By choosing to study operations and supply chain management, you may become a purchasing manager, managing the effective and efficient supply of resources needed for your company to function. You may become a quality control manager, ensuring that the product your company manufactures is acceptable before it becomes available to the general public. Quality control managers may be employed by companies that provide services rather than goods, such as overnight mail and package delivery companies, airlines, cruise ship lines and other tourism businesses, and hospitals.

As an operations and supply chain management student, you may study purchasing and materials management, production forecasting and scheduling, methods of managing a project from start to finish, production objectives, planning and control, quality control, and the science behind effective management. In addition, you may study international business operations and management of working capital for the manufacture and distribution of a product.
