Labor Economist
Market Research Analyst
Statisticians
Urban and Regional Planners

As an economics student, you will study consumer choice theory; demand and supply analysis; factors affecting employment, income level and output; financial institutions and money; market equilibrium under different market structures; national income concepts and measurements; and production and cost theory. Courses focus on a variety of areas including econometrics, labor economics, law and economics, industrial organization, international trade, managerial finance, public economics and urban economics.

A variety of business careers are available to you when you choose to study economics. Economics is the study of decision making, and the course work in this area focuses on making decisions in a business environment. You will study the short-term and long-term effects on an industry resulting from changes in government policy, technology, and other important factors. In addition, you learn about the workings of the overall economy and the forces that affect it.

As a business economist, you may be employed in banking, communications, energy, insurance, investment, manufacturing, oil and gas extraction, retailing, transportation or the utility industries. You may work for an international trade association or a governmental agency such as the Bureau of Labor Statistics, the Census Bureau, the Federal Reserve System, the Federal Trade Commission or the Treasury department. Some business economists work for consulting firms or are self-employed as consultants.
