Executive Summary

The Office of Applied Studies (OAS), Substance Abuse and Mental Health Services Administration (SAMHSA), annually determines the allocation of funding to States and territories for four grant programs: Substance Abuse Prevention and Treatment Block Grant (SAPT BG), Mental Health Services Block Grant (MH BG), Protection and Advocacy for Individuals with Mental Illness Formula Grant (PAIMI FG), and Projects for Assistance in Transition from Homelessness Formula Grant (PATH FG). The allocations are made in accordance with SAMHSA's legislative authorities. Over time, the underlying bases of the calculations, particularly that for SAPT BG and MH BG, have undergone changes primarily because of changes in legislation. This guidebook presents the formulas for the SAPT BG, MH BG, PAIMI FG, and PATH FG allotment calculations and reflects the rules laid out in the initial legislation or subsequent reauthorizations.

In general, the methodology of allotment determination for all four programs involves the following three common steps: (1) setting aside a certain percentage of the appropriated amount for SAMHSA's use to cover the costs for data collection, technical assistance, and program evaluation; (2) calculating baseline allotments based on certain factors; and (3) adjusting the allotments, if necessary, so that statutory minimum allotment constraints are satisfied.

For the SAPT BG, State baseline allotment calculations, when warranted, are based on the relative share of the Population-at-Risk, Cost-of-Services, and Fiscal Capacity Indexes, while the territory allotments are based solely on the relative share of the population. For the MH BG, similar factors are used in State and territory allotment calculations, except that the Population-at-Risk Index is replaced by the Weighted Population-at-Risk in State baseline allotment calculations, and different statutory minimum allotments apply.

For the PAIMI FG, baseline allotments are calculated as the sum of two components: 50 percent is based on the relative share of the total population, and another 50 percent is based on the relative share of the total population weighted by the relative per capita income. For the PATH FG, baseline allotments, except for four territories, are determined by the relative share of the population of urbanized areas. Each of the four territories receives \$50,000 and no factor-based calculations are involved.

For all four programs, it is important to note that baseline allotments are not necessarily the final allotments, and they may require adjustment so that the statutory minimum allotment constraints are satisfied. Statutory minimum allotments vary across calculations and are not the same for States and territories in each calculation.

A nontechnical overview of the calculation procedures, detailed descriptions of the four sets of formulas, and the data needed for calculations are presented in separate sections. To provide an overall understanding of the calculation procedures employed, flowcharts depicting the major steps involved also are presented. Additionally, relevant excerpts from enabling legislation are included and detailed tables of the allotment calculations are presented. Finally, the calculations are cross-referenced to the legislation text and to example-tables to help the reader better understand the formulas.

This page intentionally left blank.

1. Introduction

This document presents formulas as well as flowcharts showing the major steps involved in the current allotment calculations for States and territories for the four "block grant" and "formula grant" programs. It also presents the relevant sections of legislative text and other references from which the allotment formulas are deduced. It describes the data files used in the calculations and the data files' sources, outlining the calculation procedures with examples.

These grant programs are administered by the Substance Abuse and Mental Health Services Administration (SAMHSA). Although they are implemented by the Center for Mental Health Services (CMHS), the Center for Substance Abuse Prevention (CSAP), and the Center for Substance Abuse Treatment (CSAT), allotment calculations are performed by the Office of Applied Studies (OAS). The four grant programs are as follows:

- 1) The *Substance Abuse Prevention and Treatment Block Grant* (SAPT BG) Program addresses SAMHSA's goal of "supporting and expanding substance abuse prevention and treatment services" (SAMHSA, Fiscal Year 2007). Funds are distributed to eligible States, territories, former territories, the District of Columbia (DC), and the Red Lake Indian Tribe of Minnesota. As detailed in Chapter 2, the SAPT BG allotments are determined by a set of formulas based upon specified economic and demographic factors and several minimum allotment constraints.
- 2) The *Mental Health Services Block Grant* (MH BG) Program focuses on SAMHSA's goals of increasing capacity and promoting effective mental health services (SAMHSA, Fiscal Year 2007). As can be seen in Chapter 3, the MH BG allotments are determined by a set of formulas based upon factors similar to those used in the SAPT BG calculations although the population factor and the minimum allotment constraints used in the calculations are different.
- 3) The *Protection and Advocacy for Individuals with Mental Illness Formula Grant* (PAIMI FG) Program is designed "to protect and advocate the rights of individuals with mental illness in public and private facilities" (SAMHSA, Fiscal Year 2007; p. CMHS-3). Grants are awarded to the 50 States, DC, and Puerto Rico plus four territories (Guam, Virgin Islands, Northern Mariana Islands, and American Samoa) and the American Indian Consortium. As described in Chapter 4, the PAIMI FG allotments are determined by formulas that take into account relative differences in the size of the population, per capital income, and minimum allotment constraints.
- 4) The *Projects for Assistance in Transition from Homelessness Formula Grant* (PATH FG) Program "supports services to individuals with serious mental illnesses who are homeless or at risk of becoming homeless" (SAMHSA, Fiscal Year 2007; p. CMHS-3). Grants are awarded to the 50 States, DC, and Puerto Rico plus four territories. As explained in Chapter 5, the PATH FG allotments are determined using formulas that are primarily based upon the size of the population of urbanized areas and minimum allotment constraints.

Over time, the applications used for the SAPT and MH BG allotment calculations underwent changes primarily because of changes in enabling legislation. Although there have been no changes in the laws for PAIMI and PATH FG allotment calculations, some minor modifications were made to more closely model Congressional intent.

Evolution of the SAPT and MH BG Allotment Calculations

- Beginning in fiscal year (FY) 1992, Lotus spreadsheet applications have been used to calculate SAPT and MH BG allotments. These programs were originally developed by the General Accounting Office (GAO, now the Government Accountability Office) and provided to SAMHSA, and were used by CSAT and CMHS to determine allotments for FY 1992-1994.
- For FY 1992-1994, a SAS application was developed and used by CSAT and CMHS staff to construct the Cost-of-Services Index (CSI) in these allotment calculations.
- In FY 1995, responsibility for determination of SAPT and MH BG allotments passed from CSAT and CMHS, respectively, to OAS. In that year, OAS staff and an OAS contractor (Klemm Analysis Group) independently reviewed the Lotus application used for SAPT BG allotment calculations and the SAS application used for CSI calculations and concluded that the applications were doing the jobs correctly.
- For FY 1995-1997, the determination of SAPT and MH BG allotments were performed by SAMHSA/OAS by: (1) changing the funding redistribution logic for territories in order to satisfy statutory minimum allotment constraints; (2) rounding final allotments to the nearest dollar; (3) adding additional tables to the models for the source data used in the calculations; and (4) removing unnecessary columns/variables from the models.
- For FY 1996 and 1997, the CSI values were revised using a Wage Subindex based upon non-manufacturing rather than manufacturing wages.
- In early 1997, the Lotus spreadsheet application used for the MH BG allotment calculations was verified by Klemm.
- Beginning in FY 1998, average State wages were calculated by applying a revised methodology for determination of the Wage Subindex of the CSI.
- Beginning in FY 1999, the Lotus spreadsheet application used for the SAPT BG allotment calculations was modified by developing and incorporating the logic required to determine allotments subject to statutory minimum allotment constraints, and for years in which the appropriation amount declines relative to that for the prior year. GAO concurrently developed a spreadsheet model for SAPT allotment calculations in QuatroPro using macros to determine allotments

subject to the statutory minimum constraints, and validated the calculations of the modified Lotus model.

- For FY 2007-2009, CSI calculations were performed using both the Lotus-based model and a PC SAS-based model independently developed by SAMHSA/OAS staff, and the results from the two models were compared and validated.

Modifications in PAIMI and PATH FG Allotment Calculations Beginning in FY 2002

a) PAIMI:

- The use of a 3-year average estimate of Per Capita Income (PCI) was replaced by the use of the estimate for the most recent single year.
- The use of rounded population data was replaced by the use of data without rounding as obtained from the source.
- The use of a simple average of the PCI was replaced by the use of a population-weighted average in the determination of the national PCI.
- Logic was added to automatically determine the number of funding redistribution cycles necessary in the calculations.

b) PATH:

- Logic was added to correct for the error in the Domain allotment total due to rounding to the nearest thousand dollars.
- Logic was added to automatically determine the number of funding redistribution cycles necessary in the calculations.

Impetus for Development of the Guide

The formulas for SAPT BG and MH BG allotment calculations that were deduced from the Alcohol, Drug Abuse, and Mental Health Administration Reorganization Act of 1992 (P.L. 102-321) were earlier described by SAMHSA in the *Federal Register* (June 17, 1996; pp. 30625-30632). However, the changes to the allotment calculations, as referred to above, for the SAPT BG and MH BG have not been formally documented. For these BG programs, the absence of documentation reflecting the changes in the allotment calculations resulting primarily from the 1999 Reauthorization has been a major impetus for developing this Guide. Furthermore, for the other two grant programs (i.e., PAIMI FG and PATH FG), documentation of formulas and calculation procedures has been nonexistent until now. In this Guide, we present updated formulas and calculation procedures for both BG and FG programs.

For the four programs, formulas along with calculation flowcharts and data sources are presented in Chapters 2-5. The types of calculations performed and quality control employed are described in Chapter 6. The relevant text references for the formulas are presented in Appendices A-D. Detailed tables of allotment calculations are presented as examples in Appendices E-H. These example-tables in the appendices and formulas in Chapters 2-5 are cross-referenced.

2. Substance Abuse Prevention and Treatment Block Grant (SAPT BG) Allotment Formulas

The Office of Applied Studies (OAS) of the Substance Abuse and Mental Health Services Administration (SAMHSA) determines annually the allocation of funding to States and territories for the SAPT BG in accordance with enabling legislation. The formulas presented below are mathematical expressions of the rules laid out in the legislation and subsequent Reauthorizations.

The SAPT BG allotment calculation begins with a comparison of the appropriated amount for the current vs. prior fiscal year. If the appropriation amount for a given fiscal year is greater than that for the prior fiscal year, then a “Scenario 1” type of calculation is performed to determine allotments. As the law requires, 5 percent of the appropriated amount for a given fiscal year is first set aside for SAMHSA to cover the costs for data collection, technical assistance, and program evaluation. Of the remaining 95 percent of the appropriated amount, 98.5 percent is distributed to 50 States (with the allotment for Minnesota apportioned between the Red Lake Indians and the remainder of the State) and the District of Columbia (DC) and 1.5 percent is distributed to five territories and three former territories. Under this scenario, the initial or “baseline” allotments for the States and DC are determined by the relative share of Population-at-Risk, Cost-of-Services, and Fiscal Capacity Indexes. However, the allotment calculations for territories are solely based on the relative share of the population. The baseline allotments are adjusted, if and as necessary, so that statutory minimum allotment constraints are satisfied. This is accomplished via an iterative calculation algorithm which uniformly and proportionately reduces the baseline funding of some Domains and redistributes it to other Domains in order that all minimum allotment constraints are fully satisfied.

If the appropriated amount for a given fiscal year is equal to or less than that of the prior fiscal year, then a greatly simplified “Scenario 2” type of calculation is performed. If the appropriated amount is unchanged, then, for the given year, the set-aside amount for SAMHSA remains the same and all States receive the allotments which they received for the prior year. For a given fiscal year, if the appropriated amount is less, then the set-aside amount and the allotments for States are reduced by the same proportion by which the appropriation amount declined between the years.

The SAPT BG formulas for the two scenarios are presented in the following sequence.

Scenario 1: Appropriation for the Reference Fiscal Year Increased, Relative to Prior Year's Amount

Baseline Allotment Formula (50 States and DC)

(A1)

$$A_{i,RFY,Baseline} = 0.95 \times 0.985 \times AP_{RFY} \times \left(\frac{P_i \times C_i \times F_i}{\sum_{i=1}^{51} (P_i \times C_i \times F_i)} \right)$$

$\{i(State) = 1, 2, \dots, 51\}$

where $A_{i,RFY,Baseline}$ = Baseline allotment for State i for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

P_i = Population-at-Risk Index (ages 18-64) for State i (Formula A2)

C_i = Cost-of-Services Index for State i (Formula A3)

F_i = Fiscal Capacity Index for State i (Formulas A6 and A7)

0.95 = Proportion of AP_{RFY} for disbursement to States and territories

0.985 = Proportion of State-Territory allotment for disbursement to States

According to this formula, the appropriation amount for the program (AP_{RFY}) for a given, or "reference," fiscal year is determined annually by the Congress. Five percent of the appropriated amount is used by the Department of Health and Human Services (DHHS)/ Substance Abuse and Mental Health Services Administration (SAMHSA) for data collection to determine the incidence and prevalence of substance abuse and for technical assistance and program evaluations relevant to substance abuse treatment and prevention, while 95 percent of the appropriation is allocated among the States (including DC) and territories (hence the factor "0.95" used in the formula). Of the amount allocated to States and territories, 98.5 percent is distributed to the States (hence the factor "0.985" used in the formula), which is referred to as the "State Subtotal." Refer to Appendix Table E1 as an example of calculations of the amounts available for States, territories, and SAMHSA set-aside.

The initial or "baseline" allotment for a State ($A_{i,RFY,Baseline}$) is determined by three factors: the Population-at-Risk Index (P_i), the Cost-of-Services Index (C_i), and the Fiscal Capacity Index (F_i). The share that a State receives of the State Subtotal is equal to the ratio formed by the product of the three factors for the State divided by the sum of the products for all the States; this ratio is shown within large parentheses on the right-hand side of the formula. The baseline allotment for a State is then determined as the product of this ratio (the State's share) with the

State Subtotal (the funding available to all the States). Refer to Appendix Table E10 for an example of baseline allotment calculations.

Population-at-Risk Index Formula (P_i)
(A2)

$$P_i = \frac{1}{2} \left(\frac{P_{i,18-24} + \frac{P_{i,18-24} \times UP_{i,18-24(Census)}}{P_{i,18-24(Census)}}}{\sum_{i=1}^{51} \left(P_{i,18-24} + \frac{P_{i,18-24} \times UP_{i,18-24(Census)}}{P_{i,18-24(Census)}} \right)} + \frac{P_{i,25-64}}{\sum_{i=1}^{51} P_{i,25-64}} \right)$$

$\{i(State) = 1, 2, \dots, 51\}$

where P_i = Population-at-Risk Index (ages 18-64) for State i

$P_{i, 18-24}$ = Population estimate for ages 18-24 for State i

$P_{i, 25-64}$ = Population estimate for ages 25-64 for State i

$UP_{i, 18-24 (Census)}$ = Urbanized area population at ages 18-24 for State i (recent decennial census)

$P_{i, 18-24 (Census)}$ = Population at ages 18-24 for State i (recent decennial census)

The Population-at-Risk Index (P_i) is determined annually and represents, or is a proxy for, the relative need for substance abuse prevention and treatment services in a State. The index is an average of two ratios, each having an equal weight of 50 percent (hence the factor "1/2" that appears on the left of the large parentheses). The first ratio is the number of individuals aged 18-24 plus the number of individuals in the same age group who reside in urbanized areas in a State divided by the sum of the same populations of all the States. This effective "double-counting" of individuals aged 18-24 residing in urbanized areas is intentional. The second ratio is the number of individuals aged 25-64 in a State divided by the sum of the same populations of all the States. Refer to Appendix Table E2 for an example of the calculation of the Population-at-Risk Index.

Cost-of-Services Index Formula (C_i)
(A3)

$$C'_i = 0.75W_i + 0.15R_i + 0.10S_i$$

$$C_i = 0.9 \text{ if } C'_i < 0.9$$

$$C_i = 1.1 \text{ if } C'_i > 1.1$$

Otherwise

$$C_i = C'_i$$

$$\{i(State) = 1, 2, \dots, 51\}$$

where C'_i = Unconstrained Cost-of-Services Index for State i

C_i = Constrained Cost-of-Services Index for State i

W_i = Wage Subindex (proxy for labor costs) for State i (Formula A4)

R_i = Rental Subindex (proxy for facility costs) for State i (Formula A5)

S_i = Supply Subindex (proxy for materials costs) for State i (The value of this subindex is 1 for all States.)

The Cost-of-Services Index is determined triennially (i.e., it is revised every third fiscal year rather than annually) and the most current index is being used for the determination of allotments for fiscal year (FY) 2007, FY 2008, and FY 2009. It represents, or is a proxy for, the relative costs of providing substance abuse prevention and treatment services in a State. This index consists of three component subindexes, each of which is weighted. The Wage Subindex (W_i) has a weight of 75 percent, the Rental Subindex (R_i) has a weight of 15 percent, and the Supplies Subindex (S_i) has a weight of 10 percent, hence the coefficients 0.75, 0.15, and 0.10 in the formula for the unconstrained Cost-of-Services Index (C'_i), respectively.

The Wage and Rental Subindexes are proxies for labor and facility costs, respectively, and are recalculated every third fiscal year when the Cost-of-Services Index is revised. However, the Supplies Subindex, which is a proxy for materials costs, is not recalculated but rather has a perpetual, uniform value of 1.0 for all States. This implies that all States have equal access to a national market for supplies, and thus the relative costs for the same are assumed to not vary geographically.

The final, or constrained, Cost-of-Services Index (C_i) is then set to a value of 0.9 if C' is less than 0.9, or set to a value of 1.1 if C' is greater than 1.1. If the unconstrained index is equal to or greater than 0.9 and less than or equal to 1.1, then the final constrained index is set equal to the unconstrained index. Refer to Appendix Tables E3-E5 for an example of the calculations of the Cost-of-Services Index and its subindexes.

Wage Subindex Formula (W_i)

(A4)

$$W_i = \frac{\left(\sum_{j=1}^5 S_{ij,CENSUS_BY} / \sum_{j=1}^5 H_{ij,CENSUS_BY} \right) \times \left(\frac{\sum_{k=1}^N S_{ik,CMS_RY} / \sum_{k=1}^N H_{ik,CMS_RY}}{\sum_{k=1}^N S_{ik,CMS_BY} / \sum_{k=1}^N H_{ik,CMS_BY}} \right)}{\left(\sum_{i=1}^{51} \sum_{j=1}^5 S_{ij,CENSUS_BY} / \sum_{i=1}^{51} \sum_{j=1}^5 H_{ij,CENSUS_BY} \right) \times \left(\frac{\sum_{i=1}^{51} \sum_{k=1}^N S_{ik,CMS_RY} / \sum_{i=1}^{51} \sum_{k=1}^N H_{ik,CMS_RY}}{\sum_{i=1}^{51} \sum_{k=1}^N S_{ik,CMS_BY} / \sum_{i=1}^{51} \sum_{k=1}^N H_{ik,CMS_BY}} \right)}$$

$\{i(\text{State}) = 1, 2, \dots, 51\}$

$\{j(\text{Occupation} - \text{Industry}) = 1, 2, \dots, 5\}$

$\{k(\text{Provider}) = 1, 2, \dots, N\}$

where W_i = Wage Subindex for State i

$S_{ij, CENSUS_BY}$ = Total salary earned in occupation-industry category j (Counselors, Psychologists, Social Workers, Physicians and Surgeons, and Registered Nurses) in State i during the base year (recent decennial census)

$H_{ij, CENSUS_BY}$ = Total hours worked in occupation-industry category j in State i during the base year (recent decennial census)

S_{ik, CMS_BY} = Total wages (except for a few categories noted in Appendix A) paid by hospital (provider) k in State i during the base fiscal year (Centers for Medicare and Medicaid Services [CMS])

H_{ik, CMS_BY} = Total hours (except for a few categories noted in Appendix A) for which wages were paid by hospital (provider) k in State i during the base fiscal year (CMS)

S_{ik, CMS_RY} = Total wages (except for a few categories noted in Appendix A) paid by hospital (provider) k in State i during the most recent fiscal year (CMS)

H_{ik, CMS_RY} = Total hours (except for a few categories noted in Appendix A) for which wages were paid by hospital (provider) k in State i during the most recent fiscal year (CMS)

The Wage Subindex (W_i) is a component of the Cost-of-Services Index and is a measurement of the relative labor costs required to provide substance abuse prevention and treatment services in a State (including DC). Despite the complex appearance of Formula A4, the composition of the Wage Subindex is actually straightforward.

The value calculated in the numerator of the formula is an average wage rate for a given State, while the value calculated in the denominator is an average (weighted) wage rate for the United States (exclusive of territories) using the same methodology as employed for calculation of the value in the numerator. The Wage Subindex is, therefore, a ratio equal to an average State wage rate divided by an average national wage rate. It is a dimensionless (i.e., unitless) measurement of the relative deviation of a State's average wage rate from the nation's average wage rate.

Both the State and national average wage rates consist of two parts: a base wage rate and an update factor. The base wage rate is multiplied by the update factor to yield the most recent average wage rate.

Shown within the first parentheses in the numerator, the State average base wage is determined by dividing the total salaries (earned income) of workers (working in the State, regardless of their State of residence) in five specific occupation-industry categories ($S_{ij, CENSUS_BY}$, State i and occupation-industry category j) by the associated total hours worked ($H_{ij, CENSUS_BY}$). Data used in the calculation of this average base wage rate are derived from the 16 percent sample of the most recent decennial census and provided in the form of special tabulations by the U.S. Census Bureau.

The State update factor, shown as the quotient of two terms (each within parentheses) in the second part of the numerator, is based upon source data from CMS. The denominator of this quotient consists of the State average wage rate for the "base year" (which is the same year as

that used for data collection for the most recent decennial census), and is calculated by dividing the total salaries of workers in selected occupation categories in all provider facilities in the State (S_{ik,CMS_BY} , State i and provider k) by the associated total hours worked (H_{ik,CMS_BY}). The numerator of this quotient is similarly calculated from CMS-based source data for the most recent year (S_{ik,CMS_RY} and H_{ik,CMS_RY}).

The denominator of Formula A4 (i.e., the average national wage rate) is calculated in an identical manner to that described above for a State, except that relevant data are compiled within each formula component for all States rather than just for a single State. Shown within the first parentheses in the denominator, a decennial census-based average national wage rate is determined, which is then updated by a CMS-based national update factor in the second portion of the denominator. The current average national wage rate calculated is, therefore, a weighted-average value rather than a simple average of 51 State values.

The calculation of the Wage Subindex of the CSI used for the determination of FY 2007-2009 Block Grant allotments is shown in Table E3 of Appendix E. As an example, the calculation of the Wage Subindex for Alabama (AL) is described. The average base wage for AL was \$23.98, shown as the first entry in Column 1 of the table, while that for the nation was \$24.20, shown as the last entry in the column. These rates were derived from dollars earned and hours worked information for calendar year 1999 as reported in the 2000 Decennial Census for specific occupation-industry categories.

The base wage rate of the Update Factor for AL was \$15.41 and that for the nation was \$18.31, shown as the first and last entries in Column 2 of the table, respectively. These rates were derived from dollars paid and hours worked information for FY 1999 for all occupations except for several specific excluded ones as reported to CMS by hospitals participating in the Medicare program (i.e., providers). Data for FY 1999 were used because they were the most contemporaneous with the Census-based data (i.e., 9 months of FY 1999 fell in calendar year 1999).

The most recent wage rate of the Update Factor for AL was \$17.66 and that for the nation was \$21.35, shown as the first and last entries in Column 3 of the table, respectively. These rates were derived from dollars earned and hours worked information for FY 2002 for all occupations except for several specific excluded ones as reported to CMS by hospitals participating in the Medicare program. Data for FY 2002 were used because they were the most current available on October 1, 2005 (i.e., the source data "cutoff date" for the FY 2007 Block Grant calculations). These data were used by CMS to establish Medicare reimbursement rates for FY 2006.

In Column 4 of the table, the Update Factor is calculated by dividing the value in Column 3 (the most recent CMS-based wage rate) by the value in Column 2 (the CMS-based wage rate for the base year) to derive the percentage or proportionate increase between the base year and most recent year for which data are available. The Update Factor for AL was 1.1459 ($\$17.66 \div \15.41) while that for the nation was 1.1659 ($\$21.35 \div \18.31), shown as the first and last values in Column 4, respectively.

The Updated Census Wage Rate is shown in Column 5 of the table, which is calculated by multiplying the Census wage rate from the base year (Column 1 value) by the Update Factor

(Column 4 value). The value calculated for AL was \$27.48 ($\23.98×1.1459) while that for the nation was \$28.22 ($\24.20×1.1659) shown as the first and last values in Column 5, respectively.

The final step in the calculations is the determination of the Wage Subindex itself, shown in Column 6 of the table. The Wage Subindex for a State is calculated by dividing the Updated Census Wage Rate for the State by the Updated Census Wage Rate for the nation, both values of which are in Column 5. Thus the Wage Subindex for AL is calculated as 0.9739 ($\$27.48 \div \28.22), while the value for the nation is always 1.0 ($\$28.22 \div \28.22).

Rental Subindex Formula (R_i)

(A5)

$$R_i = \frac{\sum_{j=1}^N (POP_{ij} \times FMR_{ij})}{\sum_{i=1}^{51} \sum_{j=1}^N (POP_{ij} \times FMR_{ij})} \cdot \frac{\sum_{j=1}^N POP_{ij}}{\sum_{i=1}^{51} \sum_{j=1}^N POP_{ij}}$$

$\{i(\text{State}) = 1, 2, \dots, 51\}$
 $\{j(\text{County} / \text{Subcounty}) = 1, 2, \dots, N\}$

where R_i = Rental Subindex for State i

POP_{ij} = Resident population estimate (all ages) for substate area (county or subcounty) j in State i

FMR_{ij} = 40th or 50th percentile of Fair Market Rent (FMR) for a four-bedroom residential unit for substate area j in State i

The Rental Subindex (R_i) is a component of the Cost-of-Services Index and is a measurement of the costs of facility space required to provide substance abuse prevention and treatment services in a State (including DC) relative to the average costs for the nation. The composition of the Rental Subindex is fairly simple.

The value calculated in the numerator of the formula is an average rental rate for a State, while the value calculated in the denominator is an average (weighted) rental rate for the United States (exclusive of territories) using the same methodology as employed for calculation of the value in the numerator. The Rental Subindex is, therefore, a ratio equal to an average State rental rate divided by an average national rental rate. It is a dimensionless (i.e., unitless) measurement of the relative deviation of a State's average rental rate from the nation's average rental rate.

The State average rental rate, shown in the numerator, is a population-weighted average rental rate for the State. The rental data used as proxies for facility space costs (FMR_{ij} , State i and substate area j) are the most current 40th or 50th percentile values for four-bedroom FMRs as

determined by and available from the U.S. Department of Housing and Urban Development (HUD). FMRs are defined by HUD as "the amount that would be needed to pay the gross rent (shelter rent plus utilities) of privately owned, decent, and safe rental housing of a modest (non-luxury) nature with suitable amenities" (Department of Housing and Urban Development, 2006). FMR data are reported at the county level for all States except the six New England States, and at the subcounty level (city, town, or township) for the New England States.

The population data used in the determination of the Rental Subindex are the most current substate (county and subcounty) level estimates available from the U.S. Bureau of the Census for resident population (POP_{ij} , State i and substate area j). These are used to weight the FMR data with population for all areas within the State. A population-weighted average FMR for the State is then calculated by dividing the sum of the population-weighted FMRs for all areas in the State by the total population of the State (i.e., the sum of the populations of all the areas within the State).

The denominator of Formula A5 (i.e., the average national population-weighted rental rate) is calculated in an identical manner to that described above for a State, except that data are compiled for all States rather than for a single State. The average national rental rate calculated is, therefore, a weighted-average rather than a simple average of the 51 State values.

The calculation of the Rental Subindex of the CSI used for the determination of FY 2007-2009 Block Grant allotments is shown in Table E4 of Appendix E. As an example, the calculation of the Rental Subindex for Alabama (AL) is described.

The number of county (or county-equivalent) areas in a State for which HUD established FMRs is shown in the first column of the table, while the number of subcounty areas is shown in the second column. There were 67 county or county-equivalent areas in AL, and 3,077 for the nation. Alabama had no subcounty areas (as noted, only New England States had FMR data at the subcounty level), while the total number of subcounty areas for the nation (i.e., for the six New England States) was 1,604.

The third column of the table contains State population estimates, which are aggregations of the population estimates for county or subcounty areas within the States, and that for the nation, which is the sum of the county or subcounty areas for all the States. The total population for AL was 4,530,182, while the total for the nation was 293,655,400.

In the fourth column of the table, the sum of the FMR times population products for all the county or subcounty areas within a State are shown for the States and for the nation. For AL this value was 3,485,284,401 Dollar-Persons, while for the nation it was 350,133,831,845 Dollar-Persons.

The State average four-bedroom rent is shown in the fifth column of the table, and is calculated by dividing the sum of the products of the FMR times population for the areas of a State (fifth column value) by the population of the State (third column value). This average rent value for AL was \$769 ($3,485,284,401 \text{ Dollar-Persons} \div 4,530,182 \text{ Persons}$), while that for the nation was \$1,192 ($350,133,831,845 \text{ Dollar-Persons} \div 293,655,400 \text{ Persons}$).

The final step in the calculations is the determination of the Rental Subindex itself, shown in the last column of the table. The Rental Subindex for a State is calculated by dividing the State average four-bedroom rent (fourth column value) by the average four-bedroom rent for the nation (fourth column, bottom value). Thus the Rental Subindex for AL was calculated as $\$769 \div \$1,192 = 0.64525$, while the value for the nation is always 1.0 ($\$1,192 \div \$1,192$). In this example, AL was found to have an average cost for facility space that was approximately 65% of the national average.

There are a few exceptions to the methodology for calculation of the Rental Subindex, which are cited below.

- Crawford County, MO. As noted, HUD generally promulgates subcounty-level FMRs only for the New England States. However, one exception to this is Crawford County, MO, for which HUD promulgates one rate for Sullivan City, which lies within Crawford County, and another rate for the balance of the county. In calculating the Rental Subindex, the current Bureau of the Census population estimates for both Sullivan City and Crawford County are used to appropriately weight the FMR rates for Sullivan City and Crawford County net of the population of Sullivan City.
- Howard County, MD. As noted above, HUD generally promulgates subcounty-level FMRs only for the New England States. However, a second exception to this rule is Howard County, MD, for which HUD promulgates one rate for Columbia, which lies within Howard County, and another rate for the balance of the county. While the Bureau of the Census counted the population of Columbia for the 2000 Decennial Census, it has not estimated the population of Columbia since the last census because Columbia is not an official municipality within Howard County. SAMHSA therefore estimates the most current population for both Columbia and Howard County net of the population of Columbia by using the most recent population estimate for Howard County (which includes the population of Columbia) and the proportion of the population of Howard County that resided in Columbia at the time of the 2000 Decennial Census.
- Minor Geographic Discrepancies. Occasionally, SAMHSA must perform minor reconciliations of discrepancies in the geographies used by HUD and the Bureau of the Census. An example of this was several small townships in Maine, for which the Census Bureau reported populations but for which HUD promulgated no corresponding FMRs. In such instances, SAMHSA assigns a FMR to such entities equal to the FMR for the townships in closest proximity.

Fiscal Capacity Index Formula—All but DC (F_i)
(A6)

$$F_{i\{\forall i, i \neq DC\}} = \max_{\{i(State) = 1, 2, \dots, 51\}} \left[0.4, 1 - 0.35 \times \left(\frac{\frac{\overline{TTR}_i}{C_i}}{\frac{\sum_{i=1}^{51} \overline{TTR}_i}{\sum_{i=1}^{51} C_i}} \right) \right]$$

where F_i = Fiscal Capacity Index for State i (except for DC)

\overline{TTR}_i = Most recent 3 years' average Total Taxable Resources for State i

C_i = Cost-of-Services Index for State i (Formula A3)

P_i = Population-at-Risk Index for State i (Formula A2)

The Fiscal Capacity Index (F_i) is determined annually and represents, or is a proxy for, the relative ability of a State to pay for substance abuse prevention and treatment services. It is a factor whose value declines with increasing fiscal capacity (effectively fiscal resources) of a State.

The first step in the determination of the Fiscal Capacity Index for all States other than DC is the collection and compilation of Total Taxable Resources (TTR) data for the most recent 3 years for the States (including DC) from the Office of Macroeconomic Policy (OEP), U.S. Department of the Treasury. Three-year averages of TTR (\overline{TTR}_i) are then calculated for all the States (and DC).

The next step in the calculations is to divide the 3-year average TTR for a State (other than DC) by the Cost-of-Services Index (C_i) for that State, effectively producing a cost-adjusted average TTR for the subject State. This term is shown in the top portion of the numerator appearing on the right-hand side of Formula A6.

The sum of cost-adjusted average TTR for all the States (including DC) is calculated, and then divided into the cost-adjusted average TTR value for the subject State. The sum of the cost-adjusted average TTR for all States is shown in the bottom portion of the numerator (which can also be referred to as the denominator term in the numerator) in the formula. The result of this step is to effectively produce a cost-adjusted, relative, average TTR for the subject State.

The next step is to calculate a term equal to the Population-at-Risk Index for the subject State (P_i , other than DC) divided by the sum of the Population-at-Risk Indexes for all the States (including DC), and divide this term into the cost-adjusted, relative, average TTR for the subject

State. This population-related term is shown in the denominator of the expression on the right-hand side of Formula A6. The result of this step is to effectively produce a cost-adjusted, population-adjusted, relative, average TTR for the subject State (other than DC).

This value is multiplied by 0.35, and then subtracted from 1, to yield the unconstrained Fiscal Capacity Index for a State (other than DC). However, if this unconstrained value is less than 0.4, then the final (constrained) Fiscal Capacity Index for the State (F_i) is set equal to 0.4. Refer to Appendix Tables E6-E9 for an example of the calculation of the Fiscal Capacity Index and its components.

Fiscal Capacity Index Formula for DC (F_{DC})

(A7)

$$F_{DC} = \max \left[0.4, 1 - 0.35 \times \left(\frac{\frac{\overline{TPI}_{DC}}{C_{DC}}}{\frac{P_{DC}}{\sum_{i=1}^{51} \frac{\overline{TPI}_i}{C_i}}} \right) \right]$$

$\{i(State) = 1, 2, \dots, 51\}$

where F_{DC} = Fiscal Capacity Index for DC

\overline{TPI}_{DC} = Most recent 3 years' average Total Personal Income for DC

C_{DC} = Cost-of-Services Index for DC (Formula A3)

P_{DC} = Population-at-Risk Index for DC (Formula A2)

\overline{TPI}_i = Most recent 3 years' average Total Personal Income for State i

C_i = Cost-of-Services Index for State i (Formula A3)

P_i = Population-at-Risk Index for State i (Formula A2)

The Fiscal Capacity Index for DC (F_{DC}) is determined annually and represents, or is a proxy for, the relative ability of DC to pay for substance abuse prevention and treatment services. It is a factor very similar in construction and meaning to the Fiscal Capacity Indexes of the States, whose value declines with increasing fiscal capacity (effectively fiscal resources) of DC.

The first step in the determination of the Fiscal Capacity Index for DC is the collection and compilation of Total Personal Income (TPI) data for the States and DC for the most recent 3 years from the Bureau of Economic Analysis (BEA), U.S. Department of Commerce. Three-year averages of TPI are then calculated for all the States (\overline{TPI}_i) and DC (\overline{TPI}_{DC}).

The next step in the calculations is to divide the 3-year average TPI for DC by the Cost-of-Services Index for DC (C_{DC}), effectively producing a cost-adjusted, average TPI for DC. This term is shown in the top portion of the numerator appearing on the right-hand side of Formula A7.

The sum of cost-adjusted average TPI for all the States (including DC) is calculated, and then divided into the cost-adjusted average TPI value for DC. The sum of the cost-adjusted average TPI for all States and DC is shown in the bottom portion of the numerator (which can also be referred to as the denominator term in the numerator) in the formula. The result of this step is to effectively produce a cost-adjusted, relative, average TPI for DC.

The next step is to calculate a term equal to the Population-at-Risk Index for DC (P_{DC}) divided by the sum of the Population-at-Risk Indexes (P_i) for all the States and DC, and divide this term into the cost-adjusted, relative, average TPI for DC. This population-related term is shown in the denominator of the expression on the right-hand side of Formula A7. The result of this step is to effectively produce a cost-adjusted, population-adjusted, relative, average TPI for DC.

This value is first multiplied by 0.35, and then subtracted from 1, to yield the unconstrained Fiscal Capacity Index for DC. However, if this unconstrained value is less than 0.4, then the final (constrained) Fiscal Capacity Index for DC (F_{DC}) is set equal to 0.4. Refer to Appendix Tables E7-E9 for an example of the calculation of the Fiscal Capacity Index and its components.

Formula for Determining Below/Equal-to-Statutory-Minimum Allotment (BESMA) States vs. Above-Statutory-Minimum Allotment (ASMA) States
(A8)

$$\text{When } A_{i,RFY,Baseline} \leq \max \left[\begin{array}{l} (A_{i,RFY-1} \times (1 + 0.3065r)), \\ \min((0.00375 \times AP_{RFY}), (A_{i,RFY-1} \times (1 + 3r))) \end{array} \right]$$

$$A_{i,BESMA} = \max \left[\begin{array}{l} (A_{i,RFY-1} \times (1 + 0.3065r)), \\ \min((0.00375 \times AP_{RFY}), (A_{i,RFY-1} \times (1 + 3r))) \end{array} \right]$$

otherwise $A_{i,ASMA} = A_{i,RFY,Baseline}$

$\{i \text{ (State)} = 1, 2, \dots, 51\}$

where $A_{i,RFY-1}$ = Allotment for State i for the year prior to the reference fiscal year

r = Rate of increase in appropriation between prior and reference fiscal years as defined below:

$$r = \frac{AP_{RFY} - AP_{RFY-1}}{AP_{RFY-1}}$$

AP_{RFY} = Appropriation amount for the reference fiscal year

AP_{RFY-1} = Appropriation amount for the year prior to the reference fiscal year

$A_{i,RFY,Baseline}$ = Baseline allotment for State i for the reference fiscal year

$A_{i,BESMA}$ = Allotment for BESMA State i ($= 1 \dots, N_1$)

$A_{i,ASMA}$ = Allotment for ASMA State i ($= 1 \dots, N_2$)

Determination of BESMA and ASMA States follows the calculation of the statutory minimum allotments, using the following steps. First, what is referred to as the "In General" minimum allotment constraint is determined, which is shown as the first argument within the square brackets in Formula A8. This ensures that no State receives less than the amount that it received for the prior fiscal year ($A_{i,RFY-1}$) increased by 30.65 percent (the factor "0.3065") of the proportionate increase (the variable " r ") in the total appropriation amount between the prior fiscal year (AP_{RFY-1}) and current fiscal year (AP_{RFY}).

Second, what is referred to as the "Exception" minimum allotment constraint is determined, which is shown as the first argument within the "min" function parentheses in Formula A8. This ensures that no State receives less than 0.375 percent (the factor "0.00375") of the current fiscal year appropriation amount (AP_{RFY}).

Third, the "Limitation" minimum allotment constraint is calculated as the second argument within the "min" function in Formula A8. This constraint ensures that no State receives more than the amount that it received for the prior fiscal year ($A_{i,RFY-1}$) increased by 300 percent (the factor "3") of the proportionate increase (the variable " r ") in the total appropriation amount between the prior fiscal year (AP_{RFY-1}) and current fiscal year (AP_{RFY}).

Fourth, the statutory minimum allotment is calculated as the maximum of the "In General" allotment constraint and the quantity that is the minimum of the "Exception" and "Limitation" allotment constraints. Refer to Appendix Table E11 as an example of the statutory minimum allotment calculations.

In the final step, the baseline allotments must be compared with statutory minimum allotments. If any baseline allotments are less than or equal to the statutory minimums, then those are increased in subsequent calculations to the statutory minimums or held constant, respectively; these allotments are referred to as "BESMA" ($A_{i,BESMA}$). States for which baseline allotments are greater than the statutory minimums are referred to as "ASMA" ($A_{i,ASMA}$), and in subsequent calculations funding from ASMA States is redistributed to BESMA States in order to increase the latter from their baseline values to the statutory minimums. The allotment values for ASMA States are set equal to baseline allotments. Refer to Appendix Tables E12-E14 as an example of determining BESMA and ASMA States.

Scaled Allotment Formula for ASMA States
(A9)

$$A_{ij, Scaled ASMA} = \left(A_{ij, ASMA} \times \frac{0.95 \times 0.985 \times AP_{RFY} - \sum_{i=1}^{N_1} A_{ij, BESMA}}{\sum_{i=1}^{N_2} A_{ij, ASMA}} \right)$$

$\{i \text{ (ASMA State)} = 1, 2, \dots, N_2\}$
 $\{i \text{ (BESMA State)} = 1, 2, \dots, N_1\}$
 $\{j \text{ (Cycle)} = 1, 2, \dots, m\}$

where $A_{ij, Scaled ASMA}$ = Scaled allotment for ASMA State i in Cycle j for the reference fiscal year

$A_{ij, ASMA}$ = Allotment for ASMA State i in Cycle j for the reference fiscal year

$A_{ij, BESMA}$ = Allotment for BESMA State i in Cycle j for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

0.95 = Proportion of AP_{RFY} disbursed to States and territories

0.985 = Proportion of State-Territory allotment disbursed to States

Scaled allotments for ASMA States in Cycle j require comparison with statutory minimums and may require constraining or re-scaling through an iterative process until re-scaled allotments ($A_{ij, Scaled ASMA}$) meet the following criteria:

$$A_{ij, Scaled ASMA} > \max \left[\left(A_{i, RFY-1} \times (1 + 0.3065r) \right), \right. \\ \left. \min \left((0.00375 \times AP_{RFY}), (A_{i, RFY-1} \times (1 + 3r)) \right) \right]$$

$\{i \text{ (ASMA State)} = 1, 2, \dots, N_2\}$
 $\{j \text{ (Cycle)} = 1, 2, \dots, m\}$

In order for the allotments of BESMA States to be increased from their baseline values to statutory minimum values, funding must be redistributed to them from ASMA States. This redistribution is effected by the application of a "Scale Factor" to the allotments of ASMA States in one or multiple redistribution cycles, which reduces such allotments by a uniform proportion and allows just enough funding to be transferred to BESMA States so that statutory minimums are achieved.

Formula A9 shows how scaled allotments for ASMA States ($A_{ij, Scaled ASMA}$) are calculated, which is simply the multiplication of the unscaled allotment for that cycle ($A_{ij, ASMA}$) by a Scale Factor for that cycle ("j"). The term on the right-hand side of the quantity within the large parentheses is the Scale Factor, which is a ratio less than unity and consists of a numerator and denominator.

The numerator of the Scale Factor is the total funding available for ASMA States in the redistribution cycle, which is itself the difference of two values. The first term in the numerator is the total funding available in the reference (current) year to all States, which is the total appropriation amount (AP_{RFY}) less 5 percent of the appropriation amount for administration and technical assistance (hence the 0.95 factor) less 1.5 percent of this net amount that is slated for territory allotments (hence the 0.985 factor). The second term in the numerator is the sum of the allotments ($A_{ij, BESMA}$) for BESMA States in the redistribution cycle. The difference of these two terms is thus the total funding available for ASMA States in the redistribution cycle.

The denominator of the Scale Factor is the sum of the allotments for ASMA States in the redistribution cycle *prior to scaling*, and is thus the total funding that the ASMA States in the cycle should receive if they were not being scaled in that cycle. The Scale Factor is thus a ratio equal to the funding that is available for the ASMA States in the cycle divided by the funding that they would otherwise receive in the cycle without further scaling.

The allotments for ASMA States prior to scaling in a given redistribution cycle are either the baseline allotments, if it is the first cycle, or scaled allotments from the prior cycle, if it is the second or later redistribution cycle. After each redistribution cycle, all scaled ASMA's must be compared with statutory minimums and, if any are less than or equal to statutory minimums, then any such allotments are themselves BESMA in subsequent redistribution cycles. As an example, these calculations are shown in Appendix Tables E12-E14.

Final Allotment Formula (States)

(A10)

$$A_{i, Final} = A_{ij=m, BESMA} \text{ for } \{i = 1, 2, \dots, N_1\}$$

$$A_{i, Final} = A_{ij=m, Scaled ASMA} \text{ for } \{i = 1, 2, \dots, N_2\}$$

where $A_{i, Final}$ = Final allotment for State i for the reference fiscal year

$A_{ij=m, BESMA}$ = Allotment for BESMA State i in the last Cycle ($j=m$) for the reference fiscal year

$A_{ij=m, Scaled ASMA}$ = Scaled allotment for ASMA State i in the last Cycle ($j=m$) for the reference fiscal year

The calculations to determine final State allotments ($A_{i, Final}$) may require multiple funding redistribution cycles in order that all States receive at least the statutory minimums. When this condition has been achieved after a sufficient (m) number of cycles, then final allotments are either statutory minimums ($A_{ij=m, BESMA}$) for BESMA States or are scaled allotments ($A_{ij=m, Scaled ASMA}$) for ASMA States. Refer to Appendix Table E15 as an example of final allotment calculations.

Scenario 2: Appropriation for the Reference Fiscal Year Decreased or Remained the Same as the Prior Year's Amount

Formula for States

(A11)

$$A_{i,RFY} = A_{i,RFY-1} \times \frac{AP_{RFY}}{AP_{RFY-1}}$$
$$\{i(State) = 1, 2, \dots, 51\}$$

where $A_{i,RFY}$ = Allotment for State i for the reference fiscal year

$A_{i,RFY-1}$ = Allotment for State i for the year prior to the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

AP_{RFY-1} = Appropriation amount for the year prior to the reference fiscal year

In the event that the appropriation amount for the current (reference) fiscal year (AP_{RFY}) is either less than or equal to the amount for the prior fiscal year (AP_{RFY-1}), then a very simple calculation is performed to determine State allotments. The allotments for the reference fiscal year ($A_{i,RFY}$) are determined by multiplying the allotments for the prior fiscal year ($A_{i,RFY-1}$) by the ratio of the reference year appropriation amount to the prior year appropriation amount, that is, by the ratio AP_{RFY}/AP_{RFY-1} . State allotments for the reference fiscal year are thus either reduced proportionately from the prior year if the appropriation amount is reduced, or kept unchanged if the appropriation amount is unchanged. Refer to Appendix Table E17 as an example of Scenario 2 allotment calculations for States.

Formula for Apportioning Minnesota Allotment between Red Lake Indians and the Rest of Minnesota (Scenarios 1 and 2)

(A12)

$$A_{RLI,RFY} = 0.0240535 \times A_{MN,RFY}$$
$$A_{MN-RLI,RFY} = A_{MN,RFY} - A_{RLI,RFY}$$

where $A_{RLI,RFY}$ = Allotment for Red Lake Indians of Minnesota for the reference fiscal year

$A_{MN,RFY}$ = Allotment for Minnesota for the reference fiscal year

$A_{MN-RLI,RFY}$ = Allotment for Minnesota excluding Red Lake Indians for the reference fiscal year

0.0240535 = Proportion of Minnesota allotment that Red Lake Indians receive

A special situation exists in the determination of the final allotment for the State of Minnesota. Minnesota is treated the same as all other States via the application of Formulas A1-A10, or Formula A11, as applicable, for the reference fiscal year, with the determination of a final allotment for Minnesota ($A_{MN,RFY}$).

However, the Red Lake Band of the Chippewa Tribe in Minnesota receives an allotment ($A_{RLI,RFY}$) directly from SAMHSA, which is equal to 2.40535 percent (hence the factor 0.0240535 in the formula) of the allotment for Minnesota; this proportion was established during, and has been unchanged since, FY 1992. The remainder of Minnesota receives an

allotment ($A_{MN-RLI, RFY}$) equal to the total allotment for Minnesota less the allotment received by the Red Lake Indians. As an example, apportioning of the Minnesota allotment is shown in Appendix Table E15.

Baseline Formula for Territories (Scenarios 1 and 2)

(A13)

$$A_{i, RFY, Baseline} = \left(0.95 \times 0.015 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^8 P_i} \right)$$

$$\{i(Territory) = 1, 2, \dots, 8\}$$

where $A_{i, RFY, Baseline}$ = Baseline allotment for Territory i for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

P_i = Total civilian population for Territory i (recent census)

0.95 = Proportion of AP_{RFY} disbursed to States and territories

0.015 = Proportion of State-Territory allotment disbursed to territories

The appropriation amount for the program (AP_{RFY}) for a given, or "reference," fiscal year is determined annually by the Congress. Five percent of the appropriated amount is used by DHHS/SAMHSA for data collection to determine the incidence and prevalence of substance abuse and for technical assistance and program evaluations relevant to substance abuse treatment and prevention, while 95 percent of the appropriation is allocated among the States (including DC) and territories (consisting of five current and three former territories) hence the factor "0.95" used in the formula. Of the amount allocated to States and territories, 1.5 percent is distributed to the territories (hence the factor "0.015" used in the formula), which is referred to as the "Territory Subtotal."

The initial or "baseline" allotment for a territory ($A_{i, RFY, Baseline}$) is determined exclusively by the proportion of the civilian population of all territories that resides in the subject territory. The share that a territory receives of the Territory Subtotal is equal to the ratio formed by the civilian population of the territory (P_i) divided by the sum of the civilian populations of all territories. The baseline allotment for a territory is then determined as the product of this ratio (the territory's share) with the Territory Subtotal (the funding available to all the territories).

Formula for Determining Below/Equal-To-Statutory-Minimum Allotment (BESMA) Territories vs. Above-Statutory-Minimum Allotment (ASMA) Territories

(A14)

$$\text{When } A_{i, RFY, Baseline} \leq \$50,000 \quad A_{i, BESMA} = \$50,000$$

$$\text{otherwise} \quad A_{i, ASMA} = A_{i, RFY, Baseline}$$

$$\{i(Territories) = 1, 2, \dots, 8\}$$

where $A_{i, RFY, Baseline}$ = Baseline allotment for Territory i for the reference fiscal year

$A_{i, BESMA}$ = Allotment for BESMA Territory i ($=1, \dots, N_1$)

$A_{i, ASMA}$ = Allotment for ASMA Territory i ($=1, \dots, N_2$)

For territories, the statutory minimum allotment is \$50,000. If any baseline allotments are less than or equal to this statutory minimum, then those are increased to this minimum or held constant. These allotments are referred to as "BESMA" ($A_{i, BESMA}$). Territories for which baseline allotments are greater than the statutory minimum are referred to as ASMA ($A_{i, ASMA}$) territories, and in subsequent calculations funding from ASMA territories is redistributed to BESMA territories in order to increase the latter from their baseline values to the statutory minimum. Refer to Appendix Table E16 for an example showing that no allotments fell below the statutory minimum of \$50,000, and hence, there were no BESMA territories, meaning that all territories were ASMA territories.

Scaled Allotment Formula for ASMA Territories

(A15)

$$A_{ij, Scaled ASMA} = \left(A_{ij, ASMA} \times \frac{0.95 \times 0.015 \times AP_{RFY} - \sum_{i=1}^{N_1} A_{ij, BESMA}}{\sum_{i=1}^{N_2} A_{ij, ASMA}} \right)$$

$$\{i \text{ (BESMA Territory)} = 1, 2, \dots, N_1\}$$

$$\{i \text{ (ASMA Territory)} = 1, 2, \dots, N_2\}$$

$$\{j \text{ (Cycle)} = 1, 2, \dots, m\}$$

where $A_{ij, Scaled ASMA}$ = Scaled allotment for ASMA Territory i in Cycle j for the reference fiscal year

$A_{ij, ASMA}$ = Allotment for ASMA Territory i in Cycle j for the reference fiscal year

$A_{ij, BESMA}$ = Allotment for BESMA Territory i in Cycle j for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

0.95 = Proportion of AP_{RFY} for disbursement to States and territories

0.015 = Proportion of State-Territory allotment for disbursement to territories

Scaled allotments for ASMA territories in Cycle j require comparison with the statutory minimum and may require constraining or re-scaling through an iterative process until re-scaled allotments ($A_{ij, Scaled ASMA}$) meet the following criterion:

$$A_{ij, Scaled ASMA} > \$50,000$$

$$\{i \text{ (ASMA Territory)} = 1, 2, \dots, N_2\}$$

$$\{j \text{ (Cycle)} = 1, 2, \dots, m\}$$

where $A_{ij, Scaled ASMA}$ = Scaled allotment for ASMA Territory i in Cycle j for the reference fiscal year.

In order for the allotments of BESMA territories to be increased from their baseline values to the statutory minimum value, funding must be redistributed to them from the allotments for ASMA territories. This redistribution is effected by the application of a "Scale Factor" to the allotments of ASMA territories in one or multiple redistribution cycles, which reduces such allotments by a uniform proportion and allows just enough funding to be transferred to BESMA territories so that the statutory minimum is achieved.

Formula A15 shows how scaled allotments for ASMA territories ($A_{ij, Scaled ASMA}$) are calculated, which is simply the multiplication of the unscaled allotment for that cycle ($A_{ij, ASMA}$) by a Scale Factor for that cycle (" j "). The term on the right-hand side of the quantity within the large parentheses is the Scale Factor, which is a ratio less than unity and consists of a numerator and denominator.

The numerator of the Scale Factor is the total funding available for ASMA territories in the redistribution cycle, which is itself the difference of two values. The first term in the numerator is the total funding available in the reference (current) year to all territories, which is the total appropriation amount (AP_{RFY}) less 5 percent of the appropriation amount for administration and technical assistance (hence the 0.95 factor) less 98.5 percent of this net amount that is slated for State allotments (hence the 0.015 factor). The second term in the numerator is the sum of the allotments ($A_{ij, BESMA}$) for BESMA territories in the redistribution cycle. The difference of these two terms is thus the total funding available for ASMA territories in the redistribution cycle.

The denominator of the Scale Factor is the sum of the allotments for ASMA territories in the redistribution cycle *prior to scaling*, and is thus the total funding that the ASMA territories in the cycle should receive if they were not being scaled in that cycle. The Scale Factor is thus a ratio equal to the funding that is available for the ASMA territories in the cycle divided by the funding that they would otherwise receive in the cycle without further scaling.

The allotments for ASMA territories prior to scaling in a given redistribution cycle are either the baseline allotments, if it is the first cycle, or scaled allotments from the prior cycle, if it is the second or later redistribution cycle. After each redistribution cycle, all scaled ASMA must be compared with the statutory minimum and, if any are less than or equal to the statutory minimum, then any such allotments are themselves BESMA in subsequent redistribution cycles. As noted earlier, in reference to the example shown in Appendix Table E16, since there were no BESMA territories (i.e., all territories are ASMA territories), ASMA-scaling was not needed.

Final Allotment Formula (Territories)

(A16)

$$A_{i, Final} = A_{ij=m, BESMA} \text{ for } \{i = 1, 2, \dots, N_1\}$$

$$A_{i, Final} = A_{ij=m, Scaled ASMA} \text{ for } \{i = 1, 2, \dots, N_2\}$$

where $A_{i, Final}$ = Final allotment for Territory i for the reference fiscal year

$A_{ij=m, BESMA}$ = Allotment for BESMA Territory i in last Cycle ($j=m$) for the reference fiscal year

$A_{ij=m, Scaled ASMA}$ = Scaled allotment for ASMA Territory i in last Cycle ($j=m$) for the reference fiscal year

The calculations to determine final territory allotments ($A_{i, Final}$) may require multiple funding redistribution cycles in order that all territories receive at least the statutory minimum. When this condition has been achieved after a sufficient (m) number of cycles, then final allotments are either the statutory minimum ($A_{ij=m, BESMA}$) for BESMA territories or are scaled allotments ($A_{ij=m, Scaled ASMA}$) for ASMA territories. Refer to Appendix Table E16 as an example of allotment calculations for territories.

Table 2.1 Data Elements and Data Sources for SAPT BG Calculations

No.	Data Elements	Data Sources
(For 50 States and DC)		
1	Population Estimates (Population-at-Risk Index Calculations)	U.S. Census Bureau
2	Resident Population and Population of Urbanized Areas at Ages 18-24 (Population-at-Risk Index Calculations)	U.S. Census Bureau (2000 Decennial Census)
3	Wage Data (Cost-of-Services Index Calculations)	U.S. Census Bureau (2000 Decennial Census—16 Percent Sample)
4	Wage Data for Base Year and Recent Year (Cost-of-Services Index Calculations)	CMS
5	40 th and 50 th Percentile Fair Market Rent Estimates (Cost-of-Services Index Calculations)	HUD
6	Population Estimates by County/Subcounty (Cost-of-Services Index Calculations)	U.S. Census Bureau
7	Total Taxable Resources (Fiscal Capacity Index Calculations)	Department of Treasury/Office Of Economic Policy
8	Total Personal Income (Fiscal Capacity Index Calculations)	U.S. Department of Commerce/Bureau of Economic Analysis
9	SAPT BG Allotments by State and Appropriation Amount for Prior Fiscal Year; and Appropriation Amount for the Current Fiscal Year	SAMHSA
(For 8 Territories)		
10	Civilian Population (all ages combined)	U.S. Census Bureau and census for three former territories

Note: All Data Elements are required for Scenario 1 calculations, while Data Elements (9) and (10) are required for Scenario 2 calculations.

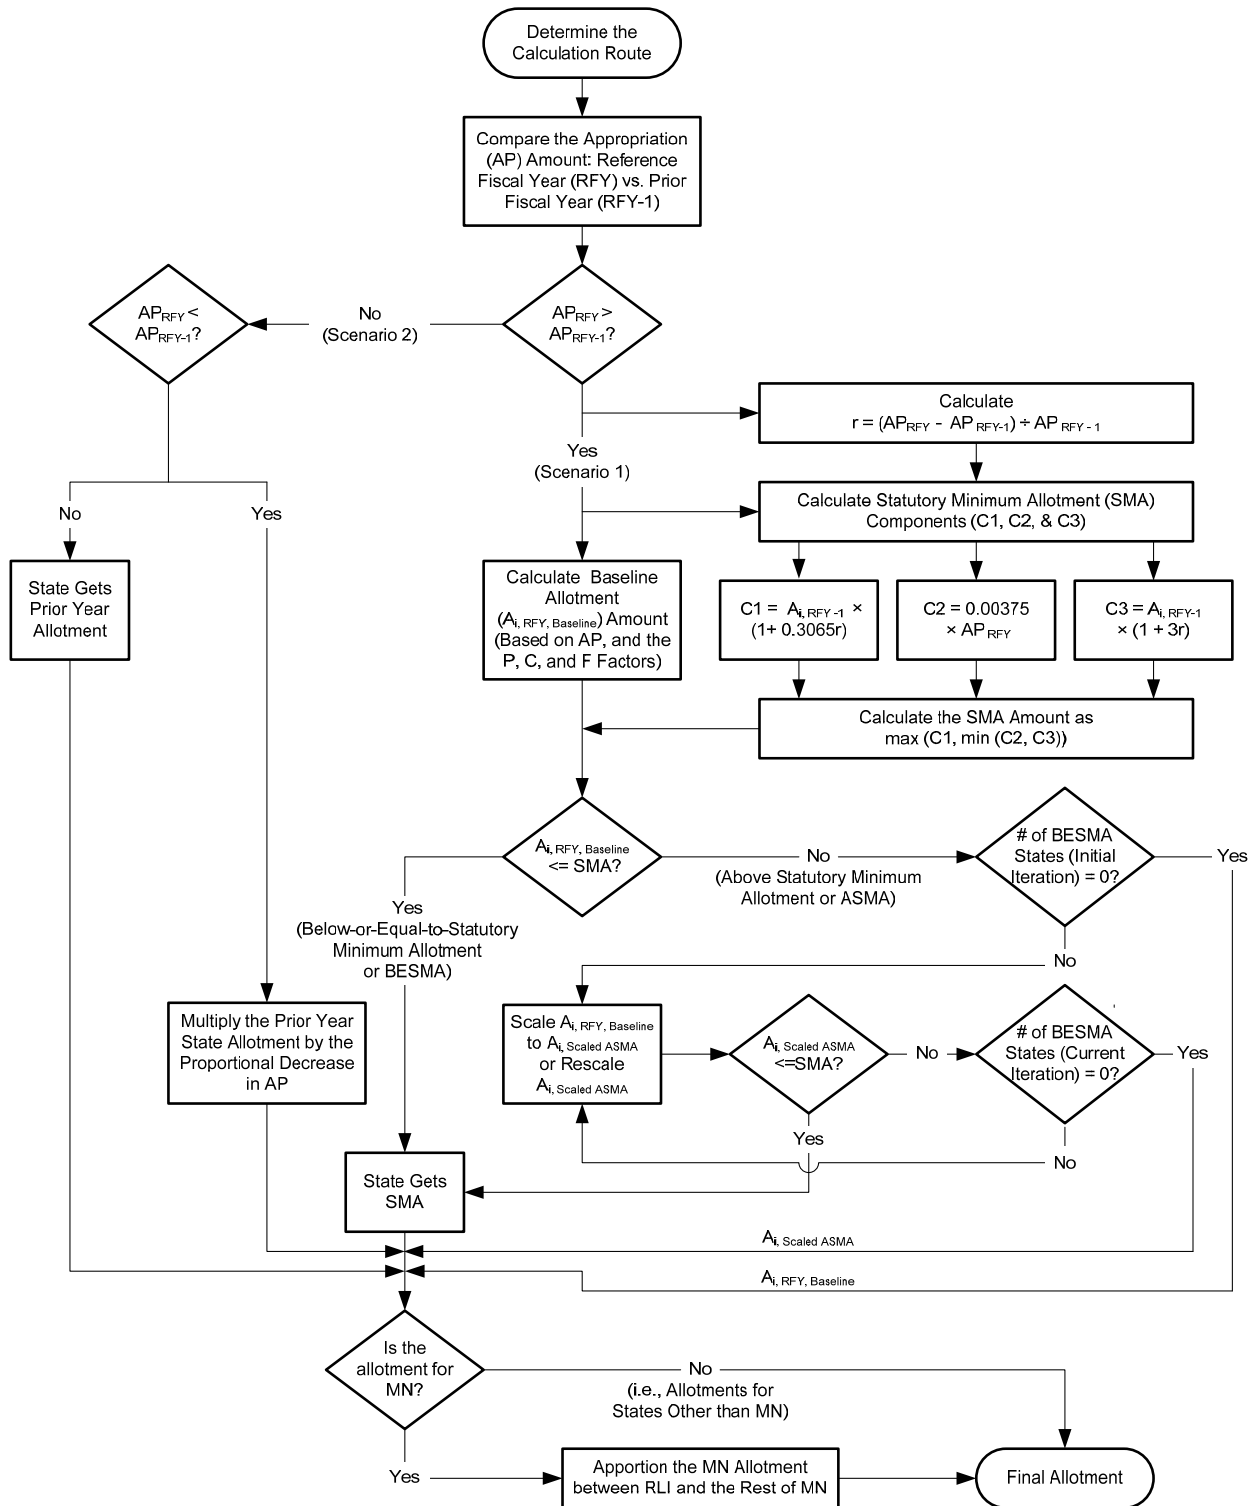

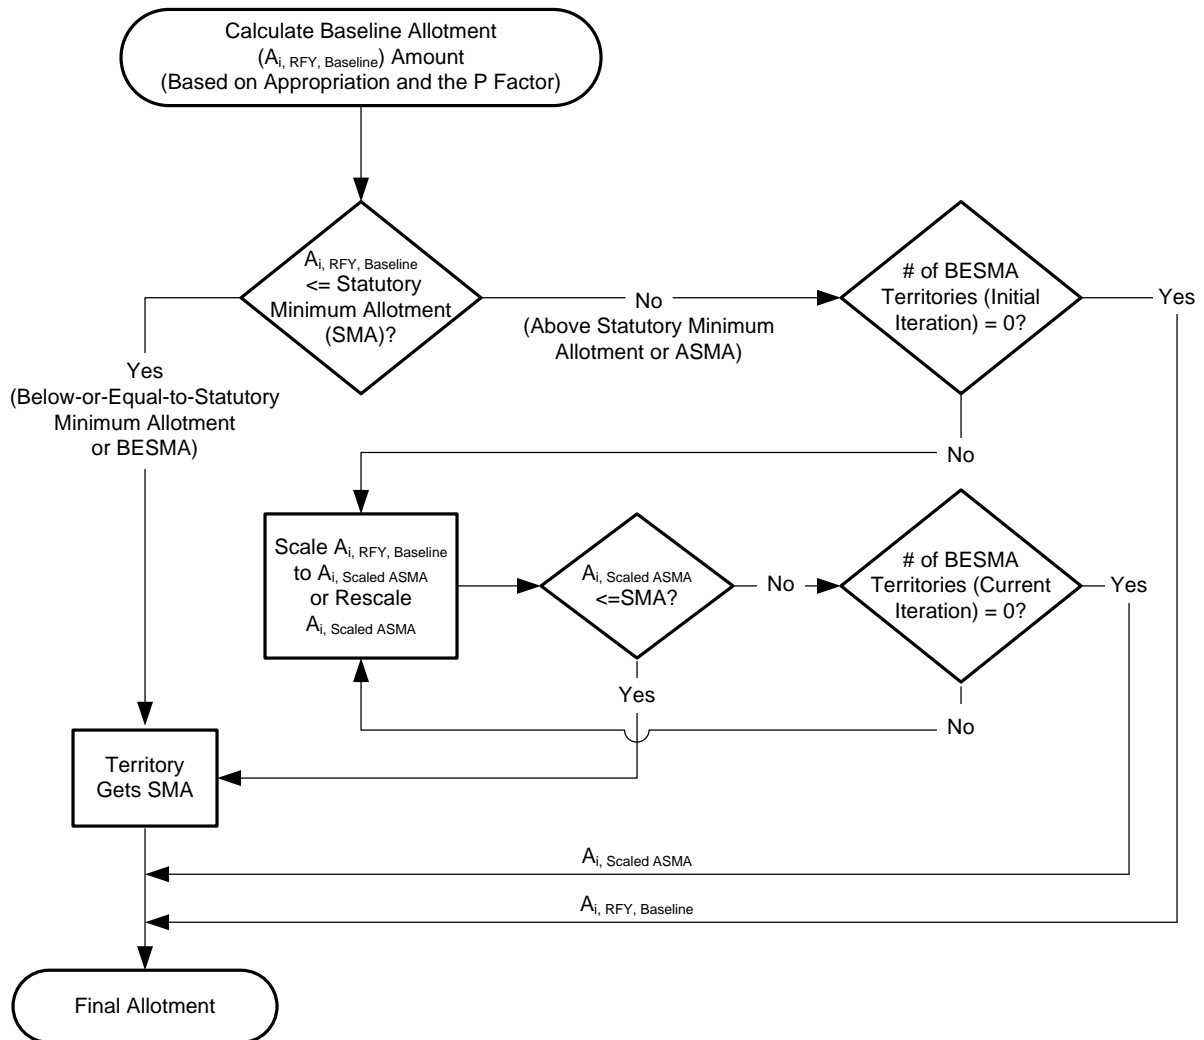

Figure 2.2 SAPT BG Calculation Flowchart (Eight Territories)

3. Mental Health Services Block Grant (MH BG) Allotment Formulas

The Office of Applied Studies (OAS) of the Substance Abuse and Mental Health Services Administration (SAMHSA) determines annually the allocation of funding to States and territories for the MH BG in accordance with enabling legislation. The formulas presented below are mathematical expressions of the rules laid out in the legislation and subsequent Reauthorizations.

As the law requires, 5 percent of the appropriated amount for a given fiscal year is first set aside for SAMHSA to cover the costs for data collection, technical assistance, and program evaluation. Of the remaining 95 percent of the appropriated amount, 98.5 percent is distributed to 50 States and the District of Columbia (DC) and 1.5 percent is distributed to five territories and three former territories. The initial or “baseline” allotments for the States and DC are determined by the relative share of the Weighted Population-at-Risk Index, the Cost-of-Services Index, and the Fiscal Capacity Index. However, the allotment calculations for territories are solely based on the relative share of the population. The baseline allotments are adjusted, if and as necessary, so that statutory minimum allotment constraints are satisfied. This is accomplished via an iterative calculation algorithm which uniformly and proportionately reduces the baseline funding of some Domains and redistributes it to other Domains in order that all minimum allotment constraints are fully satisfied. The MH BG formulas are presented in the following sequence.

Baseline Allotment Formula (50 States and DC)

(B1)

$$A_{i,RFY, Baseline} = 0.95 \times 0.985 \times AP_{RFY} \times \left(\frac{P_i \times C_i \times F_i}{\sum_{i=1}^{51} (P_i \times C_i \times F_i)} \right)$$

$\{i(State) = 1, 2, \dots, 51\}$

where $A_{i,RFY, Baseline}$ = Baseline allotment for State i for the reference fiscal year

AP_{RFY} = Total appropriation amount for the reference fiscal year

P_i = Weighted Population-at-Risk (ages 18+) for State i (Formula B2)

C_i = Cost-of-Services Index for State i (Formula B3)

F_i = Fiscal Capacity Index for State i (Formulas B6 and B7)

0.95 = Proportion of AP_{RFY} for disbursement to States and territories

0.985 = Proportion of State-Territory allotment for disbursement to States

According to this formula, the appropriation amount for the program (AP_{RFY}) for a given, or "reference," fiscal year is determined annually by the Congress. Five percent of the appropriated amount is used by the Department of Health and Human Services (DHHS)/

Substance Abuse and Mental Health Services Administration (SAMHSA) to collect data on mental health services and patients and conduct evaluations of programs to prevent and treat mental health problems, while 95 percent of the appropriation is allocated among the States (including DC) and territories (hence the factor "0.95" used in the formula). Of the amount allocated to States and territories, 98.5 percent is distributed to the States (hence the factor "0.985" used in the formula), which is referred to as the "State Subtotal." Refer to Appendix Table F1 as an example of calculations of the amounts available for States, territories, and SAMHSA set-aside.

The initial or "baseline" allotment for a State ($A_{i,RFY,Baseline}$) is determined by three factors: the Weighted Population-at-Risk Index (P_i), the Cost-of-Services Index (C_i), and the Fiscal Capacity Index (F_i). The share that a State receives of the State Subtotal is equal to the ratio formed by the product of the P, C, and F factors for the State divided by the sum of the products of the P, C, and F factors for all the States; this ratio is shown within large parentheses on the right-hand side of the formula. The baseline allotment for a State is then determined as the product of this ratio (the State's share) with the State Subtotal (the funding available to all the States). Refer to Appendix Table F6 for an example of baseline allotment calculations.

Weighted Population-at-Risk Formula (P_i)

(B2)

$$P_i = 0.107 \times P_{18-24,i} + 0.166 \times P_{25-44,i} + 0.099 \times P_{45-64,i} + 0.082 \times P_{65+,i}$$

$$\{i(State) = 1, 2, \dots, 51\}$$

where P_i = Weighted Population-at-Risk for State i

$P_{18-24,i}$ = Population estimate for ages 18-24 for State i

$P_{25-44,i}$ = Population estimate for ages 25-44 for State i

$P_{45-64,i}$ = Population estimate for ages 45-64 for State i

$P_{65+,i}$ = Population estimate for ages 65+ for State i

The Weighted Population-at-Risk (P_i) is determined annually and represents, or is a proxy for, the risk of mental health problems in a State. It consists of four components, each consisting of the number of individuals in a specific population age group within a State multiplied by a weighting factor.

The first component in the equation is the State resident population aged 18-24 ($P_{18-24,i}$), with a weight of 0.107; the second component is the State resident population aged 25-44 ($P_{25-44,i}$), with a weight of 0.166; the third component is the State resident population aged 45-64 ($P_{45-64,i}$), with a weight of 0.099; and the fourth component is the State resident population aged 65 and over ($P_{65+,i}$), with a weight of 0.082. The most current State population estimates by age are obtained annually from the U.S. Census Bureau to calculate the Population-at-Risk. Refer to Appendix Table F2 for an example of the calculation of the Weighted Population-at-Risk.

Cost-of-Services Index Formula (C_i)
(B3)

$$\begin{aligned}C'_i &= 0.75W_i + 0.15R_i + 0.10S_i \\C_i &= 0.9 \text{ if } C'_i < 0.9 \\C_i &= 1.1 \text{ if } C'_i > 1.1 \\&\textit{Otherwise} \\C_i &= C'_i \\i(\textit{State}) &= 1, 2, \dots, 51\end{aligned}$$

where C'_i = Unconstrained Cost-of-Services Index for State i

C_i = Constrained Cost-of-Services Index for State i

W_i = Wage Subindex (proxy for labor costs) for State i (Formula B4)

R_i = Rental Subindex (proxy for facility costs) for State i (Formula B5)

S_i = Supply Subindex (proxy for materials costs) for State i (The value of this subindex is 1 for all States.)

The Cost-of-Services Index is determined triennially (i.e., it is revised every third fiscal year rather than annually) and the most current index is being used for the determination of allotments for fiscal year (FY) 2007, FY 2008, and FY 2009. It represents, or is a proxy for, the relative costs of providing mental health-related services in a State.

The Cost-of-Services Index consists of three component "subindexes," each of which is weighted. The Wage Subindex (W_i) has a weight of 75 percent, the Rental Subindex (R_i) has a weight of 15 percent, and the Supplies Subindex (S_i) has a weight of 10 percent, hence the coefficients 0.75, 0.15, and 0.10 in the formula for the unconstrained Cost-of-Services Index (C'_i), respectively.

The Wage and Rental Subindexes are proxies for labor and facility costs, respectively, and are recalculated every third fiscal year when the Cost-of-Services Index is revised. However, the Supplies Subindex, which is a proxy for materials costs, is not recalculated but rather has a perpetual, uniform value of 1.0 for all States. This implies that all States have equal access to a national market for supplies, and thus the relative costs for the same are assumed to not vary geographically.

The final, or constrained, Cost-of-Services Index (C_i) is then set to a value of 0.9 if C'_i is less than 0.9, or set to a value of 1.1 if C'_i is greater than 1.1. If the unconstrained index is equal to or greater than 0.9 and less than or equal to 1.1, then the final constrained index is set equal to the unconstrained index. Refer to Appendix Tables E3-E5 for an example of the calculations of the Cost-of-Services Index and its subindexes. Note that the same index and subindex values are used in the allotment calculations for both Block Grants.

Wage Subindex Formula (W_i)
(B4)

$$W_i = \frac{\left(\sum_{j=1}^5 S_{ij,CENSUS_BY} / \sum_{j=1}^5 H_{ij,CENSUS_BY} \right) \times \left(\sum_{k=1}^N S_{ik,CMS_RY} / \sum_{k=1}^N H_{ik,CMS_RY} \right)}{\left(\sum_{k=1}^N S_{ik,CMS_BY} / \sum_{k=1}^N H_{ik,CMS_BY} \right)} \times \frac{\left(\sum_{i=1}^{51} \sum_{j=1}^5 S_{ij,CENSUS_BY} / \sum_{i=1}^{51} \sum_{j=1}^5 H_{ij,CENSUS_BY} \right) \times \left(\sum_{i=1}^{51} \sum_{k=1}^N S_{ik,CMS_RY} / \sum_{i=1}^{51} \sum_{k=1}^N H_{ik,CMS_RY} \right)}{\left(\sum_{i=1}^{51} \sum_{k=1}^N S_{ik,CMS_BY} / \sum_{i=1}^{51} \sum_{k=1}^N H_{ik,CMS_BY} \right)}$$

$\{i(\text{State}) = 1, 2, \dots, 51\}$

$\{j(\text{Occupation} - \text{Industry}) = 1, 2, \dots, 5\}$

$\{k(\text{Provider}) = 1, 2, \dots, N\}$

where W_i = Wage Subindex for State i

$S_{ij,CENSUS_BY}$ = Total salary earned in occupation-industry category j (Counselors, Psychologists, Social Workers, Physicians and Surgeons, and Registered Nurses) in State i during the base year (recent decennial census)

$H_{ij,CENSUS_BY}$ = Total hours worked in occupation-industry category j in State i during the base year (recent decennial census)

S_{ik,CMS_BY} = Total wages (except for a few categories as referred to in Appendix A) paid by hospital (provider) k in State i during the base fiscal year (Centers for Medicare and Medicaid Services [CMS])

H_{ik,CMS_BY} = Total hours (except for a few categories as referred to in Appendix A) for which wages were paid by hospital (provider) k in State i during the base fiscal year (CMS)

S_{ik,CMS_RY} = Total wages (except for a few categories as referred to in Appendix A) paid by hospital (provider) k in State i during the most recent fiscal year (CMS)

H_{ik,CMS_RY} = Total hours (except for a few categories as referred to in Appendix A) for which wages were paid by hospital (provider) k in State i during the most recent fiscal year (CMS)

The Wage Subindex (W_i) is a component of the Cost-of-Services Index and is a measurement of the relative labor costs required to provide mental health services in a State (including DC). Despite the complex appearance of Formula B4, the composition of the Wage Subindex is actually straightforward.

The value calculated in the numerator of the formula is an average wage rate for a given State, while the value calculated in the denominator is an average (weighted) wage rate for the United States (exclusive of territories) using the same methodology as employed for calculation of the value in the numerator. The Wage Subindex is, therefore, a ratio equal to an average State wage rate divided by an average national wage rate. It is a dimensionless (i.e., unitless)

measurement of the relative deviation of a State's average wage rate from the nation's average wage rate.

Both the State and national average wage rates consist of two parts: a base wage rate and an update factor. The base wage rate is multiplied by the update factor to yield the most recent average wage rate.

Shown within the first parentheses in the numerator, the State average base wage is determined by dividing the total salaries (earned income) of workers (working in the State, regardless of their State of residence) in five specific occupation-industry categories ($S_{ij,CENSUS_BY}$, State i and occupation-industry category j) by the associated total hours worked ($H_{ij,CENSUS_BY}$). Data used in the calculation of this average base wage rate are derived from the 16 percent sample of the most recent decennial census and provided in the form of special tabulations by the U.S. Census Bureau.

The State update factor, shown as the quotient of two terms (each within parentheses) in the second part of the numerator, is based upon source data from CMS. The denominator of this quotient consists of the State average wage rate for the "base year" (which is the same year as that used for data collection for the most recent decennial census), and is calculated by dividing the total salaries of workers in selected occupation categories in all provider facilities in the State (S_{ik,CMS_BY} , State i and provider k) by the associated total hours worked (H_{ik,CMS_BY}). The numerator of this quotient is similarly calculated from CMS-based source data for the most recent year (S_{ik,CMS_RY} and H_{ik,CMS_RY}).

The denominator of Formula B4 (i.e., the average national wage rate) is calculated in an identical manner to that described above for a State, except that relevant data are compiled within each formula component for all States rather than just for a single State. Shown within the first parentheses in the denominator, a decennial census-based average national wage rate is determined, which is then updated by a CMS-based national update factor in the second portion of the denominator. The current average national wage rate calculated is, therefore, a weighted-average value rather than a simple average of 51 State values. The calculation of the Wage Subindex of the CSI used for the determination of FY 2007-2009 Block Grant allotments is shown in Table E3 of Appendix E. As noted earlier, the same Wage Subindex values are used in the construction of the CSI in the allotment calculations for both Block Grants.

Rental Subindex Formula (R_i)
(B5)

$$R_i = \frac{\sum_{j=1}^N (POP_{ij} \times FMR_{ij})}{\sum_{i=1}^{51} \sum_{j=1}^N (POP_{ij} \times FMR_{ij})} \cdot \frac{\sum_{j=1}^N POP_{ij}}{\sum_{i=1}^{51} \sum_{j=1}^N POP_{ij}}$$

$\{i(\text{State}) = 1, 2, \dots, 51\}$
 $\{j(\text{County / Subcounty}) = 1, 2, \dots, N\}$

where R_i = Rental Subindex for State i

POP_{ij} = Resident population estimate (all ages) for substate area (county or subcounty) j in State i

FMR_{ij} = 40th or 50th percentile of FMR level for a four-bedroom residential unit for substate area j in State i

The Rental Subindex (R_i) is a component of the Cost-of-Services Index and is a measurement of the costs of facility space required to provide mental health services in a State (including DC) relative to the average costs for the nation. The composition of the Rental Subindex is fairly simple.

The value calculated in the numerator of the formula is an average rental rate for a State, while the value calculated in the denominator is an average (weighted) rental rate for the United States (exclusive of territories) using the same methodology as employed for calculation of the value in the numerator. The Rental Subindex is, therefore, a ratio equal to an average State rental rate divided by an average national rental rate. It is a dimensionless (i.e., unitless) measurement of the relative deviation of a State's average rental rate from the nation's average rental rate.

The State average rental rate, shown in the numerator, is a population-weighted average rental rate for the State. The rental data used as proxies for facility space costs (FMR_{ij} , State i and substate area j) are the most current 40th or 50th percentile values for four-bedroom FMRs as determined by and available from the U.S. Department of Housing and Urban Development (HUD). FMRs are defined by HUD as "the amount that would be needed to pay the gross rent (shelter rent plus utilities) of privately owned, decent, and safe rental housing of a modest (non-luxury) nature with suitable amenities" (Department of Housing and Urban Development, 2006). FMR data are reported at the county level for all States except the six New England States, and at the subcounty level (city, town, or township) for the New England States.

The population data used in the determination of the Rental Subindex are the most current substate (county and subcounty) level estimates available from the U.S. Bureau of the Census for resident population (POP_{ij} , State i and substate area j). These are used to weight the FMR data with population for all areas within the State. A population-weighted average FMR for the State is then calculated by dividing the sum of the population-weighted FMRs for all areas in the State by the total population of the State (i.e., the sum of the populations of all the areas within the State).

The denominator of Formula B5 (i.e., the average national population-weighted rental rate) is calculated in an identical manner to that described above for a State, except that data are compiled for all States rather than for a single State. The average national rental rate calculated is, therefore, a weighted-average rather than a simple average of the 51 State values. The calculation of the Rental Subindex of the CSI used for the determination of FY 2007-2009 Block Grant allotments is shown in Appendix Table E4. As noted earlier, the same Rental Subindex values are used in the construction of the CSI in the allotment calculations for both Block Grants. Furthermore, the construction of this subindex is discussed in detail in Chapter 2 and not repeated here.

Fiscal Capacity Index Formula—All but DC (F_i)
(B6)

$$F_{i\{\forall i, i \neq DC\}} = \max_{\{i(State) = 1, 2, \dots, 51\}} \left[0.4, 1 - 0.35 \times \left(\frac{\frac{\overline{TTR}_i}{C_i}}{\frac{P_i / \sum_{i=1}^{51} P_i}{\sum_{i=1}^{51} \frac{\overline{TTR}_i}{C_i}}} \right) \right]$$

where F_i = Fiscal Capacity Index for State i (except for DC)

\overline{TTR}_i = Most recent 3 years' average Total Taxable Resources for State i

C_i = Cost-of-Services Index for State i (Formula B3)

P_i = Weighted Population-at-Risk for State i (Formula B2)

The Fiscal Capacity Index (F_i) is determined annually and represents, or is a proxy for, the relative ability of a State to pay for mental health-related services. It is a factor whose value declines with increasing fiscal capacity (effectively fiscal resources) of a State.

The first step in the determination of the Fiscal Capacity Index for all States (other than DC) is the collection and compilation of Total Taxable Resources (TTR) data for the most recent 3 years for the States (including DC) from the Office of Macroeconomic Policy (OEP), U.S.

Department of the Treasury. Three-year averages of TTR (\overline{TTR}_i) are then calculated for all the States (and DC).

The next step in the calculations is to divide the 3-year average TTR for a State (other than DC) by the Cost-of-Services Index (C_i) for that State, effectively producing a cost-adjusted average TTR for the subject State. This term is shown in the top portion of the numerator appearing on the right-hand side of Formula B6.

The sum of cost-adjusted average TTR for all the States (including DC) is calculated, and then divided into the cost-adjusted average TTR value for the subject State. The sum of the cost-adjusted average TTR for all States is shown in the bottom portion of the numerator (which can also be referred to as the denominator term in the numerator) in the formula. The result of this step is to effectively produce a cost-adjusted, relative, average TTR for the subject State.

The next step is to calculate a term equal to the Population-at-Risk for the subject State (P_i , other than DC) divided by the sum of the weighted Populations-at-Risk for all the States (including DC), and divide this term into the cost-adjusted, relative, average TTR for the subject State. This population-related term is shown in the denominator of the expression on the right-hand side of Formula B6. The result of this step is to effectively produce a cost-adjusted, population-adjusted, relative, average TTR for the subject State (other than DC).

This value is multiplied by 0.35, and then subtracted from 1, to yield the unconstrained Fiscal Capacity Index for a State (other than DC). However, if this unconstrained value is less than 0.4, then the final (constrained) Fiscal Capacity Index for the State (F_i) is set equal to 0.4. Refer to Appendix Tables F3-F5 for an example of the calculation of the Fiscal Capacity Index and its components.

Fiscal Capacity Index Formula for DC (F_{DC})

(B7)

$$F_{DC} = \max \left[0.4, 1 - 0.35 \times \left(\frac{\frac{\overline{TPI}_{DC}}{C_{DC}}}{\frac{P_{DC}}{\sum_{i=1}^{51} P_i}} \right) \right]$$

$\{i(\text{State}) = 1, 2, \dots, 51\}$

where F_{DC} = Fiscal Capacity Index for DC

\overline{TPI}_{DC} = Most recent 3 years' average Total Personal Income for DC

C_{DC} = Cost-of-Services Index for DC (Formula B3)

P_{DC} = Weighted Population-at-Risk for DC (Formula B2)

\overline{TPI}_i = Most recent 3 years' average Total Personal Income for State i

C_i = Cost-of-Services Index for State i (Formula B3)

P_i = Weighted Population-at-Risk for State i (Formula B2)

The Fiscal Capacity Index for DC (F_{DC}) is determined annually and represents, or is a proxy for, the relative ability of DC to pay for mental health-related services. It is a factor very similar in construction and meaning to the Fiscal Capacity Indexes of the States.

The first step in the determination of the Fiscal Capacity Index for DC is the collection and compilation of Total Personal Income (TPI) data for the States and DC for the most recent 3 years from the Bureau of Economic Analysis (BEA), U.S. Department of Commerce. Three-year averages of TPI are then calculated for all the States (\overline{TPI}_i) and DC (\overline{TPI}_{DC}).

The next step in the calculations is to divide the 3-year average TPI for DC by the Cost-of-Services Index for DC (C_{DC}), effectively producing a cost-adjusted, average TPI for DC. This term is shown in the top portion of the numerator appearing on the right-hand side of Formula B7.

The sum of cost-adjusted average TPI for all the States (including DC) is calculated, and then divided into the cost-adjusted average TPI value for DC. The sum of the cost-adjusted average TPI for all States and DC is shown in the bottom portion of the numerator (which can also be referred to as the denominator term in the numerator) in the formula. The result of this step is to effectively produce a cost-adjusted, relative, average TPI for DC.

The next step is to calculate a term equal to the Weighted Population-at-Risk for DC (P_{DC}) divided by the sum of the Weighted Populations-at-Risk (P_i) for all the States and DC, and divide this term into the cost-adjusted, relative, average TPI for DC. This population-related term is shown in the denominator of the expression on the right-hand side of Formula B7. The result of this step is to effectively produce a cost-adjusted, population-adjusted, relative, average TPI for DC.

This value is first multiplied by 0.35, and then subtracted from 1, to yield the unconstrained Fiscal Capacity Index for DC. However, if this unconstrained value is less than 0.4, then the final (constrained) Fiscal Capacity Index for DC (F_{DC}) is set equal to 0.4. Refer to Appendix Tables F3-F5 for an example of the calculation of the Fiscal Capacity Index for DC and its components.

Formula for Determining Below/Equal-to-Statutory-Minimum Allotment (BESMA) States versus Above-Statutory-Minimum Allotment (ASMA) States
(B8)

$$\begin{aligned} & \text{When } A_{i,RFY,Baseline} \leq A_{i,1998} \\ & \qquad A_{i,BESMA} = A_{i,1998} \\ & \text{otherwise } \qquad A_{i,ASMA} = A_{i,RFY,Baseline} \\ & \{i \text{ (State)} = 1, 2, \dots, 51\} \end{aligned}$$

where $A_{i,RFY,Baseline}$ = Baseline allotment for State i for the reference fiscal year

$A_{i,1998}$ = Allotment received by State i in FY 1998

$A_{i,BESMA}$ = Allotment for BESMA State i ($= 1 \dots, N_1$)

$A_{i,ASMA}$ = Allotment for ASMA State i ($= 1 \dots, N_2$)

Refer to Appendix Table F7 for an example of baseline versus 1998 allotment comparisons. In this example, no allotments fell below the corresponding 1998 allotments, and hence, there were no BESMA States, meaning that all States were ASMA States.

Scaled Allotment Formula for ASMA States
(B9)

$$A_{ij,Scaled\ ASMA} = \left(A_{ij,ASMA} \frac{0.95 \times 0.985 \times AP_{RFY} - \sum_{i=1}^{N_1} A_{ij,BESMA}}{\sum_{i=1}^{N_2} A_{ij,ASMA}} \right)$$

$\{i \text{ (BESMA State)} = 1, 2, \dots, N_1\}$
 $\{i \text{ (ASMA State)} = 1, 2, \dots, N_2\}$
 $\{j \text{ (Cycle)} = 1, 2, \dots, m\}$

where $A_{ij,Scaled\ ASMA}$ = Scaled allotment for ASMA State i in Cycle j for the reference fiscal year

$A_{ij,ASMA}$ = Allotment for ASMA State i in Cycle j for the reference fiscal year

$A_{ij,BESMA}$ = Allotment for BESMA State i in Cycle j for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

0.95 = Proportion of AP_{RFY} disbursed to States and territories

0.985 = Proportion of State-Territory allotment disbursed to States

Scaled allotments for ASMA States in Cycle j require comparison with statutory minimums and may require constraining or re-scaling through an iterative process until re-scaled allotments ($A_{ij,Scaled\ ASMA}$) meet the following criteria:

$$A_{ij, Scaled ASMA} > A_{i, 1998}$$

$$\{i (ASMA State) = 1, 2, \dots, N_2\}$$

$$\{j (Cycle) = 1, 2, \dots, m\}$$

In order for the allotments of BESMA States to be increased from their baseline values to statutory minimum values, funding must be redistributed to them from the allotments for ASMA States. This redistribution is effected by the application of a "Scale Factor" to the allotments of ASMA States in one or multiple redistribution cycles, which reduces such allotments by a uniform proportion and allows just enough funding to be transferred to BESMA States so that statutory minimums are achieved.

Formula B9 shows how scaled allotments for ASMA States ($A_{ij, Scaled ASMA}$) are calculated, which is simply the multiplication of the unscaled allotment for that cycle ($A_{ij, ASMA}$) by a Scale Factor for that cycle ("j"). The term on the right-hand side of the quantity within the large parentheses is the Scale Factor, which is a ratio less than unity and consists of a numerator and denominator.

The numerator of the Scale Factor is the total funding available for ASMA States in the redistribution cycle, which is itself the difference of two values. The first term in the numerator is the total funding available in the reference (current) year to all States, which is the total appropriation amount (AP_{RFY}) less 5 percent of the appropriation amount for administration and technical assistance (hence the 0.95 factor) less 1.5 percent of this net amount that is slated for territory allotments (hence the 0.985 factor). The second term in the numerator is the sum of the allotments ($A_{ij, BESMA}$) for BESMA States in the redistribution cycle. The difference of these two terms is thus the total funding available for ASMA States in the redistribution cycle.

The denominator of the Scale Factor is the sum of the allotments for ASMA States in the redistribution cycle *prior to scaling*, and is thus the total funding that the ASMA States in the cycle should receive if they were not being scaled in that cycle. The Scale Factor is thus a ratio equal to the funding that is available for the ASMA States in the cycle divided by the funding that they would otherwise receive in the cycle without further scaling.

The allotments for ASMA States prior to scaling in a given redistribution cycle are either the baseline allotments, if it is the first cycle, or scaled allotments from the prior cycle, if it is the second or later redistribution cycle. After each redistribution cycle, all scaled ASMA's must be compared with statutory minimums and, if any are less than or equal to statutory minimums, then any such allotments are themselves BESMA in subsequent redistribution cycles. As noted earlier, in reference to the example shown in Appendix Table F7, since there were no BESMA States (i.e., all States are ASMA States), ASMA-scaling was not needed.

Final Allotment Formula (States)

(B10)

$$A_{i,Final} = A_{ij=m,BESMA} \text{ for } \{i = 1, 2, \dots, N_1\}$$
$$A_{i,Final} = A_{ij=m,Scaled ASMA} \text{ for } \{i = 1, 2, \dots, N_2\}$$

where $A_{i, Final}$ = Final allotment for State i for the reference fiscal year

$A_{ij=m, BESMA}$ = Allotment for BESMA State i in the last Cycle ($j=m$) for the reference fiscal year

$A_{ij=m, Scaled ASMA}$ = Scaled allotment for ASMA State i in the last Cycle ($j=m$) for the reference fiscal year

The calculations to determine final State allotments ($A_{i, Final}$) may require multiple funding redistribution cycles in order that all States receive at least the statutory minimums. When this condition has been achieved after a sufficient (m) number of cycles, then final allotments are either statutory minimums ($A_{ij=m, BESMA}$) for BESMA States or are scaled allotments ($A_{ij=m, Scaled ASMA}$) for ASMA States. Refer to Appendix Table F7 for an example of the final allotment calculations.

Baseline Formula (Territories)

(B11)

$$A_{i,RFY, Baseline} = \left(0.95 \times 0.015 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^8 P_i} \right)$$
$$\{i(Territory) = 1, 2, \dots, 8\}$$

where $A_{i, RFY, Baseline}$ = Baseline allotment for Territory i for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

P_i = Total civilian population for Territory i (recent census)

0.95 = Proportion of AP_{RFY} disbursed to States and territories

0.015 = Proportion of State-Territory allotment disbursed to territories

The appropriation amount for the program (AP_{RFY}) for a given, or "reference," fiscal year is determined annually by the Congress. Five percent of the appropriated amount is used by SAMHSA to collect data on mental health services and patients and conduct evaluations of programs to prevent and treat mental health problems, while 95 percent of the appropriation is allocated among the States (including DC) and territories (consisting of five current and three former territories) hence the factor "0.95" used in the formula. Of the amount allocated to States and territories, 1.5 percent is distributed to the territories (hence the factor "0.015" used in the formula), which is referred to as the "Territory Subtotal."

The initial or "baseline" allotment for a territory ($A_{i, RFY, Baseline}$) is determined exclusively by the proportion of the civilian population of all territories that resides in the subject territory.

The share that a territory receives of the Territory Subtotal is equal to the ratio formed by the civilian population of the territory (P_i) divided by the sum of the civilian populations of all territories. The baseline allotment for a territory is then determined as the product of this ratio (the territory's share) with the Territory Subtotal (the funding available to all the territories). Refer to Appendix Table F8 for an example of the baseline allotment calculations.

Formula for Determining Below/Equal-to-Statutory-Minimum Allotment (BESMA) Territories versus Above-Statutory-Minimum Allotment (ASMA) Territories (B12)

$$\begin{aligned} & \text{When } A_{i,RFY,Baseline} \leq \$50,000 \quad A_{i,BESMA} = \$50,000 \\ & \text{otherwise} \quad A_{i,ASMA} = A_{i,RFY,Baseline} \\ & \{i \text{ (Territories)} = 1, 2, \dots, 8\} \end{aligned}$$

where $A_{i,RFY,Baseline}$ = Baseline allotment for Territory i for the reference fiscal year

$A_{i,BESMA}$ = Allotment for BESMA Territory i ($= 1 \dots, N_1$)

$A_{i,ASMA}$ = Allotment for ASMA Territory i ($= 1 \dots, N_2$)

Territory allotments determined by the application of Formula B11 result in "baseline" allotment values for the territories ($A_{i,RFY,Baseline}$). After these baseline allotments are determined, they must be compared with the statutory minimum allotment constraint of \$50,000. If any baseline allotments are less than or equal to this statutory minimum, then those are increased in subsequent calculations to the statutory minimum or held constant, respectively. These allotments are referred to as "BESMA" ($A_{i,BESMA}$).

Territories for which baseline allotments are greater than the statutory minimum are referred to as ASMA ($A_{i,ASMA}$) territories, and in subsequent calculations funding from ASMA territories is redistributed to BESMA territories in order to increase the latter from their baseline values to the statutory minimum. Refer to Appendix Table F8 for an example of distinguishing between BESMA and ASMA territories.

Scaled Allotment Formula for ASMA Territories (B13)

$$A_{ij,Scaled\ ASMA} = \left(A_{ij,ASMA} \times \frac{0.95 \times 0.015 \times AP_{RFY} - \sum_{i=1}^{N_1} A_{ij,BESMA}}{\sum_{i=1}^{N_2} A_{ij,ASMA}} \right)$$

$\{i \text{ (BESMA Territory)} = 1, 2, \dots, N_1\}$
 $\{i \text{ (ASMA Territory)} = 1, 2, \dots, N_2\}$
 $\{j \text{ (Cycle)} = 1, 2, \dots, m\}$

where $A_{ij, Scaled ASMA}$ = Scaled allotment for ASMA Territory i in Cycle j for the reference fiscal year

$A_{ij, ASMA}$ = Allotment for ASMA Territory i in Cycle j for the reference fiscal year

$A_{ij, BESMA}$ = Allotment for BESMA Territory i in Cycle j for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

0.95 = Proportion of AP_{RFY} for disbursement to States and territories

0.015 = Proportion of State-Territory allotment for disbursement to territories

Scaled allotments for ASMA Territories in Cycle j require comparison with the statutory minimum and may require constraining or re-scaling through an iterative process until re-scaled allotments ($A_{ij, Scaled ASMA}$) meet the following criterion:

$$\begin{aligned}
 &A_{ij, Scaled ASMA} > \$50,000 \\
 &\{i \text{ (ASMA Territory)} = 1, 2, \dots, N_2\} \\
 &\{j \text{ (Cycle)} = 1, 2, \dots, m\}
 \end{aligned}$$

where $A_{ij, Scaled ASMA}$ = Scaled allotment for ASMA Territory i in Cycle j for the reference fiscal year.

In order for the allotments of BESMA territories to be increased from their baseline values to the statutory minimum value, funding must be redistributed to them from the allotments for ASMA territories. This redistribution is effected by the application of a "Scale Factor" to the allotments of ASMA territories in one or multiple redistribution cycles, which reduces such allotments by a uniform proportion and allows just enough funding to be transferred to BESMA territories so that the statutory minimum is achieved.

Formula B13 shows how scaled allotments for ASMA territories ($A_{ij, Scaled ASMA}$) are calculated, which is simply the multiplication of the unscaled allotment for that cycle ($A_{ij, ASMA}$) by a Scale Factor for that cycle (" j "). The term on the right-hand side of the quantity within the large parentheses is the Scale Factor, which is a ratio less than unity and consists of a numerator and denominator.

The numerator of the Scale Factor is the total funding available for ASMA territories in the redistribution cycle, which is itself the difference of two values. The first term in the numerator is the total funding available in the reference (current) year to all territories, which is the total appropriation amount (AP_{RFY}) less 5 percent of the appropriation amount for administration and technical assistance (hence the 0.95 factor) less 98.5 percent of this net amount that is slated for State allotments (hence the 0.015 factor). The second term in the numerator is the sum of the allotments ($A_{ij, BESMA}$) for BESMA territories in the redistribution cycle. The difference of these two terms is thus the total funding available for ASMA territories in the redistribution cycle.

The denominator of the Scale Factor is the sum of the allotments for ASMA territories in the redistribution cycle *prior to scaling*, and is thus the total funding that the ASMA territories in

the cycle should receive if they were not being scaled in that cycle. The Scale Factor is thus a ratio equal to the funding that is available for the ASMA territories in the cycle divided by the funding that they would otherwise receive in the cycle without further scaling.

The allotments for ASMA territories prior to scaling in a given redistribution cycle are either the baseline allotments, if it is the first cycle, or scaled allotments from the prior cycle, if it is the second or later redistribution cycle. After each redistribution cycle, all scaled ASMA must be compared with the statutory minimum and, if any are less than or equal to the statutory minimum, then any such allotments are themselves BESMA in subsequent redistribution cycles. These calculations are shown in Appendix Table F8.

Final Allotment Formula (Territories)

(B14)

$$A_{i,Final} = A_{ij=m,BESMA} \text{ for } \{i = 1, 2, \dots, N_1\}$$

$$A_{i,Final} = A_{ij=m,Scaled ASMA} \text{ for } \{i = 1, 2, \dots, N_2\}$$

where $A_{i, Final}$ = Final allotment for State i for the reference fiscal year

$A_{ij=m, BESMA}$ = Allotment for BESMA State i in the last Cycle ($j=m$) for the reference fiscal year

$A_{ij=m, Scaled ASMA}$ = Scaled allotment for ASMA State i in the last Cycle ($j=m$) for the reference fiscal year

The calculations to determine final territory allotments ($A_{i,Final}$) may require multiple funding redistribution cycles in order that all territories receive at least the statutory minimum. When this condition has been achieved after a sufficient (m) number of cycles, then final allotments are either the statutory minimum ($A_{ij=m, BESMA}$) for BESMA territories or are scaled allotments ($A_{ij=m, Scaled ASMA}$) for ASMA territories. Refer to Appendix Table F8 for an example of the final allotment calculations.

Table 3.1 Data Elements and Data Sources for Mental Health Block Grant (MH BG) Calculations

No.	Data Elements	Data Sources
(For 50 States and DC)		
1	Population Estimates (Population-at-Risk Calculations)	U.S. Census Bureau
2	Wage Data (Cost-of-Services Index Calculations)	U.S. Census Bureau (2000 Decennial Census—16 percent Sample)

4. Protection and Advocacy for Individuals with Mental Illness Formula Grant (PAIMI FG) Allotment Formulas

The Office of Applied Studies (OAS) of the Substance Abuse and Mental Health Services Administration (SAMHSA) determines annually the allocation of funding to 50 States, the District of Columbia (DC), Puerto Rico (PR), four other territories, and the American Indian Consortium (AIC) for the PAIMI FG in accordance with enabling legislation. The recipients of allotments are referred to as "Domains" in this section. The formulas presented below are mathematical expressions of the rules laid out in the legislation.

As the law requires, 2 percent of the appropriated amount for a given fiscal year is first set aside for SAMHSA to cover the costs for data collection, technical assistance, and program evaluation. The remaining 98 percent is distributed as allotments, with baseline allotments calculated as the sum of two components – 50 percent based on the relative share of the total population and another 50 percent based on the relative share of the total population weighted by per capita income. The baseline allotments are adjusted, if and as necessary, so that statutory minimum allotment constraints are satisfied. This is accomplished via an iterative calculation algorithm which uniformly and proportionately reduces the baseline funding of some Domains and redistributes it to other Domains in order that all minimum allotment constraints are fully satisfied. The PAIMI FG formulas are presented in the following sequence.

Baseline Allotment Formula (50 States, DC, PR, 4 Territories, and American Indian Consortium [AIC])

(C1)

$$= \left\{ \begin{array}{l} \left(0.98 \times 0.50 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^{57} P_i} \right) + \left(0.98 \times 0.50 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^{57} P_i} \right) \\ \times \frac{\left(\sum_{i=1}^{52} (PCI_i \times P_i) \right)}{PCI_i \sum_{i=1}^{52} P_i} \times AF \\ \text{when } i = \text{State, DC or PR} \\ \left(0.98 \times 0.50 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^{57} P_i} \right) + \left(0.98 \times 0.50 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^{57} P_i} \right) \times AF \\ \text{when } i = \text{Territory (except PR) or AIC} \end{array} \right.$$

$$A_{AIC, RFY, Baseline} = 0 \text{ when } AP_{RFY} < \$25,000,000$$

$$\{i(\text{Domain})=1, 2, \dots, 57\}$$

where $A_{i, RFY, Baseline}$ = Baseline allotment for Domain i for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

$A_{AIC, RFY, Baseline}$ = Baseline allotment for American Indian Consortium

P_i = Population estimate (all ages combined) for Domain i

PCI_i = Per Capita Income for Domain i ($i = 1 \dots 52$; PCI data are not available for four territories and AIC)

0.98 = Proportion of AP_{RFY} for disbursement to all Domains

0.50 = Proportion of funds for disbursement based on P_i only or P_i and PCI_i

AF = Adjustment Factor (calculated as follows)

$$AF = \frac{0.98 \times 0.50 \times AP_{RFY}}{\left[\sum_{i=1}^{52} \left(0.98 \times 0.50 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^{57} P_i} \right) \times \frac{\left(\frac{\sum_{i=1}^{52} (PCI_i \times P_i)}{\sum_{i=1}^{52} P_i} \right)}{PCI_i} + \sum_{i=53}^{57} \left(0.98 \times 0.50 \times AP_{RFY} \times \frac{P_i}{\sum_{i=1}^{57} P_i} \right) \right]}$$

i (Domain) = 1, 2, ..., 57)

The appropriation amount for the program (AP_{RFY}) for a given, or "reference," fiscal year is determined annually by the Congress. Two percent of the appropriated amount is used by SAMHSA for administration and technical assistance, while 98 percent of the appropriation is allocated among the States, DC, PR, four other territories, and the AIC (hence the factor "0.98" used in the formula). Refer to Appendix Table G1 as an example of calculations of the amounts available for States, territories/AIC, and SAMHSA set-aside.

The initial or "baseline" allotment for Domains ($A_{i, RFY, Baseline}$) is based upon two components, which have equal weights of 0.50. The first component of the baseline allotment is a population-based distribution of half the available funding for allotments. The amount that is available for this component is equal to half (the factor "0.50") of the appropriation amount (AP_{RFY}) less 2 percent for technical assistance (the factor "0.98"). This amount is then multiplied by the ratio formed by the resident population of Domain "i" (P_i) divided by the sum of the resident populations of all Domains. Refer to Appendix Table G2 for an example of Part 1 baseline allotment calculations.

The second component of the baseline allotment is a population-based distribution of half the available funding for allotments (i.e., that described above, then weighted by the relative PCI, and finally adjusted so that the sum of these "second component" allotments for all Domains is equal to half of the amount available for allotments to all Domains). The population-based term is identical to that described above. The relative PCI is defined as the PCI for the United States divided by the PCI of a given Domain (PCI_i) if the Domain is a State, DC, or PR, while it is set equal to 1 if the Domain is a territory (other than Puerto Rico) or the AIC. The PCI for the United States is calculated in the formula as a population-weighted average using PCI and population source data for all Domains for which PCI is known (i.e., the 50 States, DC, and PR). Refer to Appendix Table G3 for an example of Part 2 unadjusted baseline allotment calculations.

An Adjustment Factor (AF) is used to adjust the population-relative PCI-weighted allotments so that the sum of these allotments for all Domains equals half of the total amount available for allotments to all Domains. The Adjustment Factor is a ratio (which could be greater than, less than, or equal to 1) calculated as the total funding available for allotments to all Domains in this "second component" ($0.98 \times 0.50 \times AP_{RFY}$, [i.e., half the funding for all allotments]) divided by the sum of the allotments for all Domains calculated for this component.

In the denominator of the AF , the calculated allotments for the States, DC, and PR are shown on the left-hand side, and those for the other territories and the AIC are shown on the right-hand side. Refer to Appendix Table G4 for an example of baseline allotments calculations (Parts 1 and 2 combined).

According to the enabling legislation, if the appropriation amount (AP_{RFY}) is less than \$25,000,000, then the AIC would not receive an allotment at all.

Formula for Determining Below/Equal-to-Statutory-Minimum Allotment (BESMA) Domains vs. Above-Statutory-Minimum Allotment (ASMA) Domains
(C2)

$$A_{i,BESMA} = \begin{cases} \frac{\$260,000 \times AP_{RFY}}{AP_{1995}} & \text{when } A_{i,RFY,Baseline} \leq \frac{\$260,000 \times AP_{RFY}}{AP_{1995}} \text{ (for } i = \text{State, DC or PR)} \\ \frac{\$139,300 \times AP_{RFY}}{AP_{1995}} & \text{when } A_{i,RFY,Baseline} \leq \frac{\$139,300 \times AP_{RFY}}{AP_{1995}} \text{ (for } i = \text{Territory or AIC)} \end{cases}$$

$$A_{i,ASMA} = \begin{cases} A_{i,RFY,Baseline} & \text{when } A_{i,RFY,Baseline} > \frac{\$260,000 \times AP_{RFY}}{AP_{1995}} \text{ (for } i = \text{State, DC or PR)} \\ A_{i,RFY,Baseline} & \text{when } A_{i,RFY,Baseline} > \frac{\$139,300 \times AP_{RFY}}{AP_{1995}} \text{ (for } i = \text{Territory or AIC)} \end{cases}$$

$$A_{AIC,BESMA} = A_{AIC,ASMA} = 0 \text{ when } AP_{RFY} < \$25,000,000$$

$$\{i (\text{Domain}) = 1, 2, \dots, 57\}$$

where $A_{i,RFY,Baseline}$ = Baseline allotment for Domain i for the reference fiscal year

$A_{i,BESMA}$ = Allotment for BESMA Domain i ($= 1 \dots, N_1$)

$A_{i,ASMA}$ = Allotment for ASMA Domain i ($= 1 \dots, N_2$)

AP_{RFY} = Appropriation amount for the reference fiscal year

AP_{1995} = Appropriation amount for fiscal year (FY) 1995

$A_{AIC,BESMA}$ or $A_{AIC,ASMA}$ = Allotment for American Indian Consortium

Determination of BESMA and ASMA Domains follows the calculation of the statutory minimum allotments. The statutory minimum for the States, DC, and PR is \$260,000 (the minimum amount that the States, DC, and PR received for FY 1995) multiplied by the ratio equal to the appropriation amount for the reference (current) fiscal year (AP_{RFY}) divided by the

appropriation amount for FY 1995 (AP_{1995}). The statutory minimum for the territories (other than PR) and the AIC is \$139,300 (the minimum amount that these territories and the AIC received for FY 1995) multiplied by the ratio equal to the appropriation amount for the reference (current) fiscal year (AP_{RFY}) divided by the appropriation amount for FY 1995 (AP_{1995}). As an example, the statutory minimum allotments are shown in Appendix Table G4.

If any baseline allotments are less than or equal to the statutory minimums, then those are increased in subsequent calculations to the statutory minimums or held constant, respectively. These allotments are referred to as "BESMA" ($A_{i, BESMA}$). Domains for which baseline allotments are greater than the statutory minimums are referred to as "ASMA" ($A_{i, ASMA}$) Domains, and in subsequent calculations funding from ASMA Domains is redistributed to BESMA Domains in order to increase the latter from their baseline values to the statutory minimums. Refer to Appendix Tables G5 and G6 as an example of determining BESMA and ASMA Domains.

The allotment values for ASMA Domains are set equal to baseline allotments for the next step in the calculations. If the appropriation amount (AP_{RFY}) is less than \$25,000,000, then the AIC does not receive an allotment and is not categorized into BESMA or ASMA Domains.

Scaled Allotment Formula for ASMA Domains
(C3)

$$A_{ij, Scaled ASMA} = \left(A_{ij, ASMA} \times \frac{0.98 \times AP_{RFY} - \sum_{i=1}^{N_1} A_{ij, BESMA}}{\sum_{i=1}^{N_2} A_{ij, ASMA}} \right)$$

$$\{i \text{ (BESMA Domain)} = 1, 2, \dots, N_1\}$$

$$\{i \text{ (ASMA Domain)} = 1, 2, \dots, N_2\}$$

$$\{j \text{ (Cycle)} = 1, 2, \dots, m\}$$

where $A_{ij, Scaled ASMA}$ = Scaled allotment for ASMA Domain i in Cycle j for the reference fiscal year

$A_{ij, ASMA}$ = Allotment for ASMA Domain i in Cycle j for the reference fiscal year

$A_{ij, BESMA}$ = Allotment for BESMA Domain i in Cycle j for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

0.98 = Proportion of AP_{RFY} for disbursement to Domains

Scaled allotments for ASMA Domain i in Cycle j may require re-scaling or constraining through an iterative process until re-scaled allotments ($A_{ij, Scaled ASMA}$) meet the following statutory minimum:

$$A_{ij, Scaled ASMA} > \frac{\$260,000 \times AP_{RFY}}{AP_{1995}} \text{ (for } i = \text{States/DC/PR)}$$

$$\text{or } \frac{\$139,300 \times AP_{RFY}}{AP_{1995}} \text{ (for } i = \text{Territories/AIC)}$$

$$\{i \text{ (ASMA Domain)} = 1, 2, \dots, N_2\}$$

$$\{j \text{ (Cycle)} = 1, 2, \dots, m\}$$

In order for the allotments of BESMA Domains to be increased from their baseline values to statutory minimum values, funding must be redistributed to them from the allotments for ASMA Domains. This redistribution is effected by the application of a Scale Factor (different from the Adjustment Factor described in Formula C1 above) to the allotments of ASMA Domains in one or multiple redistribution cycles, which reduces such allotments by a uniform proportion and allows just enough funding to be transferred to BESMA Domains so that statutory minimums are achieved.

Formula C3 shows how scaled allotments for ASMA Domains ($A_{ij, Scaled ASMA}$) are calculated, which is simply the multiplication of the unscaled allotment for that cycle ($A_{ij, ASMA}$) by a Scale Factor for that cycle (" j "). The term on the right-hand side of the quantity within the large parentheses is the Scale Factor, which is a ratio less than unity and consists of a numerator and denominator.

The numerator of the Scale Factor is the total funding available for ASMA Domains in the redistribution cycle, which is itself the difference of two values. The first term in the numerator is the total funding available in the reference (current) year to all Domains, which is the total appropriation amount (AP_{RFY}) less 2 percent of the appropriation amount for administration and technical assistance (hence the 0.98 factor). The second term in the numerator is the sum of the allotments ($A_{ij, BESMA}$) for BESMA Domains in the redistribution cycle. The difference of these two terms is thus the total funding available for ASMA Domains in the redistribution cycle.

The denominator of the Scale Factor is the sum of the allotments for ASMA Domains in the redistribution cycle *prior to scaling*, and is thus the total funding that the ASMA Domains in the cycle should receive if they were not being scaled in that cycle. The Scale Factor is thus a ratio equal to the funding that is available for the ASMA Domains in the cycle divided by the funding that they would otherwise receive in the cycle without further scaling.

The allotments for ASMA Domains prior to scaling in a given redistribution cycle are either the baseline allotments, if it is the first cycle, or scaled allotments from the prior cycle, if it is the second or later redistribution cycle. After each redistribution cycle, all scaled ASMA must be compared with statutory minimums and, if any are less than or equal to statutory minimums,

then any such allotments are themselves BESMA in subsequent redistribution cycles. As an example, these calculations are shown in Appendix Tables G5 and G6.

Final Allotment Formula

(C4)

$$A_{i,Final} = A_{ij=m, BESMA} \text{ for } \{i = 1, 2, \dots, N_1\}$$

$$A_{i,Final} = A_{ij=m, Scaled ASMA} \text{ for } \{i = 1, 2, \dots, N_2\}$$

where $A_{i, Final}$ = Final allotment for Domain i for the reference fiscal year

$A_{ij=m, BESMA}$ = Statutory minimum allotment for BESMA Domain i in the last Cycle ($j=m$) for the reference fiscal year

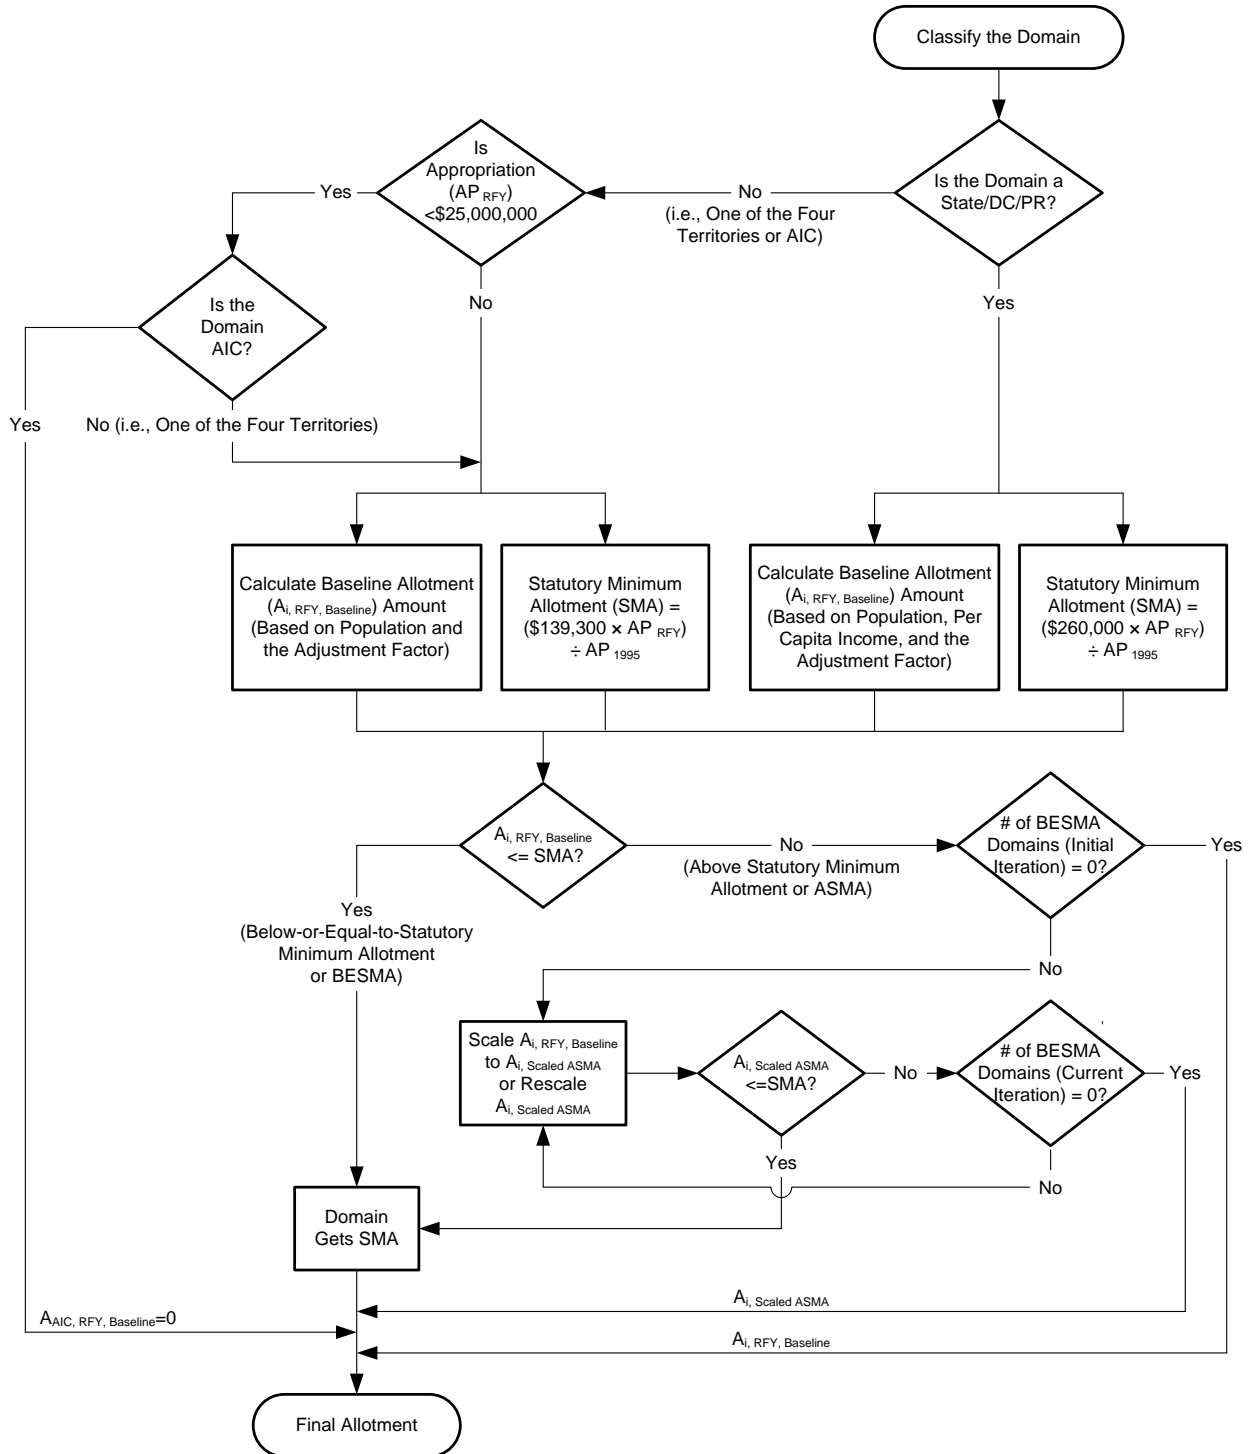

$A_{ij=m, Scaled ASMA}$ = Scaled allotment for ASMA Domain i in the last Cycle ($j=m$) for the reference fiscal year

The calculations to determine final Domain allotments ($A_{i, Final}$) may require multiple funding redistribution cycles in order that all Domains receive at least the statutory minimums. When this condition has been achieved after a sufficient (m) number of cycles, then final allotments are either statutory minimums ($A_{ij=m, BESMA}$) for BESMA Domains or are scaled allotments ($A_{ij=m, Scaled ASMA}$) for ASMA Domains. Refer to Appendix Table G6 for an example of the calculation of final allotments.

Table 4.1 Data Elements and Data Sources for Protection and Advocacy for Individuals with Mental Illness Formula Grant (PAIMI FG) Allotment Calculations

No.	Data Elements	Data Sources

(For 50 States, DC, and PR)		
2	Per Capita Personal Income	U.S. Department of Commerce/Bureau of Economic Analysis

Figure 4.1 PAIMI FG Calculation Flowchart (Fifty States, the District of Columbia, Puerto Rico, Four Territories, and American Indian Consortium [AIC] –57 Domains)

5. Projects for Assistance in Transition from Homelessness Formula Grant (PATH FG) Allotment Formulas

The Office of Applied Studies (OAS) of the Substance Abuse and Mental Health Services Administration (SAMHSA) determines annually the allocation of funding to 50 States, the District of Columbia (DC), Puerto Rico (PR), and four other territories for the PATH FG in accordance with enabling legislation. The recipients of allotments are referred to as "Domains" in this section. The formulas presented below are mathematical expressions of the rules laid out in the legislation.

Four and four-tenths percent of the appropriated amount for a given fiscal year is first set aside for SAMHSA to cover the costs for data collection, technical assistance, and program evaluation. The remaining 95.6 percent of the appropriated amount is distributed as allotments, with baseline allotments for Domains other than the four territories determined by the relative share of the population of urbanized areas. The baseline allotments are adjusted, if and as necessary, so that statutory minimum allotment constraints are satisfied. This is accomplished via an iterative calculation algorithm which uniformly and proportionately reduces the baseline funding of some Domains and redistributes it to other Domains in order that all minimum allotment constraints are fully satisfied. The PATH FG formulas are presented in the following sequence.

Baseline Allotment Formula (50 States, DC, PR, and 4 Other Territories)

(D1)

$$A_{i,RFY, Baseline} = \begin{cases} 0.956 \times AP_{RFY} \times \frac{UP_i}{\sum_{i=1}^{52} UP_i} & \text{when } i \text{ is a State/DC/PR} \\ 0 & \text{when } i \text{ is a territory (other than PR)} \end{cases}$$

$\{i(\text{Domain}) = 1, 2, \dots, 56\}$

where $A_{i,RFY, Baseline}$ = Baseline allotment for Domain i for the reference fiscal year

AP_{RFY} = Total appropriation amount for the reference fiscal year

UP_i = Population living in urbanized areas in Domain i

0.956 = Proportion of AP_{RFY} for disbursement to all Domains

The appropriation amount for the program (AP_{RFY}) for a given, or "reference," fiscal year is determined annually by the Congress. Four and four-tenths percent of the appropriated amount is used by the Department of Health and Human Services (DHHS)/Substance Abuse and Mental Health Services Administration (SAMHSA) for administration and technical assistance, while 95.6 percent of the appropriation is allocated among 56 Domains (hence the factor "0.956" used

in the formula). Refer to Appendix Table H1 as an example of calculations of the amounts available for States, territories, and SAMHSA set-aside.

The initial or "baseline" allotments ($A_{i,RFY, Baseline}$) for the States, DC, and PR are based upon the proportion of the total population of urbanized areas of all Domains that resides in a given Domain. That is, the share of the total amount available for allotments (95.6 percent of AP_{RFY}) is calculated as the population of urbanized areas of the State, DC or PR (UP_i) divided by the sum of the populations of urbanized areas in all the States, DC, and PR. Refer to Appendix Table H2 for an example of baseline allotment calculations.

The baseline allotments for territories (other than PR) are set equal to zero in this step. Although the law directs that the populations of urbanized areas of the four territories are to be considered, such information is not available and is, therefore, not used in the determination of allotments.

In the event that the appropriation amount for the reference fiscal year (AP_{RFY}) is less than \$15,800,000 (i.e., the minimum amount required to provide statutory minimum allotments to all Domains), then SAMHSA does not calculate allotments. Instead, the Secretary of DHHS makes discretionary allotments to some, but not necessarily all, Domains.

Formula for Determining Below/Equal-to-Statutory-Minimum Allotment (BESMA) Domains vs. Above-Statutory-Minimum Allotment (ASMA) Domains

$$\begin{aligned} & \text{When } A_{i,RFY, Baseline} \leq \$300,000 \text{ (State / DC / PR) or } \leq \$50,000 \text{ (Territory)} \\ & \qquad A_{i,BESMA} = \$300,000 \text{ or } \$50,000 \\ & \text{otherwise} \qquad A_{i,ASMA} = A_{i,RFY, Baseline} \\ & \{i \text{ (Domain)} = 1, 2, \dots, 56\} \end{aligned}$$

where $A_{i,RFY, Baseline}$ = Baseline allotment for Domain i for the reference fiscal year

$A_{i,BESMA}$ = Allotment for BESMA Domain i ($= 1 \dots, N_1$)

$A_{i,ASMA}$ = Allotment for ASMA Domain i ($= 1 \dots, N_2$)

The statutory minimum allotment for the States, DC, and PR is \$300,000, while the statutory minimum for the territories (other than PR) is \$50,000. If any baseline allotments are less than or equal to the statutory minimums, then those are increased in subsequent calculations to the statutory minimums or held constant, respectively; these allotments are referred to as "BESMA" ($A_{i,BESMA}$). Baseline allotments that are greater than the statutory minimums are referred to as "ASMA" ($A_{i,ASMA}$), and in subsequent calculations funding from Domains with ASMA allotments is redistributed to Domains with BESMA allotments in order to increase the latter from their baseline values to the statutory minimums. As an example, categorization of BESMA and ASMA Domains is shown in Appendix Tables H3 and H4.

Scaled Allotment Formula for ASMA Domains
(D2)

$$A_{ij, Scaled ASMA} = \left(A_{ij, ASMA} \times \frac{0.956 \times AP_{RFY} - \sum_{i=1}^{N_1} A_{ij, BESMA}}{\sum_{i=1}^{N_2} A_{ij, ASMA}} \right)$$

$\{i (BESMA \text{ Domain}) = 1, 2, \dots, N_1\}$
 $\{i (ASMA \text{ Domain}) = 1, 2, \dots, N_2\}$
 $\{j (Cycle) = 1, 2, \dots, m\}$

where $A_{ij, Scaled ASMA}$ = Scaled allotment for ASMA Domain i in Cycle j for the reference fiscal year

$A_{ij, ASMA}$ = Allotment for ASMA Domain i in Cycle j for the reference fiscal year

$A_{ij, BESMA}$ = Allotment for BESMA Domain i in Cycle j for the reference fiscal year

AP_{RFY} = Appropriation amount for the reference fiscal year

0.956 = Proportion of AP_{RFY} disbursed to 50 States, DC, PR, and 4 territories

Scaled allotments for ASMA Domains in Cycle j require comparison with statutory minimums and may require constraining or re-scaling through an iterative process until re-scaled allotments ($A_{ij, Scaled ASMA}$) meet the following criteria:

$$A_{ij, Scaled ASMA} > \$300,000 \text{ (for States / DC / PR) or } \$50,000 \text{ (Territories)}$$

$\{i (ASMA \text{ Domain}) = 1, 2, \dots, N_2\}$
 $\{j (Cycle) = 1, 2, \dots, m\}$

In order for the allotments of BESMA Domains to be increased from their baseline values to statutory minimum values, funding must be redistributed to them from the allotments for ASMA Domains. This redistribution is effected by the application of a Scale Factor to the allotments of ASMA Domains in one or multiple redistribution cycles, which reduces such allotments by a uniform proportion and allows just enough funding to be transferred to BESMA Domains so that statutory minimums are achieved.

Formula D3 shows how scaled allotments for ASMA Domains ($A_{ij, Scaled ASMA}$) are calculated, which is simply the multiplication of the unscaled allotment for that cycle ($A_{ij, ASMA}$) by a Scale Factor for that cycle ("j"). The term on the right-hand side of the quantity within the large parentheses is the Scale Factor, which is a ratio less than unity and consists of a numerator and denominator.

The numerator of the Scale Factor is the total funding available for ASMA Domains in the redistribution cycle, which is itself the difference of two values. The first term in the numerator is the total funding available in the reference (current) year to all Domains, which is

the total appropriation amount (AP_{RFY}) less 4.4 percent of the appropriation amount for administration and technical assistance (hence the 0.956 factor). The second term in the numerator is the sum of the allotments ($A_{ij, BESMA}$) for BESMA Domains in the redistribution cycle. The difference of these two terms is thus the total funding available for ASMA Domains in the redistribution cycle.

The denominator of the Scale Factor is the sum of the allotments for ASMA Domains in the redistribution cycle *prior to scaling*, and is thus the total funding that the ASMA Domains in the cycle should receive if they were not being scaled in that cycle. The Scale Factor is thus a ratio equal to the funding that is available for the ASMA Domains in the cycle divided by the funding that they would otherwise receive in the cycle without further scaling.

The allotments for ASMA Domains prior to scaling in a given redistribution cycle are either the baseline allotments, if it is the first cycle, or scaled allotments from the prior cycle, if it is the second or later redistribution cycle. After each redistribution cycle, all scaled ASMA must be compared with statutory minimums and, if any are less than or equal to statutory minimums, then any such allotments are themselves BESMA in subsequent redistribution cycles. As an example, these calculations are shown in Appendix Tables H3 and H4.

Final Allotment Formula

(D3)

$$A_{i, Final} = A_{ij=m, BESMA} \text{ for } \{i = 1, 2, \dots, N_1\}$$

$$A_{i, Final} = A_{ij=m, Scaled ASMA} \text{ for } \{i = 1, 2, \dots, N_2\}$$

where $A_{i, Final}$ = Final allotment for Domain i for the reference fiscal year

$A_{ij=m, BESMA}$ = Allotment for BESMA Domain i in the last Cycle ($j=m$) for the reference fiscal year

$A_{ij=m, Scaled ASMA}$ = Scaled allotment for ASMA Domain i in the last Cycle ($j=m$) for the reference fiscal year

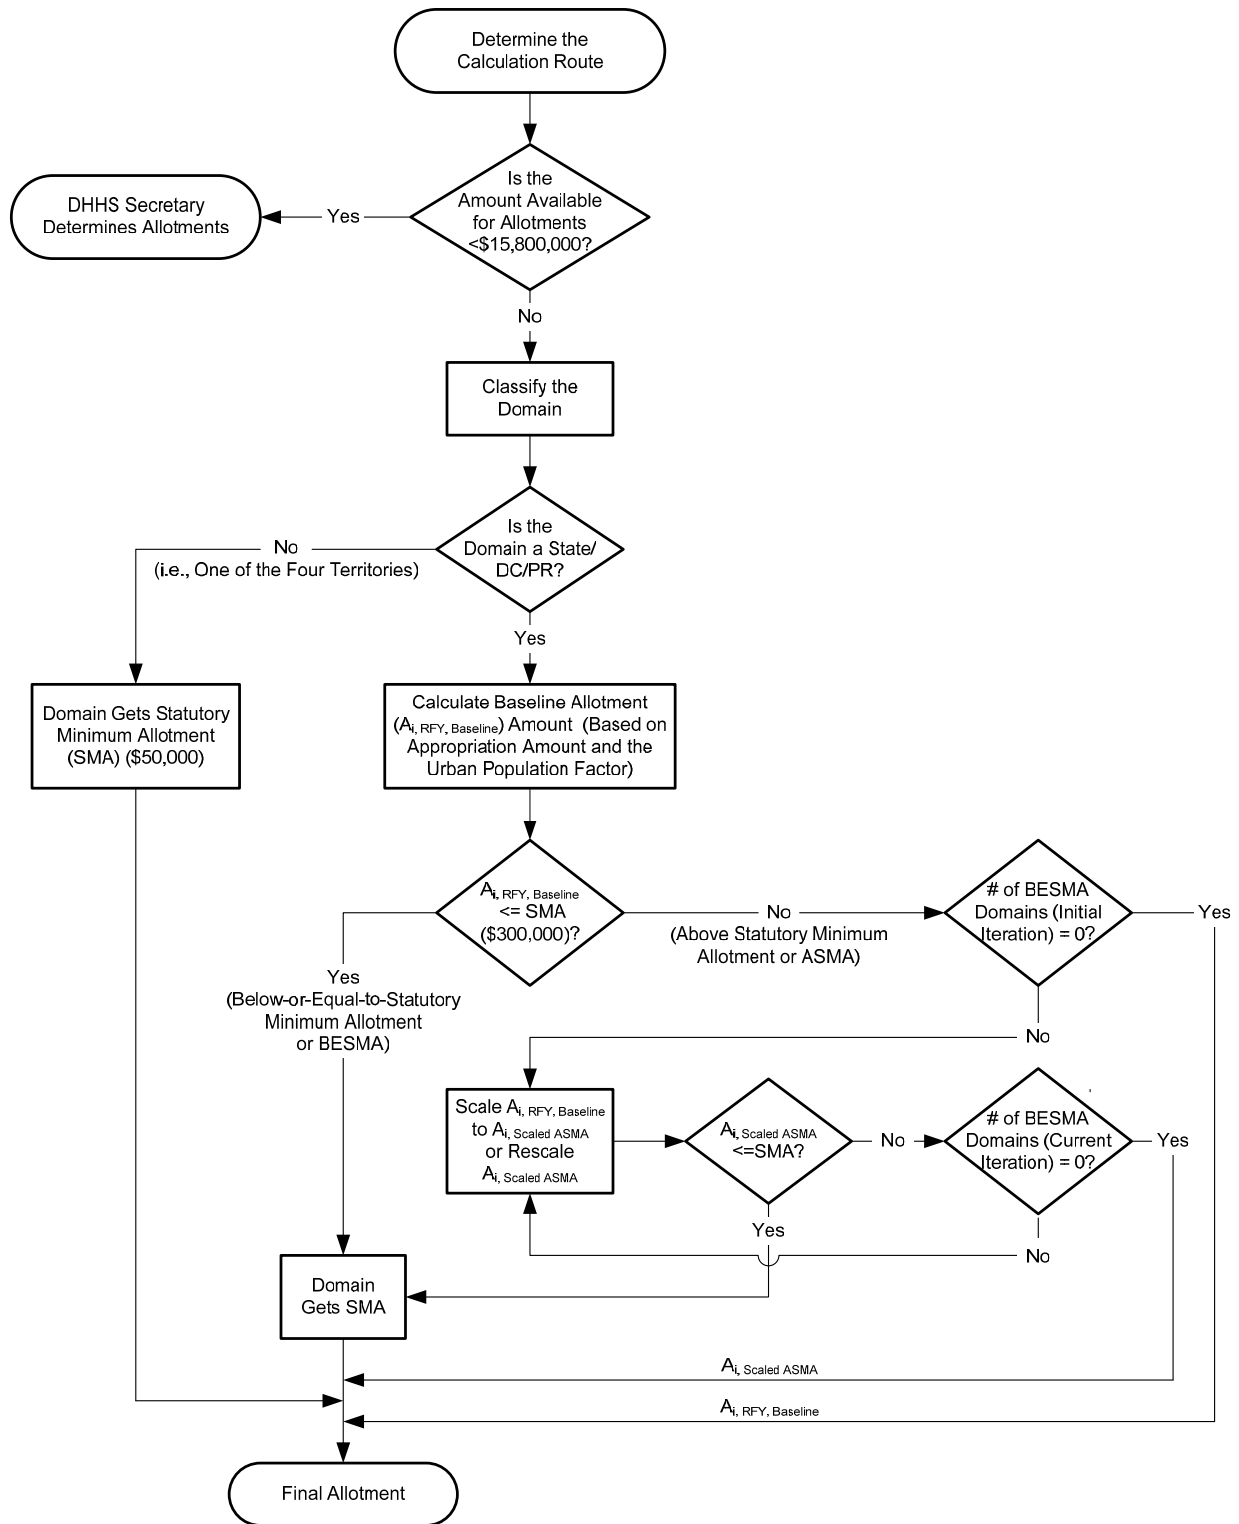

The calculations to determine final Domain allotments ($A_{i, Final}$) may require multiple funding redistribution cycles in order that all Domains receive at least the statutory minimums. When this condition has been achieved after a sufficient (m) number of cycles, then final allotments are either statutory minimums ($A_{ij=m, BESMA}$) for BESMA Domains or are scaled allotments ($A_{ij=m, Scaled ASMA}$) for ASMA Domains.

Because final allotments are rounded to the nearest thousand dollars, round-off error typically results (i.e., the sum of all final allotments is usually either slightly greater or less than the total amount available for allotments). This round-off error is either subtracted from or added to the SAMHSA set-aside, as appropriate. Refer to Appendix Table H4 for an example of final allotment calculations.

Figure 5.1 PATH FG Calculation Flowchart (Fifty States, the District of Columbia, Puerto Rico, and Four Territories – 56 Domains)

6. Types of Calculations and Quality Control

In the previous chapters, we have presented and discussed in great detail the formulas and calculation procedures that are currently used in the determination of allotments for the Substance Abuse Prevention and Treatment Block Grant (SAPT BG), the Mental Health Services Block Grant (MH BG), the Protection and Advocacy for Individuals with Mental Illness Formula Grant (PAIMI FG) and the Projects for Assistance in Transition from Homeless Formula Grant (PATH FG). In this chapter, we describe the schedule of calculations and the quality control procedures.

Types of Calculations

During a given fiscal year, at least two types of calculations are performed for each of the four grants. The first type of calculations is to determine the final allotments for the current fiscal year, based on the final appropriation determined by Congress. The second type of calculations is part of the Presidential/Congressional budget submissions for the next fiscal year.

For example, during fiscal year (FY) 2006, the two types were FY 2006 final appropriation-based allotment calculations and Presidential/Congressional budget-based allotment calculations for FY 2007. As another example, during FY 2007 the two types were FY 2007 final appropriation-based allotment calculations and Presidential/Congressional budget-based allotment calculations for FY 2008.

The source data that are the most current as of the first day of the prior fiscal year are used in the calculations of allotments for a given fiscal year. In the context of the first example, it was during FY 2005 that allotments for FY 2006, as part of the Congressional budget submission, were first calculated. Thus the "cutoff date" for source data used for FY 2006 allotment calculations was October 1, 2004 (i.e., the first day of FY 2005). In the context of the second example, it was during FY 2006 that allotments for FY 2007 were first calculated. Thus the "cutoff date" for source data used for FY 2007 allotment calculations was October 1, 2005 (i.e., the first day of FY 2006).

The examples of the two types of calculations performed for FYs 2006 and 2007 are further described below:

Fiscal Year During Which Calculations Were Performed	Fiscal Year <i>for</i> Which Final Appropriation- Based Calculations Were Performed	Source Data Cutoff Date	Fiscal Year <i>for</i> Which Presidential/Congressional Budget-Based Calculations Were Performed	Source Data Cutoff Date
FY 2006	FY 2006	Oct. 1, 2004	FY 2007	Oct. 1, 2005
FY 2007	FY 2007	Oct. 1, 2005	FY 2008	Oct. 1, 2006

Because the P factor for the SAPT BG, the MH BG, and the PAIMI FG gets updated each year, the next-fiscal-year budget-based allotment may be different from the final-appropriation-based allotment. However, for the PATH FG, the P factor (population of urbanized areas from the decennial census) remains the same for the current and next fiscal years (unless new decennial census data are available the next year), therefore the Domain allotments also remain the same, if the appropriation amount is unchanged.

Quality Control

Lotus spreadsheets have long been used by the contractor and the OAS staff to perform data aggregation and allotment calculations. Results have always been compared for verification purposes before they are delivered to the Substance Abuse and Mental Health Services Administration (SAMHSA) Budget Office. Recently the quality control procedures have been further strengthened.

- Beginning in FY 2006 SAMHSA/OAS first developed, then tested, and has since deployed SAS PROC SQL/PROC REPORT-based applications to independently perform core calculations for the SAPT BG, MH BG, PAIMI FG, and PATH FG programs.
- SAMHSA/OAS also developed a separate set of SAS applications to independently perform the data-aggregation at the Domain-level before they are fed into the core SAS applications as referred to above.
- In April 2006, SAMHSA/OAS also initiated the development of a comprehensive guide for the entire calculation process for the block and formula grants.
- At a meeting at SAMHSA/OAS on May 18, 2006, the A-123 Review Group endorsed the idea of verifying the allotment calculations using SAS-based applications.

- At the same meeting, the Group also recognized the importance of documenting the calculation processes, which SAMHSA/OAS had already started.
- During a follow-up meeting in late 2006, the A-123 Review Group recommended that the source data that are acquired for use in the calculations be stored centrally, and that the initial aggregated results from these data be compared and verified before they are used in SAS or Lotus-based allotment calculations. Accordingly, SAMHSA/OAS has started the process of storing the data centrally and comparing and verifying aggregated source data prior to using the same in allotment calculations.
- The final allotments calculated from the Lotus and SAS-based models match with differences typically in the tens-of-dollars place for some Domains. It is important to note that the spreadsheet results cannot be exactly reproduced by SAS due to numeric representation error (SAS, no date). Because SAS can only represent integer numbers up to a certain magnitude exactly and store the numeric variables as floating point binary numbers, the SAS operations may have reduced the number of significant digits in the numeric values of certain variables in the calculations. Ignoring these minor differences, the allotments as determined from the Lotus spreadsheet-based calculations are considered final.

Appendix A: Referenced Text—Substance Abuse Prevention and Treatment Block Grant (SAPT BG) Allotment Calculations

In reference to the formulas described in the main text, presented here are relevant legislative excerpts (in *italics*) obtained from the website <http://uscode.house.gov>, and materials from other relevant sources. This appendix is intended to help readers understand the basis of the SAPT BG formulas.

Formula A1: Baseline Allotment Formula

The following portion of the law applies to the determination of SAPT BG baseline allotments.

42 USC Sec. 300x-33

"(a) States

(1) In general

Subject to subsection (b) of this section, the Secretary shall determine the amount of the allotment required in section 300x-21 of this title for a State for a fiscal year as follows:

- (A) The formula established in paragraph (1) of section 300x-7(a) of this title shall apply to this subsection to the same extent and in the same manner as the formula applies for purposes of section 300x-7(a) of this title, except that, in the application of such formula for purposes of this subsection, the modifications described in subparagraph (B) shall apply.*
- (B) For purposes of subparagraph (A), the modifications described in this subparagraph are as follows:*
 - (i) The amount specified in paragraph (2)(A) of section 300x-7(a) of this title is deemed to be the amount appropriated under section 300x-35(a) of this title for allotments under section 300x-21 of this title for the fiscal year involved.*
 - (ii) The term "P" is deemed to have the meaning given in paragraph (2) of this subsection. Section 300x-7(a) (5) (B) of this title applies to the data used in determining such term for the States.*
 - (iii) The factor determined under paragraph (8) of section 300x-7(a) of this title is deemed to have the purpose of reflecting the differences that exist between the State involved and other States in the costs of providing authorized services...*

Formula A1: Set-Aside for Substance Abuse and Mental Health Services Administration (SAMHSA) Technical Assistance

The following portion of the law specifies the amount of funding available to SAMHSA for the provision of technical assistance.

42 USC Sec. 300x-35

"Funding...

...(b) Allocations for technical assistance, national data base, data collection, and program evaluations (1) In general (A) For the purpose of carrying out section 300x-58(a) of this title with respect to substance abuse, section 290bb-21(d) of this title, and the purposes specified in subparagraphs (B) and (C), the Secretary shall obligate 5 percent of the amounts appropriated under subsection (a) of this section each fiscal year... "

Formula A1: Baseline Allotment Formula for States and the District of Columbia (DC)

The following portion of the law specifies the fundamental formula to be used for the determination of baseline allotments (i.e., prior to the application of statutory minimum constraints) for the States and DC.

42 USC Sec. 300x-7

"(a) States

- (1) Determination under formula Subject to subsection (b) of this section, the Secretary shall determine the amount of the allotment required in section 300x of this title for a State for a fiscal year in accordance with the following formula: $A (X / U)$*
- (2) Determination of term "A". For purposes of paragraph (1), the term "A" means the difference between - (A) the amount appropriated under section 300x-9(a) of this title for allotments under section 300x of this title for the fiscal year involved; and (B) an amount equal to 1.5 percent of the amount referred to in subparagraph (A).*
- (3) Determination of term "U". For purposes of paragraph (1), the term "U" means the sum of the respective terms "X" determined for the States under paragraph (4).*
- (4) Determination of term "X". For purposes of paragraph (1), the term "X" means the product of - (A) an amount equal to the product of - (i) the term "P", as determined for the State involved under paragraph (5); and (ii) the factor determined under paragraph (8) for the State; and (B) the greater of - (i) 0.4; and (ii) an amount equal to an amount determined for the State in accordance with the following formula: $1 - .35(R\% / P\%)...$*

Formula A2: Determination of Population-at-Risk Index (P)

The following portion of the law specifies the composition of the Population-at-Risk Index for the States and DC.

42 USC Sec. 300x-33

"(a) States...

...(2) Determination of term "P" For purposes of this subsection, the term "P" means the percentage that is the arithmetic mean of the percentage determined under subparagraph (A) and the percentage determined under subparagraph (B), as follows:

(A) The percentage constituted by the ratio of - (i) an amount equal to the sum of the total number of individuals who reside in the State involved and are between 18 and 24 years of age (inclusive) and the number of individuals in the State who reside in urbanized areas of the State and are between such years of age; to (ii) an amount equal to the total of the respective sums determined for the States under clause (i).

(B) The percentage constituted by the ratio of - (i) the total number of individuals in the State who are between 25 and 64 years of age (inclusive); to (ii) an amount equal to the sum of the respective amounts determined for the States under clause (i)..."

Population estimates by age for urbanized areas are normally not available from the U.S. Census Bureau. Therefore, SAMHSA estimates these values using data from the most recent decennial census and the most current population estimates for the 18-24 age group, as shown in Formula A2. Below is the description of this methodology as published in the June 17, 1996, *Federal Register*, Page 30632.

"D. Population in Urbanized Areas for Substance Abuse Block Grant

The formula for the SAPT block grant adjusts for the population at risk for substance abuse using the State population between 18-24 years of age living in urbanized areas and the total U.S. population between 18-24 years living in urbanized areas. The U.S. Census Bureau does not make inter-censal estimates of the population living in urbanized areas. Therefore, the estimates of this population group are derived from the 1990 census."

Formula A2: Data on Population

The following portion of the law specifies the source data to be used in the determination of the Population-at-Risk Index.

42 USC Sec. 300x-7

"(a) States...

...(5) Determination of term "P"...

...(B) With respect to data on population that is necessary for purposes of making a determination under subparagraph (A), the Secretary shall use the most recent data that is available from the Secretary of Commerce pursuant to the decennial census and pursuant to reasonable estimates by such Secretary of changes occurring in the data in the ensuing period..."

Formula A3: Refinements to Methodology of Cost-of-Services Index Construction

The following portion of the law specifies the methodology to be used for calculation of the Cost-of-Services Index (by reference to an external document), upper and lower bounds for the index, and the frequency with which the index must be calculated. It also empowers the Secretary of DHHS to make refinements in the methodology used for calculation of the index as necessary.

42 USC Sec. 300x-7

"(a) States...

...(8) *Determination of certain factor*

- (A) *The factor determined under this paragraph for the State involved is a factor whose purpose is to adjust the amount determined under clause (i) of paragraph (4)(A), and the amounts determined under each of subparagraphs (B)(i) and (D) (ii) (I) of paragraph (6), to reflect the differences that exist between the State and other States in the costs of providing comprehensive community mental health services to adults with a serious mental illness and to children with a serious emotional disturbance.*
- (B) *Subject to subparagraph (C), the factor determined under this paragraph and in effect for the fiscal year involved shall be determined according to the methodology described in the report entitled "Adjusting the Alcohol, Drug Abuse and Mental Health Services Block Grant Allocations for Poverty Populations and Cost-of-Service", dated March 30, 1990, and prepared by Health Economics Research, a corporation, pursuant to a contract with the National Institute on Drug Abuse.*
- (C) *The factor determined under this paragraph for the State involved may not for any fiscal year be greater than 1.1 or less than 0.9.*
- (D) (i) *Not later than October 1, 1992, the Secretary, after consultation with the Comptroller General, shall in accordance with this section make a determination for each State of the factor that is to be in effect for the State under this paragraph. The factor so determined shall remain in effect through fiscal year 1994, and shall be recalculated every third fiscal year thereafter. (ii) After consultation with the Comptroller General, the Secretary shall, through publication in the Federal Register, periodically make such refinements in the methodology referred to in subparagraph (B) as are consistent with the purpose described in subparagraph (A)... "*

Although Paragraph A above refers to mental health services, etc., 42 U.S. Code (USC) Sec. 300x-33 (a)(1)(B)(iii) states that it refers to substance abuse prevention and treatment (SAPT) services for the purposes of determining SAPT BG allotments.

The methodology for calculation of the Cost-of-Services Index is specified on Pages 17 and 18, Section 5.2, "Adjusting the Alcohol, Drug Abuse and Mental Health Services Block Grant Allocations for Poverty Populations and Cost-of-Service," dated March 30, 1990, by

Health Economics Research, Inc." The overall cost index is defined as $.10 + .75 X$ (wage index) $+ .15 X$ (rental index)."

The price proxy for labor is the median hourly earnings of all non-manufacturing workers from the 1980 Census of Population and Housing. The price proxy for building rental is the FMR for a four-bedroom unit established by the Department of Housing and Urban Development (HUD). The price proxy for supplies, drugs, and miscellaneous is assumed to be bought in a national market, with no geographic variations.

Formula A4: Conclusions of Expert Panel on Wage Subindex Calculations

In accordance with the law, SAMHSA refined the methodology by which the Wage Subindex of the Cost-of-Services Index is calculated. A panel of experts met on March 12, 1997, and developed the revised methodology for determination of the Wage Subindex, which has been in effect and employed by SAMHSA since fiscal year (FY) 1998.

The conclusions of the expert panel are listed below (Reference Page 11 of the document "Report of the Meeting of Experts to Review the Wage Proxy in the SAMHSA Block Grant Formula, March 1997").

"...

- SAMHSA should not use manufacturing wage rates as the proxy for the cost of labor in the Cost-of-Service Index in calculating the allotments under the Block Grant for Community Mental Health Services and the Block Grant for Prevention and Treatment of Substance Abuse.
- SAMHSA should use nonmanufacturing wage information collected in the Decennial Census specific to the industries and occupations known to be involved in providing mental health and substance abuse services as the proxy for the cost of labor in the Cost-of-Service Index.
- SAMHSA should use the HCFA Hospital Wage Rate Index to adjust the wage rate information from the decennial census to take into account changes in the relative wage rates among the states during the years between the surveys..."

Based upon the recommendations of the panel of experts, SAMHSA revised the methodology by which the Cost-of-Services Wage Subindex is calculated beginning in FY 1998. This methodology was documented in June 1997 in a SAMHSA internal memorandum.

"Index Base

The base is the 1990 decennial census mean wage for the following occupational categories:

physician (occupation code 084) components are from industry 812 (offices and clinics of doctors);

registered nurse (occupation code 095) components are from industry 812-830 plus 831 (812 – offices and clinics of doctors – through 830 – offices and clinics of other health practitioners; 831 – hospitals);

counselor (occupation code 163) components are for all industry codes, all education levels;

psychologist (occupation codes 166-173) components are for all industry codes, all education levels;

social worker (occupation code 174) components are for all industry codes, all education levels.

The mean wage is the total salary divided by the total hours worked; it is weighted by total annual work hours for the occupation categories. The U.S. Census Bureau produced a specially-extracted data file from its 16 percent sample of detailed data. Health Economics Research, Waltham, MA, produced the mean wage for each of the 50 States and DC using the census data file.

Index Update

The update is the percent change in the mean hourly hospital wage. The Health Care Financing Administration (HCFA) is the source of wage data for each hospital. The hospital average hourly wages are derived by calculating the sum of total salaries plus fringe benefits divided by total hours worked. Hospital workers in skilled nursing facilities, home health components of the hospital, and other parts of the hospital not reimbursed under HCFA Medicare Prospective Payment System (PPS) are excluded. Hospital workers under contract are included. The percent change for FY 1998 is calculated from the hourly wage applied to FY 1997 (based on FY 1993 data) and the hourly wage applied to FY 1993 (based on FY 1990 data).

Index Adjustment

The proposed wage index for FY 1998 (or any year) is calculated in two steps. First, the base wage is multiplied by the update for each State and DC to give an updated hourly wage. Second, the State updated hourly wage is divided into the national updated hourly wage for the wage index for the State. The wage index is then included in the cost-of-service index."

Formula A4: Calculation of Census-Based Mean Wage Rates

Both occupation and industry codes used for the 2000 Decennial Census were different from those used for the 1990 Decennial Census (cited in Appendix A4-B). The specificity of information required necessitated a query using a microdata sample. Public access to both a 1-Percent and 5-Percent Public Use Microdata Sample (PUMS) file was available. However, SAMHSA decided to take advantage of the full 16-Percent sample from the 2000 Decennial Census to which only the U.S. Census Bureau has access.

The following specifications were enumerated by SAMHSA for the special extract:

1. The sample used was the civilian labor force from the 2000 Decennial Census 16-Percent sample of U.S. households. Records with the Census variable MILITARY=1 ("now on active duty") were excluded. The analysis was restricted to individuals: (1) aged over 16; (2) worked (full-time or some) within the past 5 years (since 1994 for employment status as of 1999), and (3) were engaged in the specific industry-occupation categories.
2. Variables included total wage/salary income and total hours worked in each of the occupation-industry classes specified in (3). The "total wage/salary income" variable was the total of the Census Person variable INCWS, "Wage/Salary Income in 1999." The "total hours worked" variable was the total hours worked during 1999, or the sum of the products of the Census Person variables WEEKS ("Weeks Worked in 1999") times HOURS ("Hours per Week in 1999").
3. Occupation-Industry classes included the following:
 - (1) "Counselors" - 2000 Census Occupation Code OCCCEN=200, employed in all industries
 - (2) "Psychologists" - 2000 Census Occupation Code OCCCEN=182, employed in all industries
 - (3) "Social Workers" - 2000 Census Occupation Code OCCCEN=201, employed in all industries
 - (4) "Physicians and Surgeons" - 2000 Census Occupation Code OCCCEN=306, employed in industries INDCEN=797 ("Offices of Physicians") or INDCEN=809 ("Outpatient Care Centers")
 - (5) "Registered Nurses" - 2000 Census Occupation Code OCCCEN=313, employed in industries INDCEN=797 ("Offices of Physicians") or INDCEN=809 ("Outpatient Care Centers") or INDCEN=808 ("Offices of Other Health Practitioners") or INDCEN=819 ("Hospitals").

Data were tabulated by the States wherein workers were employed, not where they resided. SAMHSA did not require data for work performed in U.S. territories, nor overseas by U.S. citizens. More specifically, data were tabulated using the Census Person variable POWST ("Place of Work State or Foreign Country Code") for FIPS codes=001-056 (i.e., for the 50 States and DC only). The goal was to produce a weighted mean hourly wage across the relevant occupations and industries by State.

Formula A4: HCFA/CMS-Based Wage Rates

HCFA (now CMS) provided direction to SAMHSA for the compilation of hospital wage data used to update the wage bases of the Cost-of-Services Wage Subindex (Reference email of April 12, 1999, from Valerie Miller of HCFA to Albert Woodward of SAMHSA). This direction was as follows (the years refer to the years in which the source data were collected by

HCFA/CMS, and the variable names are those used by HCFA/CMS in the hospital wage data file):

"Subtotal Salaries

1993: L03

1996: IIWG1 – (IIWG3 + IIWG5 + IIWG7 + IIWG8 + IIWG8_01)

Subtotal Hours

1993: L11

1996: IIHR1 – (IIHR3 + IIHR5 + IIHR7 + IIHR8 + IIHR8_01)

The variables cited above have the following definitions:

IIWG1/IIHR1 – Salaries/hours for all labor categories
IIWG3/IIHR3 – Salaries/hours for non-physician anesthetists
IIWG5/IIHR5 – Salaries/hours for physician Part B
IIWG7/IIHR7 – Salaries/hours for home office personnel
IIWG8/IIHR8 – Salaries/hours for Skilled Nursing Facilities
IIWG8_01/IIHR8_01 – Salaries/hours for excluded area salaries."

Formula A5: Rental Subindex Calculations

The methodology for calculation of the Cost-of-Services Rental Subindex is specified on Page 17, Section 5.2, "Adjusting the Alcohol, Drug Abuse and Mental Health Services Block Grant Allocations for Poverty Populations and Cost-of-Service," dated March 30, 1990, by Health Economics Research, Inc.

Formula A6: Fiscal Capacity Index (F_i) Construction for All But DC

The portion of the law below specifies the calculation of the Fiscal Capacity Index for the 50 States.

42 USC Sec. 300x-7

"(a) States...

...(4)(B) the greater of - (i) 0.4; and (ii) an amount equal to an amount determined for the State in accordance with the following formula: $1 - .35(R\% / P\%)$...

...(6) Determination of term "R%"

(A) For purposes of paragraph (4), the term "R%", except as provided in subparagraph (D), means the percentage constituted by the ratio of the amount determined under subparagraph (B) for the State involved to the amount determined under subparagraph (C).

(B) *The amount determined under this subparagraph for the State involved is the quotient of - (i) the most recent 3-year arithmetic mean of the total taxable resources of the State, as determined by the Secretary of the Treasury; divided by (ii) the factor determined under paragraph (8) for the State.*

(C) *The amount determined under this subparagraph is the sum of the respective amounts determined for the States under subparagraph (B) (including the District of Columbia)...*

...(7) *Determination of term "P%"*

For purposes of paragraph (4), the term "P%" means the percentage constituted by the ratio of the term "P" determined under paragraph (5) for the State involved to the sum of the respective terms "P" determined for the States..."

Formula A7: Fiscal Capacity Index Construction for DC (F_{DC})

The portion of the law below specifies the calculation of the Fiscal Capacity Index for DC.

42 USC Sec. 300x-7

"(a) States...

...(4)(B) *the greater of - (i) 0.4; and (ii) an amount equal to an amount determined for the State in accordance with the following formula: $1 - .35(R\% / P\%)$...*

...(6) *Determination of term "R%"...*

... (D)

In the case of the District of Columbia, for purposes of paragraph (4), the term "R%" means the percentage constituted by the ratio of the amount determined under clause (ii) for such District to the amount determined under clause (iii).

The amount determined under this clause for the District of Columbia is the quotient of - (I) the most recent 3-year arithmetic mean of total personal income in such District, as determined by the Secretary of Commerce; divided by (II) the factor determined under paragraph (8) for the District.

The amount determined under this clause is the sum of the respective amounts determined for the States (including the District of Columbia) by making, for each State, the same determination as is described in clause (ii) for the District of Columbia.

(7) *Determination of term "P%"*

For purposes of paragraph (4), the term "P%" means the percentage constituted by the ratio of the term "P" determined under paragraph (5) for the State involved to the sum of the respective terms "P" determined for the States..."

Formula A8: Determining BESMA versus ASMA States

The criteria for determining minimum allotments for States are specified in the law, and are shown below.

42 USC Sec. 300x-33

"...(b) Minimum allotments for States

(1) In general

With respect to fiscal year 2000, and each subsequent fiscal year, the amount of the allotment of a State under section 300x-21 of this title shall not be less than the amount the State received under such section for the previous fiscal year increased by an amount equal to 30.65 percent of the percentage by which the aggregate amount allotted to all States for such fiscal year exceeds the aggregate amount allotted to all States for the previous fiscal year.

(2) Limitations

(A) In general

Except as provided in subparagraph (B), a State shall not receive an allotment under section 300x-21 of this title for a fiscal year in an amount that is less than an amount equal to 0.375 percent of the amount appropriated under section 300x-35(a) of this title for such fiscal year.

(B) Exception

In applying subparagraph (A), the Secretary shall ensure that no State receives an increase in its allotment under section 300x-21 of this title for a fiscal year (as compared to the amount allotted to the State in the prior fiscal year) that is in excess of an amount equal to 300 percent of the percentage by which the amount appropriated under section 300x-35(a) of this title for such fiscal year exceeds the amount appropriated for the prior fiscal year..."

Formula A9: Scaled Allotments for ASMA States

Formula A9 is not specified in the law, but rather is a procedure that was developed by SAMHSA and the General Accounting Office (GAO, now the Government Accountability Office) in order to determine the allotments for ASMA States (i.e., allotments for those States for which the statutory minimums [Formula A8] do not apply).

For a given cycle in which funding is redistributed from ASMA States to BESMA States, a "Scale Factor" is determined. The Scale Factor is used to reduce the allotments of ASMA States, by a uniform proportion, and effectively transfers funding to BESMA States so that all BESMA States in that cycle receive statutory minimum allotments.

Scaled allotments of ASMA States are tested against statutory minimums at the end of each redistribution cycle. If the allotments for any States fall below or equal to the statutory minimums, then another redistribution cycle is performed in which the allotments for any such States are set to statutory minimums.

Formula A10: Final Allotment for States

The final allotment for a State is either the statutory minimum allotment as specified by the law (i.e., for BESMA States, Appendix A, Formula A8), or a scaled formula allotment (i.e., for ASMA States, Appendix A, Formula A9).

Final allotments are determined only after a sufficient number of funding redistribution cycles have been performed, resulting in all States having allotments either equal to or greater than the statutory minimums.

Formula A11: Determining State Allotments When the Appropriation Amount Decreased or Remained the Same as the Prior Year's Amount

The portion of the law cited below specifies how State allotments are to be determined if the total appropriation amount for the subject (or reference) fiscal year is less than or equal to that for the prior fiscal year.

42 USC Sec. 300x-33

"...(b) Minimum allotments for States...

...(3) Decrease in or equal appropriations. If the amount appropriated under section 300x-35(a) of this title for a fiscal year is equal to or less than the amount appropriated under such section for the prior fiscal year, the amount of the State allotment under section 300x-21 of this title shall be equal to the amount that the State received under section 300x-21 of this title in the prior fiscal year decreased by the percentage by which the amount appropriated for such fiscal year is less than the amount appropriated or (!1) such section for the prior fiscal year...

...-FOOTNOTE-

(!1) So in original. Probably should be "for"..."

Formula A12: Determining Allotment for Red Lake Indians and the Remainder of the Minnesota Allotment

42 USC Sec. 300x-33

"...(d) Indian tribes and tribal organizations

(1) In general

If the Secretary - (A) receives a request from the governing body of an Indian tribe or tribal organization within any State that funds under this subpart be provided directly by the Secretary to such tribe or organization; and (B) makes a

determination that the members of such tribe or tribal organization would be better served by means of grants made directly by the Secretary under this; (!2) the Secretary shall reserve from the allotment under section 300x-21 of this title for the State for the fiscal year involved an amount that bears the same ratio to the allotment as the amount provided under this subpart to the tribe or tribal organization for fiscal year 1991 for activities relating to the prevention and treatment of the abuse of alcohol and other drugs bore to the amount of the portion of the allotment under this subpart for the State for such fiscal year that was expended for such activities...

...-FOOTNOTE-...

...(12) So in original. Probably should be "this subpart..."

Below is a description of why an allotment is made directly to the Red Lake Indians and how the allotment for Minnesota is apportioned between the Red Lake Indians and the remainder of the State. This information was promulgated by SAMHSA in the June 17, 1996, *Federal Register*, Page 30632.

"E. Indian Tribes Receiving Direct Allotments Under the Substance Abuse Block Grant

Section 1933(d) of the Act provides for separate grants for substance abuse prevention and treatment to Indian tribes or tribal organizations. Several categorical grant programs for which a number of tribes had been direct recipients were folded into the former ADMS block grant when it was established in 1981. The Red Lake Band of the Chippewa Indians in Minnesota was the only tribe or tribal organization still receiving ADMS block grant funds at the time the SAPT Block Grant was established in 1992 and is therefore the only Indian tribe currently eligible for direct receipt of funds. This group continues to receive a direct allotment under the SAPT Block Grant. The funding level for the Red Lake Indians, as determined by SAMHSA based on FY 1991 funding levels, is 0.0240535 of the total amount of the Minnesota annual allocation."

Formula A13: Baseline Allotments for Territory Allotments

The portion of the law specifying the set-aside for SAMHSA technical assistance is cited in Appendix A, Formula A1. The rest of the law pertaining to the determination of baseline territory allotments is cited below.

42 USC Sec. 300x-33

"...(c) Territories

(1) Determination under formula. Subject to paragraphs (2) and (4), the amount of an allotment under section 300x-21 of this title for a territory of the United States for a fiscal year shall be the product of – (A) an amount equal to the amounts reserved under paragraph (3) for the fiscal year; and (B) a percentage equal to the quotient of - (i) the civilian population of the territory, as indicated by the most recently available data; divided by (ii) the aggregate civilian population of the territories of the United States, as indicated by such data...

... (3) Reservation of amounts. The Secretary shall each fiscal year reserve for the territories of the United States 1.5 percent of the amounts appropriated under section 300x-35(a) of this title for allotments under section 300x-21 of this title for the fiscal year...

...(5)Applicability of certain provisions. For purposes of subsections (a) and (b) of this section, the term "State" does not include the territories of the United States..."

Note: Three entities which receive allotments are former U.S. territories rather than current territories.

Formula A13: Population Data Used for Determination of Territory Allotments

The law provides the following direction regarding population data to be used in the determination of territory allotments.

*42 USC Sec. 300x-33
"...(c) Territories...*

...(4) Availability of data on population. With respect to data on the civilian population of the territories of the United States, if the Secretary determines for a fiscal year that recent such data for purposes of paragraph (1)(B) do not exist regarding a territory, the Secretary shall for such purposes estimate the civilian population of the territory by modifying the data on the territory to reflect the average extent of change occurring during the ensuing period in the population of all territories with respect to which recent such data do exist..."

SAMHSA promulgated, in the June 17, 1996, *Federal Register*, Page 30632, the following information concerning population data used for the determination of territory allotments.

"C. Population Estimates for Territories

For both the mental health and the substance abuse block grants the law provides that the Secretary shall estimate the civilian population of a territory current [sic] if data on the civilian population of the territory does [sic] not exist. These estimates are developed by modifying the population estimates for the territories for which recent data do not exist by the average increase or decrease in the population of all territories for which there are recent data...

...The Bureau of the Census has made post-1990 decennial census estimates only for Puerto Rico. With post-1990 estimates available only for Puerto Rico, the only way to adjust the population estimates for the other territories is to assume that the percentage change in the population of each is similar to the percentage change in Puerto Rico. Since the distribution of funding for each territory is proportional to its contribution to the total population of the territories, any adjustment based only on the change for Puerto Rico would not alter the allocation of funds. Therefore, the territory population data and estimates for 1990 continue to be used for allocation purposes."

Note: SAMHSA is currently using, and has used since they became available, population data collected in the 2000 Decennial Census for current U.S. territories, and 2000 census data provided by three former U.S. territories.

Formula A14: Determining BESMA versus ASMA Territory Allotments

The criteria for determining minimum allotments for territories are specified in the law, and are shown below.

42 USC Sec. 300x-33
"...(c) Territories...

...(2) Minimum allotment for territories. The amount of an allotment under section 300x-21 of this title for a territory of the United States for a fiscal year shall be the greater of – the amount determined under paragraph (1) for the territory for the fiscal year; 50,000; and (c) with respect to fiscal years 1993 and 1994, an amount equal to 79.4 percent of the amount received by the territory from allotments made pursuant to this part for fiscal year 1992... "

Formula A15: Scaled Allotments for ASMA Territories

Formula A15 is not specified in the law, but is rather a procedure that was developed by SAMHSA in order to determine the allotments for ASMA territories (i.e., allotments for those territories for which the statutory minimum [Appendix A, Formula A14] does not apply).

For a given cycle in which funding is redistributed from ASMA territories to BESMA territories, a "Scale Factor" is determined. The Scale Factor is used to reduce the allotments of ASMA territories, by a uniform proportion, and effectively transfers funding to BESMA territories so that all BESMA territories in that cycle receive the statutory minimum allotment.

Scaled allotments of ASMA territories are tested against the statutory minimum at the end of each redistribution cycle. If the allotments for any territories fall below or equal to the statutory minimum, then another redistribution cycle is performed in which the allotments for any such territories are set to the statutory minimum.

Formula A16: Final Allotment Formula for Territories

The final allotment for a territory is either the statutory minimum allotment as specified by the law (i.e., for BESMA territories, Appendix A, Formula A14), or a scaled formula allotment (i.e., for ASMA territories, Appendix A, Formula A15). Final allotments are determined only after a sufficient number of funding redistribution cycles have been performed, resulting in all territories having allotments either equal to or greater than the statutory minimum.

Cutoff Date for Source Data Used in Allotment Determinations

SAMHSA promulgated, in the June 17, 1996, *Federal Register*, Page 30631, the following information concerning the establishment and use of a "cutoff date" for source data used in the determination of allotments.

"A. Establishment of Cutoff Date for 'Most Recent Data'

The legislation for both block grants refers to use of the most recent available data in calculating the allotments for each State and territory. Section 1918(a)(5)(B) states that 'With respect to data on population that is necessary for purposes of making a determination under subparagraph (A), the Secretary shall use the most recent data that is [sic] available from the Secretary of Commerce pursuant to the decennial census and pursuant to reasonable estimates by such Secretary of changes occurring in the data in the ensuing period. 'Section 1918(a)(6)(B)(I) requires use of 'the most recent 3-year arithmetic mean of the total taxable resources of the State, as determined by the Secretary of the Treasury.' Section 1918(a)(6)(D)(ii) requires 'the most recent 3-year arithmetic mean of total personal income in such District [the District of Columbia], as determined by the Secretary of Commerce.'

When the legislation for the two block grants was first implemented, SAMHSA staff tried to update population and other data whenever new estimates of the block grant allotments were required. This caused considerable confusion because projections of specific State allotments under the two Block Grant programs were changing constantly. Specific State allotment projections for various appropriation levels must be provided to Congress early in the budget consideration process; and changing estimates complicate the decision making process.

Given the time constraints and the need for consistent estimates for the budget process, SAMHSA now bases all calculations on the latest data available by the beginning of each fiscal year (October 1). For example, allotments for FY 1997, determined during FY 1996, employ those data available as of October 1, 1995. This approach was adopted for all allotment determinations beginning with those for FY 1996. Congress was notified of the change in approach in February 1995."

Appendix B: Referenced Text—Mental Health Services Block Grant (MH BG) Allotment Calculations

In reference to the formulas described in the main text, presented here are relevant legislative excerpts (in *italics*) obtained from the website <http://uscode.house.gov>. The excerpts of MH BG formulas that are the same as those of the SAPT BG formulas have not been repeated, but are referenced. This appendix is expected to help readers understand the basis of the MH BG formulas.

Formula B1: Set-Aside for Substance Abuse and Mental Health Services Administration (SAMHSA) Technical Assistance

The following portion of the law specifies the amount of funding available to SAMHSA for the provision of technical assistance.

42 USC Sec. 300x-9
"Funding...

...(b) Allocations for technical assistance, data collection, and program evaluation

In general

For the purpose of carrying out section 300x-58(a) of this title with respect to mental health and the purposes specified in paragraphs (2) and (3), the Secretary shall obligate 5 percent of the amounts appropriated under subsection (a) of this section for a fiscal year..."

Formula B1: Baseline Allotment for States and the District of Columbia (DC)

Refer to Appendix A.

Formula B2: Determination of Weighted Population-at-Risk (P_i)

42 USC Sec. 300x-7
"(a) States..."

...(5) Determination of term "P"

For purposes of paragraph (4), the term "P" means the sum of - (i) an amount equal to the product of 0.107 and the number of individuals in the State who are between 18 and 24 years of age (inclusive); (ii) an amount equal to the product of 0.166 and the number of individuals in the State who are between 25 and 44 years of age (inclusive); (iii) an amount equal to the product of 0.099 and the number of individuals in the State who are

between 45 and 64 years of age (inclusive); and (iv) an amount equal to the product of 0.082 and the number of individuals in the State who are 65 years of age or older..."

Formula B2: Data on Population Index (P_i)

Refer to Appendix A.

Formula B3: Cost-of-Services Index (C_i)

Refer to Appendix A.

Formula B4: Wage Subindex (W_i)

Refer to Appendix A.

Formula B5: Rental Subindex (R_i)

Refer to Appendix A.

Formulas B6 and B7: Fiscal Capacity Index (F_i)

Refer to Appendix A. For MH BG calculations, the P factor (shown in Appendix B, Formula B2) is applicable rather than the one shown in Appendix A.

Formula B8: Determining BESMA versus ASMA States

The criterion for determining minimum allotments for States is specified in the law, and is shown below.

42 USC Sec. 300x-7

"...(b) Minimum allotments for States

With respect to fiscal year 2000, and subsequent fiscal years, the amount of the allotment of a State under section 300x of this title shall not be less than the amount the State received under such section for fiscal year 1998..."

Formula B9: Scaled Allotments for ASMA States

Refer to SAPT Appendix A, Formula A9.

For MH, the minimum allotment constraint in MH Appendix B, Formula B8 is applicable rather than the minimum allotment constraints in SAPT Appendix A, Formula A8.

Formula B10: Final Allotments for States

Refer to SAPT Appendix A, Formula A10.

The minimum allotment constraint in MH BG Formula B8 is applicable rather than the minimum allotment constraints in SAPT Formula A8.

Formula B11: Baseline Allotments for Territories

The portion of the law specifying the set-aside for SAMHSA technical assistance is cited in Appendix B, Formula B1. The rest of the law pertaining to the determination of baseline territory allotments is cited below.

42 USC Sec. 300x-7

"...(c) Territories

Determination under formula

Subject to paragraphs (2) and (4), the amount of an allotment under section 300x of this title for a territory of the United States for a fiscal year shall be the product of –

(A) an amount equal to the amounts reserved under paragraph (3) for the fiscal year; and

(B) a percentage equal to the quotient of–

(i) the civilian population of the territory, as indicated by the most recently available data; divided by

(ii) the aggregate civilian population of the territories of the United States, as indicated by such data...

...(3) Reservation of amounts

The Secretary shall each fiscal year reserve for the territories of the United States 1.5 percent of the amounts appropriated under section 300x-9(a) of this title for allotments under section 300x of this title for the fiscal year...

...(5) Applicability of certain provisions

For purposes of subsection (a) of this section, the term "State" does not include the territories of the United States."

Formula B11: Population Data for Territory Allotments

The law provides the following direction regarding population data to be used in the determination of territory allotments.

42 USC Sec. 300x-7

"...(c) Territories...

...(4) Availability of data on population

With respect to data on the civilian population of the territories of the United States, if the Secretary determines for a fiscal year that recent such data for purposes of paragraph (1)(B) do not exist regarding a territory, the Secretary shall for such purposes

estimate the civilian population of the territory by modifying the data on the territory to reflect the average extent of change occurring during the ensuing period in the population of all territories with respect to which recent such data do exist..."

SAMHSA promulgated, in the June 17, 1996, *Federal Register*, Page 30632, the following information concerning population data used for the determination of territory allotments.

"C. Population Estimates for Territories

For both the mental health and the substance abuse block grants the law provides that the Secretary shall estimate the civilian population of a territory current [sic] if data on the civilian population of the territory does [sic] not exist. These estimates are developed by modifying the population estimates for the territories for which recent data do not exist by the average increase or decrease in the population of all territories for which there are recent data...

...The Bureau of the Census has made post-1990 decennial census estimates only for Puerto Rico. With post-1990 estimates available only for Puerto Rico, the only way to adjust the population estimates for the other territories is to assume that the percentage change in the population of each is similar to the percentage change in Puerto Rico. Since the distribution of funding for each territory is proportional to its contribution to the total population of the territories, any adjustment based only on the change for Puerto Rico would not alter the allocation of funds. Therefore, the territory population data and estimates for 1990 continue to be used for allocation purposes."

SAMHSA is currently using, and has used since they became available, population data collected in the 2000 decennial census for current U.S. territories, and 2000 census data provided by three former U.S. territories.

Formula B12: Determining BESMA versus ASMA Territory Allotments

The criteria for determining minimum allotments for territories are specified in the law, and are shown below.

42 USC Sec. 300x-7

"...(c) Territories...

...(2) Minimum allotment for territories

The amount of an allotment under section 300x of this title for a territory of the United States for a fiscal year shall be the greater of –

(A) the amount determined under paragraph (1) for the territory for the fiscal year;

(B) 50,000; and

(C) with respect to fiscal years 1993 and 1994, an amount equal to 20.6 percent of the amount received by the territory from allotments made pursuant to this part for fiscal year 1992..."

Formula B13: Scaled Allotments for ASMA Territories

Refer to Appendix A SAPT Formula A15.

Formula B14: Final Allotment Formula for Territories

Refer to Appendix A SAPT Formula A16.

Cutoff Date for Source Data Used in Allotment Determinations

Refer to Appendix A SAPT Formula A17.

Appendix C: Referenced Text—Protection and Advocacy for Individuals with Mental Illness Formula Grant (PAIMI FG) Allotment Calculations

In reference to the formulas described in the main text, presented here are relevant legislative excerpts obtained from the website <http://uscode.house.gov> and appear in *italics*. This appendix is intended to help readers understand the basis of the PAIMI FG formulas.

Formula C1: Set-Aside for the Substance Abuse and Mental Health Services Administration (SAMHSA)

The following portion of the law specifies the amount of funding available to SAMHSA for the provision of technical assistance.

*42 USC Sec. 10825
"Technical Assistance*

The Secretary shall use not more than 2 percent of the amounts appropriated under section 10827 of this title to provide technical assistance to eligible systems with respect to activities carried out under this subchapter, consistent with requests by such systems for such assistance."

Note: SAMHSA actually uses a 2 percent set-aside.

Formula C1: Baseline Allotment

The following portion of the law specifies the formula to be used for the determination of baseline allotments (i.e., prior to the application of statutory minimum constraints) for the States, District of Columbia (DC), Puerto Rico, four other U.S. territories, and the American Indian Consortium.

*42 USC Sec. 10822
"Allotment formula and reallocations*

(a)(1)(A) Except as provided in paragraph (2) and subject to the availability of appropriations under section 10827 of this title, the Secretary shall make allotments under section 10803 of this title from amounts appropriated under section 10827 of this title for a fiscal year to eligible systems on the basis of a formula prescribed by the Secretary which is based equally –

(i) on the population of each State in which there is an eligible system; and

(ii) on the population of each such State weighted by its relative per capita income.

(B) For purposes of subparagraph (A)(ii), the term "relative per capita income" means the quotient of the per capita income of the United States and the per capita income of the State, except that if the State is Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, the Marshall Islands, the Federated States of Micronesia, the Republic of Palau, or the Virgin Islands, the quotient shall be considered to be one..."

With regard to the "per capita income of the United States," SAMHSA calculates and uses a population-weighted PCI for the United States using data for Domains for which the PCI is known (i.e., the 50 States, DC, and PR), rather than using an unweighted PCI for the nation.

Formula C1: Baseline Allotment—Definition of "State"

For the purposes of the computations specified in 42 U.S. Code (USC) Sec. 10822 Paragraph (a)(1)(A) (refer to Appendix 1-B), all Domains except the American Indian Consortium are referred to as "States."

*42 USC Sec. 10802
"Definitions"*

For purposes of this title:...

...(7) The term "State" means each of the several States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, the Commonwealth of the Northern Mariana Islands, American Samoa, the Virgin Islands, and the Trust Territory of the Pacific Islands.

(8) The term "American Indian Consortium" means a consortium established under part C of the Developmental Disabilities Assistance and Bill of Rights Act (42 U.S.C. 6042 et seq.)"

Note: An amendment to the law in 2000 replaced the term "Trust Territory of the Pacific Islands" with Marshall Islands, Federated States of Micronesia, and Republic of Palau.

Formula C2: Determining BESMA versus ASMA Domains

The criteria for determining minimum allotments for all Domains (States, DC, Puerto Rico, four territories other than Puerto Rico, and the American Indian Consortium), are specified in the law and are shown below.

*42 USC Sec. 10822
"Allotment formula and reallocations"*

(a)...

...(2)(A) The minimum amount of the allotment of an eligible system shall be the product (rounded to the nearest 100) of the appropriate base amount determined under subparagraph (B) and the factor specified in subparagraph (C).

(B) For purposes of subparagraph (A), the appropriate base amount -

for American Samoa, Guam, the Marshall Islands, the Federated States of Micronesia, the Commonwealth of the Northern Mariana Islands, the Republic of Palau, and the Virgin Islands, is 139,300; and

(ii) for any other State, is 260,000.

(C) The factor specified in this subparagraph is the ratio of the amount appropriated under section 10827 of this title for the fiscal year for which the allotment is being made to the amount appropriated under such section for fiscal year 1995.

(D) If the total amount appropriated for a fiscal year is at least 25,000,000, the Secretary shall make an allotment in accordance with subparagraph (A) to the eligible system serving the American Indian consortium... "

Formula C3: Scaled Allotments for ASMA Domains

Formula C3 is not specified in the law, but is a procedure that was developed by SAMHSA in order to determine the allotments for ASMA Domains (i.e., allotments for those Domains for which the statutory minimums do not apply).

For a given cycle in which funding is redistributed from ASMA Domains to BESMA Domains, a "Scale Factor" is determined. The Scale Factor is used to reduce the allotments of ASMA Domains, by a uniform proportion, and effectively transfers funding to BESMA Domains so that the latter in that cycle receive statutory minimum allotments.

Scaled allotments of ASMA Domains are tested against statutory minimums at the end of each redistribution cycle. If the allotments for any Domains fall below the statutory minimums, then another redistribution cycle is performed in which the allotments for any such Domains are set to statutory minimums.

Formula C4: Final Allotment Formula for Domains

The final allotment for a Domain is either the statutory minimum allotment as specified by the law (i.e., for BESMA Domains, Formula C2), or a scaled formula allotment (i.e., for ASMA Domains, Formula C3). Final allotments are determined only after a sufficient number of funding redistribution cycles have been performed, resulting in all Domains having allotments either equal to or greater than the statutory minimums.

Cutoff Date for Source Data Used in Allotment Determinations

Shortly after OAS assumed responsibility for determination of PAIMI FG allotments, the same "cutoff date" rule was applied to the determination of PAIMI allotments as has been applied to the determination of MH and SAPT allotments, as described in the June 17, 1996, *Federal Register*, Page 30631 (refer to SAPT Appendix, last section).

This page intentionally left blank.

Appendix D: Referenced Text—Projects for Assistance in Transition from Homelessness Formula Grant (PATH FG) Allotment Calculations

In reference to the formulas in the main text, presented here are relevant legislative excerpts obtained from the website <http://uscode.house.gov> and appear in *italics*. This appendix is intended to help readers understand the basis of the PATH FG formulas.

Formula D1: Set-Aside for the Substance Abuse and Mental Health Services Administration (SAMHSA)

The law does not specify the amount for a SAMHSA set-aside for the PATH FG program. Since fiscal year (FY) 2005, the PATH FG set-aside has been 4.4 percent of the total appropriation amount, which consisted of 2 percent for technical assistance and 2.4 percent for the Public Health Service (PHS) Section 241 tap.

Formula D1: Baseline Allotment Formula

The following portion of the law specifies the formula to be used for the determination of baseline allotments (i.e., prior to the application of statutory minimum constraints) for the States, District of Columbia (DC), Puerto Rico, and four other U.S. territories.

42 USC Sec. 290cc-24

"Determination of amount of allotment...

...(b) Determination under formula

The amount referred to in subsection (a)(2) of this section is the product of-

(1) an amount equal to the amount appropriated under section 290cc-35(a) of this title for the fiscal year; and

(2) a percentage equal to the quotient of-

(A) an amount equal to the population living in urbanized areas of the State involved, as indicated by the most recent data collected by the Bureau of the Census; and

(B) an amount equal to the population living in urbanized areas of the United States, as indicated by the sum of the respective amounts determined for the States under subparagraph (A)."

Although the law directs that the populations of urbanized areas of the four territories are to be considered (refer to Appendix D, Formula D1, definition of "State"), such information is not available and, therefore, not used in the determination of allotments.

Formula D1: Baseline Allotment for "States"

For the purposes of the computations specified in 42 U.S. Code (USC) Sec. 290cc-24 Paragraph (b)(2) (refer to Appendix D, Formula D1), all Domains are referred to as "States."

42 USC Sec. 290cc-34

"Definitions

For purposes of this part:...

...(3) State

The term "State" means each of the several States, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands..."

As noted in Appendix D, Formula D1, data on the population of urbanized areas of the four territories (other than Puerto Rico) are not available.

Formula D2: Determining BESMA versus ASMA Domains

The criteria for determining minimum allotments for all Domains (States, DC, Puerto Rico, and the four territories other than Puerto Rico), when sufficient funds exist so that statutory minimum allotment constraints can be satisfied, are specified in the law and are shown below.

42 USC Sec. 290cc-24

"Determination of amount of allotment

(a) Minimum allotment

The allotment for a State under section 290cc-21 of this title for a fiscal year shall be the greater of -

(1) 300,000 for each of the several States, the District of Columbia, and the Commonwealth of Puerto Rico, and 50,000 for each of Guam, the Virgin Islands, American Samoa, and the Commonwealth of the Northern Mariana Islands; and

(2) an amount determined in accordance with subsection (b) of this section..."

Formula D2: Contingency if Appropriation Amount is Insufficient to Make Statutory Minimum Allotments to All Domains

In the event that the total appropriation amount is insufficient to make statutory minimum allotments to all Domains, then the Secretary of DHHS is empowered to make discretionary

grants to some, but not necessarily all, Domains. The applicable portion of the law which addresses this contingency is cited below.

42 USC Sec. 290cc-35

"Funding...

...(b) Effect of insufficient appropriations for minimum allotments

(1) In general

If the amounts made available under subsection (a) of this section for a fiscal year are insufficient for providing each State with an allotment under section 290cc-21 of this title of not less than the applicable amount under section 290cc-24(a)(1) of this title, the Secretary shall, from such amounts as are made available under such subsection, make grants to the States for providing to eligible homeless individuals the services specified in section 290cc-22(b) of this title.

(2) Rule of construction

Paragraph (1) may not be construed to require the Secretary to make a grant under such paragraph to each State."

Formula D3: Scaled Allotments for ASMA Domains

Formula D3 is not specified in the law, but is rather a procedure that was developed by SAMHSA in order to determine the allotments for ASMA Domains (i.e., allotments for those States for which the statutory minimums [Reference Appendix D, Formula D2] do not apply). For a given cycle in which funding is redistributed from ASMA Domains to BESMA Domains, a "Scale Factor" is determined. The Scale Factor is used to reduce the allotments of ASMA Domains, by a uniform proportion, and effectively transfers funding to BESMA Domains so that the latter in that cycle receive statutory minimum allotments.

Scaled allotments of ASMA Domains are tested against statutory minimums at the end of each redistribution cycle. If the allotments for any Domains fall below the statutory minimums, then another redistribution cycle is performed in which the allotments for any such Domains are set to statutory minimums.

Formula D4: Final Allotment Formula for Domains

The final allotment for a Domain is either the statutory minimum allotment as specified by the law (i.e., for BESMA Domains, Appendix D, Formula D2), or a scaled formula allotment (i.e., for ASMA Domains, Appendix D, Formula D3). Final allotments are determined only after a sufficient number of funding redistribution cycles have been performed, resulting in all Domains having allotments either equal to or greater than the statutory minimums.

Cutoff Date for Source Data Used in Allotment Determinations

Shortly after OAS assumed responsibility for determination of PATH FG allotments, the same "cutoff date" rule was applied to the determination of PATH allotments as has been applied to the determination of MH and SAPT allotments, as described in the June 17, 1996, *Federal Register*, Page 30631 (refer to Appendix A, last section).

Appendix E: SAPT BG Allotment Calculations in Spreadsheet—Examples

The tables contained in this appendix are hypothetical examples of the tables that are usually produced in SAPT BG allotment calculations. The example-tables are included here just to illustrate the calculation process. In these examples, the calendar or fiscal years to which the source data pertain are specified. However, we deliberately avoided specifying the reference fiscal year for which the final allotment figures by State or territory were calculated. Furthermore, the appropriation used in the calculations is also hypothetical and does not necessarily represent the appropriation for any fiscal year. For States and territories, the final allotment figures shown here should also not be viewed as the actual allotment awards.

Table E1. Budget Appropriation, Technical Assistance, and Net Amount Available for SAPT BG for a Given Reference Fiscal Year (Scenario 1)

Appropriation (Reference Fiscal Year) (\$)	1,779,146,000.00
Set-aside ($AP_{RFY} \times 0.05$) (\$)	88,957,300.00
Available for Allotments for Fifty States, District of Columbia, and Eight Territories (\$)	1,690,188,700.00
Available for Allotments for Fifty States and District of Columbia (\$)	1,664,835,869.50
Available for Allotments for Eight Territories	25,352,830.50
Appropriation (Prior Fiscal Year) (\$)	1,753,932,000.00
Statutory Minimum Allotment for States and District of Columbia	May Vary as Shown in the Subsequent Tables
Statutory Minimum Allotment for Territories (\$)	50,000.00
Rate of Increase in Appropriation, r^*	0.014376

$$*r = \frac{AP_{RFY} - AP_{RFY-1}}{AP_{RFY-1}} = \frac{1,779,146,000 - 1,753,932,000}{1,753,932,000} = \frac{25,214,000}{1,753,932,000} = 0.014376$$

Note 1: The State-level wage rate was calculated based on the 16 percent sample of the 2000 Decennial Census.

Note 2: For update factor calculations, the State-level "baseline year" wage rate was calculated based on the provider (hospital)-level data reported to CMS for FY 1999 that were originally compiled to establish Medicare reimbursement rates for FY 2003.

Note 3: For update factor calculations, the State-level "most recent year" wage rate was calculated based on the provider (hospital)-level data for FY 2002 that were originally compiled to establish Medicare reimbursement rates for FY 2006.

Table E12. Cycle 1-BESMA, ASMA, and Scaled ASMA in SAPT BG Calculations (Scenario 1) (continued)

Used In:	Formula A8	Formula A8	Formula A9
State	$A_{i(j=1), BESMA}$ (\$)	$A_{i(j=1), ASMA}$ (\$)	$A_{i(j=1), Scaled ASMA}$ (\$)
Tennessee	0	31,300,433	30,233,645
Texas	0	143,082,155	138,205,599
Utah	0	18,028,931	17,414,466
Vermont	5,140,414	0	0
Virginia	0	45,336,816	43,791,637
Washington	35,280,442	0	0
West Virginia	0	9,164,871	8,852,512
Wisconsin	0	26,722,836	25,812,063
Wyoming	3,340,190	0	0
Subtotal (50 States and District of Columbia)	508,371,439	1,197,270,040	1,156,464,430

$$\begin{aligned}
 \text{Scale Factor (Cycle } j = 1) &= \frac{0.95 \times 0.985 \times AP_{RFY} - \sum A_{i(j=1), BESMA}}{\sum A_{i(j=1), ASMA}} \\
 &= \frac{1,664,835,869 - 508,371,439}{1,197,270,040} = \frac{1,156,464,430}{1,197,270,040} = 0.96592
 \end{aligned}$$

Note 1: In this redistribution cycle, $A_{ij, BESMA}$ is set to 0 if the State does not fall into the BESMA (Below/Equal-to-the-Statutory Minimum Allotment) category because it is considered an ASMA (Above the Statutory Minimum Allotment) State.

Note 2: In this redistribution cycle, $A_{ij, ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 3: In this redistribution cycle, $A_{ij, Scaled ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 4: Some of the calculations may have minor rounding error.

Table E17. SAPT BG Allotment Calculations (Scenario 2) (continued)

Used In:	Formula A11	Formula A11
State	Prior Fiscal Year Final Allotments (\$)	Reference Fiscal Year Final Allotments (\$)
Utah	17,248,099	17,071,988
Vermont	5,130,038	5,077,658
Virginia	43,373,280	42,930,418
Washington	35,209,227	34,849,724
West Virginia	8,767,941	8,678,416
Wisconsin	25,938,905	25,674,056
Wyoming	3,333,448	3,299,412
Subtotal (50 States and District of Columbia)	1,661,475,329	1,644,510,861

Note 1: Calculation procedures used to determine territory allotments are identical to those used for Scenario 1.

Note 2: Reference fiscal year allotments, relative to those for the prior fiscal year, were reduced by a factor of 0.98979. The calculation involved the appropriation amounts of 1,775,554,720 and 1,757,425,446 for the prior FY and reference FY, respectively.

Appendix F: MH BG Allotment Calculations in Spreadsheet—Examples

The tables contained in this appendix are hypothetical examples of the tables that are usually produced in MH BG allotment calculations. The example-tables are included here just to illustrate the calculation process. In these examples, we have specified the calendar or fiscal years to which the source data pertain. However, we deliberately avoided specifying the reference fiscal year for which the final allotment figures by State or territory were calculated. Furthermore, the appropriation used in the calculations is also hypothetical and does not necessarily represent the appropriation for any fiscal year. For States and territories, the final allotment figures shown here should also not be viewed as the actual allotment awards.

Table F1. Budget Appropriation, Technical Assistance, and Net Amount Available for MH BG for a Given Reference Fiscal Year

Appropriation (AP_{RFY}) (\$)	427,958,945
Set-aside ($AP_{RFY} \times 0.05$) (\$)	21,397,947
Available for Allotments for Fifty States, District of Columbia, and Eight Territories (\$)	406,560,997.75
Available for Allotments for Fifty States and District of Columbia (\$)	400,462,582.78
Available for Eight Territories (\$)	6,098,414.97
Statutory Minimum Allotment for States and District of Columbia (\$)	Shown in Table F8
Statutory Minimum Allotment for Territories (\$)	50,000

Appendix G: PAIMI FG Allotment Calculations in Spreadsheet—Examples

The tables contained in this appendix are hypothetical examples of the tables that are usually produced in PAIMI FG allotment calculations. The example-tables are included here just to illustrate the calculation process. In these examples, we have specified the calendar or fiscal years to which the source data pertain. However, we deliberately avoided specifying the reference fiscal year for which the final allotment figures by Domain were calculated. Furthermore, the appropriation used in the calculations is also hypothetical and does not necessarily represent the appropriation for any fiscal year. The final allotment figures shown here should also not be viewed as the actual allotment awards.

Table G1. Budget Appropriation, Technical Assistance, Statutory Minimum Allotments and Net Amount Available for PAIMI FG for a Given Reference Fiscal Year

Appropriation (AP_{RFY}) (\$)	34,000,000
Set-aside 2% ($AP_{RFY} \times 0.02$) (\$)	680,000
Available for Allotments (\$)	33,320,000
FY 1995 Appropriation	21,957,000
Change in Appropriation from FY 1995 to Reference FY (%)	54.8
FY 1995 Statutory Minimum for 50 States, District of Columbia, and Puerto Rico (\$)	260,000
FY 1995 Statutory Minimum for the Remaining Domains (\$)	139,300
Reference FY Statutory Minimum for 50 States, District of Columbia, and Puerto Rico (\$)	402,700
Reference FY Statutory Minimum for the Remaining Domains (\$)	215,800

Puerto Rico	0	627,807	627,807	627,807	627,807
American Samoa	215,800	0	0	215,800	215,800
Guam	215,800	0	0	215,800	215,800
American Indian Consortium	215,800	0	0	215,800	215,800
Northern Mariana Islands	215,800	0	0	215,800	215,800
Virgin Islands	215,800	0	0	215,800	215,800
Total	12,354,600	20,965,400	20,965,400	33,319,997	33,320,000

$$\begin{aligned}
 \text{Scale Factor (Cycle } j = 3) &= \frac{0.98 \times AP_{RFY} - \sum A_{i(j=3), BESMA}}{\sum A_{i(j=3), ASMA}} \\
 &= \frac{33,320,000 - 12,354,600}{20,965,400} = \frac{20,965,400}{20,965,400} = 1.0000
 \end{aligned}$$

Note 1: In this redistribution cycle, $A_{ij, BESMA}$ is set to 0 if the State does not fall into the BESMA (Below/Equal-to-the-Statutory Minimum Allotment) category because it is considered an ASMA (Above the Statutory Minimum Allotment) State.

Note 2: In this redistribution cycle, $A_{ij, ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 3: In this redistribution cycle, $A_{ij, Scaled ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 4: Because the totals of these two columns are the same, no further scaling of ASMA is needed.

Note 5: Some of the calculations in this table may have minor rounding errors.

*Note 6: The allotment figures in the last column are the same as the figures in the previous column for all Domains except California, which is given an extra \$3 to compensate for rounding errors.

This page intentionally left blank.

Appendix H: PATH FG Allotment Calculations in Spreadsheet—Examples

The tables contained in this appendix are hypothetical examples of the tables that are usually produced in PATH FG allotment calculations. The example-tables are included here just to illustrate the calculation process. In these examples, we have specified the calendar or fiscal years to which the source data pertain. However, we deliberately avoided specifying the reference fiscal year for which the final allotment figures by Domain were calculated. Furthermore, the appropriation used in the calculations is also hypothetical and does not necessarily represent the appropriation for any fiscal year. The final allotment figures shown here should also not be viewed as the actual allotment awards.

Table H1. Budget Appropriation, Technical Assistance, and Net Amount Available for PATH FG for a Given Reference Fiscal Year

Appropriation (AP_{RFY}) (\$)	54,223,237
Set-aside ($0.044 \times AP_{RFY}$)* (\$)	2,386,000
Available for Allotments (\$)	51,837,237
Minimum Allotment for States, District of Columbia, and Puerto Rico (\$)	300,000
Minimum Allotment for Four Territories (\$)	50,000

*Although the calculated set-aside amount is 2,385,822.40, we used 2,386,000 as instructed by the Budget Office.

N. Mariana Isl.	50,000	0	0	50,000	0	0
Total	5,900,000	49,099,616	45,937,235	6,200,000	45,638,065	45,637,237

$$\begin{aligned}
 \text{Scale Factor (Cycle } j = 1) &= \frac{0.956 \times AP_{RFY} - \sum A_{i(j=1), BESMA}}{\sum A_{i(j=1), ASMA}} \\
 &= \frac{51,837,237 - 5,900,000}{49,099,616} = \frac{45,937,237}{49,099,616} = 0.93559
 \end{aligned}$$

$$\begin{aligned}
 \text{Scale Factor (Cycle } j = 2) &= \frac{0.956 \times AP_{RFY} - \sum A_{i(j=2), BESMA}}{\sum A_{i(j=2), ASMA}} \\
 &= \frac{51,837,237 - 6,200,000}{49,099,616} = \frac{45,637,237}{45,638,065} = 0.99998
 \end{aligned}$$

Note 1: In this redistribution cycle, $A_{ij, BESMA}$ is set to 0 if the State does not fall into the BESMA (Below/Equal-to-the-Statutory Minimum Allotment) category because it is considered an ASMA (Above the Statutory Minimum Allotment) State.

Note 2: In this redistribution cycle, $A_{ij, ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 3: In this redistribution cycle, $A_{ij, Scaled ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 4: Some of the calculations in this table may have minor rounding errors.

Virginia	0	1,167,434	1,167,434	1,167,434	1,167,000	1,167,000
Washington	0	1,066,005	1,066,005	1,066,005	1,066,000	1,066,000
West Virginia	300,000	0	0	300,000	300,000	300,000
Wisconsin	0	704,055	704,055	704,055	704,000	704,000
Wyoming	300,000	0	0	300,000	300,000	300,000
Puerto Rico	0	861,138	861,138	861,138	861,000	861,000
Guam	50,000	0	0	50,000	50,000	50,000
Virgin Islands	50,000	0	0	50,000	50,000	50,000
Am. Samoa	50,000	0	0	50,000	50,000	50,000
N. Mariana Island	50,000	0	0	50,000	50,000	50,000
Total	6,200,000	45,637,237	45,637,237	51,837,237	51,837,000	51,837,000

$$\begin{aligned}
 \text{Scale Factor (Cycle } j = 3) &= \frac{0.956 \times AP_{RFY} - \sum A_{i(j=3), BESMA}}{\sum A_{i(j=3), ASMA}} \\
 &= \frac{51,837,237 - 6,200,000}{45,637,237} = \frac{45,637,237}{45,637,237} = 1.0000
 \end{aligned}$$

Note 1: In this redistribution cycle, $A_{ij, BESMA}$ is set to 0 if the State does not fall into the BESMA (Below/Equal-to-the-Statutory Minimum Allotment) category because it is considered an ASMA (Above the Statutory Minimum Allotment) State.

Note 2: In this redistribution cycle, $A_{ij, ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 3: In this redistribution cycle, $A_{ij, Scaled ASMA}$ is set to 0 if the State does not fall into the ASMA (Above the Statutory Minimum Allotment) category because it is considered a BESMA (Below/Equal-to-the-Statutory Minimum Allotment) State.

Note 4: Some of the calculations in this table may have minor rounding errors.

Note 5: Because the totals of columns 4 and 5 are the same, no further scaling of ASMA is needed.

*Note 6: Because the allotments have been rounded to the nearest thousand dollars, there is an excess amount of \$237, which has been added to the SAMHSA set-aside amount.
