Measuring the Effect of Benefits and Taxes on Income and Poverty: 1986

INTRODUCTION

This is the first of a series of experimental reports to be released with a P-60-RD designation. This new series will bring together the benefit and tax data that have previously appeared in separate reports. This report presents experimental data showing the effect of taxes and transfers on the distribution of income and the prevalence of poverty. It was prepared by using statistical techniques and models to estimate amounts of taxes paid and the income value of food stamps, school lunch subsidies, rent subsidies, Medicare coverage, Medicaid coverage, employer contributions to employee health plans, and home equity. (Appendixes B and C explain the methodology.) The estimates of the income value of noncash benefits are based on specific assumptions and models and may change as additional research results and more current data sources become available.

The report shows the distribution of income among households and the prevalence of poverty under the official definition (money income excluding capital gains before taxes) and under definitions that add income components or subtract taxes. For example, the 1986 median income of U.S. households was \$24,897 (\pm \$206)¹ under the official definition but dropped to \$22,745 (\pm \$237) when government transfers were excluded from the income definition. The median rose to \$24,211 (\pm \$242) when capital gains and the value of employer contributions to employee health plans were added to the definition, then declined to \$20,180 (\pm \$186) when income and payroll taxes were deducted. By adding in the various government transfer components, the median was brought to \$23,220 (\pm \$160), and adding in the final component, net imputed return on home equity, brought the median to \$24,984 (\pm \$170). The official poverty rate for persons was 13.6 (\pm .3) percent in 1986, and the rate rose to 20.8 (\pm .4) percent when government transfers were excluded from the income definition. Adding in capital gains and employer health benefits brought the poverty rate to 19.9 (\pm .4) percent, but deducting income and payroll taxes increased the rate to 21.2 (\pm .4) percent. Nonmeans-tested government

cash transfers were added, bringing the poverty rate down to 14.9 (\pm .4) percent, and adding in the other components of government transfers resulted in a rate of 11.6 (\pm .3) percent.

The income distribution research on which the report is based was performed at the Bureau of the Census during the past several years and included comments received from data users. A number of recommendations were offered by participants in the Census Bureau's 1985 Conference on the Measurement of Noncash Benefits,² and those recommendations received careful consideration during the development of the estimation methods used in this report. Data in this report are for calendar year 1986. It was not possible to produce estimates for 1987 because the data that are required to estimate income taxes were not available at the time this report was prepared.

In the recent past, the Bureau of the Census has published a number of technical papers that presented experimental poverty estimates based on income definitions that counted the value of selected government noncash benefits. The Census Bureau has also published annual reports on after-tax income.

The Census Bureau will continue to publish annual official statistics on income and poverty, and for purposes of comparison, the tables in this report show official as well as experimental estimates. The official series on the distribution of income began in 1947, and estimates of the number and percentage of persons in poverty are available from 1959 to the present (1987). Annual income and poverty estimates are based on data collected each March in a supplement to the Current Population Survey (CPS).

The growth in government programs such as food stamps, Medicaid, and Medicare, and the private sector growth in employer contributions to health plans focused attention on the issue of whether currently available data on the distribution of income and the prevalence of poverty were based on an income definition that was sufficiently comprehensive.

Beginning with the March 1980 CPS, the Census Bureau began collecting information on the receipt of selected noncash benefits. Benefits covered in the

¹The figures in parentheses denote the 90-percent confidence interval of the estimate.

²The Census Bureau sponsored this conference in December 1985. Its proceedings have been published in *Conference on the Measurement of Noncash Benefits*.

survey included food stamps, school lunches, Medicaid coverage, Medicare coverage, rent subsidies, energy assistance, and coverage under employer provided health insurance and pension plans. Data on these topics have been collected in each subsequent March interview.

The first Census Bureau report to present data on the value of noncash benefits was Technical Paper 50, *Alternative Methods for Valuing Selected In-Kind Transfer Benefits and Measuring Their Effect on Poverty*. That report, containing estimates for 1979, was issued in March 1982. Since then, the Census Bureau has issued technical papers, based on the original methodology, that provided updated estimates for each calendar year through 1987.

Series P-23, No.126, *Estimating After-Tax Money Income Distribution Using Data From the March Current Population Survey*, (issued August 1983) was the first Census Bureau report to present data on the distribution of after-tax income. The Bureau has issued reports containing estimates for subsequent years through 1986.

From the beginning, it was apparent that the valuation of noncash benefits involved very difficult measurement issues. For certain types of benefits, e.g. food stamps, there was general agreement that the benefit should be counted as income and there was no serious disagreement about the appropriate way to value the benefit. For other benefits, especially the benefit of being covered by Medicare or Medicaid, there was some disagreement about whether the benefit should be counted as income, and there was serious disagreement about the way to value the benefit.

Census Bureau methods of valuing noncash benefits have been the subject of a continuing review by the General Accounting Office (GAO). In September 1987, the GAO issued a report, *Noncash Benefits: Methodological Review of Experimental Valuation Methods Indicate Many Problems Remain*.

DEFINITION OF INCOME

A paper by Ellwood and Summers³ presented at the December 1985 conference attempted to answer the question as to what should be counted as income. They rejected both extremes, that income should include only cash and that income should measure overall well-being. The former was rejected because it excludes important items of consumption, and the latter was rejected because it is impossible to assign income values to individuals that reflect the increase

in well-being that is experienced as a result of expenditures on "public" goods (e.g. national defense, police protection, roads, educational services). They concluded that "the distribution of income should then be thought of as attempting to measure the distribution of the private goods consumption piece of individual well-being." They went on to describe the implication of this conclusion for decisions about the value of noncash benefits. They stated that "the benefit ought to be included if it provides for immediate material consumption or if the benefit is fungible, freeing up resources which then become available for material consumption."

This report presents data on twelve definitions of income. The types of income that are included in one or more of the definitions include (1) money income excluding capital gains or lump-sum payments, (2) capital gains, (3) the value of employer contributions to health insurance plans, (4) the value of food stamps, (5) the subsidy value of school lunches, (6) the subsidy value of housing assistance, (7) the fungible value of Medicare coverage, (8) the fungible value of Medicaid coverage, and (9) the imputed net return on equity in own home. The types of taxes that are accounted for are Federal and State income taxes and payroll taxes. Because of a technical problem, the Federal tax adjustments shown in this report do not include the effect of earned income tax credits. This omission will be corrected in future reports.

For a description of the methods used to value noncash benefits, see appendix B. Information on the methods used to estimate taxes and capital gains is shown in appendix C.

MEASUREMENT ISSUES

Some of the methods used to value noncash benefits differ considerably from those used in the previous series of technical papers. The changes were made on the basis of Census Bureau research and the comments and analysis of data users. A description of some of the basic measurement issues is given below:

1. *What value should be assigned to Medicare and Medicaid coverage?* The previous series of technical papers presented poverty estimates based on an income definition that counted as income the full market value (mean outlays for families in a given risk class) of Medicare and Medicaid benefits. Comparisons of the market value of these benefits with the official poverty threshold showed that the market value of these benefits

³Ellwood, David T., and Lawrence H. Summers, "Measuring Income: What Kind Should Be In?", *Conference on the Measurement of Noncash Benefits, U.S. Bureau of the Census, 1986*.

was frequently very high, compared with the poverty thresholds, and sometimes exceeded them. It became apparent to many analysts that it was inappropriate simply to count the full market value of Medicare and Medicaid and then use the resulting income figure to determine poverty status. The valuation approach adopted for this report is the fungible value approach. The benefits of being covered by Medicare or Medicaid are counted as income to the extent that they free up resources that could have been spent on medical care. Additional information on the fungible approach is contained in appendix B. A separate issue concerns the choice of risk classes to use in calculating mean outlays. The risk classes for Medicare include the aged and the disabled. Those for Medicaid include the elderly, blind or disabled adults, nondisabled adults, and children. For both programs, mean outlays vary by State of residence. There are questions as to the appropriateness of these risk classes because a shift from one risk class to another or from one State to another can result in a change in assigned income. A related issue for the purpose of calculating mean outlays for the Medicaid program is whether the universe should include persons who receive benefits because they are "medically needy." These persons were included in the universe for these calculations; because they have very high medical expenses their inclusion caused mean outlays to be higher than they otherwise would have been.

2. *What method should be used to determine the subsidy value of housing assistance?* The estimates shown in this report are based on a model that attempted to measure the factors that determine the market rental value of nonsubsidized rental units. The model was then used to estimate the market rental value of subsidized units. The model-based estimate of the market rental value of subsidized units was then compared to the actual rent paid by residents of subsidized units and the difference was accepted as the subsidy value. This measurement technique is complex and the results depend on the specification of the model. Additional testing will be conducted to verify that the model is robust.
3. *What method should be used to measure the income flow from housing equity?* Persons with home equity receive housing services that are not included in measures of cash income. Two methods have been used to measure the income flow from owner-occupied housing. The first method estimates net rental income. The procedure estimates the market rent which the owner-occupied unit would receive in the rental market and deducts

various costs of home ownership including mortgage interest, depreciation, maintenance costs, and property taxes. There are significant measurement difficulties with this method. For example, the market rental value of owner-occupied housing is usually not directly observable and estimates based on rental units must consider differences in quantity and quality between the two types of units. The second methodology (the one used in this study) applies a rate of return to home equity to obtain an estimate of the income that the household would receive if it chose to shift the amount held as home equity into an interest-earning account. This approach avoids many of the estimation problems of the first approach. The primary measurement problems associated with the net imputed rate of return approach are the lack of home equity data on the CPS data file and the necessity of choosing an appropriate rate of return.

4. *Should an income definition that includes the net imputed return on home equity be used in the determination of poverty status?* A concern with adding this component to an income definition has to do with the way the original poverty thresholds were defined. Because this component (net imputed return on home equity) was not part of the income definition used in calculating the poverty "multiplier," there is an argument for not including it in an income definition that is used to determine poverty status. This argument holds, to some degree, for any income component that was not part of the original definition. A counterargument, that certain income components (e.g. food stamps) were small or non-existent at the time the poverty definition was developed, clearly does not apply to home equity.
5. *Should school lunch subsidies be counted as income, and if so, how should they be valued?* For this report, school lunch subsidies (including those associated with regular price lunches) have been counted as income at their full subsidy value. There are two issues of concern. The first is whether it is consistent to count school lunch subsidies when the value of subsidized meals consumed in a business situation are not counted. The latter meals include those consumed by business travelers for which the traveler is reimbursed, and those consumed in a business setting that are paid for by an employer. For example, a Federal government employee who spent 20 days in a calendar year on travel status would receive a minimum of \$500 as reimbursement for meal expenses. If a decision is made to count school lunch subsidies, an issue remains about whether the full amount of the subsidy should be counted

as income. Families who participate in this program have no choice about the quantity and type of food and their perception of the income value of the benefit may be well below the full subsidy value.

6. *What adjustment should be made for underreporting?* Household respondents tend to underreport some types of income and the problem can be severe for those sources that are received at irregular intervals or for those sources about which the household respondent may have limited information. (See appendix F for a discussion of this issue.) The Census Bureau expects to intensify its research in this area to obtain more current and accurate estimates of the extent of the problem and to identify methods for adjusting for underreporting.

DISTRIBUTION OF INCOME

Taxes, government transfers, and other benefits have substantial effects on the level and distribution of income. These effects can be seen by examining distributional changes under the 12 different definitions of income used in this report. Text tables A through D and detailed tables 1 through 3 show data on the distribution of income under the twelve definitions.

Under the official definition of income (definition 1), which is based on money income before taxes and includes government cash transfers, aggregate household income totaled \$2,752 billion in 1986 for the 89.5 million households in the United States. Median household income was \$24,897. Looking at the distribution of aggregate household income by income quintiles, 3.8 percent of the total was received by the lowest quintile, 9.7 percent by the second quintile, 16.4 percent by the third quintile, 24.0 percent by the fourth quintile, and 46.1 percent by the highest quintile. The degree of income inequality is summarized by the Gini index, which is a statistic that varies between 0 (perfect equality) and 1 (perfect inequality).⁴ In 1986, the Gini index for household income was .420.

Definition 2 shows the effect on the income distribution when income was defined to exclude government cash transfers. This basically is the distribution of income generated by the private sector.⁵ Exclusion of government cash transfers lowered the estimate of aggregate household income by \$219 billion to \$2,533 billion and lowered the estimate of median household income by \$2,152 to \$22,745. The distribution of

Table A. Median, Mean, and Aggregate Household Income, by Definition of Income: 1986

(Total households = 89,479,000)

Definition of income	Median income	Mean income	Aggregate income (in billions)
Income before taxes:			
1. Money income excluding capital gains (current measure) . . .	\$24,897	\$30,759	\$2,752.3
2. Definition 1 less government money transfers	22,745	28,313	2,533.4
3. Definition 2 plus capital gains.	23,274	31,073	2,780.4
4. Definition 3 plus health insurance supplements to wage or salary income	24,211	32,082	2,870.7
Income after taxes:			
5. Definition 4 less Federal income taxes	22,071	28,050	2,509.8
6. Definition 5 less State income taxes	21,530	27,113	2,426.0
7. Definition 6 less Social Security payroll taxes	20,180	25,582	2,289.1
8. Definition 7 plus nonmeans-tested government cash transfers	22,204	27,774	2,485.2
9. Definition 8 plus nonmeans-tested government noncash transfers	22,941	28,375	2,539.0
10. Definition 9 plus means-tested government cash transfers . . .	23,037	28,629	2,561.7
11. Definition 10 plus means-tested government noncash transfers	23,220	28,914	2,587.2
12. Definition 11 plus net imputed return on equity in own home.	24,984	31,068	2,780.0

income generated by the private sector was much more unequal than the distribution under the official definition of income. Without government cash transfers, the share of aggregate income declined for the lowest three quintiles of households (from 3.8 to 1.1 percent for the lowest quintile, 9.7 to 8.2 percent for the second quintile, and 16.4 to 16.0 percent for the third quintile). Accordingly, the share of aggregate income increased for the upper two quintiles of households (from 24.0 to 25.6 percent for the fourth quintile, and 46.1 to 49.2 percent for the highest quintile). The net effect of these shifts was to raise the Gini index sharply, from .420 to .473.

Definition 3 shows the effect of adding capital gains to the definition of income. In 1986, capital gains amounted to \$247 billion.⁶ The net effect of adding capital gains to the income definition was to raise aggregate household income from \$2,533 billion to \$2,780 billion, and median household income from \$22,745 to \$23,274. Since capital gains are highly

⁴A description of the Gini index can be found in appendix A.

⁵The private sector distribution of income would be much different if the government sector did not, in fact, exist, because individual behavior would adjust to this change.

⁶Capital gains were unusually large in 1986. IRS figures show that the 1986 level was 204 percent of the 1985 level and 250 percent of the 1984 level.

concentrated in the upper portion of the income distribution, mean income rose at a sharper rate than median income. The addition of capital gains caused mean household income to rise from \$28,313 to \$31,073.⁷ The inclusion of capital gains lowered the share of aggregate income held by the lowest four quintiles, and raised the share held by the highest quintile (from 49.2 to 52.5 percent). These shifts resulted in a significant increase in the Gini index, from .473 to .503. This rather large effect on measured income inequality was due in part to the unusually high amount of capital gains that were recorded in 1986.

A major type of private sector income received in noncash form is employer contributions to the health insurance plans of employees. As shown by definition 4, these supplements amounted to \$90 billion in 1986, raising aggregate household income to \$2,871 billion. They also had a significant effect on median household income, raising it by \$937 to \$24,211. As shown in table B, health insurance supplements had no significant effect on income inequality. Neither the proportion of income received by each quintile, nor the Gini index changed in a statistically significant way when this component was added to the income definition. The reason for this result is that health insurance benefits are received by people throughout the income distribution, and do not vary significantly in value.

⁷Mean income is affected by extreme values in the income distribution; median income is not.

Definition 4 represents the broadest concept of private sector income shown in this study. Other types of employer-provided benefits that might legitimately be included in a measure of income (e.g., contributions to life insurance plans, meals, child care subsidies) are not covered in this study because of a lack of data. Future research will address the issue of counting the value of other employer benefits.

Definition 5 shows the effect of Federal individual income taxes on the distribution of income. In 1986, the Federal Government collected approximately \$361 billion in individual income taxes, which lowered aggregate household income to \$2,510 billion. On an individual household basis, Federal individual income taxes lowered median income by \$2,140 to \$22,071. Although the Federal income tax structure is commonly regarded as progressive, in actuality taxes had a relatively minor effect on the redistribution of income. The share of aggregate income received by quintiles of households after taxes increased by less than 1 percentage point for each of the lower three quintiles, and decreased by less than 2 percentage points for the highest quintile. Overall, the tax system lowered the Gini index from .500 to .486, or by only 3 percent.

The effect of State individual income taxes on the distribution of income is shown in definition 6. In the aggregate, State individual income taxes amounted to \$84 billion, lowering aggregate household income to \$2,426 billion and lowering median household income by \$541, to \$21,530. The State income tax structure is

Table B. Percentage of Aggregate Income Received by Income Quintiles and Index of Income Concentration, by Definition of Income: 1986

(Total households = 89,479,000)

Definition of income	Lowest quintile	Second quintile	Third quintile	Fourth quintile	Highest quintile	Index of income concentration
Income before taxes:						
1. Money income excluding capital gains (current) measure	3.8	9.7	16.4	24.0	46.1	.420
2. Definition 1 less government money transfers	1.1	8.2	16.0	25.6	49.2	.473
3. Definition 2 plus capital gains	1.0	7.6	15.1	23.9	52.5	.503
4. Definition 3 plus health insurance supplements to wage or salary income	1.0	7.6	15.0	24.1	52.4	.500
Income after taxes:						
5. Definition 4 less Federal income taxes	1.1	8.2	15.7	24.4	50.6	.486
6. Definition 5 less State income taxes	1.1	8.4	15.8	24.5	50.2	.481
7. Definition 6 less Social Security payroll taxes	1.1	8.4	15.8	24.4	50.3	.483
8. Definition 7 plus nonmeans-tested government cash transfers	3.4	9.9	16.0	23.4	47.2	.434
9. Definition 8 plus nonmeans-tested government noncash transfers	3.6	10.4	16.2	23.3	46.5	.424
10. Definition 9 plus means-tested government cash transfers	4.2	10.4	16.1	23.2	46.1	.417
11. Definition 10 plus means-tested government noncash transfers	4.7	10.6	16.0	23.0	45.7	.408
12. Definition 11 plus net imputed return on equity in own home	4.9	10.5	16.1	23.0	45.5	.404

guided by the federal structure in most States that have such taxes, but is less progressive. State individual income taxes had little or no effect on the share of aggregate income held by each quintile. The effect of State individual income taxes on the Gini index was small, reducing it from .486 to .481.

As shown in definition 7, Social Security payroll taxes amounted to \$137 billion in 1986, and lowered aggregate household income to \$2,289 billion. They also lowered median household income from \$21,530 to \$20,180. Such taxes did not have a significant effect on the distribution of income, as shown by the fact that the inclusion of these taxes produced no statistically significant change in the Gini index.

At this juncture, it is possible to assess the combined effect of the tax system on the distribution of income. The combined effect of Federal individual income taxes, State individual income taxes, and Social Security payroll taxes lowered aggregate household income by \$582 billion (from \$2,871 billion to \$2,289 billion). On an individual household basis, the combined effect of these three taxes lowered median household income by \$4,031 (from \$24,211 to \$20,180). The combined effect of the tax system produced a decline in the Gini index from .500 to .483.

The effect of government transfers on the distribution of income are shown in income definitions 8 through 11. Definition 8 shows the effect of nonmeans-tested government cash transfers. Included in this category are Social Security and Railroad Retirement, Veteran's payments, and unemployment and workers' compensation. These benefits, \$196 billion in 1986, raised aggregate household income to \$2,485 billion. They also raised median household income by \$2,024 to a level of \$22,204. Nonmeans-tested government cash transfers had a very significant effect on the distribution of income. They increased the share of aggregate income going to the lowest quintile (from 1.1 to 3.4 percent) and to the second quintile (from 8.4 to 9.9 percent), had little effect on the middle quintile, and decreased the share of aggregate income going to the fourth quintile (from 24.4 to 23.4 percent) and to the highest quintile (from 50.3 to 47.2 percent). Overall, these transfers lowered income inequality significantly, as shown by the decline in the Gini index from .483 to .434.

The effect of nonmeans-tested government non-cash transfers is shown in definition 9. Included in this category are Medicare benefits and subsidies from regular-price school lunches. Adding the fungible value of Medicare⁸ and the subsidy value of regular-price school lunches to the income definition increased aggregate income to \$2,539 billion (an increase of \$54 billion). The addition of these benefits increased median

household income by \$737 to \$22,941. These benefits reduced income inequality slightly by raising the share of aggregate income received by the two lowest quintiles. The net effect was to lower the Gini index from .434 to .424.

Definition 10 shows the effect of adding means-tested government cash transfers to the definition of income. This category includes AFDC or other assistance or welfare payments and Supplemental Security income. In order to qualify for these means-tested benefits, households must meet certain eligibility requirements, based on income, wealth, and other criteria. Adding these transfers increased aggregate household income by \$23 billion, to \$2,562 billion, but did not have a statistically significant effect on median household income (\$23,037). Since these benefits are means-tested, their most significant effect was to increase the share of aggregate income received by the lower income groups. The addition of these transfers increased the share of aggregate income going to the lowest quintile of households from 3.6 to 4.2 percent but had no statistically significant effect on the other quintiles. Overall, the net effect of these benefits was to lower the Gini index from .424 to .417.

The effect of means-tested government noncash transfers on the income distribution is shown in definition 11. Included in this category are Medicaid, food stamps, subsidies from free or reduced-price school lunches, and rent subsidies. Counting Medicaid at its fungible value,⁹ these benefits in the aggregate amounted to \$26 billion in 1986, raising the overall aggregate income to \$2,587 billion. The addition of these benefits raised median household income by \$183, to \$23,220. Means-tested noncash transfers were similar to means-tested cash transfers in their effect on the income distribution. They raised the share of aggregate income received by the lowest quintile of households from 4.2 to 4.7 percent, and had no statistically significant effect on the other four quintiles. The net effect of these benefits was to lower the Gini index from .417 to .408.

At this point, it is possible to assess the combined effect of government taxes and transfers on the distribution of income. Government transfers of all types (means-and nonmeans-tested, cash and noncash) raised aggregate household income by approximately \$298 billion (from \$2,289 billion to \$2,587 billion). Altogether these transfers raised median household income by \$3,040 (from \$20,180 to \$23,220). Government transfers were much more significant than taxes in lowering income inequality. While taxes in total lowered the Gini index from .500 to .483, total government transfers lowered the Gini from .483 to .408. This happened despite the fact that government transfers

⁸The fungible value of Medicare is defined in appendix B.

⁹The fungible value of Medicaid is defined in appendix B.

to individuals were approximately half of total taxes. Government nonmeans-tested transfers had a larger effect on income inequality than means tested transfers. Nonmeans-tested transfers reduced the Gini index from .483 to .424 while means-tested transfers reduced the index from .424 to .408.

Definition 12 shows the effect of adding the net imputed return on equity in own home to the definition of income. This income component raised aggregate income by \$193 billion to \$2,780 billion, and raised median household income by \$1,764 to \$24,984. Inclusion of this income source did not produce a statistically significant change in the Gini index. The lack of change in inequality can be attributed to the fact that homeowners are spread throughout the income distribution, and many older persons have large equity values in their homes despite the fact that their incomes are relatively low.

It is instructive to compare the fully adjusted distribution of income—taking into account taxes, transfers, and other benefits—with the official distribution of income. The fully adjusted measure produced an estimate of aggregate household income that was \$28 billion higher than the estimate produced by the official method (\$2,780 billion versus \$2,752 billion). The use of the fully adjusted measure did not produce a statistically significant change in median household income. The distribution of income was more equal under the broader definition of income, as reflected by Gini index values of .420 for the official measure and .404 for the fully adjusted measure.

It has long been known that the Federal Government plays a significant role in lowering income inequality in the United States. One of the salient findings of this study is that the equalizing influence occurs mainly through the transfer system rather than the tax system. In the next section, we will focus on how the tax and transfer system affects income levels for different subgroups of the population.

INCOME CHARACTERISTICS OF SELECTED POPULATION GROUPS

The different income definitions not only result in different income distributions and income measures for the Nation as a whole, but also for various groups in our population. In this section we discuss their impact on selected groups. For the sake of brevity, most attention will be focused on the impact these definitions have on the median incomes of particular groups, although other summary measures (e.g., means, quintiles, or the index of income concentration) could have been used.

Table C shows median household incomes in 1986 by race and Hispanic origin under the 12 different income definitions. When moving from the official

Table C. Median Household Income, by Race, Hispanic Origin of Householder, and Definition of Income: 1986

Definition of income	White	Black	Hispanic ¹
All households (thousands) . . .	77,284	9,922	5,418
Income before taxes:			
1. Money income excluding capital gains (current measure) . . .	\$26,175	\$15,080	\$18,352
2. Definition 1 less government money transfers	24,220	12,993	16,947
3. Definition 2 plus capital gains.	24,800	13,231	17,284
4. Definition 3 plus health insurance supplements to wage or salary income	25,673	13,730	18,099
Income after taxes:			
5. Definition 4 less Federal income taxes	23,328	12,984	16,919
6. Definition 5 less State income taxes	22,766	12,701	16,798
7. Definition 6 less Social Security payroll taxes	21,310	11,913	15,721
8. Definition 7 plus nonmeans-tested government cash transfers	23,300	13,653	16,832
9. Definition 8 plus nonmeans-tested government noncash transfers	24,055	14,270	17,182
10. Definition 9 plus means-tested government cash transfers . . .	24,115	14,738	17,393
11. Definition 10 plus means-tested government noncash transfers	24,244	15,427	17,942
12. Definition 11 plus net imputed return on equity in own home.	26,118	16,313	18,906

¹Persons of Hispanic origin may be of any race.

definition of income to the definition which excludes government money transfers, median incomes declined for White, Black, and Hispanic households by different degrees. The White and Hispanic medians fell by approximately 8 percent (from \$26,175 to \$24,220 and from \$18,352 to \$16,947), but Black median income declined by 13.8 percent (from \$15,080 to \$12,993).

Median incomes for each group rose by approximately 5 to 6 percent when capital gains and health insurance contributions were added to the income definition. White median income rose to \$25,673, Black median income to \$13,730, and Hispanic median income to \$18,099.

The subtraction of Federal and State income taxes and Social Security payroll taxes reduced White median household income to \$21,310, Black median income to \$11,913, and Hispanic median income to \$15,721. The decline in median income amounted to 17.0 percent for Whites, and approximately 13 percent for Blacks and for persons of Hispanic origin.

The addition of the value of government transfers, both cash and noncash and both means-tested and nonmeans-tested, resulted in a 29.5 percent increase in Black median income, and an increase of approximately 14 percent in the median incomes of Whites and Hispanics. The final adjustment to the income

definition, the addition of the imputed net return on home equity brought the median income of White households to \$26,118, the median income of Black households to \$16,313, and the median income of Hispanic households to \$18,906.

Table C also shows how the income position of Black and Hispanic households relative to that of White households varied across income definitions. According to the current definition, the median income of Black households was 57.6 percent of that for White households in 1986. For Hispanic households, the ratio was 70.1 percent. Subtracting money income transfers and adding in capital gains and the value of health insurance supplements reduced the Black ratio to 53.5 percent, while the ratio for persons of Hispanic origin showed no statistically significant change. When Federal and State income taxes and payroll taxes were deducted, the income ratio of Black households rose to 55.9 percent and the ratio for Hispanic households rose to 73.8 percent. The addition of government cash and noncash transfers improved the relative income position of Black households to 63.6 percent but did not produce a statistically significant change in the income ratio of Hispanic households.

Improvements in relative income can also be observed for Black and Hispanic married-couple households

with children (see table D). Under the current definition, the median incomes for White, Black, and Hispanic households of this family type were \$34,989, \$28,961, and \$23,742, respectively. The Black-to-White income ratio was .83 and the Hispanic-to-White ratio was .68. When taxes were deducted and all government transfers (cash and noncash) were included in the income definition, the Black-to-White income ratio rose to .88 and the Hispanic-to-White ratio rose to .73.

The relative incomes of Black and Hispanic households with a female householder, no husband present, with children, also improved when the effect of taxes and transfers were taken into consideration. Under the current definition, White households of this family type had a median income of \$13,158, Black households had a median income of \$8,452 (64 percent of the White figure) and Hispanic households had a median income of \$8,588 (65 percent of the White figure).¹⁰ Under income definition 11, the Black-to-White ratio improved to .82, and the Hispanic-to-White ratio improved to .79.¹¹

¹⁰The income levels and ratios of Black and Hispanic households were statistically different.

¹¹The income ratios of Black and Hispanic households were not statistically different.

Table D. Median Household Income, by Selected Characteristics and Definition of Income: 1986

Characteristic	Definition 1 (money income before taxes excluding capital gains)	Definition 4 (definition 1 less govern- ment transfers plus capital gains and employer health insur- ance benefits)	Definition 7 (definition 4 less income and payroll taxes)	Definition 11 (definition 7 plus govern- ment cash and noncash transfers)	Definition 12 (definition 11 plus net imputed return on home equity)

With two or more year-round, full-time workers....	46,196	48,792	38,810	39,483	41,681
With one or more members 20 to 64 years and no workers.....	6,986	1,912	1,910	9,337	10,171

¹Persons of Hispanic origin may be of any race.

A change in relative income can be observed when the median incomes of households with children under 18 are compared to the median incomes of households with members 65 and over. Under the current definition, the median income of the latter group was 51 percent of the median income of the former group (\$14,922 versus \$29,320). Adding in the effects of taxes and all income components except return on home equity (definition 11) brought the ratio to 67 percent (\$17,875 versus \$26,615), and adding in the effect of return on home equity brought the ratio to 73 percent (\$20,600 versus \$28,092).

Table D also shows data on the median incomes of households whose members had different levels of work experience in 1986. Based on the current income definition, the median income for the 17.0 million households in which two or more persons worked year-round, full-time, was \$46,196. In contrast, the median income for the 6.4 million households with members age 20 to 64 but with no workers, was only \$6,986 (the latter median was only 15.1 percent of the former).

For households with two or more year-round, full-time workers, deducting government transfers but including capital gains and health insurance supplements raised their median income by \$2,596 (from \$46,196 to \$48,792). For households with no workers but with members aged 20 to 64 years, the same process produced a \$5,074 reduction in median income. When the effect of taxes is examined, the incremental effect of subtracting taxes was to reduce the median income of the two or more year-round, full-time worker households by \$9,982, but the subtraction of taxes did not affect the median income of households with no workers. Adding in government cash and noncash transfer payments to the income definition added only \$673 to the median for two-worker households, but \$7,427 to the median for nonworker households. After the final income component (imputed return on home equity) was added to the income definition, the median for households with no earners was 24.3 percent of the median for households with two or more year-round, full-time workers; \$10,171 versus \$41,681.

AGGREGATE TAXES AND TRANSFERS

It is possible to examine the data on taxes and transfers shown in this report in terms of aggregate amounts paid or received by population subgroups, but comparisons must be made with great caution. There are several reasons for the need to exercise caution. The most important concerns the treatment of Social Security payments. In this report, Social Security payments are treated as transfers. But users of these data should realize that such payments are not assistance payments and do not belong in the

same category as AFDC or other means-tested transfers. In a basic way, Social Security payments are the payments that are produced by a national retirement plan to which most workers belong. Contributions are made during working-age years and payments are received during retirement years (this is not to imply that the relationship between contributions and benefits is an exact one for individuals). When Social Security payments are counted as an income transfer, and taxes are defined to include Social Security payroll taxes, the tax and transfer tables will imply a shift in resources from the young to the old. The tax and transfer tables do not capture the life-cycle effects of the Social Security system.

A second reason for caution is the omission of certain kinds of income from the definitions in this report. Part of the taxes paid by individuals is used to pay for "public" goods such as national defense, police and fire protection, educational services, and transportation facilities. The value of such goods cannot be assigned to individuals (although there is room for a discussion of the treatment of certain kinds of services) so the value of such benefits is excluded from the definitions in this report. Given these qualifications (and certain other qualifications such as the omission of certain types of taxes and transfers and the problem of underreporting), table E shows the amount of taxes, means-tested transfers, and nonmeans-tested transfers that are paid (received) by selected groups of households. Households with one or more members 65 years and over paid 10.4 percent of all income and payroll taxes, received 77.7 percent of all nonmeans-tested transfers (users should recall that these data exclude the life-cycle effect of Social Security), and received 20.3 percent of all means-tested transfers. Comparable figures for households with one or more related children under 18 years were 41.6 percent (share of taxes), 12.9 percent (share of nonmeans-tested transfers), and 66.0 percent (share of means tested transfers).

Data by race and Hispanic origin show that White households paid 91.2 percent of all taxes, received 90.5 percent of all nonmeans-tested transfers, and received 63.4 percent of all means-tested transfers.¹² The comparable figures for Black households were 5.9 percent, 8.2 percent, and 32.3 percent. Among households with a Hispanic householder, the comparable figures were 3.8 percent (share of taxes), 3.3 percent (share of nonmeans-tested transfers), and 14.7 percent (share of means-tested transfers).

A substantial amount of means-tested transfers are received by households with children. Married-couple households with children received 21.9 percent of all

¹²The percentages of total taxes paid and nonmeans-tested transfers received by White households were not statistically different.

means-tested transfers and paid 37.9 percent of all income and payroll taxes. Households with a female householder with children but no husband present, received 42 percent of all means-tested transfers and paid 2.6 percent of all taxes.

Work experience was, of course, strongly associated with the amount of taxes paid and the amount of means-tested transfers received. Households with one or more year-round, full-time worker paid 87.8 percent of all taxes and received 20.7 percent of all means-tested transfers. The comparable figures for households with one or more members 20 to 64 years of age and no workers were 0.8 percent (taxes) and 37.5 percent (means-tested transfers).

POVERTY STATUS

Text tables F through I and detailed tables 4 through 8 show how poverty estimates changed when income was defined to include or exclude certain components. The starting point for each of the tables was the

current CPS income measure (money income excluding capital gains before taxes) that is used to produce the official poverty estimates. In 1986, the official estimate of the number of persons in poverty was 32.4 million, or 13.6 percent of the population. Tables F and G show how the overall poverty figures changed when specific components were subtracted or added to the definition of income.

When the current income measure was modified to exclude government money transfers (definition P2) the number of persons below the poverty line rose sharply, from 32.4 million to 49.7 million. The increase in the number of persons in poverty translated into an increase in the poverty rate from 13.6 percent to 20.8 percent.

Adding in capital gains and the value of employer-provided health insurance (definitions P3 and P4) had a relatively minor effect on the poverty estimates. The combined effect of the two additions was to reduce the number in poverty from 49.7 million to 47.4 million and the proportion in poverty from 20.8 percent to 19.9 percent.

¹Persons of Hispanic origin may be of any race.

Income definition P5 deducts income taxes (Federal and State) and payroll taxes from the previous income definition. Adjusting the income definition for taxes produced an increase of 3.2 million in the estimate of the number of persons in poverty (from 47.4 to 50.6 million) and an increase of 1.3 percentage points in the poverty rate (from 19.9 percent to 21.2 percent).

Definitions P6 through P10 introduce specific types of government transfers, both cash and noncash, and

tables F and G show the extent to which these transfers reduced poverty estimates. The addition of nonmeans-tested government cash transfers (primarily Social Security) had a very strong effect. The addition of this income component reduced the estimate of the number of persons in poverty by 15.1 million persons (from 50.6 to 35.5 million), and reduced the estimated poverty rate from 21.2 to 14.9 percent (see definition P6). The addition of the fungible value of Medicare (definition P7) had a relatively minor effect on poverty

¹Persons of Hispanic origin may be of any race.

estimates, reducing the number from 35.5 to 34.3 million and the rate from 14.9 to 14.4 percent. The effect on poverty estimates of adding in means tested cash transfers (primarily AFDC and SSI) was small compared to the effect of adding in nonmeans-tested cash transfers. Adding in means-tested cash transfers (definition P8) reduced the estimate of the number of persons in poverty by 2.1 million (from 34.3 to 32.2 million), compared with the previously cited reduction of 15.1 million. The poverty rate associated with definition P8 was 13.5 percent, down 0.9 percentage points from the previous definition. An income definition that included a money income value for food stamps, school lunches, and rent subsidies (definition P9) lowered the estimate of the number of persons in poverty by 3.4 million (from 32.2 to 28.8 million) and lowered the poverty rate from 13.5 to 12.1 percent. The next definition (P10) shows the effect of defining income to include the fungible value of Medicaid. The addition of this component had a relatively small effect; the estimated number in poverty fell from 28.8 to 27.6 million, and the rate fell from 12.1 percent to 11.6 percent.

Income definition P11 adds to the income definition the net imputed return on equity in own home. The appropriateness of determining poverty status by using an income definition that includes this component was discussed earlier in this report. There is a serious measurement issue, but the data are presented in this report for reasons of completeness. The addition of this component reduced the estimated number of persons in poverty by 3 million (from 27.6 to 24.6 million) and reduced the estimated poverty rate by 1.3 percentage points (from 11.6 to 10.3 percent).

A review of the data shows that the income component that had the largest effect on the poverty estimate was Social Security (the primary component of nonmeans-tested government cash transfers). Other types of government transfers had smaller incremental effects.

Tables F and G show data for persons of all races and for Whites, Blacks, and persons of Hispanic origin. The data show that the poverty rate for Whites is much lower than the rates for Blacks and Hispanics regardless of the income definition, but the data also show that the incremental effect of some income components is different for Whites than for Blacks or Hispanics. Among Whites, the incremental effect of adding nonmeans-tested government transfers to the income definition was to reduce the poverty estimate by 35.1 percent (from 37.3 to 24.2 million). The effect on Blacks was to reduce the poverty estimate by 15.4 percent (from 11.7 to 9.9 million), and the effect on persons of Hispanic origin was to reduce the estimate

by 12.5 percent (from 6.4 to 5.6 million).¹³ The conclusion from the data is that there is a very large number of White Social Security beneficiaries who would be poor without that benefit.

The incremental effect of income components on the poverty status of persons by age group is shown in table H. The data show clearly that the effect of government transfers on the poverty status of persons 65 years and over is very large compared to the effect of such transfers on the poverty status of young persons. The percent of older persons (65 years and over) in poverty was 47.5 percent before government transfers were added to the income definition (definition P5). The addition of nonmeans-tested cash transfers (primarily Social Security) reduced the rate to 14.0 percent (definition P6) and the addition of other government transfers brought the rate to 9.0 percent (definition P10). The total effect of adding government transfers was to reduce the poverty rate of older persons by 81.1 percent. Among those under 18 years of age, the before-transfer poverty rate was 24.0 percent (definition P5) and the addition of all government transfers brought the rate to 17.1 percent (definition P10). The effect of government transfers was to reduce the poverty rate of young persons by 28.8 percent.

Counting the net imputed return on equity in own home has a larger effect on poverty rates for older persons than for other age groups. Table H shows that counting this component would reduce the poverty rate of persons 65 years and over by 36.7 percent (from 9.0 to 5.7 percent), compared with 21.0 percent (from 8.1 to 6.4 percent) for persons 45 to 64 years, and 6.7 percent (from 9.0 to 8.4 percent) for persons 25 to 44 years.

The probability of being in poverty is strongly associated with the type of family to which a person belongs. Table I shows poverty rates for persons in families with children by whether the family is a married-couple family or a family with a female householder, no husband present. The estimates are shown for Whites, Blacks, and Hispanics.

The official poverty figures show that persons in married-couple families had much lower poverty rates than persons in families with a female householder, no husband present. Among Whites, the rate was 8.4 percent for those in a married-couple family with

¹³The percent reductions in the poverty rates of Blacks and Hispanics were not statistically different.

¹Persons of Hispanic origin may be of any race.

children and 42.3 percent for those in a female householder family with children and no husband present. The comparable figures for Blacks were 13.0 and 61.0 percent, and for Hispanics, the figures were 22.5 and 59.9 percent.¹⁴

The data in table I show the incremental effect on poverty rates of adding various components to and subtracting taxes from the definition of income. The incremental effect of subtracting taxes from income is shown by comparing the poverty rates associated with definition P4 with the rates associated with definition P5. Among persons in married-couple families, for example, the effect of subtracting taxes from income definition P4 (definition P4 includes money income less government transfers plus capital gains and employer health insurance contributions) was to increase the poverty rate from 9.4 to 10.6 percent among Whites, from 15.8 to 18.5 percent among Blacks, and from 23.8 to 26.6 percent among Hispanics. Among persons in families with a female householder, no husband present, the effect of taxes was to increase the poverty rate from 47.4 to 49.9 percent among Whites, from 64.7 to 67.9 percent among Blacks, and from 65.0 to 68.5 percent among Hispanics. The poverty rates associated with income definitions P6 through P10 show the extent to which government transfers lower the poverty rate among the universe of persons who live in families with children. In total, government transfers produced sizable reductions in the poverty rates, but some groups were characterized by high rates of poverty even after all government transfers were accounted for. A comparison of the poverty rates associated with definitions P5 and P10 (pre- and post-transfers) show that transfers reduced the poverty rate of Whites in married-couple families with children from 10.6 percent to 7.3 percent, a reduction of 31.1 percent. Among Blacks and Hispanics in married-couple families with children, government transfers reduced the poverty rate

by 42.7 percent (from 18.5 percent to 10.6 percent) and 24.4 percent (from 26.6 percent to 20.1 percent) respectively. Persons in families with a female householder, no husband present had much higher pre-transfer and post-transfer poverty rates. The effect of government transfers was to reduce the poverty rate of Whites in this family category from 49.9 to 34.2 percent. Among Blacks and Hispanics in this family category, government transfers reduced the poverty rate from 67.9 percent to 49.7 percent and from 68.5 percent to 47.7 percent, respectively.¹⁵

RESEARCH ACTIVITY

The Census Bureau maintains an ongoing research program designed to produce improved estimates of the distribution of income. During the coming year, the Census Bureau expects to focus considerable attention on the problem of underreporting. There is need to update estimates of the extent of underreporting by source of income, and there is a need to develop procedures that would make it feasible to adjust for at least part of the unreported income. In addition, work will continue on the valuation of non-cash benefits. Concepts will be reviewed and there will be an attempt to identify and utilize all appropriate data sources.

USER COMMENTS

The Census Bureau welcomes the comments and advice of data users. We are particularly interested in receiving comments about this report, because of its experimental nature. If you have suggestions or comments, please write to:

1948

1. The first part of the report deals with the general situation of the country and the progress of the work during the year. It is divided into two main sections: the first section deals with the general situation and the second section deals with the progress of the work.

2. The general situation of the country is described in the first section. It is noted that the country has made considerable progress in the field of industry and commerce during the year. The production of goods has increased and the trade has expanded. The government has also taken steps to improve the living conditions of the people and to promote the development of the country.

3. The progress of the work is described in the second section. It is noted that the work has been carried out in accordance with the plan and that the objectives have been largely achieved. The work has been carried out in a systematic and organized manner and the results have been satisfactory.

4. The report concludes with a summary of the work done during the year and a statement of the objectives for the next year. It is noted that the work will continue to be carried out in a systematic and organized manner and that the objectives will be achieved.

Appendix A. Definitions, Explanations, and Comparability of Estimates with Data from Other Sources

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 879,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to include most or all of its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

Central cities. The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

Geographic regions. The four major regions for which data are presented in this report represent groups of States as follows:

Northeast:

New England: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.

Middle Atlantic: New Jersey, New York, and Pennsylvania.

Midwest:

East North Central: Illinois, Indiana, Michigan, Ohio, and Wisconsin.

West North Central: Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, and South Dakota.

South:

South Atlantic: Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia and West Virginia.

East South Central: Alabama, Kentucky, Mississippi, and Tennessee.

West South Central: Arkansas, Louisiana, Oklahoma, and Texas.

West:

Mountain: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming.

Pacific: Alaska, California, Hawaii, Oregon, and Washington.

Money income other than capital gains. For each person in the sample 15 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or welfare payments; (7) interest (on savings or other investments which pay interest); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and worker's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, and labor force status, and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. However, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received before deductions for personal income taxes, Social Security taxes, union dues, Medicare taxes, and other deductions.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government farm programs, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal personal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In

general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government. Medicare reimbursements are not included.

Supplemental Security income includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) aged (65 years old or over), (2) blind, or (3) disabled.

Public assistance or welfare payments include public assistance payments, such as aid to families with dependent children and general assistance.

Dividends, interest (on savings or other investments which pay interest), income from estates or trusts, net rental income, or royalties include dividends from stockholdings or membership in associations, interest on savings or any type of investment which pays interest, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Unemployment compensation, veterans' payments, or worker's compensation include (1) unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (3) worker's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private and government employee pensions include (1) private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company and (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors.

Annuities, alimony, regular contributions from persons not living in the household, and other periodic income include (1) periodic receipts from annuities or insurance; (2) alimony and child support; (3) contributions received periodically from persons not living in

the household; (4) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

Capital gains. See appendix C for an explanation of the methods used to calculate capital gains.

Value of noncash benefits. See appendix B for an explanation of the methods used to value noncash benefits.

Taxes paid. See appendix C for an explanation of the methods used to estimate taxes paid.

Government transfers. There are four categories of government transfer income:

Nonmeans-tested cash transfers. Includes Social Security or railroad retirement, Veteran's payments, and unemployment and workers' compensation.

Means-tested cash transfers. Includes public assistance or welfare payments and Supplemental Security Income.

Nonmeans-tested noncash transfers. Includes Medicare benefits and subsidies from regular-price school lunches.

Means-tested noncash transfers. Includes Medicaid benefits, food stamps, subsidies from free or reduced-price school lunches, and rent subsidies.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group.

Per capita income. Per capita income is derived by dividing the total income of a particular group by the total number of persons in that group.

Index of income concentration. The index of income concentration (or Gini index) is a statistical measure of income equality ranging from 0 to 1. A measure of 1 indicates perfect inequality, i.e., one person having all the wealth and the rest having none. A measure of 0 indicates perfect equality, i.e., all persons having equal shares of the wealth. For a more detailed discussion see Current Population Reports, Series P-60, No. 123.

Poverty definition. Poverty statistics presented in this report are based on a definition developed by the Social Security Administration in 1964 and revised in 1969 and 1981.

The original poverty index provided a range of income cutoffs adjusted by such factors as family size, sex of the family head, number of children under 18 years old, and farm-nonfarm residence. At the core of this definition of poverty was the economy food plan, the least costly of four nutritionally adequate food plans designed by the Department of Agriculture. It was determined from the Department of Agriculture's 1955 survey of food consumption that families of three or more persons spent approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. Annual revisions of these SSA poverty cutoffs were based on price changes of the items in the economy food budget.

As a result of deliberations of a Federal Interagency Committee in 1969, the following two modifications to the original SSA definition of poverty were recommended: (1) that the SSA thresholds for nonfarm families be retained for the base year 1963, but that annual adjustments in the levels be based on changes in the Consumer Price Index (CPI) rather than on changes in the cost of food included in the economy food plan; and (2) that the farm thresholds be raised from 70 to 85 percent of the corresponding nonfarm levels. The combined impact of these two modifications resulted in an increase of 360,000 poor families and 1.6 million poor persons in 1967.

In 1980, another interagency committee recommended three additional modifications that were implemented in the March 1982 CPS as well as the 1980 census: (1) elimination of separate thresholds for farm families, (2) averaging of thresholds for female-householder and "all other" families, and (3) extension of the poverty matrix to families with nine or more members. For further details, see the section, "Changes in the Definition of Poverty," in Current Population Reports, Series P-60, No. 133.

The poverty thresholds rise each year by the same percentage as the annual average Consumer Price Index.

Alternate levels. Alternative estimates can be obtained by multiplying the official thresholds by a given percentage. For example, an alternate cutoff, set at 125 percent of the official government standard, is obtained by multiplying the income cutoffs at the poverty level by 1.25. Thus, the income cutoff for a family of four at 125 percent of the poverty level was \$14,004 in 1986.

Weighted average thresholds at the poverty level.

As shown in table A-1, the poverty cutoffs used by the Bureau of the Census to determine the poverty status of families and unrelated individuals consist of a set of 48 thresholds arranged in a two-dimensional matrix consisting of family size (from one person, i.e., unrelated individuals, to nine or more persons) cross-classified by presence and number of family members under 18 years old (from no children present to eight or more children present). Unrelated individuals and two person families are further differentiated by the age of the individual or family householder (under 65 years and 65 years and over). The total family income of each family in the sample is tested against the appropriate dollar threshold to determine the poverty status of the family. If the family's total income is less than its corresponding cutoff, the family is classified as below the poverty level. The average thresholds shown in table A-1 were weighted by the presence and number of children. For a given size of family, the weighted average threshold for that group is obtained by multiplying the threshold for each presence and number of children category within the given family size by the number of families in that category. These

products are then aggregated across the entire range of presence and number of children categories, and the total aggregate is divided by the total number of families in the group to yield the weighted average threshold at the poverty level for that size family.

Since the basic thresholds used to determine the poverty status of families and unrelated individuals are applied to all families and unrelated individuals, the weighted poverty thresholds are derived using all families and unrelated individuals rather than just those families and unrelated individuals classified as below the poverty level. To obtain the weighted poverty thresholds for families and unrelated individuals below 125 percent of the poverty level, the weighted thresholds may be multiplied directly by 1.25.

Income deficit. Income deficit is the difference between the total income of families and unrelated individuals below the poverty level, and their respective poverty thresholds. In computing the income deficit, families reporting a net income loss are assigned zero dollars and for such cases the deficit is equal to the poverty threshold. This measure provides an estimate of the amount which would be required to raise the incomes of all poor families and unrelated individuals to their respective poverty thresholds. The income deficit is thus a measure of the degree of impoverishment of a family or unrelated individual. However, caution must be exercised in comparing the average deficit of families classified by the race or sex of the householder. Since the poverty thresholds used in this report are based on family size and composition, apparent differences in the average income deficits may, to some extent, be a function of the differences in these characteristics.

Table A-1. Poverty Thresholds in 1986, by Size of Family and Number of Related Children Under 18 Years Old

Size of family unit	Weighted average thresholds	Related children under 18								
		None	One	Two	Three	Four	Five	Six	Seven	Eight or more
One person (unrelated individual).....	\$5572									
Under 65 years.....	5701	\$5701								
65 years and over.....	5255	5255								
Two persons.....	7138									
Householder under 65 years.....	7372	7338	\$7553							
Householder 65 years and over.....	6630	6623	7524							
Three persons.....	8737	8571	8820	\$ 8829						
Four persons.....	11203	11302	11487	11113	\$11151					
Five persons.....	13259	13630	13828	13405	13077	\$12877				
Six persons.....	14986	15677	15739	15415	15104	14642	\$14368			
Seven persons.....	17049	18039	18151	17763	17492	16988	16400	\$15755		
Eight persons.....	18791	20175	20353	19986	19665	19210	18632	18030	\$17877	
Nine or more persons.....	22497	24269	24386	24062	23790	23343	22728	22171	22033	\$21185

Mean income deficit. The mean income deficit is the amount obtained by dividing the total income deficit of a group below the poverty level by the number of families or unrelated individuals (as appropriate) in that group.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. All persons who are not members of households are regarded as living in group quarters. Group quarters contain five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses. Persons living in military barracks and inmates of institutions were excluded from the survey.

Householder. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If the house is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of the other household members is recorded. One person in each household is designated as the "householder." The number of householders, therefore, is equal to the number of households.

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above), and any unrelated persons (unrelated subfamily members and/or

secondary individuals) who may be residing there are included. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Unrelated subfamily. An unrelated subfamily (formerly called a secondary family) is a group of two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," or "family," indicates that the household, or family, is maintained by a husband and wife.

Unrelated individuals. The term "unrelated individuals" refers to persons 15 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated individual may (1) constitute a one-person household, (2) be part of a household including one or more other families or unrelated individuals, or (3) reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding

nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption.

Own children and related children under 18 years of age. "Own" children in a family are sons and daughters, including stepchildren and adopted children of the householder. "Related" children in a family include own children and all other children in the household who are related to the householder by blood, marriage, or adoption.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household (or housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, wife present," "separated," and "other married, wife absent" for male householders and "married, husband absent" by reason for absence of husband for female householders. A male householder was classified as "married, wife present" if his wife was reported as a member of the household, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The groups "other married, wife absent" and "other married, husband absent" included married persons living apart because either the wife or the husband was employed and living at a considerable distance from home, was residing in an institution, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Number of earners. This number includes all persons in the household with \$1 or more in wage and salaries or \$1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Hispanic origin. Persons of Hispanic origin were identified by a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Hispanics, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Central or South American, or some other Hispanic origin. It should be noted that persons of Hispanic origin may be of any race.

Years of school completed. Data on years of school completed were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions of educational attainment apply only to progress in "regular" schools. Such schools included public, private, and parochial elementary and high schools (both junior and senior), colleges, universities, and professional schools (whether day schools or night schools). Thus, regular schooling is that which may advance a person toward an elementary school certificate, a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status relate to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the survey week containing March 12, 1987 did any work at all as paid employees or in

their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week containing March 12, 1987, had no employment but were available for work and (1) had engaged in any specific jobseeking activity *within the past 4 weeks*, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, who were attending school or were unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours during the specified week) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week containing March 12, 1987, or were looking for work at the time and had last worked as wage and salary or self-employed worker.

Work experience. A person with work experience is one who, during the preceding calendar year, did any

civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round, full-time worker. A year-round, full-time worker is one who worked primarily at full-time civilian jobs for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Symbols. A dash (—) represents zero or rounds to zero, the symbol "B" means that the base for the derived figure is less than 75,000, the symbol "X" means not applicable, the symbol "NA" means not available, and the symbol "r" means revised.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Income quintiles. The dollar cutoffs which divided the distribution of households into five equal groups were calculated using estimates from grouped data as described below:

1. The upper income levels (quintiles) of each fifth were estimated using either linear or Pareto interpolation depending upon the methods used to estimate the mean income in the interval in which the quintile was located (reference interval). After determining a particular quintile, the aggregate income above this quintile was calculated by

estimating the aggregate income of the subinterval between the quintile and the next higher actual income interval and adding the result to the aggregate income above the reference interval. The aggregate income of the subinterval was determined using the method (either Pareto or linear interpolation) consistent with that used for estimating the quintile and the mean income of the reference interval. The aggregate incomes between the quintiles were determined by disaccumulating the aggregate income distribution.

2. In calculating the aggregate income by fifths of households using grouped data, the underlying aggregate income distribution by size of income was estimated initially. The aggregate income distributions were obtained by multiplying the number of units in each income interval by an estimated mean income for the corresponding income interval. For the top open-ended interval (\$100,000 and over), aggregate incomes for all intervals below the open-end were subtracted from the overall aggregate with the remainder being assigned to the open-end. The mean incomes for intervals above the median were estimated from a fitted Pareto distribution. If the absolute value of the slope parameter of the fitted Pareto distribution was greater than 1, the mean income of the interval was estimated from the fitted Pareto distribution. If the absolute value of the slope parameter was less than or equal to 1, the midpoint of the interval was used as the estimated mean of the interval. The interval containing the median and those below used the midpoint as the best estimate of the interval mean.

For more information on the use of Pareto techniques, see "Estimation of Summary Measures of Income Size Distribution from Grouped Data," by Emmett F. Spiers, published in the *American Statistical Association Proceedings of the Social Statistics Section*, 1977.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA AND ADJUSTMENTS FOR NONINTERVIEWS AND NONRESPONSES

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. **Income definition.** The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: wages received in kind, the value of food and fuel produced and consumed on farms, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series.
2. **Source of data.** The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employer's wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households.

As discussed in the section, "Source and Reliability of Estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 89 percent of the comparable total money income aggregates and about 98 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.
3. **Population coverage.** The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post).

In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differ somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts, such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from most income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than \$3,300 (less than \$4,300 if 65 years old or over) and married couples receiving less than \$5,400 (\$6,400 if one spouse is 65 years old or over; \$7,400 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Noninterviews and nonresponses. In the March 1987 CPS, no interview was obtained for approximately 4 percent of the 61,500 households in the sample. No

interview was obtained at these households during the enumeration week for reasons such as "no one home," "temporarily absent," or "refusals." In order to account for these households, the weights assigned to households in which interviews were obtained have been increased slightly. This "noninterview" adjustment procedure adjusts the weights of sample households by race of householder and within a specified set of geographical restrictions.

The nonresponse problem, which is sometimes referred to as "item nonresponse," is a serious problem in most household surveys and is especially troublesome for income. Even though an interview is obtained in many cases, complete information for all of the income questions is not available, unknown or refused. In March 1984, the income data were incomplete for about 28 percent of the persons 15 years old and over. About 34 percent of the families had one or more members with incomplete income information. In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics.

Appendix B. Description of Methods Used to Value Noncash Benefits

Food stamps. The March supplement to the CPS collects information on the face value of food stamps received by households during the calendar year and on the number of persons in each household who were in a food stamp reciprocity unit. This information was used to determine the face value of food stamps received by families and unrelated individuals during the calendar year. The income value of food stamps was set equal to their face value.

School lunches. The March supplement collects information on the number of children in each household who usually ate a complete hot lunch offered at school and the number who received free or reduced-price lunches because they qualified for the Federal School Lunch program. The income value of the school lunch program for each participant family was calculated by determining the annual subsidy received by each child depending on whether the lunches were regular price, reduced price, or free. Information on subsidies per meal was obtained from the Department of Agriculture.

Housing subsidies. The March supplement collects information on the number of households living in public or subsidized housing units, but a rather complex procedure is required to estimate the income value of these housing subsidies.

Because the CPS does not collect data on housing costs, the basis for the calculation of the value of housing subsidies was the 1985 American Housing Survey. This data file was used to calculate the actual gross rent (rent plus utilities) paid by families in subsidized housing and the rent these families would have been expected to pay had their units not been subsidized. The calculation of actual rent and was taken directly from survey responses. The calculation of the rent the family would have expected to pay if the unit was not subsidized required the development of a statistical model that measured the effect of certain housing characteristics on gross rent.

For each of the four major regions, a model was estimated from the universe of two bedroom nonsubsidized units that related gross rent to (a) number of bathrooms, (b) number of appliances, (c) number of housing flaws, and (d) presence of satisfactory neighborhood services. The coefficients of the model were then used with the universe of subsidized units to determine the amount these units would have rented for had they not been subsidized.

The two items of information—actual rent and predicted rent—provide a measure of the income value of the housing subsidy.

The complete model contained two additional features not described above. First, the relative subsidies observed for two bedroom units were assumed to apply as well to smaller and larger units (there were insufficient observations to perform separate analyses for these units). Second, because the required rent payment in some subsidized housing is dependent on the income of the family, subsidies were estimated for families with incomes under \$6,000, \$6,000 to \$9,999, and \$10,000 and over.

The estimated subsidies are shown in table B-1. These estimates were used as measures of the income value of housing subsidies.

Medicare and Medicaid. The March supplement collects information on the number of persons who were covered by Medicare and/or Medicaid at any time during the previous calendar year. For the purpose of preparing income estimates it was assumed that anyone who was covered at any time during the year was covered for the entire year. For reasons described in the front text of this report, the income value of benefits from Medicare and Medicaid was defined as the fungible value of the benefits. The principle that was followed in determining fungible value can be summarized as follows:

Medicare and Medicaid benefits are counted as income to the extent that they free up resources that could have been spent on medical care.

The model used to measure fungible value has the following elements:

1. Medicare and/or Medicaid benefits have no income value if the family is unable to meet basic food and housing requirements or if the family has no remaining resources after meeting basic food and housing requirements. The cost of basic food requirements is determined by the cost of the Department of Agriculture's Thrifty Food Plan (the lowest cost of several food plans). The cost of basic housing is taken from the Department of Housing and Urban Development's Fair Market Rent series that measures market rent levels for standard quality housing in each U.S. county.

Table B-1. Estimates of Monthly Rent Subsidies, by Number of Bedrooms, Region, and Income Level: 1986

Region and income level of family.	One bedroom	Two bedrooms	Three or more bedrooms
Northeast:			
Income under \$6,000	\$191	\$225	\$252
Income \$6,000 to \$9,999	175	207	232
Income \$10,000 and over	73	86	96
Midwest:			
Income under \$6,000	116	148	168
Income \$6,000 to \$9,999	106	136	155
Income \$10,000 and over	44	57	64
South:			
Income under \$6,000	133	160	202
Income \$6,000 to \$9,999	123	147	186
Income \$10,000 and over	51	61	77
West:			
Income under \$6,000	160	201	265
Income \$6,000 to \$9,999	147	185	243
Income \$10,000 and over	61	77	101

Note: Data from the American Housing Survey were used to determine how much families in subsidized (or public) housing pay and how much families living in nonsubsidized units with characteristics similar to the subsidized unit pay. The difference is the rent subsidy.

- Medicare and/or Medicaid benefits have full income value (defined to be the mean government outlay for families in a given risk class) if the resources of the family after deducting amounts required for basic food and housing costs were as great or greater than the mean Medicare and/or Medicaid outlays for families in the same risk class.
- Medicare and/or Medicaid benefits have partial income value if the resources of the family are higher than the level specified in element 1 but lower than the level specified in element 2.

The actual calculation involves the following steps:

For a given family, determine:

- A = Cost of basic food and housing.
 B = Amount of resources (includes money income, food stamps, and housing subsidies).
 C_1 = Mean Medicare outlays for families in the risk class to which this family belongs.
 C_2 = Mean Medicaid outlays for families in the risk class to which this family belongs.

Then, the income value of Medicare and/or Medicaid = \$0 if B is less than or equal to A
 = $C_1 + C_2$ if (B-A) is greater than or equal to $C_1 + C_2$
 = X if B is greater than A and (B-A) is less than $C_1 + C_2$

where $X = (r \cdot C_1) + (r \cdot C_2)$ and

$$r = \frac{B - A}{C_1 + C_2}$$

Table B-2 shows the cost of the Thrifty Food Plan for 1986, table B-3 shows mean outlays per enrollee for the Medicare program, and table B-4 shows mean outlays per beneficiary for the Medicaid program.

Employer contributions to health insurance. The March supplement collects information on the number of persons who were covered at any time during the previous calendar year by a health insurance plan obtained through an employer or union. The supplement also collects information on whether the employer paid for all, part, or none of the cost of the plan.

For the purpose of this report, employer contributions to health insurance plans are treated as a form of wages and the entire estimated value of the employer contribution is counted as income.

The best data source available for measuring the amount employers contribute to health plans was the 1977 National Medical Care Expenditures Survey (NMCES).

Table B-2. Cost of Thrifty Food Plan: 1986

Sex and age	Annual amount
Child:	
1 and 2 years	\$517
3 to 5 years	560
6 to 8 years	687
9 to 11 years	816
Male:	
12 to 14 years	853
15 to 19 years	885
20 to 50 years	946
51 years and over	858
Female:	
12 to 19 years	846
20 to 50 years	849
51 years and over	839

Annual amounts are adjusted according to family size:

- 1 person—add 20 percent
- 2 persons—add 10 percent
- 3 persons—add 5 percent
- 4 persons—no adjustment
- 5 or 6 persons—subtract 5 percent
- 7 persons or more—subtract 10 percent

That survey had a relatively large sample size and included data on contributions that were obtained by conducting interviews with the employers of persons who were in the household portion of the NMCES sample.

The procedure for estimating the value of employer contributions for persons and families on the March 1987 CPS data file involved the following steps:

1. An enhanced NMCES data file was prepared by adding two variables not on the original file. The two variables were total earnings during the year and usual hours worked per week. The variables were created by statistically matching NMCES and CPS using and CPS using the appropriate demographic and economic variables that were available from both sources. The match made it possible to assign the earnings and full-time/part-time variables to the NMCES file.
2. The enhanced NMCES file was used to estimate a model that related employer contributions to a set of explanatory variables. The variables chosen were ones that are also available on the CPS file. The list of variables included (1) type of plan (family or individual), (2) proportion of cost paid for by employer (part or all), (3) level of earnings, (4) type of worker (full time or part time), (5) industry, (6) occupation, (7) sector (private or government) (8) region, (9) residence, (10) personal characteristics such as age, race, marital status, and education.
3. The model was run on the March 1987 CPS file to obtain estimates of the amount of employer contributions for each worker whose employer paid all or part of the cost of his or her health plan. The model was run after deflating 1986 earnings to 1977 dollars. The estimates produced by this model were then inflated to 1986 estimates by multiplying the 1977 level estimates by the 1977 to 1986 change in employer contributions per covered employer.
4. For those persons who worked for the Federal government in 1986, the amount of employer contribution was calculated using administrative data. Separate calculations were made for postal and nonpostal employees.

Net imputed return on equity in own home. Homeowners with a positive amount of home equity receive income in the form of housing services but that income is usually omitted from estimates of the distribution of income. There are two possible approaches to measuring this income. The net rental income approach begins with an estimate of the amount the home would rent for in the market and subtracts expenses related to home ownership such as mortgage interest, property taxes, maintenance costs, depreciation, and insurance. The net rental approach presents very serious measurement difficulties and was not used for this report. The approach that was chosen applies a rate of return to the estimated amount of home equity.

The March supplement collects information on whether the housing unit is owned or rented, but does not collect information on home equity. The rate of return approach was implemented by preparing an enhanced CPS file that used information on the 1985 American Housing Survey (AHS) file to assign values of home

equity and amounts of property taxes to CPS households. The file was created by statistically matching each CPS household to an AHS household with similar characteristics. (The procedures used in matching the two files are described in appendix C.)

The estimate of the amount of income derived from home equity is dependent on the rate of return that is

chosen. The rate chosen for this report was the average rate of return on high-grade municipal bonds (from the Standard and Poor's series). This rate was 7.38 percent in 1986. Because homeowners pay property taxes, the final estimate of the amount of income derived from home equity is made equal to the imputed return less the amount of property taxes paid.

Appendix C. Description of Methods Used to Estimate Taxes and Capital Gains

INTRODUCTION

This section describes the methodology and procedures which were developed to estimate taxes associated with the income information on the March 1987 CPS microdata files. In all, four types of taxes were simulated: 1) Federal individual income taxes, 2) State individual income taxes, 3) property taxes on owner-occupied housing, and 4) payroll taxes.

Development of the after-tax simulation procedures began with the March CPS annual demographic supplement. This microdata file contains demographic and economic information for approximately 58,000 sample households and the persons living in these households. It includes detailed information on household and family relationship; age; marital status; race and ethnicity; educational attainment; weeks and hours worked during the calendar year; occupation, industry, and class of worker of the job held longest during the calendar year; and income amounts for wages and salary, nonfarm and farm self-employment income, interest, dividends, rental income, estates and trusts, royalties, pension income, unemployment compensation, and sources of nontaxable income.

The second major element in the simulation system was statistical summaries of individual income tax returns compiled by the Internal Revenue Service. These statistics are made available in the IRS publication series, Statistics of Income (SOI). Some unpublished statistical summaries from the IRS were also used to develop these procedures.

A third element was the 1985 American Housing Survey microdata file. This element was used to assign property taxes paid to the March CPS sample households residing in owner-occupied housing.

Finally, in order to estimate proportions of tax filers owning homes and itemizing deductions, tabulations were made from Interview No. 5 (6) of the 1979 Income Survey Development Program.

The system for estimating taxes paid and after-tax income created a modified March CPS microdata file. This file was formed by expanding the March CPS format to include variables relevant to the simulation of taxes paid. The detailed tables contained in this report were derived from this modified March CPS data file.

Federal Income Taxes

Simulation of Federal income taxes required up to four separate operations. First was the formation and classification of tax filing units using household relationship, marital status, and dependency rules. Second, was the calculation of adjusted gross income for each of those units. Third was the simulation of amount of Federal income taxes paid. Finally, the calculation of earned income tax credits was made, when applicable.

Formation and classification of Federal income tax filing units. A Federal tax filing "unit" was defined as any individual (or married couple) with either \$400 in self-employment income, \$1,000 in wages or salary, or a total of \$1,000 in interest, dividends, rents and royalties, estates and trusts, or pension income in 1986. These income levels were chosen because they either corresponded to tax laws or helped bring the estimated number of filing units on the CPS in line with 1986 IRS Statistics of Income (SOI) data.

The next step in the formation of Federal tax filing units was the assignment of dependency status. The algorithm for assigning dependency for each tax unit used the following rules:

- All filing primary family householders and spouses were included as dependents on their own tax returns.
- All children under age 15 who were members of the primary family were counted as dependents on the return of the family householder. Children aged 15 and over (except related subfamily members) with a total taxable income of less than \$1,000 were assigned dependency to the tax return of the primary family householder. Children aged 15 and over who were students were assigned dependency to the primary family householder regardless of income level.
- All other primary family members (except related subfamily members) with taxable income of less than \$1,000 were assigned as dependents on the tax return of the primary family householder.
- Related subfamilies having at least one Federal tax filing unit were treated separately in the same manner as primary families. Members of a related

subfamily containing no Federal tax filing unit were assigned dependency to the tax return of the primary family householder.

- All unrelated subfamilies were treated in the same manner as primary families.
- Primary and secondary unrelated individuals age 15 and over were treated as dependents only on their own tax returns.

All simulated filing units were classified into one of three return types. Married couples and persons whose marital status was "married, spouse absent in Armed Forces" were assumed to file joint returns. Unmarried family householders with dependents were assumed to file head of household returns. All other persons classified as Federal tax filing units were assumed to file as single individuals.

Computation of adjusted gross income and capital gains. Adjusted gross income (AGI) for each simulated tax filing unit was calculated by summing the income amounts from all taxable sources and an imputed amount for capital gains. The sources of CPS income included in AGI were wages and salaries, net farm and nonfarm self-employment income, net rental and royalty income, dividends, interest, estates and trusts, and income from private and government pensions.

Capital gains were imputed to tax filing units based on data obtained from a Statistics of Income (SOI) public use file and reports summarizing information reported on Federal tax returns. These data provide estimates of the probability that a filing unit in a given matrix cell reported capital gains and the mean amount of capital gains for that cell. The variables in this probability matrix were: level of AGI, type of return, and age of tax filer. A Monte Carlo technique was used to randomly assign capital gains: a random number (between 0 and 1) was generated for each filing unit; if that number was less than or equal to the probability of filing units in that matrix cell reporting capital gains, the mean amount of capital gains, as computed above, was added to that unit's AGI. This procedure does not control on other characteristics that might affect the allocation of this source of income.

In the calculation of adjusted gross income, a portion of unemployment compensation was also included in AGI if the sum of AGI and unemployment compensation for that tax unit exceeded \$12,000 (\$18,000 for joint returns). In these cases, the lesser of 1) the amount of unemployment compensation or 2) one-half of the difference between the sum of AGI and unemployment compensation and the income limit was included in AGI.

In 1986, a portion of Social Security income was included in AGI if the sum of AGI and half of the total Social Security amount exceeded \$25,000 (\$32,000

for joint returns). In these cases, the lesser of 1) one-half of the Social Security payments or 2) one-half of the difference between the modified AGI and the income limit was included in AGI.

In 1986, married-couple filing units in which both spouses had earnings were allowed to deduct 10 percent of the earned income of the lesser-earnings spouse (to a maximum of \$3,000). This adjustment is reflected in the 1986 tax model. In addition, payments to Individual Retirement Accounts (IRA's) were simulated for the 1986 tax model. The May 1983 CPS pension supplement (updated annually with SOI data) was used to estimate probabilities of tax-filing units contributing to IRA's and the average amounts contributed. These probabilities were then used to assign IRA contributions to individual tax-filing units on the CPS file. The IRA payments were deducted from the total income received by the tax-filing units in order to compute adjusted gross income.

Computation of taxable income and taxes paid. Taxable income was computed by subtracting the estimated allowable deductions from AGI. The first step in this process consisted of predicting which filing units itemized deductions.

Homeownership was determined to be the most important variable available from the CPS for assigning itemization status to tax filers. Outlined below is a step-by-step description of the procedures used to assign itemization status.

1. A statistical match was made of the March CPS and American Housing Survey (AHS) data files in order to assign a monthly mortgage amount and a property tax amount to each owner-occupied unit on the March CPS file.¹
2. Probabilities of itemizing for homeowner, tax-filing units were computed by size of monthly mortgage payment from the 1979 Income Survey Development Program (ISDP) test panel. Probabilities for renters were computed by AGI level.
3. The probabilities described in step 2 were used to randomly assign itemization status within monthly mortgage (or AGI) intervals using the same Monte Carlo technique used in the assignment of capital gains.
4. The amount of itemized deductions for tax filing units was computed using a matrix showing the ratio of itemized deductions to AGI for all units by AGI interval, type of tax return, and presence of a home mortgage. The ratios of itemized deductions to AGI were computed using a 1984 SOI public use file and 1986 SOI data.

¹A detailed description of the CPS-AHS statistical match can be found later in this appendix.

Next, a standard deduction was estimated for each tax filing unit by multiplying the number of exemptions by \$1,090. Taxable income was then estimated by subtracting the itemized and standard deductions from AGI. Tax liability was then computed using the appropriate tax schedule for that simulated return type.

The dependent child care credit was simulated for the 1986 Federal tax model and subtracted from the total tax liability. This credit allows tax filers to deduct a portion of child care expenses while they work or look for work. Data from the June 1982 CPS supplement were used to estimate probabilities of tax filers paying for child care.

The simulation procedures do not capture variations in proportions of income paid in taxes within AGI intervals. The proportion of income paid in taxes for households with similar AGI amounts may differ relative to factors such as race, age of household members, number of household members, and marital status. The extent to which these variations exist has not been measured, therefore, caution should be used when interpreting relatively small differences between the incomes of various subgroups of the population.

The lack of variation in proportions of income paid in taxes within AGI intervals is due in large part to the use of aggregate-level IRS data in the simulation process, as described previously in the appendix. The use of aggregate-level IRS data was necessary because the detailed information needed to simulate tax liability was not available on an individual-level basis (i.e., from a matched CPS-IRS microdata file).

State Individual Income Taxes

There were 44 States that required payment of individual income taxes in 1986. For the purpose of this model, the definitions of tax filing units and AGI used for the estimation of Federal income taxes were also used for the simulation of State income taxes.

The amounts of State individual income taxes paid were computed by developing a model of each State's income tax regulations. Information on the State tax systems was obtained from a publication entitled, *State Tax Handbook*, October 1, 1986. While every detail of each State's income tax system was not simulated, most of the important aspects were accounted for.

Property Taxes on Owner-Occupied Housing

In order to simulate property taxes for owner-occupied housing units, the March 1987 CPS simulation file was statistically matched to a file from the 1985 American Housing Survey (AHS). Since the AHS

file contained responses to questions on annual property tax expenses the statistical match allowed the transfer of property tax amounts to CPS records when a CPS and AHS household were found to have similar characteristics. The group of variables used to match the two files were: age of householder, State, SMSA and central-city status of the household, household income, household size, number of living quarters, and the race, sex, and educational attainment of the householder. Using a very detailed combination of recodes based on the above variables, the two files were matched. If there was no AHS household with the exact combination of characteristics as a particular CPS household, a match was then attempted at a new level that did not have quite as much detail. This was repeated until a match was found for every CPS household.

Households on the AHS file that did not answer the question dealing with property tax expenses were ineligible for the match. Since monthly mortgage expenses, which were used to simulate itemization status for Federal taxpayers, were also assigned to CPS households using this match, households that did not answer the AHS questions on that subject were similarly excluded from the match.

Property taxes paid on secondary residences, such as vacation homes, could not be simulated. Also, the proportion of rent that pays the property taxes on renter-occupied housing units was not estimated.

The estimation procedures for property taxes paid by homeowners produces estimates that do not correspond precisely with those available from the AHS. These differences are mainly the result of differing universes and use of the statistical matching procedure. In 1983 the published AHS estimate of median property taxes was \$564, compared with an estimate of \$541 based on the March CPS simulation.

Payroll Taxes

The Social Security payroll tax (FICA) was simulated using occupation of longest job and earnings data reported on the CPS.² Social Security payroll taxes were calculated directly from the reported CPS earnings using the Social Security payroll tax formula for 1986. For wages and salary, the tax rate used was 7.15 percent up to a maximum of \$42,000.

The tax rate for self-employment was 12.3 percent of the amount between \$400 and \$42,000. Not all workers were assigned coverage under Social Security and, therefore, a small number were not subject to

²According to the National Income and Product Accounts published by the Bureau of Economic Analysis (BEA), Social Security (FICA) payments are not treated as taxes. Instead, they are included under Federal Government receipts as "Contributions for Social Insurance." We have included them under the broad heading of taxes as they are mandatory deductions from gross earnings.

Social Security taxes. All Federal employees and specific proportions of workers in certain occupation groups were assigned noncovered status. Unpublished statistics supplied by the Social Security Administration were used to make these assignments.

COMPARISON OF SIMULATION RESULTS WITH DATA FROM IRS AND OTHER INDEPENDENT SOURCES

The procedures described in the preceding section were translated into a computer simulation model. Tables C-1 through C-3 in this section provide a basic evaluation of the accuracy of this model by presenting comparison of the simulation results with data from independent sources.

Number of Federal Tax Filing Units and Amount of Adjusted Gross Income

Shown in tables C-1 and C-2 are comparisons of IRS and CPS distributions of adjusted gross income and number of returns with specified income types. The 1986 CPS tax simulation yielded 103.5 million Federal tax filing units, about the same as the 1986 preliminary IRS Statistics of Income figure of 103.3 million. The CPS simulated aggregate adjusted gross income was \$2,569.4 billion, which was slightly higher than the preliminary IRS figure of \$2,522.5 billion. While the CPS and IRS adjusted gross income amounts are very close, there are major differences in the components of total adjusted gross income. Although the IRS data indicate a larger amount of interest income than the CPS, the CPS recorded significantly larger amounts of self-employment income. Larger total amounts of self-employment income by the CPS can be attributed to the far fewer number of losses

Table C-1. Comparison of IRS and CPS Simulated Number of Federal Individual Income Tax Returns, by Adjusted Gross Income: 1986

(Numbers in thousands)

Adjusted gross income	Number of returns		Percent difference
	CPS	IRS	
Total	103,473	103,300	0.2
Under \$2,000	5,604	6,344	*-11.7
\$2,000 to \$3,999	8,016	6,793	*18.0
\$4,000 to \$5,999	6,494	6,837	-5.0
\$6,000 to \$7,999	5,927	6,452	*8.1
\$8,000 to \$9,999	5,391	6,345	*-15.0
\$10,000 to \$11,999	5,420	5,739	-5.6
\$12,000 to \$14,999	7,684	8,031	-4.3
\$15,000 to \$19,999	10,966	11,358	-3.5
\$20,000 to \$24,999	9,483	9,236	2.7
\$25,000 to \$29,999	7,819	7,546	3.6
\$30,000 to \$39,999	12,289	11,535	*6.5
\$40,000 to \$49,999	7,531	7,516	0.2
\$50,000 to \$74,999	7,206	6,472	*11.3
\$75,000 and over	3,641	3,095	*17.6

*Significant at the 90-percent confidence level.

reported in the survey than on tax returns. The reasons for these differences are not fully understood. The smaller amounts of interest income on the CPS can be attributed to survey underreporting.

Number of Federal Taxable Returns and Amount of Taxable Income

The 1986 CPS simulation estimated 84.4 million Federal tax filing units with taxable income (after credits). This estimate is not significantly different from the IRS preliminary figure of 84.3 million. (See table C-3.)

While, overall, there are relatively small differences between the simulated CPS number of taxable returns, there are significant differences in many of the AGI

Table C-2. Comparison of IRS and CPS Simulated Number of Federal Individual Income Tax Returns and Adjusted Gross Income, by Type of Income: 1986

(Numbers in thousands and aggregate adjusted gross income in billions of dollars)

Type of income	Number of returns		Aggregate adjusted gross income			
	CPS	IRS	CPS		IRS	
			Amount	Percent distribution	Amount	Percent distribution
Total AGI	103,473	103,300	2,569.4	100.0	2,522.5	100.0
Wages and salary	87,916	88,587	2,069.8	80.6	2,046.1	81.1
Nonfarm self-employment	9,799	12,431	151.3	5.9	90.4	3.6
Farm self-employment	1,599	2,533	11.3	0.4	-6.9	-0.3
Interest	63,333	65,490	127.9	5.0	168.2	6.7
Dividends, rents, royalties, and estates or trusts	17,032	(NA)	67.2	2.6	58.9	2.3
Pensions	¹ 12,903	14,850	1101.7	4.0	108.5	4.3
Other income minus adjustments	(NA)	(NA)	40.2	1.6	57.3	2.3

NA Not available.

¹Includes nontaxable pensions or the nontaxable portions of pensions.

intervals as shown in table C-3. The smaller number of returns in the "Under \$5,000" category for the CPS (about 32 percent less) results mainly because the procedures did not simulate tax returns for dependents specifically.

Amount of Federal Income Taxes Paid (Net Tax Liability)

According to the CPS simulation, the total amount of Federal individual income taxes paid in 1986 was \$364.4 billion, about 14 percent of the estimated CPS adjusted gross income. (See table C-3.) This estimate is not significantly different from the IRS total of \$370.9 billion in net tax liability (after credits) for 1986. Overall, the IRS and CPS proportion of taxes paid by adjusted gross income level are quite similar as indicated in table C-3.

State Income Taxes Paid

The CPS tax simulation yielded \$83.8 billion in State income taxes paid in 1986. According to the Bureau of the Census publication entitled *Quarterly Summary of State and Local Tax Revenue: October-December 1986*, the net amount of individual income taxes collected

by the States during calendar year 1986 was \$70.3 billion. The overestimation of State income taxes paid by the CPS tax simulation can be attributed to several factors. First, the simulation did not account for every detail of each State's income tax regulations. Second, the simulation did not include various State tax credits and exemptions which could not be computed from the data available on the March CPS file; these included credits for home energy-saving expenditures, and charitable contributions.

Payroll Taxes

According to the simulation, Social Security payroll taxes totaled \$138.1 billion in 1986. This estimate is not significantly different than the aggregate amount of \$138.0 billion according to figures from the Social Security Administration.

Amount of Property Taxes

The simulation produced an estimated \$50.9 billion in property taxes for 1986. This compares with the \$50.4 billion figure published in the National Income Accounts by the Bureau of Economic Analysis (BEA).

Table C-3. Comparison of IRS and CPS Simulated Number of Taxable Returns, Federal Income Tax, and Income Taxes Paid as a Percent of Adjusted Gross Income: 1986

(Numbers in thousands and taxes in billions of dollars)

Adjusted gross income	Number of taxable returns			Federal income ¹ tax after credits		Federal income taxes as a percent of adjusted gross income	
	CPS	IRS	Percent difference	CPS	IRS	CPS	IRS
Total	84,420	84,265	0.2	364.4	370.9	14.2	14.7
Under \$5,000 ¹	2,524	3,734	*-32.4	0.2	0.4	0.4	3.8
\$5,000 to \$5,999	2,111	2,089	1.1	0.4	0.4	2.1	2.3
\$6,000 to \$7,999	3,965	4,199	-5.6	1.4	1.5	3.4	3.3
\$8,000 to \$9,999	4,289	5,036	*-14.8	2.2	2.6	4.6	4.6
\$10,000 to \$11,999	5,120	5,265	-2.8	3.7	3.7	6.3	5.9
\$12,000 to \$14,999	7,513	7,660	-1.9	7.7	7.8	7.6	7.2
\$15,000 to \$19,999	10,931	11,129	-1.8	17.2	17.4	9.1	8.8
\$20,000 to \$24,999	9,481	9,158	3.5	21.9	20.9	10.4	10.1
\$25,000 to \$29,999	7,819	7,496	4.3	23.9	22.8	11.2	11.0
\$30,000 to \$39,999	12,289	11,471	*7.1	52.3	48.6	12.4	12.2
\$40,000 to \$49,999	7,531	7,503	0.4	47.4	45.8	14.1	13.7
\$50,000 to \$74,999	7,206	6,447	*11.8	72.5	62.4	17.0	16.2
\$75,000 and over	3,641	3,077	*18.3	113.6	136.7	24.7	27.9

*Significant at the 90-percent confidence level.

¹Single returns with AGI less than \$3,560 and joint returns with AGI less than \$5,830 were not considered taxable under the CPS simulation, even though a small percentage of those returns do incur a tax liability.

Appendix D. Source and Reliability of Estimates

SOURCES OF DATA

Data from the Annual Housing Survey (AHS, now called the American Housing Survey), the Income Survey Development Program (ISDP), and the Internal Revenue Service (IRS) were combined with Current Population Survey (CPS) data to create simulations of taxes paid, number of tax filing units, adjusted gross income, and other tax characteristics for the March 1987 CPS. Data from the AHS and the Consumer Expenditure Survey (CE) were used with the CPS data to evaluate the number and condition of persons in poverty.

In addition, this report uses unpublished data from the Social Security Administration (SSA); administrative data from the Office of Personal Management (OPM); data from the National Income Accounts prepared by the Bureau of Economic Analysis (BEA); the *State Tax Handbook* from Commerce Clearing House; and the Bureau of the Census Publication, *Quarterly Summary of State and Local Tax Revenue: October-December 1986* as information sources for tax data. For poverty data, this report uses administrative records from the Department of Agriculture (USDA), the Health Care Financing Administration (HCFA), and the Veterans' Administration.

A description of sources of data from which these estimates were derived follows. Except for the CPS, these descriptions are brief. See the other appendices of this report and publications on the appropriate surveys for more details.

American Housing Survey. The Bureau of the Census collects housing data for the Department of Housing and Urban Development. The population covered by the sample for the AHS, which was called the Annual Housing Survey before 1984, includes all housing units in the United States. A structure must meet specific criteria developed by the Bureau of the Census before it is termed a housing unit. For a more detailed description of the sample design see the report *Current Housing Reports, Series H-150-85, Financial Characteristics of the Housing Inventory, Annual Housing Survey: 1985, Part C*, U.S. Department of Commerce.

The AHS is no longer conducted in even-numbered years, so property tax estimates in this report are based on the 1985 AHS. Also, for the noncash estimates, 1985 AHS data were used in a model to

estimate the value of public housing. For more details on the AHS model used to estimate public and subsidized housing values, please see appendix B of this report.

Income Survey Development Program. The ISDP was the research and development phase for the Survey of Income and Program Participation (SIPP). The ISDP was used to examine and resolve design, operational, and technical issues for SIPP. The household sample for the 1979 ISDP was a nationwide multiple-frame sample. The majority of sample households in the ISDP came from addresses contacted in the 1976 Survey of Income and Education. The remainder of sample households were selected from a reserve file of sample cases maintained by the Census Bureau. For a more detailed description of this sample design, see the report, *Wage and Salary Data from the Income Survey Development Program: 1979 (Preliminary Data from Interview Period One)*, Current Population Reports, Series P-23, No. 118.

Internal Revenue Service Data. Much of the IRS data in this report comes from the Statistics of Income (SOI) series, in particular, the SOI Bulletin, *Individual Income Tax Returns, Preliminary Data: 1986, Winter 1987-88*. This report, based on a sample drawn from all tax returns filed through September 1987, presents information on taxpayers' incomes, exemptions, deductions, credits, and taxes. Another report which gives complete information on 1985 tax returns is the SOI Report, *Individual Income Tax Returns - 1985, April 1988*.

Data from other sources. Administrative statistics on Federal retirement taxes from the OPM and on Social Security taxes from the SSA are from unpublished records kept by those agencies. Data on property taxes are from administrative statistics published by the BEA in the July 1987 issue of *Survey of Current Business*. Data on State income taxes are from administrative records published by the Bureau of the Census in the publication, *Quarterly Summary of State and Local Tax Revenue: October-December 1986*. Information on state tax systems is published in *State Tax Handbook, October 1, 1986*, from Commerce Clearing House.

Much of the data on cash and noncash benefits are from administrative records. Values of school lunches

and food stamps are from USDA unpublished data. Medicaid and Medicare data come from HCFA unpublished records. Information on veterans' pensions were obtained from Veterans Administration unpublished data. Supplemental Security Income (SSI) and Aid to Families with Dependent Children (AFDC) amounts are from administrative records published in the Social Security Bulletin. Recipient value for food expenditures was estimated from 1972-3 CE data.

Current Population Survey

The CPS estimates in this report came from the March CPS and from supplementary questions to the March CPS. The Bureau of the Census conducts the CPS for the Bureau of Labor Statistics (BLS).

Basic CPS. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Census Bureau interviewers ask questions relating to labor force participation about each member in every sample household.

Since the CPS began in 1948, the Census Bureau has redesigned the sample several times to improve data quality and reliability and to meet changing data needs. The last CPS redesign was phased in beginning in April 1984 and was completed in July 1985. During that time, the sample included housing units in both the old and new designs.

The present CPS sample, which represents all 50 States and the District of Columbia, was selected from the 1980 decennial census files. The sample is continually updated to reflect new construction. CPS sample housing units are located in 729 sample areas which include 1,973 counties, independent cities, and minor civil divisions. Each month approximately 59,500 occupied housing units are eligible for interview; of these, about 2,500 are designated noninterviews, because interviewers cannot find the occupants at home after repeated calls or cannot obtain an interview for some other reason.

The following table displays some information about the basic CPS sample designs in use during the referenced data collection periods.

Design of the Basic Current Population Survey

Interview period	Number of sample areas	Housing units eligible	
		Interviewed	Not interviewed
1986-87	729	57,000	2,500
1985.....	629/729	57,000	2,500
1982-84.....	629	59,000	2,500
1980-81.....	629	65,500	3,000

March supplement. In addition to the basic CPS questions described above, interviewers ask supplementary questions every March about money income

and work experience for the previous year. To obtain more reliable data for the Hispanic population, the Census Bureau enlarges the March CPS sample to include all households from the previous November with at least one sample person of Hispanic origin (approximately 3,000 in November 1986). Also, for this report, the Census Bureau interviews only those Armed Forces members who live with civilian adults.

Because the CPS is designed primarily to provide labor force estimates, it is not an optimal design for the types of information covered in the supplements. Therefore, estimates from the supplements may vary more than estimates from a sample designed specifically to produce estimates of the items covered in the supplement such as income. See the section on reliability below for a more detailed discussion.

CPS estimation procedure. Estimates from this survey are calculated by inflating the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, sex, and Hispanic origin. These independent estimates are based on statistics from decennial censuses of population; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. The independent population estimates used in this report come from the 1980 decennial census. For data in this report, the sample estimates are adjusted so that the husband and wife in a household receive the same sample weight.

Simulation techniques are used to obtain estimates of after-tax income based on CPS data. For more details on this procedure, see the pertinent sections of this report.

RELIABILITY OF ESTIMATES

Because the CPS estimates come from a sample, they may differ somewhat from figures from a complete census using the same questionnaires, instructions, and enumerators. There are two types of errors possible in a sample survey estimate, sampling and nonsampling, and the accuracy of a survey result depends on both types of errors. The full effect of the nonsampling error is unknown, so exercise care when interpreting figures based on a relatively small number of cases or on small differences between estimates.

The standard errors provided here primarily measure the CPS sampling error. They also partially measure the effect of some of the CPS nonsampling errors in responses and enumeration, but they do not include any systematic biases in the data. (Bias is the difference, averaged over all possible samples, between the sample estimates and the desired value.)

These standard errors, computed from CPS data alone, do not reflect any sampling or nonsampling errors present in data from other sources. In addition, these standard errors do not entirely apply to estimates from the CPS simulation. No data are available on the size of these additional error sources, so use caution when interpreting such estimates.

Nonsampling variability. Nonsampling variability, or nonsampling error, is variation that would occur whether a sample or a complete census was taken. Nonsampling error is present in both the CPS and other data sources mentioned in this report. The interaction of nonsampling errors when combining data from many surveys may result in an additional component of error. The CPS simulation introduces still another error component. The total extent of these additional errors is unknown.

Nonsampling error arises from many sources. For example, respondents may be unable or unwilling to provide correct information, may have trouble recalling information, or may interpret questions or define terms differently from what was intended. The data are subject to several potential sources of error: collection errors in recording or coding data, processing errors, and errors in estimating values for missing data. Additionally, the Census Bureau may be unable to obtain information about all cases in the sample, or may fail to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample housing units. CPS coverage is about 7 percent lower than the 1980 decennial census. CPS undercoverage varies with age, sex, and race: generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race-Hispanic population controls, as described earlier, partially corrects for the bias from survey undercoverage. However, biases still exist in the estimates to the extent that missed persons are different from interviewed persons in the same age-sex-race-Hispanic group. Also, the independent population controls are not adjusted for 1980 census undercoverage.

Answers to questions about income or noncash benefits often depend on the memory or knowledge of one person in a household, usually the wife. For this reason, recall problems can cause underestimates of income in survey data, because people can easily forget minor or irregular sources of income. Respondents may also misunderstand what the Census Bureau considers income or noncash benefits, or may simply be unwilling to answer these questions correctly because they think the questions are too personal. For more discussion, see the section on underreporting of income.

For additional information on nonsampling error including the possible effect on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Sampling variability. Sampling variability is variation that occurs by chance because a sample was surveyed rather than the entire population. The standard errors given in the following tables are primarily measures of sampling variability, although they also include some of the effect of nonsampling error.

Standard errors are used to determine the reliability of survey estimates and to evaluate the statistical validity of conclusions made about the data. For example, a conclusion that the difference between two estimates is statistically significant can be verified using standard errors.

Two procedures, confidence interval estimation and hypothesis testing, are commonly used to test for statistical validity. The confidence interval is a range about the sample estimate constructed so that, if the survey was repeated a large number of times under the same general conditions, the confidence intervals would include the average result of all possible samples with a known probability. For example, approximately 90 percent of intervals with a range of 1.6 standard errors below the estimate to 1.6 standard errors above the estimate include the average result of all possible samples. A particular interval may not contain the average result, but one can be 90 percent confident that it does.

Some statements in the report may contain estimates followed by another number. For such statements, simply add that number to and subtract it from the estimate to calculate the upper and lower bounds of the 90 percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (± 1.0)," then the 90-percent confidence interval for the estimate, 1.7 percent, is from 0.7 to 2.7 percent.

Hypothesis testing uses sample estimates to distinguish between true population values. One common type of hypothesis is that two population values are different. Comparing the Black poverty rate to that of Whites is an example.

Tests may be performed at various levels of significance. The significance level of a test is the probability of concluding that two parameters are different when, in fact, they are not. For example, for a statement of difference to pass at the 0.10 significance level, the absolute value of the difference between the estimates must be greater than 1.6 times the standard error of the difference.

The Census Bureau uses as standard statistical testing criteria 90-percent confidence intervals and 0.10 significance levels. Past reports in this series have used 95-percent confidence intervals and 0.05 significance levels, which require differences of at least 2.0 times the standard error. Consult standard textbooks on statistics for alternative criteria.

Comparability with other data. As described earlier, data obtained from the CPS are not fully comparable with data from other government sources, mostly because of differences in interviewer training and experience and different survey procedures. This is another component of error not reflected in the standard error tables.

Also, because the CPS simulations described in this report include data from other government agencies, the standard error tables do not reflect all sources of error in the CPS simulations. Therefore, exercise caution when using the standard error tables to compare data from the CPS or CPS simulation with data from other agencies.

Note when using small estimates. Summary measures (such as means, medians, and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates are provided primarily to enable the data user to combine categories as needed.

Take care when interpreting small differences: even a small amount of nonsampling error can distort a seemingly valid hypothesis test if it involves a borderline difference.

Standard errors for data from surveys other than CPS. To compute standard errors of data obtained from the SOI reports, see the SOI Bulletin, *Individual Income Tax Returns, Preliminary Data: 1986*, Winter 1987-88. Additional information on standard errors of different taxes and sources of income can be found in the SOI Bulletin, *Individual Income Tax Returns, 1985*, April 1988. To compute standard errors of AHS data, see any of the reports in the series Current Housing Reports, Series H-150-85, Annual Housing Survey for 1985. Standard errors for 1972-73 CE data are available upon request from the Bureau of Labor Statistics (Division of Living Conditions Studies, Office of Prices and Living Conditions). Data from other sources are from administrative records and as such are not subject to sampling error.

STANDARD ERROR TABLES

Standard errors for data from the CPS sample. To derive, at a moderate cost, standard errors for all estimates in this report, the Census Bureau has made several approximations. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided here show the order of magnitude of the standard error of an estimate rather than the precise standard error.

Standard error tables and their use. There are two ways to estimate standard errors from the tables provided. The first way is to use the figures presented in tables D-1 through D-8 to approximate the standard errors of various estimates for households, families, unrelated individuals, and persons. To approximate the standard error for a specific characteristic, multiply the appropriate standard error in tables D-1 through D-8 by the factor for that characteristic given in tables D-9 through D-11. These factors adjust the generalized standard errors for the combined effect of sample design and the estimating procedure on the value of the characteristic.

Use linear interpolation to approximate standard errors for intermediate values not shown in the generalized tables of standard errors.

The second method uses the parameters, a and b , presented in tables D-9 through D-11. Each type of characteristic has its own set of parameters. These parameters were used to calculate the standard errors in tables D-1 through D-8 and the factors in tables D-9 through D-11. They also may be used to calculate the

Table D-1. Standard Errors of Estimated Numbers of Households, Families, Unrelated Individuals, and Persons for 1986 CPS and CPS Tax Simulations: Total or White

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75	12	7,500	117
100	14	10,000	134
250	22	15,000	162
500	31	25,000	203
1,000	43	50,000	264
2,000	61	100,000	299
3,000	75	125,000	284
5,000	96	160,000	217

Note: Standard errors in this table are calculated using $a = -0.000010$ and $b = 1,896$ from table D-9.

Multiply these standard errors by the appropriate factor from table D-9 to obtain the correct standard error.

Table D-2. Standard Errors of Estimated Numbers of Households, Families, Unrelated Individuals, and Persons for 1986 CPS and CPS Tax Simulations: Black or Hispanic

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75	12	3,000	74
100	14	5,000	91
250	23	7,500	105
500	32	10,000	112
1,000	45	15,000	113
2,000	62	20,000	95

Note: Standard errors in this table are calculated using a = -0.000081 and b = 2,067 from table D-9.

Multiply these standard errors by the appropriate factor from table D-9 to obtain the correct standard error.

standard errors for estimated numbers and percentages directly. Computing the standard errors directly from the parameters gives more accurate results than using the standard error tables. Methods for computation follow.

Standard errors of estimated means and medians are provided in the detailed tables.

Standard errors of estimated numbers. To approximate the standard error, s_x , of an estimated number shown in this report from the standard error tables, use the formula

$$s_x = fs \tag{1}$$

where f is the appropriate factor from table D-9, D-10, or D-11, and s is the standard error of the estimate obtained by interpolating in tables D-1 through D-4. For a more accurate approximation, use the formula

$$s_x = \sqrt{ax^2 + bx} \tag{2}$$

from which the standard errors in tables D-1 through D-4 were calculated. Here x is the size of the estimate and a and b are the parameters from table D-9, D-10, or D-11 for the particular characteristic.

When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters which gives the largest standard error.

Computing the standard error of an estimated number— illustration. There were 4,230,000 households with before-tax incomes between \$25,000 and \$27,499 in 1986. Using formula (1), the appropriate factor from table D-9 (1.0), and interpolation from table D-1, the approximate standard error is

$$s_x = (1.0)(88,000) = 88,000$$

Alternatively, using formula (2), with a = -0.000010 and b = 1,896 from table D-9, the approximate standard error is

$$s_x = \sqrt{(-0.000010)(4,230,000)^2 + 1,896(4,230,000)} = 89,000$$

So the 90-percent confidence interval for the number of households with incomes between \$25,000 and \$27,499 before taxes is from 4,088,000 to 4,372,000, i.e., 4,230,000 ± 1.6(89,000). Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, whose numerator and denominator are both sample estimates, depends on its size and on the size of its base (i.e., the total on which it is based). An estimated percentage is relatively more reliable than the corresponding estimate of its numerator, particularly if the percentage is 50 percent or greater.

To compute a standard error for a poverty rate, use the procedure for an estimated ratio. Otherwise, when the numerator and denominator are in different categories, use the factor or parameters from table D-9, D-10, or D-11 for the numerator.

Again, there are two ways to estimate the standard error of a percentage, $s_{x,p}$. To approximate the standard error using the standard error tables (tables D-5 through D-8), use the formula

$$s_{x,p} = fs \tag{3}$$

In this formula, f is the appropriate factor from table D-9, D-10, or D-11 and s is the standard error of the estimate from tables D-5 through D-8.

For a more accurate approximation, use

$$s_{x,p} = \sqrt{(b/x) p (100-p)} \tag{4}$$

from which the standard errors in tables D-5 through D-8 were calculated. Here x is the base of the percentage, p is the percentage (0 ≤ p ≤ 100), and b is the parameter from table D-9, D-10, or D-11 for the characteristic in the numerator.

Table D-3. Standard Errors of Estimated Numbers of Families Below the Poverty Level: 1986

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75	12	5,000	112
100	14	7,500	142
250	23	10,000	170
500	32	15,000	223
1,000	46	25,000	323
2,000	67	50,000	560
3,000	83	100,000	1,023

Note: Standard errors in this table are calculated using a = +0.000084 and b = 2,067 from table D-10.

Multiply these standard errors by the appropriate factor from table D-10 or D-11 to obtain the correct standard error.

Table D-4. Standard Errors of Estimated Numbers of Persons Below the Poverty Level: 1986

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75	27	7,500	264
100	31	10,000	304
250	49	15,000	368
500	69	25,000	464
1,000	98	50,000	616
2,000	138	100,000	744
3,000	169	125,000	750
5,000	217	160,000	701

Note: Standard errors in this table are calculated using $a = -0.000041$ and $b = 9,628$ from table D-10.

Multiply these standard errors by the appropriate factor from table D-10 or D-11 to obtain the correct standard error.

Computing the standard error of an estimated percentage— illustration. In 1986, 4.7 percent of the 89,479,000 households had before-tax incomes between \$25,000 and \$27,499. Using formula (3), the appropriate factor from table D-9 (1.0), and $s = 0.1$ (interpolating from table D-5), the standard error of 4.7 percent is approximately

$$s_{x,p} = (1.0)(0.1) = 0.1$$

Using formula (4) and $b = 1,896$ from table D-9, the standard error of 4.7 percent is approximately

$$s_{x,p} = \sqrt{(1,896/89,479,000)4.7(100.0 - 4.7)} = 0.1$$

So, rounded to one decimal place, the 90-percent confidence interval for the estimated percentage of households with before-tax incomes of \$25,000 to \$27,499 is from about 4.5 percent to about 4.9 percent, i.e., 4.7 percent \pm 1.6(0.1 percent).

Standard errors of estimated differences. For a difference between two sample estimates, the standard error is approximately

$$s_{x-y} = \sqrt{s_x^2 + s_y^2 - 2rs_x s_y} \quad (5)$$

where s_x and s_y are the standard errors of the estimates x and y , and r represents the correlation between the two estimates. The estimates can be numbers, percentages, ratios, etc. For differences between before- and after-tax estimates, and for other alternate income definitions, assume a value of 0.7 for r . For all other differences, assume that r is equal to zero.

Computing the standard error of an estimated difference— illustration. The median before-tax 1986 income of White households was \$26,175 and the median before-tax 1986 income of Black households was \$15,080. The published estimates of the standard errors of these medians are \$127 and \$296, respectively. Therefore, the standard error of the estimated difference of \$11,095 is about

$$s_{x-y} = \sqrt{(127)^2 + (296)^2} = 322$$

This means that the 90-percent confidence interval around the difference is from \$10,580 to \$11,610. Because this interval does not contain zero, we can conclude with 90-percent confidence that 1986 median before-tax income for White households was higher than 1986 median before-tax income for Black households.

Standard error of an estimated ratio. Certain mean values for persons in families or households shown in the tables were calculated as the ratio of two numbers. For example, the mean number of persons per

Table D-5. Standard Errors of Estimated Percentages of Households, Families, Unrelated Individuals, and Persons for 1986 CPS and CPS Tax Simulations: Total or White

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50

20,000	0.1	0.2	0.3	0.4	0.5

Standard errors in this table are calculated using $b = 2,067$ from table D-9.

Multiply these standard errors by the appropriate factor from table D-9 to obtain the correct standard error.

family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Ratios of before- to after-tax estimates are also discussed in this report. For example, the ratio of mean household income before and after taxes is calculated as

$$\frac{x}{y} = \frac{\text{mean household income before taxes}}{\text{mean household income after taxes}}$$

Standard errors for these ratios may be approximated as shown below. There are four cases to consider. In the first two cases, the denominator y represents a count of families or households of a certain class, and the numerator x represents a count of persons with the characteristic of interest who are members of these families or households. In the third case, the

numerator x and denominator y represent before- and after-tax estimates, and the fourth case represents different definitions of income to measure poverty.

Case 1: There is at least one person having the characteristic in every family or household of the class: for example, the mean number of persons per family or the mean number of persons per family with a male householder. For ratios of this kind, approximate the standard errors using the following formula:

$$s_{x/y} = (x/y) \sqrt{(s_x/x)^2 + (s_y/y)^2 - 2r(s_x/x)(s_y/y)} \quad (6)$$

The standard error of the estimated number of families or households, s_y , and the standard error of the estimated number of persons with the characteristics in those families or households, s_x , may be calculated

Table D-7. Standard Errors of Estimated Percentages of Families Below the Poverty Level: 1986

Base of estimated percentage (thousands)	Estimated percentage

Hispanic	-0.000807	9,475	2.14

ator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of r .

Case 2: The number of persons having the characteristic in a given family or household may be 0, 1, 2, 3, or more; for example, the mean number of persons under 18 years of age per household. For this kind of ratio, use formula (6), but assume r is equal to zero. If r is actually positive (negative), then this will overestimate (underestimate) the standard error of the ratio.

Case 3: The numerator and denominator represent before- and after-tax estimates. For example, the numerator may be the mean income of families or households of a certain type before taxes, and the denominator may be the mean income for the same category of families or households after taxes. For such ratios, s_x and s_y represent the standard errors of before- and after-tax estimates, respectively. Assume that r is equal to .7 for before- and after-tax estimates.

Case 4: The numerator and denominator are different definitions of income to measure poverty. See the sections below on poverty estimates for more detail.

Standard errors of within-year differences in poverty estimates using different income measures. Estimate the standard error for the difference of two poverty estimates (numbers or percentages), using different definitions of income to evaluate poverty, for a given year with the formula

$$s_{x,y} = s_d \quad (7)$$

The value $d = |x-y|$, is the absolute difference between the two estimates x and y . Estimate s_d from formula (1) or (2) where d is the size of the estimate, or from formula (3) or (4) where d is the estimated percentage.

by methods described earlier. In formula (6), r represents the coefficient of correlation between the numer-

¹ These factors are to be applied to table D-7 only. For estimated numbers use formula (2).

² For nonmetropolitan residence categories multiply the "a" and "b" parameters by 1.5 and the factor by 1.22.

Standard error of a ratio of two poverty estimates using different income measures. Estimate the standard error of the ratio of the number of persons in poverty using two different definitions of income with the formula

$$s_{x/y} = (x/y) \sqrt{(s_x/x)^2 - (s_y/y)^2} \quad (8)$$

where s_x and s_y are the estimates of the standard errors of the estimates x and y (poverty estimates using different methods of estimating income) as determined by formula (1) or (2).

Standard errors of estimated means and medians. Estimated standard errors are provided for the means and medians of the published income distributions and need not be calculated. However, the methods for calculating these standard errors are provided below in case some users want to combine two or more income distributions.

Standard error of an estimated mean for grouped data. Use the formula

$$s_x = \sqrt{(b/y) S^2} \quad (9)$$

to approximate the standard error of a mean, where y is the size of the base and b is the appropriate b parameter for the characteristic from table D-9, D-10, or D-11. The variance, S^2 , is equal to

$$S^2 = \sum_{i=1}^c p_i \bar{x}_i^2 - \bar{x}^2 \quad (10)$$

where
 \bar{x} = the mean of the distribution, defined by

$$\sum_{i=1}^c p_i \bar{x}_i$$

c = the number of groups: i indicates a specific group, taking on values 1 through c ;
 p_i = the estimated proportion of households, families or persons whose values for the characteristic (x -values) fall in group i ; and
 $\bar{x}_i = (A_{i-1} + A_i)/2$, where A_{i-1} and A_i are the lower and upper interval boundaries, respectively, for group i .

The value x_i is assumed to be the most representative value of the characteristic for households, families or persons in group i . Group c is open-ended, i.e., no upper interval boundary exists. For this group an approximate average value is

$$\bar{x}_c = (3/2) A_{c-1} \quad (11)$$

Contact Statistical Methods Division of the Census Bureau for the method to compute the standard error of a mean for two or more combined distributions.

Note that because the formula for the standard error of a mean involves several approximations, this statistic will generally be different from the tabled value.

Confidence interval and standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. One way to approximate the standard error of an estimated median is to determine a 68-percent confidence interval around the median and then compute the standard error from the confidence interval. (See the section on sampling variability for a general discussion of confidence intervals.) The steps below describe this method.

1. Determine the standard error on 50 percent using either formula (3) or formula (4).
2. Add to and subtract from 50 percent the standard error determined in step 1.

3. Using the distribution of the characteristic, estimate the 68-percent confidence interval for the median by calculating the values corresponding to the two points computed in step 2. Call the resultant values U and L, for the upper and lower limits of the interval, respectively.

If all income intervals in the calculation are no wider than \$2,500, calculate the upper and lower limits using linear interpolation. Use the following formula along with a cumulative percentage distribution of the characteristic.

$$x_{pN} = \frac{pN - N_2}{N_1 - N_2} (A_1 - A_2) + A_2 \quad (12)$$

where

x_{pN} = estimated value (e.g., income) for which the number of households, families, or persons, pN ($0 \leq p \leq 1$), in the distribution has larger or equal values. When calculating the confidence interval, x_{pN} is equal to U and L for the upper and lower limits, respectively.

p = the values obtained in step 2. Note that x_{pN} estimates the median when $p = 0.50$.

N = total number of households, families, or persons in the distribution.

A_1 and A_2 are the endpoints of the interval containing x_{pN} .

N_1 and N_2 = the estimated number of households, families, or persons with values of the characteristic greater than or equal to A_1 and A_2 , respectively (note that $N_1 > N_2$ here).

Use Pareto interpolation, formula (13), instead of linear interpolation, formula (12), when any income interval used in the calculation is wider than \$2,500. The formula for Pareto interpolation is

$$x_{pN} = \exp \left[\frac{\ln(pN/N_2)}{\ln(N_1/N_2)} \ln(A_1/A_2) \right] \times A_2 \quad (13)$$

where \exp is the exponential function, and \ln is the natural logarithm function. Note that logarithms and antilogarithms using base 10 or any other base produce a mathematically equivalent result.

4. After the limits of the 68-percent confidence interval are computed, compute the standard error with the formula

$$s_{\text{median}} = (U-L)/2 \quad (14)$$

This procedure can also be used to estimate standard errors for quintiles or other percentiles: simply substitute the proper percentage value for

p and follow the steps outlined above. Note that when combining distributions the resulting median or percentile may lie in an open-ended interval. To calculate such standard errors, call Housing and Household Economic Statistics Division of the Census Bureau to obtain the detailed distribution.

Pareto interpolation should only be used when computing standard errors for income, and the median (or percentile) of the income distribution falls in an interval wider than \$2,500. Because the new, more detailed income intervals used in this report have \$2,500 increments up to \$40,000 for households and families, Pareto interpolation is only needed when estimating standard errors of percentiles or medians larger than \$40,000. Therefore, no illustration of the use of Pareto interpolation is given here. If one is needed, see the source and reliability section of Current Population Reports, Series P-60, No. 123. See any of the reports in this series for an illustration of the use of linear interpolation.

Standard error of estimated per capita income. Certain mean values in this report represent the per capita

income for households of a certain class. The mean per capita income is approximately equal to

$$x = hm/p \quad (15)$$

where

h = number of households in the class,

m = mean income for households in the class,

p = number of persons in households in the class,
and

x = mean per capita income of persons in households in the class.

To approximate standard errors for these means, use the formula

$$s_x = (hm/p) \sqrt{(s_m/m)^2 + (s_p/p)^2 + (s_h/h)^2 - 2r(s_p/p)(s_h/h)} \quad (16)$$

In this formula, r represents the correlation between p and h . There are two cases to consider, depending on the nature of the class:

Case 1: The class represents households containing a fixed number of persons. For example, h could be the number of three-person households. In this case, there is an exact correlation between the number of persons in households and the number of households. Therefore, $r = 1$ for such households.

Case 2: The class represents households of other demographic types, for example, households in distinct regions, households in which the householder is of a certain age group, and owner-occupied and

tenant-occupied households. In this and other cases in which the correlation between p and h is not perfect, use .7 as an estimate of r .

Standard error of an estimated aggregate cash value.

Aggregates such as adjusted gross income or aggregate taxes paid as described in "Methodology and Procedures" are computed by multiplying the mean cash value per household or tax filing unit, \bar{x} , by the number of households or tax filing units, y :

$$T = \bar{x}y \quad (17)$$

where T is the aggregate to be computed.

Both \bar{x} and y have a standard error, so the standard error of a product must be computed. Approximate the standard error of an aggregate with the formula

$$s_T = \sqrt{\bar{x}^2 s_y^2 + y^2 s_{\bar{x}}^2} \quad (18)$$

where $S_{\bar{x}}$ is computed using formula (7) and s_y is computed using formula (2). In the above formula, the correlation r between \bar{x} and y is assumed to be zero. If r is actually positive (negative), then this formula will underestimate (overestimate) the standard error of the product. To compute standard errors of mean taxes paid, call Housing and Household Economic Statistics Division of the Census Bureau to obtain detailed distributions.

Standard error of an Index of Income Concentration.

Please contact Statistical Methods Division of the Census Bureau for the method of estimating the standard error of an index of income concentration.

Appendix E. Program Descriptions and Data Collection

This appendix contains brief descriptions of each public in-kind transfer program covered in the March CPS, a description of the questions used to collect the data, and an evaluation of the data quality. The description of each program begins with a statement of program objectives and is followed by general comments regarding program characteristics, eligibility, and so forth. Next is a review of the survey questions and the limitations associated with the question wording and design.

FOOD STAMPS

The Food Stamp Act of 1977 defines this Federally funded program as one intended to "permit low-income households to obtain a more nutritious diet." (From title XIII of P.L. 95-113, The Food Stamp Act of 1977, declaration of policy.) Food purchasing power is increased by providing eligible households with coupons which can be used to purchase food. The Food and Nutrition Service (FNS) of the U.S. Department of Agriculture (USDA) administers the Food Stamp program through State and local welfare offices. The Food Stamp program is the major national income support program to which all low-income and low-resource households, regardless of household characteristics, are eligible.

The Food Stamp Act was amended by the 1981 Omnibus Budget Reconciliation Act which changed the criteria used to determine food stamp eligibility (P.L. 97-35, title I, subtitle A). As of October 1, 1981, households without an elderly or disabled member must have gross monthly income below 130 percent of the Federal poverty level. Previously, eligibility was based on "countable" income (gross income less specified deductions for shelter, medical expenses, child care, etc.) so, e.g., a household with a gross income of twice the poverty guideline and substantial specified deductions could have been eligible for food stamps. Households meeting the income requirement may be ruled ineligible for the program on the basis of their holdings of assets (resources). The current limit for assets is \$2,000 for households with no elderly persons and \$3,000 for households with at least one elderly person. The questions on participation in the Food Stamp Program in the March CPS were designed to identify households in which one or more of the

current members received food stamps during the calendar year. Once a food stamp household was identified, a question was asked to determine the number of current household members covered by food stamps during the year. Questions were also asked about the number of months food stamps were received and the total face value of all food stamps received during that period.

SCHOOL LUNCHES

The National School Lunch Program is designed "to help safeguard the health and well-being of the Nation's children by assisting the States in providing an adequate supply of foods" (P.L. 79-396, the National School Lunch Act of 1946) for all children at moderate cost. Additional assistance is provided for children determined by local school officials to be unable to pay the "full established" price for lunches. Like the Food Stamp program, the National School Lunch Program is administered by the Food and Nutrition Service of the U.S. Department of Agriculture through State educational agencies or through regional USDA nutrition services for some nonprofit private schools.

All students eating lunches prepared at participating schools pay less than the total cost of the lunches. Some students pay the "full established" price for lunch (which itself is subsidized), while others pay a "reduced" price for lunch, and still others receive a "free" lunch. Until January 1981, children were eligible for free school lunches if their household's income was below 125 percent of the poverty guidelines or reduced-price lunches if their household's income was between 125 and 195 percent of the poverty guidelines. The term "income" basically followed the Census Bureau definition but excluded certain Federal benefits and specified "hardship" expenses. Effective January 1, 1981, the hardship exclusion was replaced by a standard deduction. (Ref. Federal Register, Vol. 46, No. 11, January 16, 1981.) Beginning August 13, 1981, the income definition was amended to a gross income concept with the standard deduction being eliminated. At the same time, the income eligibility criteria were changed to 130 percent for free lunches and to 185 percent for reduced-price lunches. (Ref. Omnibus Budget Reconciliation Act of 1981, P.L. 97-35, title VIII.)

The questions on the March CPS provide a limited amount of data for the School Lunch program. Questions concerning the program were designed to identify the number of household members 5 to 18 years old who "usually" ate hot lunches during the year. This defined the universe of household members receiving this noncash benefit. This approach was necessary because the majority of children benefit indirectly; i.e., they pay full-established price but are not aware that these lunches are subsidized. A second question identified the number of members receiving free or reduced-price lunches.

PUBLIC OR OTHER SUBSIDIZED HOUSING

There are numerous programs designed to "remedy the unsafe and unsanitary housing conditions and the acute shortage of decent, safe, and sanitary dwellings for low-income families" (U.S. Housing Act of 1937, declaration of policy). Several Federal, State, and local agencies administer these programs. Some are funded by USDA (for rural families) or State-local agencies, but most are administered by the Department of Housing and Urban Development (HUD). Among the most important HUD rental housing programs are Low Rent Public Housing and Sections 8, 236, and 101 (rent supplements) of various U.S. Housing Acts.

Low Rent Public Housing projects are owned, managed, and administered by a local housing authority. Partial financing may be provided by the State or HUD. Participation in public housing is determined by two factors: program eligibility and the availability of housing. Income standards for initial and continuing occupancy vary by local housing authority, although the limits are constrained by Federal guidelines. Rental charges, which, in turn, define net benefits, are set by a Federal statute not to exceed 30 percent of adjusted monthly money income. A recipient household can be a family or two or more related persons or an individual who is handicapped, elderly, or displaced by urban renewal or natural disaster. Other HUD programs provide similar types of housing assistance to low-income families and individuals.

Two of the more common types of programs in which Federal, State, and local funds are used to subsidize private sector rental housing are rent supplement and interest reduction plans. Under a rent supplement plan (e.g., Sections 8 and 101), the difference between the "fair market" rent and the rent charged to the tenant is paid to the owner by a government agency. Under an interest reduction program (e.g., Section 236), the amount of interest paid on the mortgage by the owner is reduced so that subsequent savings can be passed along to low-income tenants in the form of lower rent changes.

There were two questions dealing with public and low-cost rental housing on the March CPS supplement questionnaire. The first question identified residence in a housing unit owned by a public agency. The second question identified beneficiaries who were not living in public housing projects but who were paying lower rent because of a government subsidy.

MEDICAID

The Medicaid program is designed to furnish medical assistance for needy families with dependent children and for aged, blind, or disabled individuals whose incomes and resources are insufficient to meet the costs of necessary medical services.¹ The program is administered by State agencies through grants from the Health Care Financing Administration (HCFA) of the Department of Health and Human Services.

Medicaid is, for the most part, a categorical program with complex eligibility rules which vary from State to State. There are two basic groups of eligible individuals: the categorically eligible and the medically needy. The major categorically eligible groups are all Aid to Families with Dependent Children (AFDC) recipients and most Supplemental Security Income (SSI) recipients.² Other categorically eligible groups are (1) those who meet basic State cash assistance eligibility rules (the aged, blind, or disabled; needy single parents with children; and, in some States, needy unemployed parents with children who are not currently receiving money payments) and (2) needy persons meeting categorical eligibility standards who are institutionalized for medical reasons (e.g., low-income elderly persons in nursing homes). Institutionalized persons are not included in the CPS universe and, therefore, are not reflected in the CPS reciprocity statistics.

In many States, Medicaid coverage is also extended to the medically needy: persons meeting categorical age, sex, or disability criteria and having money incomes and assets which exceed eligibility levels for cash assistance but are not sufficient to meet the cost of medical care. Families with large medical expenses relative to their incomes and assets may also meet medically needy eligibility standards by "spending down" (i.e., having high enough medical expenses) to obtain eligibility.

¹Taken from Title XIX of the 1965 Amendments to P.L. 89-97, *The Social Security Act*, "Grants to States for Medical Assistance Programs," declaration of policy.

²In 1981, Public Law 97-35 made several changes in AFDC eligibility determinations under the Medicaid program. Changes in treatment of earnings and other income and resources have resulted in some persons being dropped not only from the AFDC rolls but also off of automatic Medicaid coverage. Some of these individuals may be able to regain coverage if their State offers medically needy protection; however, the range of available benefits may be less.

The Medicaid question on the March CPS attempted to identify all persons 15 years old and over who were covered by Medicaid at any time during the year. The term "covered" means enrolled in the Medicaid program, i.e., had a Medicaid medical assistance card or incurred medical bills which were paid for by Medicaid. In order to be counted, the person did not necessarily have to receive medical care paid for by Medicaid.

After data collection and creation of an initial micro-data file, further refinements were made to assign Medicaid coverage to children. In this procedure, all children under 21 years old in families were assumed to be covered by Medicaid if either the householder or spouse reported being covered by Medicaid.³ AFDC recipients in all States and SSI recipients living in the 36 States which legally require Medicaid coverage of all SSI recipients were also assigned coverage. The data shown in this report exclude children covered by Medicaid in households where no adult member was covered. Because there are no administrative data which separately identify these recipients, the extent of the bias is unknown.

MEDICARE

The Medicare program consists of two separate but complementary health plans to provide adequate medical care for the aged and disabled. The Hospital

³This procedure was required mainly because the Medicaid coverage question was asked only for persons 15 years old and over.

Insurance Plan (Part A) is designed to provide basic protection against the costs of hospital and related post-hospital services. In addition to the elderly, this plan also covers virtually all persons under 65 years old who receive Social Security or Railroad Retirement benefits based on long-term disability. Part A is financed jointly by employers and employees through Social Security payroll deductions. Qualified persons 65 years old and over who are not otherwise eligible for Part A benefits may pay premiums directly to obtain this coverage. The Supplemental Medical Insurance Plan (Part B) is a voluntary plan which builds upon the hospital insurance protection provided by the basic plan and is available to all Medicare Part A beneficiaries. It provides insurance protection covering physicians' and surgeons' services and a variety of medical and other health services received either in hospitals or on an ambulatory basis. It is financed through monthly premium payments (about \$8.50 per month in 1979 and \$17.90 in 1987) by each enrollee and further subsidized by Federal general revenue funds.

The Medicare question on the March CPS attempted to identify all persons 15 years old and over who were covered by Medicare at any time during the year. The term "covered" means enrolled in the Medicare program. In order to be counted, the persons did not necessarily have to receive medical care paid for by Medicare.

THE HISTORY OF THE UNITED STATES

BY CHARLES A. BEAN

The history of the United States is a story of growth and development. It begins with the first settlers who came to the shores of the continent, and it ends with the present day. The story is one of struggle and triumph, of hardship and hope.

The first settlers came to the continent in search of a better life. They were driven by the promise of land and freedom. They found a land of opportunity, but they also found a land of hardship. The weather was harsh, the soil was poor, and the natives were hostile. Yet, they persevered, and they built a new life for themselves.

As the years passed, the settlers grew in number. They spread across the continent, and they built a new society. They were a people of faith and courage, and they were determined to make a home for themselves in a new world.

The settlers were not alone. They were joined by others who came from all over the world. They brought with them their own customs and traditions, and they blended them with the traditions of the first settlers. The result was a new and unique American culture.

The history of the United States is a story of progress and achievement. It is a story of a people who have overcome all odds and who have built a great nation. It is a story of a people who have shown the world that freedom and democracy are possible.

The history of the United States is a story of hope and optimism. It is a story of a people who believe in a better future. It is a story of a people who are determined to make the world a better place.

The history of the United States is a story of a people who have shown the world that freedom and democracy are possible. It is a story of a people who have overcome all odds and who have built a great nation.

Appendix F. Underreporting of Cash Income and Noncash Benefits

This appendix discusses some important aspects of underreporting and its measurement and presents some estimates of underreporting for the year 1983. The general survey phenomenon that is commonly termed underreporting actually refers to the tendency of household surveys to underestimate the number of income or noncash benefit recipients and/or the amount of income or benefits received. There are three main causes for underreporting. These are failure to report receipt of the income type, underreporting of the amount received, and misclassification of the income type received.

Accurately measuring the extent of underreporting of cash income and noncash benefits is difficult for many of the income types and noncash benefit programs. There are two main components of measuring underreporting: the number of income or noncash benefit recipients and the total amount of income or benefits received. Measuring the survey undercount of recipients for the March CPS is extremely difficult because independent estimates (benchmarks or controls) for the CPS noninstitutional, "ever-received during the year" recipient concept are difficult to validate. In addition, some of the administrative sources required for the derivation of independent estimates have significant errors themselves.

The data in table F-1 show comparisons of CPS aggregate money income in 1983 with independent estimates. Comparisons of the 1984 CPS estimates with the independent totals reveal that overall income in the survey after allocation is underreported by about 10 percent. However, wide variations are found in the amount of underreporting by source of income. Underreporting varied from about 45 percent for interest income to only about 1 percent for wage and salary income. Both reported and allocated proportions of CPS aggregate incomes are shown in table F-1.

In 1983, \$442.2 billion, or about 20 percent of the total aggregate income was allocated as a result of nonresponses to the income questions. About 13 percent of the \$10.5 billion of the CPS public assistance or welfare income in 1983 was allocated, while about 33 percent of the \$119.8 billion of nonfarm self-employment income was allocated. Other sources of income with allocated proportions of 30 percent or above include interest and dividends.

Estimates of the extent of underreporting for most noncash benefits are less well defined. Following are discussions of the underreporting for each benefit type.

Food stamps. The March CPS estimate for the face value of food stamps received in 1984 was about \$7.6 billion, 71 percent of the independent estimate derived for that year. The 20.1-million recipient (persons covered) estimate for 1984 compares to a 26.1-million independent estimate of recipients. Since this independent estimate was developed using USDA monthly person reciprocity counts and average months of participation as reported in the CPS, it is difficult to validate its accuracy.

School lunches. The March CPS data for 1984 show 10.8 million children usually eating free or reduced-price school lunches and 17.5 million usually eating full-price school lunches. Since independent estimates on the "ever-participated" universe are not available for this group, comparisons of the CPS estimates with peak monthly average daily participation have been made. These peak figures were 11.6 million for free or reduced-price lunches and 11.4 million for full-price lunches. The CPS estimate is 93 percent of the peak monthly average for free or reduced-price. The CPS estimate of full-price lunch participants was about 54 percent higher than the peak monthly figure. The obvious conceptual differences between the CPS and USDA figures make these comparisons difficult to interpret.

Public or other subsidized housing. In 1984 the March CPS estimate for the number of households residing in public or other subsidized rental housing was 3.6 million. An independent estimate was derived by summing housing units in (1) low-income public housing, (2) Section 8 (including Section 202), (3) rent supplements (Section 101), and (4) Section 236. This summing yielded a figure of 3.3 million. While the CPS estimate was about 9 percent higher than the independent figure, it is likely that the survey estimate contains some units, such as student or military housing, that were not intended to be counted. The magnitude of this problem is probably small, but unknown.

Medicare. The independent estimate for persons covered by Medicare is probably the most reliable of all independent estimates. In 1984, this figure was 28.4

Table F-1. Comparison of CPS Aggregate Money Income Concepts, by Type of Income and Reported and Allocated CPS Amounts: 1983

Source of Income	Independent source		CPS					
			Total		Reported		Allocated	
	Millions of dollars	Percent distribution	Millions of dollars	Percent distribution	Millions of dollars	Percent distribution	Millions of dollars	Percent distribution

million persons. This compares to a survey estimate of 28.2 million, 0.9 percent higher than the control. The survey count probably contains some persons covered by Medicaid that report coverage under Medicare by mistake. The magnitude of this misreporting problem is not known.

Medicaid. The CPS estimate of 19.3 million for 1984 was about 3 percent higher than the "unduplicated" administrative figure of 18.7 million persons "ever receiving" benefits available from the Health Care Financing Administration (HCFA). This HCFA figure has not been adjusted for decedents or the institutionalized population and does not include persons who were covered by Medicaid but did not receive benefits in 1984.

Appendix G. U.S. Senate Statement, "Data Collection and Poverty Level"

Official poverty statistics published by the Bureau of the Census currently ignore billions of dollars of Government in-kind benefits, such as food stamps, public housing rental subsidies, and medical care. The Congressional Budget Office has estimated that including in-kind benefits in the income statistics would cause the number of people in poverty to decline to about 9 million as compared with official statistics showing nearly 25 million people in poverty. The official statistics show no significant reduction in recent years in the incidence of poverty, although in-kind benefit programs have expanded greatly.

The Committee considers it essential that official poverty statistics reflect, at the earliest possible date, the effects of in-kind benefits. Without such information, Congress and the Executive Branch cannot be certain that Government transfer programs are properly targeted.

The Census Bureau has recognized the need for better data on in-kind benefits. The most recent March Current Population Survey has collected data on some types of in-kind program benefits. In addition, Census has under way an experimental survey—known as the Survey of Income and Program Participation— which collects more extensive data. However, Census has not yet published the data collected thus far and has no current plans for integrating such data with cash income data now reported routinely.

The Committee has inscribed language in the bill directing the Secretary of Commerce to expedite the program of collecting, through surveys, data on benefits received and data on participation in federally

funded, in-kind benefit programs. Programs on which data are to be reported include, but are not necessarily limited to, food stamps, Medicaid, Medicare and subsidies in areas such as housing, nutrition, child care, and transportation. The Secretary of Commerce is further directed to continue research and testing of techniques for assigning monetary values to in-kind benefits and for calculating the impact of such benefits on income and poverty estimates. The Secretary of Commerce is also directed to include in survey reports, beginning no later than October 1, 1981, appropriate summaries of data on in-kind benefits and estimates of the effect of in-kind benefits on the number of families and individuals below the poverty level.¹

Note: The above language was modified in conference but the substance of the new language was similar and included the statement "the Secretary should include in survey reports beginning no later than October 1, 1981, appropriate summaries of data on in-kind benefits and estimates of the effect of in-kind benefits on the number of families and individuals below the poverty level."²

Form CPS-1-Continued

18. LINE NUMBER

19. What was ... doing most of LAST WEEK -

- Working
- Keeping house
- Going to school or something else?
- Working (Skip to 20A) ... WK
- With a job but not at work ... J
- Looking for work ... LK
- Keeping house ... H
- Going to school ... S
- Unable to work (Skip to 24) ... U
- Retired ... R
- Other (Specify) ... OT

20. Did ... do any work at all LAST WEEK, not counting work around the house? (Note: If farm or business operator in hh, ask about unpaid work.)

Yes No (Go to 21)

20A. How many hours did ... work LAST WEEK at all jobs?

0 1 2 3 4 5 6 7 8 9

20B. INTERVIEWER CHECK ITEM

49 (Skip to Item 23)

1-34 (Go to 20C)

35-48 (Go to 20D)

20D. Did ... lose any time or take any time off LAST WEEK for any reason such as illness, holiday or slack work?

Yes No How many hours did ... take off?

(Correct 20A if lost time not already deducted; if 20A reduced below 35, correct 20B and fill 20C)

20E. Did ... work any overtime or at more than one job LAST WEEK?

Yes No How many extra hours did ... work?

(Correct 20A and 20B as necessary if extra hours not already included and skip to 23.)

No (Skip to 23)

20C. Does ... USUALLY work 35 hours or more a week at this job?

Yes No What is the reason ... worked less than 35 hours LAST WEEK?

What is the reason ... USUALLY works less than 35 hours a week?

(Mark the appropriate reason)

- Slack work
- Material shortage
- Plant or machine repair
- New job started during week
- Job terminated during week
- Could find only part-time work
- Holiday (Legal or religious)
- Labor dispute
- Bad weather
- Own illness
- On vacation
- Too busy with housework, school, personal bus, etc.
- Did not want full-time work
- Full-time work week under 35 hours
- Other reason (Specify)

(Skip to 23 and enter job worked at last week)

21. (If in 19, skip to 21A.) Did ... have a job or business from which he/she was temporarily absent or on layoff LAST WEEK?

Yes No (Go to 22)

21A. Why was ... absent from work LAST WEEK?

- Own illness
- On vacation
- Bad weather
- Labor dispute
- New job to begin within 30 days (Skip to 22B and 22C2)
- Temporary layoff (Under 30 days)
- Indefinite layoff (30 days or more or no def. recall date) (Skip to 22C3)
- Other (Specify) ...

21B. Is ... receiving wages or salary from his/her employer for any of the time off LAST WEEK?

Yes No

21C. Does ... usually work 35 hours or more a week at this job?

Yes No (Skip to 23 and enter job held last week)

22. (If LK in 19, skip to 22A.) Has ... been looking for work during the past 4 weeks?

Yes No (Go to 24)

22A. What has ... been doing in the last 4 weeks to find work? (Mark all methods used; do not read list.)

- Checked pub. employ. agency with - pvt. employ. agency
- employer directly
- friends or relatives
- Placed or answered ads.
- Nothing (Skip to 24)
- Other (Specify in notes, e.g., JTPA, union or prof. register, etc.)

22B. At the time ... started looking for work, was it because he/she lost or quit a job or was there some other reason?

- Lost job
- Quit job
- Left school
- Wanted temporary work
- Change in home or family responsibilities
- Left military service
- Other (Specify in notes)

22C. 1) How many weeks has ... been looking for work?

0 1 2 3 4 5 6 7 8 9

2) How many weeks ago did ... start looking for work?

0 1 2 3 4 5 6 7 8 9

3) How many weeks ago was ... laid off?

0 1 2 3 4 5 6 7 8 9

22D. Has ... been looking for full-time or part-time work?

Full Part

22E. Could ... have taken a job LAST WEEK if one had been offered?

Yes No Why not?

- Already has a job
- Temporary illness
- Going to school
- Other (Specify in notes)

22F. When did ... last work at a full-time job or business lasting 2 consecutive weeks or more?

Within last 12 months (Specify) ... (Month) _____

- One to five years ago
- More than 5 years ago
- Never worked full-time 2 wks. or more
- Never worked at all (Skip to 23. If layoff entered in 21A, enter job, either full or part time, from which laid off. Else enter last full time job lasting 2 weeks or more, or "never worked.")

23. DESCRIPTION OF JOB OR BUSINESS

23A. For whom did ... work? (Name of company, business, organization or other employer.)

23B. What kind of business or industry is this? (For example: TV and radio mfg, retail shoe store, State Labor Dept., farm.)

23C. What kind of work was ... doing? (For example: electrical engineer, stock clerk, typist, farmer.)

23D. What were ...'s most important activities or duties at this job? (For example: types, keeps account books, files, sells cars, operates printing press, finishes concrete.)

23E. Was this person

- An employee of a PRIVATE Co., bus., or individual for wages, salary or comm. ... P
- A FEDERAL government employee ... F (Go to 23F)
- A STATE government employee ... S
- A LOCAL government employee ... L
- Self-empl. in OWN bus., prof. practice, or farm
- Is the business incorporated? Yes No SE (Skip to 26)
- Working WITHOUT PAY in fam. bus. or farm ... WP
- NEVER WORKED ... NEV

23F. INTERVIEWER CHECK ITEM

Entry (or NA) in item 20A (Go to 25 at top of page)

Entry (or NA) in item 21B

All other cases (Skip to 26)

24. INTERVIEWER CHECK ITEM (Rotation number)

First digit of SEGMENT number is:

- 0 2, 3, 4, 6, 7 or 8 (Skip to 26)
- 1 or 5 (Go to 24A)

24A. When did ... last work for pay at a regular job or business, either full- or part-time?

- Within past 12 months
- 1 up to 2 years ago
- 2 up to 3 years ago (Go to 24B)
- 3 up to 4 years ago
- 4 up to 5 years ago
- 5 or more years ago (Skip to 24C)
- Never worked

24B. Why did ... leave that job?

- Personal, family (incl. pregnancy) or school
- Health
- Retirement or old age
- Seasonal job completed
- Slack work or business conditions
- Temporary nonseasonal job completed
- Unsatisfactory work arrangements (Hours, pay, etc.)
- Other

24C. Does ... want a regular job now, either full- or part-time?

- Yes (Go to 24D)
- Maybe - it depends (Specify in notes)
- No (Skip to 24E)
- Don't know

24D. What are the reasons ... is not looking for work? (Mark each reason mentioned)

- Believes no work available in line of work or area
- Couldn't find any work
- Lacks nec. schooling, training, skills or experience
- Employers think too young or too old
- Other pers. handicap in finding job
- Can't arrange child care
- Family responsibilities
- In school or other training
- Ill health, physical disability

NOTES:				

current housing reports

Data on housing vacancies and housing characteristics

U.S. Department of Commerce
BUREAU OF THE CENSUS

CURRENT DATA ON HOUSING

HOUSING VACANCIES (SERIES H-111)

Current statistics on housing vacancies, based on a scientifically selected sample. This series of four quarterly reports and one annual report provides rental vacancy rates, homeowner vacancy rates and homeownership rates for the United States, each of the four regions, and inside and outside standard metropolitan Statistical areas. The statistics for the current quarter are compared with data for the same quarter in the preceding year. Percent distributions are presented for rental vacancies and homeowner vacancies by the following housing characteristics:

- Number of rooms
- Number of bedrooms
- Number of housing units in structure
- Duration of vacancy
- Plumbing facilities
- Monthly rent and sales price asked
- Year structure built

Also shown are percent distributions of all vacant housing units by year-round and seasonal status, figures on occupancy and vacancy rates based on the total housing inventory. The annual report, in addition to the above, presents percent distribution of housing characteristics for both renter- and owner-occupied units.

HOUSING CHARACTERISTICS (H-121)

This series of reports is published on an irregular schedule. Individual reports present data for the United States, regions, or local areas on one or more selected housing characteristics. (Publications in this series include 15 reports on television ownership, 1 report on second homes, 1 report on housing units by plumbing facilities and condition, a special study on housing characteristics classified by the 1959 income of occupants and a report on homeownership trends.) Stocks of these reports are exhausted. Photocopies only are available. For information, write to: Housing Division, Bureau of the Census, Washington, D.C. 20233

HOW TO ORDER

Both series of current housing reports described in this announcement are available from the Superintendent of Documents in a combined subscription for \$6 per year (individual copies vary in price). Use the order form furnished below.

RELATED REPORTS

The Bureau of the Census also issues several series of monthly reports on the construction industry. Subjects covered include housing starts; construction activity, building permits, and housing sales. An announcement and order form covering these reports is available free of charge upon request to: Customer Services, Bureau of the Census, Washington, D.C. 20233.
