high-energy water flow, filter sediment, capture bedload, and aid floodplain development; improve floodwater retention and groundwater recharge; develop root masses that stabilize streambanks; develop diverse fluvial geomorphology (pool and channel complexes) to provide habitat for wildlife and support greater biodiversity

Rock Art: Petroglyphs or pictographs.

Route: Linear line for motorized travel.

Rutting Habitat: An area where big game species engage in breeding activities during specific times of the year.

Salable Minerals: Common variety minerals on the public lands, such as sand and gravel, which are used mainly for construction and are disposed of by sales or special permits to local governments. Also referred to as mineral materials.

Scenic Byways: Highway routes, which have roadsides or corridors of special aesthetic, cultural, or historic value. An essential part of the highway is its scenic corridor. The corridor may contain outstanding scenic vistas, unusual geologic features, or other natural elements.

Scoping: The process of identifying the range of issues, management concerns, preliminary alternatives, and other components of an environmental impact statement or land-use planning document. It involves both internal and public viewpoints.

Section 7 Consultation: The requirement of Section 7 of the Endangered Species Act that all federal agencies consult with the U.S. Fish and Wildlife Service or the National Marine Fisheries Service if a proposed action might affect a federally listed species or its critical habitat.

Section 106 Compliance: The requirement of Section 106 of the National Historic Preservation Act that any project funded, licensed, permitted, or assisted by the Federal Government be reviewed for impacts to significant historic properties and that the State Historic Preservation Officer and the Advisory Council on Historic Preservation be allowed to comment on a project.

Sediment Yield: The amount of sediment produced in a watershed, expressed in tons, acre feet, or cubic yards, of sediment per unit of drainage area per year.

Sensitive Soils: Sensitive soils" are those identified as having characteristics that make them extremely susceptible to impacts or they may be more difficult to restore or reclaim after disturbance -- characteristics such as high wind or water erosion hazard (steep slopes), moderate to high salinity, low nutrient levels, low water holding capacity (droughty), or high water table (wetland/riparian soils). Information used to identify sensitive soils includes NRCS published soil surveys, ecological site descriptions, local monitoring records and research studies.

Sensitive Species: All species that are under status review, have small or declining populations, live in unique habitats, or need special management. Sensitive species include threatened, endangered, and proposed species as classified by the Fish and Wildlife Service and National Marine Fisheries Service.

Significant: An effect that is analyzed in the context of the proposed action to determine the degree or magnitude of importance of the effect, wither beneficial or adverse. The degree of significance can be related to other actions with individually insignificant but cumulatively significant impacts.

Slope: The degree of deviation of a surface from the horizontal.

Special Recreation Management Area (SRMA): Areas, which require explicit recreation management to achieve recreation objectives and provide specific recreation opportunities.

Special Status Species: Includes proposed species, listed species, and candidate species under the Endangered Species Act; State-listed species; and BLM State Director-designated sensitive species (see BLM Manual 6840-Special Status Species Policy).

Stipulations: Requirements that are part of the terms of a mineral lease. Some stipulations are standard on all Federal leases. Other stipulations may be applied to the lease at the discretion of the surface management agency to protect valuable surface resources and uses.

Strategic Plan: A plan that establishes the overall direction for the BLM. This plan is guided by the requirements of the Government Performance and Results Act of 1993, covers a 5-year period, and is updated every 3 years. It is consistent with FLPMA and other laws affecting the public lands.

Surface Disturbance: activities that normally result in more than negligible disturbance to public lands and that accelerate the natural erosive process. These activities normally involve use and/or occupancy of the surface, cause disturbance to soils and vegetation, and are usually caused by motorized or mechanical actions. Surface disturbance may result from activities using earth-moving and drilling equipment; geophysical exploration; off road vehicle travel; vegetation treatments; the use of pyrotechnics and explosives; and construction of facilities like powerlines, pipelines, oil and gas wells, recreation sites, livestock facilities, wildlife waters, or new roads. Surface disturbance is not normally caused by casual use. Activities that are not typically surface disturbing include, but are not limited to, proper livestock grazing, cross-country hiking, minimum impact filming and vehicle travel on designated routes.

Sustainability: The ability of an ecosystem to maintain ecological processes and functions, biological diversity, and productivity over time.

Threatened Species: Any plant or animal species defined under the Endangered Species Act as likely to become endangered within the foreseeable future throughout all or a significant portion of its range; listings are published in the Federal Register.

Timing Limitation Stipulation: A fluid minerals leasing constraint that prohibits surface use during specified time periods to protect identified resource values. The constraint does not apply to the operation and maintenance of production facilities unless analysis demonstrates that such constraints are needed and that less stringent, project-specific constraints would be insufficient.

Undertaking: A project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance; those requiring a Federal permit, license or approval; and those subject to State or local regulation administered pursuant to a delegation or approval by a Federal agency.

User Day: Any calendar day, or portion thereof, for each individual accompanied or serviced by an operator or permittee on the public lands of related waters; synonymous with passenger day or participant day.

Utility Corridor: A parcel of land that has been identified by law, Secretarial order, through a land use plan or by other management decision as being the preferred location for existing and future right-of-way grants and suitable to accommodate one type of right-of-way or one or more rights-of-way which are similar, identical or compatible.

Valid Existing Rights: Valid existing rights are legal rights to use the land that were in existence prior to implementation of the decisions in the RMP. The most significant types of valid existing rights are oil and gas leases, potash and salt leases, mining claims, and right-of-way authorizations. Examples of how BLM views valid existing rights including oil and gas leasing stipulations specified for specific areas in this new RMP would not apply to existing leases. These existing leases would be subject to the specific lease stipulations that were applied under the previous land use plan. Mining claims that exist on the effective day of a withdrawal may still be valid if they can meet the test of discovery of a valuable mineral required under the Mining Laws. An existing right-of-way would only be subject to the specific terms and conditions that were applied when it was authorized even if it is located within a right-of-way exclusion or avoidance area specified under the RMP.

Vegetation Manipulation: Alteration of vegetation by using fire, plowing, or other means.

Vegetation Type: A plant community with distinguishable characteristics described by the dominant vegetation present.

Visual Resources: The visible physical features of a landscape (topography, water, vegetation, animals, structures, and other features) that constitute the scenery of an area.

Waiver: Permanent exemption from a lease stipulation. The stipulation no longer applies anywhere within the leasehold. See also *Exception* and *Modification*.

Water Quality: The chemical, physical, and biological characteristics of water with respect to its suitability for a particular use.

Watershed: All lands, which are enclosed by a continuous hydrologic drainage, divide and lay upslope from a specified point on a stream.

Way: A vehicle route within a wilderness study area that was in existence and identified during the FLPMA Section 603-mandated wilderness inventory. The *Interim Management Policy for Lands under Wilderness Review (H-8550-1)* defines a way as "a trace maintained solely by the passage of vehicles which has not been improved and/or maintained by mechanical means to ensure relatively regular and continuous use." The term is also used during wilderness inventory to identify routes that are not roads. The term developed from the definition of the term "roadless" provided in the *Wilderness Inventory Handbook* (September 27, 1978), as follows: "roadless:

refers to the absence of roads which have been improved and maintained by mechanical means to insure relatively regular and continuous use. A way maintained solely by the passage of vehicles does not constitute a road."

Wild, Scenic or Recreational River: The three classes of what is traditionally referred to as a "Wild and Scenic River." Designated river segments are classified as wild, scenic and/or recreational, but the segments cannot overlap.

Wild, and Scenic River Study: Rivers identified in Section 5 of the Wild and Scenic Rivers Act for study as potential additions to the National Wild and Scenic Rivers System. The rivers shall be studied under the provisions of Section 4 of the Wild and Scenic Rivers Act.

Wilderness Study Area: A roadless area or island of undeveloped federal land that has been inventoried and found to possess wilderness characteristics described under Title VI, Section 603 of FLPMA and Section 2C of the Wilderness Act of 1964. These characteristics are: (1) generally appears to have been affected mainly by the forces of nature, with human imprints substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least 5,000 acres or is large enough to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historic value.

Wilderness: A congressionally designated area of undeveloped federal land retaining its primeval character and influence, without permanent improvements or human habitation that is protected and managed to preserve its natural conditions as described in Section 2A of the Wilderness Act of 1964.

Wilderness Characteristics: Key characteristics of wilderness listed in section 2 (c) of the Wilderness Act of 1964 and used by BLM in conducting wilderness inventories. These characteristics are features of the land associated with the concept of wilderness that specifically deal with naturalness and opportunities for solitude and primitive and unconfined recreation. These characteristics may be considered in land use planning when BLM determines that those characteristics are reasonably present, of sufficient value (condition, uniqueness, relevance, importance), and need (trend, risk), and are practical to manage (from IM-2003-275, Change 1, Considerations of Wilderness Characteristics in LUP, Attachment 1).

Wildfire: Any unwanted wild land fire.

Wildland Fire: Any nonstructural fire, other than prescribed fire, that occurs in the wild land.

Winter Range. The portion of the winter range to which a wildlife species is confined during periods of heaviest snow cover.

Withdrawal: An action that restricts the use of public lands by removing them from the operation of some or all of the public land or mining laws.

Woodland: A forest community occupied primarily by noncommercial species such as juniper, mountain mahogany, or quaking aspen groves; all western juniper forestlands are classified as woodlands, since juniper is classified as a noncommercial species.
