(NOTE: This release was reissued on Friday, May 29, 2009, to correct wage data in table 1 for three occupations: (1) postal service clerks; (2) postal service mail carriers; and (3) postal service mail sorters, processors, and processing machine operators. These corrections did not affect any other tables in the release or the analysis of occupational employment and wage data.)

OCCUPATIONAL EMPLOYMENT AND WAGES, 2008

In 2008, the U.S. median wage was \$15.57 per hour or \$32,390 per year, according to the Bureau of Labor Statistics (BLS) of the U.S. Department of Labor. These data are from the Occupational Employment Statistics (OES) program, which provides employment and wage estimates for wage and salary workers in 22 major occupational groups and 801 detailed occupations. OES produces data by occupation for the nation, states, metropolitan areas, metropolitan divisions, and nonmetropolitan areas, and by occupation and industry for the nation. National cross-industry employment and wage information for all occupations is shown in table 1. Complete data are available from the OES homepage at <http://www.bls.gov/oes/>.

The median wage represents the pay of the typical worker. Table 4 shows employment and wage information for occupations with median wages between 5 percent above and 5 percent below the U.S. median wage. Many of the occupations with wages within this range were office and administrative support, construction and extraction, or production occupations.

OES data can be used to compare employment and wages for different occupations, such as the occupations with wages near the U.S. median shown in table 4. With employment of 1.9 and 1.3 million, respectively, bookkeeping, accounting, and auditing clerks; and general maintenance and repair

Changes to Occupational Employment Statistics Data

Effective with this news release, the Occupational Employment Statistics program has switched the basis for their industry classification from the 2002 North American Industry Classification System (NAICS) to the 2007 NAICS. Historical data were not revised.

workers were the largest occupations with wages near the U.S. median, and also were among the 20 largest occupations overall. The 2 largest occupations in the U.S., retail salespersons and cashiers, had employment of approximately 4.4 and 3.5 million, respectively.

Other large occupations with wages near the U.S. median included all other teachers and instructors, with employment of 574,540; billing and posting clerks and machine operators (512,120); inspectors, testers, sorters, samplers, and weighers (467,010); welders, cutters, solderers, and brazers (392,520); and dental assistants (293,090). Among the smallest occupations with wages near the U.S. median were forest fire inspectors and prevention specialists, farm labor contractors, wood model makers, and wood patternmakers, each of which had employment levels between 1,000 and 2,000.

While some of these occupations were concentrated in specific industries, others were more widely distributed across industries. For example, although 93 percent of dental assistants worked in offices of dentists, the largest employer of general maintenance and repair workers—lessors of real estate—employed only about 10 percent of this occupation.

Median wages for occupations shown in table 4 ranged from \$14.83 to \$16.35 per hour. In contrast, the lowest paying occupations included gaming dealers; combined food preparation and serving workers; waiters and waitresses; dining room and cafeteria attendants and bartender helpers; and fast food cooks, with median wages ranging from \$7.84 to \$8.12 per hour. Among the highest paying occupations were several specialty physician and dentist occupations, which had median wages over \$80.00 per hour or \$166,400 annually.

Major Occupational Group Employment and Wages by Industry Sector

Most occupations with wages near the U.S. median were office and administrative support; construction and extraction; installation, maintenance, and repair; or production occupations. Table 4 contains 26 occupations in the production group, making this group the one with the largest number of occupations earning near the median wage. Twelve office and administrative support occupations had wages near the U.S. median; however, total employment in these 12 occupations was approximately 3.8 million, as compared to total employment of 2.1 million for the production occupations shown in table 4.

Office and administrative support also was the largest occupational group overall, with total employment of 23.2 million, followed by sales and related occupations, with total employment of 14.3 million, and food preparation and serving related occupations, with total employment of 11.4 million. (See table 2.) While some occupational groups were highly concentrated in specific industry sectors, others were distributed more evenly across sectors. For example, nearly 89 percent of employment in education, training, and library occupations was found in the educational services sector, and over 87 percent of employment in healthcare support occupations was found in the health care and social assistance sector. In contrast, although retail trade, finance and insurance, and health care and social assistance were among the largest employers of office and administrative support occupations, no single sector employed more than 12.4 percent of this group. (See table 2.)

The highest paying occupational groups included management occupations, with a median hourly wage of \$42.15, legal occupations (\$34.49), and computer and mathematical science occupations (\$34.26). Food preparation and serving related occupations (\$8.59); farming, fishing, and forestry occupations (\$9.34); personal care and service occupations (\$9.82); and building and grounds cleaning and maintenance occupations (\$10.52) were among the lowest paying occupational groups. (See table 3.)

Wages for the occupational groups varied by industry. Utilities; transportation and warehousing; information; and finance and insurance were among the highest paying industry sectors for several occupational groups. Agriculture, forestry, fishing, and hunting; retail trade; and accommodation and food services were among the lowest paying sectors. For example, median hourly wages for business and financial operations occupations ranged from \$33.75 in utilities to \$20.94 in accommodation and food services, while median wages for office and administrative support occupations ranged from \$19.57 in transportation and warehousing to \$10.75 in retail trade.

Detailed Occupational Employment and Wages by Detailed Industry

In addition to the occupational group and industry sector data previously discussed, OES data also are available for detailed occupations and industries. For example, table 5 shows employment and wages by industry for bookkeeping, accounting, and auditing clerks. Employment in this occupation was widely distributed across industries. The accounting, tax preparation, bookkeeping, and payroll services industry employed more bookkeeping clerks than any other industry, but only about 5.4 percent of bookkeeping clerks were employed in this industry. Other large employers of this occupation were building equipment contractors, depository credit intermediation, management of companies and enterprises, and local government (OES designation); each representing less than 5 percent of occupational employment. The median hourly wage for bookkeeping clerks in these industries ranged from \$14.43 in depository credit intermediation to \$16.22 in building equipment contractors.

Although accounting, tax preparation, bookkeeping, and payroll services employed a relatively small percentage of all bookkeeping clerks, this was the second largest occupation in the accounting services industry, representing about 11.4 percent of industry employment. (See table 6.) Accountants and auditors was by far the largest occupation in the industry, with 286,110 jobs making up about one-third of industry employment. Tax preparers was the third largest occupation in accounting services, with employment of 61,160. Most of the other large occupations in this industry were office and administrative support occupations.

Occupational Employment and Wages by State and Area

OES data also allow comparison of occupational employment and wages across states and metropolitan areas. Tables 7 and 8 show the states and metropolitan areas with the highest employment and highest employment concentrations of selected detailed occupations. Areas with high total employment also tend to be among the largest employers of any individual occupation, while employment concentrations reflect factors other than overall employment levels, such as the area's industry mix. For example, Texas employed more welders, cutters, solderers, and brazers than any other state, with 53,530 jobs in this occupation; and Wyoming, although it employed fewer total welders than Texas, had one of the highest employment concentrations in this occupation, with welders representing over 9 jobs out of every 1,000 in the state. Louisiana was the only state with both high employment levels and a high employment concentration of this occupation. (See table 7.)

Aside from Louisiana, the only state appearing on both sides of table 7 for the same occupation is California, which was both one of the largest employers of dental assistants and one of the states with the highest concentrations of this occupation. Other states with high concentrations of dental assistants were Utah and Washington. Nevada and Hawaii had some of the highest concentrations of construction and maintenance painters, while Connecticut and Nebraska had some of the highest concentrations of insurance claims and policy processing clerks.

Although all of the selected occupations shown in table 7 had national median wages near the U.S. median, wages for each occupation varied across states. For example, among the states shown in the table, median wages for welders, cutters, solderers, and brazers varied from \$13.83 in South Dakota to \$21.29 in Wyoming, while median wages for construction and maintenance painters varied from \$13.82 in Texas to \$23.14 in Hawaii.

At the metropolitan area level, as at the state level, areas with high employment of the selected occupations also tended to have high overall employment levels. (See table 8.) Chicago-Naperville-Joliet, Ill., and Los Angeles-Long Beach-Glendale, Calif., were among the largest employers for all of the selected occupations, while New York-White Plains-Wayne, N.Y.-N.J., and Houston-Sugar Land-Baytown, Texas, were among the largest employers for 3 out of the 4 occupations. These also were among the largest metropolitan areas or metropolitan divisions in the United States in terms of total employment.

While both Houston-Sugar Land-Baytown, Texas, and Dallas-Plano-Irving, Texas, were among the metropolitan areas with the highest employment of welders, cutters, solderers, and brazers, two other metropolitan areas in Texas—Odessa and Beaumont-Port Arthur—reported some of the highest employment concentrations of this occupation. Houma-Bayou Cane-Thibodaux, La., and Peoria, Ill., also had high concentrations of welders. Two metropolitan divisions in California—Los Angeles-Long Beach-Glendale and Santa Ana-Anaheim-Irvine—were among the largest employers of dental assistants, while four of the metropolitan areas with the highest concentrations of dental assistants also were in California. Naples-Marco Island, Fla., and Beaumont-Port Arthur, Texas, were among the areas with the highest concentrations of construction and maintenance painters, while Wausau, Wis., and Macon, Ga., were among the areas with the highest concentrations of insurance claims and policy processing clerks, although both areas employed relatively few workers in this occupation. Wages for the selected occupations varied by metropolitan area. For example, among the metropolitan areas shown, median wages for construction and maintenance painters ranged from \$13.46 in Jacksonville, N.C., to \$21.85 in Chicago-Naperville-Joliet, Ill., while wages for insurance claims and policy processing clerks ranged from \$14.21 in Wausau, Wis., to \$19.30 in Boston-Cambridge-Quincy, Mass.

Additional Information

The Occupational Employment Statistics program produces cross-industry occupational employment and wage estimates nationwide and for all states, 377 metropolitan areas, 34 metropolitan divisions, and 174 nonmetropolitan areas. OES also publishes national industry-specific occupational employment and wage estimates for NAICS sectors and 3-, 4-, and selected 5-digit industries. In addition to mean hourly and annual wages, wage data include 10th, 25th, 50th (median), 75th, and 90th percentile wages, which can be used to show the distribution of wages within an occupation or industry. OES data are produced by a cooperative effort between BLS and State Workforce Agencies, and are based on a sample of 1.2 million business establishments, collected in 6 semiannual panels over a 3-year period. Complete May 2008 Occupational Employment Statistics data are available from the OES Web site at <http://www.bls.gov/oes/>.

Technical Note

Scope of the survey

The Occupational Employment Statistics (OES) survey is a semiannual mail survey measuring occupational employment and wage rates for wage and salary workers in nonfarm establishments in the United States. Guam, Puerto Rico, and the Virgin Islands also are surveyed, but their data are not included in this release. OES estimates are constructed from a sample of about 1.2 million establishments. Forms are mailed to approximately 200,000 establishments in May and November of each year for a 3-year period. The nationwide response rate for the May 2008 estimates is 78.2 percent based on establishments and 74.3 percent based on employment. The survey included establishments sampled in the May 2008, November 2007, May 2007, November 2006, May 2006, and November 2005 semiannual panels.

The occupational coding system

The OES survey uses the Office of Management and Budget's (OMB) occupational classification system, the Standard Occupational Classification (SOC) system. The SOC system is the first OMB-required occupational classification system for federal agencies. The OES survey categorizes workers into 801 detailed occupations. Together, these detailed occupations make up 22 of the 23 major occupational groups. Military specific occupations are not included in the OES survey. The major groups are as follows:

- Management occupations
- Business and financial operations occupations
- Computer and mathematical science occupations
- Architecture and engineering occupations
- Life, physical, and social science occupations
- Community and social services occupations
- Legal occupations
- Education, training, and library occupations
- Arts, design, entertainment, sports, and media occupations
- Healthcare practitioner and technical occupations
- Healthcare support occupations
- Protective service occupations
- Food preparation and serving related occupations
- Building and grounds cleaning and maintenance occupations
- Personal care and service occupations
- Sales and related occupations
- Office and administrative support occupations
- Farming, fishing, and forestry occupations
- Construction and extraction occupations
- Installation, maintenance, and repair occupations
- Production occupations
- Transportation and material moving occupations
- Military specific occupations (not surveyed in OES)

For more information about the SOC system, please see the Bureau of Labor Statistics (BLS) Web site at <http://www.bls.gov/soc/>.

The industry coding system

The OES survey uses the North American Industry Classification System (NAICS). The May 2008 estimates and survey data are based on the 2007 NAICS. Earlier panel data and estimates were based on the 2002 NAICS. For more information about NAICS, see the BLS Web site at <http://www.bls.gov/naics.htm>.

The OES survey includes establishments in NAICS sectors 11 (logging and agricultural support activities only), 21, 22, 23, 31-33, 42, 44-45, 48-49, 51, 52, 53, 54, 55, 56, 61, 62, 71, 72, 81 (except private households), state government, and local government. The U.S. Postal Service and the executive branch of the federal government also are included. An establishment is defined as an economic unit that processes goods or provides services, such as a factory, mine, or store. The establishment is generally at a single physical location and is engaged primarily in one type of economic activity.

The OES survey covers all full- and part-time wage and salary workers in nonfarm industries. The survey does not include the self-employed, owners and partners in unincorporated firms, household workers, or unpaid family workers.

Survey sample

BLS funds the survey and provides the procedures and technical support, while the State Workforce Agencies (SWAs) collect most of the data. BLS produces cross-industry and industry-specific estimates for the nation, states, metropolitan statistical areas (MSAs), metropolitan divisions, and nonmetropolitan areas. Industry-specific estimates are produced at the NAICS sector, 3-digit, 4-digit, and selected 5-digit industry levels. BLS releases all cross-industry and national estimates; many SWAs release industry-specific estimates at the state and MSA levels.

State unemployment insurance (UI) files provide the universe from which the OES survey draws its sample. Employment benchmarks are obtained from reports submitted by employers to the UI program. Supplemental sources are used for rail transportation (NAICS 4821) and Guam because they do not report to the UI program. The OES survey sample is stratified by metropolitan and nonmetropolitan areas and industry. The 2000 Metropolitan Statistical Area standards were used to define the metropolitan areas.

An annual census is taken of the executive branch of the federal government, the U.S. Postal Service, state government, and Hawaii's local government. In order to provide the most occupational coverage, larger employers are more likely to be selected than smaller employers. The

unweighted employment of sampled establishments makes up approximately 61 percent of total national employment.

Concepts

Occupational employment is the estimate of total wage and salary employment in an occupation across the industries surveyed. The OES survey defines employment as the number of workers who can be classified as full- or part-time employees, including workers on paid vacations or other types of paid leave; workers on unpaid short-term absences; salaried officers, executives, and staff members of incorporated firms; employees temporarily assigned to other units; and employees for whom the reporting unit is their permanent duty station regardless of whether that unit prepares their paycheck.

The OES survey forms sent to larger establishments, generally those with 20 or more workers, contain between 50 and 225 SOC occupations selected on the basis of the sampled establishment's industry classification. To reduce paperwork and respondent burden, no survey form contains every SOC occupation. Thus, data for specific occupations are collected primarily from establishments in industries that are the predominant employers of workers in those occupations. Each survey form is structured, however, to allow a respondent to provide detailed occupational information for each worker at the establishment; that is, unlisted occupations can be added to the survey form. Smaller establishments, generally those with fewer than 20 workers, are sent a form with no occupations listed, and are instructed to fill in the occupations for their workers.

Wages for the OES survey are straight-time, gross pay, exclusive of premium pay. Base rate, cost-of-living allowances, guaranteed pay, hazardous-duty pay, incentive pay including commissions and production bonuses, tips, and on-call pay are included. Excluded are back pay, jury duty pay, overtime pay, severance pay, shift differentials, nonpro-

duction bonuses, employer cost for supplementary benefits, and tuition reimbursements.

The OES survey collects wage data in 12 intervals. Employers report the number of employees in an occupation for each wage range. The wage intervals used for the May 2008 survey are shown in the previous column.

Mean hourly wage. The mean hourly wage rate for an occupation is the total wages that all workers in the occupation earn in an hour divided by the total employment of the occupation. To calculate the mean hourly wage of each occupation, total weighted hourly wages are summed across all intervals and divided by the occupation's weighted survey employment. The mean wage for each interval is based on occupational wage data collected by the BLS Office of Compensation and Working Conditions for the National Compensation Survey (NCS). With the exception of the highest wage interval, mean wage rates for each panel are calculated using NCS data for the panel's reference year.

The lower boundary of the highest wage interval was \$80.00. The mean hourly wage for this interval was calculated using the average of the 2005, 2006, and 2007 NCS data.

Percentile wage. The p-th percentile wage rate for an occupation is the wage where p percent of all workers earn that amount or less and where (100-p) percent of all workers earn that amount or more. This statistic is calculated by uniformly distributing the workers inside each wage interval, ranking the workers from lowest paid to highest paid, and calculating the product of the total employment for the occupation and the desired percentile to determine the worker that earns the p-th percentile wage rate.

Annual wage. Many employees are paid at an hourly rate by their employers and may work more than or less than 40 hours per week. Annual wage estimates for most occupations in this release are calculated by multiplying the mean hourly wage by a "year-round, full-time" figure of 2,080 hours (52 weeks by 40 hours). Thus, annual wage estimates may not represent the actual annual pay received by the employee if they work more or less than 2,080 hours per year. Some workers typically work less than 40 hours per week, year round. For these occupations, the OES survey collects and reports either the annual salary or the hourly wage rate, depending on how the occupation is typically paid, but not both. For example, teachers, flight attendants, and pilots may be paid an annual salary, but do not work the usual 2,080 hours per year. In this case, an annual salary is reported. Other workers, such as entertainment workers, are paid hourly rates, but generally do not work 40 hours per week, year round. For these workers, only an hourly wage is reported.

Hourly versus annual wage reporting. For each occupation, respondents are asked to report the number of

employees paid within specific wage intervals. The intervals are defined both as hourly rates and the corresponding annual rates, where the annual rate for an occupation is calculated by multiplying the hourly wage rate by a typical work year of 2,080 hours. The responding establishment can reference either the hourly or the annual rate for full-time workers, but they are instructed to report the hourly rate for part-time workers.

Estimation methodology

With the exception of the May 2008 panel, each OES panel includes approximately 200,000 establishments. Due to budget constraints, the May 2008 sample was reduced to approximately 174,000 establishments. The OES survey is designed to produce estimates using six panels (3 years) of data. The full six-panel sample of nearly 1.2 million establishments allows the production of estimates at detailed levels of geography, industry, and occupation.

Wage updating. Significant reductions in sampling errors are obtained by combining six panels of data, particularly for small geographic areas and occupations. Wages for the current panel need no adjustment. However, wages in the five previous panels need to be updated to the current panel's reference period.

The OES program uses the BLS Employment Cost Index (ECI) to adjust survey data from prior panels before combining them with the current panel's data. The wage updating procedure adjusts each detailed occupation's wage rate, as measured in the earlier panel, according to the average movement of its broader occupational division. The procedure assumes that there are no major differences by geography, industry, or detailed occupation within the occupational division. The wage rates for the highest wage interval are not updated.

Imputation. About 20 percent of establishments do not respond for a given panel. A "nearest neighbor" hot deck imputation procedure is used to impute missing occupational employment totals. A variant of mean imputation is used to impute missing wage distributions. The variant of mean imputation for wage distributions also is applied to establishments that provide reports with occupational totals but partial or missing wage data.

Weighting and benchmarking. The sample establishments in each panel are weighted to represent all establishments that were part of the in-scope frame from which the panel was selected. Based on the sampled establishments, sampling weights are adjusted when six panels are combined. Sampling weights are further adjusted by the ratio of employment totals (the average of November 2007 and May 2008 employment) from the BLS Quarterly Census of Employ-

ment and Wages to employment totals from the OES survey.

May 2008 OES survey estimates. The May 2008 OES survey estimates are based on all data collected from establishments in the May 2008, November 2007, May 2007, November 2006, May 2006, and November 2005 semiannual samples.

Reliability of the estimates. Estimates calculated from a sample survey are subject to two types of error: sampling and nonsampling. *Sampling error* occurs when estimates are calculated from a subset (that is, a sample) of the population instead of the full population. When a sample of the population is surveyed, there is a chance that the sample estimate of the characteristic of interest may differ from the population value of that characteristic. Differences between the sample estimate and the population value will vary depending on the sample selected. This variability can be estimated by calculating the standard error (SE) of the sample estimate. If we were to repeat the sampling and estimation process countless times using the same survey design, approximately 90 percent of the intervals created by adding and subtracting 1.645 SEs from the sample estimate would include the population value. These intervals are called 90-percent confidence intervals. The OES survey, however, usually uses the relative standard error (RSE) of a sample estimate instead of its SE to measure sampling error. RSE is defined as the SE of a sample estimate divided by the sample estimate itself. This statistic provides the user with a measure of the relative precision of the sample estimate. RSEs are calculated for both occupational employment and mean wage rate estimates. Occupational employment RSEs are calculated using a subsample, random group replication technique called the jackknife. Mean wage rate RSEs are calculated using a variance components model that accounts for both the observed and unobserved components of the wage data. The variances of the unobserved components are estimated using wage data from the BLS National Compensation Survey. In general, estimates based on many establishments have lower RSEs than estimates based on few establishments. If the distributional assumptions of the models are violated, the resulting confidence intervals may not reflect the prescribed level of confidence.

Nonsampling error occurs for a variety of reasons, none of which are directly connected to sampling. Examples of nonsampling error include: nonresponse, data incorrectly reported by the respondent, errors in the administrative data used to create the sampling frame, mistakes made in entering collected data into the database, and mistakes made in editing and processing the collected data. Every attempt is made to minimize nonsampling error through survey methods such as data editing, imputation methods, and benchmarking of data to current employment totals.

¹ Annual wages have been calculated by multiplying the hourly mean wage by a "year-round, full-time" hours figure of 2,080 hours; for those occupations where there is not an hourly mean wage published, the annual wage has been directly calculated from the reported survey data.

² Wages for some occupations that do not generally work year round, full time, are reported either as hourly wages or annual salaries depending on how they are typically paid.

³ Represents a wage above \$80.00 per hour.

c = corrected.

¹ Occupations shown have wages within plus or minus 5 percent of the all-occupation median. Occupations with employment less than 1,000 are not shown. Major groups are ranked from highest to lowest total employment in occupations paying near the median wage. Within each group, occupations are shown in order of highest to lowest employment.

² Annual wages have been calculated by multiplying the hourly mean wage by a "year-round, full-time" hours figure of 2,080 hours; for those occupations where there is not an hourly mean wage published, the annual wage has been directly calculated from the reported survey data.

³ Wages for some occupations that do not generally work year round, full time, are reported either as hourly wages or annual salaries depending on how they are typically paid.
