Background

Since its creation in the early 1950s, Banks Lake has been operated and maintained for the storage and delivery of irrigation water drawn from the Columbia River to Columbia Basin Project (CBP) lands. At Dry Falls Dam, the Main Canal flows south from the Banks Lake outlet works to the northern portion of the CBP's irrigable area. Reclamation operates the reservoir within established constraints on water surface elevation to meet contractual obligations, ensure public safety, and protect property. Reclamation considers other resource needs as feasible within existing operational constraints.

In December of 2000, the National Marine Fisheries Service issued a Biological Opinion (BIOP) to the Bureau

of Reclamation, the U.S. Army Corps of Engineers, and Bonneville Power Administration for the operation of the Federal Columbia River Power System. The BIOP included a Reasonable and Prudent Alternative (RPA), of which action 31 advised Reclamation to "assess the likely environmental effects of operation of Banks Lake up to 10 feet down from full pool during August."

Reclamation proposes to complete RPA action 31 by preparing the Banks Lake Drawdown draft Environmental Impact Statement to describe and analyze the environmental effects of lowering the August surface elevation of Banks Lake to elevation 1560 feet, which is 10 feet below full pool.
