## NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA scientific and technical information (STI) program plays a key part in helping NASA maintain this important role.

The NASA STI program operates under the auspices of the Agency Chief Information Officer. It collects, organizes, provides for archiving, and disseminates NASA's STI. The NASA STI program provides access to the NASA Aeronautics and Space Database and its public interface, the NASA Technical Report Server, thus providing one of the largest collections of aeronautical and space science STI in the world. Results are published in both non-NASA channels and by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA Programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services also include creating custom thesauri, building customized databases, and organizing and publishing research results.

For more information about the NASA STI program, see the following:

- Access the NASA STI program home page at <http://www.sti.nasa.gov>
- E-mail your question via the Internet to [help@sti.nasa.gov](mailto:help@sti.nasa.gov)

# Introduction

*Scientific and Technical Aerospace Reports (STAR)* is an online information resource listing citations and abstracts of NASA and worldwide aerospace-related scientific and technical information (STI). Updated biweekly, *STAR* highlights the most recent additions to the NASA Aeronautics and Space Database. Through this resource, the NASA STI Program provides timely access to the most current aerospace-related research and development (R&D) results.

*STAR* subject coverage includes all aspects of aeronautics and space research and development, supporting basic and applied research, and application, as well as aerospace aspects of Earth resources, energy development, conservation, oceanography, environmental protection, urban transportation and other topics of high national priority. The listing is arranged first by 11 broad subject divisions, then within these divisions by 76 subject categories and includes two indexes: subject and author.

*STAR* includes citations to R&D results reported in:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institution, universities, and private firms
- Translations
- NASA-owned patents and patent applications
- Other U.S. Government agency and foreign patents and patent applications
- Domestic and foreign dissertations and theses

## The NASA STI Program

The NASA STI Program was established to support the objectives of NASA's missions and research to advance aeronautics and space science. By sharing information, the NASA STI Program ensures that the U.S. maintains its preeminence in aerospace-related industries and education, minimizes duplication of research, and increases research productivity.

Through the NASA Center for AeroSpace Information (CASI), the NASA STI Program acquires, processes, archives, announces, and disseminates both NASA's internal STI and world-wide STI. The results of 20th and 21st century aeronautics and aerospace research and development, a worldwide investment totaling billions of dollars, have been captured, organized, and stored in the NASA Aeronautics and Space Database. New information is continually announced and made available as it is acquired, making this a dynamic and historical collection of value to business, industry, academia, federal institutions, and the general public.

The STI Program offers products and tools that allow efficient access to the wealth of information derived from global R&D efforts. In addition, customized services are available to help tailor this valuable resource to meet your specific needs.

For more information on the most up-to-date NASA STI, visit the STI Program's Web site at <http://www.sti.nasa.gov>.

# NASA STI Availability Information

## NASA Center for AeroSpace Information (CASI)

Through NASA CASI, the NASA STI Program offers many information products and services to the aerospace community and to the public, including access to a selection of full text of the NASA STI. Free registration with the program is available to NASA, U.S. Government agencies and contractors. To register, contact CASI at [help@sti.nasa.gov](mailto:help@sti.nasa.gov). Others should visit the program at [www.sti.nasa.gov](http://www.sti.nasa.gov). The 'search selected databases' button provides access to the NASA Technical Reports Server (NTRS) – the publicly available contents of the NASA Aeronautics and Space Database.

Each citation in *STAR* indicates a 'Source of Availability.' When CASI is indicated, the user can order this information directly from CASI using the [STI Online Order Form](#), e-mail to [help@sti.nasa.gov](mailto:help@sti.nasa.gov), or telephone the STI Help Desk at 301-621-0390. Before ordering you may access [price code tables](#) for STI documents and videos. When information is not available from CASI, the source of the information is indicated when known.

NASA STI is also available to the public through Federal information organizations. NASA CASI disseminates publicly available NASA STI to the National Technical Information Service (NTIS) and to the Federal Depository Library Program (FDLP) through the Government Printing Office (GPO). In addition, NASA patents are available online from the U.S. Patent and Trademark Office.

## National Technical Information Service (NTIS)

The National Technical Information Service serves the American public as a central resource for unlimited, unclassified U.S. Government scientific, technical, engineering, and business related information. For more than 50 years NTIS has provided businesses, universities, and the public timely access to well over 2 million publications covering over 350 subject areas. Visit NTIS at <http://www.ntis.gov>.

## The Federal Depository Library Program (FDLP)

The U.S. Congress established the **Federal Depository Library Program** to ensure access for the American public to U.S. Government information. The program acquires and disseminates information products from all three branches of the U.S. Government to nearly 1,300 Federal depository libraries nationwide. The libraries maintain these information products as part of their existing collections and are responsible for assuring that the public has free access to the information. Locate the Federal depository libraries at <http://www.gpoaccess.gov/index.html>.

## The U.S. Patent and Trademark Office (USPTO)

The U.S. Patent and Trademark Office provides online access to full text patents and patent applications. The database includes patents back to 1976 plus some pre-1975 patents. Visit the USPTO at <http://www.uspto.gov/patft/>.

# SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS

*A Biweekly Publication of the National Aeronautics and Space Administration*

---

VOLUME 45, NUMBER 16

AUGUST 20, 2007

## 02 AERODYNAMICS

Includes aerodynamics of flight vehicles, test bodies, airframe components and combinations, wings, and control surfaces. Also includes aerodynamics of rotors, stators, fans, and other elements of turbomachinery. For related information see also 34 Fluid Mechanics and Thermodynamics.

**20070023369** NASA Langley Research Center, Hampton, VA, USA

### **A Review of Hypersonics Aerodynamics, Aerothermodynamics and Plasmadynamics Activities within NASA's Fundamental Aeronautics Program**

Salas, Manuel D.; June 25, 2007; 14 pp.; In English; 39th AIAA Thermophysics Conference, 25-28 June 2007, Miami, FL, USA; Original contains color illustrations

Report No.(s): AIAA Paper 2007-4264; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023369>

The research program of the aerodynamics, aerothermodynamics and plasmadynamics discipline of NASA's Hypersonic Project is reviewed. Details are provided for each of its three components: 1) development of physics-based models of non-equilibrium chemistry, surface catalytic effects, turbulence, transition and radiation; 2) development of advanced simulation tools to enable increased spatial and time accuracy, increased geometrical complexity, grid adaptation, increased physical-processes complexity, uncertainty quantification and error control; and 3) establishment of experimental databases from ground and flight experiments to develop better understanding of high-speed flows and to provide data to validate and guide the development of simulation tools.

## 03 AIR TRANSPORTATION AND SAFETY

Includes passenger and cargo air transport operations; airport ground operations; flight safety and hazards; and aircraft accidents. Systems and hardware specific to ground operations of aircraft and to airport construction are covered in 09 Research and Support Facilities (Air). Air traffic control is covered in 04 Aircraft Communications and Navigation. For related information see also 16 Space Transportation and Safety and 85 Technology Utilization and Surface Transportation.

### **Developing the Federal Aviation Administration's Requirements for Color Use in Air Traffic Control Displays**

Xing, Jing; May 2007; 19 pp.; In English

Contract(s)/Grant(s): AM-BHRR522

Report No.(s): DOT/FAA/AM-07/10; No Copyright; Avail.: CASI: [A03](#), Hardcopy

This report describes the materials we developed for the Federal Aviation Administration's requirements for color use in Air Traffic Control (ATC) displays. While many color use guidelines and the Federal Aviation Administration's Human Factors Design Standard (HF-STD-001) provide general information about how to choose color schemes in visual displays, the purpose of this document is for developers of ATC technologies and human factors practitioners to evaluate the use of color from the perspective of ATC operations. This document provides two checklists. The first is a 'To-do' checklist to assess whether the use of a color is effective for its intended purpose of assisting ATC task performance. The second is a 'Do-not do' checklist to assess whether the use of color introduces potential negative effects on performance. While the two checklists may not cover all color use issues, they are pertinent to performance and can serve as a baseline to qualify/disqualify color

schemes in ATC displays. Developers and human factors practitioners are encouraged to reference these checklists for interface design and acquisition evaluation of ATC technologies.

**Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy**

DeWeese, Richard L.; Moorcroft, David M.; Green, Tom; Philippens, M. M. G. M.; May 2007; 30 pp.; In English; Original contains black and white illustrations

Report No.(s): DOT/FAA/AM-07/13; Copyright; Avail.: CASI: [A03](#), Hardcopy

A project was conducted to assess the injury potential of current side facing aircraft seat configurations using the ES-2 Anthropomorphic Test Dummy proposed for use in Federal Motor Vehicle Safety Standards. The ability of inflatable restraint systems to mitigate injuries in these configurations was also assessed. Impact sled tests were conducted at the Federal Aviation Administration's Civil Aerospace Medical Institute using a sidefacing sofa fixture with cushion construction representative of current business jets. The tests simulated three typical seating configurations: occupant in the middle seat, occupant seated next to a rigid wall, and occupant seated next to an armrest end closure. Two types of restraints were evaluated: a three-point body centered conventional restraint with inertia reel and a similar restraint incorporating a new inflatable shoulder restraint (airbag). The test conditions were the 16g, 44 ftls, horizontal impact specified in 14 CFR 25.562 but without yaw. Test setup techniques were developed to ensure consistent occupant positioning. Test repeatability was assessed for some test conditions. The suitability of the ES-2 for use in aircraft seat testing was evaluated. Injury criteria were calculated from the data gathered during the tests, including criteria currently published in the Federal Aviation Regulations and Federal Motor Vehicle Safety Standards such as the Head Injury Criteria, upper torso restraint loads, Thoracic Trauma Index, and peak lateral pelvis acceleration. Other research criteria and those identified in proposed Federal Motor Vehicle Safety Standards were also calculated. These criteria included neck forces and moments, Preliminary Lateral Nij, Viscous Criteria, rib deflection, abdominal forces, pubic force, upper spine acceleration, and femur torsion. Results were analyzed to identify criteria relevant for aviation use and seating and restraint system configurations that indicated potential improvements in occupant protection for side-facing Seats

**Using Computational Cognitive Modeling to Diagnose Possible Sources of Aviation Error**

Byrne, M. D.; Kirlik, Alex; The International Journal of Aviation Psychology; Jun. 2003; Volume 15, No. 2, pp. 135-155; In English; Original contains color illustrations

Contract(s)/Grant(s): NAG2-1609; NCC2-1219; NDD2-1321

Report No.(s): PB2007-105492; AHFD-03-14; Copyright; Avail.: Other Sources

We present a computational model of a closed-loop, pilot-aircraft-visual scene-taxiway system created to shed light on possible sources of taxi error. Creating the cognitive aspects of the model using ACT-R required us to conduct studies with subject matter experts to identify experiential adaptations pilots bring to taxiing. Five decision strategies were found, ranging from cognitively-intensive but precise, to fast, frugal but robust. We provide evidence for the model by comparing its behavior

to a NASA Ames Research Center simulation of Chicago O'Hare surface operations. Decision horizons were highly variable; the model selected the most accurate strategy given time available. We found a signature in the simulation data of the use of globally robust heuristics to cope with short decision horizons as revealed by errors occurring most frequently at atypical taxiway geometries or clearance routes. These data provided empirical support for the model.

Method and system for displaying information on one or more aircraft flights, where at least one flight is determined to have at least one atypical flight phase according to specified criteria. A flight parameter trace for an atypical phase is displayed and compared graphically with a group of traces, for the corresponding flight phase and corresponding flight parameter, for flights that do not manifest atypicality in that phase.

**Failure Maps for Rectangular 17-4PH Stainless Steel Sandwiched Foam Panels**

Raj, S. V.; Ghosn, L. J.; May 31, 2007; 24 pp.; In English; Original contains color and black and white illustrations

Report No.(s): NASA/TM-2007-214802; E-15935; Copyright; Avail.: CASI: [A03](#), Hardcopy

A new and innovative concept is proposed for designing lightweight fan blades for aircraft engines using commercially available 17-4PH precipitation hardened stainless steel. Rotating fan blades in aircraft engines experience a complex loading state consisting of combinations of centrifugal, distributed pressure and torsional loads. Theoretical failure plastic collapse maps, showing plots of the foam relative density versus face sheet thickness,  $t$ , normalized by the fan blade span length,  $L$ , have been generated for rectangular 17-4PH sandwiched foam panels under these three loading modes assuming three failure plastic collapse modes. These maps show that the 17-4PH sandwiched foam panels can fail by either the yielding of the face sheets, yielding of the foam core or wrinkling of the face sheets depending on foam relative density, the magnitude of  $t/L$  and the loading mode. The design envelop of a generic fan blade is superimposed on the maps to provide valuable insights on the probable failure modes in a sandwiched foam fan blade.

**On an Asymptotically Consistent Unsteady Interacting Boundary Layer**

Bartels, Robert E.; June 2007; 15 pp.; In English; Original contains black and white illustrations

Report No.(s): NASA/TM-2007-214868; L-19308; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070022843>

This paper develops the asymptotic matching of an unsteady compressible boundary layer to an inviscid flow. Of particular importance is the velocity injection or transpiration boundary condition derived by this theory. It is found that in general the transpiration will contain a slope of the displacement thickness and a time derivative of a density integral. The conditions under which the second term may be neglected, and its consistency with the established results of interacting boundary layer are discussed.

**Neural Net Safety Monitor Design**

Larson, Dick; May 07, 2007; 39 pp.; In English; AIAA Infotech\@2007 Conference and Exhibit, 7-10 May 2007, Edwards, CA, USA; Original contains color illustrations

Report No.(s): AIAA Paper 2007-2812; No Copyright; Avail.: CASI: [C01](#), CD-ROM: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023364>

The National Aeronautics and Space Administration (NASA) at the Dryden Flight Research Center (DFRC) has been conducting flight-test research using an F-15 aircraft (figure 1). This aircraft has been specially modified to interface a neural net (NN) controller as part of a single-string Airborne Research Test System (ARTS) computer with the existing quad-redundant flight control system (FCC) shown in figure 2. The NN commands are passed to FCC channels 2 and 4 and are cross channel data linked (CCDL) to the other computers as shown. Numerous types of fault-detection monitors exist in the FCC when the NN mode is engaged; these monitors would cause an automatic disengagement of the NN in the event of a triggering fault. Unfortunately, these monitors still may not prevent a possible NN hard-over command from coming through to the control laws. Therefore, an additional and unique safety monitor was designed for a single-string source that allows authority at maximum actuator rates but protects the pilot and structural loads against excessive g-limits in the case of a NN hard-over command input. This additional monitor resides in the FCCs and is executed before the control laws are computed. This presentation describes a floating limiter (FL) concept<sup>1</sup> that was developed and successfully test-flown for this program (figure 3). The FL computes the rate of change of the NN commands that are input to the FCC from the ARTS. A window is created with upper and lower boundaries, which is constantly floating and trying to stay centered as the NN command rates are changing. The limiter works by only allowing the window to move at a much slower rate than those of the NN commands.

Anywhere within the window, however, full rates are allowed. If a rate persists in one direction, it will eventually hit the boundary and be rate-limited to the floating limiter rate. When this happens, a persistent counter begins and after a limit is reached, a NN disengage command is generated. The tunable metrics for the FL are (1) window size, (2) drift rate, and (3) persistence counter. Ultimate range limits are also included in case the NN command should drift slowly to a limit value that would cause the FL to be defeated. The FL has proven to work as intended. Both high-g transients and excessive structural loads are controlled with NN hard-over commands. This presentation discusses the FL design features and presents test cases. Simulation runs are included to illustrate the dramatic improvement made to the control of NN hard-over effects. A mission control room display from a flight playback is presented to illustrate the neural net fault display representation. The FL is very adaptable to various requirements and is independent of flight condition. It should be considered as a cost-effective safety monitor to control single-string inputs in general.

**Screening of Potential Landing Gear Noise Control Devices at Virginia Tech For QTD II Flight Test**

Ravetta, Patricio A.; Burdisso, Ricardo A.; Ng, Wing F.; Khorrami, Mehdi R.; Stoker, Robert W.; May 21, 2007; 13 pp.; In English; 13th AIAA/CEAS Aeroacoustics Conference, 21-23 May 2007, Rome, Italy; Original contains color illustrations Contract(s)/Grant(s): NAG1-02084

Report No.(s): AIAA Paper No. 2007-3455; Copyright; Avail.: CASI: [A03](#), Hardcopy

In support of the QTD II (Quiet Technology Demonstrator) program, aeroacoustic measurements of a 26%-scale, Boeing 777 main landing gear model were conducted in the Virginia Tech Stability Tunnel. The objective of these measurements was to perform risk mitigation studies on noise control devices for a flight test performed at Glasgow, Montana in 2005. The noise control devices were designed to target the primary main gear noise sources as observed in several previous tests. To accomplish this task, devices to reduce noise were built using stereo lithography for landing gear components such as the brakes, the forward cable harness, the shock strut, the door/strut gap and the lower truck. The most promising device was down selected from test results. In subsequent stages, the initial design of the selected lower truck fairing was improved to account for all the implementation constraints encountered in the full-scale airplane. The redesigned truck fairing was then retested to assess the impact of the modifications on the noise reduction potential. From extensive acoustic measurements obtained using a 63-element microphone phased array, acoustic source maps and integrated spectra were generated in order to estimate the noise reduction achievable with each device.

**A Sequential Shifting Algorithm for Variable Rotor Speed Control**

Litt, Jonathan S.; Edwards, Jason M.; DeCastro, Jonathan A.; June 25, 2007; 18 pp.; In English; AHS 63rd Annual Forum and Technology Display, 29 April - 3 May 2007, Virginia Beach, VA, USA; Original contains color illustrations  
Report No.(s): NASA/TM-2007-214842; ARL-TR-4086; E-16058; No Copyright; Avail.: CASI: **A03**, Hardcopy  
ONLINE: <http://hdl.handle.net/2060/20070023675>

A proof of concept of a continuously variable rotor speed control methodology for rotorcraft is described. Variable rotor speed is desirable for several reasons including improved maneuverability, agility, and noise reduction. However, it has been difficult to implement because turboshaft engines are designed to operate within a narrow speed band, and a reliable drive train that can provide continuous power over a wide speed range does not exist. The new methodology proposed here is a sequential shifting control for twin-engine rotorcraft that coordinates the disengagement and engagement of the two turboshaft engines in such a way that the rotor speed may vary over a wide range, but the engines remain within their prescribed speed bands and provide continuous torque to the rotor; two multi-speed gearboxes facilitate the wide rotor speed variation. The shifting process begins when one engine slows down and disengages from the transmission by way of a standard freewheeling clutch mechanism; the other engine continues to apply torque to the rotor. Once one engine disengages, its gear shifts, the multi-speed gearbox output shaft speed resynchronizes and it re-engages. This process is then repeated with the other engine. By tailoring the sequential shifting, the rotor may perform large, rapid speed changes smoothly, as demonstrated in several examples. The emphasis of this effort is on the coordination and control aspects for proof of concept. The engines, rotor, and transmission are all simplified linear models, integrated to capture the basic dynamics of the problem.

**Automatic Collision Avoidance Technology (ACAT)**

Swihart, Donald E.; Skoog, Mark A.; June 12, 2007; 24 pp.; In English; UVS 2007, 12-14 June 2007, Paris, France; Original contains color illustrations; No Copyright; Avail.: CASI: **A03**, Hardcopy  
ONLINE: <http://hdl.handle.net/2060/20070023632>

This document represents two views of the Automatic Collision Avoidance Technology (ACAT). One viewgraph presentation reviews the development and system design of Automatic Collision Avoidance Technology (ACAT). Two types of ACAT exist: Automatic Ground Collision Avoidance (AGCAS) and Automatic Air Collision Avoidance (AACAS). The AGCAS Uses Digital Terrain Elevation Data (DTED) for mapping functions, and uses Navigation data to place aircraft on map. It then scans DTED in front of and around aircraft and uses future aircraft trajectory (5g) to provide automatic flyup maneuver when required. The AACAS uses data link to determine position and closing rate. It contains several canned maneuvers to avoid collision. Automatic maneuvers can occur at last instant and both aircraft maneuver when using data link. The system can use sensor in place of data link. The second viewgraph presentation reviews the development of a flight test and an evaluation of the test. A review of the operation and comparison of the AGCAS and a pilot's performance are given. The same review is given for the AACAS is given.

ONLINE: <http://hdl.handle.net/2060/20070023677>

Method and system for monitoring and comparing, in real time, performance of an aircraft during an approach to touchdown along a conventional approach path and along a contemplated modified approach path to touchdown. In a first procedure, a flight parameter value at a selected location is compared and displayed, for the planned path and for the modified path. In a second procedure, flight parameter values  $FP(t_{(sub\ m)})$  at a sequence  $(t_{(sub\ n)})_n$ , of measurement times is compared and displayed, for the planned path and for a contemplated or presently-executed modified path. If the flight parameter for the planned path and for the modified path differ too much from each other, the pilot in command has an option of terminating the approach along the modified path.

ONLINE: <http://hdl.handle.net/2060/20070023441>

An optimized rotorcraft propulsion system incorporating a foil air bearing supported Oil-Free engine coupled to a high power density gearbox using high viscosity gear oil is explored. Foil air bearings have adequate load capacity and temperature capability for the highspeed gas generator shaft of a rotorcraft engine. Managing the axial loads of the power turbine shaft (low speed spool) will likely require thrust load support from the gearbox through a suitable coupling or other design. Employing specially formulated, high viscosity gear oil for the transmission can yield significant improvements (approx. 2X) in allowable gear loading. Though a completely new propulsion system design is needed to implement such a system, improved performance is possible.

Patent Info.: Filed 31 Jul. 2003; US-Patent-7,191,161; US-Patent-Appl-SN-637087; NASA-Case-ARC-14281-3; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023485>

A method and system for data modeling that incorporates the advantages of both traditional response surface methodology (RSM) and neural networks is disclosed. The invention partitions the parameters into a first set of  $s$  simple parameters, where observable data are expressible as low order polynomials, and  $c$  complex parameters that reflect more complicated variation of the observed data. Variation of the data with the simple parameters is modeled using polynomials; and variation of the data with the complex parameters at each vertex is analyzed using a neural network. Variations with the simple parameters and with the complex parameters are expressed using a first sequence of shape functions and a second sequence of neural network functions. The first and second sequences are multiplicatively combined to form a composite response surface, dependent upon the parameter values, that can be used to identify an accurate mode

**Spitzer Orbit Determination During In-orbit Checkout Phase**

Menon, Premkumar R.; August 16, 2004; 11 pp.; In English; AIAA/AAS Astrodynamics Specialist Conference and Exhibit, 16-19 Aug. 2004, Providence, RI, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40027>

The Spitzer Space Telescope was injected into heliocentric orbit on August 25, 2003 to observe and study astrophysical

phenomena in the infrared range of frequencies. The initial 60 days was dedicated to Spitzer's 'In-Orbit Checkout (IOC)' efforts. During this time high levels of Helium venting were used to cool down the telescope. Attitude control was done using reaction wheels, which in turn were de-saturated using cold gas Nitrogen thrusting. Dense tracking data (nearly continuous) by the Deep Space network (DSN) were used to perform orbit determination and to assess any possible venting imbalance. Only Doppler data were available for navigation. This paper deals with navigation efforts during the IOC phase. It includes Dust Cover Ejection (DCE) monitoring, orbit determination strategy validation and results and assessment of non-gravitational accelerations acting on Spitzer including that due to possible imbalance in Helium venting.

ONLINE: <http://hdl.handle.net/2060/20070023390>

This viewgraph presentation reviews the state of science research on the International Space Station (ISS). The shuttle and other missions that have delivered science research facilities to the ISS are shown. The different research facilities provided by both NASA and partner organizations available for use and future facilities are reviewed. The science that has been already completed is discussed. The research facilitates the Vision for Space Exploration, in Human Life Sciences, Biological Sciences, Materials Science, Fluids Science, Combustion Science, and all other sciences. The ISS Focus for NASA involves: Astronaut health and countermeasure, development to protect crews from the space environment during long duration voyages, Testing research and technology developments for future exploration missions, Developing and validating operational procedures for long-duration space missions. The ISS Medical Project (ISSMP) address both space systems and human systems. ISSMP has been developed to maximize the utilization of ISS to obtain solutions to the human health and performance problems and the associated mission risks of exploration class missions. Including complete programmatic review with medical operations (space medicine/flight surgeons) to identify: (1) evidence base on risks (2) gap analysis.

The 385 kg Stardust mission was launched on Feb 7, 1999 on a mission to collect samples from the tail of comet Wild 2 and from interplanetary space. Stardust returned to Earth in the early morning of January 15, 2006. The sample return capsule landed in the Utah Test and Training Range (UTTR) southwest of Salt Lake City. Because Stardust was landing on Earth, hazard analysis was required by the National Aeronautics and Space Administration, UTTR, and the Stardust Project to ensure the safe return of the landing capsule along with the safety of people, ground assets, and aircraft. This paper focuses on the requirements affecting safe return of the capsule and safety of people on the ground by investigating parameters such as probability of impacting on UTTR, casualty expectation, and probability of casualty. This paper introduces the methods for the calculation of these requirements and shows how they affected mission planning, site selection, and mission operations. By analyzing these requirements before and during entry it allowed for the selection of a robust landing point that met all of the requirements during the actual landing event.

ONLINE: <http://hdl.handle.net/2014/40014>

Adaptive combining of experimentally obtained heterodyned pulse position modulated (PPM) signals with pulse-to-pulse coherence in the presence of simulated spatial distortions resembling atmospheric turbulence is demonstrated. The adaptively combined PPM signals are phased up via an LMS algorithm suitably optimized to operate with PPM in the presence of additive shot-noise. A convergence analysis of the algorithm is presented, and results with both, computer simulated and experimentally obtained PPM signals are analyzed.

NASA's Global Precipitation Measurement (GPM) mission is an ongoing Goddard Space Flight Center (GSFC) project whose basic objective is to improve global precipitation measurements. It has been decided that the GPM spacecraft is to be

a 'design for demise' spacecraft. This requirement resulted in the need for a propellant tank that would also demise or ablate to an appropriate degree upon re-entry. This paper will describe GSFC-performed spacecraft and tankage demise analyses, vendor conceptual design studies, and vendor performed hydrazine compatibility and wettability tests performed on 6061 and 2219 aluminum alloys.

Contract(s)/Grant(s): NCC3-1033; Copyright; Avail.: Other Sources

Low Earth orbital (LEO) atomic oxygen cannot only erode the external surfaces of polymers on spacecraft, but can cause degradation of surfaces internal to components on the spacecraft where openings to the space environment exist. Although atomic oxygen attack on internal or interior surfaces may not have direct exposure to the LEO atomic oxygen flux scattered impingement can have serious degradation effects where sensitive interior surfaces are present. The effects of atomic oxygen erosion of polymer interior to an aperture on a spacecraft is simulated using Monte Carlo computational techniques. A 2-dimensional model is used to provide quantitative indications of the attenuation of atomic oxygen flux as a function of distance into a parallel walled cavity. The degree of erosion relative is compared between the various interior locations and the external surface of a LEO spacecraft.

Report No.(s): AIAA Paper 2004-5212; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/39973>

The Earth Observatory Formation at L2, a Lagrange libration point, is a unique large aperture (25 m diameter) space telescope concept that will improve the knowledge and understanding of dynamic, chemical and radiative mechanisms that cause changes in the atmosphere, and can lead to the development of models and techniques to predict short and long-term climate changes. The results of this concept definition study show that the telescope concept is feasible, and can have technology readiness in the 2020 time frame. Further advanced development in several subsystems is needed, such as higher efficiency Xenon ion thrusters with throttling, and optical quality large membrane mirror with active shape control. It presents an analysis and solution of guidance, sensing, control, and propulsion problems for a formation of two spacecraft on the Sun-Earth line in the neighborhood of the Sun-Earth L2 point, that observes Earth's atmosphere during continuous solar occultation by the Earth. A system architecture is described for the observatory, and its components that include unique mission specific metrology. The formation must follow a powered trajectory with strictly limited fuel use to observe solar occultation. A configuration of ion thrusters and reaction wheels for translation and attitude control is designed along with algorithms for orbit following and formation control. Simulation results of the orbital and formation dynamics are presented that verify performance of the control systems.

**Developmental Considerations on the Free-piston Stirling Power Convertor for Use in Space**

Schreiber, Jeffrey G.; May 14, 2007; 41 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): WBS 138494.04.01.01

Report No.(s): NASA/TM-2007-214805; AIAA-2006-4015; E-15938; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070022840>

Free-piston Stirling power conversion has been considered a candidate for radioisotope power systems for space for more than a decade. Prior to the free-piston Stirling architecture, systems were designed with kinematic Stirling engines with rotary alternators to convert heat to electricity. These systems were proposed with lightly loaded linkages to achieve the necessary life. When the free-piston configuration was initially proposed, it was thought to be attractive due to the relatively high conversion efficiency, acceptable mass, and the potential for long life and high reliability. These features have consistently been recognized by teams that have studied technology options for radioisotope power systems. Since free-piston Stirling

power conversion was first considered for space power applications, there have been major advances in three general areas of development: demonstration of life and reliability, the success achieved by Stirling cryocoolers in flight, and the overall developmental maturity of the technology for both flight and terrestrial applications. Based on these advances, free-piston Stirling convertors are currently being developed for a number of terrestrial applications. They commonly operate with the power, efficiency, life, and reliability as intended, and much of the development now centers on system integration. This paper will summarize the accomplishments of free-piston Stirling power conversion technology over the past decade, review the status, and discuss the challenges that remain.

**Final Results for the GRC Supporting Technology Development Project for the 110-Watt Stirling Radioisotope Generator (SRG110)**

Schreiber, Jeffrey G.; Thieme, Lanny G.; June 2007; 24 pp.; In English; Space Technology and Applications International Forum (STAIF-2007), 11-14 Feb. 2007, Albuquerque, NM, USA; Original contains color illustrations

Contract(s)/Grant(s): WBS 138494.04.01.01

Report No.(s): NASA/TM-2007-214839; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023440>

From 1999 to 2006, the NASA Glenn Research Center (GRC) supported the development of a high-efficiency, nominal 110-We Stirling Radioisotope Generator (SRG110) for potential use on NASA missions, including deep space missions, Mars rovers, and lunar applications. Lockheed Martin (LM) was the system integrator for the SRG110, under contract to the Department of Energy (DOE). Infinia Corporation (formerly Stirling Technology Company) developed the Stirling convertor, first as a contractor to DOE and then under subcontract to LM. The SRG110 development has been redirected, and recent program changes have been made to significantly increase the specific power of the generator. System development of an Advanced Stirling Radioisotope Generator (ASRG) has now begun, using a lightweight, advanced convertor from Sunpower, Inc. This paper summarizes the results of the supporting technology effort that GRC completed for the SRG110. GRC tasks included convertor extended-duration testing in air and thermal vacuum environments, heater head life assessment, materials studies, permanent magnet aging characterization, linear alternator evaluations, structural dynamics testing, electromagnetic interference (EMI) and electromagnetic compatibility (EMC) characterization, organic materials evaluations, reliability studies, and development of an end-to-end system dynamic model. Related efforts are now continuing in many of these areas to support ASRG development.

ONLINE: <http://hdl.handle.net/2014/40025>

We present the most recent propulsion requirements for the Laser Interferometer Space Antenna (LISA) Mission and describe potential microthruster technology that can meet these requirements. LISA consists of three spacecraft in heliocentric orbits, forming a triangle with  $5 \times 10^6$  km sides that are the arms of three Michelson-type interferometers. Reflective proof masses provide the reference surfaces at the end of the interferometer arms as part of the Gravitational Reference Sensor (GRS) designed to detect gravitational waves. The microthrust propulsion system will be part of the Disturbance Reduction System (DRS), which is responsible for maintaining each spacecraft position within approximately 10 nm around the proof masses. To provide the necessary sensitivity, the GRS must not experience spurious accelerations  $> 15 \times 10^{-10}$  m/s<sup>2</sup> in the 0.1 mHz to 1 Hz bandwidth, requiring precision formation flying and drag-free operation of the LISA spacecraft. This leads to the following microthruster performance requirements: a thrust range of 2-30 Micro N, a thrust resolution  $< 0.1$  Micro N, and thrust noise  $< 0.1$  Hz (exp -1/2) over the LISA measurement bandwidth. The microthruster must provide this performance for 5 years continuously, contain 10 years worth of propellant, and not disrupt the science measurements. Potential microthruster technologies include Colloid, Field Emission Electric Propulsion (FEEP), and precision cold gas

microthrusters. Each of these technologies is described in detail with focus on the NASA microthruster development of the Busek Colloid Micro-Newton Thruster (CMNT).

ONLINE: <http://hdl.handle.net/2014/40022>

The Mars Exploration Rovers Spirit and Opportunity successfully landed respectively at Gusev Crater and Meridiani Planum in January 2004. The rovers are essentially robotic geologists, sent on a mission to search for evidence in the rocks and soil pertaining to the historical presence of water and the ability to possibly sustain life. In order to conduct NASA's 'follow the water' strategy on opposite sides of the planet Mars, an interplanetary journey of over 300 million miles culminated with historic navigation precision. Rigorous trajectory targeting and control was necessary to achieve the atmospheric entry requirements for the selected landing sites. The propulsive maneuver design challenge was to meet or exceed these requirements while preserving the necessary design margin to accommodate additional project concerns. Landing site flexibility was maintained for both missions after launch, and even after the first trajectory correction maneuver for Spirit. The final targeting strategy was modified to improve delivery performance and reduce risk after revealing constraining trajectory control characteristics. Flight results are examined and summarized for the six trajectory correction maneuvers that were planned for each mission.

ONLINE: <http://hdl.handle.net/2014/39948>

The Deep Space Avionics (DSA) Project is developing a new generation of power system building blocks. Using application specific integrated circuits (ASICs) and power switching modules a scalable power system can be constructed for use on multiple deep space missions including future missions to Mars, comets, Jupiter and its moons. The key developments of the DSA power system effort are five power ASICs and a module for power switching. These components enable a modular and scalable design approach, which can result in a wide variety of power system architectures to meet diverse mission requirements and environments. Each component is radiation hardened to one megaread total dose. The power switching module can be used for power distribution to regular spacecraft loads, to propulsion valves and actuation of pyrotechnic devices. The number of switching elements per load, pyrotechnic firings and valve drivers can be scaled depending on mission needs. Telemetry data is available from the switch module via an I2C data bus. The DSA power system components enable power management and distribution for a variety of power buses and power system architectures employing different types of energy storage and power sources. This paper will describe each power ASIC's key performance characteristics as well as recent prototype test results. The power switching module test results will be discussed and will demonstrate its versatility as a multipurpose switch. Finally, the combination of these components will illustrate some of the possible power system architectures achievable from small single string systems to large fully redundant systems.

This viewgraph document reviews test results from tests of different material used for wire insulation for flame propagation and flammability. The presentation focused on investigating data variability both within and between laboratories; evaluated the between-laboratory consistency through consistency statistic *h*, which indicates how one laboratory's cell average compares with averages from other labs; evaluated the within-laboratory consistency through the consistency statistic *k*, which is an indicator of how one laboratory's within-laboratory variability compares with the variability of other labs combined; and extreme results were tested to determine whether they resulted by chance or from nonrandom causes (human error, instrument calibration shift, non-adherence to procedures, etc.)

**Thermal Properties of Oxides With Magnetoplumbite Structure for Advanced Thermal Barrier Coatings**

Bansal, Narottam P.; Zhu, Dongming; May 24, 2007; 16 pp.; In English; Sixth International Conference on High Temperature Ceramic Matrix Composites (HTCMC-6), 4-7 September 2007, New Dehli, India; Original contains color illustrations

Report No.(s): NASA/TM-2007-214850; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070022842>

Oxides having magnetoplumbite structure are promising candidate materials for applications as high temperature thermal barrier coatings because of their high thermal stability, high thermal expansion, and low thermal conductivity. In this study, powders of LaMgAl<sub>11</sub>O<sub>19</sub>, GdMgAl<sub>11</sub>O<sub>19</sub>, SmMgAl<sub>11</sub>O<sub>19</sub>, and Gd<sub>0.7</sub>Yb<sub>0.3</sub>MgAl<sub>11</sub>O<sub>19</sub> magnetoplumbite oxides were synthesized by citric acid sol-gel method and hot pressed into disk specimens. The thermal expansion coefficients (CTE) of these oxide materials were measured from room temperature to 1500 C. The average CTE value was found to be approx.  $9.6 \times 10^{-6}$ /C. Thermal conductivity of these magnetoplumbite-based oxide materials was also evaluated using steady-state laser heat flux test method. The effects of doping on thermal properties were also examined. Thermal conductivity of the doped Gd<sub>0.7</sub>Yb<sub>0.3</sub>MgAl<sub>11</sub>O<sub>19</sub> composition was found to be lower than that of the undoped GdMgAl<sub>11</sub>O<sub>19</sub>. In contrast, thermal expansion coefficient was found to be independent of the oxide composition and appears to be controlled by the magnetoplumbite crystal structure. Thermal conductivity testing of LaMgAl<sub>11</sub>O<sub>19</sub> and LaMnAl<sub>11</sub>O<sub>19</sub> magnetoplumbite oxide coatings plasma sprayed on NiCrAlY/Rene N5 superalloy substrates indicated resistance of these coatings to sintering even at temperatures as high as 1600 C.

Contract(s)/Grant(s): NNNJ05HI05C; No Copyright; Avail.: Other Sources; Abstract Only

Single wall carbon nanotubes (SWCNTs) are currently being produced and processed by several methods. Many researchers are continuously modifying existing methods and developing new methods to incorporate carbon nanotubes into

other materials and utilize the phenomenal properties of SWCNTs. These applications require availability of SWCNTs with known properties and there is a need to characterize these materials in a consistent manner. In order to monitor such progress, it is critical to establish a means by which to define the quality of SWCNT material and develop characterization standards to evaluate of nanotube quality across the board. Such characterization standards should be applicable to as-produced materials as well as processed SWCNT materials. In order to address this issue, NASA Johnson Space Center has developed a protocol for purity and dispersion characterization of SWCNTs (Ref.1). The NASA JSC group is currently working with NIST, ANSI and ISO to establish purity and dispersion standards for SWCNT material. A practice guide for nanotube characterization is being developed in cooperation with NIST (Ref.2). Furthermore, work is in progress to incorporate additional characterization methods for electrical, mechanical, thermal, optical and other properties of SWCNTs.

ONLINE: <http://hdl.handle.net/2060/20070023393>

A double vacuum bag molding assembly with improved void management and laminate net shape control which provides a double vacuum environment for use in fabricating composites from prepregs containing air and/or volatiles such as reactive resin matrix composites or composites from solvent containing prepregs with non-reactive resins matrices. By using two vacuum environments during the curing process, a vacuum can be drawn during a B-stage of a two-step cycle without placing the composite under significant relative pressure. During the final cure stage, a significant pressure can be applied by releasing the vacuum in one of the two environments. Inner and outer bags are useful for creating the two vacuum environments with a perforated tool intermediate the two. The composite is placed intermediate a tool plate and a caul plate in the first environment with the inner bag and tool plate defining the first environment. The second environment is characterized by the outer bag which is placed over the inner bag and the tool plate.

A method for fabricating a piezoelectric macro-fiber composite actuator comprises making a piezoelectric fiber sheet by providing a plurality of wafers of piezoelectric material, bonding the wafers together with an adhesive material to form a stack of alternating layers of piezoelectric material and adhesive material, and cutting through the stack in a direction substantially parallel to the thickness of the stack and across the alternating layers of piezoelectric material and adhesive material to provide at least one piezoelectric fiber sheet having two sides comprising a plurality of piezoelectric fibers in juxtaposition to the adhesive material. The method further comprises bonding two electrically conductive films to the two sides of the piezoelectric fiber sheet. At least one conductive film has first and second conductive patterns formed thereon which are electrically isolated from one another and in electrical contact with the piezoelectric fiber sheet.

**A Comparison of Various Stress Rupture Life Models for Orbiter Composite Pressure Vessels and Confidence Intervals**

Grimes-Ledesma, Lorie; Murthy, Pappu L. N.; Phoenix, S. Leigh; Glaser, Ronald; June 2007; 21 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 843515.02.01.03.04.04.03

Report No.(s): NASA/TM-2007-214808; Copyright; Avail.: CASI: [A03](#), Hardcopy

In conjunction with a recent NASA Engineering and Safety Center (NESC) investigation of flight worthiness of Kevlar Overwrapped Composite Pressure Vessels (COPVs) on board the Orbiter, two stress rupture life prediction models were proposed independently by Phoenix and by Glaser. In this paper, the use of these models to determine the system reliability of 24 COPVs currently in service on board the Orbiter is discussed. The models are briefly described, compared to each other, and model parameters and parameter uncertainties are also reviewed to understand confidence in reliability estimation as well as the sensitivities of these parameters in influencing overall predicted reliability levels. Differences and similarities in the various models will be compared via stress rupture reliability curves (stress ratio vs. lifetime plots). Also outlined will be the differences in the underlying model premises, and predictive outcomes. Sources of error and sensitivities in the models will be examined and discussed based on sensitivity analysis and confidence interval determination. Confidence interval results and their implications will be discussed for the models by Phoenix and Glaser.

**Oxidation Through Coating Cracks of SiC-Protected Carbon/Carbon**

Jacobson, Nathan S.; Roth, Don J.; Rauser, Richard W.; Curry, Donald M.; June 2007; 28 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 377816.06.03.02.08

Report No.(s): NASA/TM-2007-214834; Copyright; Avail.: CASI: [A03](#), Hardcopy

The oxidation of SiC-protected carbon/carbon through machined slots and naturally occurring craze cracks in the SiC was studied. The slot and crack geometries were characterized, and the subsurface oxidation of the carbon/carbon substrate at temperatures of 1000 to 1300 C in air was assessed using weight change, x-ray computed tomography, and optical microscopy of sections. Rate constants were derived from these measurements and compared with a two-step diffusion control model of carbon oxidation. Oxidation kinetic measurements on both the specimens with machined slots and with naturally occurring craze cracks showed good agreement with the model.

Contract(s)/Grant(s): WBS 843515.02.01.03.04.04.03

Report No.(s): NASA/TM-2007-214848; Copyright; Avail.: CASI: [A03](#), Hardcopy

Composite Overwrapped Pressure Vessels (COPVs) are often used for storing pressurant gases onboard spacecraft. Kevlar (DuPont), glass, carbon and other more recent fibers have all been used as overwraps. Due to the fact that overwraps are subjected to sustained loads for an extended period during a mission, stress rupture failure is a major concern. It is therefore important to ascertain the reliability of these vessels by analysis, since the testing of each flight design cannot be completed on a practical time scale. The present paper examines specifically a Weibull statistics based stress rupture model and considers the various uncertainties associated with the model parameters. The paper also examines several reliability estimate measures that would be of use for the purpose of recertification and for qualifying flight worthiness of these vessels. Specifically, deterministic values for a point estimate, mean estimate and 90/95 percent confidence estimates of the reliability are all examined for a typical flight quality vessel under constant stress. The mean and the 90/95 percent confidence estimates are computed using Monte-Carlo simulation techniques by assuming distribution statistics of model parameters based also on

simulation and on the available data, especially the sample sizes represented in the data. The data for the stress rupture model are obtained from the Lawrence Livermore National Laboratories (LLNL) stress rupture testing program, carried out for the past 35 years. Deterministic as well as probabilistic sensitivities are examined.

A method of growing carbon nanotubes uses a synthesized mesoporous silica template with approximately cylindrical pores being formed therein. The surfaces of the pores are coated with a carbon nanotube precursor, and the template with the surfaces of the pores so-coated is then heated until the carbon nanotube precursor in each pore is converted to a carbon nanotube.

ONLINE: <http://hdl.handle.net/2060/20070023495>

Nitric oxide in a gaseous stream is converted to nitrogen dioxide using oxidizing species generated at least in part using in situ UV radiation sources. The sources of the oxidizing species include oxygen and/or hydrogen peroxide. The oxygen may be a component of the gaseous stream or added to the gaseous stream, preferably near a UV radiation source, and is converted to ozone by the UV irradiation. The hydrogen peroxide is decomposed through a combination of vaporization and UV irradiation. The hydrogen peroxide is preferably stored at stable concentration levels, i.e., approximately 50% by volume and increased in concentration in a continuous process preceding vaporization within the flow channel of the gaseous stream and in the presence of the UV radiation sources.

#### **N-15 NMR Spectroscopy as a Method for Comparing the Rates of Imidization of Several Diamines**

Johnson, J. Christopher; Kuczarski, Maria A.; [2006]; 28 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 599489.02.07.03; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023557>

The relative rates of the conversion of amide-acid to imide was measured for a series of aromatic diamines that have been identified as potential replacements for 4,4'-methylene dianiline (MDA) in high-temperature polyimides and polymer

composites. These rates were compared with the N-15 NMR resonances of the unreacted amines. The initial rates of imidization track with the difference in chemical shift between the amine nitrogens in MDA and those in the subject diamines. This comparison demonstrated that N-15 NMR spectroscopy is appropriate for the rapid screening of candidate diamines to determine their reactivity relative to MDA, and can serve to provide guidance to the process of creating the time-temperature profiles used in processing these materials into polymer matrix composites.

Report No.(s): NASA/TM-2007-214801; E-15934; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023673>

A challenge for catalytic combustion in monolithic reactors at elevated temperatures is the start-up or 'light-off' from a cold initial condition. In this work, we demonstrate a concept called 'back-end catalytic ignition that potentially can be utilized in the light-off of catalytic monoliths. An external downstream flame or Joule heating raises the temperature of a small portion of the catalyst near the outlet initiating a localized catalytic reaction that propagates upstream heating the entire channel. This work uses a transient numerical model to demonstrate 'back-end' ignition within a single channel which can characterize the overall performance of a monolith. The paper presents comparisons to an experiment using a single non-adiabatic channel but the concept can be extended to the adiabatic monolith case. In the model, the time scales associated with solid heat-up are typically several orders of magnitude larger than the gas-phase and chemical kinetic time-scales. Therefore, the model assumes a quasi-steady gas-phase with respect to a transient solid. The gas phase is one-dimensional. Appropriate correlations, however, account for heat and mass transfer in a direction perpendicular to the flow. The thermally-thin solid includes axial conduction. The gas phase, however, does not include axial conduction due to the high Peclet number flows. The model includes both detailed gas-phase and catalytic surface reactions. The experiment utilizes a pure platinum circular channel oriented horizontally through which a CO/O<sub>2</sub> mixture (equivalence ratios ranging from 0.6 to 0.9) flows at 2 m/s.

ONLINE: <http://hdl.handle.net/2060/20070022851>

NASA's Global Precipitation Measurement (GPM) mission is an ongoing Goddard Space Flight Center (GSFC) project whose basic objective is to improve global precipitation measurements. The space-based portion of the mission architecture consists of a primary or core spacecraft and a constellation of NASA and contributed spacecrafts. The efforts described in this paper refer to the core spacecraft (hereafter referred to as simply GPM) which is to be fabricated at GSFC. It has been decided that the GPM spacecraft is to be a 'design-for-demise-spacecraft.' This requirement resulted in the need for a propellant tank that would also demise or ablate to an appropriate degree upon re-entry. Composite overwrapped aluminum lined propellant tanks with aluminum propellant management devices (PMD) were shown by analyses to demise and thus became the baseline configuration for GPM. As part of the GPM tank development effort, long term compatibility and wettability testing with hydrazine was performed on Al6061 and 2219 coupons fabricated and cleaned by conventional processes. Long term compatibility was confirmed. However, the wettability of the aluminum as measured by contact angle produced higher than desired angles (greater than 30 deg.) with excessive scatter. The availability of PMD materials exhibiting consistently low contact angles aids in the design of simple PMDs. Two efforts performed by Angeles Crest Engineering and funded by GSFC

were undertaken to reduce the risk of using aluminum for the GPM PMD. The goal of the first effort was to develop a cleaning or treatment process to produce consistently low contact angles. The goal of the second effort was to prove via testing that the processed aluminum would retain compatibility with hydrazine and retain low contact angle after long term exposure to hydrazine. Both goals were achieved. This paper describes both efforts and the results achieved.

**Real-time Signal-to-noise Ratio (SNR) Estimation for BPSK and QPSK Modulation Using the Active Communications Channel**

Manning, Robert M., Inventor; March 13, 2007; 15 pp.; In English; Original contains black and white illustrations  
 Patent Info.: Filed 21 Oct. 2002; US-Patent-7,190,741; US-Patent-Appl-SN-274756; NASA-Case-LEW-16901-1; No Copyright; Avail.: CASI: A03, Hardcopy  
 ONLINE: <http://hdl.handle.net/2060/20070023394>

Method and apparatus for estimating signal-to-noise ratio (SNR)  $\gamma$  of a composite input signal  $e(t)$  on a phase modulated (e.g., BPSK) communications link. A first demodulator receives the composite input signal and a stable carrier signal and outputs an in-phase output signal; a second demodulator receives the composite input signal and a phase-shifted version of the carrier signal and outputs a quadrature-phase output signal; and phase error  $\theta_E(t)$  contained within the composite input signal  $e(t)$  is calculated from the outputs of the first and second demodulators. A time series of statistically independent phase error measurements  $\theta_E(t_1)$ ,  $\theta_E(t_2)$ , ...,  $\theta_E(t_k)$  is obtained from the composite input signal subtending a time interval  $\Delta t = t_k - t_1$  whose value is small enough such that  $\gamma(t)$  and  $\sigma(t)$  can be taken to be constant in  $\Delta t$ . A biased estimate  $\gamma^*$  for the signal-to-noise ratio (SNR)  $\gamma$  if the composite input signal is calculated using maximum likelihood (ML) estimation techniques, and an unbiased estimate  $\gamma^{\wedge}$  for the signal-to-noise ratio (SNR)  $\gamma$  of the composite input signal is determined from the biased estimate  $\gamma^*$ , such as by use of a look-up table.

This paper presents the tool chain, methodology, and initial results of a study to provide a thorough, objective, and quantitative analysis of the design alternatives for space Software Defined Radio (SDR) transceivers. The approach taken was to develop a set of models and tools for describing communications requirements, the algorithm resource requirements, the available hardware, and the alternative software architectures, and generate analysis data necessary to compare alternative designs. The Space Transceiver Analysis Tool (STAT) was developed to help users identify and select representative designs, calculate the analysis data, and perform a comparative analysis of the representative designs. The tool allows the design space to be searched quickly while permitting incremental refinement in regions of higher payoff.

ONLINE: <http://hdl.handle.net/2014/39954>

The CCSDS File Delivery Protocol (CFDP) Standard could reshape ground support architectures by enabling applications to communicate over the space link using reliable-symmetric transport services. JPL utilized the CFDP standard to support the Deep Impact Mission. The architecture was based on layering the CFDP applications on top of the CCSDS Space Link Extension Services for data transport from the mission control centers to the ground stations. On July 4, 2005 at 1:52 A.M. EDT, the Deep Impact impactor successfully collided with comet Tempel 1. During the final 48 hours prior to impact, over 300 files were uplinked to the spacecraft, while over 6 thousand files were downlinked from the spacecraft using the CFDP. This paper uses the Deep Impact Mission as a case study in a discussion of the CFDP architecture, Deep Impact Mission requirements, and design for integrating the CFDP into the JPL deep space support services. Issues and recommendations for future missions using CFDP are also provided.

ONLINE: <http://hdl.handle.net/2060/20070023637>

The near field radiation characteristics of implantable Square Spiral Chip Inductor Antennas (SSCIA) for Bio-Sensors have been measured. Our results indicate that the measured near field relative signal strength of these antennas agrees with simulated results and confirm that in the near field region the radiation field is fairly uniform in all directions. The effects of parameters such as ground-plane, number of turns and microstrip-gap width on the performance of the SSCIA are presented. Furthermore, the SSCIA antenna with serrated ground plane produce a broad radiation pattern, with a relative signal strength detectable at distances within the range of operation of hand-held devices for self-diagnosis.

Environmental radio frequency (RF) data over a broad band of frequencies (30 MHz to 1000 MHz) were obtained to evaluate the electromagnetic environment in airspace around several airports. An RF signal measurement system was designed utilizing a spectrum analyzer connected to the NASA Lancair Columbia 300 aircraft's VHF/UHF navigation antenna. This

paper presents an overview of the RF measurement system and provides analysis of sample RF signal measurement data. This aircraft installation package and measurement system can be quickly returned to service if needed by future projects requiring measurement of an RF signal environment or exploration of suspected interference situations.

Multifunction phased array systems with radar, telecom, and imaging applications have already been established for flat plate phased arrays of dipoles, or waveguides. In this paper the design trades and candidate options for combining the radar and telecom functions of the Deep Space Network (DSN) into a single large transmit array of small parabolic reflectors will be discussed. In particular the effect of combining the radar and telecom functions on the sizes of individual antenna apertures and the corresponding spacing between the antenna elements of the array will be analyzed. A heterogeneous architecture for the DSN large transmit array is proposed to meet the radar and telecom requirements while considering the budget, scheduling, and strategic planning constrains.

A sensor has a plurality of carbon nanotube (CNT)-based conductors operatively positioned on a substrate. The conductors are arranged side-by-side, such as in a substantially parallel relationship to one another. At least one pair of spaced-apart electrodes is coupled to opposing ends of the conductors. A portion of each of the conductors spanning between each pair of electrodes comprises a plurality of carbon nanotubes arranged end-to-end and substantially aligned along an axis. Because a direct correlation exists between resistance of a carbon nanotube and carbon nanotube strain, changes experienced by the portion of the structure to which the sensor is coupled induce a change in electrical properties of the conductors.

ONLINE: <http://hdl.handle.net/2060/20070023486>

An ultrasonic device and method obtains desirable crimp connections between a crimp connector and a wire, or bundle

of wires, by assessing the desirability of connections made in a wire-to-wire connection and in other situations where two materials with good acoustic propagation characteristics are joined together via deformation. An embodiment of the device as a crimping tool comprises a compressing means, pulse-generating circuitry, at least one ultrasonic transmitting transducer, at least one ultrasonic receiving transducer, receiving circuitry, and a display. The user may return to a previously crimped connection and assess the desirability of the connection by compressing the device about the connection, sending an acoustic signal through the crimp, and comparing the received signal to a signal obtained from known desirable connections.

**Hollow Cathode and Keeper-region Plasma Measurements Using Ultra-fast Miniature Scanning Probes**

Goebel, Dan M.; Jameson, Kristina K.; Watkins, Ron M.; Katz, Ira; July 12, 2004; 16 pp.; In English; 40th AIAA/ASME/SAE/ASEE Joint Propulsion Conference, Fort Lauderdale, Florida, July 11-14, 2004, 11-14 Jul. 2004, Fort Lauderdale, FL, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/39989>

In order to support the development of comprehensive performance and life models for future deep space missions that will utilize ion thrusters, we have undertaken a study of the plasma structure in hollow cathodes using a new pneumatic scanning probe diagnostic. This device is designed to insert a miniature probe directly into the hollow cathode orifice from either the upstream insert region in the interior of the hollow cathode, or from the downstream keeper-plasma region at the exit of the hollow cathode, to provide complete axial profiles of the discharge plasma parameters. Previous attempts to diagnose this region with probes was limited by the melting of small probes in the intense discharge near the orifice, or caused significant perturbation of the plasma by probes large enough to survive. Our new probe is extremely compact, and when configured as a single Langmuir probe, the ceramic tube insulator is only 0.5mm in diameter and the current collecting conductor has a total area of 0.002 cm<sup>2</sup>. A series of current-voltage characteristics are obtained by applying a rapid sawtooth voltage waveform to the probe as it is scanned by the pneumatic actuator into and out of the plasma region. The bellows-sealed pneumatic drive scans the probe 4 cm in the cathode insert region and 10 cm in the anode/keeper plasmas region at average speeds of about 1 mm/msec, and the residence time at the end of the insertion stroke in the densest part of the plasma near the orifice is measured to be only 10 msec. Since the voltage sweep time is fast compared to the motion of the probe, axial profiles of the plasma density, temperature and potential with reasonable spatial resolution are obtained. Measurements of the internal cathode pressures and the axial plasma-parameter profiles for a hollow cathode operating at discharge currents of up to 35 A in xenon will be presented.

**Design of a Wideband 900 GHz Balanced Frequency Tripler for Radioastronomy**

Tripon-Canseliet, Charlotte; Maestrini, Alain; Mehdi, Imran; September 30, 2004; 2 pp.; In English; Infrared and Millimeterwave Conference, 28-30 Sep. 2004, Karlsruhe, Germany; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40037>

We report on the design of a fix-tuned split-block waveguide balanced frequency tripler working nominally at 900GHz. It uses a GaAs Schottky planar diode pair in a balanced configuration. The circuit will be fabricated with JPL membrane technology in order to minimize dielectric loading. The multiplier is bias-less to dramatically ease the mounting and the operating procedure. At room temperature, the expected output power is 50- 130 (micro)W in the band 800-970 GHz when the tripler is pumped with 4mW. By modifying the waveguide input and output matching circuit, the multiplier can be tuned to operate at lower frequencies.

**Qualification and Reliability for MEMS and IC Packages**

Ghaffarian, Reza; September 26, 2004; 10 pp.; In English; Surface Mount Technology Association (SMTA), 26-30 Sep. 2004, Chicago, IL, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/39978>

Advanced IC electronic packages are moving toward miniaturization from two key different approaches, front and back-end processes, each with their own challenges. Successful use of more of the back-end process front-end, e.g. microelectromechanical systems (MEMS) Wafer Level Package (WLP), enable reducing size and cost. Use of direct flip chip die is the most efficient approach if and when the issues of know good die and board/assembly are resolved. Wafer level package solve the issue of known good die by enabling package test, but it has its own limitation, e.g., the I/O limitation, additional cost, and reliability. From the back-end approach, system-in-a-package (SIAP/SIP) development is a response to an increasing demand for package and die integration of different functions into one unit to reduce size and cost and improve functionality. MEMS add another challenging dimension to electronic packaging since they include moving mechanical elements. Conventional qualification and reliability need to be modified and expanded in most cases in order to detect new unknown failures. This paper will review four standards that already released or being developed that specifically address the issues on qualification and reliability of assembled packages. Exposures to thermal cycles, monotonic bend test, mechanical shock and drop are covered in these specifications. Finally, mechanical and thermal cycle qualification data generated for MEMS accelerometer will be presented. The MEMS was an element of an inertial measurement unit (IMU) qualified for NASA Mars Exploration Rovers (MERs), Spirit and Opportunity that successfully is currently roaring the Martian surface

**The Pulse Width Modulator ASIC for Deep Space Missions**

Carr, Gregory A.; Wester, Gene W.; Lam, Barbara; Bennett, Johnny; Franco, Lauro; Woo, Erika; August 16, 2004; 5 pp.; In English; International Energy Conversion Engineering Conference, 16-19 Aug. 2004, Providence, RI, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40011>

The Jet Propulsion Laboratory has started the development of a Pulse Width Modulator Application Specific Integrated Circuit (PWMA). This development is leveraging the previous development of the Switch Control ASIC (SCA). The purpose of the development is to provide the control for a selected range of power converter topologies and to meet the stringent environmental requirements of deep space missions. The PWMA will include several power control functions that are not normally included on the off-the-shelf components available today. One key functional requirement is the ability to implement an N + K redundant power converter with the ability to control the charging of a battery. Other applications will be the typical point of load isolated and non-isolated power converters. The purpose the development is not only to provide a much needed flight part, but also to accelerate the engineering process by using a standard cell library from previous ASIC developments. Under previous developments with Boeing and Lockheed Martin, JPL has produced three ASICs. Each ASIC has been implemented by using an analog standard cell library. One such development was the SCA, which is design to provide a floating power switch control. The functional verification of this ASIC has been completed and the cells used have been targeted for the new development of the PWMA. The primary function of the PWMA is to provide the control function of a point of load power converter. The design is an isolated 60 W converter with a 33 V output. In architecting the design, several functions were left up to the power converter design in order to make the ASIC more generic. The ASIC can be used for several power converter topologies and power levels. Some additional features have been added to the ASIC to provide the interfaces for multi-phase topologies and battery control functions. An N+K fault tolerant strategy has been implemented in order to provide the battery control functions. The PWMA has been developed to provide an ASIC with several functions not normally available in the off the shelf controllers. These functions have been added to enable the power converter designers to achieve fault tolerant designs and battery control functions.

**Design of a Wideband 6-Anode Frequency Tripler at 300 GHz with Optimum Balance**

Maestrini, Alain; Tripon-Canseliet, Charlotte; Mehdi, Imran; September 28, 2004; 2 pp.; In English; Infrared and Millimeterwave Conference, 28-30 Sep. 2004, Karlsruhe, Germany; Original contains fold-outs or oversized pages that could not be scanned; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/39966>

We report on the design methodology of a fix-tuned split-block waveguide balanced frequency tripler working nominally at 300 GHz. It features six GaAs Schottky planar diodes in a balanced configuration. The circuit will be fabricated with JPL membrane technology in order to minimize dielectric loading and insure an accurate and uniform thickness of the substrate. The multiplier power handling is limited by the breakdown voltage of the diodes that depends on the doping level of the active layer. With six diodes, the current choice for the doping level leads to medium power handling capabilities of about 50 mW. Increasing the number of diodes to eight would be an option but would lead to increased difficulties in design and fabrication.

ONLINE: <http://hdl.handle.net/2014/39993>

This paper examines single-event upsets in advanced commercial SOI microprocessors in a dynamic mode, studying SEU sensitivity of General Purpose Registers (GPRs) with clock frequency. Results are presented for SOI processors with feature sizes of 0.18 microns and two different core voltages. Single-event upset from heavy ions is measured for advanced commercial microprocessors in a dynamic mode with clock frequency up to 1GHz. Frequency and core voltage dependence of single-event upsets in registers is discussed.

### **CFD to Flight: Some Recent Success Stories of X-plane Design to Flight Test at the NASA Dryden Flight Research Center**

Cosentino, Gary B.; May 25, 2007; 21 pp.; In English; Frontiers of Computational Fluid Dynamics Workshop, 20-21 Jun. 2007, Davis, CA, USA; Original contains color illustrations; No Copyright; Avail.: CASI: **A03**, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070022848>

Several examples from the past decade of success stories involving the design and flight test of three true X-planes will be described: in particular, X-plane design techniques that relied heavily upon computational fluid dynamics (CFD). Three specific examples chosen from the authors personal experience are presented: the X-36 Tailless Fighter Agility Research Aircraft, the X-45A Unmanned Combat Air Vehicle, and, most recently, the X-48B Blended Wing Body Demonstrator Aircraft. An overview will be presented of the uses of CFD analysis, comparisons and contrasts with wind tunnel testing, and information derived from the CFD analysis that directly related to successful flight test. Some lessons learned on the proper application, and misapplication, of CFD are illustrated. Finally, some highlights of the flight-test results of the three example X-planes will be presented. This overview paper will discuss some of the authors experience with taking an aircraft shape from early concept and three-dimensional modeling through CFD analysis, wind tunnel testing, further refined CFD analysis, and, finally, flight. An overview of the key roles in which CFD plays well during this process, and some other roles in which it does not, are discussed. How wind tunnel testing complements, calibrates, and verifies CFD analysis is also covered. Lessons learned on where CFD results can be misleading are also given. Strengths and weaknesses of the various types of flow solvers, including panel methods, Euler, and Navier-Stokes techniques, are discussed. The paper concludes with the three specific examples, including some flight test video footage of the X-36, the X-45A, and the X-48B.

### **Nonstandard Analysis and Shock Wave Jump Conditions in a One-Dimensional Compressible Gas**

Baty, Roy S.; Farassat, Fereidoun; Hargreaves, John; May 2007; 81 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): DE-AC52-06NA25396; WBS 561581.02.08.07.18.02

Report No.(s): LA-14334; No Copyright; Avail.: CASI: **A05**, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023401>

Nonstandard analysis is a relatively new area of mathematics in which infinitesimal numbers can be defined and manipulated rigorously like real numbers. This report presents a fairly comprehensive tutorial on nonstandard analysis for physicists and engineers with many examples applicable to generalized functions. To demonstrate the power of the subject, the problem of shock wave jump conditions is studied for a one-dimensional compressible gas. It is assumed that the shock thickness occurs on an infinitesimal interval and the jump functions in the thermodynamic and fluid dynamic parameters occur smoothly across this interval. To use conservation laws, smooth pre-distributions of the Dirac delta measure are applied whose supports are contained within the shock thickness. Furthermore, smooth pre-distributions of the Heaviside function are applied which vary from zero to one across the shock wave. It is shown that if the equations of motion are expressed in nonconservative form then the relationships between the jump functions for the flow parameters may be found unambiguously. The analysis yields the classical Rankine-Hugoniot jump conditions for an inviscid shock wave. Moreover, non-monotonic entropy jump conditions are obtained for both inviscid and viscous flows. The report shows that products of generalized functions may be defined consistently using nonstandard analysis; however, physically meaningful products of generalized functions must be determined from the physics of the problem and not the mathematical form of the governing equations.

Contract(s)/Grant(s): NAG1-02059; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023593>

Flow separation in internal and external flows generally results in a significant degradation in aircraft performance. For internal flows, such as inlets and transmission ducts in aircraft propulsion systems, separation is undesirable as it reduces the overall system performance. The aim of this research has been to understand the nature of separation and more importantly, to explore techniques to actively control it. In this research, we extended our investigation of active separation control (under a previous NASA grant) where we explored the use of microjets for the control of boundary layer separation. The geometry used for the initial study was a simple diverging Stratford ramp, equipped with arrays of microjets. These early results clearly show that the activation of microjets eliminated flow separation. Furthermore, the velocity-field measurements, using PIV, also demonstrate that the gain in momentum due to the elimination of separation is at least an order of magnitude larger (two orders of magnitude larger in most cases) than the momentum injected by the microjets and is accomplished with very little mass flow through the microjets. Based on our initial promising results this research was continued under the present grant, using a more flexible model. This model allows for the magnitude and extent of separation as well as the microjet parameters to be independently varied. The results, using this model were even more encouraging and demonstrated that microjet control completely eliminated significant regions of flow separation over a wide range of conditions with almost negligible mass flow. Detailed studies of the flowfield and its response to microjets were further examined using 3-component PIV and unsteady pressure measurements, among others. As the results presented this report will show, microjets were successfully used to control the separation of a much larger extent and magnitude than demonstrated in our earlier experiments. In fact, using the appropriate combination of control parameters (microjet, location, angle and pressure) separation was completely eliminated for the largest separated flowfield we could generate with the present model. Separation control also resulted in a significant reduction in the unsteady pressures in the flow where the unsteady pressure field was found to be directly responsive to the state of the flow above the surface. Hence, our study indicates that the unsteady pressure signature is a strong candidate for a flow state sensor, which can be used to estimate the location, magnitude and other properties of the separated flowfield. Once better understood and properly utilized, this behavior can be of significant practical importance for developing and implementing online control.

**Orbiter Entry Aeroheating Working Group Viscous CFD Boundary Layer Transition Trailblazer Solutions**

Wood, William A.; Erickson, David W.; Greene, Francis A.; June 2007; 22 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 23-376-70-30-08

Report No.(s): NASA/TM-2007-214882; L-19281; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023635>

Boundary layer transition correlations for the Shuttle Orbiter have been previously developed utilizing a two-layer boundary layer prediction technique. The particular two-layer technique that was used is limited to Mach numbers less than 20. To allow assessments at Mach numbers greater than 20, it is proposed to use viscous CFD to the predict boundary layer properties. This report addresses if the existing Orbiter entry aeroheating viscous CFD solutions, which were originally

intended to be used for heat transfer rate predictions, adequately resolve boundary layer edge properties and if the existing two-layer results could be leveraged to reduce the number of needed CFD solutions. The boundary layer edge parameters from viscous CFD solutions are extracted along the wind side centerline of the Space Shuttle Orbiter at reentry conditions, and are compared with results from the two-layer boundary layer prediction technique. The differences between the viscous CFD and two-layer prediction techniques vary between Mach 6 and 18 flight conditions and Mach 6 wind tunnel conditions, and there is not a straightforward scaling between the viscous CFD and two-layer values. Therefore: it is not possible to leverage the existing two-layer Orbiter flight boundary layer data set as a substitute for a viscous CFD data set; but viscous CFD solutions at the current grid resolution are sufficient to produce a boundary layer data set suitable for applying edge-based boundary layer transition correlations.

ONLINE: <http://hdl.handle.net/2060/20070023496>

Magnetic field response sensors designed as passive inductor- capacitor circuits produce magnetic field responses whose harmonic frequencies correspond to states of physical properties for which the sensors measure. Power to the sensing element is acquired using Faraday induction. A radio frequency antenna produces the time varying magnetic field used for powering the sensor, as well as receiving the magnetic field response of the sensor. An interrogation architecture for discerning changes in sensor's response frequency, resistance and amplitude is integral to the method thus enabling a variety of measurements. Multiple sensors can be interrogated using this method, thus eliminating the need to have a data acquisition channel dedicated to each sensor. The method does not require the sensors to be in proximity to any form of acquisition hardware. A vast array of sensors can be used as interchangeable parts in an overall sensing system.

**Progress on Background-Limited Membrane-Isolated TES Bolometers for Far-IR/Submillimeter Spectroscopy**

Kenyon, M.; Day, P. K.; Bradford, C. M.; Bock, J. J.; Leduc, H. G.; May 29, 2006; In English; SPIE Astronomical Telescopes and Instrumentation, 24-31 May 2006, Orlando, FL, USA; Original contains color and black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40089>

To determine the lowest attainable phonon noise equivalent power (NEP) for membrane-isolation bolometers, we fabricated and measured the thermal conductance of suspended Si<sub>3</sub>N<sub>4</sub> beams with different geometries via a noise thermometry technique. We measured beam cross-sectional areas ranging from 0.35 x 0.5 (micro)m<sup>2</sup> to 135 x 1.0 (micro)m<sup>2</sup> and beam lengths ranging from (micro)m to 8300 (micro)m. The measurements directly imply that membrane-isolation bolometers are capable of reaching a phonon noise equivalent power (NEP) of  $4 \times 10^{-20}$  W/Hz<sup>1/2</sup>. This NEP adequate for the Background-Limited Infrared-Submillimeter Spectrograph (BLISS) proposed for the Japanese SPICA observatory, and adequate for NASA's SAFIR observatory, a 10-meter, 4 K telescope to be deployed at L2. Further, we measured the heat capacity of a suspended Si<sub>3</sub>N<sub>4</sub> membrane and show how this result implies that one can make membrane-isolation bolometers with a response time which is fast enough for BLISS.

ONLINE: <http://hdl.handle.net/2014/40090>

The nulling coronagraph is one of 5 instrument concepts selected by NASA for study for potential use in the TPF-C mission. This concept for extreme starlight suppression has two major components, a nulling interferometer to suppress the starlight to  $\sim 10^{-10}$  per airy spot within  $2(\lambda)/D$  of the star, and a calibration interferometer to measure the residual scattered starlight. The ability to work at  $2(\lambda)/D$  dramatically improves the science throughput of a space based coronagraph like TPF-C. The calibration interferometer is an equally important part of the starlight suppression system. It measures the wavefront of the scattered starlight with very high SNR, to 0.05nm in less than 5 minutes on a 5mag star. In addition, the post coronagraph wavefront sensor will be used to measure the residual scattered light after the coronagraph and subtract it in post processing to  $1\sim 2 \times 10^{-11}$  to enable detection of an Earthlike planet with a SNR of 5~10.

Report No.(s): Paper No. B11P4; Copyright; Avail.: CASI: [A01](#), Hardcopy

High-accuracy, vertical profiles of the horizontal vector wind in earth's atmosphere, with the global coverage of an orbiting sensor, are a highly desired measurement of NASA, NOAA, and many other agencies and countries. It is the consensus of NASA and NOAA that the most cost effective, lowest risk measurement method with the earliest achievable mission date is the hybrid Doppler lidar method which utilizes both coherent- and direct-detection Doppler lidars to obtain the desired profiles. NASA Langley Research Center (LaRC) has advanced the 2-micron pulsed solid-state laser greatly over the past 15 years and has recently demonstrated 1.2 J of pulse energy whereas the requirement for a 400-km hybrid Doppler lidar mission is only 0.25 J. The IIP project reported here is an effort to increase the ruggedness and to compactly package the LaRC state-of-the-art laser technology.

ONLINE: <http://hdl.handle.net/2060/20070023678>

An optical fiber for evenly illuminating a target. The optical fiber is coupled to a laser emitting diode and receives laser light. The laser light travels through the fiber optic and exits at an exit end. The exit end has a diffractive optical pattern formed thereon via etching, molding or cutting, to reduce the Gaussian profile present in conventional fiber optic cables. The reduction of the Gaussian provides an even illumination from the fiber optic cable.

Free-piston Stirling power conversion has been considered a candidate for radioisotope power systems for space for more than a decade. Prior to the free-piston Stirling architecture, systems were designed with kinematic Stirling engines that used linkages and rotary alternators to convert heat to electricity. These systems were able to achieve long life by lightly loading the linkages; however, the life was nonetheless limited. When the free-piston configuration was initially proposed, it was

thought to be attractive due to the relatively high conversion efficiency, acceptable mass, and the potential for long life and high reliability based on wear-free operation. These features have consistently been recognized by teams that have studied technology options for radioisotope space power systems. Since free-piston Stirling power conversion was first considered for space power applications, there have been major advances in three general areas of development: hardware that has demonstrated long-life and reliability, the success achieved by Stirling cryocoolers in space, and the overall developmental maturity of the technology for both space and terrestrial applications. Based on these advances, free-piston Stirling converters are currently being developed for space power, and for a number of terrestrial applications. They commonly operate with the power, efficiency, life, and reliability as intended, and much of the development now centers on system integration. This paper will summarize the accomplishments of free-piston Stirling power conversion technology over the past decade, review the status of development with regard to space power, and discuss the challenges that remain.

**Unsteady Velocity Measurements in the NASA Research Low Speed Axial Compressor: Smooth Wall Configuration**

Lepicovsky, Jan; May 2007; 114 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): NNC06BA07B; WBS 561581.02.08.03.21.02

Report No.(s): NASA/CR-2007-214815; E-15971; No Copyright; Avail.: CASI: [A06](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070022841>

The report is a collection of experimental unsteady data acquired in the first stage of the NASA Low Speed Axial Compressor in configuration with smooth (solid) wall treatment over the first rotor. The aim of the report is to present a reliable experimental data base that can be used for analysis of the compressor flow behavior, and hopefully help with further improvements of compressor CFD codes. All data analysis is strictly restricted to verification of reliability of the experimental data reported. The report is divided into six main sections. First two sections cover the low speed axial compressor, the basic instrumentation, and the in-house developed methodology of unsteady velocity measurements using a thermo-anemometric split-fiber probe. The next two sections contain experimental data presented as averaged radial distributions for three compressor operation conditions, including the distribution of the total temperature rise over the first rotor, and ensemble averages of unsteady flow data based on a rotor blade passage period. Ensemble averages based on the rotor revolution period, and spectral analysis of unsteady flow parameters are presented in the last two sections. The report is completed with two appendices where performance and dynamic response of thermo-anemometric probes is discussed.

**Volatile Organic Analyzer (VOA) in 2006: Repair, Revalidation, and Restart of Elektron Event**

Limero, Thomas; July 22, 2007; 5 pp.; In English; 16th International Conference on Ion Mobility, 22-26 Jul. 2007, Mikkeli, Finland; Original contains color illustrations; Copyright; Avail.: CASI: [A01](#), Hardcopy

The Volatile Organic Analyzer (VOA) was launched to the International Space Station (ISS) in August 2001 and was the first instrument to provide near real-time measurement of volatile organic compounds in a spacecraft atmosphere. The VOA

performed an analysis of the ISS air approximately twice a month for most of its operation through May 2003. This intermittent operation, caused by a software interface issue with the ISS communication bus, slowed the validation of the VOA. However, operational validation was completed in 2003 when analysis of air samples collected in grab sample containers (GSCs) compared favorably with simultaneous VOA runs (1). The VOA has two channels that provide redundant function, albeit at slightly reduced performance, when only one channel is operating (2). Most target compounds can be detected on both channels. In January 2003, the VOA identified a malfunction in the channel 2 preconcentrator and it shut down that channel. The anomaly profile suggested that a fuse might have failed, but the root cause could not be determined. In May 2003, channel 1 was shut down when the detector's elevated temperature could not longer be maintained. Since both VOA channels were now deactivated, VOA operations ended until an in-flight repair could be planned and executed. This paper describes the process to repair the VOA and to revalidate it for operations, and then an account is given of the VOA's contribution following a contingency event on ISS.

### **Analysis of the Effects of Sea Disposal on a One-Ton Container**

Jackson, Wde C.; Jackson, Karen E.; Fasanella, Edwin L.; Kelley, John; July 2007; 50 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 732759.07.09

Report No.(s): NASA/TM-2007-214881; ARL-TR-3883; L-19368; Copyright; Avail.: CASI: A03, Hardcopy

Excess and obsolete stocks of chemical warfare material (CWM) were sea disposed by the USA between 1919 and 1970. One-ton containers were used for bulk storage of CWM and were the largest containers sea disposed. Disposal depths ranged from 300 to 17,000 feet. Based on a Type D container assembly drawing, three independent analyses (one corrosion and two structural) were performed on the containers to address the corrosion resistance from prolonged exposure to sea water and the structural response during the descent. Corrosion predictions were made using information about corrosion rates and the disposal environment. The structural analyses employed two different finite element codes and were used to predict the buckling and material response of the container during sea disposal. The results of these investigations are summarized below. Detailed reports on each study are contained in the appendices.

**System and Method for Detecting Cracks and their Location**

Woodward, Stanley E., Inventor; Shams, Qamar A., Inventor; June 19, 2007; 9 pp.; In English; Original contains black and white illustrations

Patent Info.: Filed 12 Sep. 2005; US-Patent-7,231,832; US-Patent-Appl-SN-229439; US-Patent-Appl-SN-611170; NASA-Case-LAR-16970-1; No Copyright; Avail.: CASI: [A02](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023494>

A system and method are provided for detecting cracks and their location in a structure. A circuit coupled to a structure has capacitive strain sensors coupled sequentially and in parallel to one another. When excited by a variable magnetic field, the circuit has a resonant frequency that is different for unstrained and strained states. In terms of strained states, the resonant frequency is indicative of a region of the circuit that is experiencing strain induced by strain in a region of the structure in proximity to the region of the circuit. An inductor is electrically coupled to one end of each circuit. A magnetic field response recorder wirelessly transmits the variable magnetic field to the inductor and senses the resonant frequency of the circuit so-excited by the variable magnetic field.

We are using Web (Grid) service technology to demonstrate the assimilation of multiple distributed data sources (a typical data grid problem) into a major parallel high-performance computing earthquake forecasting code. Such a linkage of Geoinformatics with Geocomplexity demonstrates the value of the Solid Earth Research Virtual Observatory (SERVO) Grid concept, and advance Grid technology by building the first real-time large-scale data assimilation grid Here we develop the next steps for both the SERVO concept and the identified need for a Solid Earth problem-solving environment. We use a challenging motivating problem of importance to NASA namely integrating NASA space geodetic observations with numerical simulations of a changing earth.

**Validation of GOES-10 Satellite-derived Cloud and Radiative Properties for the MASRAD ARM Mobile Facility Deployment**

Khayer, M. M.; Doelling, D. R.; Palikonda, R.; Mordeen, M. L.; Minnis, P.; March 26, 2007; 1 pp.; In English; 17th Annual ARM Science Team Meeting, 26-30 March 2007, Monterey, CA, USA; Original contains color illustrations; Copyright; Avail.: CASI: [A01](#), Hardcopy

This poster presentation reviews the process used to validate the GOES-10 satellite derived cloud and radiative properties. The ARM Mobile Facility (AMF) deployment at Pt Reyes, CA as part of the Marine Stratus Radiation Aerosol and Drizzle

experiment (MASRAD), 14 March - 14 September 2005 provided an excellent chance to validate satellite cloud-property retrievals with the AMF's flexible suite of ground-based remote sensing instruments. For this comparison, NASA LaRC GOES10 satellite retrievals covering this region and period were re-processed using an updated version of the Visible Infrared Solar-Infrared Split-Window Technique (VISST), which uses data taken at 4 wavelengths (0.65, 3.9, 11 and 12  $\mu$ m resolution), and computes broadband fluxes using improved CERES (Clouds and Earth's Radiant Energy System)-GOES-10 narrowband-to-broadband flux conversion coefficients. To validate MASRAD GOES-10 satellite-derived cloud property data, VISST-derived cloud amounts, heights, liquid water paths are compared with similar quantities derived from available ARM ground-based instrumentation and with CERES fluxes from Terra.

The current ARM satellite cloud products derived from Geostationary Operational Environmental Satellite (GOES) data provide continuous coverage of many cloud properties over the ARM Southern Great Plains domain. However, discontinuities occur during daylight near the terminator, a time period referred to here as twilight. This poster presentation will demonstrate the improvements in cloud detection provided by the improved cloud mask algorithm as well as validation of retrieved cloud properties using surface observations from the Atmospheric Radiation Measurement Southern Great Plains (ARM SGP) site.

This article addresses land-cover and land-use dynamics from the perspective of regional science and economic geography. It first provides an account of the so-called spatially explicit model, which has emerged in recent years as a key empirical approach to the issue. The article uses this discussion as a springboard to evaluate the potential utility of von Thunen to the discourse on land-cover and land-use change. After identifying shortcomings of current theoretical approaches to land use in mainly urban models, the article filters a discussion of deforestation through the lens of bid-rent and assesses its effectiveness in helping us comprehend the destruction of tropical forest in the Amazon basin. The article considers the adjustments that would have to be made to existing theory to make it more useful to the empirical issues.

Changes in land use and land cover are dynamic processes reflecting a sequence of decisions made by individual land

managers. In developing economies, these decisions may be embedded in the evolution of individual households, as is often the case in indigenous areas and agricultural frontiers. One goal of the present article is to address the land use and land-cover decisions of colonist farmers in the Amazon Basin as a function, in part, of household characteristics. Another goal is to generalize the issue of tropical deforestation into a broader discussion on forest dynamics. The extent of secondary forest in tropical areas has been well documented in South America and Africa. Agricultural-plot abandonment often occurs in tandem with primary forest clearance and as part of the same decision-making calculus. Consequently, tropical deforestation and forest succession are not independent processes in the landscape. This article presents a framework that integrates them into a model of forest dynamics at household level, and in so doing provides an account of the spatial pattern of deforestation that has been observed in the Amazon's colonization frontiers.

Tropical deforestation remains a critical issue given its present rate and a widespread consensus regarding its implications for the global carbon cycle and biodiversity. Nowhere is the problem more pronounced than in the Amazon basin, home to the world's largest intact, tropical forest. This article addresses land cover change processes at household level in the Amazon basin, and to this end adapts a concept of domestic life cycle to the current institutional environment of tropical frontiers. In particular, it poses a risk minimization model that integrates demography with market-based factors such as transportation costs and accessibility. In essence, the article merges the theory of Chayanov with the household economy framework, in which markets exist for inputs (including labor), outputs, and capital. The risk model is specified and estimated, using survey data for 261 small producers along the Transamazon Highway in the eastern sector of the Brazilian Amazon.

**Fire in the Brazilian Amazon: A Spatially Explicit Model for Policy Impact Analysis**

Arima, Eugenio Y.; Simmons, Cynthia S.; Walker, Robert T.; Cochrane, Mark A.; Journal of Regional Science; August 2007; Volume 47, Issue 3, pp. 541-567; In English

Contract(s)/Grant(s): NCC5-694; Copyright; Avail.: Other Sources; Abstract Only

ONLINE: <http://dx.doi.org/10.1111/j.1467-9787.2007.00519.x>

This article implements a spatially explicit model to estimate the probability of forest and agricultural fires in the Brazilian Amazon. We innovate by using variables that reflect farmgate prices of beef and soy, and also provide a conceptual model of managed and unmanaged fires in order to simulate the impact of road paving, cattle exports, and conservation area designation on the occurrence of fire. Our analysis shows that fire is positively correlated with the price of beef and soy, and that the creation of new conservation units may offset the negative environmental impacts caused by the increasing number of fire events associated with early stages of frontier development.

Understanding the impact of road investments on deforestation is part of a complete evaluation of the expansion of infrastructure for development. We find evidence of spatial spillovers from roads in the Brazilian Amazon: deforestation rises in the census tracts that lack roads but are in the same county as and within 100 km of a tract with a new paved or unpaved

road. At greater distances from the new roads the evidence is mixed, including negative coefficients of inconsistent significance between 100 and 300 km, and if anything, higher neighbor deforestation at distances over 300 km.

ONLINE: <http://dx.doi.org/10.1111/j.1467-8306.2007.00525.x>

This paper addresses deforestation processes in the Amazon basin. It deploys a methodology combining remote sensing and survey-based fieldwork to examine, with regression analysis, the impact household structure and economic circumstances on deforestation decisions made by colonist farmers in the forest frontiers of Brazil. Unlike most previous regression-based studies, the methodology implemented analyzes behavior at the level of the individual property. The regressions correct for endogenous relationships between key variables, and spatial autocorrelation, as necessary. Variables used in the analysis are specified, in part, by a theoretical development integrating the Chayanovian concept of the peasant household with spatial considerations stemming from von Thunen. The results from the empirical model indicate that demographic characteristics of households, as well as market factors, affect deforestation in the Amazon. Thus, statistical results from studies that do not include household-scale information may be subject to error. From a policy perspective, the results suggest that environmental policies in the Amazon based on market incentives to small farmers may not be as effective as hoped, given the importance of household factors in catalyzing the demand for land. The paper concludes by noting that household decisions regarding land use and deforestation are not independent of broader social circumstances, and that a full understanding of Amazonian deforestation will require insight into why poor families find it necessary to settle the frontier in the first place.

Most research featuring demographic factors in environmental change has focused on processes operating at the level of national or global populations. This paper focuses on household-level demographic life cycles among colonists in the Amazon, and evaluates the impacts on land use allocation. The analysis goes beyond prior research by including a broader suite of demographic variables, and by simultaneously assessing their impacts on multiple land uses with different economic and ecological implications. We estimate a system of structural equations that accounts for endogeneity among land uses, and the findings indicate stronger demographic effects than previous work. These findings bear implications for modeling land use, and the place of demography in environmental research.

ONLINE: [http://www.clarku.edu/econogeography/issue.cfm?issue=2006\\_03.html#Art\\_2](http://www.clarku.edu/econogeography/issue.cfm?issue=2006_03.html#Art_2)

Tropical deforestation is a significant driver of global environmental change, given its impacts on the carbon cycle and biodiversity. Loss of the Amazon forest, the focus of this article, is of particular concern because of the size and the rapid rate at which the forest is being converted to agricultural use. In this article, we identify what has been the most important driver

of deforestation in a specific colonization frontier in the Brazilian Amazon. To this end, we consider (1) the land-use dynamics of smallholder households, (2) the formation of pasture by large-scale ranchers, and (3) structural processes of land aggregation by ranchers. Much has been written about relations between smallholders and ranchers in the Brazilian Amazon, particularly those involving conflict over land, and this article explicates the implications of such social processes for land cover. Toward this end, we draw on panel data (1996-2002) and satellite imagery (1986-1999) to show the deforestation that is attributable to small- and largeholders, and the deforestation that is attributable to aggregations of property arising from a process that we refer to as frontier stratification. Evidently, most of the recent deforestation in the study area has resulted from the household processes of smallholders, not from conversions to pasture pursuant to the appropriations of smallholders' property by well-capitalized ranchers or speculators.

ONLINE: 10.1111/j.1467-8306.2005.00473.x

Although a large literature now exists on the drivers of tropical deforestation, less is known about its spatial manifestation. This is a critical shortcoming in our knowledge base since the spatial pattern of land-cover change and forest fragmentation, in particular, strongly affect biodiversity. The purpose of this article is to consider emergent patterns of road networks, the initial proximate cause of fragmentation in tropical forest frontiers. Specifically, we address the road-building processes of loggers who are very active in the Amazon landscape. To this end, we develop an explanation of road expansions, using a positive approach combining a theoretical model of economic behavior with geographic information systems (GIS) software in order to mimic the spatial decisions of road builders. We simulate two types of road extensions commonly found in the Amazon basin in a region: showing the fishbone pattern of fragmentation. Although our simulation results are only partially successful, they call attention to the role of multiple agents in the landscape, the importance of legal and institutional constraints on economic behavior, and the power of GIS as a research tool.

Unofficial roads form dense networks in landscapes, generating a litany of negative ecological outcomes, but unofficial roads in frontier areas are also instrumental in local livelihoods and community development. This trade-off poses dilemmas for the governance of unofficial roads. Unofficial road building in frontier areas of the Brazilian Amazon illustrates the challenges of 'road governance.' Both state-based and community based governance models exhibit important liabilities for governing unofficial roads. Whereas state-based governance has experienced difficulties in adapting to specific local contexts and interacting effectively with local interest groups, community-based governance has a mixed record owing to social inequalities and conflicts among local interest groups. A state-community hybrid model may offer more effective governance of unofficial road building by combining the oversight capacity of the state with locally grounded community management via participatory decision-making.

Roads have manifold social and environmental impacts, including regional development, social conflicts and habitat fragmentation. 'Road ecology' has emerged as an approach to evaluate the various ecological and hydrological impacts of roads. This article aims to complement road ecology by examining the socio-spatial processes of road building itself. Focusing on the Brazilian Amazon, a heavily-studied context due to forest fragmentation by roads, the authors consider non-state social actors who build 'unofficial roads' for the purpose of gaining access to natural resources to support livelihoods and community development. They examine four case studies of roads with distinct histories in order to explain the socio-spatial processes behind road building in terms of profit maximization, land tenure claims, co-operative and conflictive political ecologies, and constraints as well as opportunities afforded by the biophysical environment. The study cases illustrate the need for a multi-pronged theoretical approach to understanding road building, and call for more attention to the role of non-state actors in unofficial road construction.

**Progress in Modeling Global Atmospheric CO<sub>2</sub> Fluxes and Transport: Results from Simulations with Diurnal Fluxes**

Collatz, G. James; Kawa, R.; April 24, 2007; 1 pp.; In English; 8th TransCom Workshop, 24-27 Apr. 2007, West Lafayette, IN, USA; No Copyright; Avail.: Other Sources; Abstract Only

Progress in better determining CO<sub>2</sub> sources and sinks will almost certainly rely on utilization of more extensive and intensive CO<sub>2</sub> and related observations including those from satellite remote sensing. Use of advanced data requires improved modeling and analysis capability. Under NASA Carbon Cycle Science support we seek to develop and integrate improved formulations for 1) atmospheric transport, 2) terrestrial uptake and release, 3) biomass and 4) fossil fuel burning, and 5) observational data analysis including inverse calculations. The transport modeling is based on meteorological data assimilation analysis from the Goddard Modeling and Assimilation Office. Use of assimilated met data enables model comparison to CO<sub>2</sub> and other observations across a wide range of scales of variability. In this presentation we focus on the short end of the temporal variability spectrum: hourly to synoptic to seasonal. Using CO<sub>2</sub> fluxes at varying temporal resolution from the SIB 2 and CASA biosphere models, we examine the model's ability to simulate CO<sub>2</sub> variability in comparison to observations at different times, locations, and altitudes. We find that the model can resolve much of the variability in the observations, although there are limits imposed by vertical resolution of boundary layer processes. The influence of key process representations is inferred. The high degree of fidelity in these simulations leads us to anticipate incorporation of realtime, highly resolved observations into a multiscale carbon cycle analysis system that will begin to bridge the gap between top-down and bottom-up flux estimation, which is a primary focus of NACP.

For more than 2 years, the NASA Dryden Flight Research Center has been preparing for the receipt of two Advanced Concept Technology Demonstration Global Hawk air vehicles from the USA Air Force. NASA Dryden intends to establish a Global Hawk Project Office, which will be responsible for developing the infrastructure required to operate this unmanned aerial system and establishing a trained maintenance and operations team. The first flight of a NASA Global Hawk air vehicle

is expected to occur in 2008. The NASA Global Hawk system can be used by a variety of customers, including U.S. Government agencies, civilian organizations, universities, and state governments. A combination of the vehicle's range, endurance, altitude, payload power, payload volume, and payload weight capabilities separates the Global Hawk unmanned aerial system from all other platforms available to the science community.

ONLINE: <http://dx.doi.org/10.1109/TGRS.2006.871214>

The analysis of two years of Collection 3 and five years of Collection 4 Terra Moderate Resolution Imaging Spectroradiometer (MODIS) Leaf Area Index (LAI) and Fraction of Photosynthetically Active Radiation (FPAR) data sets is presented in this article with the goal of understanding product quality with respect to version (Collection 3 versus 4), algorithm (main versus backup), snow (snow-free versus snow on the ground), and cloud (cloud-free versus cloudy) conditions. Retrievals from the main radiative transfer algorithm increased from 55% in Collection 3 to 67% in Collection 4 due to algorithm refinements and improved inputs. Anomalously high LAI/FPAR values observed in Collection 3 product in some vegetation types were corrected in Collection 4. The problem of reflectance saturation and too few main algorithm retrievals in broadleaf forests persisted in Collection 4. The spurious seasonality in needleleaf LAI/FPAR fields was traced to fewer reliable input data and retrievals during the boreal winter period. About 97% of the snow covered pixels were processed by the backup Normalized Difference Vegetation Index-based algorithm. Similarly, a majority of retrievals under cloudy conditions were obtained from the backup algorithm. For these reasons, the users are advised to consult the quality flags accompanying the LAI and FPAR product.

ONLINE: <http://dx.doi.org/10.1016/j.agrformet.2005.10.008>

The first significant processing of Terra MODIS data, called Collection 3, covered the period from November 2000 to December 2002. The Collection 3 leaf area index (LAI) and fraction vegetation absorbed photosynthetically active radiation (FPAR) products for broadleaf crops exhibited three anomalies (a) high LAI values during the peak growing season, (b) differences in LAI seasonality between the radiative transfer-based main algorithm and the vegetation index based back-up algorithm, and (c) too few retrievals from the main algorithm during the summer period when the crops are at full flush. The cause of these anomalies is a mismatch between reflectances modeled by the algorithm and MODIS measurements. Therefore, the Look-Up-Tables accompanying the algorithm were revised and implemented in Collection 4 processing. The main algorithm with the revised Look-Up-Tables generated retrievals for over 80% of the pixels with valid data. Retrievals from the back-up algorithm, although few, should be used with caution as they are generated from surface reflectances with high uncertainties.

**Improving Assimilation of SeaWiFS Data by the Application of Bias Correction with a Local SEIK Filter**

Nerger, Lars; Gregg, Watson W.; [2007]; 27 pp.; In English; Original contains black and white illustrations; Copyright; Avail.: Other Sources

Daily surface chlorophyll concentrations are estimated by assimilating chlorophyll data from the Sea-viewing Wide

Field-of-view Sensor (SeaWiFS) into the NASA Ocean Biogeochemical Model (NOBM). The assimilation is performed by the ensemble-based singular 'evolutive' interpolated Kalman (SEIK) filter, which is simplified here by the use of a static error covariance matrix. The filter operates with a localized filter analysis and is amended by an online bias correction scheme. The performance of the filter algorithm is assessed by comparison with independent in situ data over the 7-year period 1998 - 2004. The root-mean square (RMS) log error, the bias and the correlation coefficient of logarithmic fields are considered for the performance evaluation. The assimilation provides surface chlorophyll concentrations with about 3.3% lower error than SeaWiFS data. While the error is only slightly lower on a global scale, the assimilation shows significantly smaller errors than SeaWiFS data in many of the major oceanic basins. The assimilation estimate exhibits a very small bias of -0.025 log chlorophyll. The correlation with the in situ data is increased by the assimilation from 0.52 for the free-run model to 0.83, which is slightly larger than the correlation of 0.81 of SeaWiFS data.

The validation of moderate-resolution satellite leaf area index (LAI) products such as those operationally generated from the Moderate Resolution Imaging Spectroradiometer (MODIS) sensor data requires reference LAI maps developed from field LAI measurements and fine-resolution satellite data. Errors in field measurements and satellite data determine the accuracy of the reference LAI maps. This paper describes a method by which reference maps of known accuracy can be generated with knowledge of errors in fine-resolution satellite data. The method is demonstrated with data from an international field campaign in a boreal coniferous forest in northern Sweden, and Enhanced Thematic Mapper Plus images. The reference LAI map thus generated is used to assess modifications to the MODIS LAI/fPAR algorithm recently implemented to derive the next generation of the MODIS LAI/fPAR product for this important biome type.

**Combined Radar and Radiometer Analysis of Precipitation Profiles for a Parametric Retrieval Algorithm**

Masunaga, Hirohiko; Kummerow, Christian D.; Journal of Atmospheric and Oceanic Technology; July 2005; Volume 22, Issue 7, pp. 909-929; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NAG5-13694; Copyright; Avail.: Other Sources

A methodology to analyze precipitation profiles using the Tropical Rainfall Measuring Mission (TRMM) Microwave Imager (TMI) and precipitation radar (PR) is proposed. Rainfall profiles are retrieved from PR measurements, defined as the best-fit solution selected from precalculated profiles by cloud-resolving models (CRMs), under explicitly defined assumptions of drop size distribution (DSD) and ice hydrometeor models. The PR path-integrated attenuation (PIA), where available, is further used to adjust DSD in a manner that is similar to the PR operational algorithm. Combined with the TMI-retrieved nonraining geophysical parameters, the three-dimensional structure of the geophysical parameters is obtained across the satellite-observed domains. Microwave brightness temperatures are then computed for a comparison with TMI observations to examine if the radar-retrieved rainfall is consistent in the radiometric measurement space. The inconsistency in microwave brightness temperatures is reduced by iterating the retrieval procedure with updated assumptions of the DSD and ice-density models. The proposed methodology is expected to refine the a priori rain profile database and error models for use by parametric passive microwave algorithms, aimed at the Global Precipitation Measurement (GPM) mission, as well as a future TRMM algorithms.

**3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields**

Wen, Guoyong; Marshak, Alexander; Cahalan, Robert F.; Remer, Lorraine A.; Kleidman, Richard G.; [2007]; 41 pp.; In English; Original contains black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

3D aerosol-cloud interaction is examined by analyzing two images containing cumulus clouds in biomass burning regions in Brazil. The research consists of two parts. The first part focuses on identifying 3D cloud impacts on the reflectance of pixel selected for the MODIS aerosol retrieval based purely on observations. The second part of the research combines the observations with radiative transfer computations to identify key parameters in 3D aerosol-cloud interaction. We found that 3D cloud-induced enhancement depends on optical properties of nearby clouds as well as wavelength. The enhancement is too large to be ignored. Associated biased error in 1D aerosol optical thickness retrieval ranges from 50% to 140% depending on wavelength and optical properties of nearby clouds as well as aerosol optical thickness. We caution the community to be prudent when applying 1D approximations in computing solar radiation in dear regions adjacent to clouds or when using traditional retrieved aerosol optical thickness in aerosol indirect effect research.

**MeV Ion Anisotropies in the Vicinity of Interplanetary Shocks**

Richardson, I. G.; Cane, H. V.; von Rosenvinge, T. T.; May 22, 2007; 1 pp.; In English; American Geophysical Union 2007 Joint Assembly, 22-25 May 2007, Acapulco, Mexico

Contract(s)/Grant(s): NNG06EO90A; Copyright; Avail.: Other Sources; Abstract Only

The anticipated signatures of interplanetary shock acceleration to be found in energetic ion anisotropies in the vicinity of interplanetary shocks include near-isotropic particle distributions consistent with of diffusive shock acceleration, 'pancake' distributions indicative of shock drift acceleration, and flow reversals, suggestive of a particle acceleration region passing by the observing spacecraft. In practice, while clear examples of these phenomena exist, more typically, particle anisotropies near interplanetary shocks show considerable variation in time and space, both in individual events and from event to event. We investigate the properties of MeV/n ions in the vicinity of a number of interplanetary shocks associated with the largest energetic particle events of solar cycle 23, and previous cycles, including their intensity-time profiles, anisotropies, and relationship with local solar wind structures, using observations from the IMP 8, ISEE-3, Helios 1 and 3 spacecraft. The aim is to help to understand the role of shocks in major solar energetic particle events.

**Interplanetary Coronal Mass Ejections During 1996 - 2007**

Richardson, I. G.; Cane, H. V.; May 22, 2007; 1 pp.; In English; American Geophysical Union 2007 Joint Assembly, 22-25 May 2007, Acapulco, Mexico

Contract(s)/Grant(s): NNG06EO90A; Copyright; Avail.: Other Sources; Abstract Only

Interplanetary coronal mass ejections, the interplanetary counterparts of coronal mass ejections at the Sun, are the major drivers of interplanetary shocks in the heliosphere, and are associated with modulations of the galactic cosmic ray intensity, both short term (Forbush decreases caused by the passage of the shock, post-shock sheath, and ICME), and possibly with longer term modulation. Using several in-situ signatures of ICMEs, including plasma temperature, and composition, magnetic

fields, and cosmic ray modulations, made by near-Earth spacecraft, we have compiled a 'comprehensive' list of ICMEs passing the Earth since 1996, encompassing solar cycle 23. We summarize the properties of these ICMEs, such as their occurrence rate, speeds and other parameters, the fraction of ICMEs that are classic magnetic clouds, and their association with solar energetic particle events, halo CMEs, interplanetary shocks, geomagnetic storms, shocks and cosmic ray decreases.

**Airborne Validation of Spatial Properties Measured by the CALIPSO Lidar**

McGill, Matthew J.; Vaughan, Mark A.; Trepte, Charles Reginald; Hart, William D.; Hlavka, Dennis L.; Winker, David M.; Keuhn, Ralph; [2007]; 23 pp.; In English; Original contains black and white illustrations; Copyright; Avail.: CASI: A03, Hardcopy

The primary payload onboard the Cloud-Aerosol Lidar Infrared Pathfinder Satellite Observations (CALIPSO) satellite is a dual-wavelength backscatter lidar designed to provide vertical profiling of clouds and aerosols. Launched in April 2006, the first data from this new satellite was obtained in June 2006. As with any new satellite measurement capability, an immediate post-launch requirement is to verify that the data being acquired is correct lest scientific conclusions begin to be drawn based on flawed data. A standard approach to verifying satellite data is to take a similar, or validation, instrument and fly it onboard a research aircraft. Using an aircraft allows the validation instrument to get directly under the satellite so that both the satellite instrument and the aircraft instrument are sensing the same region of the atmosphere. Although there are almost always some differences in the sampling capabilities of the two instruments, it is nevertheless possible to directly compare the measurements. To validate the measurements from the CALIPSO lidar, a similar instrument, the Cloud Physics Lidar, was flown onboard the NASA high-altitude ER-2 aircraft during July- August 2006. This paper presents results to demonstrate that the CALIPSO lidar is properly calibrated and the CALIPSO Level 1 data products are correct. The importance of the results is to demonstrate to the research community that CALIPSO Level 1 data can be confidently used for scientific research.

**Surface Ruptures and Building Damage of the 2003 Bam, Iran, Earthquake Mapped by Satellite Synthetic Aperture Radar Interferometric Correlation**

Fielding, Eric J.; Talebian, M.; Rosen, P. A.; Nazari, H.; Jackson, J. A.; Ghorashi, M.; Walker, R.; Journal of Geophysical Research; March 4, 2005; ISSN 0148-0227; Volume 110; 15 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40041>; <http://dx.doi.org/10.1029/2004JB003299>

We use the interferometric correlation from Envisat synthetic aperture radar (SAR) images to map the details of the surface ruptures related to the 26 December 2003 earthquake that devastated Bam, Iran. The main strike-slip fault rupture south of the city of Bam has a series of four segments with left steps shown by a narrow line of low correlation in the coseismic interferogram. This also has a clear expression in the field because of the net extension across the fault. Just south of the city limits, the surface strain becomes distributed over a width of about 500 m, probably because of a thicker layer of soft sedimentary material.

Donnellan, Andrea; Parker, Jay; Lyzenga, Greg; Granat, Robert; Fox, Geoffrey; Pierce, Marlon; Rundle, John; McLeod, Dennis; Grant, Lisa; Tullis, Terry; June 22, 2004; 5 pp.; In English; NASA Earth Science Technology Conference, 26 Jun. 2004, Palo Alto, CA, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40002>

In order to develop a solid earth science framework for understanding and studying of active tectonic and earthquake processes, this task develops simulation and analysis tools to study the physics of earthquakes using state-of-the art modeling,

data manipulation, and pattern recognition technologies. We develop clearly defined accessible data formats and code protocols as inputs to the simulations. These are adapted to high-performance computers because the solid earth system is extremely complex and nonlinear resulting in computationally intensive problems with millions of unknowns. With these tools it will be possible to construct the more complex models and simulations necessary to develop hazard assessment systems critical for reducing future losses from major earthquakes.

#### **Statistical Aspects of the North Atlantic Basin Tropical Cyclones: Trends, Natural Variability, and Global Warming**

Wilson, Robert M.; May 2007; 64 pp.; In English; Original contains black and white illustrations

Report No.(s): NASA/TP-2007-214905; M-1185; No Copyright; Avail.: CASI: [A04](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070022846>

Statistical aspects of the North Atlantic basin tropical cyclones for the interval 1945- 2005 are examined, including the variation of the yearly frequency of occurrence for various subgroups of storms (all tropical cyclones, hurricanes, major hurricanes, U.S. landfalling hurricanes, and category 4/5 hurricanes); the yearly variation of the mean latitude and longitude (genesis location) of all tropical cyclones and hurricanes; and the yearly variation of the mean peak wind speeds, lowest pressures, and durations for all tropical cyclones, hurricanes, and major hurricanes. Also examined is the relationship between inferred trends found in the North Atlantic basin tropical cyclonic activity and natural variability and global warming, the latter described using surface air temperatures from the Armagh Observatory Armagh, Northern Ireland. Lastly, a simple statistical technique is employed to ascertain the expected level of North Atlantic basin tropical cyclonic activity for the upcoming 2007 season.

#### **Midweek Increase in U.S. Summer Rain and Storm Heights, Suggests Air Pollution Invigorates Rainstorms**

Bell, Thomas L.; Rosenfeld, Daniel; Kim, Kyu-Myong; Yoo, Jung-Moon; Hahnenberger, Maura; January 2007; 42 pp.; In English; Original contains black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

Tropical Rainfall Measuring Mission (TRMM) satellite data show a significant midweek increase in summertime rainfall over the southeast U.S., due to afternoon intensification. TRMM radar data show a significant midweek increase in rain area and in the heights reached by afternoon storms. Weekly variations in model-reanalysis wind patterns over the region and in rain-gauge data are consistent with the satellite data. A midweek decrease of rainfall over the nearby Atlantic is also seen. EPA measurements of particulate concentrations show a midweek peak over much of the U.S. These observations are consistent with the theory that anthropogenic air pollution suppresses cloud-drop coalescence and early rainout during the growth of thunderstorms over land, allowing more water to be carried above the 0 C isotherm, where freezing yields additional latent heat, invigorating the storms--most dramatically evidenced by the shift in the midweek distribution of afternoon-storm heights--and producing large ice hydrometeors. The enhanced convection induces regional convergence, uplifting and an overall increase of rainfall. Compensating downward air motion suppresses convection over the adjacent ocean areas. Pre-TRMM-era data suggest that the weekly cycle only became strong enough to be detectable beginning in the 1980's. Rain-gauge data also suggest that a weekly cycle may have been detectable in the 1940's, but with peak rainfall on Sunday or Monday, possibly explained by the difference in composition of aerosol pollution at that time. This 'weekend effect' may thus offer climate researchers an opportunity to study the regional climate-scale impact of aerosols on storm development and monsoon-like circulation.

**Using Multi-scale Modeling Systems to Study the Precipitation Processes**

Tao, Wei-Kuo; April 12, 2007; 1 pp.; In English; No Copyright; Avail.: Other Sources; Abstract Only

Numerical cloud models, which are based the non-hydrostatic equations of motion, have been extensively applied to cloud-scale and mesoscale processes during the past four decades. Because cloud-scale dynamics are treated explicitly, uncertainties stemming from convection that have to be parameterized in (hydrostatic) large-scale models are obviated, or at least mitigated, in cloud models. Global models will use the non-hydrostatic framework when their horizontal resolution becomes about 10 km, the theoretical limit for the hydrostatic approximation. This juncture will be reached one to two decades from now. Recently, a multi-scale modeling system with unified physics was developed at NASA Goddard. It consists of (1) a cloud-resolving model (CRM), (2) a regional scale model, (3) a coupled CRM and global model, and (4) a land modeling system. The same microphysical processes, long and short wave radiative transfer processes and the explicit cloud-radiation, and cloudland surface interactive processes are applied in this multi-scale modeling system. In this talk, a review of developments and applications of the multi-scale modeling system will be presented. In particular, the results from using multi-scale modeling system to study the interactions between clouds, precipitation, and aerosols will be presented.

ONLINE: <http://hdl.handle.net/2014/39957>

NASA is currently developing advanced instrument concepts and technologies for future spaceborne atmospheric radars, with an over-arching objective of making such instruments more capable in supporting future science needs and more cost effective. Two such examples are the Second-Generation Precipitation Radar (PR-2) and the Nexrad-In-Space (NIS). PR-2 is a 14/35-GHz dual-frequency rain radar with a deployable 5-meter, wide-swath scanned membrane antenna, a dual-polarized/dual-frequency receiver, and a realtime digital signal processor. It is intended for Low Earth Orbit (LEO) operations to provide greatly enhanced rainfall profile retrieval accuracy while consuming only a fraction of the mass of the current TRMM Precipitation Radar (PR). NIS is designed to be a 35-GHz Geostationary Earth Orbiting (GEO) radar for providing hourly monitoring of the life cycle of hurricanes and tropical storms. It uses a 35-m, spherical, lightweight membrane antenna and Doppler processing to acquire 3-dimensional information on the intensity and vertical motion of hurricane rainfall.

From August 2003 to December 2006, In-Service Evaluations (ISE) of the Turbulence Auto-PIREP System (TAPS) and Enhanced Turbulence (E-Turb) Radar, technologies developed in NASA's Turbulence Prediction and Warning System (TPAWS) element of its Aviation Safety and Security Program (AvSSP), were conducted. NASA and AeroTech Research established an industry team comprising AeroTech, Delta Air Lines, Rockwell Collins, and ARINC to conduct the ISEs. The technologies were installed on Delta aircraft and their effectiveness was evaluated in day-to-day operations. This report documents the establishment and conduct of the ISEs and presents results and feedback from various users.

**The Continuous Intercomparison of Radiation Codes (CIRC): Phase I Cases**

Oreopoulos, Lazaros; Mlawer, Eli; Delamere, Jennifer; Shippert, Timothy; Turner, David D.; Miller, Mark A.; Minnis, Patrick; Clough, Shepard; Barker, Howard; Ellingson, Robert; March 26, 2007; 1 pp.; In English; Original contains color illustrations  
Contract(s)/Grant(s): WBS 188362.02.07.; Copyright; Avail.: CASI: [A01](#), Hardcopy

CIRC aspires to be the successor to ICRCCM (Intercomparison of Radiation Codes in Climate Models). It is envisioned as an evolving and regularly updated reference source for GCM-type radiative transfer (RT) code evaluation with the principle goal to contribute in the improvement of RT parameterizations. CIRC is jointly endorsed by DOE's Atmospheric Radiation Measurement (ARM) program and the GEWEX Radiation Panel (GRP). CIRC's goal is to provide test cases for which GCM RT algorithms should be performing at their best, i.e., well characterized clear-sky and homogeneous, overcast cloudy cases. What distinguishes CIRC from previous intercomparisons is that its pool of cases is based on observed datasets. The bulk of atmospheric and surface input as well as radiative fluxes come from ARM observations as documented in the Broadband Heating Rate Profile (BBHRP) product. BBHRP also provides reference calculations from AER's RRTM RT algorithms that can be used to select the most optimal set of cases and to provide a first-order estimate of our ability to achieve radiative flux closure given the limitations in our knowledge of the atmospheric state.

**Toward a Global Map of Raindrop Size Distributions, Part 1, Rain-Type Classification and Its Implications for Validating Global Rainfall Products**

L'Ecuyer, Tristan S.; Kummerow, Christian; Berg, Wesley; Journal of Hydrometeorology; October 2004; Volume 5, pp. 831-849; In English; Original contains color and black and white illustrations  
Contract(s)/Grant(s): NAG5-13694; NAG5-13637; NAG5-11189; Copyright; Avail.: Other Sources

Variability in the global distribution of precipitation is recognized as a key element in assessing the impact of climate change for life on earth. The response of precipitation to climate forcings is, however, poorly understood because of discrepancies in the magnitude and sign of climatic trends in satellite-based rainfall estimates. Quantifying and ultimately removing these biases is critical for studying the response of the hydrologic cycle to climate change. In addition, estimates of random errors owing to variability in algorithm assumptions on local spatial and temporal scales are critical for establishing how strongly their products should be weighted in data assimilation or model validation applications and for assigning a level of confidence to climate trends diagnosed from the data. This paper explores the potential for refining assumed drop size distributions (DSDs) in global radar rainfall algorithms by establishing a link between satellite observables and information gleaned from regional validation experiments where polarimetric radar, Doppler radar, and disdrometer measurements can be used to infer raindrop size distributions. By virtue of the limited information available in the satellite retrieval framework, the current method deviates from approaches adopted in the ground-based radar community that attempt to relate microphysical processes and resultant DSDs to local meteorological conditions. Instead, the technique exploits the fact that different microphysical pathways for rainfall production are likely to lead to differences in both the DSD of the resulting raindrops and the three-dimensional structure of associated radar reflectivity profiles. Objective rain-type classification based on the complete three-dimensional structure of observed reflectivity profiles is found to partially mitigate random and systematic errors in DSDs implied by differential reflectivity measurements. In particular, it is shown that vertical and horizontal reflectivity structure obtained from spaceborne radar can be used to reproduce significant differences in  $Z(\text{sub dr})$  between the easterly and westerly climate regimes observed in the Tropical Rainfall Measuring Mission Large-scale Biosphere-Atmosphere (TRMM-LBA) field experiment as well as the even larger differences between Amazonian rainfall and that observed in eastern Colorado. As such, the technique offers a potential methodology for placing locally observed DSD information into a global framework.

**Construction and Use of Resting 12-Lead High Fidelity ECG 'SuperScores' in Screening for Heart Disease**

Schlegel, T. T.; Arenare, B.; Greco, E. C.; DePalma, J. L.; Starc, V.; Nunez, T.; Medina, R.; Jugo, D.; Rahman, M.A.; Delgado, R.; September 30, 2007; 1 pp.; In English; Computers in Cardiology 2007, 30 September - 3 October 2007, Durham, NC, USA; Copyright; Avail.: Other Sources; Abstract Only

We investigated the accuracy of several conventional and advanced resting ECG parameters for identifying obstructive coronary artery disease (CAD) and cardiomyopathy (CM). Advanced high-fidelity 12-lead ECG tests (approx. 5-min supine) were first performed on a 'training set' of 99 individuals: 33 with ischemic or dilated CM and low ejection fraction (EF less than 40%); 33 with catheterization-proven obstructive CAD but normal EF; and 33 age-/gender-matched healthy controls. Multiple conventional and advanced ECG parameters were studied for their individual and combined retrospective accuracies in detecting underlying disease, the advanced parameters falling within the following categories: 1) Signal averaged ECG, including 12-lead high frequency QRS (150-250 Hz) plus multiple filtered and unfiltered parameters from the derived Frank leads; 2) 12-lead P, QRS and T-wave morphology via singular value decomposition (SVD) plus signal averaging; 3) Multichannel (12-lead, derived Frank lead, SVD lead) beat-to-beat QT interval variability; 4) Spatial ventricular gradient (and gradient component) variability; and 5) Heart rate variability. Several multiparameter ECG SuperScores were derivable, using stepwise and then generalized additive logistic modeling, that each had 100% retrospective accuracy in detecting underlying CM or CAD. The performance of these same SuperScores was then prospectively evaluated using a test set of another 120 individuals (40 new individuals in each of the CM, CAD and control groups, respectively). All 12-lead ECG SuperScores retrospectively generated for CM continued to perform well in prospectively identifying CM (i.e., areas under the ROC curve greater than 0.95), with one such score (containing just 4 components) maintaining 100% prospective accuracy. SuperScores retrospectively generated for CAD performed somewhat less accurately, with prospective areas under the ROC curve typically in the 0.90-0.95 range. We conclude that resting 12-lead high-fidelity ECG employing and combining the results of several advanced ECG software techniques shows great promise as a rapid and inexpensive tool for screening of heart disease.

**Association between Randall's Plaque and Calcifying Nanoparticles**

Ciftcioglu, Neva; Vejdani, Kaveh; Lee, Olivia; Mathew, Grace; Aho, Katja M.; Kajander, Olavi; McKay, David S.; Jones, Jeff A.; Hayat, Matthew; Stoller, Marshall L.; [2007]; 33 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

Randall's plaques, first described by Alexander Randall in the 1930s, are small subepithelial calcifications in the renal papillae (RP) that also extend deeply into the renal medulla. Despite the strong correlation between the presence of these plaques and the formation of renal stones, the precise origin and pathogenesis of Randall's plaque formation remain elusive. The discovery of calcifying nanoparticles (CNP) and their detection in many calcifying processes of human tissues has raised hypotheses about their possible involvement in renal stone formation. We collected RP and blood samples from 17 human patients who had undergone laparoscopic nephrectomy due to neoplasia. Homogenized RP tissues and serum samples were cultured for CNP. Scanning electron microscopy (SEM) and energy dispersive X-ray spectroscopy (EDS) analysis were performed on fixed RP samples. Immunohistochemical staining (IHS) was applied on the tissue samples using CNP-specific monoclonal antibody (mAb). Randall's plaques were visible on gross inspection in 11 out of 17 collected samples. Cultures of all serum samples and 13 tissue homogenates had CNP growth within 4 weeks. SEM revealed spherical apatite formations in 14 samples, with calcium and phosphate peaks detected by EDS analysis. IHS was positive in 9 out of 17 samples. A strong link was found between the presence of Randall's plaques and the detection of CNP, also referred to as nanobacteria. These results suggest new insights into the etiology of Randall's plaque formation, and will help us understand the pathogenesis of stone formation. Further studies on this topic may lead us to new approaches on early diagnosis and novel medical therapies of kidney stone formation.

**Three-dimensional Model of Tissue and Heavy Ions Effects**

Ponomarev, Artem L.; Sundaresan, Alamelu; Huff, Janice L.; Cucinotta, Francis A.; July 08, 2007; 1 pp.; In English; International Congress of Radiation Research, 8-12 July 2007, San Francisco, CA, USA; Copyright; Avail.: Other Sources; Abstract Only

A three-dimensional tissue model was incorporated into a new Monte Carlo algorithm that simulates passage of heavy ions in a tissue box. The tissue box was given as a realistic model of tissue based on confocal microscopy images. The action of heavy ions on the cellular matrix for 2- or 3-dimensional cases was simulated. Cells were modeled as a cell culture monolayer in one example, where the data were taken directly from microscopy (2-d cell matrix), and as a multi-layer obtained from confocal microscopy (3-d case). Image segmentation was used to identify cells with precise areas/volumes in an irradiated cell culture monolayer, and slices of tissue with many cell layers. The cells were then inserted into the model box of the simulated physical space pixel by pixel. In the case of modeled tissues (3-d), the tissue box had periodic boundary conditions imposed, which extrapolates the technique to macroscopic volumes of tissue. For the real tissue (3-d), specific spatial patterns for cell apoptosis and necrosis are expected. The cell patterns were modeled based on action cross sections for apoptosis and necrosis estimated from current experimental data. A spatial correlation function indicating a higher spatial concentration of damaged cells from heavy ions relative to the low-LET radiation cell damage pattern is presented. The spatial correlation effects among necrotic cells can help studying microlesions in organs, and probable effects of directionality of heavy ion radiation on epithelium and endothelium.

**An Additional Potential Factor for Kidney Stone Formation during Space Flights: Calcifying Nanoparticles (Nanobacteria): A Case Report**

Jones, Jeffrey A.; Ciftcioglu, Neva; Schmid, Joseph; Griffith, Donald; [2007]; 11 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

Spaceflight-induced microgravity appears to be a risk factor for the development of urinary calculi due to skeletal calcium liberation and other undefined factors, resulting in stone disease in crewmembers during and after spaceflight. Calcifying nanoparticles, or nanobacteria, reproduce at a more rapid rate in simulated microgravity conditions and create external shells of calcium phosphate in the form of apatite. The questions arises whether calcifying nanoparticles are niduses for calculi and contribute to the development of clinical stone disease in humans, who possess environmental factors predisposing to the

development of urinary calculi and potentially impaired immunological defenses during spaceflight. A case of a urinary calculus passed from an astronaut post-flight with morphological characteristics of calcifying nanoparticles and staining positive for a calcifying nanoparticle unique antigen, is presented.

#### **Space Environment Effects on Stability of Medications Flown on Space Shuttles and the International Space Station (ISS)**

Daniels, Vernie; Du, Jianping; Crady, Camille; Satterfield, Rick; Putcha, Lakshmi; [2007]; 1 pp.; In English; 2007 ACCP Annual Meeting, 14-17 October 2007, Denver, CO, USA; Copyright; Avail.: Other Sources; Abstract Only

The purpose is to assess physical and chemical degradation of select pharmaceutical formulations from the Shuttle and ISS medical kits. Eleven pharmaceuticals dispensed as different dosage forms were selected based on their physical / chemical characteristics and susceptibility to environmental factors such as, temperature, humidity and light sensitivity. When available, ground-controls of the study medications with matching brand and lot numbers were used for comparison. Samples retrieved from flight were stored along with their matching controls in a temperature and humidity controlled environmental chamber. Temperature, humidity, and radiation data from the Shuttle and ISS were retrieved from onboard HOBO U12 Temp/RH Data Loggers, and from passive dosimeters. Physical and chemical analyses of the pharmaceuticals were conducted using validated USA Pharmacopeia (USP) methods. Results indicated degradation of 6 of the 11 formulations returned from space flights. Four formulations, Amoxicillin / Clavulanate, promethazine, sulfamethoxazole / trimethoprim, and ciprofloxacin tablets depicted discoloration after flight. Chemical content analyses using High or Ultra Performance Liquid Chromatography (HPLC / UPLC) methods revealed that dosage forms of Amoxicillin / Clavulanate, promethazine, sulfamethoxazole / trimethoprim, lidocaine, ciprofloxacin and mupirocin contained less than 95% of manufacturer's labeled claim of active drug compound. Shuttle and ISS environments affect stability and shelf life of certain medications flown on these missions. Data analysis is in progress to examine the effect of specific space flight environmental factors on pharmaceutical stability. The degradation profiles generated from ground studies in analog environments will be useful in establishing predictive shelf-life profiles for medications intended for use during long-term space exploration missions.

#### **First-Generation H1 Antihistamines Found in Pilot Fatalities of Civil Aviation Accidents, 1990-2005**

Sen, Ahmet; Akin, Ahmet; Craft, Kristi J.; Cranfield, Dennis V.; Chaturvedi, Arvind K.; May 2007; 17 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): AM-B-07-TOX-202

Report No.(s): DOT/FAA/AM-07/12; Copyright; Avail.: CASI: [A03](#), Hardcopy

First-generation H1-receptor antagonists are popularly used for alleviating allergy and cold symptoms, but these antihistaminics cause drowsiness and sedation. Such side effects could impair performance and, thus, could be the cause or a factor in accidents. Therefore, the prevalence of these antagonists was evaluated in aviation accident pilot fatalities. During civil aircraft accident investigations, postmortem samples from pilots involved in fatal aviation accidents are submitted to the Civil Aerospace Medical Institute (CAMI) for toxicological analyses. These analytical findings are stored in a database. This CAMI Toxicology Database was examined for the presence of the first-generation antihistamines in pilot fatalities of civil aircraft accidents that occurred during a 16-year (1990-2005) period. Of 5383 fatal aviation accidents from which CAMI received specimens, there were 338 accidents wherein pilot fatalities (cases) were found to contain the antihistaminics brompheniramine, chlorpheniramine, diphenhydramine, doxylamine, pheniramine, phenyltoloxamine, promethazine, and triprolidine. Of the 338 accidents, 304 were general aviation accidents; 175 of the 338 pilots held private pilot airman

certificates. Antihistamines were detected alone in 103 fatalities (1 antihistamine in 94 fatalities and 2 antihistamines in 9), while other drug(s) and/or ethanol were also present in an additional 235 fatalities. Thirty-five of the 338 fatalities had more than 1 antihistamine. The antihistamines were found in approximately 4 and 11% of the fatalities/accidents in 1990 and in 2004, respectively. Although blood was not available for the analyses in all 338 cases, the blood concentrations (ng/mL) were 5-200 (n = 8) for brompheniramine; 4-61 14 (n = 67) for chlorpheniramine; 9-3800 (n = 125) for diphenhydramine; 10- 1309 (n = 33) for doxylamine; and 4 (n = 1) for phenyltoloxamine. The use of antihistamine(s), with/without other drug(s) and/or ethanol, was determined by the National Transportation Safety Board to be the cause in 13 and a factor in 50 of the 338 accidents. The majority of the accidents were of the general aviation category. There was an overall increasing trend in the use of antihistamines by aviators during the 16-year span. Blood levels of the antihistaminics were in the sub-therapeutic to toxic range. Findings from this study will be useful in investigating future accidents involving antihistamines.

### **Evaluating Trauma Sonography for Operational Use in the Microgravity Environment**

Kirkpatrick, Andrew W.; Jones, Jeffrey A.; Sargsyan, Ashot; Hamilton, Douglas; Melton, Shannon; Beck, George; Nicolaou, Savvas; Campbell, Mark; Dulchavsky, Scott; [2007]; 23 pp.; In English; Original contains color illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

Sonography is the only medical imaging modality aboard the ISS, and is likely to remain the leading imaging modality in future human space flight programs. While trauma sonography (TS) has been well recognized for terrestrial trauma settings, the technique had to be evaluated for suitability in space flight prior to adopting it as an operational capability. The authors found the following four-phased evaluative approach applicable to this task: 1) identifying standard or novel terrestrial techniques for potential use in space medicine; 2) developing and testing these techniques with suggested modifications on the ground (1g) either in clinical settings or in animal models, as appropriate; 3) evaluating and refining the techniques in parabolic flight (0g); and 4) validating and implementing for clinical use in space. In Phase I of the TS project, expert opinion and literature review suggested TS to be a potential screening tool for trauma in space. In Phase II, animal models were developed and tested in ground studies, and clinical studies were carried out in collaborating trauma centers. In Phase III, animal models were flight-tested in the NASA KC-135 Reduced Gravity Laboratory. Preliminary results of the first three phases demonstrated potential clinical utility of TS in microgravity. Phase IV studies have begun to address crew training issues, on-board imaging protocols, and data transfer procedures necessary to offer the modified TS technique for space use.

ONLINE: <http://hdl.handle.net/2060/20070023306>

Even after more than thirty years of scientific investigation, serious concerns regarding human physiological effects of long-duration microgravity exposure remain. These include loss of bone mineral density, skeletal muscle atrophy, and orthostatic hypertension, among others. In particular, 'Safe Passage: Astronaut Care for Exploration Missions,' states 'loss of bone density, which apparently occurs at a rate of 1% per month in microgravity, is relatively manageable on the short-duration missions of the space shuttle, but it becomes problematic on the ISS [International Space Station]. ...If this loss is not mitigated, interplanetary missions will be impossible.' While extensive investigations into potential countermeasures are planned on the ISS, the delay in attaining full crew complement and onboard facilities, and the potential for extending crews tours of duty threaten the timely (< 20 years!) accumulation of sufficient data for countermeasures formulation. Indeed, there is no guarantee that even with the data, a practical or sufficiently robust set of countermeasures will be forthcoming. Providing an artificial gravity (AG) environment by crew centrifugation aboard deep-space human exploration vehicles, long a staple technique of science fiction, has received surprisingly limited engineering assessment. This is most likely due to a number of factors: the lack of definitive design requirements, especially acceptable artificial gravity levels and rotation rates, the perception of high vehicle mass and performance penalties, the incompatibility of resulting vehicle configurations with space propulsion options (i.e., aerocapture), the perception of complications associated with de-spun components such as antennae and photovoltaic arrays, and the expectation of effective crew micro-gravity countermeasures. These perception and concerns may have been overstated, or may be acceptable alternatives to countermeasures of limited efficacy. This study was undertaken as an initial step to try to understand the implications of and potential solutions to incorporating artificial gravity in the design of human deep-space exploration vehicles. Of prime interest will be the mass penalties incurred by incorporating AG, along with any mission performance degradation.

**Usability Study of Two Collocated Prototype System Displays**

Trujillo, Anna C.; July 2007; 33 pp.; In English; Original contains black and white illustrations

Report No.(s): NASA/TM-2007-214884; L-19326; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023641>

Currently, most of the displays in control rooms can be categorized as status screens, alerts/procedures screens (or paper), or control screens (where the state of a component is changed by the operator). The primary focus of this line of research is to determine which pieces of information (status, alerts/procedures, and control) should be collocated. Two collocated displays were tested for ease of understanding in an automated desktop survey. This usability study was conducted as a prelude to a larger human-in-the-loop experiment in order to verify that the 2 new collocated displays were easy to learn and usable. The results indicate that while the DC display was preferred and yielded better performance than the MDO display, both collocated displays can be easily learned and used.

Experimental work on the Miniature Mass Spectrometer (MMS) at JPL has resulted in a 'table top' configuration with a CCD detector that has demonstrated a detection limit of 50 parts per billion. The CCD detector operates at ambient temperature. Intelligent Ion, Inc., a commercial instrument developer, has taken out a license on the JPL technology and has built a prototype using a Faraday Cup Array detector as a placeholder detector. The prototype instrument was tested at

Kennedy Space Center and demonstrated detection limits in the parts per million range. The test results are presented as well as detailed photographs of the prototype instrument. A presentation of the MMS was made to an expert review panel for 'On-Board Environmental Monitoring Systems for the International Space Station (ISS).' The scores obtained by the MMS system are presented. The prototype instrument will be retro fitted with a CCD array detector in August 2004 and will again be tested at KSC. The instrument is expected to show a detection level for hydrazines of 10 ppb and a detection level for solvents below 10 ppb. The expectations are based on raw data from the first batch of CCD's that was tested.

**Deductive Glue Code Synthesis for Embedded Software Systems Based on Code Patterns**

Liu, Jian; Fu, Jicheng; Zhang, Yansheng; Bastani, Farokh; Yen, I-Ling; Tai, Ann; Chau, Savio N.; June 14, 2006; 8 pp.; In English; ACM Sig Plan/Sig Bed Conference on Languages, Compilers, and Tools for Embedded System, 14 Jun. 2006, Ottawa, Canada; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40116>

Automated code synthesis is a constructive process that can be used to generate programs from specifications. It can, thus, greatly reduce the software development cost and time. The use of formal code synthesis approach for software generation further increases the dependability of the system. Though code synthesis has many potential benefits, the synthesis techniques are still limited. Meanwhile, components are widely used in embedded system development. Applying code synthesis to component based software development (CBSB) process can greatly enhance the capability of code synthesis while reducing the component composition efforts. In this paper, we discuss the issues and techniques for applying deductive code synthesis techniques to CBSB. For deductive synthesis in CBSB, a rule base is the key for inferring appropriate component composition. We use the code patterns to guide the development of rules. Code patterns have been proposed to capture the typical usages of the components. Several general composition operations have been identified to facilitate systematic composition. We present the technique for rule development and automated generation of new patterns from existing code patterns. A case study of using this method in building a real-time control system is also presented.

ONLINE: <http://hdl.handle.net/2060/20070023420>

A stream of raw data is compressed prior to transmissio in a communication channel by a system which includes modules for choosing a current segment of the raw data stream for processing and defining a set of operators for representing data segments by a mathematical operation and parameters thereof. The system performs a competitive evaluation of different tools comprising different combinations of one or more of the operators and the parameters threrof with respect to the current data segment in order to determine relative abilities among the different tools to reduce the number of bits required to represent the current data segment. The system then selects a tool and a set of parameters thereof found in the competitive evaluation to have a superior ability relative to others of the different tools to reduce a number of bits required to represent the current data segment.

**Ensemble Weight Enumerators for Protograph LDPC Codes**

Divsalar, Dariush; July 9, 2006; 5 pp.; In English; IEEE International Symposium on Information Theory, 9-14 Jul. 2006, Seattle, WA, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40117>

Recently LDPC codes with projected graph, or protograph structures have been proposed. In this paper, finite length ensemble weight enumerators for LDPC codes with protograph structures are obtained. Asymptotic results are derived as the block size goes to infinity. In particular we are interested in obtaining ensemble average weight enumerators for protograph LDPC codes which have minimum distance that grows linearly with block size. As with irregular ensembles, linear minimum distance property is sensitive to the proportion of degree-2 variable nodes. In this paper the derived results on ensemble weight enumerators show that linear minimum distance condition on degree distribution of unstructured irregular LDPC codes is a sufficient but not a necessary condition for protograph LDPC codes.

Using a simulated environment the hypothesis was tested that dismounted units would be able to operate more effectively when they have rich and up-to-date information available. A virtual gaming environment and a simulated Soldier Digital Assistant (SDA) were developed to this end. The results show that soldiers using the simulated SDA could navigate faster through unknown terrain, experience more efficiency and have a higher situational awareness then soldiers without the SDA. The lessons learned on using virtual game environments for research are discussed.

This paper describes experiments that quantify the improvement that autonomous behaviors enable in the amount of user interaction required to navigate a robot in urban environments. Many papers have discussed various ways to measure the absolute level of autonomy of a system; we measured the relative improvement of autonomous behaviors over teleoperation across multiple traverses of the same course. We performed four runs each on an 'easy' course and a 'hard' course, where half the runs were teleoperated and half used more autonomous behaviors. Statistics show 40-70% reductions in the amount of time the user interacts with the control station; however, with the behaviors tested, user attention remained on the control station even when he was not interacting. Reducing the need for attention will require better obstacle detection and avoidance and better absolute position estimation.

The space transportation systems required to support NASA's Exploration Initiative will demand a high degree of reliability to ensure mission success. This reliability can be realized through autonomous fault/damage detection and repair capabilities. It is crucial that such capabilities are incorporated into these systems since it will be impractical to rely upon Extra-Vehicular Activity (EVA), visual inspection or tele-operation due to the costly, labor-intensive and time-consuming nature of these methods. One approach to achieving this capability is through the use of an autonomous inspection system comprised of miniature mobile sensor platforms that will cooperatively perform high confidence inspection of space vehicles and habitats. This paper will discuss the efforts to develop a small scale demonstration test-bed to investigate the feasibility of using autonomous mobile sensor platforms to perform inspection operations. Progress will be discussed in technology areas

including: the hardware implementation and demonstration of robotic sensor platforms, the implementation of a hardware test-bed facility, and the investigation of collaborative control algorithms.

Method and system for generating an elliptic grid in generalized coordinates in two or three dimensions, where one or more decay parameters near a boundary segment of a grid are determined as part of the grid solution, rather than being prescribed initially by a user. The decay parameters may vary with one or more generalized coordinates and determine the rate(s) at which separation distances between adjacent grid lines change as one moves toward or away from a grid boundary segment.

Hardcopy

The Orion capsule vehicle will have a Lift-to-Drag ratio (L/D) of 0.3-0.35. For an Apollo-like direct entry into the Earth's atmosphere from a lunar return trajectory, this L/D will give the vehicle a maximum range of about 2500 nm and a maximum crossrange of 216 nm. In order to y longer ranges, the vehicle lift must be used to loft the trajectory such that the aerodynamic forces are decreased. A Skip-Trajectory results if the vehicle leaves the sensible atmosphere and a second entry occurs downrange of the atmospheric exit point. The Orion capsule is required to have landing site access (either on land or in water) inside the Continental USA (CONUS) for lunar returns anytime during the lunar month. This requirement means the vehicle must be capable of flying ranges of at least 5500 nm. For the L/D of the vehicle, this is only possible with the use of a guided Skip-Trajectory. A skip entry guidance algorithm is necessary to achieve this requirement. Two skip entry guidance algorithms have been developed: the Numerical Skip Entry Guidance (NSEG) algorithm was developed at NASA/JSC and PredGuid was developed at Draper Laboratory. A comparison of these two algorithms will be presented in this paper. Each algorithm has been implemented in a high-fidelity, 6 degree-of-freedom simulation called the Advanced NASA Technology Architecture for Exploration Studies (ANTARES). NASA and Draper engineers have completed several monte carlo analyses in order to compare the performance of each algorithm in various stress states. Each algorithm has been tested for entry-to-target ranges to include direct entries and skip entries of varying length. Dispersions have been included on the initial entry interface state, vehicle mass properties, vehicle aerodynamics, atmosphere, and Reaction Control System (RCS). Performance criteria include miss distance to the target, RCS fuel usage, maximum g-loads and heat rates for the first and second entry, total heat load, and control system saturation. The comparison of the performance criteria has led to a down select and guidance merger that will take the best ideas from each algorithm to create one skip entry guidance algorithm for the Orion vehicle.

### **Numerical Simulation of Two-grid Ion Optics Using a 3D Code**

Anderson, John R.; Katz, Ira; Goebel, Dan; July 11, 2004; 14 pp.; In English; 40th AIAA Joint Propulsion Conference, 12-14 Jul. 2004, Fort Lauderdale, FL, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources  
ONLINE: <http://hdl.handle.net/2014/40012>

A three-dimensional ion optics code has been developed under NASA's Project Prometheus to model two grid ion optics systems. The code computes the flow of positive ions from the discharge chamber through the ion optics and into the beam downstream of the thruster. The rate at which beam ions interact with background neutral gas to form charge exchange ions is also computed. Charge exchange ion trajectories are computed to determine where they strike the ion optics grid surfaces and to determine the extent of sputter erosion they cause. The code has been used to compute predictions of the erosion pattern and wear rate on the NSTAR ion optics system; the code predicts the shape of the eroded pattern but overestimates the initial wear rate by about 50%. An example of use of the code to estimate the NEXIS thruster accelerator grid life is also presented.

### **JMR Noise Diode Stability and Recalibration Methodology after Three Years On-Orbit**

Brown, Shannon; Desai, Shailen; Keihm, Stephen; Ruf, Christopher; February 28, 2006; 9 pp.; In English; IEEE Microrad 2006, 28 Feb. - 3 Mar. 2006, San Juan, Puerto Rico; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40119>

The Jason Microwave Radiometer (JMR) is included on the Jason-1 ocean altimeter satellite to measure the wet tropospheric path delay (PD) experienced by the radar altimeter signal. JMR is nadir pointing and measures the radiometric brightness temperature ( $T_{sub B}$ ) at 18.7, 23.8 and 34.0 GHz. JMR is a Dicke radiometer and it is the first radiometer to be flown in space that uses noise diodes for calibration. Therefore, monitoring the long term stability of the noise diodes is essential. Each channel has three redundant noise diodes which are individually coupled into the antenna signal to provide an estimate of the gain. Two significant jumps in the JMR path delays, relative to ground truth, were observed around 300 and 700 days into the mission. Slow drifts in the retrieved products were also evident over the entire mission. During a recalibration effort, it was determined that a single set of calibration coefficients was not able to remove the calibration jumps and drifts, suggesting that there was a change in the hardware and time dependent coefficients would be required. To facilitate the derivation of time dependent coefficients, an optimal estimation based calibration system was developed which iteratively determines that set of calibration coefficients which minimize the RMS difference between the JMR TBs and on-Earth hot and cold absolute references. This optimal calibration algorithm was used to fine tune the front end path loss coefficients and derive a time series of the JMR noise diode brightness temperatures for each of the nine diodes. Jumps and drifts, on the order of 1% to 2%, are observed among the noise diodes in the first three years on-orbit.

ONLINE: <http://hdl.handle.net/2060/20070023426>

A vertically-coupled whispering gallery mode (WGM) resonator optical waveguide, a method of reducing a group velocity of light, and a method of making a waveguide are provided. The vertically-coupled WGM waveguide comprises a cylindrical rod portion having a round cross-section and an outer surface. First and second ring-shaped resonators are formed on the outer surface of the cylindrical rod portion and are spaced from each other along a longitudinal direction of the cylindrical rod. The first and second ringshaped resonators are capable of being coupled to each other by way an evanescent field formed in an interior of the cylindrical rod portion.

### **An Integrated Optimal Estimation Approach to Spitzer Space Telescope Focal Plane Survey**

Bayard, David S.; Kang, Bryan H.; Brugarolas, Paul B.; Boussalis, D.; June 21, 2004; 12 pp.; In English; SPIE Astronomical Telescopes and Instrumentation, 21-25 June 2004, Glasgow, UK; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/39942>

This paper discusses an accurate and efficient method for focal plane survey that was used for the Spitzer Space Telescope. The approach is based on using a high-order 37-state Instrument Pointing Frame (IPF) Kalman filter that combines both engineering parameters and science parameters into a single filter formulation. In this approach, engineering parameters such as pointing alignments, thermomechanical drift and gyro drifts are estimated along with science parameters such as plate scales and optical distortions. This integrated approach has many advantages compared to estimating the engineering and science parameters separately. The resulting focal plane survey approach is applicable to a diverse range of science instruments such as imaging cameras, spectroscopy slits, and scanning-type arrays alike. The paper will summarize results from applying the IPF Kalman Filter to calibrating the Spitzer Space Telescope focal plane, containing the MIPS, IRAC, and the IRS science Instrument arrays.

### **Experimentally Determined Plasma Parameters in a 30 cm Ion Engine**

Sengupta, Anita; Goebel, Dan; Fitzgerald, Dennis; Owens, Al; Tynan, George; Dorner, Russ; July 11, 2004; 23 pp.; In English; 40th AIAA/ASME/SAE/ASEE Joint Propulsion Conference, 11-14 Jul. 2004, Fort Lauderdale, FL, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40016>

Single planar Langmuir probes and fiber optic probes are used to concurrently measure the plasma properties and neutral density variation in a 30cm diameter ion engine discharge chamber, from the immediate vicinity of the keeper to the near grid plasma region. The fiber optic probe consists of a collimated optical fiber recessed into a double bore ceramic tube fitted with

a stainless steel light-limiting window. The optical fiber probe is used to measure the emission intensity of excited neutral xenon for a small volume of plasma, at various radial and axial locations. The single Langmuir probes, are used to generate current-voltage characteristics at a total of 140 spatial locations inside the discharge chamber. Assuming a Maxwellian distribution for the electron population, the Langmuir probe traces provide spatially resolved measurements of plasma potential, electron temperature, and plasma density. Data reduction for the NSTAR TH8 and TH15 throttle points indicates an electron temperature range of 1 to 7.9 eV and an electron density range of  $4 \times 10^{10}$  to  $1 \times 10^{13}$  cm<sup>-3</sup>, throughout the discharge chamber, consistent with the results in the literature. Plasma potential estimates, computed from the first derivative of the probe characteristic, indicate potential from 0.5V to 11V above the discharge voltage along the thruster centerline. These values are believed to be excessively high due to the sampling of the primary electron population along the thruster centerline. Relative neutral density profiles are also obtained with a fiber optic probe sampling photon flux from the 823.1 nm excited to ground state transition. Plasma parameter measurements and neutral density profiles will be presented as a function of probe location and engine discharge conditions. A discussion of the measured electron energy distribution function will also be presented, with regards to variation from pure Maxwellian. It has been found that there is a distinct primary population found along the thruster centerline, which causes estimates of electron temperature, electron density, and plasma potential, to err on the high side, due to this energetic population. Computation of the energy distribution function of the plasma clearly indicates the presence of primaries, whose presence become less obvious with radial distance from the main discharge plume.

#### **Discharge Chamber Performance of the NEXIS Ion Thruster**

Goebel, Dan M.; Polk, James; Sengupta, Anita; FROM; July 12, 2004; 11 pp.; In English; 40th AIAA/ASME/SAE/ASEE Joint Propulsion Conference, 11-14 Jul. 2004, Fort Lauderdale, FL, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/39985>

The Nuclear-Electric Xenon Ion System (NEXIS) thruster was designed to produce greater than or equal to 70% efficiency at ISPs in excess of 6500 sec and total power levels in excess of 15 kW. In order to achieve this performance, the thruster requires a large area plasma generator capable of high propellant utilization efficiency and low discharge loss while producing a very flat, uniform beam profile. Fortunately, larger thrusters can be made more uniform and efficient due to the higher volume to surface ratio, provided that the magnetic cusp confinement is designed properly and the thruster length to diameter ratio is adequate. This paper describes the discharge chamber performance of the NEXIS Laboratory Model (LM) thruster. The LM discharge chamber is 65 cm in diameter at the grid plane and uses 6 ring-cusps to provide magnetic confinement of the plasma. The thruster was tested with flat carbon-carbon composite grids with the hole pattern masked to 57 cm in diameter and a conventional Type-B '1/2' diameter hollow cathode. During the preliminary 'discharge only' tests, the LM thruster demonstrated profile factors of 0.84 and a discharge loss of about 160 eV/ion at 25 V discharge voltage and over 90% propellant utilization efficiency in simulated beam extraction experiments at 3.9 A of beam current. Analysis of the data from these tests used the discharge-only model developed by Brophy. Subsequent beam extraction experiments validated the key variables used in the model to predict the performance from the discharge-only data, and demonstrated 3.9 A of beam current at over 90% propellant utilization efficiency with a flatness parameter of better than 0.8 and a discharge loss of about 185 eV/ion. The slightly higher discharge loss measured during beam extractions was found to be due to a lower screen transparency in the as-manufactured LM grid set. Plasma measurements with a scanning probe internal to the thruster near the screen grid showed plasma densities over  $1 \times 10^{11}$  per cubic centimeter and electron temperatures of 3.5 to 5.5 eV depending on the operation parameters. The performance of the NEXIS discharge chamber contributed to the over 78% thruster efficiency measured during beam extraction at 7500 sec ISP and 25 kW of power, and over 81% thruster efficiency measured at 8500 sec ISP.

#### **Chaotic Motion of Relativistic Electrons Driven by Whistler Waves**

Khazanov, G. V.; Telnikhin, A. A.; Kronberg, Tatiana K.; January 16, 2007; 26 pp.; In English; To appear in Plasma Physics and Controlled Fusion; Original contains black and white illustrations; Copyright; Avail.: CASI: A03, Hardcopy

Canonical equations governing an electron motion in electromagnetic field of the whistler mode waves propagating along the direction of an ambient magnetic field are derived. The physical processes on which the equations of motion are based are

identified. It is shown that relativistic electrons interacting with these fields demonstrate chaotic motion, which is accompanied by the particle stochastic heating and significant pitch angle diffusion. Evolution of distribution functions is described by the Fokker-Planck-Kolmogorov equations. It is shown that the whistler mode waves could provide a viable mechanism for stochastic energization of electrons with energies up to 50 MeV in the Jovian magnetosphere.

We examine zero-magnetic-field spin-dependent transmission in nonmagnetic semiconductor heterostructures with structural inversion asymmetry (SIA) and bulk inversion asymmetry (BIA), and report spin devices concepts that exploit their properties. Our modeling results show that several design strategies could be used to achieve high spin filtering efficiencies. The current spin polarization of these devices is electrically controllable, and potentially amenable to highspeed spin modulation, and could be integrated in optoelectronic devices for added functionality.

**20070022795** General Accounting Office, Washington, DC, USA

#### **Polar-Orbiting Operational Environmental Satellites: Restructuring Is Under Way, but Technical Challenges and Risks Remain**

April 2007; 63 pp.; In English; Original contains color and black and white illustrations

Report No.(s): GAO-07-498; No Copyright; Avail.: CASI: [A04](#), Hardcopy

The National Polar-orbiting Operational Environmental Satellite System (NPOESS) is a tri-agency acquisition managed by the Departments of Commerce and Defense and the National Aeronautics and Space Administration which experienced escalating costs, schedule delays, and technical difficulties. These factors led to a June 2006 decision to restructure the program thereby decreasing the program's complexity, increasing its estimated cost to \$12.5 billion, and delaying the first two satellites

by 3 to 5 years. GAO was asked to (1) assess progress in restructuring the acquisition, (2) evaluate progress in establishing an effective management structure, (3) assess the reliability of the cost and schedule estimate, and (4) identify the status and key risks facing the program's major segments. To do so, GAO analyzed program and contractor data, attended program reviews, and interviewed program officials. GAO recommends that the appropriate executives approve key acquisition documents, the Secretary of Defense delay reassigning the Program Executive, and the Secretary of Commerce ensure that program authorities identify and address staffing needs. Agency officials agreed with all of the recommendations except delaying the Program Executive's reassignment. GAO believes that proceeding with this reassignment would increase program risks.

**Operational Use of the Air Traffic Selection and Training Battery**

King, Raymond E.; Manning, Carol A.; Drechsler, Gena K.; May 2007; 11 pp.; In English

Contract(s)/Grant(s): AM-HRR-523

Report No.(s): DOT/FAA/AM-07/14; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The Federal Aviation Administration (FAA) is commencing a massive hiring of air traffic control specialists using a new selection procedure, the Air Traffic Selection and Training (AT-SAT) computerized test battery. Before AT-SAT could be used for hiring purposes, however, the issue of its potential for adverse impact (potential unfair discrimination) had to be addressed. A previous project reweighted the subtests and adjusted the overall constant to mitigate potential group differences that could result in adverse impact, without unduly compromising validity. A subsequent study used research participants and found that this effort appeared to have achieved its goal of mitigating group differences that could result in adverse impact. The present study endeavors to: 1) describe how AT-SAT functions as an operational selection method with respect to the several applicant pools, and 2) determine how the reweighting effort fares with actual applicants in the goal of reducing/eliminating group differences that could result in adverse impact. Of the 854 applicants who have taken AT-SAT as part of a job application process (rather than as according to a research protocol), 219 applicants (25.64%) voluntarily disclosed their race; gender was known for 253 (29.63%). The results suggest that the reweighting effort is paying dividends as group differences that could result in adverse impact are not in evidence. While the initial numbers reported here are relatively small, the issue of group differences that could result in adverse impact will be continually monitored. Longitudinal validation, comparing AT-SAT results to training and on-the-job performance, is a research priority due to concerns about the overall passing rate of 93.33%, which is higher than the expected passing rate of 67%.

**Far-ultraviolet Spectroscopy of O+o Binaries in the Magellanic Clouds**

Sonneborn, George; Iping, R. C.; Gies, D.; Vander Hucht, K.; Kaper, L.; May 27, 2007; 1 pp.; In English; American Astronomical Society 210th Meeting, 27-31 May 2007, Honolulu, HI, USA; Copyright; Avail.: Other Sources; Abstract Only

We report FUSE observations in 2006 of three O-type, double-lined spectroscopic binaries in the Magellanic Clouds. Their binary nature was discovered only in the past several years. The systems have very short periods (1.4 - 2.25 days), represent rare, young evolutionary stages of massive stars and binaries, and provide a unique glimpse at some of the most massive systems that form in dense clusters of massive stars. The systems are: LH54-425 in the LMC (O3III<sub>f</sub> + O6V, P=2.25 days, approx. 100+50 Mo), J053441-693139 in the LMC (O2-3I<sub>f</sub> + O6V, P=1.4 days, 41+27 Mo), and Hodge 53-47 in the SMC (O6V + O4-5III<sub>f</sub>, P=2.2 days, 24+14 Mo, where the O4 star appears to be less massive than the O6 star). These represent some of the most massive binaries known. Their short periods indicates that wind interaction and mass transfer are likely important factors in their evolution. The spectra provide quantitative and systematic studies of phase-dependent stellar wind properties, wind collision effects in O+O binaries at lower metallicities, improved radial velocity curves, and FUV spectrophotometric changes as a function of orbital phase.

The James Webb Space Telescope (JWST) is a large, infrared-optimized space telescope scheduled for launch in 2013. JWST will find the first stars and galaxies that formed in the early universe, connecting the Big Bang to our own Milky Way galaxy. JWST will peer through dusty clouds to see stars forming planetary systems, connecting the Milky Way to our own Solar System. JWST's instruments are designed to work primarily in the infrared range of 1 - 28 microns, with some capability in the visible range. JWST will have a large mirror, 6.5 meters in diameter, and will be diffraction-limited at 2 microns (0.1 arcsec resolution). JWST will be placed in an L2 orbit about 1.5 million km from the Earth. The instruments will provide imaging, coronagraphy, and multi-object and integral-field spectroscopy across the full 1 - 28 micron wavelength range. The breakthrough capabilities of JWST will enable new studies of massive star winds from the Milky Way to the early universe.

**Co/Ni Ratio Between Is Approximately 0.35 - 8.0 GeV/nucleon from the TIGER-2001 Flight**

deNolfo, G. A.; Barbier, L. M.; Binns, W. R.; Cummings, J. R.; Geier, S.; Israel, M. N.; Link, J. T.; Mewaldt, R. A.; Mitchell, J. W.; Rauch, B. F.; Schindler, S. M.; Scott, L. M.; Stone, E. C.; Streitmatter, R. E.; Waddington, C. J.; July 03, 2007; 1 pp.; In English; International Cosmic Ray Conference, 3-11 July 2007, Merida, Yucatan, Mexico

Contract(s)/Grant(s): NNG06EO90A; Copyright; Avail.: Other Sources; Abstract Only

The Trans-Iron Galactic Element Recorder (TIGER) was launched in December 2001 and 2003 from McMurdo, Antarctica and was designed to observe elements ranging from  $14 < Z < 40$  over an extended energy range. Observations of radioactive isotopes produced during explosive nucleosynthesis such as Ni-59 that decay only through electron capture provide important constraints on the delay between nucleosynthesis and the acceleration of galactic cosmic rays (GCRs). The isotopes of Co and Ni at low energies, in particular, the observations of the Ni-59 and Co-59 from the Cosmic Ray Isotope Spectrometer (CRIS) on the Advanced Composition Explorer, indicate a significant time delay (greater than  $7.6 \times 10^4$  yr) between GCR nucleosynthesis and acceleration. While TIGER is not able to resolve isotopes, observations of the elemental abundances of Co and Ni at high energies further constrain models for the acceleration and propagation of GCRs. The 2001 & 2003 flights of TIGER lasted a total of approx. 50 days and collected sufficient statistics to study the Co/Ni elemental ratio over a wide range in energies. We present the elemental ratio of Co/Ni in galactic cosmic rays between approx. 0.8- 5.0 GeV/nucleon and compare these results with previous measurements and models for cosmic-ray propagation.

V.; Oglione, R.; Stone, E. C.; Von Rosenvinge, T. T.; Wiedenback, M. E.; July 03, 2007; 1 pp.; In English; International Cosmic Ray Conference, 3-11 July 2007, Merida, Yucatan, Mexico

Contract(s)/Grant(s): NNG06EO90A; Copyright; Avail.: Other Sources; Abstract Only

Observations of cosmic-ray helium energy spectra provide important constraints on cosmic ray origin and propagation. However, helium intensities measured at Earth are affected by solar modulation, especially below several GeV/nucleon. Observations of helium intensities over a solar cycle are important for understanding how solar modulation affects galactic cosmic ray intensities and for separating the contributions of anomalous and galactic cosmic rays. The Cosmic Ray Isotope Spectrometer (CRIS) on ACE has been measuring cosmic ray isotopes, including helium, since 1997 with high statistical precision. We present helium elemental intensities between approx. 10 to approx. 100 MeV/nucleon from the Solar Isotope Spectrometer (SIS) and CRIS observations over a solar cycle and compare these results with the observations from other satellite and balloon-borne instruments, and with GCR transport and solar modulation models.

**Determination of Black Hole Mass in Cyg X-1 by Scaling of Spectral Index-QPO Frequency Correlation**

Shaposhnikov, Nikolai; Titarchuk, Lev; [2007]; 14 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NNG06EO90A; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023323>

It is well established that timing and spectral properties of Galactic Black Hole (BH) X-ray binaries (XRB) are strongly correlated. In particular, it has been shown that low frequency Quasi-Periodic Oscillation (QPO)  $\nu$ (sub low) - photon index GAMMA correlation curves have a specific pattern. In a number of the sources studied the shape of the index-low frequency QPO correlations are self-similar with a position offset in the  $\nu$ (sub low) - GAMMA plane determined by a BH mass  $M$ (sub BH). Specifically, Titarchuk & Fiorito (2004) gave strong theoretical and observational arguments that the QPO frequency values in this  $\nu$ (sub low) - GAMMA correlation should be inversely proportional to  $M$ (sub BH). A simple translation of the correlation for a given source along frequency axis leads to the observed correlation for another source. As a result of this translation one can obtain a scaling factor which is simply a BH mass ratio for these particular sources. This property of the correlations offers a fundamentally new method for BH mass determination in XRBs. Here we use the observed QPO-index correlations observed in three BH sources: GRO J1655-40, GRS 1915+105 and Cyg X-1. The BH mass of (6.3 plus or minus

0.5) solar mass in GRO J1655-40 is obtained using optical observations. RXTE observations during the recent 2005 outburst yielded sufficient data to establish the correlation pattern during both rise and decay of the event. We use GRO J1655-40 as a standard reference source to measure the BH mass in Cyg X-1. We also revisit the GRS 1915+105 data as a further test of our scaling method. We obtain the BH mass in Cyg X-1 in the range 7.6-9.9.

**Cosmic Ray Electron Science with GLAST**

Ormes, J. F.; Moiseev, Alexander; [2007]; 2 pp.; In English; Original contains black and white illustrations; Copyright; Avail.: CASI: [A01](#), Hardcopy

Cosmic ray electrons at high energy carry information about their sources, their definition in local magnetic fields and their interactions with the photon fields through which they travel. The spectrum of the particles is affected by inverse Compton losses and synchrotron losses, the rates of which are proportional to the square of the particle's energy making the spectra very steep. However, GLAST will be able to make unique and very high statistics measurements of electrons from approx. 20 to approx. 700 GeV that will allow us to search for anisotropies in any direction and spectral features associated with some dark matter candidates. Complementary information on electrons of still higher energy will be required to see effects of possible individual cosmic ray sources.

**Recoiling from a Kick in the Head-On Case**

Choi, Dae-II; Kelly, Bernard J.; Boggs, William D.; Baker, John G.; Centrella, Joan; Van Meter, James; [2007]; 10 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): O5-BEFS-05-0044; Copyright; Avail.: CASI: [A02](#), Hardcopy

Recoil 'kicks' induced by gravitational radiation are expected in the inspiral and merger of black holes. Recently the numerical relativity community has begun to measure the significant kicks found when both unequal masses and spins are considered. Because understanding the cause and magnitude of each component of this kick may be complicated in inspiral simulations, we consider these effects in the context of a simple test problem. We study recoils from collisions of binaries with initially head-on trajectories, starting with the simplest case of equal masses with no spin; adding spin and varying the mass ratio, both separately and jointly. We find spin-induced recoils to be significant even in head-on configurations. Additionally, it appears that the scaling of transverse kicks with spins is consistent with post-Newtonian (PN) theory, even though the kick is generated in the nonlinear merger interaction, where PN theory should not apply. This suggests that a simple heuristic description might be effective in the estimation of spin-kicks.

**The Suzaku Observation of the Nucleus of the Radio Loud Active Galaxy Centaurus A: Constraints on Abundances in the Accreting Material**

Markowitz, A.; Takahashi, T.A.; Watanabe, S.; Nakazawa, K.; Fukazawa, Y.; Kokubun, M.; Makishima, K.; Awaki, H.; Bamba, A.; Isobe, N.; Kataoka, J.; Madejski, G.; Mushotzky, R.; Okajima, T.; Ptak, A.; Reeves, J. N.; Ueda, Y.; Yamasaki, T.; Yaqoob, T.; [2007]; 17 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NNG06EO90A; Copyright; Avail.: CASI: [A03](#), Hardcopy

A Suzaku observation of the nucleus of the radio-loud AGN Centaurus A in 2005 has yielded a broadband spectrum spanning 0.3 to 250 keV. The hard X-rays are fit by two power laws, absorbed by columns of  $1.5$  and  $7 \times 10^{23}$  per square centimeter. The dual power-laws are consistent with previous suggestions that the powerlaw components are X-ray emission from the sub-pc VLBI jet and from Bondi accretion at the core, or are consistent with a partial covering interpretation. The soft band is dominated by thermal emission from the diffuse plasma and is fit well by a two-temperature VAPEC model, plus a third power-law component to account for scattered nuclear emission, kpc-scale jet emission, and emission from X-ray Binaries and other point sources. Narrow fluorescent emission lines from Fe, Si, S, Ar, Ca and Ni are detected. The width of

the Fe K $\alpha$  line yields a 200 light-day lower limit on the distance from the black hole to the line-emitting gas. K-shell absorption edges due to Fe, Ca, and S are detected. Elemental abundances are constrained via the fluorescent lines strengths, absorption edge depths and the diffuse plasma emission lines. The high metallicity ([Fe/H]=+0.1) of the circumnuclear material compared to that in the metal-poor outer halo suggests that the accreting material could not have originated in the outer halo unless enrichment by local star formation has occurred. Relative abundances are consistent with enrichment from Type II and Ia supernovae.

**The Diffuse X-ray Background, from Earth's Exosphere to the Edge of the Universe: Or, One Astronomer's Signal is Another Astronomer's Contamination**

Snowden, Steve; April 24, 2007; 1 pp.; In English; No Copyright; Avail.: Other Sources; Abstract Only

The 'X-ray background' means various things to various people. It's origin is comprised of emission from objects as close as Earth's exosphere to as far away as the most distant clusters of galaxies. It is comprised of the emission of truly diffusely distributed plasmas and the superposition of the emission from unresolved point-like objects. To add to the confusion, in general there is no redshift information so there is very little information on where an individual X-ray may originate. This talk will address the evolution of our understanding of origin of the X-ray background and the current best-guess about what is really going on.

**Evidence of the Exponential Decay Emission in the Swift Gamma-ray Bursts**

[2007]; 30 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NNG06EO90A; 18740153; Copyright; Avail.: CASI: [A03](#), Hardcopy

We present a systematic study of the steep decay emission of gamma-ray bursts (GRBs) observed by the Swift X-Ray Telescope (XRT). In contrast to the analysis in recent literature, instead of extrapolating the data of Burst Alert Telescope (BAT) down into the XRT energy range, we extrapolated the XRT data up to the BAT energy range, 15-25 keV, to produce the BAT and XRT composite light curve. Based on our composite light curve fitting, we have confirmed the existence of an exponential decay component which smoothly connects the BAT prompt data to the XRT steep decay for several GRBs. We also find that the XRT steep decay for some of the bursts can be well fitted by a combination of a power-law with an exponential decay model. We discuss that this exponential component may be the emission from an external shock and a sign of the deceleration of the outflow during the prompt phase.

**MegaMIR: The Megapixel Mid-Infrared Instrument for the Large Binocular Telescope Interferometer**

Mainzer, Amanda K.; Young, Erick; Hong, John; Werner, Mike; Hinz, Phil; Gorjan, Varoujan; Ressler, Michael E.; May 27, 2006; 11 pp.; In English; SPIE Astronomical Telescopes and Instrumentation, 24-31 May 2006, Orlando, FL, USA; Original contains color and black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40110>

The Megapixel Mid-infrared Instrument (MegaMIR) is a proposed Fizeau-mode camera for the Large Binocular

Telescope operating at wavelengths between 5 and 28 micrometers. The camera will be used in conjunction with the Large Binocular Telescope Interferometer (LBTI), a cryogenic optical system that combines the beams from twin 8.4-m telescopes in a phase coherent manner. Unlike other interferometric systems, the co-mounted telescopes on the LBT satisfy the sine condition, providing diffraction-limited resolution over the 40' field of view of the camera. With a 22.8-m baseline, MegaMIR will yield 0.1' angular resolution, making it the highest resolution wide field imager in the thermal infrared for at least the next decade. MegaMIR will utilize a newly developed 1024 x 1024 pixel Si:As detector array that has been optimized for use at high backgrounds. This new detector is a derivative of the Wide-field Infrared Survey Explorer (WISE) low-background detector. The combination of high angular resolution and wide field imaging will be a unique scientific capability for astronomy. Key benefits will be realized in planetary science, galactic, and extra-galactic astronomy. High angular resolution is essential to disentangle highly complex sources, particularly in star formation regions and external galaxies, and MegaMIR provides this performance over a full field of view. Because of the great impact being made by space observatories like the Spitzer Space Telescope, the number of available targets for study has greatly increased in recent years, and MegaMIR will allow efficient follow up science.

#### **Performance of the Three-Dimensional Track Imager (3-DTI) for Gamma-Ray Telescopes**

Son, Seunghee; Barbier, L. M.; Bloser, P. F.; Floyd, S. R.; Hunter, S. D.; Krizmanic, J. F.; Link, J. T.; McConnell, M. L.; DeNolfo, Georgia; Ryan, J. M.; July 03, 2007; 1 pp.; In English; 2007 International Cosmic Ray Conference, 3-11 Jul. 2007, Merida, Yucatan, Mexico

Contract(s)/Grant(s): NNG06EO90A; No Copyright; Avail.: Other Sources; Abstract Only

We have been developing a gas time projection chamber for the imaging of gamma-rays between 0.3 - 50 MeV, the Three-Dimensional Track Imager (3DTI). The detector is being designed for use on satellite experiments for the imaging of astrophysical gamma-ray sources. Electrons produced by pair production or Compton scattering ionize the gas and these ionization electrons are detected by the cross-strip micro-well detector at the bottom of the chamber. Discrete component of front end electronics and time digitization electronics have been developed. We will present results of prototype microwell detector and laboratory set-up in various gas mixtures.

#### **Relativistic Iron K Emission and Absorption in the Seyfert 1.9 Galaxy MCG-05-23-16**

Braito, V.; Reeves, J. N.; Dewangan, G. C.; George, I.; Griffiths, R.; Markowitz, A.; Nandra, K.; Porquet, D.; Ptak, A.; Turner, T. J.; Yaqoob, T.; Weaver, K.; [2007]; 42 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NNG04GB78A; Copyright; Avail.: CASI: [A03](#), Hardcopy

We present the results of the simultaneous deep XMM-Newton and Chandra observations of the bright Seyfert 1.9 galaxy MCG-5-23-16, which is thought to have one of the best known examples of a relativistically broadened iron K $\alpha$  line. We detected a narrow sporadic absorption line at 7.7 keV which appears to be variable on a time-scale of 20 ksec. If associated with FeXXVI this absorption is indicative of a possible variable high ionization, high velocity outflow. The time averaged spectral analysis shows that the iron K-shell complex is best modeled with an unresolved narrow emission component (FWHM less than 5000 kilometers per second, EW approx. 60 eV) plus a broad component. This latter component has FWHM approx. 44000 kilometers per second, an EW approx. 50 eV and its profile is well described with an emission line originating from the accretion disk viewed with an inclination angle approx. 40 deg. and with the emission arising from within a few tens of gravitational radii of the central black hole. The time-resolved spectral analysis of the XMM-Newton EPIC-pn spectrum shows that both the narrow and broad components of the Fe K emission line appear to be constant within the errors. The analysis of the XMM-Newton/RGS spectrum reveals that the soft X-ray emission of MCG-5-23-16 is likely dominated by several emission lines superimposed on an unabsorbed scattered power-law continuum. The lack of strong Fe L shell emission

together with the detection of a strong forbidden line in the O VII triplet supports a scenario where the soft X ray emission lines are produced in a plasma photoionized by the nuclear emission.

**LAT Perspectives in Detection of High Energy Cosmic Ray Electrons**

Moiseev, Alexander; Ormes, J. F.; Funk, Stefan; [2007]; 2 pp.; In English; Original contains black and white illustrations; Copyright; Avail.: CASI: [A01](#), Hardcopy

The GLAST Large Area Telescope (LAT) science objectives and capabilities in the detection of high energy electrons in the energy range from 20 GeV to approx. 1 TeV are presented. LAT simulations are used to establish the event selections. It is found that maintaining the efficiency of electron detection at the level of 30% the residual hadron contamination does not exceed 2-3% of the electron flux. LAT should collect approx. ten million of electrons with the energy above 20 GeV for each year of observation. Precise spectral reconstruction with high statistics presents us with a unique opportunity to investigate several important problems such as studying galactic models of IC radiation, revealing the signatures of nearby sources such as high energy cutoff in the electron spectrum, testing the propagation model, and searching for KKDM particles decay through their contribution to the electron spectrum.

**Testing Special Relativity at High Energies with Astrophysical Sources**

Stecker, F. W.; May 30, 2007; 1 pp.; In English; No Copyright; Avail.: Other Sources; Abstract Only

Since the group of Lorentz boosts is unbounded, there is a question as to whether Lorentz invariance (LI) holds to infinitely short distances. However, special and general relativity may break down at the Planck scale. Various quantum gravity scenarios such as loop quantum gravity, as well as some forms of string theory and extra dimension models may imply Lorentz violation (LV) at ultrahigh energies. The Gamma-Ray Large Area Space Telescope (GLAST), to be launched in mid-December, will measure the spectra of distant extragalactic sources of high energy gamma-rays, particularly active galactic nuclei and gamma-ray bursts. GLAST can look for energy-dependent gamma-ray propagation effects from such sources as a signal of Lorentz invariance violation. These sources may also exhibit the high energy cutoffs predicted to be the result of intergalactic annihilation interactions with low energy photons having a flux level as determined by various astronomical observations. With LV the threshold for such interactions can be significantly raised, changing the predicted absorption turnover in the observed spectrum of the sources. Stecker and Glashow have shown that the existence such absorption features in the spectra of extragalactic sources puts constraints on LV. Such constraints have important implications for some quantum gravity and large extra dimension models. Future spaceborne detectors dedicated to measuring gamma-ray polarization can look for birefringence effects as a possible signal of loop quantum gravity. A very small LV may also result in the modification or elimination of the GZK effect, thus modifying the spectrum of ultrahigh energy cosmic rays. This possibility can be explored with ground-based arrays such as Auger or with a space based detector system such as the proposed OWL satellite mission.

Report No.(s): AD-A464454; Copyright; Avail.: Other Sources

Near-Infrared spectroscopy combined with high spatial resolution imaging have been used in this work to probe the central 500 pc of M82. Imaging observations in the 2.36 micrometers CO band head are added to our previously published near-infrared hydrogen recombination line imaging, near-infrared broadband imaging, and 3.29 micrometers dust feature imaging observations, in order to study the nature of the starburst stellar population. A starburst model is constructed and compared with the observations of the stellar clusters in the starburst complex. Our analysis implies that the typical age for the starburst clusters is  $10(\exp 7)$  yr. In addition, our high spatial resolution observations indicate that there is an age dispersion within the starburst complex that is correlated with projected distance from the center of the galaxy. The inferred age dispersion is  $6 \times 10(\exp 6)$  yr. If the starburst in M82 is propagating outward from the center, this age dispersion corresponds to a velocity of propagation, originating in the center, of  $\sim 50 \text{ km s}(\exp -1)$ . Our quantitative analysis also reveals that a Salpeter initial mass function, extending from 0.1 to 100 solar Mass, can fit the observed properties of M82 without using up more than 30% of the total dynamical mass in the starburst.

**Submicrometer Organic Grains: Widespread Constituents of the Early Solar System**

Messenger, Scott; Nakamuri-Messenger, Keiko; Keller, Lindsay; Matrajt, Graciela; Clemett, Simon; Ito, Motoo; [2007]; 1 pp.; In English; Goldschmidt 2007: Atoms to Planets, 19-24 August 2007, Cologne, Germany; Copyright; Avail.: CASI:

[A01](#), Hardcopy

Primitive meteorites and interplanetary dust particles (IDPs) contain remnants of interstellar organic matter, marked by anomalous H and N isotopic ratios. These isotopic anomalies are attributed to mass fractionation during chemical reactions at cryogenic temperatures (10-100K) in a cold molecular cloud. Significant variations in the chemistry and isotopic compositions of organic compounds within and between these samples suggest varying histories of alteration and dilution of the presolar components. Recent studies have reported large H and N isotopic anomalies preserved in sub-m organic inclusions in both meteorites and IDPs. In the Tagish Lake meteorite, the largest H and N isotopic anomalies are associated with sub-m, hollow organic globules. The common physical, chemical, and isotopic characteristics of these globules suggest that they

formed before being incorporated into their parent meteorite. These organic globules probably originated as organic ice coatings that formed on preexisting ice or mineral grains in a cold molecular cloud. Radiation driven photochemistry may have processed them into refractory organic grains. This model implies that submicrometer organic grains were widely distributed throughout the solar nebula during the epoch of planet formation. Submicrometer organic particles were detected by the Giotto and Vega encounters with comet Halley, termed CHON particles based on their major element chemistry. The first direct samples of cometary dust (comet Wild-2) were returned by the Stardust spacecraft in January 2006. These samples exhibit widely varying, fine grained mineralogy similar to anhydrous IDPs, including submicrometer carbonaceous grains. The submicrometer organic grains from comet Wild-2 exhibit H and N isotopic anomalies of similar magnitude to those commonly observed in primitive meteorites and IDPs. Isotopically anomalous, submicrometer organic grains have now been observed in meteorites, IDPs, the Oort-cloud comet Halley, and the Kuiper-belt comet Wild-2, suggesting that such grains were prevalent throughout the protoplanetary disk.

**International Space Station Research: Accomplishments and Pathways for Exploration and Fundamental Research**

Robinson, Julie A.; [2007]; 1 pp.; In English; AIAA Aerospace Sciences Meeting to be held on Jan. 7-10, 2008 in Reno, NV; No Copyright; Avail.: Other Sources; Abstract Only

Beginning with the launch of the European Columbus module planned for December 2007, we approach a transition in the assembly of the International Space Station (ISS) that is of great importance for the sciences. During the following 18 months, we will operate the first experiments in Columbus physical science resource facilities and also launch and commission the Japanese Kibo module. In addition, two Multi-purpose Logistics Module (MPLM) flights will deliver the U.S. Combustion Integrated Rack (CIR) and Fluids Integrated Rack (FIR) along with their first science experiments. These facilities provide significant new capabilities for basic and applied physical science research in microgravity. New life support technologies will come online throughout 2008, and we will reach the milestone of a 6-person crew planned for April 2009. A larger crew enables significant more scientific use of all the facilities for the life of ISS. Planning for the use of the International Space Station as a national laboratory is also maturing as we near the completion of assembly, enabling access to ISS as a research platform for other government agencies and the private sector. The latest updates on National Laboratory implementation will also be provided in this presentation. At the same time as these significant increases in scientific capability, there have been significant ongoing accomplishments in NASA's early ISS research both exploration related and fundamental research. These accomplishments will be reviewed in context as harbingers of the capabilities of the International Space Station when assembly is complete. The Vision for Space Exploration serves to focus NASA's applied investigations in the physical sciences. However, the broader capability of the space station as a National Laboratory and as a nexus for international collaboration will also influence the study of gravity-dependent processes by researchers around the world.

Report No.(s): NASA/TM-2007-214704; AIAA Paper-2007-0963; Copyright; Avail.: CASI: [A03](#), Hardcopy

The Lunar Dust Adhesion Bell Jar has been assembled at the NASA Glenn Research Center to provide a high fidelity lunar simulation facility to test the interactions of lunar dust and lunar dust simulant with candidate aerospace materials and coatings. It has a sophisticated design which enables it to treat dust in a way that will remove adsorbed gases and create a chemically reactive surface. It can simulate the vacuum, thermal, and radiation environments of the Moon, including proximate areas of illuminated heat and extremely cold shadow. It is expected to be a valuable tool in the development of dust repellent and cleaning technologies for lunar surface systems.

Heat rejection from power systems will be necessary for human and robotic activity on the lunar surface. Functional operation of such heat rejection systems is at risk of degradation as a consequence of dust accumulation. The Apollo astronauts encountered marked degradation of performance in heat rejection systems for the lunar roving vehicle, science packages, and other components. Although ground testing of dust mitigation concepts in support of the Apollo mission identified mitigation tools, the brush concept adopted by the Apollo astronauts proved essentially ineffective. A better understanding of the issues associated with the impact of lunar dust on the functional performance of heat rejection systems and its removal is needed as planning gets underway for human and robotic missions to the Moon. Renewed emphasis must also be placed on ground testing of pristine and dust-covered heat rejection system surfaces to quantify degradation and address mitigation concepts. This paper presents a review of the degradation in performance of heat rejection systems encountered on the lunar surface to-date, and will discuss current activities underway to evaluate the durability of candidate heat rejection system surfaces and current dust mitigation concepts.

**The Formation and Chronology of the PAT 91501 Impact-Melt L-Chondrite with Vesicle-Metal-Sulfide Assemblages**

Benedix, G. K.; Ketcham, R. A.; Wilson, L.; McCoy, T. J.; Bogard, D. D.; Garrison, D. H.; Herzog, G. F.; Xue, S.; Klein, J.; Middleton, R.; [2007]; 39 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NSF EAR-03-45710; NSF EAR-01-13480; Copyright; Avail.: CASI: [A03](#), Hardcopy

The L chondrite Patuxent Range (PAT) 41 91501 is an 8.5-kg unshocked, homogeneous, igneous-textured impact melt that cooled slowly compared to other meteoritic impact melts in a crater floor melt sheet or sub-crater dike. We conducted mineralogical and tomographic studies of previously unstudied mm- to cm-sized metal-sulfide-vesicle assemblages and chronologic studies of the silicate host. Metal-sulfide clasts constitute about 1 vol.%, comprise zoned taenite, troilite and pentlandite, and exhibit a consistent orientation between metal and sulfide and of metal-sulfide contacts. Vesicles make up approximately 2 vol.% and exhibit a similar orientation of long axes. Ar-39-Ar-40 measurements date the time of impact at 4.461 +/- 0.008 Gyr B.P. Cosmogenic noble gases and Be-10 and Al-21 activities suggest a pre-atmospheric radius of 40-60 cm and a cosmic ray exposure age of 25-29 Myr, similar to ages of a cluster of L chondrites. PAT 91501 dates the oldest known impact on the L chondrite parent body. The dominant vesicle-forming gas was S<sub>2</sub> (approximately 15-20 ppm), which formed in equilibrium with impact-melted sulfides. The meteorite formed in an impact melt dike beneath a crater, as did other impact melted L chondrites, such as Chico. Cooling and solidification occurred over approximately 2 hours. During this time, approximately 90% of metal and sulfide segregated from the local melt. Remaining metal and sulfide grains oriented themselves in the local gravitational field, a feature nearly unique among meteorites. Many of these metal sulfide grains adhered to vesicles to form aggregates that may have been close to neutrally buoyant. These aggregates would have been carried upward with the residual melt, inhibiting further buoyancy-driven segregation. Although similar processes operated individually in other chondritic impact melts, their interaction produced the unique assemblage observed in PAT 91501.

**A Revised Model of Jupiter's Inner Electron Belts: Updating the Divine Radiation Model**

Garrett, Henry B.; Levin, Steven M.; Bolton, Scott J.; Evans, Robin W.; Bhattacharya, Bidushi; Geophysical Research Letters; February 26, 2005; ISSN 0094-8276; Volume 32; 5 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40040>; <http://dx.doi.org/10.1029/2004GL021986>

In 1983, Divine presented a comprehensive model of the Jovian charged particle environment that has long served as a reference for missions to Jupiter. However, in situ observations by Galileo and synchrotron observations from Earth indicate the need to update the model in the inner radiation zone. Specifically, a review of the model for 1 MeV < E < 100 MeV trapped

electrons suggests that, based on the new synchrotron observations, the pitch angle distributions within  $L < 4$  need to be updated by introducing two additional components: one near the Jovian magnetic equator and one at high magnetic latitudes. We report modifications to the model that reproduce these observations. The new model improves the fit to synchrotron emission observations and remains consistent with the original fit to the in situ Pioneer and Voyager data. Further modifications incorporating observations from the Galileo and Cassini spacecraft will be reported in the future.

**Constellation Program Mission Operations Project Office Status and Support Philosophy**

Smith, Ernest; Webb, Dennis; [2007]; 1 pp.; In English; No Copyright; Avail.: Other Sources; Abstract Only

The Constellation Program Mission Operations Project Office (CxP MOP) at Johnson Space Center in Houston Texas is preparing to support the CxP mission operations objectives for the CEV/Orion flights, the Lunar Lander, and Lunar surface operations. Initially the CEV will provide access to the International Space Station, then progress to the Lunar missions. Initial CEV mission operations support will be conceptually similar to the Apollo missions, and we have set a challenge to support the CEV mission with 50% of the mission operations support currently required for Shuttle missions. Therefore, we are assessing more efficient way to organize the support and new technologies which will enhance our operations support. This paper will address the status of our preparation for these CxP missions, our philosophical approach to CxP operations support, and some of the technologies we are assessing to streamline our mission operations infrastructure.

**Near Sun Free-Space Optical Communications from Space**

Biswas, Abhijit; Khatri, F.; Boroson, D.; March 4, 2006; 7 pp.; In English; IEEE Aerospace Conference, 4-11 Mar. 2006, Big Sky, MT, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40091>

Free-space optical communications offers expanded data return capacity, from probes distributed throughout the solar system and beyond. Space-borne and Earth-based optical transceivers used for communicating optically, will periodically encounter near Sun pointing. This will result in an increase in the scattered background light flux, often contributing to degraded link performance. The varying duration of near Sun pointing link operations relative to the location of space-probes, is discussed in this paper. The impact of near Sun pointing on link performance for a direct detection photon-counting communications system is analyzed for both ground- and space-based Earth receivers. Finally, impact of near Sun pointing on spaceborne optical transceivers is discussed.

### **IMP 8 GME Particle Observations Over Three Solar Cycles**

Richardson, Ian; Cane, Hilary; Von Roseninge, Tycho; McGuire, Robert; July 03, 2007; 1 pp.; In English; 2007 International Cosmic Ray Conference, 3-11 July 2007, Merida, Yucatan, Mexico

Contract(s)/Grant(s): NNG06EO90A; No Copyright; Avail.: Other Sources; Abstract Only

The Goddard Medium Energy experiment on the IMP 8 spacecraft has made nearly continuous observations of the near-Earth energetic particle environment from its launch in October, 1973 until near present. We summarize several aspects of these observations, including solar energetic particle events, CIR-associated events, and cosmic ray modulations. In particular, we note that, as expected from the pattern of smaller recurrent (27 day) cosmic ray modulations seen in the mid 1980's a less than 0 solar minimum compared to the previous and following (A greater than 0) minima, recurrent modulations are again reduced in the current solar minimum.

### **A Survey of Interplanetary Coronal Mass Ejections During 1996 - 2007**

Richardson, Ian; Cane, Hilary; May 22, 2007; 1 pp.; In English; 30th International Cosmic Ray Conference, 3-11 July 2007, Merida, Yucatan, Mexico

Contract(s)/Grant(s): NNG06EO90A; No Copyright; Avail.: Other Sources; Abstract Only

Interplanetary coronal mass ejections, the interplanetary counterparts of coronal mass ejections at the Sun, are the major drivers of interplanetary shocks in the heliosphere, and are associated with modulations of the galactic cosmic ray intensity, both short term (Forbush decreases caused by the passage of the shock, post-shock sheath, and ICME) and possibly with longer term modulation. Using several in-situ signatures of ICMEs, including plasma temperature, and composition, magnetic fields, and cosmic ray modulations, made by near-Earth spacecraft, we have compiled a 'comprehensive' list of ICMEs passing the Earth since 1996, encompassing solar cycle 23. We summarize the properties of these ICMEs, such as their occurrence rate, speeds, association with solar energetic particle events, shocks and cosmic ray decreases.

### **Effects of RAM Exposure on a Low Earth Orbit BroadBand Radiometer (BBR): CERES Experience and Implications for EarthCARE**

Matthews, Grant; Priestley, Kory; Thomas, Susan; Hess, Pil; Cooper, Denise; Walikainen, Dale; May 07, 2007; 5 pp.; In English; Meeting held on May 7-9, 2007, Noordwijk, Netherlands; Original contains color illustrations

Contract(s)/Grant(s): WBS 921266.04.07.07; Copyright; Avail.: CASI: [A01](#), Hardcopy

In order to best detect real changes in the Earth's climate system it is estimated that space based instrumentation measuring the global Earth Radiation Budget (ERB) must remain calibrated with a stability of 0.3% per decade. This level of stability is beyond the specified accuracy of existing ERB programs such as the Clouds and the Earth's Radiant Energy System (CERES, using three broadband radiometric scanning channels: the shortwave (SW 0.3 - 5 $\mu$ m), total (0.3 - >100 micron), and window (8 - 12 micron)). When in low earth orbit, it has been shown that optical response to blue-UV radiance can be reduced significantly (> 3%) due to UV hardened contaminants deposited on the surface of the optics. Evidence suggests that exposure of telescope optics to the forward looking ram direction is the primary cause of this contamination build up. With typical onboard calibration lamps emitting very low energy in the blue-UV region, this darkening is not directly measurable using standard internal calibration techniques. This paper describes a study using a model of ram exposure induced

contaminant deposition and darkening, in conjunction standard established in-flight vicarious and internal calibration techniques to derive the spectral shape of the darkening to which a broadband instrument is subjected. The results of the model when applied to the CERES instruments are shown. These findings are of great importance to the EarthCARE project, whose BBR uses one broadband telescope permanently looking forward at 45 degrees, with continual exposure to the ram direction. Specific attention may therefore be needed in the design of BBR optics and on-board calibration in order to prevent or compensate for the spectral darkening seen in the CERES project.

**Finding Uncertainties that Cause the Age Dependence of Dose Limits to Be Immature**

Cucinotta, Francis A.; July 13, 2007; 1 pp.; In English; 18th Annual NASA Space Radiation Investigators' Workshop, 13-15 July 2007, Rohnert Park, CA, USA; No Copyright; Avail.: Other Sources; Abstract Only

Space radiation permissible exposure limits (PEL) are intended to set acceptable levels of cancer risks, and avoid any clinical significant non-cancer effects. The 1989 recommendation of the National Council of Radiation Protection and Measurements (NCRP) recommended a strong age dependence of dose limits that departed drastically from the then mature 1970 dose limits recommendations from the National Academy of Science, which were independent of age. In 2000, the NCRP recommended revised limits that showed a similar trend of risk with age to the 1989 report. In this model, the cancer risk per Sv varies by more than 2-fold for ages between 30- and 50-yr. Therefore for galactic cosmic rays exposure, astronaut age has a larger influence on risk than radiation shielding mass or material composition, vehicle propulsion method, or position in the solar cycle. For considering the control of mission costs and resources, the possibility of using astronaut age as a trade variable in mission design could be considered. However, the uncertainties in describing the age dependence on risk have not been fully explored. We discuss biological factors that influence the age dependence of radiation risks, including susceptibility, expression and latency, and radiation quality. These factors depend not only on the individual's age, but also their genetic sensitivity and interaction with other environmental factors. Epidemiological data is limited in describing the age dependence on risk. The 2005, BEIR VII report recommends an age dependence for cancer risk attributable solely to the life-table disagreeing strongly with the NCRP model. However, BEIR VII also noted the limited power of human data for concomitantly describing both age and age after exposure dependences of cancer risks. Many experimental studies have shown that high LET radiation (e.g., high charge and energy (HZE) nuclei and neutrons) display reduced latency compared to low LET radiation, suggesting distinct biological factors are important. We discuss potential molecular mechanisms that would influence the age dependence of radiation risks. A probability distribution function for the uncertainties in age-dependence of risk models is described and predictions for Mars missions discussed. Our report suggests that theoretical considerations based on new experimental studies are needed to ensure the correct age dependence in space radiation risk models and the resulting Astronaut PEL.

**Six Decades of Flight Research: An Annotated Bibliography of Technical Publications of NASA Dryden Flight Research Center, 1946-2006**

Fisher, David F.; May 2007; 785 pp.; In English; Original contains color and black and white illustrations

Report No.(s): NASA/TP-2007-213684; H-2651; No Copyright; Avail.: CASI: A99, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070023367>

Titles, authors, report numbers, and abstracts are given for nearly 2900 unclassified and unrestricted technical reports and papers published from September 1946 to December 2006 by the NASA Dryden Flight Research Center and its predecessor organizations. These technical reports and papers describe and give the results of 60 years of flight research performed by the NACA and NASA, from the X-1 and other early X-airplanes, to the X-15, Space Shuttle, X-29 Forward Swept Wing, X-31,

and X-43 aircraft. Some of the other research airplanes tested were the D-558, phase 1 and 2; M-2, HL-10 and X-24 lifting bodies; Digital Fly-By-Wire and Supercritical Wing F-8; XB-70; YF-12; AFTI F-111 TACT and MAW; F-15 HiDEC; F-18 High Alpha Research Vehicle, F-18 Systems Research Aircraft and the NASA Landing Systems Research aircraft. The citations of reports and papers are listed in chronological order, with author and aircraft indices. In addition, in the appendices, citations of 270 contractor reports, more than 200 UCLA Flight System Research Center reports, nearly 200 Tech Briefs, 30 Dryden Historical Publications, and over 30 videotapes are included.

Finding Uncertainties that Cause the Age Dependence of Dose Limits to Be Immature – 74

## CARBON DIOXIDE

Progress in Modeling Global Atmospheric CO<sub>2</sub> Fluxes and Transport: Results from Simulations with Diurnal Fluxes – 40

## CARBON NANOTUBES

Carbon Nanotube-based Sensor and Method for Continually Sensing Changes in a Structure – 24

Developing Carbon Nanotube Standards at NASA – 15

Templated Growth of Carbon Nanotubes – 18

## CARBON-CARBON COMPOSITES

Oxidation Through Coating Cracks of SiC-Protected Carbon/Carbon – 17

## CATALYSTS

Catalytic Ignition and Upstream Reaction Propagation in a Platinum Tube – 19

Metallic Nanowire Interconnections for Integrated Circuit Fabrication – 27

## CENTAURUS CONSTELLATION

The Suzaku Observation of the Nucleus of the Radio Loud Active Galaxy Centaurus A: Constraints on Abundances in the Accreting Material – 66

## CENTRIFUGING

Preliminary Assessment of Artificial Gravity Impacts to Deep-Space Vehicle Design – 52

## CERES (EXPERIMENT)

Effects of RAM Exposure on a Low Earth Orbit BroadBand Radiometer (BBR): CERES Experience and Implications for EarthCARE – 74

## CHAMBERS

Performance of the Three-Dimensional Track Imager (3-DTI) for Gamma-Ray Telescopes – 67

## CHANNELS (DATA TRANSMISSION)

Compression of a Data Stream by Selection among a Set of Compression Tools – 54

Real-time Signal-to-noise Ratio (SNR) Estimation for BPSK and QPSK Modulation Using the Active Communications Channel – 21

## CHAOS

Chaotic Motion of Relativistic Electrons Driven by Whistler Waves – 61

## CHEMICAL REACTIONS

Catalytic Ignition and Upstream Reaction Propagation in a Platinum Tube – 19

N-15 NMR Spectroscopy as a Method for Comparing the Rates of Imidization of Several Diamines – 18

UV Induced Oxidation of Nitric Oxide – 18

## CHEMICAL WARFARE

Analysis of the Effects of Sea Disposal on a One-Ton Container – 34

## CHIPS (ELECTRONICS)

Near Field Radiation Characteristics of Implantable Square Spiral Chip Inductor Antennas for Bio-Sensors – 22

Open-systems Architecture of a Standardized Command Interface Chip-set for Switching and Control of a Spacecraft Power Bus – 55

## CHLOROPHYLLS

Improving Assimilation of SeaWiFS Data by the Application of Bias Correction with a Local SEIK Filter – 42

## CHONDRITES

The Formation and Chronology of the PAT 91501 Impact-Melt L-Chondrite with Vesicle-Metal-Sulfide Assemblages – 71

## CHRONOLOGY

The Formation and Chronology of the PAT 91501 Impact-Melt L-Chondrite with Vesicle-Metal-Sulfide Assemblages – 71

## CIRCUITS

Evolutionary Technique for Automated Synthesis of Electronic Circuits – 24

Magnetic Field Response Measurement Acquisition System – 30

## CIVIL AVIATION

Historical Analysis of Aircraft Flight Parameters – 3

Information Display System for Atypical Flight Phase – 3

In-Service Evaluation of the Turbulence Auto-PIREP System and Enhanced Turbulence Radar Technologies – 46

## CLIMATE CHANGE

3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields – 43

## CLIMATOLOGY

Toward a Global Map of Raindrop Size Distributions – 47

## CLOUD COVER

3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields – 43

## CLOUD PHYSICS

Airborne Validation of Spatial Properties Measured by the CALIPSO Lidar – 44

Improvements to GOES Twilight Cloud Detection over the ARM SGP – 36

Validation of GOES-10 Satellite-derived Cloud and Radiative Properties for the MASRAD ARM Mobile Facility Deployment – 35

## CLOUDS (METEOROLOGY)

Using Multi-scale Modeling Systems to Study the Precipitation Processes – 46

## COATING

Oxidation Through Coating Cracks of SiC-Protected Carbon/Carbon – 17

## COBALT ISOTOPES

Co/Ni Ratio Between Is Approximately 0.35 - 8.0 GeV/nucleon from the TIGER-2001 Flight – 64

## COGNITION

Using Computational Cognitive Modeling to Diagnose Possible Sources of Aviation Error – 3

## COHERENT RADAR

Compact and Rugged Transceiver for Coherent Doppler Wind Lidar Applications in Space – 32

## COLLISION AVOIDANCE

Automatic Collision Avoidance Technology (ACAT) – 6

## COLLOCATION

Usability Study of Two Collocated Prototype System Displays – 52

## COLOR

Developing the Federal Aviation Administration's Requirements for Color Use in Air Traffic Control Displays – 2

## COMBUSTION CHEMISTRY

Catalytic Ignition and Upstream Reaction Propagation in a Platinum Tube – 19

## COMBUSTION PRODUCTS

3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields – 43

## COMBUSTION

Upward Flame Propagation and Wire Insulation Flammability: 2006 Round Robin Data Analysis – 15

## COMMAND AND CONTROL

Autonomous Payload Operations Onboard the International Space Station – 20

## COMMUNICATION NETWORKS

Real-time Signal-to-noise Ratio (SNR) Estimation for BPSK and QPSK Modulation Using the Active Communications Channel – 21

## COMPATIBILITY

A Process for Producing Highly Wettable Aluminum 6061 Surfaces Compatible with Hydrazine – 20

## COMPOSITE MATERIALS

Developing Carbon Nanotube Standards at NASA – 16

Method of Fabricating a Composite Apparatus – 16

## COMPOSITE WRAPPING

A Comparison of Various Stress Rupture Life Models for Orbiter Composite Pressure Vessels and Confidence Intervals – 17

Stress Rupture Life Reliability Measures for Composite Overwrapped Pressure Vessels – 17

## COMPRESSIBLE BOUNDARY LAYER

On an Asymptotically Consistent Unsteady Interacting Boundary Layer – 4

## COMPRESSIBLE FLOW

Nonstandard Analysis and Shock Wave Jump Conditions in a One-Dimensional Compressible Gas – 28

## COMPUTATIONAL FLUID DYNAMICS

A Review of Hypersonics Aerodynamics, Aerothermodynamics and Plasmadynamics Activities within NASA's Fundamental Aeronautics Program – 1

CFD to Flight: Some Recent Success Stories of X-plane Design to Flight Test at the NASA Dryden Flight Research Center – 28

Developmental Considerations on the Free-piston Stirling Power Converter for Use in Space – 12

Orbiter Entry Aeroheating Working Group Viscous CFD Boundary Layer Transition Trailblazer Solutions – 29

Unsteady Velocity Measurements in the NASA Research Low Speed Axial Compressor: Smooth Wall Configuration – 33

## COMPUTATIONAL GRIDS

Numerical Simulation of Two-grid Ion Optics Using a 3D Code – 58

## COMPUTER COMPONENTS

Deductive Glue Code Synthesis for Embedded Software Systems Based on Code Patterns – 54

## COMPUTER PROGRAMS

Deductive Glue Code Synthesis for Embedded Software Systems Based on Code Patterns – 54

Ensemble Weight Enumerators for Protograph LDPC Codes – 55

The Continuous Intercomparison of Radiation Codes (CIRC): Phase I Cases – 47

## COMPUTER SYSTEMS DESIGN

Deductive Glue Code Synthesis for Embedded Software Systems Based on Code Patterns – 54

Systems, Methods and Apparatus for Determining Physical Properties of Fluids – 34

## COMPUTER SYSTEMS PROGRAMS

Developing Fault Models for Space Mission Software – 53

## COMPUTERIZED SIMULATION

Numerical Simulation of Two-grid Ion Optics Using a 3D Code – 58

Scattered Atomic Oxygen Effects on Spacecraft Materials – 11

## CONDENSATION NUCLEI

3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields – 43

## CONFIDENCE LIMITS

A Comparison of Various Stress Rupture Life Models for Orbiter Composite Pressure Vessels and Confidence Intervals – 17

## CONNECTORS

Device and Method for Connections Made Between a Crimp Connector and Wire – 25

## CONSTELLATION PROGRAM

Constellation Program Mission Operations Project Office Status and Support Philosophy – 72

## CONSTELLATION-X

The Constellation-X Mission: Science Prospects and Technology Challenges – 66

## CONTAINERS

Analysis of the Effects of Sea Disposal on a One-Ton Container – 34

## CONTOURS

Shaped Sonic Boom Demonstration/Experiment Airborne Data – 5

## CONTRACT MANAGEMENT

Polar-Orbiting Operational Environmental Satellites: Restructuring Is Under Way, but Technical Challenges and Risks Remain – 62

## CONTROL EQUIPMENT

Screening of Potential Landing Gear Noise Control Devices at Virginia Tech For QTD II Flight Test – 5

## CONTROL SURFACES

Method for Constructing Composite Response Surfaces by Combining Neural Networks with Polynomial Interpolation or Estimation Techniques – 8

## CONTROL SYSTEMS DESIGN

Neural Net Safety Monitor Design – 5  
Usability Study of Two Collocated Prototype System Displays – 52

## CORONAGRAPHS

A Nulling Coronagraph for TPF-C – 31

## CORONAL MASS EJECTION

A Survey of Interplanetary Coronal Mass Ejections During 1996 - 2007 – 73  
Interplanetary Coronal Mass Ejections During 1996 - 2007 – 43

## CORONARY ARTERY DISEASE

Construction and Use of Resting 12-Lead High Fidelity ECG 'SuperScores' in Screening for Heart Disease – 48

## CORRELATION

Determination of Black Hole Mass in Cyg X-1 by Scaling of Spectral Index-QPO Frequency Correlation – 65

Surface Ruptures and Building Damage of the 2003 Bam, Iran, Earthquake Mapped by Satellite Synthetic Aperture Radar Interferometric Correlation – 44

## COSMIC RAYS

LAT Perspectives in Detection of High Energy Cosmic Ray Electrons – 68

## COST ESTIMATES

Polar-Orbiting Operational Environmental Satellites: Restructuring Is Under Way, but Technical Challenges and Risks Remain – 62

## COUNTERMEASURES

Preliminary Assessment of Artificial Gravity Impacts to Deep-Space Vehicle Design – 52

## COUPLED MODES

Vertically-coupled Whispering Gallery Mode Resonator Optical Waveguide, and Methods – 59

## CRACK GEOMETRY

Oxidation Through Coating Cracks of SiC-Protected Carbon/Carbon – 17

## CRACKING (FRACTURING)

System and Method for Detecting Cracks and their Location – 35

## CRACKS

System and Method for Detecting Cracks and their Location – 35

## CREEP RUPTURE STRENGTH

A Comparison of Various Stress Rupture Life Models for Orbiter Composite Pressure Vessels and Confidence Intervals – 17

Stress Rupture Life Reliability Measures for Composite Overwrapped Pressure Vessels – 17

## CREW EXPLORATION VEHICLE

A Comparison of Two Skip Entry Guidance Algorithms – 57

Constellation Program Mission Operations Project Office Status and Support Philosophy – 72

Orion-CEV Project Overview To the NASA Sports and Exploration 'Kick-Off' Meeting – 12

## CRYPTOGRAPHY

Encrypting Digital Camera with Automatic Encryption Key Deletion – 30

## CULTURE TECHNIQUES

Three-dimensional Model of Tissue and Heavy Ions Effects – 49

## CUMULATIVE DAMAGE

Scattered Atomic Oxygen Effects on Spacecraft Materials – 11

## CUMULUS CLOUDS

3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields – 43

## CYCLONES

Statistical Aspects of the North Atlantic Basin Tropical Cyclones: Trends, Natural Variability, and Global Warming – 45

## CYGNUS CONSTELLATION

Determination of Black Hole Mass in Cyg X-1 by Scaling of Spectral Index-QPO Frequency Correlation – 65

## DATA ACQUISITION

Magnetic Field Response Measurement Acquisition System – 30

Unofficial Road Building in the Amazon: Socioeconomic and Biophysical Explanations – 40

## FORMATION FLYING

Microthrust Propulsion of the LISA Mission – 14

## FRAGMENTATION

Loggers and Forest Fragmentation: Behavioral Models of Road Building in the Amazon Basin – 39

## FREE-PISTON ENGINES

Developmental Considerations on the Free-piston Stirling Power Converter for Use in Space – 13

Status of the NASA Stirling Radioisotope Project – 32

## FREE-SPACE OPTICAL COMMUNICATION

Coherent Optical Receiver for PPM Signals under Atmospheric Turbulence – 10

Near Sun Free-Space Optical Communications from Space – 72

## FREQUENCIES

Design of a Wideband 900 GHz Balanced Frequency Tripler for Radioastronomy – 25

Frequency Dependence of Single-event Upset in Advanced Commercial PowerPC Microprocessors – 27

## FREQUENCY MEASUREMENT

Airborne RF Measurement System (ARMS) and Analysis of Representative Flight RF Environment – 23

## FUNCTIONS (MATHEMATICS)

Nonstandard Analysis and Shock Wave Jump Conditions in a One-Dimensional Compressible Gas – 28

## GALACTIC COSMIC RAYS

A Survey of Interplanetary Coronal Mass Ejections During 1996 - 2007 – 73

Co/Ni Ratio Between Is Approximately 0.35 - 8.0 GeV/nucleon from the TIGER-2001 Flight – 64

Cosmic Ray Electron Science with GLAST – 65

Cosmic Ray Helium Intensities over the Solar Cycle from ACE – 64

## GALACTIC EVOLUTION

The Intrinsic Properties of the Stellar Clusters in the M82 Starburst Complex: Propagating Star Formation? – 69

## GALACTIC NUCLEI

The Intrinsic Properties of the Stellar Clusters in the M82 Starburst Complex: Propagating Star Formation? – 69

## GALLIUM ARSENIDES

Design of a Wideband 6-Anode Frequency Tripler at 300 GHz with Optimum Balance – 27

## GAMMA RAY BURSTS

Evidence of the Exponential Decay Emission in the Swift Gamma-ray Bursts – 66

Testing Special Relativity at High Energies with Astrophysical Sources – 68

## GAMMA RAY TELESCOPES

LAT Perspectives in Detection of High Energy Cosmic Ray Electrons – 68

Performance of the Three-Dimensional Track Imager (3-DTI) for Gamma-Ray Telescopes – 67

## GAMMA RAYS

Cosmic Ray Electron Science with GLAST – 65

## GAS DETECTORS

A Portable Universal Hazardous Gas Detector – 53

## GAS FLOW

Nonstandard Analysis and Shock Wave Jump Conditions in a One-Dimensional Compressible Gas – 28

## GENERAL AVIATION AIRCRAFT

Airborne RF Measurement System (ARMS) and Analysis of Representative Flight RF Environment – 23

## GEOPHYSICS

A Revised Model of Jupiter's Inner Electron Belts: Updating the Divine Radiation Model – 72

Interplanetary Coronal Mass Ejections During 1996 - 2007 – 43

Introduction to Special Issue on Tropical Deforestation – 36

## GLOBAL WARMING

Statistical Aspects of the North Atlantic Basin Tropical Cyclones: Trends, Natural Variability, and Global Warming – 45

## GOES 10

Validation of GOES-10 Satellite-derived Cloud and Radiative Properties for the MASRAD ARM Mobile Facility Deployment – 36

## GOES SATELLITES

Improvements to GOES Twilight Cloud Detection over the ARM SGP – 36

## GRANULAR MATERIALS

Submicrometer Organic Grains: Widespread Constituents of the Early Solar System – 70

## GRAPHS (CHARTS)

Ensemble Weight Enumerators for Protophograph LDPC Codes – 55

## GRAVITATIONAL PHYSIOLOGY

Preliminary Assessment of Artificial Gravity Impacts to Deep-Space Vehicle Design – 52

## GRAVITATIONAL WAVES

Recoiling from a Kick in the Head-On Case – 65

## GRID GENERATION (MATHEMATICS)

Enhanced Elliptic Grid Generation – 57

## HEART DISEASES

Construction and Use of Resting 12-Lead High Fidelity ECG 'SuperScores' in Screening for Heart Disease – 48

## HEAT RADIATORS

Lunar Dust on Heat Rejection System Surfaces: Problems and Prospects – 71

## HEAT RESISTANT ALLOYS

Thermal Properties of Oxides With Magnetoplumbite Structure for Advanced Thermal Barrier Coatings – 15

## HEAVY IONS

Three-dimensional Model of Tissue and Heavy Ions Effects – 49

## HELICOPTERS

Oil-Free Rotor Support Technologies for an Optimized Helicopter Propulsion System – 7

## HELIUM ISOTOPES

Cosmic Ray Helium Intensities over the Solar Cycle from ACE – 64

## HIGH ALTITUDE

An Analysis of Fuel Cell Options for an All-electric Unmanned Aerial Vehicle – 20

## HIGH ENERGY ELECTRONS

Chaotic Motion of Relativistic Electrons Driven by Whistler Waves – 61

Cosmic Ray Electron Science with GLAST – 65

LAT Perspectives in Detection of High Energy Cosmic Ray Electrons – 68

## HIGH VOLTAGES

Low Power, High Voltage Power Supply with Fast Rise/Fall Time – 24

## HISTOCHEMICAL ANALYSIS

Association between Randall's Plaque and Calcifying Nanoparticles – 49

## HISTORIES

Historical Analysis of Aircraft Flight Parameters – 3

Six Decades of Flight Research: An Annotated Bibliography of Technical Publications of NASA Dryden Flight Research Center, 1946-2006 – 74

## HOLLOW CATHODES

Hollow Cathode and Keeper-region Plasma Measurements Using Ultra-fast Miniature Scanning Probes – 25

## HUMAN BODY

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 2

## HUMAN FACTORS ENGINEERING

Developing the Federal Aviation Administration's Requirements for Color Use in Air Traffic Control Displays – 2

Usability Study of Two Collocated Prototype System Displays – 52

Using Computational Cognitive Modeling to Diagnose Possible Sources of Aviation Error – 2

## HYDRAZINES

A Process for Producing Highly Wettable Aluminum 6061 Surfaces Compatible with Hydrazine – 20

## HYPERSONICS

A Review of Hypersonics Aerodynamics, Aerothermodynamics and Plasmodynamics Activities within NASA's Fundamental Aeronautics Program – 1

## IDENTIFYING

System and Method for Detecting Cracks and their Location – 35

## IGNITION

Catalytic Ignition and Upstream Reaction Propagation in a Platinum Tube – 19

## IMAGING TECHNIQUES

A Compact 600 GHz Electronically Tunable Vector Measurement System for Submillimeter Wave Imaging – 23

Imaging and Spectroscopy with the James Webb Space Telescope – 63

New Frontiers for Massive Star Winds: Imaging and Spectroscopy with the James Webb Space Telescope – 63

Performance of the Three-Dimensional Track Imager (3-DTI) for Gamma-Ray Telescopes – 67

## IMMUNOLOGY

Association between Randall's Plaque and Calcifying Nanoparticles – 49

## IMPACT MELTS

The Formation and Chronology of the PAT 91501 Impact-Melt L-Chondrite with Vesicle-Metal-Sulfide Assemblages – 71

## IN SITU MEASUREMENT

Improving Assimilation of SeaWiFS Data by the Application of Bias Correction with a Local SEIK Filter – 42

## INDUCTORS

Near Field Radiation Characteristics of Implantable Square Spiral Chip Inductor Antennas for Bio-Sensors – 22

## IN-FLIGHT MONITORING

Neural Net Safety Monitor Design – 5

## INFORMATION SYSTEMS

Information Display System for Atypical Flight Phase – 3

## INFRARED INSTRUMENTS

MegaMIR: The Megapixel Mid-Infrared Instrument for the Large Binocular Telescope Interferometer – 67

## INFRARED INTERFEROMETERS

MegaMIR: The Megapixel Mid-Infrared Instrument for the Large Binocular Telescope Interferometer – 67

## INFRARED RADIATION

MegaMIR: The Megapixel Mid-Infrared Instrument for the Large Binocular Telescope Interferometer – 67

Progress on Background-Limited Membrane-Isolated TES Bolometers for Far-IR/Submillimeter Spectroscopy – 31

## INFRARED SPECTROSCOPY

Progress on Background-Limited Membrane-Isolated TES Bolometers for Far-IR/Submillimeter Spectroscopy – 31

## INFRARED TELESCOPES

MegaMIR: The Megapixel Mid-Infrared Instrument for the Large Binocular Telescope Interferometer – 67

## INJURIES

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 2

Evaluating Trauma Sonography for Operational Use in the Microgravity Environment – 51

## INLET FLOW

Active-Adaptive Control of Inlet Separation Using Supersonic Microjets – 29

## INNER RADIATION BELT

A Revised Model of Jupiter's Inner Electron Belts: Updating the Divine Radiation Model – 72

## INSULATION

Metallic Nanowire Interconnections for Integrated Circuit Fabrication – 27

Upward Flame Propagation and Wire Insulation Flammability: 2006 Round Robin Data Analysis – 15

## INTEGRATED CIRCUITS

Frequency Dependence of Single-event Upset in Advanced Commercial PowerPC Microprocessors – 27

Metallic Nanowire Interconnections for Integrated Circuit Fabrication – 27

Open-systems Architecture of a Standardized Command Interface Chip-set for Switching and Control of a Spacecraft Power Bus – 55

Qualification and Reliability for MEMS and IC Packages – 26

## INTENSITY

Cosmic Ray Helium Intensities over the Solar Cycle from ACE – 64

## INTERFEROMETERS

Adaptive Nulling for the Terrestrial Planet Finder Interferometer – 31

Terrestrial Planet Finder Interferometer Technology Status and Plans – 72

## INTERFEROMETRY

Surface Ruptures and Building Damage of the 2003 Bam, Iran, Earthquake Mapped by Satellite Synthetic Aperture Radar Interferometric Correlation – 44

## INTERNATIONAL SPACE STATION

Evaluating Trauma Sonography for Operational Use in the Microgravity Environment – 51

International Space Station Research: Accomplishments and Pathways for Exploration and Fundamental Research – 70

Programmable Thermostat Module Upgrade for the Multipurpose Logistics Module – 12

Science on the International Space Station: Stepping Stones for Exploration – 9

Space Environment Effects on Stability of Medications Flown on Space Shuttles and the International Space Station (ISS) – 50

## INTERPLANETARY DUST

Submicrometer Organic Grains: Widespread Constituents of the Early Solar System – 70

## INTERPLANETARY SHOCK WAVES

A Survey of Interplanetary Coronal Mass Ejections During 1996 - 2007 – 73

Interplanetary Coronal Mass Ejections During 1996 - 2007 – 43

MeV Ion Anisotropies in the Vicinity of Interplanetary Shocks – 43

## INTERPOLATION

Method for Constructing Composite Response Surfaces by Combining Neural Networks with Polynomial Interpolation or Estimation Techniques – 8

## INVISCID FLOW

On an Asymptotically Consistent Unsteady Interacting Boundary Layer – 4

## ION ENGINES

Discharge Chamber Performance of the NEXIS Ion Thruster – 60

Experimentally Determined Plasma Parameters in a 30 cm Ion Engine – 59

Numerical Simulation of Two-grid Ion Optics Using a 3D Code – 58

## ION OPTICS

Numerical Simulation of Two-grid Ion Optics Using a 3D Code – 58

## ION PROPULSION

Experimentally Determined Plasma Parameters in a 30 cm Ion Engine – 60

## IONS

MeV Ion Anisotropies in the Vicinity of Interplanetary Shocks – 43

## IRAN

Surface Ruptures and Building Damage of the 2003 Bam, Iran, Earthquake Mapped by Satellite Synthetic Aperture Radar Interferometric Correlation – 44

## IRON

Relativistic Iron K Emission and Absorption in the Seyfert 1.9 Galaxy MCG-05-23-16 – 68

## ISOTOPE RATIOS

Co/Ni Ratio Between Is Approximately 0.35 - 8.0 GeV/nucleon from the TIGER-2001 Flight – 64

## JAMES WEBB SPACE TELESCOPE

Imaging and Spectroscopy with the James Webb Space Telescope – 63

New Frontiers for Massive Star Winds: Imaging and Spectroscopy with the James Webb Space Telescope – 63

## JET AIRCRAFT NOISE

Screening of Potential Landing Gear Noise Control Devices at Virginia Tech For QTD II Flight Test – 5

## JUPITER (PLANET)

A Revised Model of Jupiter's Inner Electron Belts: Updating the Divine Radiation Model – 72

## **K LINES**

Relativistic Iron K Emission and Absorption in the Seyfert 1.9 Galaxy MCG-05-23-16 – 68

## **KALMAN FILTERS**

Improving Assimilation of SeaWiFS Data by the Application of Bias Correction with a Local SEIK Filter – 42

## **KIDNEY STONES**

An Additional Potential Factor for Kidney Stone Formation during Space Flights: Calcifying Nanoparticles (Nanobacteria): A Case Report – 50

Association between Randall's Plaque and Calcifying Nanoparticles – 49

## **LAND MANAGEMENT**

Mapping Process to Pattern in the Landscape Change of the Amazonian Frontier – 37

## **LAND USE**

Beyond Population and Environment: Household Life Cycle Demography and Land Use Allocation among Small Farm Colonists in the Amazon – 38

Introduction to Special Issue on Tropical Deforestation – 36

Land Use and Land Cover Change in Forest Frontiers: The Role of Household Life Cycles – 37

Land-Cover and Land-Use Change in the Brazilian Amazon: Smallholders, Ranchers and Frontier Stratification – 38

Mapping Process to Pattern in the Landscape Change of the Amazonian Frontier – 36

Theorizing Land Cover and Land Use Change: The Peasant Economy of Colonization in the Amazon Basin – 38

Theorizing Land Cover and Land Use Changes: The Case of Tropical Deforestation – 36

## **LANDING GEAR**

Screening of Potential Landing Gear Noise Control Devices at Virginia Tech For QTD II Flight Test – 5

## **LASER OUTPUTS**

Fiber Coupled Laser Diodes with Even Illumination Pattern – 32

## **LAUNCH VEHICLES**

Orbital Debris Environment Assessment and Mitigation for Launch Vehicles – 9

## **LEAF AREA INDEX**

Analysis of Leaf Area Index and Fraction of PAR Absorbed by Vegetation Products from the Terra MODIS Sensor: 2000-2005 – 41

Assessment of the Broadleaf Crops Leaf Area Index Product from the Terra MODIS Instrument – 41

The Importance of Measurement Errors for Deriving Accurate Reference Leaf Area Index Maps for Validation of Moderate-Resolution Satellite LAI Products – 42

## **LIBRATION**

L2 Earth Atmosphere Observatory: Formation Guidance, Metrology and Control Synthesis – 11

## **LIFE DETECTORS**

A Roadmap for NASA's Search for Other Earths – 53

## **LIFE (DURABILITY)**

A Comparison of Various Stress Rupture Life Models for Orbiter Composite Pressure Vessels and Confidence Intervals – 17

Stress Rupture Life Reliability Measures for Composite Overwrapped Pressure Vessels – 17

## **LIFE SCIENCES**

Science on the International Space Station: Stepping Stones for Exploration – 9

## **LIFE SUPPORT SYSTEMS**

A Portable Universal Hazardous Gas Detector – 53

## **LISA (OBSERVATORY)**

Microthrust Propulsion of the LISA Mission – 14

## **LITHIUM BATTERIES**

Space Technology-5 (ST-5) Li-Ion Battery Build and Performance – 23

## **LORENTZ TRANSFORMATIONS**

Testing Special Relativity at High Energies with Astrophysical Sources – 68

## **LOW EARTH ORBITS**

Scattered Atomic Oxygen Effects on Spacecraft Materials – 11

## **LOW FREQUENCIES**

Determination of Black Hole Mass in Cyg X-1 by Scaling of Spectral Index-QPO Frequency Correlation – 65

## **LOW SPEED**

Unsteady Velocity Measurements in the NASA Research Low Speed Axial Compressor: Smooth Wall Configuration – 33

## **LOW THRUST PROPULSION**

Microthrust Propulsion of the LISA Mission – 14

## **LOW VOLTAGE**

Low Power, High Voltage Power Supply with Fast Rise/Fall Time – 24

## **LUNAR DUST**

Lunar Dust on Heat Rejection System Surfaces: Problems and Prospects – 71

Lunar Simulation in the Lunar Dust Adhesion Bell Jar – 70

## **LUNAR EXPLORATION**

Orion-CEV Project Overview To the NASA Sports and Exploration 'Kick-Off' Meeting – 12

## **LUNAR SURFACE**

Lunar Dust on Heat Rejection System Surfaces: Problems and Prospects – 71

Lunar Simulation in the Lunar Dust Adhesion Bell Jar – 70

## **MAGELLANIC CLOUDS**

Far-ultraviolet Spectroscopy of O+O Binaries in the Magellanic Clouds – 63

## **MAGNETIC FIELDS**

Magnetic Field Response Measurement Acquisition System – 30

## **MAINTENANCE**

In-Service Evaluation of the Turbulence Auto-PIREP System and Enhanced Turbulence Radar Technologies – 46

Volatile Organic Analyzer (VOA) in 2006: Repair, Revalidation, and Restart of Elektron Event – 33

## **MAN ENVIRONMENT INTERACTIONS**

3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields – 43

## **MANNED SPACE FLIGHT**

An Additional Potential Factor for Kidney Stone Formation during Space Flights: Calcifying Nanoparticles (Nanobacteria): A Case Report – 50

Evaluating Trauma Sonography for Operational Use in the Microgravity Environment – 51

## **MANUFACTURING**

Double Vacuum Bag Process for Resin Matrix Composite Manufacturing – 16

## **MARS EXPLORATION**

Mars Exploration Rovers Propulsive Maneuver Design – 14

## **MARS RECONNAISSANCE ORBITER**

Recent Project Experience Mars Reconnaissance Orbiter (MRO) – 22

## **MARS ROVING VEHICLES**

Mars Exploration Rover Operations with the Science Activity Planner – 56

Mars Exploration Rovers Propulsive Maneuver Design – 14

## **MARS SURFACE**

Mars Exploration Rovers Propulsive Maneuver Design – 14

## **MASS RATIOS**

Determination of Black Hole Mass in Cyg X-1 by Scaling of Spectral Index-QPO Frequency Correlation – 65

## **MASS SPECTROMETERS**

A Portable Universal Hazardous Gas Detector – 53

## **MASSIVE STARS**

Eta Carinae and Other Luminous Blue Variables – 68

New Frontiers for Massive Star Winds: Imaging and Spectroscopy with the James Webb Space Telescope – 63

## **MATHEMATICAL MODELS**

## MODIS (RADIOMETRY)

Analysis of Leaf Area Index and Fraction of PAR Absorbed by Vegetation Products from the Terra MODIS Sensor: 2000-2005 – 41

Assessment of the Broadleaf Crops Leaf Area Index Product from the Terra MODIS Instrument – 41

The Importance of Measurement Errors for Deriving Accurate Reference Leaf Area Index Maps for Validation of Moderate-Resolution Satellite LAI Products – 42

## MOLDS

Double Vacuum Bag Process for Resin Matrix Composite Manufacturing – 16

## MOUNTING

Self Mountable and Extractable Ultrasonic/Sonic Anchor – 33

## MULTI-PURPOSE LOGISTICS MODULES

Programmable Thermostat Module Upgrade for the Multipurpose Logistics Module – 12

## MULTISENSOR FUSION

Combined Radar and Radiometer Analysis of Precipitation Profiles for a Parametric Retrieval Algorithm – 42

## MULTISPECTRAL RADAR

Recent Advances in Spaceborne Precipitation Radar Measurement Techniques and Technology – 46

## MUSCULOSKELETAL SYSTEM

Preliminary Assessment of Artificial Gravity Impacts to Deep-Space Vehicle Design – 52

## NANOFABRICATION

Metallic Nanowire Interconnections for Integrated Circuit Fabrication – 27

## NANOPARTICLES

An Additional Potential Factor for Kidney Stone Formation during Space Flights: Calcifying Nanoparticles (Nanobacteria): A Case Report – 50

Association between Randall's Plaque and Calcifying Nanoparticles – 49

## NANOSTRUCTURE (CHARACTERISTICS)

Templated Growth of Carbon Nanotubes – 18

## NANOSTRUCTURE GROWTH

Templated Growth of Carbon Nanotubes – 18

## NANOTECHNOLOGY

Developing Carbon Nanotube Standards at NASA – 16

Metallic Nanowire Interconnections for Integrated Circuit Fabrication – 27

## NANOWIRES

Metallic Nanowire Interconnections for Integrated Circuit Fabrication – 27

## NASA PROGRAMS

A Review of Hypersonics Aerodynamics, Aerothermodynamics and Plasmodynamics Activities within NASA's Fundamental Aeronautics Program – 1

Neural Net Safety Monitor Design – 4

## NAVIGATION AIDS

Authority and Responsibility of the Dismounted Soldier, Part B: Improving the Situational Awareness Using the Soldier Digital Assistant in a Simulated Environment. – 55

## NAVIGATION

Automatic Collision Avoidance Technology (ACAT) – 6

## NEAR FIELDS

Near Field Radiation Characteristics of Implantable Square Spiral Chip Inductor Antennas for Bio-Sensors – 22

## NETWORK SYNTHESIS

Deductive Glue Code Synthesis for Embedded Software Systems Based on Code Patterns – 54

## NEURAL NETS

F-15 837 IFCS Intelligent Flight Control System Project – 8

Method for Constructing Composite Response Surfaces by Combining Neural Networks with Polynomial Interpolation or Estimation Techniques – 8

Neural Net Safety Monitor Design – 4

## NICKEL ISOTOPES

Co/Ni Ratio Between Is Approximately 0.35 - 8.0 GeV/nucleon from the TIGER-2001 Flight – 64

## NITRIC OXIDE

UV Induced Oxidation of Nitric Oxide – 18

## NITROGEN 15

N-15 NMR Spectroscopy as a Method for Comparing the Rates of Imidization of Several Diamines – 19

## NOESS

Polar-Orbiting Operational Environmental Satellites: Restructuring Is Under Way, but Technical Challenges and Risks Remain – 62

## NOISE REDUCTION

Screening of Potential Landing Gear Noise Control Devices at Virginia Tech For QTD II Flight Test – 5

Shaped Sonic Boom Demonstration/Experiment Airborne Data – 5

## NOISE (SOUND)

JMR Noise Diode Stability and Recalibration Methodology after Three Years On-Orbit – 58

## NUCLEAR ELECTRIC POWER GENERATION

Developmental Considerations on the Free-piston Stirling Power Converter for Use in Space – 13

Status of the NASA Stirling Radioisotope Project – 32

## NUCLEAR ELECTRIC PROPULSION

Discharge Chamber Performance of the NEXIS Ion Thruster – 60

## NUCLEAR MAGNETIC RESONANCE

N-15 NMR Spectroscopy as a Method for Comparing the Rates of Imidization of Several Diamines – 19

## NUCLEONS

Co/Ni Ratio Between Is Approximately 0.35 - 8.0 GeV/nucleon from the TIGER-2001 Flight – 64

## NULL ZONES

A Nulling Coronagraph for TPF-C – 31

Adaptive Nulling for the Terrestrial Planet Finder Interferometer – 31

## O STARS

Far-ultraviolet Spectroscopy of O+O Binaries in the Magellanic Clouds – 63

## OBSERVATORIES

L2 Earth Atmosphere Observatory: Formation Guidance, Metrology and Control Synthesis – 11

National Optical Astronomy Observatory/National Solar Observatory Newsletter: Issue 89 – 62

## OCEAN MODELS

A Duality Between Forward and Adjoint MPI Communication Routines – 54

Improving Assimilation of SeaWiFS Data by the Application of Bias Correction with a Local SEIK Filter – 41

## OCEANOGRAPHIC PARAMETERS

Improving Assimilation of SeaWiFS Data by the Application of Bias Correction with a Local SEIK Filter – 42

## OCEANS

JMR Noise Diode Stability and Recalibration Methodology after Three Years On-Orbit – 58

Promoting Lifelong Ocean Education-2 Years Later: Charting Progress and Adjusting Course – 48

## OPTICAL COMMUNICATION

Coherent Optical Receiver for PPM Signals under Atmospheric Turbulence – 10

## OPTICAL RADAR

Airborne Validation of Spatial Properties Measured by the CALIPSO Lidar – 44

Compact and Rugged Transceiver for Coherent Doppler Wind Lidar Applications in Space – 32

## OPTICAL WAVEGUIDES

Vertically-coupled Whispering Gallery Mode Resonator Optical Waveguide, and Methods – 59

## OPTOELECTRONIC DEVICES

Device Concepts Based on Spin-dependent Transmission in Semiconductor Heterostructures – 61

## ORBIT DETERMINATION

Spitzer Orbit Determination During In-orbit Checkout Phase – 9

## ORGANIC MATERIALS

Submicrometer Organic Grains: Widespread Constituents of the Early Solar System – 70

## OSCILLATIONS

Determination of Black Hole Mass in Cyg X-1 by Scaling of Spectral Index-QPO Frequency Correlation – 65

## OXIDATION

Oxidation Through Coating Cracks of SiC-Protected Carbon/Carbon – 17

UV Induced Oxidation of Nitric Oxide – 18

## OXIDES

Thermal Properties of Oxides With Magnetoplumbite Structure for Advanced Thermal Barrier Coatings – 15

## OXYGEN ATOMS

Scattered Atomic Oxygen Effects on Spacecraft Materials – 11

## PANELS

Failure Maps for Rectangular 17-4PH Stainless Steel Sandwiched Foam Panels – 4

## PARABOLIC REFLECTORS

Large Phased Array Radar Using Networked Small Parabolic Reflectors – 23

## PARALLEL PROGRAMMING

A Duality Between Forward and Adjoint MPI Communication Routines – 54

## PARITY

Ensemble Weight Enumerators for Protograph LDPC Codes – 55

## PARTICLE DECAY

Evidence of the Exponential Decay Emission in the Swift Gamma-ray Bursts – 66

## PAYLOAD CONTROL

Autonomous Payload Operations Onboard the International Space Station – 20

## PAYLOADS

Autonomous Payload Operations Onboard the International Space Station – 20

## PERFORMANCE TESTS

A Compact 600 GHz Electronically Tunable Vector Measurement System for Submillimeter Wave Imaging – 23

Operational Use of the Air Traffic Selection and Training Battery – 62

## PERIODIC VARIATIONS

Determination of Black Hole Mass in Cyg X-1 by Scaling of Spectral Index-QPO Frequency Correlation – 65

## PERSONNEL SELECTION

Operational Use of the Air Traffic Selection and Training Battery – 62

## PETROLOGY

The Formation and Chronology of the PAT 91501 Impact-Melt L-Chondrite with Vesicle-Metal-Sulfide Assemblages – 71

## PHARMACOLOGY

Space Environment Effects on Stability of Medications Flown on Space Shuttles and the International Space Station (ISS) – 50

## PHASE MODULATION

Real-time Signal-to-noise Ratio (SNR) Estimation for BPSK and QPSK Modulation Using the Active Communications Channel – 21

## PHASED ARRAYS

Large Phased Array Radar Using Networked Small Parabolic Reflectors – 23

## PHOTOSYNTHETICALLY ACTIVE RADIATION

Analysis of Leaf Area Index and Fraction of PAR Absorbed by Vegetation Products from the Terra MODIS Sensor: 2000-2005 – 41

## PHYSICAL SCIENCES

International Space Station Research: Accomplishments and Pathways for Exploration and Fundamental Research – 70

## PHYSIOLOGICAL EFFECTS

First-Generation H1 Antihistamines Found in Pilot Fatalities of Civil Aviation Accidents, 1990-2005 – 51

Preliminary Assessment of Artificial Gravity Impacts to Deep-Space Vehicle Design – 52

## PIEZOELECTRICITY

Method of Fabricating a Composite Apparatus – 16

## PILOT ERROR

Real-time Affective Indices of Potential CRM Breakdown: Qualitative Testing of an Operational Hypothesis – 2

## PILOT SUPPORT SYSTEMS

Real Time Analysis and Display of Aircraft Approach Maneuvers – 7

## PILOTLESS AIRCRAFT

An Analysis of Fuel Cell Options for an All-electric Unmanned Aerial Vehicle – 20

Autonomous Soaring 2005 Flight Data Summary – 3

NASA Global Hawk: A Unique Capability for the Pursuit of Earth Science – 40

## PILOTS (PERSONNEL)

Real-time Affective Indices of Potential CRM Breakdown: Qualitative Testing of an Operational Hypothesis – 2

## PISTON ENGINES

Developmental Considerations on the Free-piston Stirling Power Converter for Use in Space – 13

## PIXELS

Terrestrial Planet Finder Interferometer Technology Status and Plans – 72

## PLANETARY EVOLUTION

A Roadmap for NASA's Search for Other Earths – 53

## PLANETARY SYSTEMS

A Roadmap for NASA's Search for Other Earths – 53

## PLASMA DYNAMICS

A Review of Hypersonics Aerodynamics, Aerothermodynamics and Plasmadynamics Activities within NASA's Fundamental Aeronautics Program – 1

## PLASMA JETS

Discharge Chamber Performance of the NEXIS Ion Thruster – 60

## PLASMA PHYSICS

Chaotic Motion of Relativistic Electrons Driven by Whistler Waves – 61

## PLASMA POTENTIALS

Experimentally Determined Plasma Parameters in a 30 cm Ion Engine – 60

## PLATINUM

Catalytic Ignition and Upstream Reaction Propagation in a Platinum Tube – 19

## PNEUMATIC PROBES

Hollow Cathode and Keeper-region Plasma Measurements Using Ultra-fast Miniature Scanning Probes – 25

## POLYIMIDES

N-15 NMR Spectroscopy as a Method for Comparing the Rates of Imidization of Several Diamines – 19

## POLYMERIZATION

N-15 NMR Spectroscopy as a Method for Comparing the Rates of Imidization of Several Diamines – 19

## POLYNOMIALS

Method for Constructing Composite Response Surfaces by Combining Neural Networks with Polynomial Interpolation or Estimation Techniques – 8

## POPULATIONS

Stardust Entry: Landing and Population Hazards in Mission Planning and Operations – 10

## POSITION (LOCATION)

System and Method for Detecting Cracks and their Location – 35

## POSITIONING

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 2

## POSITION

System and Method for Detecting Cracks and their Location – 35

## POWER CONVERTERS

Developmental Considerations on the Free-piston Stirling Power Converter for Use in Space – 13

The Pulse Width Modulator ASIC for Deep Space Missions – 26

## POWER SUPPLIES

Low Power, High Voltage Power Supply with Fast Rise/Fall Time – 24

## PRECIPITATION MEASUREMENT

Combined Radar and Radiometer Analysis of Precipitation Profiles for a Parametric Retrieval Algorithm – 42

Toward a Global Map of Raindrop Size Distributions – 47

## PRECIPITATION (METEOROLOGY)

Combined Radar and Radiometer Analysis of Precipitation Profiles for a Parametric Retrieval Algorithm – 42

Recent Advances in Spaceborne Precipitation Radar Measurement Techniques and Technology – 46

Toward a Global Map of Raindrop Size Distributions – 47

Using Multi-scale Modeling Systems to Study the Precipitation Processes – 46

## PRECIPITATION PARTICLE MEASUREMENT

Toward a Global Map of Raindrop Size Distributions – 47

## PREDICTIONS

Complexity Computational Environment: Data Assimilation SERVGrid – 35

## PRESSURE VESSELS

A Comparison of Various Stress Rupture Life Models for Orbiter Composite Pressure Vessels and Confidence Intervals – 17

Stress Rupture Life Reliability Measures for Composite Overwrapped Pressure Vessels – 17

## PRODUCTION PLANNING

Orion-CEV Project Overview To the NASA Sports and Exploration 'Kick-Off' Meeting – 12

## PROGRAMMING

Programmable Thermostat Module Upgrade for the Multipurpose Logistics Module – 12

## PROJECT PLANNING

Polar-Orbiting Operational Environmental Satellites: Restructuring Is Under Way, but Technical Challenges and Risks Remain – 62

## PROPELLANT TANKS

An Overview of Demise Calculations, Conceptual Design Studies, and Hydrazine Compatibility Testing for the GPM Core Spacecraft Propellant Tank – 11

## PROPULSION SYSTEM CONFIGURATIONS

Mars Exploration Rovers Propulsive Maneuver Design – 14

Oil-Free Rotor Support Technologies for an Optimized Helicopter Propulsion System – 7

## PROPULSION

Microthrust Propulsion of the LISA Mission – 14

## PROTOCOL (COMPUTERS)

Transferring Files Between the Deep Impact Spacecrafts and the Ground Data System Using the CCSDS File Delivery Protocol (CFDP): A Case Study – 22

## PROTOTYPES

The QuakeSim Project: Numerical Simulations for Active Tectonic Processes – 45

Usability Study of Two Collocated Prototype System Displays – 52

## PROVING

Validation of GOES-10 Satellite-derived Cloud and Radiative Properties for the MASRAD ARM Mobile Facility Deployment – 36

Verifying AI Plan Models: Even the Best Laid Plans Need to be Verified – 56

## PULSE DURATION

The Pulse Width Modulator ASIC for Deep Space Missions – 26

## PULSE POSITION MODULATION

Coherent Optical Receiver for PPM Signals under Atmospheric Turbulence – 10

## QUADRATURE PHASE SHIFT KEYING

Real-time Signal-to-noise Ratio (SNR) Estimation for BPSK and QPSK Modulation Using the Active Communications Channel – 21

## QUALIFICATIONS

Operational Use of the Air Traffic Selection and Training Battery – 62

Qualification and Reliability for MEMS and IC Packages – 26

## QUANTITATIVE ANALYSIS

Modeling and Analysis of Space Based Transceivers – 21

## RADAR MEASUREMENT

Recent Advances in Spaceborne Precipitation Radar Measurement Techniques and Technology – 46

## RADIATION DISTRIBUTION

Near Field Radiation Characteristics of Implantable Square Spiral Chip Inductor Antennas for Bio-Sensors – 22

## RADIATION DOSAGE

Finding Uncertainties that Cause the Age Dependence of Dose Limits to Be Immature – 74

## RADIATION MEASUREMENT

The Continuous Intercomparison of Radiation Codes (CIRC): Phase I Cases – 47

## RADIATIVE TRANSFER

The Continuous Intercomparison of Radiation Codes (CIRC): Phase I Cases – 47

## RADIO ASTRONOMY

Design of a Wideband 900 GHz Balanced Frequency Tripler for Radioastronomy – 25

## RADIO EMISSION

The Suzaku Observation of the Nucleus of the Radio Loud Active Galaxy Centaurus A: Constraints on Abundances in the Accreting Material – 66

## RADIO FREQUENCIES

Airborne RF Measurement System (ARMS) and Analysis of Representative Flight RF Environment – 23

## RADIOISOTOPE HEAT SOURCES

Developmental Considerations on the Free-piston Stirling Power Converter for Use in Space – 13

Final Results for the GRC Supporting Technology Development Project for the 110-Watt Stirling Radioisotope Generator (SRG110) – 13

Status of the NASA Stirling Radioisotope Project – 32

## RADIOMETERS

Effects of RAM Exposure on a Low Earth Orbit BroadBand Radiometer (BBR): CERES Experience and Implications for EarthCARE – 74

## RAIN FORESTS

Theorizing Land Cover and Land Use Changes: The Case of Tropical Deforestation – 36

## RAINDROPS

Toward a Global Map of Raindrop Size Distributions – 47

## RAINSTORMS

Midweek Increase in U.S. Summer Rain and Storm Heights, Suggests Air Pollution Invigorates Rainstorms – 45

## RAIN

Combined Radar and Radiometer Analysis of Precipitation Profiles for a Parametric Retrieval Algorithm – 42

Toward a Global Map of Raindrop Size Distributions – 47

## REACTIVITY

N-15 NMR Spectroscopy as a Method for Comparing the Rates of Imidization of Several Diamines – 19

## REAL TIME OPERATION

Real Time Analysis and Display of Aircraft Approach Maneuvers – 7

## RECEIVERS

Coherent Optical Receiver for PPM Signals under Atmospheric Turbulence – 10

## RECOILINGS

Recoiling from a Kick in the Head-On Case – 65

## REENTRY

An Overview of Demise Calculations, Conceptual Design Studies, and Hydrazine Compatibility Testing for the GPM Core Spacecraft Propellant Tank – 11

## REFLECTANCE

3D Aerosol-Cloud Radiative Interaction Observed in Collocated MODIS and ASTER Images of Cumulus Cloud Fields – 43

## REGIONS

Promoting Lifelong Ocean Education-2 Years Later: Charting Progress and Adjusting Course – 48

## REGISTERS (COMPUTERS)

Frequency Dependence of Single-event Upset in Advanced Commercial PowerPC Microprocessors – 27

## RELATIVISTIC PARTICLES

Chaotic Motion of Relativistic Electrons Driven by Whistler Waves – 61

## RELATIVITY

Testing Special Relativity at High Energies with Astrophysical Sources – 68

## RELIABILITY ANALYSIS

Qualification and Reliability for MEMS and IC Packages – 26

## RELIABILITY

Stress Rupture Life Reliability Measures for Composite Overwrapped Pressure Vessels – 18

## REMOTE SENSING

Airborne Validation of Spatial Properties Measured by the CALIPSO Lidar – 44

Combined Radar and Radiometer Analysis of Precipitation Profiles for a Parametric Retrieval Algorithm – 42

Effects of RAM Exposure on a Low Earth Orbit BroadBand Radiometer (BBR): CERES Experience and Implications for EarthCARE – 73

NASA Global Hawk: A Unique Capability for the Pursuit of Earth Science – 40

Progress in Modeling Global Atmospheric CO<sub>2</sub> Fluxes and Transport: Results from Simulations with Diurnal Fluxes – 40

Theorizing Land Cover and Land Use Change: The Peasant Economy of Colonization in the Amazon Basin – 38

Validation of GOES-10 Satellite-derived Cloud and Radiative Properties for the MASRAD ARM Mobile Facility Deployment – 35

## REMOTELY PILOTED VEHICLES

Autonomous Soaring 2005 Flight Data Summary – 4

## RESEARCH AIRCRAFT

Six Decades of Flight Research: An Annotated Bibliography of Technical Publications of NASA Dryden Flight Research Center, 1946-2006 – 74

## RESEARCH AND DEVELOPMENT

International Space Station Research: Accomplishments and Pathways for Exploration and Fundamental Research – 70

Six Decades of Flight Research: An Annotated Bibliography of Technical Publications of NASA Dryden Flight Research Center, 1946-2006 – 74

The Constellation-X Mission: Science Prospects and Technology Challenges – 66

## RESEARCH FACILITIES

Science on the International Space Station: Stepping Stones for Exploration – 9

## RESIN MATRIX COMPOSITES

Double Vacuum Bag Process for Resin Matrix Composite Manufacturing – 16

## RESONANCE

Magnetic Field Response Measurement Acquisition System – 30

## RESONATORS

Vertically-coupled Whispering Gallery Mode Resonator Optical Waveguide, and Methods – 59

## RESOURCES MANAGEMENT

Real-time Affective Indices of Potential CRM Breakdown: Qualitative Testing of an Operational Hypothesis – 2

## RISK

Land Use and Land Cover Change in Forest Frontiers: The Role of Household Life Cycles – 37

## RIVER BASINS

Statistical Aspects of the North Atlantic Basin Tropical Cyclones: Trends, Natural Variability, and Global Warming – 45

## ROADS

Loggers and Forest Fragmentation: Behavioral Models of Road Building in the Amazon Basin – 39

Roads Investments, Spatial Intensification and Deforestation in the Brazilian Amazon – 37

Unofficial Road Building in the Amazon: Socioeconomic and Biophysical Explanations – 40

Unofficial Road Building in the Brazilian Amazon: Dilemmas and Models for Road Governance – 39

## ROBOTICS

Mars Exploration Rovers Propulsive Maneuver Design – 14

Reduction of User Interaction by Autonomy – 55

Towards Autonomous Inspection of Space Systems Using Mobile Robotic Sensor Platforms – 56

## ROBOTS

Reduction of User Interaction by Autonomy – 56

## ROTARY WING AIRCRAFT

A Sequential Shifting Algorithm for Variable Rotor Speed Control – 6

Oil-Free Rotor Support Technologies for an Optimized Helicopter Propulsion System – 7

## ROTOR SPEED

A Sequential Shifting Algorithm for Variable Rotor Speed Control – 6

## RUGGEDNESS

Compact and Rugged Transceiver for Coherent Doppler Wind Lidar Applications in Space – 32

## RUPTURING

Surface Ruptures and Building Damage of the 2003 Bam, Iran, Earthquake Mapped by Satellite Synthetic Aperture Radar Interferometric Correlation – 44

## SANDWICH STRUCTURES

Failure Maps for Rectangular 17-4PH Stainless Steel Sandwiched Foam Panels – 4

## SATELLITE COMMUNICATION

Coherent Optical Receiver for PPM Signals under Atmospheric Turbulence – 10

## SATELLITE INSTRUMENTS

Airborne Validation of Spatial Properties Measured by the CALIPSO Lidar – 44

## SATELLITE OBSERVATION

Airborne Validation of Spatial Properties Measured by the CALIPSO Lidar – 44

Combined Radar and Radiometer Analysis of Precipitation Profiles for a Parametric Retrieval Algorithm – 42

L2 Earth Atmosphere Observatory: Formation Guidance, Metrology and Control Synthesis – 11

Validation of GOES-10 Satellite-derived Cloud and Radiative Properties for the MASRAD ARM Mobile Facility Deployment – 35

## SATELLITE TRACKING

Spitzer Orbit Determination During In-orbit Checkout Phase – 9

## SCALE MODELS

Using Multi-scale Modeling Systems to Study the Precipitation Processes – 46

## SCANNERS

Hollow Cathode and Keeper-region Plasma Measurements Using Ultra-fast Miniature Scanning Probes – 25

## SCHEDULES

Orion-CEV Project Overview To the NASA Sports and Exploration 'Kick-Off' Meeting – 12

Polar-Orbiting Operational Environmental Satellites: Restructuring Is Under Way, but Technical Challenges and Risks Remain – 61

## SCHEDULING

Mars Exploration Rover Operations with the Science Activity Planner – 56

## SCHOTTKY DIODES

Design of a Wideband 6-Anode Frequency Tripler at 300 GHz with Optimum Balance – 27

## SEA WATER

Analysis of the Effects of Sea Disposal on a One-Ton Container – 34

## SEATS

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 2

## SEA-VIEWING WIDE FIELD-OF-VIEW SENSOR

Improving Assimilation of SeaWiFS Data by the Application of Bias Correction with a Local SEIK Filter – 42

## SEISMOLOGY

Complexity Computational Environment: Data Assimilation SERVGrid – 35

## SEMICONDUCTOR JUNCTIONS

Gap/silicon Tandem Solar Cell with Extended Temperature Range – 61

## SEMICONDUCTOR LASERS

Fiber Coupled Laser Diodes with Even Illumination Pattern – 32

## SEMICONDUCTORS (MATERIALS)

Device Concepts Based on Spin-dependent Transmission in Semiconductor Heterostructures – 61

## SENSORS

Carbon Nanotube-based Sensor and Method for Continually Sensing Changes in a Structure – 24

Towards Autonomous Inspection of Space Systems Using Mobile Robotic Sensor Platforms – 56

## SEQUENTIAL CONTROL

A Sequential Shifting Algorithm for Variable Rotor Speed Control – 6

## SEYFERT GALAXIES

Relativistic Iron K Emission and Absorption in the Seyfert 1.9 Galaxy MCG-05-23-16 – 68

## SHAPES

Shaped Sonic Boom Demonstration/Experiment Airborne Data – 5

## SHOCK WAVES

Nonstandard Analysis and Shock Wave Jump Conditions in a One-Dimensional Compressible Gas – 28

## SIGNAL TO NOISE RATIOS

Real-time Signal-to-noise Ratio (SNR) Estimation for BPSK and QPSK Modulation Using the Active Communications Channel – 21

## SILICON CARBIDES

Oxidation Through Coating Cracks of SiC-Protected Carbon/Carbon – 17

## SILICON DIOXIDE

Templated Growth of Carbon Nanotubes – 18

## SIMULATION

Authority and Responsibility of the Dismounted Soldier, Part B: Improving the Situational Awareness Using the Soldier Digital Assistant in a Simulated Environment. – 55

Lunar Simulation in the Lunar Dust Adhesion Bell Jar – 70

Progress in Modeling Global Atmospheric CO<sub>2</sub> Fluxes and Transport: Results from Simulations with Diurnal Fluxes – 40

## SINGLE EVENT UPSETS

Frequency Dependence of Single-event Upset in Advanced Commercial PowerPC Microprocessors – 27

## SITUATIONAL AWARENESS

Authority and Responsibility of the Dismounted Soldier, Part B: Improving the Situational Awareness Using the Soldier Digital Assistant in a Simulated Environment. – 55

## SIZE DISTRIBUTION

Toward a Global Map of Raindrop Size Distributions – 47

## SOARING

Autonomous Soaring 2005 Flight Data Summary – 4

## SOCIOLOGY

Unofficial Road Building in the Amazon: Socioeconomic and Biophysical Explanations – 40

## SOFTWARE ENGINEERING

Deductive Glue Code Synthesis for Embedded Software Systems Based on Code Patterns – 54

Modeling and Analysis of Space Based Transceivers – 21

## SOLAR CELLS

Gap/silicon Tandem Solar Cell with Extended Temperature Range – 61

## SOLAR CYCLES

Cosmic Ray Helium Intensities over the Solar Cycle from ACE – 64

IMP 8 GME Particle Observations Over Three Solar Cycles – 73

MeV Ion Anisotropies in the Vicinity of Interplanetary Shocks – 43

## SOLAR OBSERVATORIES

National Optical Astronomy Observatory/National Solar Observatory Newsletter: Issue 89 – 62

## SOLAR SYSTEM

Imaging and Spectroscopy with the James Webb Space Telescope – 63

Near Sun Free-Space Optical Communications from Space – 72

New Frontiers for Massive Star Winds: Imaging and Spectroscopy with the James Webb Space Telescope – 63

Submicrometer Organic Grains: Widespread Constituents of the Early Solar System – 69

## SOLID OXIDE FUEL CELLS

An Analysis of Fuel Cell Options for an All-electric Unmanned Aerial Vehicle – 20

## SONIC BOOMS

Shaped Sonic Boom Demonstration/Experiment Airborne Data – 5

## SONOGRAMS

Evaluating Trauma Sonography for Operational Use in the Microgravity Environment – 51

## SPACE DEBRIS

Orbital Debris Environment Assessment and Mitigation for Launch Vehicles – 9

## SPACE EXPLORATION

Human Challenges in Exploration Missions – 51

International Space Station Research: Accomplishments and Pathways for Exploration and Fundamental Research – 70

Science on the International Space Station: Stepping Stones for Exploration – 9

## SPACE FLIGHT

Six Decades of Flight Research: An Annotated Bibliography of Technical Publications of NASA Dryden Flight Research Center, 1946-2006 – 75

## SPACE HABITATS

Human Challenges in Exploration Missions – 51

## SPACE INFRARED TELESCOPE FACILITY

An Integrated Optimal Estimation Approach to Spitzer Space Telescope Focal Plane Survey – 59

Spitzer Orbit Determination During In-orbit Checkout Phase – 8

## SPACE LABORATORIES

Science on the International Space Station: Stepping Stones for Exploration – 9

## SPACE LOGISTICS

Programmable Thermostat Module Upgrade for the Multipurpose Logistics Module – 12

## SPACE MISSIONS

Developing Fault Models for Space Mission Software – 53

Planetary Mission Entry Vehicles Quick Reference Guide. Version 3.0 – 69

Space Technology-5 (ST-5) Li-Ion Battery Build and Performance – 23

The Constellation-X Mission: Science Prospects and Technology Challenges – 66

## SPACE PLATFORMS

Towards Autonomous Inspection of Space Systems Using Mobile Robotic Sensor Platforms – 57

## SPACE PROBES

Near Sun Free-Space Optical Communications from Space – 72

## SPACE PSYCHOLOGY

Human Challenges in Exploration Missions – 51

## SPACE SHUTTLE MISSIONS

Constellation Program Mission Operations Project Office Status and Support Philosophy – 72

## SPACE SHUTTLE ORBITERS

A Comparison of Various Stress Rupture Life Models for Orbiter Composite Pressure Vessels and Confidence Intervals – 17

Orbiter Entry Aeroheating Working Group Viscous CFD Boundary Layer Transition Trailblazer Solutions – 29

## SPACE SHUTTLES

Space Environment Effects on Stability of Medications Flown on Space Shuttles and the International Space Station (ISS) – 50

## SPACE STATION POLAR PLATFORMS

Polar-Orbiting Operational Environmental Satellites: Restructuring Is Under Way, but Technical Challenges and Risks Remain – 62

## SPACE TRANSPORTATION SYSTEM

Towards Autonomous Inspection of Space Systems Using Mobile Robotic Sensor Platforms – 57

## SPACEBORNE TELESCOPES

L2 Earth Atmosphere Observatory: Formation Guidance, Metrology and Control Synthesis – 11

## SPACECRAFT BREAKUP

Orbital Debris Environment Assessment and Mitigation for Launch Vehicles – 9

## SPACECRAFT CONFIGURATIONS

Planetary Mission Entry Vehicles Quick Reference Guide, Version 3.0 – 69

## SPACECRAFT CONSTRUCTION MATERIALS

An Overview of Demise Calculations, Conceptual Design Studies, and Hydrazine Compatibility Testing for the GPM Core Spacecraft Propellant Tank – 11

## SPACECRAFT CONTROL

Open-systems Architecture of a Standardized Command Interface Chip-set for Switching and Control of a Spacecraft Power Bus – 55

## SPACECRAFT DESIGN

Mars Exploration Rovers Propulsive Maneuver Design – 14

Planetary Mission Entry Vehicles Quick Reference Guide, Version 3.0 – 69

## SPACECRAFT ENVIRONMENTS

A Portable Universal Hazardous Gas Detector – 53

## SPACECRAFT INSTRUMENTS

Volatile Organic Analyzer (VOA) in 2006: Repair, Revalidation, and Restart of Elektron Event – 34

## SPACECRAFT MANEUVERS

Mars Exploration Rovers Propulsive Maneuver Design – 14

## SPACECRAFT ORBITS

Microthrust Propulsion of the LISA Mission – 14

## SPACECRAFT POWER SUPPLIES

New Generation Power System for Space Applications – 14

## SPACECRAFT PROPULSION

Microthrust Propulsion of the LISA Mission – 14

## SPACECRAFT REENTRY

Orbital Debris Environment Assessment and Mitigation for Launch Vehicles – 9

Orbiter Entry Aeroheating Working Group Viscous CFD Boundary Layer Transition Trailblazer Solutions – 29

## SPACECRAFT TEMPERATURE

Spitzer Orbit Determination During In-orbit Checkout Phase – 9

## SPACECRAFT

An Overview of Demise Calculations, Conceptual Design Studies, and Hydrazine Compatibility Testing for the GPM Core Spacecraft Propellant Tank – 11

## SPACECREWS

Human Challenges in Exploration Missions – 51

## SPATIAL DISTRIBUTION

Airborne Validation of Spatial Properties Measured by the CALIPSO Lidar – 44

## SPECTROMETERS

Cosmic Ray Helium Intensities over the Solar Cycle from ACE – 64

## SPECTROSCOPY

Imaging and Spectroscopy with the James Webb Space Telescope – 63

New Frontiers for Massive Star Winds: Imaging and Spectroscopy with the James Webb Space Telescope – 63

## SPECTRUM ANALYSIS

Airborne RF Measurement System (ARMS) and Analysis of Representative Flight RF Environment – 23

Evidence of the Exponential Decay Emission in the Swift Gamma-ray Bursts – 66

## SPEED CONTROL

A Sequential Shifting Algorithm for Variable Rotor Speed Control – 6

## SPIN-ORBIT INTERACTIONS

Recoiling from a Kick in the Head-On Case – 65

## SPIN

Device Concepts Based on Spin-dependent Transmission in Semiconductor Heterostructures – 61

## SPIRAL ANTENNAS

Near Field Radiation Characteristics of Implantable Square Spiral Chip Inductor Antennas for Bio-Sensors – 22

## STAINLESS STEELS

Failure Maps for Rectangular 17-4PH Stainless Steel Sandwiched Foam Panels – 4

## STANDARDS

Developing Carbon Nanotube Standards at NASA – 16

## STAR CLUSTERS

The Intrinsic Properties of the Stellar Clusters in the M82 Starburst Complex: Propagating Star Formation? – 69

## STAR FORMATION

The Intrinsic Properties of the Stellar Clusters in the M82 Starburst Complex: Propagating Star Formation? – 69

## STARBURST GALAXIES

The Intrinsic Properties of the Stellar Clusters in the M82 Starburst Complex: Propagating Star Formation? – 69

## STARDUST MISSION

Stardust Entry: Landing and Population Hazards in Mission Planning and Operations – 10

## STATISTICAL ANALYSIS

Upward Flame Propagation and Wire Insulation Flammability: 2006 Round Robin Data Analysis – 15

## STELLAR EVOLUTION

Eta Carinae and Other Luminous Blue Variables – 68

The Intrinsic Properties of the Stellar Clusters in the M82 Starburst Complex: Propagating Star Formation? – 69

## STELLAR WINDS

New Frontiers for Massive Star Winds: Imaging and Spectroscopy with the James Webb Space Telescope – 63

## STIRLING CYCLE

Final Results for the GRC Supporting Technology Development Project for the 110-Watt Stirling Radioisotope Generator (SRG110) – 13

## STIRLING ENGINES

Final Results for the GRC Supporting Technology Development Project for the 110-Watt Stirling Radioisotope Generator (SRG110) – 13

Status of the NASA Stirling Radioisotope Project – 32

## STOCHASTIC PROCESSES

Chaotic Motion of Relativistic Electrons Driven by Whistler Waves – 61

## STORAGE STABILITY

Space Environment Effects on Stability of Medications Flown on Space Shuttles and the International Space Station (ISS) – 50

## STRATIFICATION

Land-Cover and Land-Use Change in the Brazilian Amazon: Smallholders, Ranchers and Frontier Stratification – 39

## STRUCTURAL ANALYSIS

Analysis of the Effects of Sea Disposal on a One-Ton Container – 34

## STRUCTURAL STRAIN

System and Method for Detecting Cracks and their Location – 35

## SUBMILLIMETER WAVES

A Compact 600 GHz Electronically Tunable Vector Measurement System for Submillimeter Wave Imaging – 23

- Progress on Background-Limited Membrane-Isolated TES Bolometers for Far-IR/Submillimeter Spectroscopy – 31
- SULFIDES**  
The Formation and Chronology of the PAT 91501 Impact-Melt L-Chondrite with Vesicle-Metal-Sulfide Assemblages – 71
- SUMMER**  
Midweek Increase in U.S. Summer Rain and Storm Heights, Suggests Air Pollution Invigorates Rainstorms – 45
