An updated NFJP.exe for NFJP Data Validation Software version 2.0 is now available. This updated NFJP.exe file implements valid value edit checks for only those key elements that need to be validated or are important for validation, thus solving the problem that some grantee files are not able to import properly due to too many invalid values. It also fixes edit check B for the Exit Category field.

Important Note: Grantees should first install NFJP2.0_Setup.exe (released 4/30/07) if they haven't done so, then replace the old NFJP.exe in C:\Program Files\NFJP (or in whatever location grantees chose to install the software) with this updated executable. **The new executable is in addition to the installation so that the installation should not be removed.** Open the application and follow the instructions in the NFJP user handbook to import files and conduct data validation. Please contact NFJPTA@mathematica-mpr.com for any technical assistance questions.
