## The March Review

This issue provides our annual look at employment and unemployment developments during the previous calendar year. As everyone knows, 2008 was not, in any sense of the term, business as usual.

The labor market started to slide during the second half of 2007 and deteriorated at an accelerating pace as 2008 unfolded. In the fourth quarter of last year, the Nation's unemployment rate rose to nearly 7 percent, as well over 10 million persons found themselves out of work. The rise in the jobless rate was the largest fourth-quarter-to-fourth-quarter increase since 1982 , a recessionary period that has long been noted as the most severe in modern times. The labor force participation rate hovered at around 66 percent in 2008, essentially unchanged over the year, indicating that much of the downturn in the labor market resulted from individuals losing their jobs.

Total nonfarm employment peaked in December 2007, coinciding with the start of the current recession. This turning point marked the end of about 3 years of job growth totaling nearly 5.5 million jobs. During 2008, payroll employment fell by a little over 3 million, and the declines were quite widespread across industry sectors. Few parts of the economy were immune from layoffs, in fact; manufacturing, construction, financial activities and professional and business services, as well as retail trade and leisure and hospitality, all suffered job cutbacks. Only a couple of major industries, most notably health care and mining, managed to add jobs last year.

## 2009 budget

With the signing of the Omnibus Appropriations Act on March 11, 2009, we can present some information on the final Bureau of Labor Statistics (BLS) Fiscal Year 2009 budget. The Omnibus provides $\$ 597.2$ million in funding to the Bureau. We have cited in this space previously some program constraints for BLS that were necessitated by operating thus far in the current Fiscal Year at 2008 resource levels.

The 2009 level of funding will enable BLS to make progress towards its highest priority goals and objectives during the remainder of the Fiscal Year. Specifically, it includes funds to continuously update the housing and geographic samples of the Consumer Price Index, a vitally needed improvement. It provides resources to maintain the sample size of the Current Population Survey (CPS), which is critical to maintaining the survey's accuracy; the CPS is the source of such measures as the national unemployment rate, labor force participation rate, and women's-to-men's earnings ratio. The Omnibus also includes funds to maintain the American Time Use Survey (ATUS), which provides nationally representative estimates of how Americans spend their time. Articles based upon ATUS data have appeared in $M L R$ a number of times, most recently July and November of last year.

Other budget highlights include funding to conduct research to explore and address a potential undercount in the Survey of Occupational Injuries and Illnesses (discussed in our August 2008 issue). Funding was included in the budget to allow BLS to continue to release monthly estimates on the employment and
unemployment status of people with disabilities (the first issuance of which were noted in this column in January of this year).

Additional information about the 2009 budget for the BLS can be found online at http://www.bls.gov/bls/ budget2009.htm.

## Foreign-born workers

According to recently-released data for 2008 from the CPS, about 24 million persons, or 15.6 percent of the U.S. civilian labor force age 16 and over, were foreign born (persons currently residing in the United States who were not U.S. citizens at birth). The unemployment rate for the foreign born was 5.8 percent in 2008, up from 4.3 percent in 2007. The jobless rate of the native born also increased to 5.8 percent in 2008 ; it was 4.7 percent in the prior year.

The demographic characteristics of the foreign-born labor force differ from those of the native born. In 2008 , men made up a larger proportion of the foreign-born labor force ( 59.8 percent) than they did of the native-born (52.3 percent) labor force. Also, a higher proportion of the foreign-born than the native-born labor force was made up of 25 - to 54 -year-olds ( 76.6 and 66.0 percent, respectively); labor force participation is typically highest among persons in that age group.

In 2008, Hispanics comprised about half of the foreign-born labor force, compared to just under 8 percent of the native-born labor force. Asians made up almost a quarter of the foreign-born labor force, compared with less than 2 percent of the native-born labor force.

Additional information about these data can be found at http://www.bls. gov/news.release/forbrn.tn.htm.

# U.S. labor market in 2008: economy in recession 

CPS data show that the labor market weakness that began during the second half of 2007 worsened during 2008 as the U.S. economy entered a recession; unemployment rose sharply, both employment and the employment-population ratio declined, and median weekly earnings grew at about the same rate as inflation in 2008

Turmoil in the housing, credit, and financial markets plagued the U.S. economy in 2008, and the National Bureau of Economic Research (NBER) identified December 2007 as the beginning of a recession. ${ }^{1}$ The labor market started to slide during the second half of 2007 and continued sliding throughout 2008. In the fourth quarter of 2008 , the unemployment rate rose to 6.9 percent and the unemployment level reached 10.6 million, an increase of 2.1 percentage points and 3.3 million persons, respectively, over the fourth quarter of 2007. The current recession has hit the labor market particularly hard. The increase in the unemployment rate in 2008 was larger than that experienced during the 2001 recession and was the largest fourth-quarter-to-fourth-quarter increase since 1982. (See chart 1.)

The number of employed persons aged 16 years and older, as measured by the Current Population Survey (CPS), was 144.0 million in the fourth quarter of 2008, 2.2 million lower than a year earlier. ${ }^{2}$ This over-the-year decrease more than offset the 654,000 increase in 2007 . The last time employment declined over the year was in 2001, also a recessionary period.
(For a comparison of the employment measures available from the household and establishment surveys, see the box on page 5.) Reflecting the employment decline in 2008, the employmentpopulation ratio also fell during the year, from 62.8 percent in the fourth quarter of 2007 to a fourth-quarter 2008 figure of 61.3 percent, the lowest ratio since the first quarter of 1987 , when it was 61.1 percent. (Chart 2 shows the employ-ment-population ratio from 1998 to 2008.) The 1.5-percentage-point over-the-year decline was the largest fourth-quarter-to-fourth-quarter decline in the history of the series, which dates back to 1948.

While unemployment increased and employment contracted in 2008, the labor force participation rate was essentially unchanged, indicating that much of the downturn in the labor market resulted from individuals losing jobs.

In 2008, individuals in the prime working age group ( 25 to 54 years) experienced sharp increases in unemployment; men in the age group experienced greater increases in unemployment, and larger declines in employment, than did women. In the fourth quarter of 2008, the unemployment rate for persons of prime working age ( 25 to 54 years) was 5.9 percent, the highest rate since the second quarter of 1993 and up from 3.9 percent in the fourth quarter of 2007.

The number of unemployed persons aged 25 to 54 years, 6.1 million in the fourth quarter of 2008 , increased by 2.1 million over the year. The unemployment rate for prime-working-age men rose by 2.4 percentage points, to 6.2 percent, in the fourth quarter of 2008, while the unemployment rate for women aged 25 to 54 years increased from 4.0 percent to 5.5 percent that same quarter.

During 2008, the overall employment level for individuals aged 25 to 54 years fell by 2.2 million, to 98.3 million, in the fourth quarter. The significant increase in the number of unemployed men in this age group coincided with a large decrease in the number of such employed men and a decline in their employment-population ratio. Employment among men in the 25 -to- 54 -year-old age group decreased by 1.6 million, accounting for about three-quarters of the decline in employment of prime-working-age individuals in 2008, and the men's employ-ment-population ratio fell by 2.6 percentage points, to 84.6 percent. By comparison, the number of employed prime-working-age women was down by 528,000 in the fourth quarter of 2008, and their employment-population ratio fell by 0.7 percentage point, to 71.7 percent. (See table 1.) One reason men made up the majority of the employment decline in 2008 is that employment in historically male-dominated occupations, such as construc-
tion and extraction, fell sharply over the year.
In 2008, young workers were affected by poor labor market conditions more than workers aged 55 years and older were. In general, age helps explain variations in the labor market success of individuals, because, as older workers gain more experience and accumulate more skills, their marketability rises, resulting in longer job tenure and, ultimately, lower unemployment rates than those of young workers. In 2008, labor force participation and employment continued to trend upward for workers aged 55 years and older, but labor market conditions weakened for workers aged 16 to 19 years, as the group's unemployment rose sharply and labor force participation and employment declined.

In the fourth quarter of 2008, the labor force participation rate for teenagers 16 to 19 years was 38.7 percent, 2.4 percentage points lower than a year earlier. This group's rate has been on a downward trend since its most recent high of 52.6 percent in the second quarter of 2000 and is currently the lowest rate in the history of the series, which began in 1948. Teenagers may be participating in the labor force at a lower rate in recent years for a number of reasons; for example, they may be facing greater pressure to do well in school, and they are attending college at higher rates. ${ }^{3}$ By contrast, the participation rate for adults

## Differences between employment estimates from the establishment and household surveys

The Bureau of Labor Statistics produces two monthly employment series that are independently obtained: the estimate of total nonfarm jobs, derived from the Current Employment Statistics (CES) program, also called the establishment or payroll survey; and the estimate of total civilian employment, based on the Current Population Survey (CPS), also called the household survey. The two surveys use different definitions of employment, as well as different survey and estimation methodologies. The CES survey is a survey of employers that provides a measure of the number of payroll jobs in nonfarm industries. The CPS is a survey of households that provides a measure of employed persons aged 16 years and older in the civilian noninstitutional population. Employment estimates from the CPS give information about workers in both the agricultural and nonagricultural sectors and in any type of work arrangement: wage and salary jobs (including employment in a private household), self-employment, and unpaid work of at least 15 hours a week in a business or farm operated by a family member. CES payroll employment estimates are restricted to nonagricultural wage and salary jobs and exclude private household workers. As a result, employment estimates from the CPS are higher than those from the CES survey. In the CPS, however, employed persons are counted only once, regardless of whether they hold more than one job during the survey reference period. By contrast, because the CES survey counts the number of jobs rather than persons, multiple jobholders are counted once for each nonfarm job they hold.

The reference periods for the surveys also differ. In the CPS, the reference period is the calendar week that includes the 12th day of the month. In the CES survey, employers report the number of workers on their payrolls for the pay period that includes the 12th of the month. Because pay periods vary in length among employers and may be longer than 1 week, the CES employment estimates can reflect a longer reference period.

For purposes of comparison, however, some adjustments can be made to CPS employment estimates to make them more similar in definitional scope to CES employment figures. The BLS routinely carries out these adjustments to evaluate how the two employment series are tracking. The long-term trends in the two surveys' employment measures are quite comparable. Nonetheless, throughout the history of the surveys, there have been periods when the short-term trends diverged or when growth in one series significantly outpaced growth in the other. For example, following the end of the 2001 recession, CPS employment began to trend upward while CES employment continued to decline for a number of months.

The BLS publishes a monthly report with the latest trends and comparisons of CES and CPS employment. (See "Employment from the BLS household and payroll surveys: summary of recent trends" (Bureau of Labor Statistics, Feb. 6, 2009), on the Internet at www. bls.gov/web/ces_cps_trends.pdf.) This report includes a summary of possible causes of differences in the surveys' employment trends, as well as links to additional research on the topic.
aged 55 years and older continued to trend upward in 2008, increasing by 1.0 percentage point, to 39.8 percent. The participation rate for older adults has been climbing since the second quarter of 1995. Several factors may have contributed to this rise, including a gradual increase in the usual retirement age for receiving Social Security benefits, a decline in the number of individuals covered by defined-benefit plans, and the decreased availability of
employer-provided retiree health benefits. ${ }^{4}$
The jobless rate among teenagers ( 16 to 19 years) was 20.7 percent in the fourth quarter of $2008,4.4$ percentage points higher than a year earlier and the highest rate since the second quarter of 1992. The unemployment rate for young adults ( 20 to 24 years) also rose during 2008, increasing by 2.7 percentage points, to 11.3 percent. The unemployment rate for individuals aged 55 years and older

Chart 2. Labor force participation rate and employment-population ratio, seasonally adjusted, quarterly averages, 1998-2008

NOTE: Shaded areas represent recessions as designated by the National Bureau of Economic Research (NBER). The NBER has not yet determined an end point for the recession that began in December 2007.

SOURCE: Bureau of Labor Statistics, Current Population Survey.
increased by 1.7 percentage points, to 4.8 percent, in the fourth quarter of 2008.

Employment among teens dropped again in 2008, falling by 606,000 , after declining by 322,000 in 2007. The teen employment-population ratio continued to trend downward and stood at 30.7 percent in the fourth quarter, 3.7 percentage points lower than a year earlier. Young adults' (20 to 24 years) employment also declined in 2008, falling by 404,000 , and their employment-population ratio fell by 2.0 percentage points, to 65.7 percent. In contrast, employment among workers aged 55 years and older increased by 937,000 in the fourth quarter of 2008. The employmentpopulation ratio for older workers rose to 37.9 percent from the 37.6 -percent rate posted a year earlier. (See table 1.)

The major racial and etbnic groups were also adversely affected by weakness in the labor market. In 2008, unemployment rates were higher over the year for the major racial and ethnic groups. The percentage-point increase was greatest for Blacks and Hispanics, whose unemployment rates rose by 2.9 and 3.1 percentage points, to 11.5 percent and 8.9 percent, respectively, in the fourth quarter. The unemploy-
ment rate for Whites increased by 2.1 percentage points over the year, to 6.3 percent. The unemployment rate for Asians, 4.6 percent (not seasonally adjusted), was 0.9 percentage point higher than a year earlier.

In 2008, employment among the major racial and ethnic groups was lower than a year earlier. In the fourth quarter, the number of employed Whites was 118.1 million, 1.9 million lower than in the fourth quarter of 2007. The employment decline in 2008 followed a year of slowing employment growth. In 2007, employment among Whites grew by only 349,000 , after increasing by 2.1 million in 2006 . During 2008, employment among Hispanics or Latinos fell by 389,000 , to 20.2 million, in contrast to an increase of 583,000 in 2007 and nearly 1.0 million in 2006. After experiencing virtually no employment growth in 2007 and a gain of about a half million in 2006, employment among Blacks fell by 294,000 in 2008, to 15.7 million. Employment among Asians stood at 6.8 million (not seasonally adjusted) in the fourth quarter of 2008, practically unchanged from the 6.9 million figure posted a year earlier.

Reflecting the declines in employment among the racial and ethnic groups, the employment-population ratios

${ }^{1}$ Data for Asians are not seasonally adjusted.
Note: Beginning in 2007, data reflect revised population controls. Estimates for race and Hispanic ethnicity do not sum to totals because
data are not presented for all races and because persons of Hispanic ethnicity may be of any race and also are included in the racial groups.

Source: Bureau of Labor Statistics, Current Population Survey.
for these groups fell sharply during 2008. The Hispanic or Latino employment-population ratio declined by 2.7 percentage points, to 61.9 percent, in the fourth quarter of 2008 . The ratio for Blacks fell by 1.8 percentage points, to 56.1 percent, and the ratio for Whites declined by 1.4 percentage points, to 62.1 percent. The employment-population ratio for Asians was 63.2 percent (not seasonally adjusted) in the fourth quarter of 2008, 1.1 percentage points lower than a year earlier. (See table 1.)

During 2008, labor force participation for the major racial and ethnic groups remained relatively flat or edged lower. The participation rates for both Blacks and Whites were about unchanged, at 63.4 percent and 66.2 percent,
respectively, in the fourth quarter of 2008. The rate for Hispanics or Latinos fell by 0.6 percentage point, to 68.0 percent. The labor force participation rate for Asians was 66.2 percent (not seasonally adjusted).

Individuals at each level of educational attainment were affected by the weak labor market in 2008, but those with less education experienced greater percentage-point increases in their unemployment rates. Education is a major determinant of success and activity in the labor market. Individuals with more education tend to have lower unemployment rates. Indeed, in 2008, individuals with less education experienced greater percentage-point increases
in their unemployment rates than their more educated counterparts did. The unemployment rate for individuals 25 years and older with less than a high school diploma increased from 7.5 percent to 10.6 percent in the fourth quarter of 2008. The jobless rate for high school graduates with no college rose by 2.4 percentage points, to 7.0 percent, the highest quarterly rate since the series began in 1992. The unemployment rate for those with some college or an associate's degree increased by 2.0 percentage points, to 5.5 percent. Among college graduates, the unemployment rate increased by 1.2 percentage points, to 3.3 percent, equal to the previous peak in the fourth quarter of 1992. (See chart 3.)

In 2008, the employment-population ratio decreased for all levels of educational attainment. The ratio for individuals with less than a high school diploma fell by 1.0 percentage point, to 42.3 percent. For high school graduates with no college, the ratio fell by 1.6 percentage points, to 58.1 percent. At 67.8 percent, the employmentpopulation ratio for individuals with some college or an associate's degree was 1.5 percentage points lower than a year earlier. Finally, in the fourth quarter of 2008, the ratio
for college graduates decreased by 0.9 percentage point, to 75.2 percent.

During 2008, the number of persons who were unemployed due to job loss rose sharply, as did the number of long-term unemployed. Most of the increase in total unemployment in 2008 was among job losers, as opposed to individuals leaving their jobs voluntarily or those entering or reentering the labor force. Unemployed job losers are those who lost their jobs involuntarily; they include persons on temporary layoff (awaiting recall) and those not on layoff: permanent job losers and persons who completed temporary jobs. Over the year, the number of persons who were unemployed due to job loss rose by about 2.4 million, to 6.1 million, in the fourth quarter of 2008; persons who did not expect to be recalled to work accounted for most of the increase in job losers. Since the fourth quarter of 2006, the number of unemployed job losers has been on an upward trend, increasing by nearly 3.0 million. During 2008, the number of unemployed reentrants to the labor force also trended upward, increasing by 511,000 , to 2.7 million, in the fourth quarter of 2008 . The number of job

Chart 3. Unemployment rate, by educational attainment, for persons 25 years and older, seasonally adjusted, quarter IV, 2007, and quarter IV, 2008

[^0]leavers (persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work) rose by 178,000 , to 964,000 , and the number of unemployed new entrants to the labor force increased by 115,000 , to 805,000 . (See chart 4 and table 2.)

About 2.4 million unemployed persons had been jobless for at least 27 weeks at the end of 2008, an increase of approximately 1.0 million from a year earlier. (See table 2.) These long-term unemployed individuals made up a larger proportion of the total unemployed than they did the previous year: 22.2 percent in the fourth quarter of 2008, up from 18.1 percent a year earlier and well above a recent low of 10.7 percent in the second quarter of 2001. (See chart 5.) At the end of 2008 , the number of unemployed persons who had been looking for work for less than 5 weeks was 3.2 million, up by 599,000 from the fourth quarter of 2007. The average (mean) duration of unemployment in the fourth quarter of 2008, 19.5 weeks, was higher than a year earlier, as was the median duration, 10.4 weeks.

The number of persons employed part time for economic reasons rose dramatically during 2008. Those employed part time for economic reasons, also referred to as involuntary
part-time workers, are persons who would have preferred to work full time, but could not because of slack work or because they were unable to find full-time work. The number of persons who were employed part time for economic reasons rose by 2.9 million over the year, to 7.4 million in the fourth quarter of 2008. Involuntary part-time employment was on an increasingly upward trend during 2008 , rising by 487,000 in the second quarter, 653,000 in the third quarter, and 1.4 million in the fourth quarter. (Chart 6 shows trends in involuntary part-time employment from 1969 to 2008.) As is typical during labor market downturns, nearly all of the increase occurred among those who cited slack work or business conditions as their reason for working part time. A rise in economic part-time employment due to slack work generally occurs before a rise in unemployment, because, faced with a decline in demand for their goods and services, many employers tend to reduce workers' hours rather than lay off workers. ${ }^{5}$

Both the number of persons who wanted a job but were not in the labor force and the subset of persons who were marginally attached to the labor force increased in 2008. The category "not in the labor force" consists of persons who are neither

employed nor unemployed. In the fourth quarter of 2008, there were 80.2 million persons who were not in the labor force (not seasonally adjusted). Of those who were not in the labor force, slightly more than half were 55 years and older.

The number of persons who were not in the labor force and wanted a job was 5.0 million in the fourth quarter of 2008 (not seasonally adjusted), an increase of 730,000 from a year earlier. Among this group, some had looked for a job sometime during the previous year and would have been available to work had they been offered a job. These individuals who were "marginally attached to the labor force" numbered 1.8 million in the fourth quarter of 2008, up by 474,000 from a year earlier. Some persons
who were marginally attached to the labor force were not currently looking for a job because they felt that no jobs were available to them; such "discouraged workers" numbered 578,000 in the fourth quarter of 2008 , or 234,000 more than a year earlier. (See table 3.)

Paralleling the unemployment rate, the five alternative measures of labor underutilization increased in 2008. Alternative measures of labor underutilization are constructed by the Bureau of Labor Statistics (BLS) with the use of CPS data. Labeled U-1 through U-6 (U-3 is the official unemployment rate), the measures-which tend to show similar cyclical patterns-provide additional insight into the degree to which labor resources are underutilized. ${ }^{6}$

Chart 5. Long-term unemployed as a percent of total unemployed, seasonally adjusted, quarterly averages, 1990-2008

NOTE: Shaded areas represent recessions as designated by the National Bureau of Economic Research (NBER). The NBER has not yet determined an end point for the recession that began in December 2007.

${ }^{1}$ Persons who have searched for work during the previous 12 months and who were available to take a job during the reference week.
${ }^{2}$ Reasons for discouragement include "thinks no work available," "could not find work," "lacks schooling or training," "employer thinks person is too young or too old," and other types of discrimination.
${ }^{3}$ Includes those respondents who did not actively look for work in the previous 4 weeks for such reasons as childcare and transportation problems, as well as a small number for which reason for nonparticipation was not determined.

Source: Bureau of Labor Statistics, Current Population Survey.

U-4 through U-6 include the following broader groups in addition to the unemployed persons in U-3: discouraged workers (U-4); all marginally attached workers (U-5); and the marginally attached plus persons employed part time for economic reasons ( $\mathrm{U}-6$ ). In $2008, \mathrm{U}-4$ rose to 7.2 percent and U-5 to 7.9 percent. U-6 increased by 4.2 percentage points, to 12.7 percent. Most of the rise in $U-6$ was due to the increase in overall unemployment and in those employed part time for economic reasons, rather than a rise in those marginally attached to the labor force. ${ }^{7}$ (See table 4.)

In 2008, employment rose in management, professional, and related occupations and in service occupations, while it fell sharply in construction occupations. Employment also declined in sales and office occupations, production occupations, and transportation occupations. During 2008, the number of people employed in management, professional, and related occupations rose by 836,000 , after increasing by 608,000 in 2007 . (The data presented in this section are not seasonally adjusted.) Service occupations, which include health care support, protective service, and food preparation and serving related occupations, experienced another year of employment growth, rising by 723,000 in the fourth quarter of 2008 after a smaller increase in 2007.

In the fourth quarter of 2008, employment in construction and extraction occupations declined by 1.2 million, after remaining about unchanged in 2007 and following an increase of 1.5 million over the 4 -year period from
the fourth quarter of 2002 to the fourth quarter of 2006. During 2008, sales and office occupations employment fell by about 1.1 million, after a decline of 300,000 in 2007. Office and administrative support occupations accounted for nearly the entire decline in sales and office occupations in 2008. Production occupations saw no job growth in 2007, and employment fell by 939,000 in 2008. Employment in transportation and material moving occupations declined by 446,000 in the fourth quarter of 2008. (See table 5.)

Employment gains among men and women in management, business, and related occupations were about equal in 2008. Men made up approximately 98 percent of construction and extraction occupation employment in 2008 and accounted for a proportionate share of the job loss in those occupations. Women accounted for the majority of the employment increase in service occupations and for nearly the entire decline in office occupations and administrative support occupations.

Median weekly earnings for full-time wage and salary workers increased in 2008 at about the same rate as inflation, as measured by the Consumer Price Index (CPI-U). Median usual weekly earnings rose to $\$ 722$ in 2008 , an increase of 3.9 percent, about the same as the increase in the Consumer Price Index (CPI-U). (See table 6 and chart 7; the data presented in this section are annual averages.) Workers with usual weekly earnings in the tenth decile (top 10 percent of workers) experienced an increase of 5.7 percent, to $\$ 1,693$, in 2008 , while workers with earnings

| U-6 Total unemployed, plus all marginally attached workers, plus total employed part time for economic reasons, as a percent of the civilian labor force plus all marginally attached workers. $\qquad$ | 8.5 | 9.0 | 9.7 | 10.8 | 12.7 | 4.2 |

Note: Marginally attached workers are persons who currently are neither working nor looking for work, but who indicate that they want and are available for a job and have looked for work sometime in the past 12 months. Discouraged workers, a subset of the marginally attached, have given a job-market-related reason for not currently looking for a job.

Persons employed part time for economic reasons are those who want and are available for full-time work, but have had to settle for a part-time schedule.

Source: Bureau of Labor Statistics, Current Population Survey.
in the first decile (bottom 10 percent of workers) experienced an increase of 4.8 percent, to $\$ 346$. In 2008, median weekly earnings for both men and women grew at about the same rate ( 4.2 percent and 3.9 percent, respectively.) The ratio of women's earnings to men's was 79.9 percent. Over time, the earnings gap between the sexes has narrowed considerably: in 1979, women's earnings were 62.5 percent of men's. ${ }^{8}$ (See chart 8.)

Among the major racial and ethnic groups, Hispanics saw the largest percent increase in median earnings in 2008: 5.2 percent. The earnings increases for Asians (3.7 percent), Whites ( 3.6 percent), and Blacks ( 3.5 percent) were about the same.

Among the major occupation groups, workers in farming, fishing, and forestry occupations saw the largest over-the-year percent increase in earnings; although earnings for this occupation group remained the lowest overall, they were up 12.9 percent, to $\$ 420$ per week. The earnings increases for workers in sales and related occupations and in production occupations were the lowest among the major occupation groups, at 2.0 percent and 2.4 percent, respectively, in 2008. Median weekly earnings for
management, business, and financial operations occupations remained the highest among the major occupation groups, increasing to $\$ 1,128$.

Educational attainment is a major determinant of earnings. Workers 25 years and older with at least a bachelor's degree continued to have the highest median weekly earnings among the major education groups: $\$ 1,115$ in 2008, with an over-the-year percentage increase of 4.0 percent. Workers with some college or an associate's degree earned \$722, and high school graduates with no college earned \$618 in 2008, both up slightly from a year earlier. Earnings of workers with less than a high school diploma remained the lowest among the major education groups, $\$ 453$ in 2008, but this group experienced the largest over-the-year percentage increase, 5.8 percent. (See table 6.)

The overall increase in unemployment-most notably, the rise in the number of job losers-reflects the changes in labor force status flow data. Each month, millions of individuals move between employment and unemployment, and millions of others enter or leave the labor market. In addition, people move into and out of the survey universe of

Note: Data may not sum to totals due to rounding.
the civilian noninstitutional population aged 16 years and older. The flow of individuals between labor force states illustrates the fluid nature of the U.S. labor market and can be used to analyze changes in employment and unemployment. ${ }^{9}$

As stated earlier, from the fourth quarter of 2007 to the fourth quarter of 2008, the number of unemployed persons aged 16 years and older increased by 3.3 million and the number of unemployed job losers increased by 2.4 million. The rise in the number of job losers corresponds with the sharp increase in the number of employed persons who became unemployed (represented as EU in chart 9) from the fourth quarter of 2007 to the fourth quarter of 2008. In addition, the share of individuals from outside
the labor force who became unemployed increased sharply, contributing to the rise in unemployment. Thus, the flow data show that the likelihood of employed persons becoming unemployed and the likelihood of new and returning entrants becoming unemployed both grew substantially over the period.

A greater understanding of the rise in unemployment in 2008 also can be gleaned by examining the flows from unemployment. Chart 10 shows the proportion of unemployed individuals who found employment (UE), the proportion remaining unemployed (UU), and the proportion who left the labor force (UN). The data indicate that, from the fourth quarter of 2007 to the fourth quarter of 2008, unemployed individuals became less likely to find

| Table 6. Median usual weekly earnings of full-time wage |

| and salary workers, by selected characteristics, |
| annual averages, 2007-08 |

Source: Bureau of Labor Statistics, Current Population Survey and Consumer Price Index.
employment and much more likely to remain unemployed. In fact, the likelihood that an unemployed person would find employment was at a series low in the fourth quarter of 2008, dating back to February 1990. The percentage of unemployed individuals who remained unemployed rose from 51 percent in the fourth quarter of 2007 to 58 percent in the fourth quarter of 2008. Historically, the unemployed remain unemployed far longer during periods of labor market weakness. ${ }^{10}$

New CPS data on the employment status of persons with a disability were collected in 2008. In June 2008, questions were added to the CPS to identify persons with a disability in the civilian noninstitutional population aged 16 years and older. The collection of these data is sponsored by the Department of Labor's Office of Disability Employment Policy. The new questions allowed the BLS to begin releasing monthly CPS labor force data on persons with a disability. In the fourth quarter of 2008, these individuals had a labor force participation rate of 23.1 percent, compared with a rate of 71.4 percent for persons with no disabilities. The unemployment rate for persons with a disability was 11.5 percent in the fourth quarter of 2008, while the rate for persons with no disability was 6.4 percent. There also was a large difference in the employ-ment-population ratios between persons with a disability and those with no disability in the fourth quarter of 2008, at 20.4 percent and 66.9 percent, respectively. ${ }^{11}$

In SUM, DATA FROM THE HOUSEHOLD SURVEY indicate that the labor market continued to deteriorate in 2008, reflecting the onset of a recession. Unemployment rates increased gradually in the beginning of the year and accelerated after the first quarter of 2008. Employment declined for nearly all major worker groups, with men accounting for a much larger proportion of the decline than women. The employment-population ratio fell over the year, but labor force participation remained relatively flat. Also, more individuals were unemployed due to job loss, a greater number were unemployed for 27 weeks or longer, and the number of persons employed part time for economic reasons increased dramatically. Median weekly earnings for full-time wage and salary workers increased at about the same rate as inflation.

# Substantial job losses in 2008: weakness broadens and deepens across industries 

Employment losses in 2008 accelerated by year's end as continued weakness in construction, manufacturing, and professional and business services spread into consumer-driven industries

Laura A. Kelter

Laura A. Kelter is a supervisory economist in the National Estimates Branch, Office of Employment and Unemployment Statistics, Bureau of Labor Statistics. E-mail: kelter. laura@bls.gov

As measured by the Current Employment Statistics (CES) survey, total nonfarm employment peaked at 138.2 million in December 2007, coinciding with the official start of the current recession. ${ }^{1}$ This turning point marked the end of a nearly 3 -year employment expansion totaling almost 5.4 million jobs. (See chart 1.) Job growth had slowed during 2007, and then employment fell by 3.1 million (or 2.2 percent) during 2008, with declines in most industry sectors. Furthermore, the job losses were more widespread and severe than during the previous two employment contractions.
Manufacturing, construction, financial activities, and professional and business services had begun seeing job losses or weakened employment growth in 2007, after which they experienced a worsening employment picture during 2008. Consumer-driven industries, such as retail trade and leisure and hospitality, started to cut workers in 2008, and employment declines accelerated during the last several months of the year. Only health care, mining, and government industries continued to add jobs.
Several economic issues that faced the Na tion in 2008 contributed to the employment loss. Among such issues were continued housing market troubles, record-high oil and gas prices, rising costs of food, a financial crisis brought on by mortgage defaults,
tightened credit, and weak retail sales.

## Nonfarm job loss in perspective

Over the past three decades, the United States experienced three employment contractions. ${ }^{2}$ Following a peak in August 1981, total nonfarm employment fell by 2.8 million through December 1982. Next, nonfarm employment fell by 1.6 million (or 1.5 percent) during the 11 months of the 1990-91 contraction. Finally, nonfarm employment reached a peak in February 2001 and then fell by 2.7 million over the next 30 months.
The current employment contraction ran through 2008 and has continued into 2009. Compared with the previous contractions, job losses in 2008 accelerated more rapidly. During the first 8 months of the year, job losses were relatively mild, averaging 137,000 per month; then, in September and October, losses accelerated to an average of 351,000 per month. A further acceleration took place during November and December, to an average of 639,000 jobs lost per month.
In 2008, the employment contraction, in terms of total nonfarm job loss, appears most similar to the employment contraction that started in July 1981. (See chart 2.) In both the 1990 and 2001 contractions, employment flattened out 10 months after its peak. In relative terms, both the 2008 contraction and the 1980 contraction saw

## When was the last time...?

At the same time that several industries observed employment losses which had not been experienced in decades, a number of other industries set record job losses in 2008. (See table 1.) Nonfarm employment fell by more than 3.0 million, the largest 12-month loss, in absolute terms, since October 1944-October 1945. During that period, losses were attributed primarily to the contraction of defenserelated industries following the end of World War II. In percentage terms, the last time employment fell by more than 2.2 percent over the year occurred in 1982. Furthermore, job losses in November and December 2008 totaled 1.3 million-the largest 2-month loss of this magnitude since September and October 1945, when the Nation lost 1.9 million jobs.

Total private employment declined by 3.2 million over the 12 months ending in December 2008, the largest net loss in the history of the series, which began in 1939. The 1 -month diffusion index for private nonfarm industries indicates that the scope of job loss widened in 2008. (See chart 3.) In December, the 1-month diffusion index fell to 20.5-the lowest level in the series history (beginning in 1991)—from a peak of 64.9 in January 2006. This index measures the dispersion of employment change by industry. A value below 50 indicates that more private-sector industries are shedding jobs than adding them over a 1month span. The manufacturing 1 -month diffusion index also reached its lowest level, 10.2 , since December 2001.
Several other CES data series showed a labor market in deep contraction. Average weekly hours for production and nonsupervisory workers on private payrolls fell by one-half hour in 2008, to its lowest level, 33.3 hours. Although the long-run trend of the average workweek has been declining since the series began in 1964, the decrease in 2008 was significant. Both manufacturing average weekly hours and overtime hours of production workers also fell to record lows. Weekly hours fell below 40.0 for the first time since January 1996, and overtime hours fell to 2.9-the lowest level since May 1983. The factory workweek often is cited as a leading indicator of economic activity.
The index of aggregate weekly hours-the product of average weekly hours of production workers and average weekly hours of nonsupervisory workers-is a coincident index ${ }^{3}$ that peaked in December 2007 and fell by 4.3 percent over 2008, with accelerating declines during the last 4 months of the year. The last time the aggregate hours
index fell by more than 4.3 percent occurred in the 12 months ending November 1982. The index of aggregate weekly payrolls-the product of aggregate weekly hours and average hourly earnings-reached a high in August 2008 and then declined through December.

## Economy in crisis

Employment growth slowed in 2007 as housing troubles and problems with subprime mortgages struck construction and related manufacturing industries, while con-sumer-driven industries continued to expand payroll employment. ${ }^{4}$ During 2008, poor economic news swept the Nation as each additional economic weakness proliferated and permeated into the broader economy. Across the board, economic indicators continued to plunge during the year. (See table 2.)
The housing crisis broadened into commercial and heavy construction, deepening employment losses in construction and manufacturing and moving into housing-related wholesale and retail industries. Furniture and home furnishings, as well as building material and garden supply stores, were particularly hard hit.
Defaults on mortgages surged, especially for subprime loans. According to one source, "Much of the housing market's problems were concentrated in the subprime, adjustable-rate market, where homeowners with weak financial backgrounds got loans they ultimately couldn't afford." ${ }^{5}$ As a result, the mortgage crisis became so severe during 2008 that lenders tightened credit considerably and some banks failed. About 65 percent of domestic banks indicated that they had tightened their lending standards for commercial and industrial loans to small firms. ${ }^{6}$ To help reduce foreclosure rates and to encourage lending, the Federal Reserve lowered the Federal funds rate to almost zero. ${ }^{7}$ The mid-2008 financial crisis put downward pressure on employment in the financial activities industry, in housing- and construction-related industries, and in industries that rely on consumer credit for large purchases of durable goods, such as appliances and automobiles.
Record-high oil and gas prices permeated nearly every industry during 2008 and affected consumers and companies alike, resulting in cash flow problems. Many companies tried to absorb rising shipping costs in order to retain sales; in turn, this cost-minimization strategy led to jobs cuts. Still, weak sales entering the holiday season pushed many retailers into further layoffs and even bankruptcy. According to the Wall Street Journal, "Companies are increasingly hitting their fixed cost wall, as many retailers are at minimum staffing levels in stores and rent is fixed." ${ }^{8}$

## Chart 3. Total private 1-month diffusion index, January 1991-December 2008

${ }^{1}$ Measures the dispersion of employment change. A value less then 50 means that more industries are losing jobs than adding them.

At the same time, consumer confidence reached record lows as consumers, with already limited credit and recent problems filling their vehicles with gas, in turn cut spending on other products and services: "As prices near-or in some places top-\$4 a gallon, most Americans say they are cutting back on other household spending, seriously considering buying more fuel-efficient cars and consolidating their daily errands to save fuel." ${ }^{"}$ The automobile industry was particularly hard hit by high gasoline prices, rising input costs, and the credit crunch. U.S. vehicle manufacturers cut production throughout the year.

## Accelerating job losses

Following on the heels of several industries that already had been in decline in previous years, manufacturing, construction, financial activities, and temporary help services experienced a significant acceleration in job losses in 2008.

Manufacturing. U.S. manufacturing employment fell by 875,000 , to 12.9 million, reflecting the largest 12 -month job loss since 2002 and the lowest employment level since 1949. Monthly employment losses averaged 22,000 dur-

ing 2007 and accelerated to an average of 73,000 in 2008 Job losses broadened across the manufacturing sector as employment in housing and construction-related industries (including furniture and related products, wood products, nonmetallic mineral products such as cement and concrete products, and fabricated metal products) worsened, export-related industries (including machinery and computer and electronic products) began to lose workers, and auto-related manufacturing job losses accelerated at year's end. The Institute for Supply Management offered corroborating evidence of widespread weakness in manufacturing when it reported that the index of national manufacturing activity fell to a nearly three-decade low of 32.9 in December 2008. ${ }^{10}$

Compared with the last three contractions in total employment, the current contraction produced manufacturing job losses most similar to those of the 1990 contraction, until accelerated job losses toward the end of 2008 pushed the industry in the direction of experiencing job losses similar to that of the weaker 1981 period. (See chart 4.)

Construction. Employment in construction grew by an average of 15,000 jobs per month in 2006 and fell by an average of 15,000 per month in 2007. Losses then accelerated to an average of 57,000 jobs per month in 2008. Construction-related employment losses also broadened into service-providing industries during the year, including wholesale and retail trade. Employment in lumber and construction supplies and in furniture and furnishings in wholesale trade fell in 2008 after reaching peaks during 2006 and 2007, respectively. Furniture and homefurnishing stores remained stable during 2006 and 2007, but lost an average of 5,000 jobs per month in 2008 . Building material and garden supply stores started seeing job losses in 2007 that continued at the same rate in 2008.

Housing indicators set record lows in 2008. Both housing starts and new-home sales fell, by 81 percent and 75 percent, respectively, since peaking in 2006, and the monthly inventory of new homes for sale reached a record of a 12.2-months' supply. With the high inventories, home

values depreciated, further exacerbating job losses in construction and related industries. "American homeowners will collectively lose more than $\$ 2$ trillion in home value by the end of 2008," and home values dropped 8.4 percent year over year during the first 3 quarters of 2008, according to real estate Web site Zillow.com. ${ }^{11}$
Over the year, employment in construction fell by more than 680,000, the worst 12-month net job loss since 1944. In percentage terms, employment fell by more than 9 percent-the largest 12 -month decline since 1991. Employment losses in construction were concentrated on the residential side until 2008. Employment in residential construction has fallen by 800,000 since reaching a peak at the beginning of 2006. ${ }^{12}$ Not until February 2008 did construction employment losses broaden into nonresidential industries, including heavy and civil engineering. Employment losses in nonresidential construction totaled 270,000 during 2008 and contributed to accelerated losses in total construction. (See chart 5.)
In comparison to earlier periods of contraction in total employment, the current contraction produced job losses in construction similar to those of the 1981 contraction, until the fourth quarter of 2008, when job loss in the industry
accelerated. Total job losses in construction now resemble the losses seen in the 1990 contraction. Job losses during the 2001 recession were relatively mild. (See chart 6.)

Financial activities. Employment in construction and financial activities peaked at about the same time, coincident with the housing bubble. Subprime mortgage issues and the financial crisis eroded employment even more in the financial sector. The industry averaged 10,000 jobs lost per month through 2007 and 13,000 during the first 8 months of 2008; then losses accelerated to an average of 33,000 in each of the last 4 months of the year. Considering the job losses the financial activities industry experienced over the year, the loss of 233,000 jobs in 2008 was the largest in the history of the series and the largest percentage loss since the 12-month period from March 1942 to March 1943.
Compared with the last three contractions in total employment, the current contraction in financial activities rivals no other. In fact, employment in the sector grew during the 2001 and 1981 employment contractions and didn't fall until 5 months into the 1990 recession. (See chart 7.)

Temporary belp services. Within the North American

Chart 6. Job losses in construction over four contractions, percent change since total nonfarm employment peak

Industry Classification System (NAICS), temporary help services is a detailed industry among several making up the professional and business services major industry. Employment growth in professional and business services slowed during 2007, to an average increase of 25,000 jobs per month from an average of 45,000 jobs per month during 2006. Employment in the industry peaked in December 2007-coinciding with the peak in total nonfarm employment-before falling by an average of 63,000 per month in 2008. Most of the slowdown can be traced to employment losses in temporary help services-what many see as a leading indicator of labor demand. Temporary help employment peaked a full year ahead of total nonfarm employment and had fallen by almost 620,000 by December 2008.
Job losses in temporary help services during the current contraction were similar to those seen in 2001 until about 10 months into the contraction, when job losses recovered slightly and employment in the industry stabilized. In 2008, the temporary help services industry continued to experience job losses at an accelerated pace. Employment losses in temporary help services during the 1990 contraction were relatively mild, and the industry recovered
within 2 years. (See chart 8.)

## Consumer-driven job loss

As job losses in manufacturing, construction, financial activities, and temporary help services accelerated through 2008, consumer-driven industries began to show losses as well, because of falling consumer confidence, tightened credit, and less consumption.

Retail trade. Retail employment peaked in November 2007, after which employment losses averaged almost 29,000 during the first 8 months of 2008 and then accelerated to more than 74,000 per month toward year's end. Declines in consumer spending and falling consumer confidence broadened retail job cuts: from a concentration in housing and construction-related industries, cuts spread to almost all retailers. Not only did retailers end up shedding jobs, but many had to close. Even discount department stores, which normally fare well during recessions, suffered job losses.
Job losses in retail trade during the current contraction are similar to those seen during both the 1990 and 2001

Chart 7. Job losses in finanical activities over four contractions, percent change since total nonfarm employment peak

Chart 8. Job losses in temporary help services over three contractions, percent change since total nonfarm employment peak

contractions, except that, during those timeframes, job losses had slowed about 10 months into the contraction, whereas losses in 2008 continued to accelerate. Job losses in retail trade during the 1981 contraction were mild, and the industry recovered just over 12 months after the start of the contraction. (See chart 9.)

Leisure and hospitality. Tightened spending also hurt the leisure and hospitality industry as consumers traveled less and ate at restaurants less often. Leisure and hospitality employment peaked in December 2007 and fell by a monthly average of 12,000 jobs during the first 8 months of 2008; job losses accelerated to an average of 38,000 in each of the last 4 months of the year. Food services and drinking places, which showed limited job loss during the 2001 employment contraction, were responsible for 42 percent of the job losses in leisure and hospitality in 2008.

Of the four contractions examined in this article, the current one seems to be the only one in which the leisure and hospitality industry has experienced consistent job loss. During the previous three such periods, industry job losses were mild, if they occurred at all, and recovery was within a year. (See chart 10.)

## A bit of job growth

Despite job losses throughout most of the economy, a few industries were able to post job gains during 2008.

Mining. Soaring oil and gas prices, along with high prices for metals, helped push mining employment up, especially for oil and gas extraction and support activities. Previously, mining employment had reached a low point in April 2003; since then, it has risen by 235,000 . However, a sharp drop in oil prices toward the end of the year stalled employment growth in mining.
A comparison of the last three contractions in total employment reveals that the current job increases in mining rival those of the July 1981 contraction, although within 1 year the 1981 job gains had vanished. During the 1990 and 2001 periods, the industry experienced mild job losses within a year after the start of the contraction. (See chart 11.)

Health care. Employment in health care continued to expand despite employment losses in most other industries. In fact, on average, job growth in health care was slightly stronger in 2008 ( 30,000 jobs per month) and in 2007

Chart 9. Job losses in retail trade over four contractions, percent change since total nonfarm employment peak

(29,000 jobs per month) than during 2006 (27,000 jobs per month).
A comparison of job increases in health and educational services across all four contractions shows that growth currently is weaker than in 1990 and 2001, but slightly better than in 1981. (See chart 12.)

## Severe job losses during 2008

Not only were nonfarm employment losses in 2008 substantial enough to rival historic job losses, but the employment losses in construction, manufacturing, financial activities, and temporary help services that characterized 2007 broadened and accelerated toward the end of 2008. Employment in consumer-driven industries such as retail trade and leisure and hospitality began to fall during the year, and the losses accelerated during the final part of the year. Of the major industries, only mining, education, and health care saw employment grow throughout 2008. (See table 3.)

## Notes

${ }^{1}$ The Current Employment Statistics (CES) survey is a monthly survey of about 150,000 nonfarm business and government agencies representing approximately 390,000 individual worksites. For more information on the program's concepts and methodology, see "Technical Notes to Establishment Data Published in Employment and Earnings," in Economic News Release: Employment Situation (Bureau of Labor Statistics, Feb. 6, 2009), on the Internet at www.bls.gov/web/empsit.supp.toc. htm\#technote (visited Feb. 6, 2009). CES data are presented in Current Employment Statistics-CES (National) (Bureau of Labor Statistics, no date), on the Internet at www.bls.gov/ces (visited Feb. 6, 2009). The CES data used in this article are seasonally adjusted unless otherwise noted. The beginnings and endings of recessions are determined by the National Bureau of Economic Research (NBER). (See details at www. nber.org/cycles/dec2008.html (visited Jan. 30, 2009).)
${ }^{2}$ Total nonfarm employment cycles can, but do not necessarily, match business cycle peaks and troughs as determined by the NBER.
${ }^{3}$ A coincident index is an index that, more often than not, correlates
directly with the state of the economy.

${ }^{10}$ The Institute covers such indicators as new orders, production, employment, inventories, prices, and export and import orders. A reading below 50 indicates contraction in the manufacturing sector, and December marked the sector's 11th straight month of loss. (See the organization's Web site on the Internet at www.ism.ws.)
${ }^{11}$ Les Cristie, "U.S. homes lose $\$ 2$ trillion in value in '08," CNNMoney, Dec. 16, 2008, on the Internet at money.cnn.com/2008/12/15/ real_estate/underwater_borrowers_near_12million/index.htm (visited Feb. 6, 2009).
${ }^{12}$ Residential construction is the sum of residential building (NAICS 2361) and residential specialty trade contractors (NAICS 238001). Nonresidential construction is the sum of beavy and civil construction (NAICS 237), nonresidential building construction (NAICS 2362), and nonresidential specialty trade contractors (NAICS 238002).

## Nature and economics: the tie that binds

Nature: An Economic History. By Geerat J. Vermeij, Princeton, NJ, Princeton University Press, 2004, 445 pp., \$52.50/cloth, \$22.95/paperback.

Nature is an original work in evolutionary biology. Vermeij cogently argues the thesis that life on earth follows the principles of economics; a competitive struggle for scarce resources. Thus the work is an important contribution to theoretical work in all life sciences. The author is a rigorous evolutionist who, even at this late date when we are celebrating the 200th year of Darwin's birth, must chide his fellow biologists for their failure to follow the evolutionary model.

The difficulty of his text may suggest why the others have chosen a path more often traveled. Vermeij eschews the usual expository argument that states the hypothesis with examples. Nor does he allow the juxtaposition of the human species against that of the rest of the natural world to comfort us with the notion that he is dealing in metaphor. Instead he builds on his impressive erudition, attested to by his fellow biologists. He cites a myriad of instances of such phenomena as production and consumption within and across various populations, including the human species, until he convinces by preponderance of evidence. The adaptation that resulted in intelligence in the human species, permitting development of out of body technology, Vermeij places in the Pliocene Era in Equatorial East Africa, because that timeframe and area provided the competitive environment for the selectional background in which exceptional intelligence would most likely have evolved. Similarly, at the beginning of the Cambrian period, the author notes the emergence of
another familiar aspect of the human race: consumer society. He describes a revolutionary transformation from a subsistence economy to a more complex economy productive enough to support ever increasing populations of larger, actively metabolizing consumers, which began to exercise strong evolutionary control on their food organisms.

At this point we begin to leave the Hobbesian subsistence world of primary production and enter a more organized world of production and consumption. Vermeij provides myriad examples from both the human and nonhuman natural world which illustrate various production functions, and is of particular interest to the economist. It establishes a dynamic relation between producers and consumers. The dominant groups exemplify power. Competitively dominant producers create structure; modify the environment to their own advantage, even in death. Dominant consumers regulate how economic units with which they interact make their livings. Although bottom up production is essential in the struggle for life, top down consumers contribute to escalating adaptation and thus support the thesis that economic activity is itself a positive contributor to the evolutionary process.

The author organizes his material in chapters that move tellingly through various characteristics of the relation of evolution to economics. It is a difficult text for the nonbiologist; nevertheless, it is accessible to the general reader. Even though the significance of such observations as increased phosphorus in the atmosphere is not immediately apparent to the untutored, it is explained by the text. The style is discursive rather than technical.

Observations and comment in the text, obviously addressed to the
intended audience of biologists, are supported by generous citations from the work of fellow biologists. Refreshingly, these studies are not always taken at face value but provoke Vermeij into differing interpretations of the results. It is within this context that exceptional insights into human economic activity are revealed. Application of a particular observation to human species, however, is not singled out but remains embedded in the exposition. These interpretations reward the diligent economist for persistence in reading what sometimes feels like a foreign language.

It is unfortunate that the author's summations in the last chapter lack the subtle complexity of the earlier comprehensive treatment. It is in this section that Vermeij intends to illustrate the uses for social policy in his tale of how natural communities have dealt with resource limitations. His abstractions, however, omit the geological time dimension that illuminates the detailed presentation. Additionally, nowhere do we find here an analysis of his earlier statement, "Most students of human history attribute the great economic advances of our species to human action and social circumstances....Factors over which people have little control - climate, volcanic eruptions, earthquakes floods and the like are either dismissed as unimportant or blamed for economic disruption." Nor do we find in it an explanation of the statement, "I am more inclined to the view that postglacial systems ecosystems in the Middle East and China, where agriculture first originated, became more productive as growing seasons lengthened, summer temperatures rose, and rainfall increased," indicating an emphasis on the conjuncture of a favorable moment in the environment to date human agriculture.

It is the intertwining of earth's his-
tory with opportunities for change in living species that provide the sweep of this work. The narrative teems with life and enables us to feel the throbbing universe of which we are part. The summation falls short of fulfilling the author's promise to show the economic control that affects and responds adaptively to conditions on
the longest and largest scale of time and space possible. It is only in the detailed presentation that the author transforms our perception of change as disturbances from equilibriums to that of adaptive response to an ongoing process. Vermeij has demonstrated in this work the importance of orthodox economists and biolo-
gists learning from each others' disciplines, even as Darwin once found in the writing of the British economist Malthus the concept of life as the struggle for survival.

## Temporary employment

Why do companies hire temporary employees? The answer: to attain "numerical flexibility." But what are the relevant elements of numerical flexibility? Matt Vidal and Leann M. Tigges make progress towards a full answer to this question in their article "Temporary Employment and Strategic Staffing in the Manufacturing Sector" (Industrial Relations, January 2009, pp. 55-72).
Temporary employment grew dramatically in the United States in the 1980s and 1990s. Vidal and Tigges set forth three suggested general explanations for hiring temps: reactive numerical flexibility, planned numerical flexibility, and systematic numerical flexibility. Hiring temporary employees in order to cope with unexpected changes in demand or employment qualifies as reactive numerical flexibility. If an employer hires temps in order to be able to handle expected fluctuations in demand or employment, to allow a group of core workers to remain safe from layoffs, or to screen for regular employment, then the employer is engaging in planned numerical flexibility. Systematic numerical flexibility, in contrast, is achieved when a company hires "temporary" employees to fill regular, long-term positions.
Vidal and Tigges use data from a survey of Wisconsin manufacturing establishments to seek evidence supporting each of the three general explanations for hiring temps. They find statistically significant relationships indicating that employers hire temps in order to attain planned and systematic numerical flexibility, but they find much less evidence supporting the hypothesis that establishments use temps in a reactive manner.
The results of the study suggest that protecting a core workforce from layoffs is not a motivation behind the use of temporary employees. It is not known whether employers hire temps
in order to screen workers for regular employment, but if they do, this practice has not proven to be effective in reducing turnover. It does appear that businesses use temps to handle planned periods of heavy demand. When comparing establishments that use temps with those which do not, the study finds statistically significant, positive associations between the use of temps and establishments experiencing growth, establishments with a human resources department or a link to one, and establishments that are branches-in other words, establishments with better organizational resources. Although superior resources help determine which organizations use temps, these resources are not related to the degree of use when the only establishments in the sample are those which have temps. In short, it appears that businesses hire temps to attain planned and systematic numerical flexibility, and that establishments with better organizational resources are more likely to use temporary contracts.

## Financial literacy

In a timely and provocative new study published by the National Bureau of Economic Research entitled "Debt Literacy, Financial Experiences, and Overindebtedness" (NBER Working Paper No. 14808, March 2009), economists Annamaria Lusardi and Peter Tufano analyze a national sample of Americans with regard to their basic financial knowledge related to debtwhat the authors call "debt litera-cy"-as well as their actual financial experiences and their self-assessment of their personal finances and level of debt. The authors reach some interesting and perhaps not surprising conclusions. They find that, in general, debt literacy is low: only a third of the respondents seemed to grasp such relevant financial topics as compound interest and the basic workings of credit cards. Further, even when they
control for various demographic characteristics, Lusardi and Tufano find a "strong relationship" between debt literacy and both financial experience and debt burden. Specifically, those with less knowledge and understanding of how the U.S. financial system works tend to incur more high-cost debt services (higher interest rates and fees, for example) and experience a greater debt burden than those with more knowledge. The authors estimate that as much as one-third of the charges paid by the less knowledgeable are due to ignorance as opposed to other demographic factors.
Lusardi and Tufano teamed with a marketing research firm to develop and conduct their survey, which seeks information about the respondents' financial knowledge related to debt, as well as their personal financial experiences and their level of debt. The survey was conducted in November 2007, which, as the authors observe, was before the current financial crisis began. They interviewed 1,000 U.S. residents across the country by telephone, collecting self-reported demographic information such as age, sex, race and ethnicity, marital status, employment, income, and wealth. Lusardi and Tufano designed their survey questions to test the respondents' understanding of "fundamental concepts related to debt." In addition, they asked questions about a wide range of financial experiences, from traditional and alternative borrowing to investment activity. Finally, they asked people to assess their own level of "overindebtedness." The authors' "conclusions suggest a complex set of interactions among debt literacy, financial experiences, demographics, and debt loads." They find that debt literacy is especially low among the elderly, women, certain minorities, and those with lower income levels. Interestingly, some of these groups, such as the elderly, often think that they understand their finances more than they actually do.

This section of the Review presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force; employment; unemployment; labor compensation; consumer, producer, and international prices; productivity; international comparisons; and injury and illness statistics. In the notes that follow, the data in each group of tables are briefly described; key definitions are given; notes on the data are set forth; and sources of additional information are cited.

## General notes

The following notes apply to several tables in this section:

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as "seasonally adjusted." (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of current and past experiences. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted data appear in tables $1-14,17-21,48$, and 52 . Seasonally adjusted labor force data in tables 1 and 4-9 and seasonally adjusted establishment survey data shown in tables $1,12-14$, and 17 are revised in the March 2007 Review. A brief explanation of the seasonal adjustment methodology appears in "Notes on the data."

Revisions in the productivity data in table 54 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month-to-month and quarter-to-quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average AllItems CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data-such as the "real" earnings shown in table 14-are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current-dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100 . For example, given a current hourly wage rate of $\$ 3$ and a current price index number of 150 , where $1982=100$, the hourly rate expressed in 1982 dollars is $\$ 2(\$ 3 / 150$ $\mathrm{x} 100=\$ 2$ ). The $\$ 2$ (or any other resulting
values) are described as "real," "constant," or "1982" dollars.

## Sources of information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Definitions of each series and notes on the data are contained in later sections of these Notes describing each set of data. For detailed descriptions of each data series, see BLS Handbook of Methods, Bulletin 2490. Users also may wish to consult Major Programs of the Bureau of Labor Statistics, Report 919. News releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule appearing on the back cover of this issue.

More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in the Bureau's monthly publication, Employment and Earnings. Historical unadjusted and seasonally adjusted data from the household survey are available on the Internet:

## www.bls.gov/cps/

Historically comparable unadjusted and seasonally adjusted data from the establishment survey also are available on the Internet:

## www.bls.gov/ces/

Additional information on labor force data for areas below the national level are provided in the BLS annual report, Geographic Profile of Employment and Unemployment.

For a comprehensive discussion of the Employment Cost Index, see Employment Cost Indexes and Levels, 1975-95, BLS Bulletin 2466. The most recent data from the Employee Benefits Survey appear in the following Bureau of Labor Statistics bulletins: Employee Benefits in Medium and Large Firms; Employee Benefits in Small Private Establishments; and Employee Benefits in State and Local Governments.

More detailed data on consumer and producer prices are published in the monthly periodicals, The CPI Detailed Report and Producer Price Indexes. For an overview of the 1998 revision of the CPI, see the December 1996 issue of the Monthly Labor Review. Additional data on international prices appear in monthly news releases.

Listings of industries for which productivity indexes are available may be found on the Internet:

## www.bls.gov/lpc/

For additional information on international comparisons data, see Interna-
tional Comparisons of Unemployment, Bulletin 1979.

Detailed data on the occupational injury and illness series are published in Occupational Injuries and Illnesses in the United States, by Industry, a BLS annual bulletin.

Finally, the Monthly Labor Review carries analytical articles on annual and longer term developments in labor force, employment, and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

## Comparative Indicators

(Tables 1-3)
Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

Labor market indicators include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-population ratio, and unemployment rates for major demographic groups based on the Current Population ("household") Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonfarm payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on changes in compensation, prices, and productivity are presented in table 2. Measures of rates of change of compensation
and wages from the Employment Cost Index program are provided for all civilian nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in consumer prices for all urban consumers; producer prices by stage of processing; overall prices by stage of processing; and overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

Alternative measures of wage and compensation rates of change, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

## Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data.

## Employment and Unemployment Data

(Tables 1; 4-29)

## Household survey data

## Description of the series

Employment data in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

## Definitions

Employed persons include (1) all those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding

4 weeks. Persons who did not look for work because they were on layoff are also counted among the unemployed. The unemployment rate represents the number unemployed as a percent of the civilian labor force.

The civilian labor force consists of all employed or unemployed persons in the civilian noninstitutional population. Persons not in the labor force are those not classified as employed or unemployed. This group includes discouraged workers, defined as persons who want and are available for a job and who have looked for work sometime in the past 12 months (or since the end of their last job if they held one within the past 12 months), but are not currently looking, because they believe there are no jobs available or there are none for which they would qualify. The civilian noninstitutional population comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy. The civilian labor force participation rate is the proportion of the civilian noninstitutional population that is in the labor force. The employment-population ratio is employment as a percent of the civilian noninstitutional population.

## Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the intercensal years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appears in the Explanatory Notes of Employment and Earnings. For a discussion of changes introduced in January 2003, see "Revisions to the Current Population Survey Effective in January 2003" in the February 2003 issue of Employment and Earnings (available on the BLS Web site at www.bls.gov/cps/rvcps03.pdf).

Effective in January 2003, BLS began using the X-12 ARIMA seasonal adjustment program to seasonally adjust national labor force data. This program replaced the X-11 ARIMA program which had been used since January 1980. See "Revision of Seasonally Adjusted Labor Force Series in 2003," in the February 2003 issue of Employment and Earnings (available on the BLS Web site at www.bls.gov/cps/cpsrs.pdf) for a discussion of the introduction of the use of X-12 ARIMA for seasonal adjustment of the labor force data and the effects that it had on the data.

At the beginning of each calendar year, historical seasonally adjusted data usually are revised, and projected seasonal adjustment factors are calculated for use during the

January-June period. The historical seasonally adjusted data usually are revised for only the most recent 5 years. In July, new seasonal adjustment factors, which incorporate the experience through June, are produced for the July-December period, but no revisions are made in the historical data.

FOR ADDITIONAL INFORMATION on national household survey data, contact the Division of Labor Force Statistics: (202) 691-6378.

## Establishment survey data

## Description of the series

Employment, hours, and earnings data in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by about 160,000 businesses and government agencies, which represent approximately 400,000 individual worksites and represent all industries except agriculture. The active CES sample covers approximately one-third of all nonfarm payroll workers. Industries are classified in accordance with the 2002 North American Industry Classification System. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

## Definitions

An establishment is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th day of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in the goods-producing industries cover employees, up through the level of working supervisors, who engage directly in the manufacture or construction of the establishment's product. In private ser-vice-providing industries, data are collected for nonsupervisory workers, which include most employees except those in executive,
managerial, and supervisory positions. Those workers mentioned in tables 11-16 include production workers in manufacturing and natural resources and mining; construction workers in construction; and nonsupervisory workers in all private service-providing industries. Production and nonsupervisory workers account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. Real earnings are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received, and are different from standard or scheduled hours. Overtime hours represent the portion of average weekly hours which was in excess of regular hours and for which overtime premiums were paid.

The Diffusion Index represents the percent of industries in which employment was rising over the indicated period, plus one-half of the industries with unchanged employment; 50 percent indicates an equal balance between industries with increasing and decreasing employment. In line with Bureau practice, data for the $1-, 3-$, and $6-$ month spans are seasonally adjusted, while those for the 12 -month span are unadjusted. Table 17 provides an index on private nonfarm employment based on 278 industries, and a manufacturing index based on 84 industries. These indexes are useful for measuring the dispersion of economic gains or losses and are also economic indicators.

## Notes on the data

Establishment survey data are annually adjusted to comprehensive counts of employment (called "benchmarks"). The March 2003 benchmark was introduced in February 2004 with the release of data for January 2004, published in the March 2004 issue of the Review. With the release in June 2003, CES completed a conversion from the Standard Industrial Classification (SIC) system to the North American Industry Classification System (NAICS) and completed the transition from its original quota sample design to a probability-based sample design. The indus-try-coding update included reconstruction of historical estimates in order to preserve
time series for data users. Normally 5 years of seasonally adjusted data are revised with each benchmark revision. However, with this release, the entire new time series history for all CES data series were re-seasonally adjusted due to the NAICS conversion, which resulted in the revision of all CES time series.

Also in June 2003, the CES program introduced concurrent seasonal adjustment for the national establishment data. Under this methodology, the first preliminary estimates for the current reference month and the revised estimates for the 2 prior months will be updated with concurrent factors with each new release of data. Concurrent seasonal adjustment incorporates all available data, including first preliminary estimates for the most current month, in the adjustment process. For additional information on all of the changes introduced in June 2003, see the June 2003 issue of Employment and Earnings and "Recent changes in the national Current Employment Statistics survey," Monthly Labor Review, June 2003, pp. 3-13.

Revisions in State data (table 11) occurred with the publication of January 2003 data. For information on the revisions for the State data, see the March and May 2003 issues of Employment and Earnings, and "Recent changes in the State and Metropolitan Area CES survey," Monthly Labor Review, June 2003, pp. 14-19.

Beginning in June 1996, the BLS uses the X-12-ARIMA methodology to seasonally adjust establishment survey data. This procedure, developed by the Bureau of the Census, controls for the effect of varying survey intervals (also known as the 4 - versus 5-week effect), thereby providing improved measurement of over-the-month changes and underlying economic trends. Revisions of data, usually for the most recent 5-year period, are made once a year coincident with the benchmark revisions.

In the establishment survey, estimates for the most recent 2 months are based on incomplete returns and are published as preliminary in the tables (12-17 in the Review). When all returns have been received, the estimates are revised and published as "final" (prior to any benchmark revisions) in the third month of their appearance. Thus, December data are published as preliminary in January and February and as final in March. For the same reasons, quarterly establishment data (table 1) are preliminary for the first 2 months of publication and final in the third month. Fourth-quarter data are published as preliminary in January and February and as final in March.

FOR ADDITIONAL INFORMATION on
establishment survey data, contact the Division of Current Employment Statistics: (202) 691-6555.

## Unemployment data by State

## Description of the series

Data presented in this section are obtained from the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions, and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act. Seasonally adjusted unemployment rates are presented in table 10. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

## Notes on the data

Data refer to State of residence. Monthly data for all States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates are revised to new population controls, usually with publication of January estimates, and benchmarked to annual average CPS levels.

FOR ADDITIONAL INFORMATION on data in this series, call (202) 691-6392 (table 10) or (202) 691-6559 (table 11).

## Quarterly Census of Employment and Wages

## Description of the series

Employment, wage, and establishment data in this section are derived from the quarterly tax reports submitted to State employment security agencies by private and State and local government employers subject to State unemployment insurance (UI) laws and from Federal, agencies subject to the Unemployment Compensation for Federal Employees (ucfe) program. Each quarter, State agencies edit and process the data and send the information to the Bureau of Labor Statistics.

The Quarterly Census of Employment and Wages (QCEW) data, also referred as ES202 data, are the most complete enumeration of employment and wage information by industry at the national, State, metropolitan area, and county levels. They have broad economic significance in evaluating labor
market trends and major industry developments.

## Definitions

In general, the Quarterly Census of Employment and Wages monthly employment data represent the number of covered workers who worked during, or received pay for, the pay period that included the 12 th day of the month. Covered private industry employment includes most corporate officials, executives, supervisory personnel, professionals, clerical workers, wage earners, piece workers, and part-time workers. It excludes proprietors, the unincorporated self-employed, unpaid family members, and certain farm and domestic workers. Certain types of nonprofit employers, such as religious organizations, are given a choice of coverage or exclusion in a number of States. Workers in these organizations are, therefore, reported to a limited degree.

Persons on paid sick leave, paid holiday, paid vacation, and the like, are included. Persons on the payroll of more than one firm during the period are counted by each uI-subject employer if they meet the employment definition noted earlier. The employment count excludes workers who earned no wages during the entire applicable pay period because of work stoppages, temporary layoffs, illness, or unpaid vacations.

Federal employment data are based on reports of monthly employment and quarterly wages submitted each quarter to State agencies for all Federal installations with employees covered by the Unemployment Compensation for Federal Employees (UCFE) program, except for certain national security agencies, which are omitted for security reasons. Employment for all Federal agencies for any given month is based on the number of persons who worked during or received pay for the pay period that included the 12th of the month.

An establishment is an economic unit, such as a farm, mine, factory, or store, that produces goods or provides services. It is typically at a single physical location and engaged in one, or predominantly one, type of economic activity for which a single industrial classification may be applied. Occasionally, a single physical location encompasses two or more distinct and significant activities. Each activity should be reported as a separate establishment if separate records are kept and the various activities are classified under different NAICS industries.

Most employers have only one establishment; thus, the establishment is the predominant reporting unit or statistical
entity for reporting employment and wages data. Most employers, including State and local governments who operate more than one establishment in a State, file a Multiple Worksite Report each quarter, in addition to their quarterly ur report. The Multiple Worksite Report is used to collect separate employment and wage data for each of the employer's establishments, which are not detailed on the uI report. Some very small multi-establishment employers do not file a Multiple Worksite Report. When the total employment in an employer's secondary establishments (all establishments other than the largest) is 10 or fewer, the employer generally will file a consolidated report for all establishments. Also, some employers either cannot or will not report at the establishment level and thus aggregate establishments into one consolidated unit, or possibly several units, though not at the establishment level.

For the Federal Government, the reporting unit is the installation: a single location at which a department, agency, or other government body has civilian employees. Federal agencies follow slightly different criteria than do private employers when breaking down their reports by installation. They are permitted to combine as a single statewide unit: 1) all installations with 10 or fewer workers, and 2) all installations that have a combined total in the State of fewer than 50 workers. Also, when there are fewer than 25 workers in all secondary installations in a State, the secondary installations may be combined and reported with the major installation. Last, if a Federal agency has fewer than five employees in a State, the agency headquarters office (regional office, district office) serving each State may consolidate the employment and wages data for that State with the data reported to the State in which the headquarters is located. As a result of these reporting rules, the number of reporting units is always larger than the number of employers (or government agencies) but smaller than the number of actual establishments (or installations).

Data reported for the first quarter are tabulated into size categories ranging from worksites of very small size to those with 1,000 employees or more. The size category is determined by the establishment's March employment level.It is important to note that each establishment of a multi-establishment firm is tabulated separately into the appropriate size category. The total employment level of the reporting multi-establishment firm is not used in the size tabulation.

Covered employers in most States report total wages paid during the calendar quarter, regardless of when the services were performed. A few State laws, however, specify that wages be reported for, or based on the
period during which services are performed rather than the period during which compensation is paid. Under most State laws or regulations, wages include bonuses, stock options, the cash value of meals and lodging, tips and other gratuities, and, in some States, employer contributions to certain deferred compensation plans such as $401(\mathrm{k})$ plans.

Covered employer contributions for old-age, survivors, and disability insurance (OASDI), health insurance, unemployment insurance, workers' compensation, and private pension and welfare funds are not reported as wages. Employee contributions for the same purposes, however, as well as money withheld for income taxes, union dues, and so forth, are reported even though they are deducted from the worker's gross pay.

Wages of covered Federal workers represent the gross amount of all payrolls for all pay periods ending within the quarter. This includes cash allowances, the cash equivalent of any type of remuneration, severance pay, withholding taxes, and retirement deductions. Federal employee remuneration generally covers the same types of services as for workers in private industry.

Average annual wage per employee for any given industry are computed by dividing total annual wages by annual average employment. A further division by 52 yields average weekly wages per employee. Annual pay data only approximate annual earnings because an individual may not be employed by the same employer all year or may work for more than one employer at a time.

Average weekly or annual wage is affected by the ratio of full-time to part-time workers as well as the number of individuals in high-paying and low-paying occupations. When average pay levels between States and industries are compared, these factors should be taken into consideration. For example, industries characterized by high proportions of part-time workers will show average wage levels appreciably less than the weekly pay levels of regular full-time employees in these industries. The opposite effect characterizes industries with low proportions of part-time workers, or industries that typically schedule heavy weekend and overtime work. Average wage data also may be influenced by work stoppages, labor turnover rates, retroactive payments, seasonal factors, bonus payments, and so on.

## Notes on the data

Beginning with the release of data for 2001, publications presenting data from the Covered Employment and Wages program have switched to the 2002 version of the North

American Industry Classification System (NAICS) as the basis for the assignment and tabulation of economic data by industry. NAICS is the product of a cooperative effort on the part of the statistical agencies of the United States, Canada, and Mexico. Due to difference in NAICS and Standard Industrial Classification (SIC) structures, industry data for 2001 is not comparable to the SIC-based data for earlier years.

Effective January 2001, the program began assigning Indian Tribal Councils and related establishments to local government ownership. This BLS action was in response to a change in Federal law dealing with the way Indian Tribes are treated under the Federal Unemployment Tax Act. This law requires federally recognized Indian Tribes to be treated similarly to State and local governments. In the past, the Covered Employment and Wage (CEW) program coded Indian Tribal Councils and related establishments in the private sector. As a result of the new law, CEW data reflects significant shifts in employment and wages between the private sector and local government from 2000 to 2001. Data also reflect industry changes. Those accounts previously assigned to civic and social organizations were assigned to tribal governments. There were no required industry changes for related establishments owned by these Tribal Councils. These tribal business establishments continued to be coded according to the economic activity of that entity.

To insure the highest possible quality of data, State employment security agencies verify with employers and update, if necessary, the industry, location, and ownership classification of all establishments on a 3-year cycle. Changes in establishment classification codes resulting from the verification process are introduced with the data reported for the first quarter of the year. Changes resulting from improved employer reporting also are introduced in the first quarter. For these reasons, some data, especially at more detailed geographic levels, may not be strictly comparable with earlier years.

County definitions are assigned according to Federal Information Processing Standards Publications as issued by the National Institute of Standards and Technology. Areas shown as counties include those designated as independent cities in some jurisdictions and, in Alaska, those areas designated by the Census Bureau where counties have not been created. County data also are presented for the New England States for comparative purposes, even though townships are the more common designation used in New England (and New Jersey).

The Office of Management and Budget
(OMB) defines metropolitan areas for use in Federal statistical activities and updates these definitions as needed. Data in this table use metropolitan area criteria established by OMB in definitions issued June 30, 1999 (OMB Bulletin No. 99-04). These definitions reflect information obtained from the 1990 Decennial Census and the 1998 U.S. Census Bureau population estimate. A complete list of metropolitan area definitions is available from the National Technical Information Service (NTIS), Document Sales, 5205 Port Royal Road, Springfield, Va. 22161, telephone 1-800-553-6847.

OMB defines metropolitan areas in terms of entire counties, except in the six New England States where they are defined in terms of cities and towns. New England data in this table, however, are based on a county concept defined by OMB as New England County Metropolitan Areas (NECMA) because coun-ty-level data are the most detailed available from the Quarterly Census of Employment and Wages. The NECMA is a county-based alternative to the city- and town-based metropolitan areas in New England. The NECMA for a Metropolitan Statistical Area (MSA) include: (1) the county containing the first-named city in that MSA title (this county may include the first-named cities of other MSA, and (2) each additional county having at least half its population in the MSA in which first-named cities are in the county identified in step 1. The NECMA is officially defined areas that are meant to be used by statistical programs that cannot use the regular metropolitan area definitions in New England.

For additional information on the covered employment and wage data, contact the Division of Administrative Statistics and Labor Turnover at (202) 691-6567.

## Job Openings and Labor Turnover Survey

## Description of the series

## Data for the Job Openings and Labor

 Turnover Survey (JOLTS) are collected and compiled from a sample of 16,000 business establishments. Each month, data are collected for total employment, job openings, hires, quits, layoffs and discharges, and other separations. The JOLTS program covers all private nonfarm establishments such as factories, offices, and stores, as well as Federal, State, and local government entities in the 50 States and the District of Columbia. The JOLTS sample design is a random sample drawn from a universe of more than eight million establishments compiled as part of theoperations of the Quarterly Census of Employment and Wages, or QCEW, program. This program includes all employers subject to State unemployment insurance (UI) laws and Federal agencies subject to Unemployment Compensation for Federal Employees (UCFE).

The sampling frame is stratified by ownership, region, industry sector, and size class. Large firms fall into the sample with virtual certainty. JOLTS total employment estimates are controlled to the employment estimates of the Current Employment Statistics (CES) survey. A ratio of CES to JOLTS employment is used to adjust the levels for all other JolTs data elements. Rates then are computed from the adjusted levels.

The monthly JOLTS data series begin with December 2000. Not seasonally adjusted data on job openings, hires, total separations, quits, layoffs and discharges, and other separations levels and rates are available for the total nonfarm sector, 16 private industry divisions and 2 government divisions based on the North American Industry Classification System (NAICS), and four geographic regions. Seasonally adjusted data on job openings, hires, total separations, and quits levels and rates are available for the total nonfarm sector, selected industry sectors, and four geographic regions.

## Definitions

Establishments submit job openings in-for-mation for the last business day of the reference month. A job opening requires that (1) a specific position exists and there is work available for that position; and (2) work could start within 30 days regardless of whether a suitable candidate is found; and (3) the employer is actively recruiting from outside the establishment to fill the position. Included are full-time, part-time, permanent, short-term, and seasonal openings. Active recruiting means that the establishment is taking steps to fill a position by advertising in newspapers or on the Internet, posting help-wanted signs, accepting applications, or using other similar methods.

Jobs to be filled only by internal transfers, promotions, demotions, or recall from layoffs are excluded. Also excluded are jobs with start dates more than 30 days in the future, jobs for which employees have been hired but have not yet reported for work, and jobs to be filled by employees of temporary help agencies, employee leasing companies, outside contractors, or consultants. The job openings rate is computed by dividing the number of job openings by the sum of employment and job openings, and multiplying that quotient by 100 .

Hires are the total number of additions to the payroll occurring at any time during the reference month, including both new and rehired employees and full-time and parttime, permanent, short-term and seasonal employees, employees recalled to the location after a layoff lasting more than 7 days, on-call or intermittent employees who returned to work after having been formally separated, and transfers from other locations. The hires count does not include transfers or promotions within the reporting site, employees returning from strike, employees of temporary help agencies or employee leasing companies, outside contractors, or consultants. The hires rate is computed by dividing the number of hires by employment, and multiplying that quotient by 100 .

Separations are the total number of terminations of employment occurring at any time during the reference month, and are reported by type of separation-quits, layoffs and discharges, and other separations. Quits are voluntary separations by employees (except for retirements, which are reported as other separations). Layoffs and discharges are involuntary separations initiated by the employer and include layoffs with no intent to rehire, formal layoffs lasting or expected to last more than 7 days, discharges resulting from mergers, downsizing, or closings, firings or other discharges for cause, terminations of permanent or short-term employees, and terminations of seasonal employees. Other separations include retirements, transfers to other locations, deaths, and separations due to disability. Separations do not include transfers within the same location or employees on strike.

The separations rate is computed by dividing the number of separations by employment, and multiplying that quotient by 100 . The quits, layoffs and discharges, and other separations rates are computed similarly, dividing the number by employment and multiplying by 100 .

## Notes on the data

The JOLTS data series on job openings, hires, and separations are relatively new. The full sample is divided into panels, with one panel enrolled each month. A full complement of panels for the original data series based on the 1987 Standard Industrial Classification (SIC) system was not completely enrolled in the survey until January 2002. The supple-mental panels of establishments needed to create NAICS estimates were not completely enrolled until May 2003. The data collected up until
those points are from less than a full sample Therefore, estimates from earlier months should be used with caution, as fewer sampled units were reporting data at that time.

In March 2002, BLS procedures for collecting hires and separations data were revised to address possible underreporting. As a result, JOLTS hires and separations estimates for months prior to March 2002 may not be comparable with estimates for March 2002 and later.

The Federal Government reorganization that involved transferring approximately 180,000 employees to the new Department of Homeland Security is not reflected in the JOLTS hires and separations estimates for the Federal Government. The Office of Personnel Management's record shows these transfers were completed in March 2003. The inclusion of transfers in the JOLTS definitions of hires and separations is intended to cover ongoing movements of workers between establishments. The Department of Homeland Security reorganization was a massive one-time event, and the inclusion of these intergovernmental transfers would distort the Federal Government time series.

Data users should note that seasonal adjustment of the JOLTS series is conducted with fewer data observations than is customary. The historical data, therefore, may be subject to larger than normal revisions. Because the seasonal patterns in economic data series typically emerge over time, the standard use of moving averages as seasonal filters to capture these effects requires longer series than are currently available. As a result, the stable seasonal filter option is used in the seasonal adjustment of the Jolts data. When calculating seasonal factors, this filter takes an average for each calendar month after detrending the series. The stable seasonal filter assumes that the seasonal factors are fixed; a necessary assumption until sufficient data are available. When the stable seasonal filter is no longer needed, other program features also may be introduced, such as outlier adjustment and extended diagnostic testing. Additionally, it is expected that more series, such as layoffs and discharges and additional industries, may be seasonally adjusted when more data are available.

JolTs hires and separations estimates cannot be used to exactly explain net changes in payroll employment. Some reasons why it is problematic to compare changes in payroll employment with JOLTS hires and separations, especially on a monthly basis, are: (1) the reference period for payroll employment is the pay period including the 12th of the month, while the reference period for hires and separations is the calendar month; and
(2) payroll employment can vary from month to month simply because part-time and oncall workers may not always work during the pay period that includes the 12th of the month. Additionally, research has found that some reporters systematically underreport separations relative to hires due to a number of factors, including the nature of their payroll systems and practices. The shortfall appears to be about 2 percent or less over a 12-month period.

FOR ADDITIONAL INFORMATION on the Job Openings and Labor Turnover Survey, contact the Division of Administrative Statistics and Labor Turnover at (202) 961-5870.

## Compensation and Wage Data

(Tables 1-3; 30-37)
The National Compensation Survey (NCS) produces a variety of compensation data. These include: The Employment Cost Index (ECI) and NCS benefit measures of the incidence and provisions of selected employee benefit plans. Selected samples of these measures appear in the following tables. NCS also compiles data on occupational wages and the Employer Costs for Employee Compensation (ECEC).

## Employment Cost Index

## Description of the series

The Employment Cost Index (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It is a Laspeyres Index that uses fixed employment weights to measure change in labor costs free from the influence of employment shifts among occupations and industries.

The ECI provides data for the civilian economy, which includes the total private nonfarm economy excluding private households, and the public sector excluding the Federal government. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Sample establishments are classified by industry categories based on the 2002 North American Classification System (NAICS). Within a sample establishment, specific job categories are selected and classified into about 800 occupations according to the 2000 Standard Occupational Classification (SOC) System. Individual occupations are com-
bined to represent one of ten intermediate aggregations, such as professional and related occupations, or one of five higher level aggregations, such as management, professional, and related occupations.

Fixed employment weights are used each quarter to calculate the most aggregate series-civilian, private, and State and local government. These fixed weights are also used to derive all of the industry and occupational series indexes. Beginning with the March 2006 estimates, 2002 fixed employment weights from the Bureau's Occupational Employment Statistics survey were introduced. From March 1995 to December 2005, 1990 employment counts were used. These fixed weights ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the series based on bargaining status, census region and division, and metropolitan area status, fixed employment data are not available. The employment weights are reallocated within these series each quarter based on the current ECI sample. The indexes for these series, consequently, are not strictly comparable with those for aggregate, occupational, and industry series.

## Definitions

Total compensation costs include wages, salaries, and the employer's costs for employee benefits.

Wages and salaries consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

Benefits include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as Social Security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as payment-in-kind, free room and board, and tips.

## Notes on the data

The ECI data in these tables reflect the con-version to the 2002 North American Industry Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. ECI series based on NAICS and SOC became the official BLS estimates starting in March 2006.

The ECI for changes in wages and salaries
in the private nonfarm economy was published beginning in 1975. Changes in total compensation cost-wages and salaries and benefits combined-were published beginning in 1980. The series of changes in wages and salaries and for total compensation in the State and local government sector and in the civilian nonfarm economy (excluding Federal employees) were published beginning in 1981. Historical indexes (December $2005=100$ ) are available on the Internet: www.bls.gov/ect/

ADDITIONAL INFORMATION on the Employment Cost Index is available at www. bls.gov/ncs/ect/home.htm or by telephone at (202) 691-6199.

## National Compensation Survey Benefit Measures

## Description of the series

NCS benefit measures of employee benefits are published in two separate reports. The annual summary provides data on the incidence of (access to and participation in) selected benefits and provisions of paid holidays and vacations, life insurance plans, and other selected benefit programs. Data on percentages of establishments offering major employee benefits, and on the employer and employee shares of contributions to medical care premiums also are presented. Selected benefit data appear in the following tables. A second publication, published later, contains more detailed information about health and retirement plans.

## Definitions

Employer-provided benefits are benefits that are financed either wholly or partly by the employer. They may be sponsored by a union or other third party, as long as there is some employer financing. However, some benefits that are fully paid for by the employee also are included. For example, long-term care insurance paid entirely by the employee are included because the guarantee of insurability and availability at group premium rates are considered a benefit.

Employees are considered as having access to a benefit plan if it is available for their use. For example, if an employee is permitted to participate in a medical care plan offered by the employer, but the employee declines to do so, he or she is placed in the category with those having access to medical care.

Employees in contributory plans are considered as participating in an insurance or retirement plan if they have paid required
contributions and fulfilled any applicable service requirement. Employees in noncontributory plans are counted as participating regardless of whether they have fulfilled the service requirements.

Defined benefit pension plans use predetermined formulas to calculate a retirement benefit (if any), and obligate the employer to provide those benefits. Benefits are generally based on salary, years of service, or both.

Defined contribution plans generally specify the level of employer and employee contributions to a plan, but not the formula for determining eventual benefits. Instead, individual accounts are set up for participants, and benefits are based on amounts credited to these accounts.

Tax-deferred savings plans are a type of defined contribution plan that allow participants to contribute a portion of their salary to an employer-sponsored plan and defer income taxes until withdrawal.

Flexible benefit plans allow employees to choose among several benefits, such as life insurance, medical care, and vacation days, and among several levels of coverage within a given benefit.

## Notes on the data

ADDITIONAL INFORMATION ON THE NCS benefit measures is available at www.bls. gov/ncs/ebs/home.htm or by telephone at (202) 691-6199.

## Work stoppages

## Description of the series

Data on work stoppages measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of work time lost because of stoppage. These data are presented in table 37.

Data are largely from a variety of published sources and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

## Definitions

Number of stoppages: The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

Workers involved: The number of workers directly involved in the stoppage.

Number of days idle: The aggregate
number of workdays lost by workers involved in the stoppages.

Days of idleness as a percent of estimated working time: Aggregate workdays lost as a percent of the aggregate number of standard workdays in the period multiplied by total employment in the period.

## Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

ADDITIONAL INFORMATION on work stop-pages data is available at www. bls. gov/cba/home.htm or by telephone at (202) 691-6199.

## Price Data

(Tables 2; 38-46)
Price data are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base pe-riod-December 2003 = 100 for many Producer Price Indexes (unless otherwise noted), 1982-84 = 100 for many Consumer Price Indexes (unless otherwise noted), and 1990 $=100$ for International Price Indexes.

## Consumer Price Indexes

## Description of the series

The Consumer Price Index (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI-W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all-urban consumer index (CPI-U), introduced in 1978, is representative of the 1993-95 buying habits of about 87 percent of the noninstitutional population of the United States at that time, compared with 32 percent represented in the CPI-W. In addition to wage earners and clerical workers, the CPI-U covers professional, managerial, and technical workers, the self-employed, shortterm workers, the unemployed, retirees, and
others not in the labor force.
The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items are kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 23,000 retail establishments and 5,800 housing units in 87 urban areas across the country are used to develop the "U.S.city average." Separate estimates for 14 major urban centers are presented in table 39. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

## Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are meaured for the CPI-U. A rental equivalence method replaced the asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes. An updated CPI-U and CPI-W were introduced with release of the January 1987 and January 1998 data.

FOR ADDITIONAL INFORMATION, contact the Division of Prices and Price Indexes: (202) 691-7000.

## Producer Price Indexes

## Description of the series

Producer Price Indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 80,000 quotations per month, selected to represent the movement of prices of all commodities produced in the manufacturing; agriculture, forestry, and fishing; mining; and gas and electricity and public utilities sectors. The stage-of-processing structure of PPI organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end use or material composition. The industry and product structure of PPI organizes data in
accordance with the 2002 North American Industry Classification System and product codes developed by the U.S. Census Bureau.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1992, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1987. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

FOR ADDITIONAL INFORMATION, contact the Division of Industrial Prices and Price Indexes: (202) 691-7705.

## International Price Indexes

## Description of the series

The International Price Program produces monthly and quarterly export and import price indexes for nonmilitary goods and services traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts; it includes corporations, businesses, and individuals, but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected primarily by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S.
border for imports. For nearly all products, the prices refer to transactions completed during the first week of the month. Survey respondents are asked to indicate all discounts, allowances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined according to the five-digit level of detail for the Bureau of Economic Analysis End-use Classification, the three-digit level for the Standard International Trade Classification (SITC), and the four-digit level of detail for the Harmonized System. Aggregate import indexes by country or region of origin are also available.

BLS publishes indexes for selected categories of internationally traded services, calculated on an international basis and on a balance-of-payments basis.

## Notes on the data

The export and import price indexes are weighted indexes of the Laspeyres type. The trade weights currently used to compute both indexes relate to 2000 .

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

FOR ADDITIONAL INFORMATION, contact the Division of International Prices: (202) 691-7155.

## Productivity Data

(Tables 2; 47-50)

## Business and major sectors

## Description of the series

The productivity measures relate real output to real input. As such, they encompass a fam-
ily of measures which include single-factor input measures, such as output per hour, output per unit of labor input, or output per unit of capital input, as well as measures of multifactor productivity (output per unit of combined labor and capital inputs). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

## Definitions

Output per hour of all persons (labor productivity) is the quantity of goods and services produced per hour of labor input. Output per unit of capital services (capital productivity) is the quantity of goods and services produced per unit of capital services input. Multifactor productivity is the quantity of goods and services produced per combined inputs. For private business and private nonfarm business, inputs include labor and capital units. For manufacturing, inputs include labor, capital, energy, nonenergy materials, and purchased business services.

Compensation per hour is total compensation divided by hours at work. Total compensation equals the wages and salaries of employees plus employers'contributions for social insurance and private benefit plans, plus an estimate of these payments for the self-employed (except for nonfinancial corporations in which there are no self-employed). Real compensation per hour is compensation per hour deflated by the change in the Consumer Price Index for All Urban Consumers.

Unit labor costs are the labor compensation costs expended in the production of a unit of output and are derived by dividing compensation by output. Unit nonlabor payments include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current-dollar value of output and dividing by output.

Unit nonlabor costs contain all the components of unit nonlabor payments except unit profits.

Unit profits include corporate profits with inventory valuation and capital consumption adjustments per unit of output.

Hours of all persons are the total hours at work of payroll workers, self-employed persons, and unpaid family workers.

Labor inputs are hours of all persons adjusted for the effects of changes in the
education and experience of the labor force.
Capital services are the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets-equipment, structures, land, and inventories-weighted by rental prices for each type of asset.

Combined units of labor and capital inputs are derived by combining changes in labor and capital input with weights which represent each component's share of total cost. Combined units of labor, capital, energy, materials, and purchased business services are similarly derived by combining changes in each input with weights that represent each input's share of total costs. The indexes for each input and for combined units are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

## Notes on the data

Business sector output is an annually-weighted index constructed by excluding from real gross domestic product (GDP) the following outputs: general government, nonprofit institutions, paid employees of private households, and the rental value of owner-occupied dwellings. Nonfarm business also excludes farming. Private business and private nonfarm business further exclude government enterprises. The measures are supplied by the U.S. Department of Commerce's Bureau of Economic Analysis. Annual estimates of manufacturing sectoral output are produced by the Bureau of Labor Statistics. Quarterly manufacturing output indexes from the Federal Reserve Board are adjusted to these annual output measures by the BLS. Compensation data are developed from data of the Bureau of Economic Analysis and the Bureau of Labor Statistics. Hours data are developed from data of the Bureau of Labor Statistics.

The productivity and associated cost measures in tables 47-50 describe the relationship between output in real terms and the labor and capital inputs involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input.

Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; shifts in the composition of the labor force; capital investment; level of output; changes in the utilization of capacity, energy, material, and research and development; the organi-
zation of production; managerial skill; and characteristics and efforts of the work force.

FOR ADDITIONAL INFORMATION on this productivity series, contact the Division of Productivity Research: (202) 691-5606.

## Industry productivity measures

## Description of the series

The BLS industry productivity indexes measure the relationship between output and inputs for selected industries and industry groups, and thus reflect trends in industry efficiency over time. Industry measures include labor productivity, multifactor productivity, compensation, and unit labor costs.

The industry measures differ in methodology and data sources from the productivity measures for the major sectors because the industry measures are developed independently of the National Income and Product Accounts framework used for the major sector measures.

## Definitions

Output per hour is derived by dividing an index of industry output by an index of labor input. For most industries, output indexes are derived from data on the value of industry output adjusted for price change. For the remaining industries, output indexes are derived from data on the physical quantity of production.

The labor input series is based on the hours of all workers or, in the case of some transportation industries, on the number of employees. For most industries, the series consists of the hours of all employees. For some trade and services industries, the series also includes the hours of partners, proprietors, and unpaid family workers.

Unit labor costs represent the labor compensation costs per unit of output produced, and are derived by dividing an index of labor compensation by an index of output. Labor compensation includes payroll as well as supplemental payments, including both legally required expenditures and payments for voluntary programs.

Multifactor productivity is derived by dividing an index of industry output by an index of combined inputs consumed in producing that output. Combined inputs include capital, labor, and intermediate purchases. The measure of capital input represents the flow of services from the capital stock used in production. It is developed from measures
of the net stock of physical assets-equipment, structures, land, and inventories. The measure of intermediate purchases is a combination of purchased materials, services, fuels, and electricity.

## Notes on the data

The industry measures are compiled from data produced by the Bureau of Labor Statistics and the Census Bureau, with additional data supplied by other government agencies, trade associations, and other sources.

FOR ADDITIONAL INFORMATION on this series, contact the Division of Industry Productivity Studies: (202) 691-5618, or visit the Web site at: www.bls.gov/lpc/home.htm

## International Comparisons

(Tables 51-53)

## Labor force and unemployment

## Description of the series

Tables 51 and 52 present comparative measures of the labor force, employment, and unemployment approximating U.S. concepts for the United States, Canada, Australia, Japan, and six European countries. The Bureau adjusts the figures for these selected countries, for all known major definitional differences, to the extent that data to prepare adjustments are available. Although precise comparability may not be achieved, these adjusted figures provide a better basis for international comparisons than the figures regularly published by each country. For further information on adjustments and comparability issues, see Constance Sorrentino, "International unemployment rates: how comparable are they?" Monthly Labor Review, June 2000, pp. 3-20, available on the Internet at www. bls.gov/opub/mlr/2000/06/art1full.pdf.

## Definitions

For the principal U.S. definitions of the labor force, employment, and unemployment, see the Notes section on Employment and Unemployment Data: Household survey data.

## Notes on the data

Foreign country data are adjusted as closely as possible to the U.S. definitions. Primary areas of adjustment address conceptual differences in upper age limits and defini-
tions of employment and unemployment, provided that reliable data are available to make these adjustments. Adjustments are made where applicable to include employed and unemployed persons above upper age limits; some European countries do not include persons older than age 64 in their labor force measures, because a large portion of this population has retired. Adjustments are made to exclude active duty military from employment figures, although a small number of career military may be included in some European countries. Adjustments are made to exclude unpaid family workers who worked fewer than 15 hours per week from employment figures; U.S. concepts do not include them in employment, whereas most foreign countries include all unpaid family workers regardless of the number of hours worked. Adjustments are made to include full-time students seeking work and available for work as unemployed when they are classified as not in the labor force.

Where possible, lower age limits are based on the age at which compulsory schooling ends in each country, rather than based on the U.S. standard of 16 . Lower age limits have ranged between 13 and 16 over the years covered; currently, the lower age limits are either 15 or 16 in all 10 countries.

Some adjustments for comparability are not made because data are unavailable for adjustment purposes. For example, no adjustments to unemployment are usually made for deviations from U.S. concepts in the treatment of persons waiting to start a new job or passive job seekers. These conceptual differences have little impact on the measures. Furthermore, BLS studies have concluded that no adjustments should be made for persons on layoff who are counted as employed in some countries because of their strong job attachment as evidenced by, for example, payment of salary or the existence of a recall date. In the United States, persons on layoff have weaker job attachment and are classified as unemployed.

The annual labor force measures are obtained from monthly, quarterly, or continuous household surveys and may be calculated as averages of monthly or quarterly data. Quarterly and monthly unemployment rates are based on household surveys. For some countries, they are calculated by applying annual adjustment factors to current published data and, therefore, are less precise indicators of unemployment under U.S. concepts than the annual figures. The labor force measures may have breaks in series over time due to changes in surveys, sources, or estimation methods. Breaks are noted in data tables.

For up-to-date information on adjustments and breaks in series, see the Technical

Notes of Comparative Civilian Labor Force Statistics, 10 Countries, on the Internet at www.bls.gov/fls/flscomparelf.htm, and the Notes of Unemployment rates in 10 countries, civilian labor force basis, approximating U.S. concepts, seasonally adjusted, on the Internet at www.bls.gov/fls/flsjec.pdf.

FOR ADDITIONAL INFORMATION on this series, contact the Division of Foreign Labor Statistics: (202) 691-5654 or flshelp@ bls.gov.

## Manufacturing productivity and labor costs

## Description of the series

Table 53 presents comparative indexes of manufacturing output per hour (labor productivity),output,total hours, compensation per hour, and unit labor costs for the United States, Australia, Canada, Japan, the Republic of Korea, Singapore, Taiwan, and 10 European countries. These measures are trend compari-sons-that is, series that measure changes over time-rather than level comparisons. BLS does not recommend using these series for level comparisons because of technical problems.

BLS constructs the comparative indexes from three basic aggregate measures-output, total labor hours, and total compensation. The hours and compensation measures refer to employees (wage and salary earners) in Belgium and Taiwan. For all other economies, the measures refer to all employed persons, including employees, self-employed persons, and unpaid family workers.

The data for recent years are based on the United Nations System of National Accounts 1993 (SNA 93). Manufacturing is generally defined according to the International Standard Industrial Classification (ISIC). However, the measures for France include parts of mining as well. For the United States and Canada, manufacturing is defined according to the North American Industry Classification System (NAICS 97).

## Definitions

Output. For most economies, the output measures are real value added in manufacturing from national accounts. However, output for Japan prior to 1970 and for the Netherlands prior to 1960 are indexes of industrial production. The manufacturing value added measures for the United Kingdom are essentially identical to their indexes of industrial production.

For United States, the output measure for the manufacturing sector is a chain-weighted
index of real gross product originating (deflated value added) produced by the Bureau of Economic Analysis of the U.S. Department of Commerce. Most of the other economies now also use chain-weighted as opposed to fixed-year weights that are periodically updated.

To preserve the comparability of the U.S. measures with those of other economies, BLS uses gross product originating in manufacturing for the United States. The gross product originating series differs from the manufacturing output series that BLS publishes in its quarterly news releases on U.S. productivity and costs (and that underlies the measures that appear in tables 48 and 50 in this section). The quarterly measures are on a "sectoral output" basis, rather than a valueadded basis. Sectoral output is gross output less intrasector transactions.

Total hours refer to hours worked in all economies. The measures are developed from statistics of manufacturing employment and average hours. For most other economies, recent years' aggregate hours series are obtained from national statistical offices, usually from national accounts. However, for some economies and for earlier years, BLS calculates the aggregate hours series using employment figures published with the national accounts, or other comprehensive employment series, and data on average hours worked.

Hourly compensation is total compensation divided by total hours. Total compensation includes all payments in cash or in-kind made directly to employees plus employer expenditures for legally required insurance programs and contractual and private benefit plans. For Australia, Canada, France, Singapore, and Sweden, compensation is increased to account for important taxes on payroll or employment. For the United Kingdom, compensation is reduced between 1967 and 1991 to account for subsidies.

Labor productivity is defined as real output per hour worked. Although the labor productivity measure presented in this release relates output to the hours worked of persons employed in manufacturing, it does not measure the specific contributions of labor as a single factor of production. Rather, it reflects the joint effects of many influences, including new technology, capital investment, capacity utilization, energy use, and managerial skills, as well as the skills and efforts of the workforce.

Unit labor costs are defined as the cost of labor input required to produce one unit of output. They are computed as compensation in nominal terms divided by real output. Unit labor costs can also be computed by dividing hourly compensation by output per hour, that is, by labor productivity.

## Notes on the data

The measures for recent years may be based on current indicators of manufacturing output (such as industrial production indexes), employment, average hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available.

FOR ADDITIONAL INFORMATION on this series, go to http://www.bls.gov/news. release/prod4.toc.htm or contact the Division of International Labor Comparison at (202) 691-5654.

## Occupational Injury and IIIness Data

(Tables 54-55)

## Survey of Occupational Injuries and IIInesses

## Description of the series

The Survey of Occupational Injuries and Illnesses collects data from employers about their workers' job-related nonfatal injuries and illnesses. The information that employers provide is based on records that they maintain under the Occupational Safety and Health Act of 1970. Self-employed individuals, farms with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies are excluded from the survey.

The survey is a Federal-State cooperative program with an independent sample selected for each participating State. A stratified random sample with a Neyman allocation is selected to represent all private industries in the State. The survey is stratified by Standard Industrial Classification and size of employment.

## Definitions

Under the Occupational Safety and Health Act, employers maintain records of nonfatal work-related injuries and illnesses that involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment other than first aid.

Occupational injury is any injury such as a cut, fracture, sprain, or amputation that results from a work-related event or a single, instantaneous exposure in the work environment.

Occupational illness is an abnormal
condition or disorder, other than one resulting from an occupational injury, caused by exposure to factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

Lost workday injuries and illnesses are cases that involve days away from work, or days of restricted work activity, or both.

Lost workdays include the number of workdays (consecutive or not) on which the employee was either away from work or at work in some restricted capacity, or both, because of an occupational injury or illness. BLS measures of the number and incidence rate of lost workdays were discontinued beginning with the 1993 survey. The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked, such as a Federal holiday, even though able to work.

Incidence rates are computed as the number of injuries and/or illnesses or lost work days per 100 full-time workers.

## Notes on the data

The definitions of occupational injuries and illnesses are from Recordkeeping Guidelines for Occupational Injuries and Illnesses (U.S. Department of Labor, Bureau of Labor Statistics, September 1986).

Estimates are made for industries and employment size classes for total recordable cases, lost workday cases, days away from work cases, and nonfatal cases without lost workdays. These data also are shown separately for injuries. Illness data are available for seven categories: occupational skin diseases or disorders, dust diseases of the lungs, respiratory conditions due to toxic agents, poisoning (systemic effects of toxic agents), disorders due to physical agents (other than toxic materials), disorders associated with repeated trauma, and all other occupational illnesses.

The survey continues to measure the number of new work-related illness cases which are recognized, diagnosed, and reported during the year. Some conditions, for example, long-term latent illnesses caused by exposure to carcinogens, often are difficult to relate to the workplace and are not adequately recognized and reported. These long-term latent illnesses are believed to be understated in the survey's illness measure. In
contrast, the overwhelming majority of the reported new illnesses are those which are easier to directly relate to workplace activity (for example, contact dermatitis and carpal tunnel syndrome).

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses per 100 equivalent full-time workers. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Full detail on the available measures is presented in the annual bulletin, Occupational Injuries and Illnesses: Counts, Rates, and Characteristics.

Comparable data for more than 40 States and territories are available from the BLS Office of Safety, Health and Working Conditions. Many of these States publish data on State and local government employees in addition to private industry data.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration. Data from these organizations are included in both the national and State data published annually.

With the 1992 survey, BLS began publishing details on serious, nonfatal incidents resulting in days away from work. Included are some major characteristics of the injured and ill workers, such as occupation, age, gender, race, and length of service, as well as the circumstances of their injuries and illnesses (nature of the disabling condition, part of body affected, event and exposure, and the source directly producing the condition). In general, these data are available nationwide for detailed industries and for individual States at more aggregated industry levels.

FOR ADDITIONAL INFORMATION on occupational injuries and illnesses, contact the Office of Occupational Safety, Health and Working Conditions at (202) 691-6180, or access the Internet at: www.bls. gov/iif/

## Census of Fatal Occupational Injuries

The Census of Fatal Occupational Injuries compiles a complete roster of fatal job-related injuries, including detailed data about the fatally injured workers and the fatal events. The program collects and cross checks fatality information from multiple sources, including
death certificates, State and Federal workers' compensation reports, Occupational Safety and Health Administration and Mine Safety and Health Administration records, medical examiner and autopsy reports, media accounts, State motor vehicle fatality records, and follow-up questionnaires to employers.

In addition to private wage and salary workers, the self-employed, family members, and Federal, State, and local government workers are covered by the program. To be included in the fatality census, the decedent must have been employed (that is working for pay, compensation, or profit) at the time of the event, engaged in a legal work activity, or present at the site of the incident as a requirement of his or her job.

## Definition

A fatal work injury is any intentional or unintentional wound or damage to the body resulting in death from acute exposure to energy, such as heat or electricity, or kinetic energy from a crash, or from the absence of such essentials as heat or oxygen caused by a specific event or incident or series of events within a single workday or shift. Fatalities that occur during a person's commute to or from work are excluded from the census, as well as work-related illnesses,which can be difficult to identify due to long latency periods.

## Notes on the data

Twenty-eight data elements are collected, coded, and tabulated in the fatality program, including information about the fatally injured worker, the fatal incident, and the machinery or equipment involved. Summary worker demographic data and event characteristics are included in a national news release that is available about 8 months after the end of the reference year. The Census of Fatal Occupational Injuries was initiated in 1992 as a joint Federal-State effort. Most States issue summary information at the time of the national news release.

FOR ADDITIONAL INFORMATION on the Census of Fatal Occupational Injuries contact the BLS Office of Safety, Health, and Working Conditions at (202) 6916175, or the Internet at: www.bls.gov/iif/

1. Labor market indicators

[^3]${ }^{4}$ Excludes Federal and private household workers.
${ }^{5}$ Goods-producing industries include mining, construction, and manufacturing. Serviceproviding industries include all other private sector industries.

NOTE: Beginning in January 2003, household survey data reflect revised population controls. Nonfarm data reflect the conversion to the 2002 version of the North American Industry Classification System (NAICS), replacing the Standard Industrial Classification (SIC) system. NAICS-based data by industry are not comparable with SIC based data.
2. Annual and quarterly percent changes in compensation, prices, and productivity

${ }^{1}$ The population figures are not seasonally adjusted.
${ }^{2}$ Civilian employment as a percent of the civilian noninstitutional population.
${ }^{3}$ Beginning in 2003, persons who selected this race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race.

NOTE: Estimates for the above race groups (white and black or African American) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race. Beginning in January 2003, data reflect revised population controls used in the household survey.

1 Data relate to production workers in natural resources and mining and
manufacturing, construction workers in construction, and nonsupervisory
workers in the service-providing industries.

## 16. Average weekly earnings of production or nonsupervisory workers ${ }^{1}$ on private nonfarm payrolls, by industry

${ }^{1}$ Cost (cents per hour worked) measured in the Employment Cost Index consists of wages, salaries, and employer cost of employee benefits.
${ }^{2}$ Consists of private industry workers (excluding farm and household workers) and State and local government (excluding Federal Government) workers.
${ }^{3}$ Consists of legislative, judicial, administrative, and regulatory activities.

Note: The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

NOTE: The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and sOC data shown prior
to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.
33. Employment Cost Index, private industry workers by bargaining status and region

The indexes are calculated differently from those for the occupation and industry groups. For a detailed description of the index calculation, see the Monthly Labor Review Technical Note, "Estimation procedures for the Employment Cost Index," May 1982.

[^14]34. Continued-National Compensation Survey: Retirement benefits in private industry
by access, participation, and selected series, 2003-2007

${ }^{1}$ The 2002 North American Industry Classification System (NAICS) replaced the 1987 Standard Industrial Classification (SIC)
System. Estimates for goods-producing and service-providing (formerly service-producing) industries are considered comparable.
Also introduced was the 2000 Standard Occupational Classification (SOC) to replace the 1990 Census of Population system.
Only service occupations are considered comparable.
${ }^{2}$ The white-collar and blue-collar occupation series were discontinued effective 2007.
${ }^{3}$ The take-up rate is an estimate of the percentage of workers with access to a plan who participate in the plan.
Note: Where applicable, dashes indicate no employees in this category or data do not meet publication criteria.

Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:
M-Every month.
1-January, March, May, July, September, and November.
2—February, April, June, August, October, and December
${ }^{2}$ Regions defined as the four Census regions
${ }^{3}$ Indexes on a December $1996=100$ base.
${ }^{4}$ The "North Central" region has been renamed the "Midwest" region by the Census Bureau. It is composed of the same geographic entities.
${ }^{5}$ Indexes on a December $1986=100$ base
6 In addition, the following metropolitan areas are published semiannually and appear in tables 34 and 39 of the January and July issues of the CPI Detailed

Report: Anchorage, AK; Cincinnatti, OH-KY-IN; Kansas City, MO-KS; Milwaukee-Racine, WI; Minneapolis-St. Paul, MN-WI; Pittsburgh, PA; Port-land-Salem, OR-WA; St Louis, MO-IL; San Diego, CA; Tampa-St. Petersburg-Clearwater, FL.
${ }^{7}$ Indexes on a November $1996=100$ base .

NOTE: Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller sample size and is, therefore, subject to substantially more sampling and other measurement error. As a result, local area indexes show greater volatility than the national index, although their long-term trends are similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in their escalator clauses. Index applies to a month as a whole, not to any specific date Dash indicates data not available.

NOTE: Dash indicates data not available.
Quarterly figures for France, Germany, Italy, and the Netherlands are calculated by applying annual adjustment factors to current published data and therefore should be viewed as less precise indicators of unemployment under U.S. concepts than the annual figures. Quarterly figures for Sweden are BLS seasonally adjusted estimates derived from Swedish not seasonally adjusted data. For further qualifications and historical annual data, see the BLS report international comparisons of annual and historical annual data, see the BLS report International comparisons of annual labor
force statistics, 10 countries (on the internet at
http://www.bls.gov/fis/fiscomparelf.htm). For monthly unemployment rates, as well as the quarterly and annual rates published in this table, see the BLS report Unemployment rates in 10 countries, civilian labor force basis, approximating U.S. concepts, seasonally adjusted (on the Internet at http://www.bls.gov/flis/flsjec.pdf). Unemployment rates may differ between the two reports mentioned, because the former is updated annually, whereas the latter is updated monthly and reflects the most recent revisions in source data.
52. Annual data: employment status of the working-age population, approximating U.S. concepts, 10 countries
[Numbers in thousands]

[^19]NOTE: There are breaks in series for the United States (1997, 1998, 1999, 2000, 2003 2004), Australia (2001), Germany ( 1999,2005 ), the Netherlands $(2000,2003)$, and Sweden (2005). For further qualifications and historical annual data, see the BLS report

Internet at http://www.bls.gov/fis/fiscomparelf.htm ). Unemployment rates may differ from those in the BLS report Unemployment rates in 10 countries, civilian labor force basis, approximating U.S. concepts, seasonally adjusted (on the Internet at http://www.bls.gov/fis/fisjec.pdf ), because the former is updated annually, whereas the latter is updated monthly and reflects the most recent revisions in source data
53. Annual indexes of manufacturing productivity and related measures, 17 economies

Data for 1989 and subsequent years are based on the Standard Industrial Classification Manual, 1987 Edition. For this reason, they are not strictly comparable with data for the years 1985-88, which were based on the Standard Industrial Classification Manual, 1972 Edition, 1977 Supplement.
${ }^{2}$ Beginning with the 1992 survey, the annual survey measures only nonfatal injuries and illnesses, while past surveys covered both fatal and nonfatal incidents. To better address fatalities, a basic element of workplace safety, BLS implemented the Census of Fatal Occupational Injuries.
${ }^{3}$ The incidence rates represent the number of injuries and illnesses or lost workdays per 100 full-time workers and were calculated as (N/EH) X 200,000, where:
$\mathrm{N}=$ number of injuries and illnesses or lost workdays; $\mathrm{EH}=$ total hours worked by all employees during the calendar year; and $200,000=$ base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year).
${ }^{4}$ Beginning with the 1993 survey, lost workday estimates will not be generated. As of 1992, BLS began generating percent distributions and the median number of days away from work by industry and for groups of workers sustaining similar work disabilities.
${ }^{5}$ Excludes farms with fewer than 11 employees since 1976.

NOTE: Dash indicates data not available.

## 55. Fatal occupational injuries by event or exposure, 1996-2005

| Event or exposure ${ }^{1}$ | $\begin{aligned} & \text { 1996-2000 } \\ & \text { (average) } \end{aligned}$ | $\begin{aligned} & \text { 2001-2005 } \\ & \text { (average) }^{2} \end{aligned}$ | 20053 |  |

[^3]:    ${ }^{1}$ Quarterly data seasonally adjusted.
    ${ }^{2}$ Annual changes are December-to-December changes. Quarterly changes are calculated using the last month of each quarter
    ${ }^{3}$ The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

[^4]:    ${ }^{1}$ Annual changes are December-to-December changes. Quarterly changes are calculated using the last month of each quarter. Compensation and price data are not seasonally adjusted, and the price data are not compounded.
    ${ }^{2}$ Excludes Federal and private household workers.
    ${ }^{3}$ The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes

[^5]:    ${ }^{1}$ Excludes persons "with a job but not at work" during the survey period for such reasons as vacation, illness, or industrial disputes.

[^6]:    ${ }^{1}$ Beginning in 2003, persons who selected this race group only; persons who
    selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race.
    2 Data refer to persons 25 years and older.

[^7]:    1 Data relate to production workers in natural resources and mining and manufacturing,
    construction workers in construction, and nonsupervisory workers in the service-
    providing industries.
    NOTE: See "Notes on the data" for a description of the most recent benchmark revision.
    Dash indicates data not available.
    $p=$ preliminary.

[^8]:    ${ }^{1}$ Detail will not necessarily add to totals because of the independent seasonal adjustment of the various series.
    ${ }^{2}$ Includes natural resources and mining, information, financial activities, and other services, not shown separately.
    ${ }^{3}$ Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont; South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia;

    Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin; West: Alaska, Arizona California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

    Note: The hires level is the number of hires during the entire month; the hires rate is the number of hires during the entire month as a percent of total employment.
