

Home Computers and Internet Use in the United States: August 2000

Issued September 2001

Special Studies

P23-207

Defining computer and Internet access

All individuals living in a household in which the respondent answered "Yes" to the question, "Is there a personal computer or laptop in this household?" are considered to have "access" to that computer.

Households with 'Internet access' are those which have at least one member using the Internet at home.

questions raised by the nation's changing technological base.

HOME COMPUTERS AND INTERNET USE

More than half of households have computers.

In August 2000, 54 million households, or 51 percent, had one or more computers, up from 42 percent in December 1998 (Figure 1).¹ Since 1984, the first year in

¹The estimates in this report are based on responses from a sample of the population. As with all surveys, estimates may vary from the actual values for the entire population because of sampling variation, or other factors. All statements made in this report have undergone statistical testing and meet Census Bureau standards for statistical accuracy.

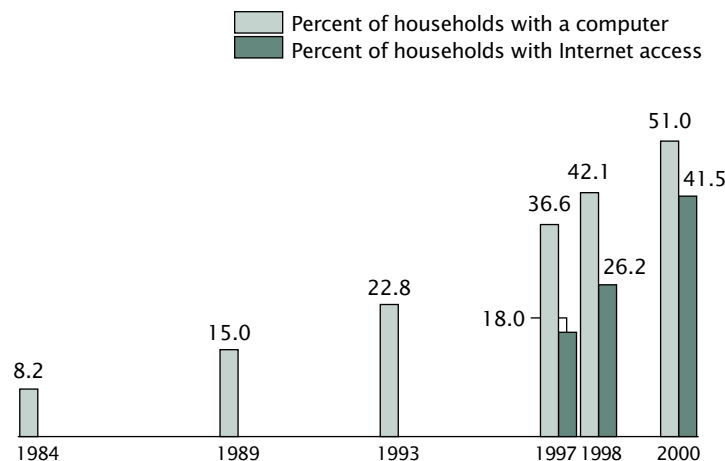

Current Population Reports

By
Eric C. Newburger

The rapid adoption of computer and Internet technology by the U.S. population has raised many questions. Which households have computers, and which have Internet access? Do children have the access to computer technology that they need to prepare them for jobs in a human capital economy? Do some children have access while others do not? Who uses the Internet, among both children and adults? How might this use change society? This report uses Current Population Survey (CPS) data to address some of the primary

U.S. CENSUS BUREAU

which the Census Bureau collected data on computer ownership and use, the country has experienced more than a fivefold increase in the proportion of households with computers.

More than 2 in 5 households have Internet access.

Forty-four million households, or 42 percent, had at least one member who used the Internet at home in 2000. This proportion was up from 26 percent in 1998, and more than double the proportion of households with Internet access in 1997 (18 percent), the first year in which the Census Bureau collected data on Internet use.² In households which have computers, Internet use has rapidly become so common as to make computer availability and Internet access nearly synonymous. In 1997, less than half of households with computers had someone using the Internet. In 2000, more than 4 in 5 households with a computer had at least one member using the Internet at home.

High-income households are more likely to have computers or Internet access.

Among family households with incomes of \$75,000 or more during the 12 months prior to the survey, 88 percent had at least one computer, and 79 percent had at least one household member who used the Internet at home in 2000. Among family households with incomes below \$25,000, only 28 percent had a computer, and 19 percent had Internet access (Table A).

One-person households were the least likely to have a computer or Internet access. While 58 percent of households with two to four people had a computer, only 30 percent of

²Data for 1997 include only those accessing the Internet through a computer. Data for 1998 and 2000 include those accessing the Internet through all types of Internet devices.

one-person households had a computer. Forty-seven percent of two-to-four-person households had Internet access compared with 24 percent of one-person households.

Similarly, married-couple households were the most likely to have a computer or Internet access. Sixty-four percent of married-couple households had a computer, and 53 percent had Internet access. Fewer than half of all other households combined had a computer, and less than one-third had Internet access.

The presence of a child also influences whether a household has a computer or Internet access. Two-thirds of households with a school-age child (6 to 17 years) had a computer, and 53 percent had Internet access. In comparison, only 45 percent of households without a school-age child had a computer, and only 37 percent had Internet access.

Household computer presence and Internet access varied among the four regions of the country. For example, households in the West were the most likely to have computers or Internet access (57 percent and 47 percent, respectively). Those in the South were least likely (47 percent and 38 percent, respectively).

Households situated in metropolitan areas, but outside central cities, were most likely to have a computer (58 percent) or Internet access (48 percent). Only 46 percent of households in central cities had a computer, and just 38 percent had Internet access. Nonmetropolitan households were least likely to have a computer or Internet access (42 percent and 32 percent, respectively).

About 94 million people use the Internet at home.

Among people 3 years old or over, 36 percent used the Internet at home in 2000, including 18 million children 3 to 17 years, and

75 million adults 18 years old and over.³ In 1998, only 57 million people, or 22 percent of those 3 years and over, used the Internet.

CHILDREN'S ACCESS TO COMPUTERS AND THE INTERNET

More children have access to a computer or use the Internet at home than ever before.

Nearly two-thirds (65 percent) of all children 3 to 17 years lived in a household with a computer in 2000, up from 55 percent in 1998. Thirty percent of all children used the Internet at home in 2000 (Table B), compared with just 19 percent in 1998.

Although girls were as likely as boys to use the Internet at home, children's Internet use varied with age. Only 7 percent of the youngest children, those 3 to 5 years, used the Internet at home. Among children 6 to 11 years, 25 percent used the Internet at home, and 48 percent, nearly half, of children 12 to 17 years used the Internet at home.

White non-Hispanic children are more likely to have home computer access or use the Internet than are Black or Hispanic children.

Among children 3 to 17 years, 77 percent of White non-Hispanics and 72 percent of Asians and Pacific Islanders lived in households with computers, while only 43 percent of Black children and 37 percent of Hispanic children did so.⁴

³Some estimates may not add up to the total population because of rounding.

⁴Based on the August 2000 Current Population Survey sample, 3 percent of Black children 3 to 17 years and 3 percent of Asians and Pacific Islanders 3 to 17 years are also of Hispanic origin. Hispanics may be of any race.

Data for the American Indian and Alaska Native population are not shown in this report because of the small sample size in the August 2000 Current Population Survey.

While 38 percent of White non-Hispanic children and 35 percent of Asian and Pacific Islander children used the Internet at home, just 15 percent of Black children and 13 percent of Hispanic children did.⁵

More school-age children use computers at school than have access to them at home.

School is a major influence on children’s access to computers. Among children of school age (6 to 17 years), 2 in 3 had access to a computer at home in 2000. However, 4 in 5 actually used a computer at school.

More than half of school-age children had access to computers both in school and at home (57 percent). However, many children had access in only one location or the other. Of them, far more had access in school than had access at home. Twenty-three percent of school-age children had access to a computer only at school, compared with just 10 percent who had access only at home. Adding all three groups together, 9 in 10 school-age children had access to a computer somewhere, leaving just 10 percent of children who had no access to a computer in any locale (Figure 2).

Schools level the playing field by giving computer access to children who have none at home.

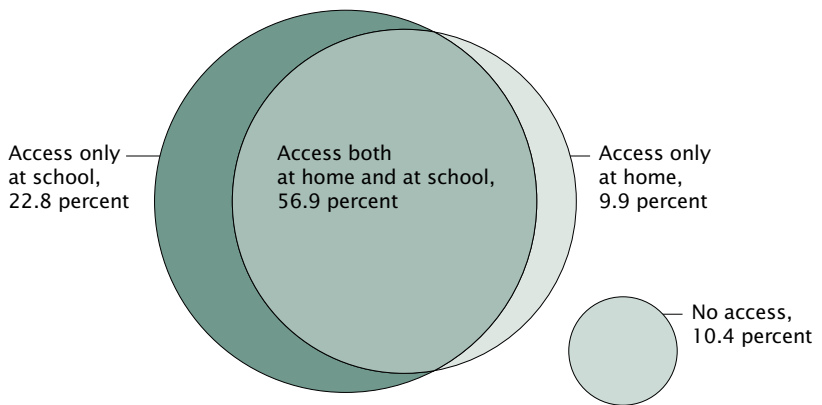

For children 6 to 17 years old, computer use at school was more nearly equal across different income, race, or ethnic groups than computer access at home (Figure 3).

School-age children in family households with incomes of \$75,000 or more had the highest rates of home

⁵The proportions of home Internet users among Asian and Pacific Islander and White non-Hispanic children were not significantly different. The proportions of home Internet users among Black and Hispanic children were also not significantly different.

Figure 2.
Access to Computers Among School-Age Children: August 2000

(Civilian noninstitutional population)

Source: U.S. Census Bureau, Current Population Survey, August 2000.

computer access, at 94 percent, compared with those with incomes below \$25,000, at 35 percent (a difference of about 60 percentage points). But at school, while 87 percent of those with the highest incomes used a computer, 72 percent of those with the lowest incomes did so, a difference of only 15 percentage points.

Figure 3 illustrates a similar equalizing effect observed among children of different racial or ethnic groups. At home, access varied from high to low by 41 percentage points. However, at school the range was much smaller, just 14 percentage points.

The net result of the effect schools have in giving computer access across income, racial, and ethnic groups is a leveling of the computer access that children of different groups have compared to what they would have had if home were the only place available for them to use computers. The absolute percentage-point gap in total computer access between children from family households with the highest and lowest incomes was only about one-third as large as the gap in

home access between these two groups. Similarly, the overall computer access gap between White non-Hispanic school-age children and Black or Hispanic school-age children was just over one-third the size of the gap between these groups in home computer access.⁶

ADULT ACCESS TO COMPUTERS AND THE INTERNET

More adults have computers and use the Internet at home than ever before.

More than half of all adults 18 years old and over, 55 percent, lived in a household with at least one computer in 2000, compared with only 46 percent in 1998. Thirty-seven percent of all adults used the Internet at home, compared with just 23 percent in 1998 (Table C).

The oldest adults had the lowest rates of home Internet use. Only 13 percent of those 65 years old or over used the Internet at home.

⁶The proportions of overall computer access among Black and Hispanic school-age children were not significantly different.

Among those 55 to 64 years, 31 percent used the Internet at home.

Interestingly, among adults less than 55 years old, the proportion using the Internet at home showed little variation by age group. Only about 4 percentage points separated the groups with the lowest and highest proportions of Internet users: 42 percent for 18 to 24 years and 46 percent for 35 to 44 years.

A small difference existed between the proportions of men and women who used the Internet at home (39 percent of men compared with 36 percent of women). However, this difference was due to the higher proportion of women 55 years old and over — an age group with lower rates of Internet use regardless of sex.

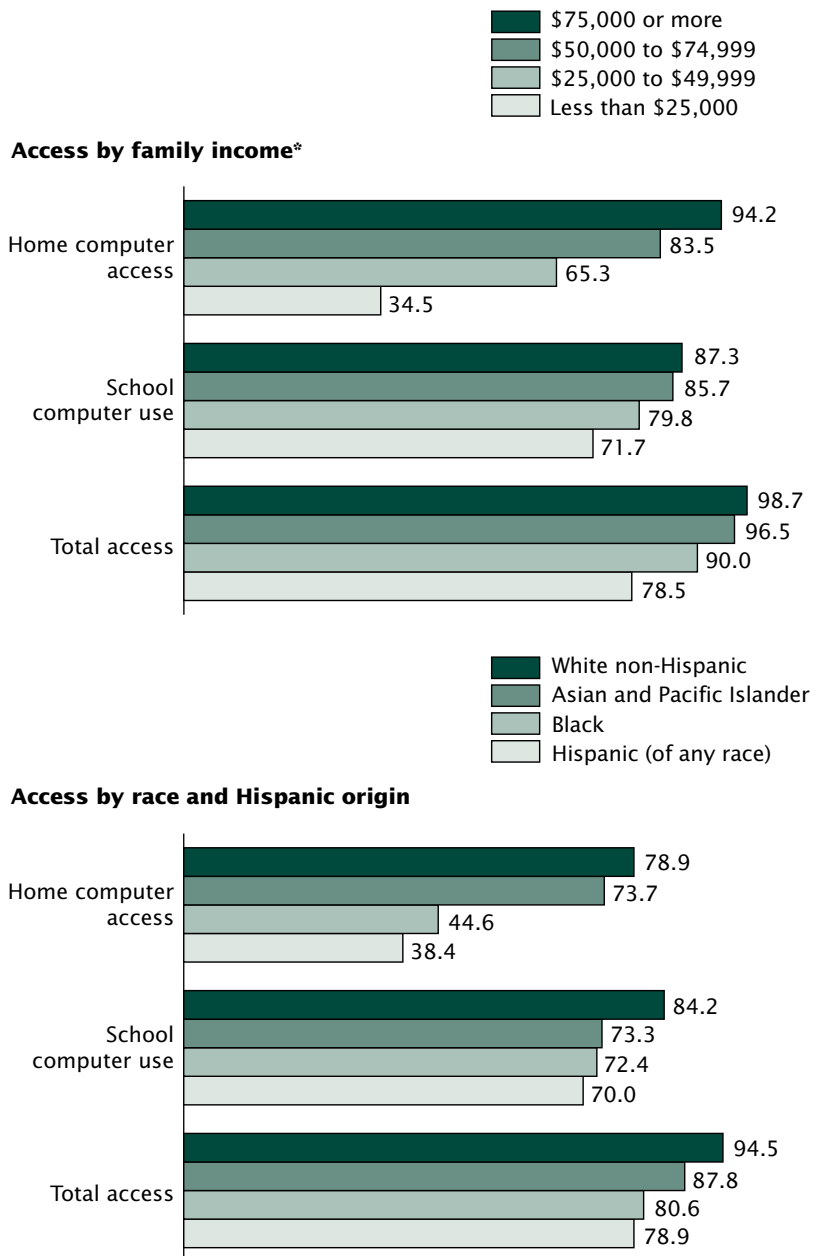

More affluent and more highly educated adults are more likely to have computers or use the Internet.

Eighty-seven percent of related adults living in family households with incomes of \$75,000 or more had a computer, compared with 28 percent of adults living in family households with incomes less than \$25,000. Two-thirds (67 percent) of related adults living in the wealthiest family households used the Internet at home, compared with 14 percent of those living in households with the lowest family incomes.

The most highly educated adults were the most likely to have a computer or use the Internet at home. Seventy-eight percent of adults with a bachelor's degree or more had access to a computer at home, compared with 46 percent of those holding only a high school diploma.

Among adults with at least a bachelor's degree, 62 percent used the Internet at home, compared with only 26 percent of adults with only a high school diploma.

Asian and Pacific Islander adults are the most likely to have computers at home.

Among Asians and Pacific Islanders 18 years old and over, 66 percent lived in a household with a computer, the highest of any race or ethnic group. In turn, 61 percent of White non-Hispanic adults lived in households with a computer, significantly more than Black or Hispanic adults (37 and 35 percent, respectively).⁷

The proportion of Asian and Pacific Islander and White non-Hispanic adults using the Internet at home was more than double that of Black adults (44 percent, 43 percent, and 21 percent, respectively).⁸ Hispanic adults had the lowest home Internet use (18 percent).

USES OF THE INTERNET

E-mail is the most common use of the Internet at home.

More home Internet users, both adults and children, sent or received e-mail in 2000 than did any other online activity. Among children, 73 percent of those who used the Internet at home used e-mail, compared with 68 percent who used the Internet to do research for school or to take courses online, the next most common use (Table D). Eighty-eight percent of adult Internet users sent or

⁷The proportions of Black or Hispanic adults with a computer at home were not significantly different. Based on the August 2000 Current Population Survey sample, 2 percent of Black adults 18 years old or over and 2 percent of Asians and Pacific Islanders over 18 years are also of Hispanic origin. Hispanics may be of any race.

⁸The proportions of Asians and Pacific Islanders and White non-Hispanic adults who were home Internet users were not significantly different.

Table D.
Specific Uses of the Internet at Home by Adults and Children: August 2000

(Numbers in thousands. Civilian noninstitutional population)

Specific use	People using the Internet at home			
	Children 3 to 17 years		Adults 18 years and over	
	Number	Percent	Number	Percent
Any Internet use	18,437	100.0	75,322	100.0
E-mail.....	13,438	72.9	66,046	87.7
School research or courses.....	12,560	68.1	18,080	24.0
Check news, weather, sports	3,658	19.8	39,528	52.5
Make phone calls	630	3.4	4,831	6.4
Information search.....	6,079	33.0	48,358	64.2
Job search	418	2.3	14,930	19.8
Job-related tasks.....	272	1.5	25,347	33.7
Shop or pay bills	1,467	8.0	30,014	39.8
Play games, entertainment, fun	1,981	10.7	3,655	4.9
Other	1,099	6.0	7,051	9.4

received e-mail, far more than performed information searches (64 percent), the next most common adult use.

Internet use is influencing how society manages information.

Although the online activities of Internet users show how people with the technology use it, the total proportion of people in the population performing certain tasks online demonstrates how the technology might impact society.

The Internet has become a major venue for the dissemination of news (Figure 4). Among adults, nearly 1 in 5 used the Internet at home to check on news, weather, or sports. Nearly 1 in 4 adults used the Internet for other sorts of information searches, such as information about businesses, health practices, or government services.

The Internet also affects interpersonal communication. About 1 in 3 adults used e-mail from home. More than 1 in 5 children (22 percent) used home e-mail.

Finally, the Internet acts as a venue for work and school to enter the

home. One adult in eight used the Internet to perform job-related tasks using a home Internet connection. Twenty-one percent of children used the Internet to perform school-related tasks, such as research for assignments or taking courses online.

SOURCE OF THE DATA

Most estimates in this report come from data obtained in August 2000 from the Current Population Survey (CPS). Some estimates are based on data obtained from the CPS in earlier years or other months. The U.S. Census Bureau conducts the Current Population Survey every month, although this report uses only data from months during which a Computer Use or Internet supplement were administered for its estimates.

ACCURACY AND RELIABILITY OF THE DATA

Statistics from sample surveys are subject to sampling and nonsampling error. All comparisons presented in this report have taken sampling error into account and meet the Census Bureau's standards for statistical significance. Nonsampling errors in surveys may be attributed

Figure 4.
**Adults and Children Using the Internet for
 a Specific Task: August 2000**

(Percent of civilian noninstitutional population)

Note: While some older children used the Internet to work at home, the proportion was too small to be shown.

to a variety of sources, such as how the survey was designed, how respondents interpret questions, how able and willing respondents are to provide correct answers, and how accurately answers are coded and classified. The Census Bureau employs quality control procedures throughout the production process — including the overall design of surveys, testing the wording of questions, review of the work of interviewers and coders, and statistical review of reports.

The CPS employs ratio estimation, whereby sample estimates are adjusted to independent estimates of the national population by age, race, sex, and Hispanic origin. This weighting partially corrects for bias due to undercoverage, but how it affects different variables in the survey is not precisely known. Moreover, biases may also be present when people who are missed in the survey differ from those interviewed in ways other than the categories used in weighting (age, race, sex, and Hispanic origin). All of these considerations affect

comparisons across different surveys or data sources. Please contact the Demographic Statistical Methods Division via Internet e-mail at dsmd_s&a@census.gov for information on the source of the data, the accuracy of the estimates, the use of standard errors, and the computation of standard errors.
