## NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA scientific and technical information (STI) program plays a key part in helping NASA maintain this important role.

The NASA STI program operates under the auspices of the Agency Chief Information Officer. It collects, organizes, provides for archiving, and disseminates NASA's STI. The NASA STI program provides access to the NASA Aeronautics and Space Database and its public interface, the NASA Technical Report Server, thus providing one of the largest collections of aeronautical and space science STI in the world. Results are published in both non-NASA channels and by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA Programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services also include creating custom thesauri, building customized databases, and organizing and publishing research results.

For more information about the NASA STI program, see the following:

# Introduction

*Scientific and Technical Aerospace Reports (STAR)* is an online information resource listing citations and abstracts of NASA and worldwide aerospace-related scientific and technical information (STI). Updated biweekly, *STAR* highlights the most recent additions to the NASA Aeronautics and Space Database. Through this resource, the NASA STI Program provides timely access to the most current aerospace-related research and development (R&D) results.

*STAR* subject coverage includes all aspects of aeronautics and space research and development, supporting basic and applied research, and application, as well as aerospace aspects of Earth resources, energy development, conservation, oceanography, environmental protection, urban transportation and other topics of high national priority. The listing is arranged first by 11 broad subject divisions, then within these divisions by 76 subject categories and includes two indexes: subject and author.

*STAR* includes citations to R&D results reported in:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institution, universities, and private firms
- Translations
- NASA-owned patents and patent applications
- Other U.S. Government agency and foreign patents and patent applications
- Domestic and foreign dissertations and theses

## The NASA STI Program

The NASA STI Program was established to support the objectives of NASA's missions and research to advance aeronautics and space science. By sharing information, the NASA STI Program ensures that the U.S. maintains its preeminence in aerospace-related industries and education, minimizes duplication of research, and increases research productivity.

Through the NASA Center for AeroSpace Information (CASI), the NASA STI Program acquires, processes, archives, announces, and disseminates both NASA's internal STI and world-wide STI. The results of 20th and 21st century aeronautics and aerospace research and development, a worldwide investment totaling billions of dollars, have been captured, organized, and stored in the NASA Aeronautics and Space Database. New information is continually announced and made available as it is acquired, making this a dynamic and historical collection of value to business, industry, academia, federal institutions, and the general public.

The STI Program offers products and tools that allow efficient access to the wealth of information derived from global R&D efforts. In addition, customized services are available to help tailor this valuable resource to meet your specific needs.

For more information on the most up-to-date NASA STI, visit the STI Program's Web site at <http://www.sti.nasa.gov>.

# NASA STI Availability Information

## NASA Center for AeroSpace Information (CASI)

Through NASA CASI, the NASA STI Program offers many information products and services to the aerospace community and to the public, including access to a selection of full text of the NASA STI. Free registration with the program is available to NASA, U.S. Government agencies and contractors. To register, contact CASI at [help@sti.nasa.gov](mailto:help@sti.nasa.gov). Others should visit the program at [www.sti.nasa.gov](http://www.sti.nasa.gov). The 'search selected databases' button provides access to the NASA Technical Reports Server (NTRS) – the publicly available contents of the NASA Aeronautics and Space Database.

Each citation in *STAR* indicates a 'Source of Availability.' When CASI is indicated, the user can order this information directly from CASI using the [STI Online Order Form](#), e-mail to [help@sti.nasa.gov](mailto:help@sti.nasa.gov), or telephone the STI Help Desk at 301-621-0390. Before ordering you may access [price code tables](#) for STI documents and videos. When information is not available from CASI, the source of the information is indicated when known.

NASA STI is also available to the public through Federal information organizations. NASA CASI disseminates publicly available NASA STI to the National Technical Information Service (NTIS) and to the Federal Depository Library Program (FDLP) through the Government Printing Office (GPO). In addition, NASA patents are available online from the U.S. Patent and Trademark Office.

## National Technical Information Service (NTIS)

The National Technical Information Service serves the American public as a central resource for unlimited, unclassified U.S. Government scientific, technical, engineering, and business related information. For more than 50 years NTIS has provided businesses, universities, and the public timely access to well over 2 million publications covering over 350 subject areas. Visit NTIS at <http://www.ntis.gov>.

## The Federal Depository Library Program (FDLP)

The U.S. Congress established the **Federal Depository Library Program** to ensure access for the American public to U.S. Government information. The program acquires and disseminates information products from all three branches of the U.S. Government to nearly 1,300 Federal depository libraries nationwide. The libraries maintain these information products as part of their existing collections and are responsible for assuring that the public has free access to the information. Locate the Federal depository libraries at <http://www.gpoaccess.gov/index.html>.

## The U.S. Patent and Trademark Office (USPTO)

The U.S. Patent and Trademark Office provides online access to full text patents and patent applications. The database includes patents back to 1976 plus some pre-1975 patents. Visit the USPTO at <http://www.uspto.gov/patft/>.

# SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS

*A Biweekly Publication of the National Aeronautics and Space Administration*

---

VOLUME 46, NUMBER 03

FEBRUARY 18, 2008

01

## AERONAUTICS (GENERAL)

Includes general research topics related to manned and unmanned aircraft and the problems of flight within the Earth's atmosphere. Also includes manufacturing, maintenance, and repair of aircraft. For specific topics in aeronautics, see categories 02 through 09. For information related to space vehicles see 12 Astronautics.

**20080008563** NASA Langley Research Center, Hampton, VA, USA

### **Spatially Developing Secondary Instabilities and Attachment Line Instability in Supersonic Boundary Layers**

Li, Fei; Choudhari, Meelan M.; January 07, 2008; 20 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color illustrations

Contract(s)/Grant(s): WBS 984754

Report No.(s): AIAA Paper-2008-590; Copyright; Avail.: CASI: [A03](#), Hardcopy

This paper reports on progress towards developing a spatial stability code for compressible shear flows with two inhomogeneous directions, such as crossflow dominated swept-wing boundary layers and attachment line flows. Certain unique aspects of formulating a spatial, two-dimensional eigenvalue problem for the secondary instability of finite amplitude crossflow vortices are discussed. A primary test case used for parameter study corresponds to the low-speed, NLF-0415(b) airfoil configuration as tested in the ASU Unsteady Wind Tunnel, wherein a spanwise periodic array of roughness elements was placed near the leading edge in order to excite stationary crossflow modes with a specified fundamental wavelength. The two classes of flow conditions selected for this analysis include those for which the roughness array spacing corresponds to either the naturally dominant crossflow wavelength, or a subcritical wavelength that serves to reduce the growth of the naturally excited dominant crossflow modes. Numerical predictions are compared with the measured database, both as indirect validation for the spatial instability analysis and to provide a basis for comparison with a higher Reynolds number, supersonic swept-wing configuration. Application of the eigenvalue analysis to the supersonic configuration reveals that a broad spectrum of stationary crossflow modes can sustain sufficiently strong secondary instabilities as to potentially cause transition over this configuration. Implications of this finding for transition control in swept wing boundary layers are examined. Finally, extension of the spatial stability analysis to supersonic attachment line flows is also considered.

### **Bayesian Inference in the Modern Design of Experiments**

DeLoach, Richard; January 07, 2008; 26 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color illustrations

Contract(s)/Grant(s): WBS 122711.03.09.07.07; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008574>

This paper provides an elementary tutorial overview of Bayesian inference and its potential for application in aerospace experimentation in general and wind tunnel testing in particular. Bayes Theorem is reviewed and examples are provided to illustrate how it can be applied to objectively revise prior knowledge by incorporating insights subsequently obtained from additional observations, resulting in new (posterior) knowledge that combines information from both sources. A logical merger of Bayesian methods and certain aspects of Response Surface Modeling is explored. Specific applications to wind tunnel testing, computational code validation, and instrumentation calibration are discussed.

### **Recent Progress in Aircraft Noise Research**

Envia, Edmane; Thomas, Russell; October 16, 2007; 43 pp.; In English; Fundamental Aeronautics Annual Meeting, 30 Oct. - 1 Nov. 2007, New Orleans, LA, USA; Original contains color and black and white illustrations  
Contract(s)/Grant(s): WBS 561581.02.08.03.18.03; No Copyright; Avail.: CASI: [A03](#), Hardcopy  
ONLINE: <http://hdl.handle.net/2060/20080006600>

An overview of the acoustics research at NASA under the Subsonic Fixed Wing project is given. The presentation describes the rationale behind the noise reduction goals of the project in the context of the next generation air transportation system, and the emphasis placed on achieving these goals through a combination of the in-house and collaborative efforts with industry, universities and other government agencies. The presentation also describes the in-house research plan which is focused on the development of advanced noise and flow diagnostic techniques, next generation noise prediction tools, and novel noise reduction techniques that are applicable across a wide range of aircraft.

### **The Potential Benefits of Advanced Casing Treatment for Noise Attenuation in Ultra-High Bypass Ratio Turbofan Engines**

Elliott, David; December 2007; 17 pp.; In English; 35th International Congress and Exposition on Noise Control Engineering (INTER-NOISE 2006), 3-6 Dec. 2006, Honolulu, HI, USA; Original contains color and black and white illustrations  
Contract(s)/Grant(s): WBS 561581.02.08.03.03.01  
Report No.(s): NASA/TM-2007-214812; E-15967; No Copyright; Avail.: CASI: [A03](#), Hardcopy  
ONLINE: <http://hdl.handle.net/2060/20080006643>

In order to increase stall margin in a high-bypass ratio turbofan engine, an advanced casing treatment was developed that extracted a small amount of flow from the casing behind the fan and injected it back in front of the fan. Several different configurations of this casing treatment were designed by varying the distance of the extraction and injection points, as well as varying the amount of flow. These casing treatments were tested on a 55.9 cm (22 in.) scale model of the Pratt & Whitney Advanced Ducted Propulsor in the NASA Glenn 9 by 15 Low Speed Wind Tunnel. While all of the casing treatment configurations showed the expected increase in stall margin, a few of the designs showed a potential noise benefit for certain engine speeds. This paper will show the casing treatments and the results of the testing as well as propose further research in this area. With better prediction and design techniques, future casing treatment configurations could be developed that may result in an optimized casing treatment that could conceivably reduce the noise further.

### **Aerodynamic Analysis of Simulated Heat Shield Recession for the Orion Command Module**

January 07, 2008; 16 pp.; Original contains color and black and white illustrations; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The aerodynamic effects of the recession of the ablative thermal protection system for the Orion Command Module of the Crew Exploration Vehicle are important for the vehicle guidance. At the present time, the aerodynamic effects of recession being handled within the Orion aerodynamic database indirectly with an additional safety factor placed on the uncertainty bounds. This study is an initial attempt to quantify the effects for a particular set of recessed geometry shapes, in order to provide more rigorous analysis for managing recession effects within the aerodynamic database. The aerodynamic forces and moments for the baseline and recessed geometries were computed at several trajectory points using multiple CFD codes, both viscous and inviscid. The resulting aerodynamics for the baseline and recessed geometries were compared. The forces (lift, drag) show negligible differences between baseline and recessed geometries. Generally, the moments show a difference between baseline and recessed geometries that correlates with the maximum amount of recession of the geometry. The

difference between the pitching moments for the baseline and recessed geometries increases as Mach number decreases (and the recession is greater), and reach a value of -0.0026 for the lowest Mach number. The change in trim angle of attack increases from approx. 0.5deg at M = 28.7 to approx. 1.3deg at M = 6, and is consistent with a previous analysis with a lower fidelity engineering tool. This correlation of the present results with the engineering tool results supports the continued use of the engineering tool for future work. The present analysis suggests there does not need to be an uncertainty due to recession in the Orion aerodynamic database for the force quantities. The magnitude of the change in pitching moment due to recession is large enough to warrant inclusion in the aerodynamic database. An increment in the uncertainty for pitching moment could be calculated from these results and included in the development of the aerodynamic database uncertainty for pitching moment.

### **Breathing New Hope into Hypersonics**

Canan, James W.; Aerospace America; November 2007; ISSN 0740-722X, pp. 26-31; In English; Original contains black and white illustrations; Copyright; Avail.: Other Sources

Hypersonics technology development has faced many obstacles not, all of them technical. But interest in the field has increased following successful ground tests of the new NASA/DARPA/Air Force X-5 7A engine. Officials say the program's short-term purpose is only to prove the practicality of hypersonic scramjet propulsion. But they also note that this is an essential first step toward development of a high-speed, long-range missile and, ultimately of an operationally responsive hypersonic space launch vehicle.

An experimental wind tunnel program is being conducted in support of a NASA wide effort to develop a Space Shuttle replacement and to support the Agency's long term objective of returning to the Moon and Mars. This report documents experimental measurements made on several scaled ceramic heat transfer models of the proposed Crew Exploration Vehicle Crew Module. The experimental data highlighted in this test report are to be used to assess numerical tools that will be used to generate the flight aerothermodynamic database. Global heat transfer images and heat transfer distributions were obtained over a range of freestream Reynolds numbers and angles of attack with the phosphor thermography technique. Heat transfer data were measured on the forebody and afterbody and were used to infer the heating on the vehicle as well as the boundary layer state on the forebody surface. Several model support configurations were assessed to minimize potential support interference. In addition, the ability of the global phosphor thermography method to provide quantitative heating measurements in the low temperature environment of the capsule base region was assessed. While naturally fully developed turbulent levels were not obtained on the forebody, the use of boundary layer trips generated fully developed turbulent flow. Laminar and turbulent computational results were shown to be in good agreement with the data. Backshell testing demonstrated the ability to obtain data in the low temperature region as well as demonstrating the lack of significant model support hardware influence on heating.

**Fluorescence Imaging Study of Impinging Underexpanded Jets**

Inman, Jennifer A.; Danehy, Paul M.; Nowak, Robert J.; Alderfer, David W.; January 07, 2008; 19 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 014368.09.07.01.08; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008561>

An experiment was designed to create a simplified simulation of the flow through a hole in the surface of a hypersonic aerospace vehicle and the subsequent impingement of the flow on internal structures. In addition to planar laser-induced fluorescence (PLIF) flow visualization, pressure measurements were recorded on the surface of an impingement target. The PLIF images themselves provide quantitative spatial information about structure of the impinging jets. The images also help in the interpretation of impingement surface pressure profiles by highlighting the flow structures corresponding to distinctive features of these pressure profiles. The shape of the pressure distribution along the impingement surface was found to be double-peaked in cases with a sufficiently high jet-exit-to-ambient pressure ratio so as to have a Mach disk, as well as in cases where a flow feature called a recirculation bubble formed at the impingement surface. The formation of a recirculation bubble was in turn found to depend very sensitively upon the jet-exit-to-ambient pressure ratio. The pressure measured at the surface was typically less than half the nozzle plenum pressure at low jet pressure ratios and decreased with increasing jet pressure ratios. Angled impingement cases showed that impingement at a 60deg angle resulted in up to a factor of three increase in maximum pressure at the plate compared to normal incidence.

**Initial Experiments and Analysis of Blunt-Edge Vortex Flows**

Luckring, James M.; January 07, 2008; 16 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 526282.01.07.04.01

Report No.(s): AIAA Paper-2008-0378; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008564>

A review is presented of the initial experimental results and analysis that formed the basis the Vortex Flow Experiment 2 (VFE-2). The focus of this work was to distinguish the basic effects of Reynolds number, Mach number, angle of attack, and leading edge bluntness on separation-induced leading-edge vortex flows that are common to slender wings. Primary analysis is focused on detailed static surface pressure distributions, and the results demonstrate significant effects regarding the onset and progression of leading-edge vortex separation.

**Grid Quality and Resolution Issues from the Drag Prediction Workshop Series**

Mavriplis, Dimitri J.; Vassberg, John C.; Tinoco, Edward N.; Mani, Mori; Brodersen, Olaf P.; Eisfeld, Bernhard; Wahls, Richard A.; Morrison, Joseph H.; Zickuhr, Tom; Levy, David; Murayama, Mitsuhiro; January 07, 2008; 25 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 561581.02.08.07.20.03; Copyright; Avail.: CASI: [A03](#), Hardcopy

The drag prediction workshop series (DPW), held over the last six years, and sponsored by the AIAA Applied Aerodynamics Committee, has been extremely useful in providing an assessment of the state-of-the-art in computationally based aerodynamic drag prediction. An emerging consensus from the three workshop series has been the identification of spatial discretization errors as a dominant error source in absolute as well as incremental drag prediction. This paper provides an overview of the collective experience from the workshop series regarding the effect of grid-related issues on overall drag prediction accuracy. Examples based on workshop results are used to illustrate the effect of grid resolution and grid quality on drag prediction, and grid convergence behavior is examined in detail. For fully attached flows, various accurate and successful workshop results are demonstrated, while anomalous behavior is identified for a number of cases involving substantial regions of separated flow. Based on collective workshop experiences, recommendations for improvements in mesh generation technology which have the potential to impact the state-of-the-art of aerodynamic drag prediction are given.

**Foundations of Military Pilot Selection Systems: World War I**

Damos, Diane L; Sep 2007; 23 pp.; In English

Contract(s)/Grant(s): DASW01-03-D-0016; Proj-A790; Proj-792

Report No.(s): AD-A474611; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes the development of the U.S. Army pilot selection system beginning in World War I. It starts with a review of aviation in the USA up to 1917. The phases of flight training then are described with the associated failure and fatality rates. Some cost estimates for each phase also are provided. Finally, the pilot selection system itself is described. Because the selection system was revised over time, the early system (administered from May, 1917 to February, 1918) is described first, followed by the revised system (administered from March, 1918 to November, 1918). Additions to the initial battery are described, as are the tests that were under development at the time of the Armistice.

**Multi-Terrain Impact Testing and Simulation of a Composite Energy Absorbing Fuselage Section**

Fasanella, Edwin L.; Jackson, Karen E.; Lyle, Karen H.; Sparks, Chad E.; Sareen, Ashish K.; [2007]; 12 pp.; In English; Submitted to the Journal of American Helicopter Society to be published in volume 52, no. 2, pp. 159-168, April 2007; Original contains color and black and white illustrations

Contract(s)/Grant(s): 23-376-70-30-07; Copyright; Avail.: CASI: [A03](#), Hardcopy

Comparisons of the impact performance of a 5-ft diameter crashworthy composite fuselage section were investigated for hard surface, soft soil, and water impacts. The fuselage concept, which was originally designed for impacts onto a hard surface only, consisted of a stiff upper cabin, load bearing floor, and an energy absorbing subfloor. Vertical drop tests were performed at 25-ft/s onto concrete, soft-soil, and water at NASA Langley Research Center. Comparisons of the peak acceleration values, pulse durations, and onset rates were evaluated for each test at specific locations on the fuselage. In addition to comparisons

of the experimental results, dynamic finite element models were developed to simulate each impact condition. Once validated, these models can be used to evaluate the dynamic behavior of subfloor components for improved crash protection for hard surface, soft soil, and water impacts.

Report No.(s): NASA/TM-2007-214932; AIAA Paper-2007-0900; E-16114; Copyright; Avail.: CASI: [A03](#), Hardcopy

This work presents the results of an experiment conducted in the Icing Research Tunnel at NASA Glenn Research Center to understand the process by which icing feathers are formed in the initial stages of ice accretion formation on swept wings. Close-up photographic data were taken on an aluminum NACA 0012 swept wing tip airfoil. Two types of photographic data were obtained: time sequence close-up photographic data during the run and close-up photographic data of the ice accretion at the end of each run. Icing runs were conducted for short ice accretion times from 10 to 180 sec. The time sequence close-up photographic data was used to study the process frame by frame and to create movies of how the process developed. The movies confirmed that at glaze icing conditions in the attachment line area icing feathers develop from roughness elements. The close-up photographic data at the end of each run showed that roughness elements change into a pointed shape with an upstream facet and join on the side with other elements having the same change to form ridges with pointed shape and upstream facet. The ridges develop into feathers when the upstream facet grows away to form the stem of the feather. The ridges and their growth into feathers were observed to form the initial scallop tips present in complete scallops.

**Structural Analysis of the Right Rear Lug of American Airlines Flight 587**

Raju, Ivatury S.; Glaessgen, Edward H.; Mason, Brian H.; Krishnamurthy, Thiagarajan; Davila, Carlos G.; November 20, 2006; 21 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 843515.03.01.07.03.01.11; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008291>

A detailed finite element analysis of the right rear lug of the American Airlines Flight 587 - Airbus A300-600R was performed as part of the National Transportation Safety Board's failure investigation of the accident that occurred on November 12, 2001. The loads experienced by the right rear lug are evaluated using global models of the vertical tail, local models near the right rear lug, and a global-local analysis procedure. The right rear lug was analyzed using two modeling approaches. In the first approach, solid-shell type modeling is used, and in the second approach, layered-shell type modeling is used. The solid-shell and the layered-shell modeling approaches were used in progressive failure analyses (PFA) to determine the load, mode, and location of failure in the right rear lug under loading representative of an Airbus certification test conducted in 1985 (the 1985-certification test). Both analyses were in excellent agreement with each other on the predicted failure loads, failure mode, and location of failure. The solid-shell type modeling was then used to analyze both a subcomponent test conducted by Airbus in 2003 (the 2003-subcomponent test) and the accident condition. Excellent

agreement was observed between the analyses and the observed failures in both cases. The moment,  $M_x$  (moment about the fuselage longitudinal axis), has significant effect on the failure load of the lugs. Higher absolute values of  $M_x$  give lower failure loads. The predicted load, mode, and location of the failure of the 1985- certification test, 2003-subcomponent test, and the accident condition are in very good agreement. This agreement suggests that the 1985-certification and 2003-subcomponent tests represent the accident condition accurately. The failure mode of the right rear lug for the 1985-certification test, 2003-subcomponent test, and the accident load case is identified as a cleavage-type failure. For the accident case, the predicted failure load for the right rear lug from the PFA is greater than 1.98 times the limit load of the lugs.

The aircraft industry plays a critical role in today's global economy. Comprising a wide array of firms supplying various products and services to a diverse and dynamic customer base, this industry represents a compelling case study from three distinct perspectives: a business strategy analysis, a review of the underlying economics, and an overview of national security issues. To provide this perspective, the study provides a description of the major markets comprising the industry followed by an analysis of the issues outlined above. Finally, the report details policy recommendations outlining the proper role of government in maintaining a vibrant industry.

#### **Application of Probability Methods to Assess Crash Modeling Uncertainty**

Lyle, Karen H.; Stockwell, Alan E.; Hardy, Robin C.; October 2007; 13 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 728-50-10-01; Copyright; Avail.: CASI: [A03](#), Hardcopy

Full-scale aircraft crash simulations performed with nonlinear, transient dynamic, finite element codes can incorporate structural complexities such as: geometrically accurate models; human occupant models; and advanced material models to include nonlinear stress-strain behaviors, and material failure. Validation of these crash simulations is difficult due to a lack of sufficient information to adequately determine the uncertainty in the experimental data and the appropriateness of modeling assumptions. This paper evaluates probabilistic approaches to quantify the effects of finite element modeling assumptions on the predicted responses. The vertical drop test of a Fokker F28 fuselage section will be the focus of this paper. The results of a probabilistic analysis using finite element simulations will be compared with experimental data.

ONLINE: <http://hdl.handle.net/2060/20080008569>

This document contains a general description for data sets of a wake vortex system in a turbulent environment. The turbulence and thermal stratification of the environment are representative of the conditions on November 12, 2001 near John F. Kennedy International Airport. The simulation assumes no ambient winds. The full three dimensional simulation of the wake vortex system from a Boeing 747 predicts vortex circulation levels at 80% of their initial value at the time of the proposed vortex encounter. The linked vortex oval orientation showed no twisting, and the oval elevations at the widest point were about 20 meters higher than where the vortex pair joined. Fred Proctor of NASA's Langley Research Center presented

the results from this work at the NTSB public hearing that started 29 October 2002. This document contains a description of each data set including: variables, coordinate system, data format, and sample plots. Also included are instructions on how to read the data.

ONLINE: <http://hdl.handle.net/100.2/ADA475023>

Accurate prediction of the response of aircraft skins to acoustic loading is important in the design of future air vehicles. Much work has been reported in recent years on prediction methods which reduce a finite element model to a reduced-order system of nonlinear modal equations. This body of work has shown good results for predicting the random response of flat structures. However, there have been few studies reported on reduced-order methods applied to structures with shallow curvature. Curvature complicates the analysis by introducing linear coupling of transverse and in-plane displacements. The implicit condensation and expansion (ICE) method, which eliminates the need for normal membrane vectors in the modal basis, has been shown to give accurate results for flat structures. This paper presents the results of a numerical study of the ICE method to predict the response of a thin, curved aluminum beam to random distributed loading. Power spectral densities of transverse and in-plane displacement from the ICE method agree very closely with those from direct integration of a full finite element model.

#### **Sensor Selection and Optimization for Health Assessment of Aerospace Systems**

Maul, William A.; Kopasakis, George; Santi, Louis M.; Sowers, Thomas S.; Chicatelli, Amy; January 2008; 32 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): WBS 136905.08.05.08.8.01.03; Copyright; Avail.: CASI: A03, Hardcopy

Aerospace systems are developed similarly to other large-scale systems through a series of reviews, where designs are modified as system requirements are refined. For space-based systems few are built and placed into service these research vehicles have limited historical experience to draw from and formidable reliability and safety requirements, due to the remote and severe environment of space. Aeronautical systems have similar reliability and safety requirements, and while these systems may have historical information to access, commercial and military systems require longevity under a range of operational conditions and applied loads. Historically, the design of aerospace systems, particularly the selection of sensors, is based on the requirements for control and performance rather than on health assessment needs. Furthermore, the safety and reliability requirements are met through sensor suite augmentation in an ad hoc, heuristic manner, rather than any systematic approach. A review of the current sensor selection practice within and outside of the aerospace community was conducted and a sensor selection architecture is proposed that will provide a justifiable, defensible sensor suite to address system health assessment requirements.

**The X-43A Six Degree of Freedom Monte Carlo Analysis**

Baumann, Ethan; Bahm, Catherine; Strovers, Brian; Beck, Roger; Richard, Michael; December 2007; 50 pp.; In English; Original contains color and black and white illustrations

Report No.(s): NASA/TM-2007-214630; H-2683; Copyright; Avail.: CASI: [A03](#), Hardcopy

This report provides an overview of the Hyper-X research vehicle Monte Carlo analysis conducted with the six-degree-of-freedom simulation. The methodology and model uncertainties used for the Monte Carlo analysis are presented as permitted. In addition, the process used to select hardware validation test cases from the Monte Carlo data is described. The preflight Monte Carlo analysis indicated that the X-43A control system was robust to the preflight uncertainties and provided the Hyper-X project an important indication that the vehicle would likely be successful in accomplishing the mission objectives. The X-43A in-flight performance is compared to the preflight Monte Carlo predictions and shown to exceed the Monte Carlo bounds in several instances. Possible modeling shortfalls are presented that may account for these discrepancies. The flight control laws and guidance algorithms were robust enough as a result of the preflight Monte Carlo analysis that the unexpected in-flight performance did not have undue consequences. Modeling and Monte Carlo analysis lessons learned are presented.

ONLINE: <http://hdl.handle.net/2060/20080006639>

The Quiet Spike(TradeMark) F-15B flight research program investigated supersonic shock reduction using a 24-ft telescoping nose boom on an F-15B airplane. The program goal was to collect flight data for model validation up to 1.8 Mach. In the area of stability and controls, the primary concerns were to assess the potential destabilizing effect of the oversized nose boom on the stability, controllability, and handling qualities of the airplane and to ensure adequate stability margins across the entire research flight envelope. This paper reports on the stability and control analytical methods, flight envelope clearance approach, and flight test results of the F-15B telescoping nose boom configuration. Also discussed are brief pilot commentary on typical piloting tasks and refueling tasks.

**Flight Testing an Iced Business Jet for Flight Simulation Model Validation**

Ratvasky, Thomas P.; Barnhart, Billy P.; Lee, Sam; Cooper, Jon; December 2007; 23 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 457280.02.07.03.02

Report No.(s): NASA/TM-2007-214936; AIAA Paper-2007-0089; E-16113; Copyright; Avail.: CASI: [A03](#), Hardcopy

A flight test of a business jet aircraft with various ice accretions was performed to obtain data to validate flight simulation models developed through wind tunnel tests. Three types of ice accretions were tested: pre-activation roughness, runback shapes that form downstream of the thermal wing ice protection system, and a wing ice protection system failure shape. The high fidelity flight simulation models of this business jet aircraft were validated using a software tool called 'Overdrive.' Through comparisons of flight-extracted aerodynamic forces and moments to simulation-predicted forces and moments, the simulation models were successfully validated. Only minor adjustments in the simulation database were required to obtain adequate match, signifying the process used to develop the simulation models was successful. The simulation models were implemented in the NASA Ice Contamination Effects Flight Training Device (ICEFTD) to enable company pilots to evaluate flight characteristics of the simulation models. By and large, the pilots confirmed good similarities in the flight characteristics when compared to the real airplane. However, pilots noted pitch up tendencies at stall with the flaps extended that were not representative of the airplane and identified some differences in pilot forces. The elevator hinge moment model and implementation of the control forces on the ICEFTD were identified as a driver in the pitch ups and control force issues, and will be an area for future work.

**CFD to Flight: Some Recent Success Stories of X-Plane Design to Flight Test at the NASA Dryden Flight Research Center**

Cosentino, Gary B.; November 12, 2007; 9 pp.; In English; 2007 ITEA Symposium, 12-15 Nov. 2007, Kaua, HI, USA; Original contains color illustrations; No Copyright; Avail.: CASI: [A02](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080007530>

Several examples from the past decade of success stories involving the design and flight test of three true X-planes will be described: in particular, X-plane design techniques that relied heavily upon computational fluid dynamics (CFD). Three specific examples chosen from the author's personal experience are presented: the X-36 Tailless Fighter Agility Research Aircraft, the X-45A Unmanned Combat Air Vehicle, and, most recently, the X-48B Blended Wing Body Demonstrator Aircraft. An overview will be presented of the uses of CFD analysis, comparisons and contrasts with wind tunnel testing, and information derived from the CFD analysis that directly related to successful flight test. Some lessons learned on the proper application, and misapplication, of CFD are illustrated. Finally, some highlights of the flight-test results of the three example X-planes will be presented. This overview paper will discuss some of the author's experience with taking an aircraft shape from early concept and three-dimensional modeling through CFD analysis, wind tunnel testing, further refined CFD analysis, and, finally, flight. An overview of the key roles in which CFD plays well during this process, and some other roles in which it does not, are discussed. How wind tunnel testing complements, calibrates, and verifies CFD analysis is also covered. Lessons learned on where CFD results can be misleading are also given. Strengths and weaknesses of the various types of flow solvers, including panel methods, Euler, and Navier-Stokes techniques, are discussed. The paper concludes with the three specific examples, including some flight test video footage of the X-36, the X-45A, and the X-48B.

The vision of NASA's Dryden Flight Research Center is to 'fly what others only imagine.' Its mission is to advance technology and science through flight. Objectives supporting the mission include performing flight research and technology integration to revolutionize aviation and pioneer aerospace technology, validating space exploration concepts, conducting airborne remote sensing and science missions, and supporting operations of the Space Shuttle and the International Space

Station. A significant focus of effort in recent years has been on Unmanned Aircraft Systems (UAS), both in support of the Airborne Science Program and as research vehicles to advance the state of the art in UAS. Additionally, the Center has used its piloted aircraft in support of UAS technology development. In order to facilitate greater access to the UAS expertise that exists at the Center, that expertise has been organized around three major capabilities. The first is access to high-altitude, long-endurance UAS. The second is the establishment of a test range for small UAS. The third is safety case assessment support.

**Interactive Inverse Design Optimization of Fuselage Shape for Low-Boom Supersonic Concepts**

Li, Wu; Shields, Elwood; Le, Daniel; January 07, 2008; 27 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA

Contract(s)/Grant(s): WBS 984754.02.07.07.12.03; Copyright; Avail.: CASI: [A03](#), Hardcopy

This paper introduces a tool called BOSS (Boom Optimization using Smoothest Shape modifications). BOSS utilizes interactive inverse design optimization to develop a fuselage shape that yields a low-boom aircraft configuration. A fundamental reason for developing BOSS is the need to generate feasible low-boom conceptual designs that are appropriate for further refinement using computational fluid dynamics (CFD) based preliminary design methods. BOSS was not developed to provide a numerical solution to the inverse design problem. Instead, BOSS was intended to help designers find the right configuration among an infinite number of possible configurations that are equally good using any numerical figure of merit. BOSS uses the smoothest shape modification strategy for modifying the fuselage radius distribution at 100 or more longitudinal locations to find a smooth fuselage shape that reduces the discrepancies between the design and target equivalent area distributions over any specified range of effective distance. For any given supersonic concept (with wing, fuselage, nacelles, tails, and/or canards), a designer can examine the differences between the design and target equivalent areas, decide which part of the design equivalent area curve needs to be modified, choose a desirable rate for the reduction of the discrepancies over the specified range, and select a parameter for smoothness control of the fuselage shape. BOSS will then generate a fuselage shape based on the designer's inputs in a matter of seconds. Using BOSS, within a few hours, a designer can either generate a realistic fuselage shape that yields a supersonic configuration with a low-boom ground signature or quickly eliminate any configuration that cannot achieve low-boom characteristics with fuselage shaping alone. A conceptual design case study is documented to demonstrate how BOSS can be used to develop a low-boom supersonic concept from a low-drag supersonic concept. The paper also contains a study on how perturbations in the equivalent area distribution affect the ground signature shape and how new target area distributions for low-boom signatures can be constructed using superposition of equivalent area distributions derived from the Seebass-George-Darden (SGD) theory.

An experimental wind tunnel test was conducted in the NASA Langley Research Center's 20-Inch Mach 6 Air Tunnel in

support of the Hypersonic International Flight Research Experimentation Program. The information in this report is focused on the Flight 1 configuration, the first in a series of flight experiments. This report documents experimental measurements made over a range of Reynolds numbers and angles of attack on several scaled ceramic heat transfer models of the Flight 1 payload. Global heat transfer was measured using phosphor thermography and the resulting images and heat transfer distributions were used to infer the state of the boundary layer on the vehicle windside and leeside surfaces. Boundary layer trips were used to force the boundary layer turbulent, and a brief study was conducted to determine the effectiveness of the trips with various heights. The experimental data highlighted in this test report were used to size and place the boundary layer trip for the flight test vehicle.

#### **Use of Traffic Displays for General Aviation Approach Spacing: A Human Factors Study**

Nadler, E.; Yost, A.; Kendra, A.; December 2007; 41 pp.; In English; Original contains black and white illustrations

Report No.(s): DOT/FAA/AM-07/30; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A flight experiment was conducted to assess human factors issues associated with pilot use of traffic displays for approach spacing. Sixteen multi-engine rated pilots participated. Eight flew approaches in a twin-engine Piper Aztec originating in Sanford, ME, and eight flew approaches in the same aircraft originating in Atlantic City, NJ. The spacing target was a Cessna 206. The traffic display was either a Garmin International MX-20TM (the 'Basic' Cockpit Display of Traffic Information, or CDTI) or an MX-20TM modified with features to help the pilot monitor the closing rate, the range and ground speed of the traffic-to-follow, and ownship ground speed (Range Monitor). Two other Equipment conditions were Baseline and Autopilot. Pilots successfully used the displays to maintain the assigned spacing on visual and instrument approaches. The spacing deviations were significantly lower when using the displays during visual approaches than when attempting to maintain spacing without a traffic display. The mean spacing deviation during the IFR approaches was less than 0.10 NM for all three equipment conditions (Basic CDTI, Range Monitor, Autopilot), and these mean spacing deviations did not differ significantly. Range Monitor features appeared to particularly benefit the low-hour pilots. While the traffic display reduced visual reacquisition times, this effect was only found with pilots whose displays showed additional traffic (not only the traffic-to-follow). In general, however, the additional traffic was associated with less time between fixations on the display and higher workload. Subjects appeared to have had difficulty identifying an optimal display range that would simultaneously provide traffic awareness and spacing task performance. The traffic display necessarily requires visual attention and reduces the attention available for scanning the instrument panel and on visual approaches, the outside world. For this reason, even if pilots assume responsibility for spacing when they temporarily lose visual contact with the assigned traffic-to-follow, they should notify ATC of the loss of visual contact so that controllers can assume responsibility for separation from other aircraft.

#### **Towards Determination of Visual Requirements for Augmented Reality Displays and Virtual Environments for the Airport Tower**

Ellis, Stephen R.; Jun 1, 2006; 29 pp.; In English; Original contains color illustrations

Report No.(s): AD-A473306; Copyright; Avail.: CASI: [A03](#), Hardcopy

The visual requirements for augmented reality or virtual environments displays that might be used in real or virtual towers are reviewed with respect to similar displays already used in aircraft. As an example of the type of human performance studies needed to determine the useful specifications of augmented reality displays, an optical see-through display was used in an ATC Tower simulation. Three different binocular fields of view (14 deg, 28 deg, and 47 deg) were examined to determine their effect on subjects' ability to detect aircraft maneuvering and landing. The results suggest that binocular fields of view much greater than 47 deg are unlikely to dramatically improve search performance and that partial binocular overlap is a feasible display technique for augmented reality Tower applications.

This paper describes the target designation, tracking, approach, and camera handoff technologies required to achieve accurate, single-command autonomous instrument placement for a planetary rover. It focuses on robust tracking integrated with obstacle avoidance during the approach phase, and image-based camera handoff to allow vision-based instrument placement. It also provides initial results from a complete system combining these technologies with rover base placement to maximize arm manipulability and image-based instrument placement.

An overview of the reconstruction analyses performed for the Stardust capsule entry is described. The results indicate that the actual entry was very close to the pre-entry predictions. The capsule landed 8.1 km north-northwest of the desired target at Utah Test and Training Range. Analyses of infrared video footage and radar range data (obtained from tracking stations) during the descent show that drogue parachute deployment was 4.8 s later than the pre-entry prediction, while main parachute deployment was 19.3 s earlier than the pre-set timer indicating that main deployment was actually triggered by the backup baroswitch. Reconstruction of a best estimated trajectory revealed that the aerodynamic drag experienced by the capsule during hypersonic flight was within 1% of pre-entry predictions. Observations of the heatshield support the pre-entry estimates of small hypersonic angles of attack, since there was very little, if any, charring of the shoulder region or the aftbody. Through this investigation, an overall assertion can be made that all the data gathered from the Stardust capsule entry were consistent with flight performance close to nominal pre-entry predictions. Consequently, the design principles and methodologies utilized for the flight dynamics, aerodynamics, and aerothermodynamics analyses have been corroborated.

The Orion Crew Exploration Vehicle is the first crewed capsule design to be developed by NASA since Project Apollo.

Unlike Apollo, however, the CEV is being designed for service in both Lunar and International Space Station missions. Ascent aborts pose some issues that were not present for Apollo, due to its launch azimuth, nor Space Shuttle, due to its cross range capability. The requirement that a North Atlantic splashdown following an abort be avoidable, in conjunction with the requirement for overlapping abort modes to maximize crew survivability, drives the thrust level of the service module main engine. This paper summarizes 3DOF analysis conducted by NASA to aid in the determination of the appropriate propulsion system for the service module, and the appropriate propellant loading for ISS missions such that crew survivability is maximized.

#### **Ares-I-X Vehicle Preliminary Range Safety Malfunction Turn Analysis**

Beaty, James R.; Starr, Brett R.; Gowan, John W., Jr.; January 07, 2008; 9 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 136905.10.10.20.20; No Copyright; Avail.: CASI: A02, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008292>

Ares-I-X is the designation given to the flight test version of the Ares-I rocket (also known as the Crew Launch Vehicle - CLV) being developed by NASA. As part of the preliminary flight plan approval process for the test vehicle, a range safety malfunction turn analysis was performed to support the launch area risk assessment and vehicle destruct criteria development processes. Several vehicle failure scenarios were identified which could cause the vehicle trajectory to deviate from its normal flight path, and the effects of these failures were evaluated with an Ares-I-X 6 degrees-of-freedom (6-DOF) digital simulation, using the Program to Optimize Simulated Trajectories Version 2 (POST2) simulation framework. The Ares-I-X simulation analysis provides output files containing vehicle state information, which are used by other risk assessment and vehicle debris trajectory simulation tools to determine the risk to personnel and facilities in the vicinity of the launch area at Kennedy Space Center (KSC), and to develop the vehicle destruct criteria used by the flight test range safety officer. The simulation analysis approach used for this study is described, including descriptions of the failure modes which were considered and the underlying assumptions and ground rules of the study, and preliminary results are presented, determined by analysis of the trajectory deviation of the failure cases, compared with the expected vehicle trajectory.

**Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities**

January 07, 2008; 26 pp.; Original contains color and black and white illustrations; No Copyright; Avail.: CASI: A03, Hardcopy

Impact and debris damage to the Space Shuttle Orbiter Thermal Protection System tiles is a random phenomenon, occurring at random locations on the vehicle surface, resulting in random geometrical shapes that are exposed to a definable range of surface flow conditions. In response to the 2003 Final Report of the Columbia Accident Investigation Board, wind tunnel aeroheating experiments approximating a wide range of possible damage scenarios covering both open and closed cavity flow conditions were systematically tested in hypersonic ground based facilities. These data were analyzed and engineering assessment tools for damage-induced fully-laminar heating were developed and exercised on orbit. These tools provide bounding approximations for the damaged-surface heating environment. This paper presents a further analysis of the baseline, zero-pressure-gradient, idealized, rectangular-geometry cavity heating data, yielding new laminar correlations for the floor-averaged heating, peak cavity endwall heating, and the downstream decay rate. Correlation parameters are derived in terms of cavity geometry and local flow conditions. Prediction Limit Uncertainty values are provided at the 95%, 99% and 99.9% levels of significance. Non-baseline conditions, including non-rectangular geometries and flows with known pressure gradients, are used to assess the range of applicability of the new correlations. All data variations fall within the 99% Prediction Limit Uncertainty bounds. Importantly, both open-flow and closed-flow cavity heating are combined into a single-curve parameterization of the heating predictions, and provide a concise mathematical model of the laminar cavity heating flow field with known uncertainty.

**Changes in the Deep Space Network to Support the Mars Reconnaissance Orbiter**

Berner, Jeff B.; Bhanji, Alaudin M.; Kurtik, Susan C.; June 19, 2006; In English; SpaceOps Earth, Moon, Mars, and Beyond, 19-23 Jun. 2006, Rome, Italy; Copyright; Avail.: Other Sources; Abstract Only

ONLINE: <http://hdl.handle.net/2014/40586>

In August of 2005, the Mars Reconnaissance Orbiter (MRO) was launched. Its mission is to orbit Mars, performing remote sensing of the planet. Its mission will either introduce new, or greatly expand upon, deep space telecommunication capabilities. To support the MRO requirements, there have been multiple changes implemented in NASA's Deep Space Network. These changes include the first deep space usage of Quadrature Phase Shift Keying (QPSK), high rate turbo coded links (up to 1.6 Mbps), high rate Reed-Solomon coded links (6 Mbps), and characterization and utilization of Ka-band for the downlink, both for telemetry and for navigational purposes. The challenges of implementing these changes are discussed.

ONLINE: <http://hdl.handle.net/2060/20080007514>

A concern was raised regarding the time after launch when the DAWN Mission Communications Subsystem, which contains a 100 Watt X-Band Traveling Wave Tube Amplifier (TWTA) with a high voltage ((approximately 7 Kilo Volt (KV)) Electronic Power Converter (EPC), will be powered on for the first post-launch downlink. This activation is planned to be approximately one hour after launch. Orbital Sciences (the DAWN Mission spacecraft contractor) typically requires a 24-hour wait period prior to high voltage initiation for Earth-orbiting Science and GEO spacecraft. The concern relates to the issue of corona and/or radio frequency (RF) breakdown of the TWTA ((high voltage direct current (DC) and RF)), and of the microwave components (high voltage RF) in the presence of partial atmospheric pressures or outgassing constituents. In particular, generally the diplexer and circulator are susceptible to RF breakdown in the corona region due to the presence of small physical gaps ((~ 2.5 millimeter (mm)) between conductors that carry an RF voltage. The NESC concurred the DAWN Mission communication system is safe for activation.

**Challenges of Space Mission Interoperability**

Martin, Warren L.; Hooke, Adrian J.; October 27, 2007; 23 pp.; In English; Executive Meeting on Space Communications Interoperability, 27 Oct. 2007, Geneva, Switzerland; Original contains color illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40574>

This viewgraph presentation reviews some of the international challenges to space mission interoperability. Interoperability is the technical capability of two or more systems or components to exchange information and to use the information that has been exchanged. One of the challenges that is addressed is the problem of spectrum bandwidth, and interference. The key to interoperability is the standardization of space communications services and protocols. Various levels of international cross support are reviewed: harmony, cooperation cross support and confederation cross support. The various international bodies charged with implementing cross support are reviewed. The goal of the Interagency Operations Advisory Group (IOAG) is to achieve plug-and-play operations where all that is required is for each of the systems to use an agreed communications medium, after which the systems configure each other for the purpose of exchanging information and subsequently effect such exchange automatically.

Report No.(s): AIAA Paper-2007-6336; Copyright; Avail.: CASI: **A03**, Hardcopy

The NASA Engineering and Safety Center (NESC) recently completed an in-depth assessment to identify a comprehensive set of engineering considerations for the Design, Development, Test and Evaluation (DDT&E) of safe and reliable human-rated spacecraft systems. Reliability subject matter experts, discipline experts, and systems engineering experts were brought together to synthesize the current 'best practices' both at the spacecraft system and subsystems levels. The objective of this paper is to summarize, for the larger Community of Practice, the initial set of Guidance, Navigation and Control (GN&C) engineering Best Practices as identified by this NESC assessment process.

### **External Tank (ET) Bipod Fitting Bolted Attachment Locking Insert Performance**

Larsen, Curtis E.; Wilson, Tim R.; Elliott, Kenny B.; Raju, Ivatury S.; McManamen, John; January 2008; 23 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 510505.01.07.01.06

Report No.(s): NASA/TM-2008-215099; NESC-RP-06-53/06-032-E; L-19439; No Copyright; Avail.: CASI: **A03**, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080007518>

Following STS-107, the External Tank (ET) Project implemented corrective actions and configuration changes at the ET bipod fitting. Among the corrective actions, the existing bolt lock wire which provided resistance to potential bolt rotation was removed. The lock wire removal was because of concerns with creating voids during foam application and potential for lock wire to become debris. The bolts had been previously lubricated to facilitate assembly but, because of elimination of the lock wire, the ET Project wanted to enable the locking feature of the insert. Thus, the lubrication was removed from bolt threads and instead applied to the washer under the bolt head. Lubrication is necessary to maximize joint pre-load while remaining within the bolt torque specification. The locking feature is implemented by thread crimping in at four places in the insert. As the bolt is torqued into the insert the bolt threads its way past the crimped parts of the insert. This provides the locking of the bolt, as torque is required to loosen the joint after clamping.

### **Aerothermodynamic Testing of Protuberances and Penetrations on the NASA Crew Exploration Vehicle Heat Shield in the NASA Langley 20-Inch Mach 6 Air Tunnel**

Liechty, Derek S.; January 07, 2008; 12 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 732759.07.05; No Copyright; Avail.: CASI: **A03**, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008297>

An experimental wind tunnel program is being conducted in support of an Agency wide effort to develop a replacement for the Space Shuttle and to support the NASA's long-term objective of returning to the moon and then on to Mars. This paper documents experimental measurements made on several scaled ceramic heat transfer models of the proposed Crew Exploration Vehicle. Global heat transfer images and heat transfer distributions obtained using phosphor thermography were

used to infer interference heating on the Crew Exploration Vehicle Cycle 1 heat shield from local protuberances and penetrations for both laminar and turbulent heating conditions. Test parametrics included free stream Reynolds numbers of  $1.0 \times 10^6$  (exp 6)/ft to  $7.25 \times 10^6$  (exp 6)/ft in Mach 6 air at a fixed angle-of-attack. Single arrays of discrete boundary layer trips were used to trip the boundary layer approaching the protuberances/penetrations to a turbulent state. Also, the effects of three compression pad diameters, two radial locations of compression pad/tension tie location, compression pad geometry, and rotational position of compression pad/tension tie were examined. The experimental data highlighted in this paper are to be used to validate CFD tools that will be used to generate the flight aerothermodynamic database. Heat transfer measurements will also assist in the determination of the most appropriate engineering methods that will be used to assess local flight environments associated with protuberances/penetrations of the CEV thermal protection system.

Report No.(s): AIAA-2008-1226; No Copyright; Avail.: CASI: [A01](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008298>

An investigation of the aeroheating environment of the Project Orion Crew Entry Vehicle has been performed in the Arnold Engineering Development Center Tunnel 9. Data were measured on a approx. 3.5% scale model (0.1778m/7-inch diam.) of the vehicle using coaxial thermocouples in the Mach 8 and Mach 10 nozzles of Tunnel 9. Runs were performed at free stream Reynolds numbers of  $1 \times 10^6$ /ft to  $20 \times 10^6$  (exp 6)/ft in the Mach 10 nozzle and  $8 \times 10^6$  (exp 6)/ft to  $48 \times 10^6$  (exp 6)/ft in the Mach 8 nozzle. The test gas in Tunnel 9 is pure N<sub>2</sub>, which at these operating conditions remains un-dissociated and may be treated as a perfect gas. At these conditions, laminar, transitional, and turbulent flow was produced on the model at Mach 10, and transitional and turbulent conditions were produced on the model at Mach 8. The majority of runs were made on a clean, smooth-surface model configuration and a limited number of runs were made in which inserts with varying boundary-layer trips configurations were used to force the occurrence of transition. Laminar and turbulent predictions were generated for all wind tunnel test conditions and comparisons were performed with the data for the purpose of helping to define uncertainty margins for the computational method. Data from both the wind tunnel test and the computations are presented herein. Figure 1 shows a schematic of the thermocouple locations on the model and figures 2 and 3 show a photo and schematic of the AEDC Hypervelocity Tunnel 9. Figure 4 shows a typical grid used in the computations. From the comparisons shown in figures 5 through 8 it was concluded that for perfect-gas conditions, the computations could predict either fully-laminar or full-turbulent flow to within +/-10% of the experimental data. The experimental data showed that transition began on the leeside of the heatshield at a free stream Reynolds number of  $9 \times 10^6$  (exp 6)/ft in the Mach 10 nozzle and fully-developed turbulent flow was produced at  $20 \times 10^6$  (exp 6)/ft. In the Mach 8 nozzle, transition on the leeside of the heat-shield was observed for all test conditions, and full-developed turbulent flow occurred at a free stream Reynolds number of  $18 \times 10^6$  (exp 6)/ft. On the aftbody of the vehicle no evidence of turbulence was detected at Mach 10 conditions, and at Mach 8 conditions, transition appeared to begin on the windside of the aftbody at free stream Reynolds number of  $18 \times 10^6$  (exp 6)/ft with fully-developed turbulent flow occurring only at the highest test condition of  $48 \times 10^6$  (exp 6)/ft.

#### **Visualization of Flowfield Modification by RCS Jets on a Capsule Entry Vehicle**

Danehy, P. M.; Inman, J. A.; Alderfer, D. W.; Buck, G. M.; Schwartz, R.; January 07, 2008; 2 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains black and white illustrations; No Copyright; Avail.: CASI: [A01](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008343>

Nitric oxide planar laser-induced fluorescence (NO PLIF) has been used to visualize the flow on the aft-body of an entry capsule having an activated RCS jet in NASA Langley Research Center's 31-Inch Mach 10 wind tunnel facility. A capsule

shape representative of the Apollo command module was tested. These tests were performed to demonstrate the ability of the PLIF method to visualize RCS jet flow while providing some preliminary input to NASA's Orion Vehicle design team. Two different RCS nozzle designs - conical and contoured - were tested. The conical and contoured nozzles had area ratios of 13.4 and 22.5 respectively. The conical nozzle had a half-angle of 10°. Low- and high-Reynolds number cases were investigated by changing the tunnel stagnation pressure from 350 psi to 1300 psi, resulting in freestream Reynolds numbers of 0.56 and 1.8 million per foot respectively. For both of these cases, three different jet plenum pressures were tested (nominally 56, 250 and 500 psi). A single angle-of-attack was investigated (24 degrees). NO PLIF uses an ultraviolet laser sheet to interrogate a slice in the flow containing seeded NO; this UV light excites fluorescence from the NO molecules which is detected by a high-speed digital camera. The system has spatial resolution of about 200 microns (2 pixel blurring) and has flow-stopping time resolution (approximately 1 microsecond). NO was seeded into the flow two different ways. First, the RCS jet fluid was seeded with approximately 1-5% NO, with the balance N<sub>2</sub>. This allowed observation of the shape, structure and trajectory of the RCS jets. Visualizations of both laminar and turbulent flow jet features were obtained. Visualizations were obtained with the tunnel operating at Mach 10 and also with the test section held at a constant pressure similar to the aftbody static pressure (0.04 psi) obtained during tunnel runs. These two conditions are called 'tunnel on' and 'tunnel off' respectively. Second, the forebody flow was seeded with a very low flowrate (<100 standard cubic centimeters per minute) of pure NO. This trace gas was entrained into and allowed visualization of the shear layer forming between the expansion fan on the shoulder of the model and the recirculating separated flow in the wake of the model. This shear layer was observed to be laminar in the absence of the RCS jet operation and turbulent above a certain RCS jet flowrate. Furthermore, the operation of the RCS jet is seen to push the shear layer out away from the model, with a higher jet pressures resulting in larger deflections. Figures show some data from this test, partially processed. In the final paper, these images will be processed and rendered on a three dimensional visualization of the test hardware for clearer visualization and interpretation of the flowfields.

Pressure Sensitive Paint (PSP) and Temperature Sensitive Paint (TSP) were used to visualize and quantify the surface interactions of reaction control system (RCS) jets on the aft body of capsule reentry vehicle shapes. The first model tested was an Apollo-like configuration and was used to focus primarily on the effects of the forward facing roll and yaw jets. The second model tested was an early Orion Crew Module configuration blowing only out of its forward-most yaw jet, which was expected to have the most intense aerodynamic heating augmentation on the model surface. This paper will present the results from the experiments, which show that with proper system design, both PSP and TSP are effective tools for studying these types of interaction in hypersonic testing environments.

The NASA Engineering and Safety Center (NESC) recently completed an in-depth assessment to identify a comprehensive set of engineering considerations for the Design, Development, Test and Evaluation (DDT&E) of safe and reliable human-rated spacecraft systems. Reliability subject matter experts, discipline experts, and systems engineering experts were brought together to synthesize the current 'best practices' both at the spacecraft system and subsystems levels. The objective of this paper is to summarize, for the larger Community of Practice, the initial set of Guidance, Navigation and

Control (GN&C) engineering Best Practices as identified by this NESAC assessment process.

ONLINE: <http://hdl.handle.net/2060/20080008558>

An investigation was made in NASA Langley Research Center's 31-Inch Mach 10 Tunnel to determine the effects of reaction-control system (RCS) jet interactions on the aft-body of a capsule entry vehicle. The test focused on demonstrating and improving advanced measurement techniques that would aid in the rapid measurement and visualization of jet interaction effects for the Orion Crew Exploration Vehicle while providing data useful for developing engineering models or validation of computational tools used to assess actual flight environments. Measurements included global surface imaging with pressure and temperature sensitive paints and three-dimensional flow visualization with a scanning planar laser induced fluorescence technique. The wind tunnel model was fabricated with interchangeable parts for two different aft-body configurations. The first, an Apollo-like configuration, was used to focus primarily on the forward facing roll and yaw jet interactions which are known to have significant aft-body heating augmentation. The second, an early Orion Crew Module configuration (4-cluster jets), was tested blowing only out of the most windward yaw jet, which was expected to have the maximum heating augmentation for that configuration. Jet chamber pressures and tunnel flow conditions were chosen to approximate early Apollo wind tunnel test conditions. Maximum heating augmentation values measured for the Apollo-like configuration (>10 for forward facing roll jet and 4 for yaw jet) using temperature sensitive paint were shown to be similar to earlier experimental results (Jones and Hunt, 1965) using a phase change paint technique, but were acquired with much higher surface resolution. Heating results for the windward yaw jet on the Orion configuration had similar augmentation levels, but affected much less surface area. Numerical modeling for the Apollo-like yaw jet configuration with laminar flow and uniform jet outflow conditions showed similar heating patterns, qualitatively, but also showed significant variation with jet exit divergence angle, with as much as 25 percent variation in heat flux intensity for a 10 degree divergence angle versus parallel outflow. These results along with the fabrication methods and advanced measurement techniques developed will be used in the next phase of testing and evaluation for the updated Orion RCS configuration.

**Mars Aeronomy Explorer (MAX): Study Employing Distributed Micro-Spacecraft**

Shotwell, Robert F.; Gray, Andrew A.; Illsley, Peter M.; Johnson, M.; Sherwood, Robert L.; Vozoff, M.; Ziemer, John K.; March 5, 2005; 10 pp.; In English; IEEE Aerospace Conference, 5-12 Mar. 2005, Big Sky, MT, USA; Original contains black and white illustrations

Report No.(s): IEEEAC Paper I400; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40603>

An overview of a Mars Aeronomy Explorer (MAX) mission design study performed at NASA's Jet Propulsion Laboratory is presented herein. The mission design consists of ten micro-spacecraft orbiters launched on a Delta IV to Mars polar orbit to determine the spatial, diurnal and seasonal variation of the constituents of the Martian upper atmosphere and ionosphere over the course of one Martian year. The spacecraft are designed to allow penetration of the upper atmosphere to at least 90 km. This property coupled with orbit precession will yield knowledge of the nature of the solar wind interaction with Mars, the influence of the Mars crustal magnetic field on ionospheric processes, and the measurement of present thermal and nonthermal escape rates of atmospheric constituents. The mission design incorporates alternative design paradigms that are more appropriate for-and in some cases motivate-distributed micro-spacecraft. These design paradigms are not defined by a simple set of rules, but rather a way of thinking about the function of instruments, mission reliability/risk, and cost in a systemic framework.

The Juno Mission was selected in the summer of 2005 via NASA's New Frontiers competitive AO process (refer to [http://www.nasa.gov/home/hqnews/2005/jun/HQ\\_05138\\_New\\_Frontiers\\_2.html](http://www.nasa.gov/home/hqnews/2005/jun/HQ_05138_New_Frontiers_2.html)). The Juno project is led by a Principle Investigator based at Southwest Research Institute [SwRI] in San Antonio, Texas, with project management based at the Jet Propulsion Laboratory [JPL] in Pasadena, California, while the Spacecraft design and Flight System Integration are under contract to Lockheed Martin Space Systems Company [LM-SSC] in Denver, Colorado. The payload suite consists of a large number of instruments covering a wide spectrum of experimentation. The science team includes a lead Co-investigator for each one of the following experiments: A Magnetometer experiment (consisting of both a FluxGate Magnetometer (FGM) built at Goddard Space Flight Center GSFC] and a Scalar Helium Magnetometer (SHM) built at JPL, a MicroWave Radiometer (MWR) also built at JPL, a Gravity Science experiment (GS) implemented via the telecom subsystem, two complementary particle instruments (Jovian Auroral Distribution Experiment, JADE developed by SwRI and Juno Energetic-particle Detector Instrument, JEDI from the Applied Physics Lab (APL)--JEDI and JADE both measure electrons and ions), an Ultraviolet Spectrometer (UVS) also developed at SwRI, and a radio and plasma (WAVES) experiment (from the University of Iowa). In addition, a visible camera (JunoCam) is included in the payload to facilitate education and public outreach (designed & fabricated by Malin Space Science Systems [MSSS]).

### Conceptual Trade Study of General Purpose Heat Source Powered Stirling Converter Configurations

Turpin, J. B.; November 2007; 44 pp.; In English; Original contains color and black and white illustrations

Report No.(s): NASA/TM-2007-215132; M-1207; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080006633>

This Technical Manual describes a parametric study of general purpose heat source (GPHS) powered Stirling converter configurations. This study was performed in support of MSFC's efforts to establish the capability to perform non-nuclear system level testing and integration of radioisotope power systems. Six different GPHS stack configurations at a total of three different power levels (80, 250, and 500 W(sub e)) were analyzed. The thermal profiles of the integrated GPHS modules (for each configuration) were calculated to determine maximum temperatures for comparison to allowable material limits. Temperature profiles for off-nominal power conditions were also assessed in order to better understand how power demands from the Stirling engine impact the performance of a given configuration.

ONLINE: <http://hdl.handle.net/2060/20080006642>

In support of the Exploration Vision for returning to the Moon and beyond, NASA and its partners are developing and testing critical cryogenic fluid propellant technologies that will meet the need for high performance propellants on long-term missions. Reliable knowledge of low-gravity cryogenic fluid management behavior is lacking and yet is critical in the areas of tank thermal and pressure control, fluid acquisition, mass gauging, and fluid transfer. Such knowledge can significantly reduce or even eliminate tank fluid boil-off losses for long term missions, reduce propellant launch mass and required on-orbit margins, and simplify vehicle operations. The Propulsion and Cryogenic Advanced Development (PCAD) Project is performing experimental and analytical evaluation of several areas within Cryogenic Fluid Management (CFM) to enable NASA's Exploration Vision. This paper discusses the status of the PCAD CFM technology focus areas relative to the anticipated CFM requirements to enable execution of the Vision for Space Exploration.

Report No.(s): NASA/TM-2007-214981; Paper 2057; E-16139; Copyright; Avail.: CASI: [A03](#), Hardcopy

The dual Brayton power conversion system constructed for NASA Glenn Research Center (GRC) was acceptance tested April 2007 at Barber-Nichols, Inc., Arvada, Colorado. This uniquely configured conversion system is built around two modified commercial Capstone C30 microturbines and employs two closed-Brayton-cycle (CBC) converters sharing a common gas inventory and common heat source. Because both CBCs share the gas inventory, behavior of one CBC has an impact on the performance of the other CBC, especially when one CBC is standby or running at a different shaft speed. Testing performed to date includes the CBCs operating at equal and unequal shaft speeds. A test was also conducted where one CBC was capped off and the other was operated as a single CBC converter. The dual Brayton configuration generated 10.6 kW<sub>e</sub> at 75 krpm and a turbine inlet temperature of 817 K. Single Brayton operation generated 14.8 kW<sub>e</sub> at 90 krpm and a turbine inlet temperature of 925 K.

**NEXT Thruster Component Verification Testing**

Pinero, Luis R.; Sovey, James S.; December 2007; 16 pp.; In English; 43rd Joint Propulsion Conference, 8-11 Jul. 2007, Cincinnati, OH, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 346620.04.05.03.15

Report No.(s): NASA/TM-2007-215036; AIAA Paper-2007-5276; E-16216; Copyright; Avail.: CASI: [A03](#), Hardcopy

Component testing is a critical part of thruster life validation activities under NASA's Evolutionary Xenon Thruster (NEXT) project testing. The high voltage propellant isolators were selected for design verification testing. Even though they are based on a heritage design, design changes were made because the isolators will be operated under different environmental conditions including temperature, voltage, and pressure. The life test of two NEXT isolators was therefore initiated and has accumulated more than 10,000 hr of operation. Measurements to date indicate only a negligibly small increase in leakage current. The cathode heaters were also selected for verification testing. The technology to fabricate these heaters, developed for the International Space Station plasma contactor hollow cathode assembly, was transferred to Aerojet for the fabrication of the NEXT prototype model ion thrusters. Testing the contractor-fabricated heaters is necessary to validate fabrication processes for high reliability heaters. This paper documents the status of the propellant isolator and cathode heater tests.

Contract(s)/Grant(s): WBS 346620.04.05.03.13

Report No.(s): NASA/TM-2007-215037; AIAA Paper-2007-5214; E-16217; Copyright; Avail.: CASI: [A03](#), Hardcopy

The NASA's Evolutionary Xenon Thruster (NEXT) project is developing an advanced ion propulsion system for future NASA missions for solar system exploration. An engineering model (EM) power processing unit (PPU) for the NEXT project was designed and fabricated by L-3 Communications under contract with NASA Glenn Research Center (GRC). This modular PPU is capable of processing up from 0.5 to 7.0 kW of output power for the NEXT ion thruster. Its design includes many significant improvements for better performance over the state-of-the-art PPU. The most significant difference is the beam supply which is comprised of six modules and capable of very efficient operation through a wide voltage range because of innovative features like dual controls, module addressing, and a high current mode. The low voltage power supplies are based on elements of the previously validated NASA Solar Electric Propulsion Technology Application Readiness (NSTAR) PPU. The highly modular construction of the PPU resulted in improved manufacturability, simpler scalability, and lower cost. This paper describes the design of the EM PPU and the results of the bench-top performance tests.

**Feasibility of Conducting J-2X Engine Testing at the Glenn Research Center Plum Brook Station B-2 Facility**

Schafer, Charles F.; Cheston, Derrick J.; Worlund, Arnis L.; Brown, James R.; Hooper, William G.; Monk, Jan C.; Winstead, Thomas W.; January 2008; 34 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 510505.01.07.01.06

Report No.(s): NASA/TM-2008-215104; NESC-RP-07-20/06-049-E; L-19421; Copyright; Avail.: CASI: [A03](#), Hardcopy

A trade study of the feasibility of conducting J-2X testing in the Glenn Research Center (GRC) Plum Brook Station (PBS) B-2 facility was initiated in May 2006 with results available in October 2006. The Propulsion Test Integration Group (PTIG) led the study with support from Marshall Space Flight Center (MSFC) and Jacobs Sverdrup Engineering. The primary focus of the trade study was on facility design concepts and their capability to satisfy the J-2X altitude simulation test requirements. The propulsion systems tested in the B-2 facility were in the 30,000-pound (30K) thrust class. The J-2X thrust is approximately 10 times larger. Therefore, concepts significantly different from the current configuration are necessary for the diffuser, spray chamber subsystems, and cooling water. Steam exhaust condensation in the spray chamber is judged to be the key risk consideration relative to acceptable spray chamber pressure. Further assessment via computational fluid dynamics (CFD) and other simulation capabilities (e.g. methodology for anchoring predictions with actual test data and subscale testing to support investigation.

**Managing Space Station Solar-Array Electrical Hazards for Sequential Shunt Unit Replacement**

Deulleur, Ann M.; Kerslake, Thomas W.; Levy, Robert K.; Journal of Propulsion and Power; January 15, 2008; Volume 22, No. 1, pp. 16-23; In English; International Energy Conversion Engineering Conference, 16-19 Aug. 2004, Providence, RI, USA; Original contains black and white illustrations

Report No.(s): Paper 2004-5500; Copyright; Avail.: CASI: [A02](#), Hardcopy

The U.S. solar-array strings on the International Space Station are connected to a sequential shunt unit. The sequential shunt unit's job is to shunt excess current from the solar array, such that just enough current is provided downstream to maintain the bus voltage while meeting the power load demand. Should a unit fail, its removal and replacement would normally be done with the solar arrays retracted to reduce the voltages and currents at the sequential shunt unit to safe levels. However, an alternate approach was desired to avoid the inherent risks associated with array retraction and redeployment. This approach allowed the replacement to be conducted via astronaut 'space walk' or extra vehicular activity with the solar array still deployed. Removing a sequential shunt unit with the solar array in sunlight could result in substantial hardware damage and/or safety risk to the astronaut due to the voltages that may be present. Replacing the sequential shunt unit during eclipse would seem optimal, except that the maximum eclipse period is only 36 min, which is insufficient time. To guide the

assessment and ameliorate hazards, the authors analyzed array string current and voltage capability during the various operating conditions using System Power Analysis for Capability Evaluation (SPACE), an electrical power system modeling code. This paper discusses six sequential shunt unit remove and replacement options and the associated analysis to develop a workable sequential shunt unit replacement procedure via extravehicular activity.

#### **Characterization of Mode I Properties of Full-Depth Z-Fiber Stubble in Co-Bonded Composites (Preprint)**

Clay, Stephen B; Apr 2007; 14 pp.; In English

Contract(s)/Grant(s): Proj-A03M

Report No.(s): AD-A475007; AFRL-RB-WP-TP-2007-325; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA475007>

Z-pins are small-diameter carbon rods that are ultrasonically inserted through composite laminates in the z-direction to provide extra resistance to crack growth and delamination. They are normally inserted through co-cured composites, but this paper presents an experimental study on a new z-pin stubble manufacturing technique that is compatible with the co-bonding process. Stubble lengths were 0.125 and 0.250 inch. Double cantilever beam (DCB) specimens were used to characterize the effect of stubble diameter and height on the Mode I crack resistance. It was determined that the new approach using a second ultrasonic step is indeed necessary for stubble heights on the order of 0.125 inch. It was also found that increasing the stubble height from 0.04 inch to 0.125 inch resulted in a much more significant improvement in Mode I properties than increasing the aerial density from 2 % to 4 %. Finally, taking that final step of increasing the stubble height from 0.125 to 0.250 inch did not improve the properties as much as would be expected from previous studies.

#### **Effect of Surface Engineering Processes on the Surface Properties and Adhesive Bonding of Graphite/Epoxy Composites (Preprint)**

Boerio, F J; Roby, B; Dillingham, R G; Bossi, R H; Dec 2007; 15 pp.; In English

Contract(s)/Grant(s): F33615-98-3-5103; Proj-2865

Report No.(s): AD-A475187; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The effect of surface engineering processes such as grit-blasting and plasma etching on the surface energy and composition of graphite/epoxy composites that were cured at 177 C was determined. As-tooled composites had about 73% carbon, 20% oxygen, and 5% nitrogen on the surface. Grit-blasting with 80- or 220-grit garnet resulted in an increase of several percent in the carbon concentration and a similar decrease in the oxygen concentration. However, grit-blasting with 220-grit alumina resulted in a decrease in the carbon concentration of a few percent and a similar increase in oxygen concentration. Etching as-tooled composites in O<sub>2</sub> plasmas resulted in a decrease in the carbon concentration and an increase in the oxygen concentration of about 10%. Derivatization of the composite surfaces with trifluoroacetic anhydride and pentafluorobenzaldehyde enabled the relative numbers of hydroxyl and amino groups on the surfaces to be determined and showed that the surface properties of the composites were dominated by the hydroxyl groups. As-tooled composites had a total surface energy of approximately 35 mJ/sq m; the polar components were small, meaning that the surface energies were mostly dispersive. After grit-blasting with 80- or 220-grit garnet or 220-grit alumina, the polar component of the surface energy increased significantly and the total surface energy was approximately 50 mJ/sq m.

ONLINE: <http://hdl.handle.net/2060/20080006597>

Ceramic integration technology has been recognized as an enabling technology for the implementation of advanced ceramic systems in a number of high-temperature applications in aerospace, power generation, nuclear, chemical, and electronic industries. Various ceramic integration technologies (joining, brazing, attachments, repair, etc.) play a role in fabrication and manufacturing of large and complex shaped parts of various functionalities. However, the development of robust and reliable integrated systems with optimum performance requires the understanding of many thermochemical and thermomechanical factors, particularly for high temperature applications. In this presentation, various challenges and opportunities in design, fabrication, and testing of integrated similar (ceramic-ceramic) and dissimilar (ceramic-metal) material systems will be discussed. Experimental results for bonding and integration of SiC based LDI fuel injector, high conductivity C/C composite based heat rejection system, solid oxide fuel cells system, ultra high temperature ceramics for leading edges, and ceramic composites for thermostructural applications will be presented. Potential opportunities and need for the development of innovative design philosophies, approaches, and integrated system testing under simulated application conditions will also be discussed.

**Fabrication and Characterization of Diffusion Bonds for Silicon Carbide**

Halbig, Michael; Singh, Mrityunjay; Martin, Richard E.; Cosgriff, Laura M.; September 16, 2007; 23 pp.; In English; MS^T'07, Materials Science and Technology Conference and Exposition, 16-20 Sep. 2007, Detroit, MI, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 561581.02.08.03.16.02; Copyright; Avail.: CASI: [A03](#), Hardcopy

Diffusion bonds of silicon carbide (SiC) were fabricated using several different types of titanium (Ti) based interlayers between the SiC substrates. The interlayers were an alloyed Ti foil, a pure Ti foil, and a physically vapor deposited (PVD) Ti coating. Microscopy was conducted to evaluate the cross-sections of the resulting bonds. Microprobe analysis identified reaction formed phases in the diffusion bonded region. Uniform and well adhered bonds were formed between the SiC substrates. In the case where the alloyed Ti foil or a thick Ti coating (i.e. 20 micron) was used as the interlayer, microcracks and several phases were present in the diffusion bonds. When a thinner interlayer was used (i.e. 10 micron PVD Ti), no microcracks were observed and only two reaction formed phases were present. The two phases were preferred and fully reacted phases that did not introduce thermal stresses or microcracks during the cool-down stage after processing. Diffusion bonded samples were evaluated with the non-destructive evaluation (NDE) methods of pulsed thermography and immersion ultrasonic testing. Joined SiC substrates that were fully bonded and that had simulated bond flaws in the interlayer were also evaluated using immersion ultrasound. Pull testing was conducted on the bonds to determine the tensile strength. To demonstrate the joining approach for a complex multilayered component for a low NO<sub>x</sub> injector application, the diffusion bonding approach was used to join three 4' diameter SiC discs that contained complex fuel and air flow channels.

ONLINE: <http://hdl.handle.net/2060/20080006602>

Lightweight materials with excellent thermal insulating properties are highly sought after for a variety of aerospace and aeronautic applications. (1) Silica based aerogels with their high surface area and low relative densities are ideal for applications in extreme environments such as insulators for the Mars Rover battery. (2) However, the fragile nature of aerogel

monoliths prevents their widespread use in more down to earth applications. We have shown that the fragile aerogel network can be cross-linked with a di-isocyanate via amine decorated surfaces to form a conformal coating. (3) This coating reinforces the neck regions between secondary silica particles and significantly strengthens the aerogels with only a small effect on density or porosity. Scheme 1 depicts the cross-linking reaction with the di-isocyanate and exhibits the stages that result in polymer cross-linked aerogel monoliths.

**Nanoscale Subsurface Imaging via Resonant Difference-Frequency Atomic Force Ultrasonic Microscopy**

Cantrell, Sean A.; Cantrell, John H.; Lilehei, Peter T.; [2007]; 11 pp.; In English

Contract(s)/Grant(s): WBS 561581.02.08.07; Copyright; Avail.: CASI: [A03](#), Hardcopy

A novel scanning probe microscope methodology has been developed that employs an ultrasonic wave launched from the bottom of a sample while the cantilever of an atomic force microscope, driven at a frequency differing from the ultrasonic frequency by the fundamental resonance frequency of the cantilever, engages the sample top surface. The nonlinear mixing of the oscillating cantilever and the ultrasonic wave in the region defined by the cantilever tip-sample surface interaction force generates difference-frequency oscillations at the cantilever fundamental resonance. The resonance-enhanced difference-frequency signals are used to create images of embedded nanoscale features.

ONLINE: <http://hdl.handle.net/2014/40590>

This viewgraph presentation reviews exploration activities at JPL into various potting materials. Since high power space-borne microwave transmitters invariably use a vacuum tube as a final power amplifier, and this tube requires high electrode voltages for operation. The associated high voltage insulation typically represents a significant fraction of the mass of the transmitter. Since mass is always a premium resource on board spacecraft, we have been investigating materials with the potential to reduce the mass required for our applications here at JPL. This paper describes electrical breakdown results obtained with various potting materials. Conathane EN-11 (polyurethane) is the traditional HVPS encapsulant at JPL, but due to temperature limitations and durability issues it was deemed inappropriate for the particular application (i.e., CloudSat radar). The choices for the best available materials were epoxies, or silicones. Epoxies are too rigid, and were deemed inadvisable. Two silicones were further investigated (i.e., ASTM E595- 93e2: GE RTV566(R) and Dow Corning 93-500X(R), another compound was considered (i.e., DC material, Sylgard 184(R)). ‘Loading’ (adding filler materials) the potting compound will frequently alter the final material properties. Powdered alumina and borosilicate glass known as ‘microballoons’ were investigated as possible loading materials. The testing of the materials is described. Each of the two loading materials offers advantages and disadvantages. The advantages and disadvantages are described.

**Use of Measured Species Class Concentrations with Chemical Kinetic Modeling for the Prediction of Autoxidation and Deposition of Jet Fuels (Postprint)**

Kuprowicz, Nicholas J; Zabarnick, Steven; West, Zachary J; Ervin, Jamie S; Feb 2007; 17 pp.; In English

Contract(s)/Grant(s): Proj-3048

Report No.(s): AD-A475189; AFRL-RZ-WP-TP-2007-249; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The production of detrimental carbonaceous deposits in jet aircraft fuel systems results from the involvement of trace heteroatomic species in the autoxidation chain that occurs upon fuel heating. Although it has been known for many years that these sulfur-, nitrogen-, and oxygen-containing species contribute to the tendency of a fuel to form deposits, simple correlations have been unable to predict the oxidation rates or the deposit forming tendencies over a range of fuel samples. In the present work, a chemical kinetic mechanism developed previously is refined to include the roles of key fuel species classes, such as phenols, reactive sulfur species, dissolved metals, and hydroperoxides. The concentrations of these fuel species classes in the unreacted fuel samples are measured experimentally and used as an input to the mechanism. The resulting model is used to simulate autoxidation behavior observed over a range of fuel samples.

**Experimental Air-Broadened Line Parameters in the  $\nu_2$  Band of CH<sub>3</sub>D**

Cross, Adriana Predoi; Brawley-Tremblay, Shannon; Povey, Chad; Smith, Mary Ann H.; [2007]; 33 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 281945.02.43.01.04; Copyright; Avail.: CASI: [A03](#), Hardcopy

In this study we report the first experimental measurements of air-broadening and air-induced pressure-shift coefficients for approximately 378 transitions in the  $\nu_2$  fundamental band of CH<sub>3</sub>D. These results were obtained from analysis of 17 room temperature laboratory absorption spectra recorded at 0.0056 cm(exp -1) resolution using the McMath-Pierce Fourier transform spectrometer located on Kitt Peak, Arizona. Three absorption cells with path lengths of 10.2, 25 and 150 cm were used to record the spectra. The total sample pressures ranged from 0.129x10(exp -2) to 52.855x10(exp -2) atm with CH<sub>3</sub>D volume mixing ratios of approximately 0.0109 in air. The spectra were analyzed using a multispectrum non-linear least-squares fitting technique. We report measurements for air pressure-broadening coefficients for transitions with quantum numbers as high as  $J' = 20$  and  $K = 15$ , where  $K' = K'$  equivalent to  $K$  (for a parallel band). The measured air broadening coefficients range from 0.0205 to 0.0835 cm(exp -1) atm(exp -1) at 296 K. All the measured pressure-shift coefficients are negative and are found to vary from about -0.0005 to -0.0080 cm(exp -1) atm(exp -1) at the temperature of the spectra. We have examined the dependence of the measured broadening and shift parameters on the  $J'$  and  $K$  quantum numbers and also developed empirical expressions to describe the broadening coefficients in terms of  $m$  ( $m = -J'$ ,  $J'$  and  $J' + 1$  in the (sup Q)P-, (sup Q)Q-, and (sup Q)R-branch, respectively) and  $K$ . On average, the empirical expressions reproduce the measured broadening coefficients to within 4.4%.

**Ultra-Lightweight Hybrid Thin-Film Solar Cells: A Survey of Enabling Technologies for Space Power Applications**

Hepp, Aloysius F.; McNatt, Jeremiah S.; Bailey, Sheila G.; Dickman, John E.; Raffaele, Ryne P.; Landi, Brian J.; Anctil, Annick; DiLeo, Roberta; Jin, Michael H.-C.; Lee, Chung-Young; Friske, Theresa J.; Sun, Sam-S.; Zhang, Cheng; Choi, S.; Ledbetter, Abram; Seo, Kang; Bonner, Carl E.; Banger, Kulbinder K.; Castro, Stephanie L.; Rauh, David; December 2007; 30 pp.; In English; 5th International Energy Conversion Engineering Conference and Exhibit (IECEC), 25-27 Jun. 2007, Saint Louis, MO, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 698671.01.03.23

Report No.(s): NASA/TM-2007-214955; AIAA-2007-4721; E-16170; Copyright; Avail.: CASI: [A03](#), Hardcopy

The development of hybrid inorganic/organic thin-film solar cells on flexible, lightweight, space-qualified, durable substrates provides an attractive solution for fabricating solar arrays with high mass specific power (W/kg). Next generation thin-film technologies may well involve a revolutionary change in materials to organic-based devices. The high-volume, low-cost fabrication potential of organic cells will allow for square miles of solar cell production at one-tenth the cost of conventional inorganic materials. Plastic solar cells take a minimum of storage space and can be inflated or unrolled for deployment. We will explore a cross-section of in-house and sponsored research efforts that aim to provide new hybrid technologies that include both inorganic and polymer materials as active and substrate materials. Research at University of Texas at Arlington focuses on the fabrication and use of poly(isothianaphthene-3,6-diyl) in solar cells. We describe efforts at Norfolk State University to design, synthesize and characterize block copolymers. A collaborative team between EIC Laboratories, Inc. and the University of Florida is investigating multijunction polymer solar cells to more effectively utilize solar radiation. The National Aeronautics and Space Administration (NASA)/Ohio Aerospace Institute (OAI) group has undertaken a thermal analysis of potential metallized substrates as well as production of nanoparticles of CuInS<sub>2</sub> and CuInSe<sub>2</sub> in good yield at moderate temperatures via decomposition of single-source precursors. Finally, preliminary work at the Rochester Institute of Technology (R.I.T.) to assess the impact on performance of solar cells of temperature and carbon nanotubes is reported. Technologies that must be developed to enable ultra-lightweight solar arrays include: monolithic interconnects, lightweight array structures, and new ultra-light support and deployment mechanisms. For NASA applications, any solar cell or array technology must not only meet weight and AMO efficiency goals, but also must be durable enough to survive launch conditions and space environments.

A primary technology barrier preventing the operation of gas turbine engines and aircraft gearboxes at higher temperatures is the inability of currently used liquid lubricants to survive at the desired operating conditions over an extended time period. Current state-of-the-art organic liquid lubricants rapidly degrade at temperatures above 300 C; hence, another form of lubrication is necessary. Vapor or mist phase reaction lubrication is a unique, alternative technology for high temperature lubrication. The majority of past studies have employed a liquid phosphate ester that was vaporized or misted, and delivered to bearings or gears where the phosphate ester reacted with the metal surfaces generating a solid lubricious film. This method resulted in acceptable operating temperatures suggesting some good lubrication properties, but the continuous reaction between the phosphate ester and the iron surfaces led to wear rates unacceptable for gas turbine engine or aircraft gearbox applications. In this study, an alternative non-phosphate liquid was used to mist phase lubricate a spur gearbox rig operating at 10,000 rpm under highly loaded conditions. After 21 million shaft revolutions of operation the gears exhibited only minor wear.

**Effects of Stoichiometry on Transformation Temperatures and Actuator-Type Performance of NiTiPd and NiTiPdX High-Temperature Shape Memory Alloys**

Bigelow, Glen S.; Gaydosh, Darrell; Garg, Anita; Padula, Santo A., II; Noebe, Ronald D.; December 03, 2007; 28 pp.; In English; International Conference on Shape Memory and Superelastic Technologies, 3-5 Dec. 2007, Tsukuba, Japan; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 561581.02.08.03.15.02; Copyright; Avail.: CASI: [A03](#), Hardcopy

High-temperature shape memory NiTiPd and NiTiPdX (X=Au, Pt, Hf) alloys were produced with titanium equivalent (Ti+Hf) compositions of 50.5, 50.0, 49.5, and 49.0 at.%. Thermo-mechanical testing in compression was used to evaluate the transformation temperatures, transformation strain, work output, and permanent deformation behavior of each alloy to study the effects of quaternary alloying and stoichiometry on high-temperature shape memory alloy behavior. Microstructural evaluation showed the presence of second phases for all alloy compositions. No load transformation temperatures in the stoichiometric alloys were relatively unchanged by Au and Pt substitutions, while the substitution of Hf for Ti causes a drop in transformation temperatures. The NiTiPd, NiTiPdAu and NiTiPdHf alloys exhibited transformation temperatures that were highest in the Ti-rich compositions, slightly lower at stoichiometry, and significantly reduced when the Ti equivalent composition was less than 50 at.%. For the NiTiPdPt alloy, transformation temperatures were highest for the Ti-rich compositions, lowest at stoichiometry, and slightly higher in the Ni-rich composition. When thermally cycled under constant stresses of up to 300 MPa, all of the alloys had transformation strains, and therefore work outputs, which increased with increasing stress. In each series of alloys, the transformation strain and thus work output was highest for stoichiometric or Ti-rich compositions while permanent strain associated with the constant-load thermal cycling was lowest for alloys with Ni-equivalent-rich compositions. Based on these results, basic rules for optimizing the composition of NiTiPd alloys for actuator performance will be discussed.

**Tensile Creep and Fatigue of Sylramic-iBN Melt-Infiltrated SiC Matrix Composites: Retained Properties, Damage Development, and Failure Mechanisms**

Morscher, Gregory N.; Ojard, Greg; Miller, Robert; Gowayed, Yasser; Santhosh, Unni; Ahmed, Jalees; John, Reji; November 26, 2007; 31 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): F33615-01-C-5234; F33615-03-D-2354-D004; NNC06ZA03A; WBS 599489.02.07.03.02.02.02; Copyright; Avail.: Other Sources

An understanding of the elevated temperature tensile creep, fatigue, rupture, and retained properties of ceramic matrix composites (CMC) envisioned for use in gas turbine engine applications are essential for component design and life-prediction. In order to quantify the effect of stress, time, temperature, and oxidation for a state-of-the-art composite system, a wide variety of tensile creep, dwell fatigue, and cyclic fatigue experiments were performed in air at 1204 C for the SiC/SiC CMC system consisting of Sylramic-iBN SiC fibers, BN fiber interphase coating, and slurry-cast melt-infiltrated (MI) SiC-based matrix. Tests were either taken to failure or interrupted. Interrupted tests were then mechanically tested at room temperature to determine the residual properties. The retained properties of most of the composites subjected to tensile creep or fatigue were usually within 20% of the as-produced strength and 10% of the as-produced elastic modulus. It was observed that during creep, residual stresses in the composite are altered to some extent which results in an increased compressive stress in the matrix upon cooling and a subsequent increased stress required to form matrix cracks. Microscopy of polished sections and the fracture surfaces of specimens which failed during stressed-oxidation or after the room-temperature retained property test was performed on some of the specimens in order to quantify the nature and extent of damage accumulation that occurred during the test. It was discovered that the distribution of stress-dependent matrix cracking at 1204 C was similar to the as-produced composites at room temperature; however, matrix crack growth occurred over time and typically did not appear to propagate through thickness except at final failure crack. Failure of the composites was due to either oxidation-induced unbridged crack growth, which dominated the higher stress regime ( $\geq 179$  MPa) or controlled by degradation of the fibers, probably caused by intrinsic creep-induced flaw growth of the fibers or internal attack of the fibers via Si diffusion through the CVI SiC and/or microcracks at the lower stress regime ( $\leq 165$  MPa).

### **Charting the Course for Ocean Science in the USA for the Next Decade: An Ocean Research Priorities Plan and Implementation Strategy**

Jan 26, 2007; 101 pp.; In English; Original contains color illustrations

Report No.(s): AD-A474708; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Proper stewardship of the ocean is critical to the long-term vitality of the USA. Despite its vast extent, the ocean is finite and cannot indefinitely absorb all the stresses being placed on it; thus, the USA must commit to protecting the ocean through responsible stewardship and sensible management. Understanding society's impact on the ocean and the ocean's impact on society forms the basis for ensuring a clean, healthy, and stable ocean environment that can be responsibly used and enjoyed for generations to come. The goal of this document is to provide the guidance to build the scientific foundation to improve society's stewardship and use of, and interaction with, the ocean. Three central elements of science and technology will provide the USA with the knowledge and means to redefine its relationship with the ocean. 1) The capability to forecast key ocean and ocean-influenced processes and phenomena will change how society takes action in the future, much like weather forecasts do today. 2) Providing the scientific support for ecosystem-based management will allow resources to be managed in ways that account for the complex interactions between those resources and other parts of the marine environment, including humans. 3) Deploying an ocean-observing system that can accurately describe the state of the ocean will revolutionize the access to and view of the ocean and increase the pace, efficiency, and scope of ocean research. In turn, this observing capability will enable ocean forecasting and ecosystem-based management. This document's final section details an implementation strategy. The implementation strategy describes characteristics of implementation, roles of various sectors,

mechanisms for collaboration, the need for an infrastructure assessment, mechanisms for research translation, strategies for assessment and evaluation, and mechanisms for budget and plan updates.

**High Specific Power Motors in LN2 and LH2**

Brown, Gerald V.; Jansen, Ralph H.; Trudell, Jeffrey J.; December 2007; 18 pp.; In English; 2007 Cryogenic Engineering Conference and International Cryogenic Materials Conference (CEC-ICMC 2007), 16-20 Jul. 2007, Chattanooga, TN, USA; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 561581.02.08.03.15.02

Report No.(s): NASA/TM-2007-215002; Paper C4-C-05; E-16171-1; Copyright; Avail.: CASI: [A03](#), Hardcopy

A switched reluctance motor has been operated in liquid nitrogen (LN2) with a power density as high as that reported for any motor or generator. The high performance stems from the low resistivity of Cu at LN2 temperature and from the geometry of the windings, the combination of which permits steady-state rms current density up to 7000 A/sq cm, about 10 times that possible in coils cooled by natural convection at room temperature. The Joule heating in the coils is conducted to the end turns for rejection to the LN2 bath. Minimal heat rejection occurs in the motor slots, preserving that region for conductor. In the end turns, the conductor layers are spaced to form a heat-exchanger-like structure that permits nucleate boiling over a large surface area. Although tests were performed in LN2 for convenience, this motor was designed as a prototype for use with liquid hydrogen (LH2) as the coolant. End-cooled coils would perform even better in LH2 because of further increases in copper electrical and thermal conductivities. Thermal analyses comparing LN2 and LH2 cooling are presented verifying that end-cooled coils in LH2 could be either much longer or could operate at higher current density without thermal runaway than in LN2.

**Unbalanced and Minimal Point Equivalent Estimation Second-Order Split-Plot Designs**

Parker, Peter A.; Kowalski, Scott M.; Vining, G. Geoffrey; October 2007; 30 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): 23-90-21-TE

Report No.(s): 23-090-21-TE; Copyright; Avail.: CASI: [A03](#), Hardcopy

Restricting the randomization of hard-to-change factors in industrial experiments is often performed by employing a split-plot design structure. From an economic perspective, these designs minimize the experimental cost by reducing the number of resets of the hard-to-change factors. In this paper, unbalanced designs are considered for cases where the subplots are relatively expensive and the experimental apparatus accommodates an unequal number of runs per whole-plot. We provide construction methods for unbalanced second-order split-plot designs that possess the equivalence estimation optimality property, providing best linear unbiased estimates of the parameters; independent of the variance components. Unbalanced versions of the central composite and Box-Behnken designs are developed. For cases where the subplot cost approaches the whole-plot cost, minimal point designs are proposed and illustrated with a split-plot Notz design.

**NASA Systems Engineering Handbook**

December 2007; 360 pp.; In English; Original contains color illustrations

Report No.(s): NASA/SP-2007-6105 Rev1; No Copyright; Avail.: CASI: [A16](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008301>

This handbook is intended to provide general guidance and information on systems engineering that will be useful to the NASA community. It provides a generic description of Systems Engineering (SE) as it should be applied throughout NASA. A goal of the handbook is to increase awareness and consistency across the Agency and advance the practice of SE. This handbook provides perspectives relevant to NASA and data particular to NASA. The coverage in this handbook is limited to

general concepts and generic descriptions of processes, tools, and techniques. It provides information on systems engineering best practices and pitfalls to avoid. There are many Center-specific handbooks and directives as well as textbooks that can be consulted for in-depth tutorials. This handbook describes systems engineering as it should be applied to the development and implementation of large and small NASA programs and projects. NASA has defined different life cycles that specifically address the major project categories, or product lines, which are: Flight Systems and Ground Support (FS&GS), Research and Technology (R&T), Construction of Facilities (CoF), and Environmental Compliance and Restoration (ECR). The technical content of the handbook provides systems engineering best practices that should be incorporated into all NASA product lines. (Check the NASA On-Line Directives Information System (NODIS) electronic document library for applicable NASA directives on topics such as product lines.) For simplicity this handbook uses the FS&GS product line as an example. The specifics of FS&GS can be seen in the description of the life cycle and the details of the milestone reviews. Each product line will vary in these two areas; therefore, the reader should refer to the applicable NASA procedural requirements for the specific requirements for their life cycle and reviews. The engineering of NASA systems requires a systematic and disciplined set of processes that are applied recursively and iteratively for the design, development, operation, maintenance, and closeout of systems throughout the life cycle of the programs and projects.

**An Extended Surface Fitting Algorithm for Random Data**

Chen, Kuo-Jen; Lai, Jiing-Hih; Ueng, Wen-Der; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 863-876; In English; See also [20080008363](#); Copyright; Avail.: Other Sources

There are various surface fitting techniques to convert cloud points into surface models in reverse engineering. One type of technique is to reconstruct a surface that can be trimmed with other surfaces. A necessary and sufficient condition for two surfaces to be trimmed is that they should intersect each other. We developed an extended surface fitting to allow the surface boundary to be adjusted freely, while maintaining the accuracy and fairness of the fitted surface. The proposed method determined a base plane from the cloud points, used for the initialization of the parametric values and the determination of the surface boundary. An objective function composed of an error function and an energy function was then proposed. An iterative algorithm incorporating the Gaussian elimination and Newton's method was provided also to optimize the control points and the parametric values. Successful examples were presented to demonstrate the feasibility of the proposed method.

Hole-filling is a process to repair the holes in a triangular model and to keep the topology accurate and preserve the smoothness of the original surface as new meshes are added. We propose a hole-filling algorithm by fitting the vertices in the vicinity of a hole into a B-spline surface and plan new vertices on the u-v domain corresponding to such a surface. The main advantage of such a method is that the LL-vp lane. instead of a 3D plane conventionally used, can better be used for the planning of new vertices distributed appropriately on the hole, especially for curved holes with steep slopes. The points on the u-v plane are mapped onto the B-spline surface to yield 3D vertices. Since the surface does not pass through the boundary vertices of the hole completely, a modification algorithm based on the local moving least squares method is proposed to modify the 3D vertices. Successful examples are presented to illustrate the feasibility of the proposed algorithm.

Deregulation has had a great impact on the electric power industry in many countries. The independent system operator (ISO), responsible for ensuring the secure, economic, and efficient dispatches, has to calculate the Available Transfer Capability (ATC) for bilateral contract customers. However, a large number of calculation<sup>^^</sup> using the power flow approach is required to calculate the ATC. In this paper, a method involving the hybrid Principal Component Analysis and multi-layer feedforward neural networks is used to estimate the ATC. The simulation results obtained from a six-bus and the IEEE 30-bus system show the applicability of the proposed method for on-line use. Key Words: available transfer capability, deregulation, principal component analysis. multi-layer feedforward neural network

Developed at National Chiao Tung University, TAIWAN iTS-1 is the first smart car with active safety systems and comfortable autonomous driving in Taiwan. An adaptive vision-based lane detection algorithm was proposed to help the lateral control unit to keep the car in its lane safely. It also carries a DSP system to generate warning signals for unintentional roadway departures. A laser radar measures the distance between the preceding car and TAIWAN iTS-1. With this information.. the longitudinal control unit performs intelligent cruise control and stop-and-go functions. The remote control function is realized on TAIWAN iTS-1 for safety testing and military applications. Unlike most smart car studies, this paper considers not only driving safety demands but also non-driving security. An active mobile surveillance system will inform the car owner when the car is illegally broken into, anytime and anyvvherc. For drivers and passengers, the perception of comfort is achieved by intelligent vehicle dynamic control. All functions integrated into TAIWAN iTS-1 have been tested repeatedly on National Highway 3 and Expressway 68 in the Hsinchu area and the system's robustness has been successfully demonstrated in these real-road experiments.

**Adaptive Control of Electrically-Driven Robot without Computation of Regressor Matrix**

Chien, Ming-Chih; Huang, An-Chyau; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 855-862; In English; See also [20080008363](#); Copyright; Avail.: Other Sources

By using the function approximation technique (FAT), the adaptive control of rigid-link electrically-driven(RLED) robots

is addressed in the presence of time-varying uncertain parameters. Unlike the conventional adaptive control of robot manipulators, the regressor matrix does not need to be calculated in the proposed controller. Rigorous proof of the closed-loop stability and the convergence of the output tracking error are derived by using Lyapunov-like theory. Simulation studies are given to illustrate the tracking performance with the proposed control schemes.

This paper presents singularity characterization and path planning design for a newly developed 3 leg 6 degree-of-freedom (DOFs) parallel manipulator. Special emphasis is placed on characterizing the platform singularity and singularity avoidance of path planning based on genetic algorithms. The path planning scheme proposed uses a real-coded genetic algorithm including a modified crossover and a \wap mutation for searching out the shortest moving path in the available workspace. Key Words: parallel manipulator, kinematics, singularity, genetic algorithms, path planning.

**Implementation of Power-Aided Control for a Virtual Reality Exercise Bike**

Tsai, Mi-Ching; Hu, Jia-Sheng; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 923-929; In English; See also [20080008363](#); Original contains black and white illustrations; Copyright; Avail.: Other Sources

This paper investigates the designs and applications of a virtual reality exercise bike system utilizing active power control. An impedance control which employs a state filter to simplify certain circuits such as torque sensors, is presented for executing functions required by these machines. This approach can be used to improve the indoor exercise experience and assist in physical rehabilitation. Moreover, this method, as opposed to passive techniques, gives patients more options in their endeavors to recover. An experimental setup is given to evaluate control performance in real time and also to demonstrate some practical uses.

**The Effect of Transformer Magnetizing Inductance on a Forward Converter with Current Mode Control**

Chen, Shen-Yuar; Huang, Kunsong; Chen, Jin-Jia; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 937-940; In English; See also [20080008363](#); Original contains black and white illustrations; Copyright; Avail.: Other Sources

The small-signal model for a forward converter with current-mode control is derived which includes the magnetizing inductance of the main power transformer. It is found that the feedforward gain is modified by magnetizing inductance and so are the transfer functions of current loop gain, control to output and audio susceptibility. Simulation and experimental results show that the effect of the magnetizing inductance is similar to an external ramp which can stabilize the converter system.

The process of spin forming is frequently used for manufacturing the axial symmetric products. The spinning process is a transient dynamic contact problem, and is difficult to solve by the quasi-static theory. It is also found that the literature contains few studies of spinning simulation modeling. The present study deals with the dynamic FEM code, LS-DYNA, to

simulate the conventional spinning processes based on the updated Lagrangian formulation. The applications of the mass scaling technique and contact algorithm between the roller and sheet are modeled. The modeling also considers the elasto-plastic material and Coulomb friction conditions. With the differences being variations in the rotation speed of the mandrel, the feed rate of the roller, and the material density. The predicted load-deformation relationships, the strain energy distributions, the full history of deformation states, and the influence and usage of the mass scaling factor are assessed. Some defects in the simulations are observed, and proper solution models are suggested. Besides, some results of the die-less spinning process using a cylindrical mandrel are compared with the conventional spinning process. The proposed models and techniques are helpful for the analysis of the spinning process, and will be a good approach for industrial metal forming simulation. Key Words: dynamic FEM, conventional spinning, mass factor, die-less.

### **Mechanism and Risk Factors of Adjacent Vertebral Failure Post Percutaneous Vertebroplasty: A Strain Energy Density Approach**

Wang, Jaw--Lin; Chiang, Chun-Kai; Yang, Been-Der; Wang, Yao-Hung; Lin, Jinn; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 899-909; In English; See also [20080008363](#)

Contract(s)/Grant(s): NHRI-Ex-94-525EI; NHRI-Ex-95-9425EI; Copyright; Avail.: Other Sources

Percutaneous vertebroplasty (PV) is an effective treatment procedure for compression fracture of osteoporotic vertebra; however, adjacent vertebral failure (AVF) is a frequently observed complication of PV. The mechanism and risk factors of AVF are not yet clear and this problem has attracted a lot of research effort in the medical community. The purpose of this study is to analyze the mechanism and risk factors of AVF post cement augmentation using a strain energy density (SED) approach. Fresh porcine spine specimens (L1-L5) were used. The effect of cement augmentation on the SED of vertebral bodies (VB), including the damaged VB and both adjacent cranial and caudal VBs, was analyzed. The result showed that the SED of the adjacent VBs did not increase after cement augmentation; however, the accumulated energy in the VBs of the whole spine motion segment decreased significantly after cement augmentation. This globally reduced energy is speculated to be absorbed by the disc between VBs. It is reasonable to believe that AVF may be initiated from the stressed disc. This study also suggests that poor bone quality and flexion compression are the two risk factors for AVF. Key Words: strain energy density, percutaneous vertebroplasty, adjacent vertebral failure, bone quality

In an earlier work, Lee et al. (Lee et al., 2001) presented a simple and fast fuzzy classifier that employed fuzzy entropy to evaluate pattern distribution information in a pattern space. In this paper, we extend his work to propose a new fuzzy classifier based on hierarchical fuzzy entropy (FC-HFE). We retained the main parts of the original structure and modified some methods (e.g., methods for deciding the number of intervals in each dimension and for assigning class labels). In addition, the hierarchical fuzzy entropy is proposed for partitioning the decision region. The proposed FC-HFE improves classification accuracy and overcomes some of the drawbacks in the Lee et al method (Lee et al., 2001). The simulation results show that the classification rate of the proposed FC-HFE is better than earlier methods.

### **Evaluation of the Interference Rejection Capability of a Uniform Circular Array**

Panduro, Marco A.; Andrade, Angel G.; Covarrubias, David H.; Mendez, Aldo L.; Dominguez, Rene; Romero, Gerardo; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 775-780; In English; See also [20080008363](#); Original contains black and white illustrations

Contract(s)/Grant(s): J50B39-Y; Copyright; Avail.: Other Sources

This paper deals with the interference rejection capability of circular antenna arrays, as base stations of wireless

communications systems. In general, this figure of merit depends strongly on the array configuration and is a function of the direction of arrival of the desired signal, the number of antenna elements, and their spacing. The main goal and contribution of this paper is to provide a detailed presentation of the behavior of the interference rejection capability of uniform circular arrays. The effect of varying the number of elements and inter-element spacing on the SIR (signal-to-interference ratio) performance is considered. In addition, the effect of mutual coupling is taken into account. Analytical results, for the total average of spatial interference suppression coefficient for circular arrays, as a function of inter-element spacing when mutual coupling is known and without mutual coupling are provided. Key Words: uniform circular array, interference rejection capability, radiation pattern

### **Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability**

Lin, Shang-Chih; Lee, Wei-Shiun; Ma, Ju-Lung; Shih, Kao-Shang; Mudgal, Chaitanya S.; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 891-898; In English; See also [20080008363](#); Copyright; Avail.: Other Sources

The biomechanical evaluation of spinal construct stability is of clinical importance as the results of such an evaluation provide information about the implant's performance in vivo in stabilizing the spine. The flexion/extension test is critical for the evaluation of spinal stability. However, it is more technically demanding to flex the spinal construct with the more structurally complex jig assembly than the assembly used in the compressive or twisting stability tests. A review of the literature shows that a variety of jig assemblies have been used to investigate the mechanical and kinematic behaviors of spinal constructs. However, there is little consensus about the influence of jig design on the investigated behaviors. The current study used the elastic beam-column theory to predict the load and deformation of the spinal construct among four possible jig assemblies. The suitability of these four jig assemblies for the short- and long-segment spinal construct was evaluated in detail with three indices: lateral deflection, loading condition, and failures at the bone-screw interfaces. Among the four assemblies, the jig assembly that generates the distally increasing flexion moment and free cephalic motion was suitable for short-segment fixation. The jig assembly that generates the constant flexion moment seemed to be more appropriate for long-segmentation cases with physiologically acceptable deflection. This study aims to provide an insight into what jig-related factors are associated with physiologically reliable outcomes of the flexion stability test for lumbar implants.

### **A Cassegrain Offset-Fed Dual-Band Reflectarray**

Huang, John; Han, Chulmin; Chang, Kai; July 9, 2006; 4 pp.; In English; IEEE Antennas and Propagation Symposium, 9-14 Jul. 2006, Albuquerque, NM, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40593>

An X/Ka dual-band microstrip reflectarray with circular polarization (CP) has been constructed using thin membranes and Cassegrain offset-fed configuration. It is believed that this is the first Cassegrain reflectarray ever been developed. This antenna has a 75-cm-diameter aperture and uses metallic subreflector and angular-rotated annular ring elements. It achieved a measured -3dB-gain bandwidth of 700 MHz at X-band and 1.5 GHz at Ka-band, as well as a CP bandwidth (3dB axial ratio) of more than 700 MHz at X-band and more than 2 GHz at Ka-band. The measured peak efficiencies are 49.8% at X-band and 48.2% at Ka-band.

The Assembly and Contingency Radio Frequency Group (ACRFG) onboard the International Space Station (ISS) is used for command and control communications and transmits (45 dBm or 32 watts) and receives at S-band. The system is nominally pressurized with gaseous helium (He) and nitrogen (N<sub>2</sub>) at 8 pounds per square inch absolute (psia). MacDonald, Dettwiler and Associates Ltd. (MDA) was engaged to analyze the operational characteristics of this unit in an effort to determine if the anomalous behavior was a result of a corona event. Based on this analysis, MDA did not recommend continued use of this ACRFG. The NESC was requested to provide expert support in the area of high-voltage corona and multipactoring in an S-Band RF system and to assess the probability of corona occurring in the ACRFG during the planned EVA. The NESC recommended minimal continued use of S/N 002 ACRFG until a replacement unit can be installed. Following replacement, S/N 002 will be subjected to destructive failure analysis in an effort to determine the proximate and root cause(s) of the anomalous behavior.

The Hyper-X program flew X-43A research vehicles to hypersonic speeds over the Pacific Ocean in March and November 2004 from the Western Aeronautical Test Range, NASA Dryden Flight Research Center. The program required multiple telemetry ground stations to provide continuous coverage of the captive carry, launch, boost, experiment, and descent phases of these missions. An overview is provided of vehicle telemetry and distributed assets that supported telemetry acquisition, best source selection, radar tracking, video tracking, flight termination systems, and voice communications. Real-time data display and processing are discussed, and postflight analysis and comparison of the acquired data are presented.

**Effects of Multiple Scattering for Millimeter-Wavelength Weather Radars**

Kobayashi, Satoru; Tanelli, Simone; Im, Eastwood; August 23, 2004; 4 pp.; In English; International Radiation Symposium, 23-27 Aug. 2004, Busan, Korea, Republic of; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40570>

Effects of multiple scattering on the reflectivity measurement for millimeter-wavelength weather radars are studied, in which backscattering enhancement may play an important role. In the previous works, the backscattering enhancement has been studied for plane wave injection, the reflection of which is received at the infinite distance. In this paper, a finite beam width of a Gaussian antenna pattern along with spherical wave is taken into account. A time-independent second order theory is derived for a single layer of clouds of a uniform density. The ordinary second-order scattering (ladder term) and the second-order backscattering enhancement (cross term) are derived for both the copolarized and cross-polarized waves.

**Very Long Microstrip Array Feeds of a Membrane Reflector for the Advanced Precipitation Radar**

Huang, John; Rahmat-Samii, Yahya; Durden, Stephen L.; Im, Eastwood; July 5, 2005; 4 pp.; In English; IEEE Antennas and

Propagation Symposium, 5-9 Jul. 2005, Washington, DC, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40596>

Very long microstrip arrays have been developed at the Ku- and Ka-band frequencies. Each array having an electrical length of about 110 free-space wavelengths is used to feed a deployable thin-membrane cylindrical reflector for a spaceborne precipitation radar application. These arrays, designed for 0(deg) and 30(deg) beam directions, achieved peak sidelobes of -20 dB and average sidelobes below -30 dB with peak cross-pol levels below -20 dB. Several unique challenges were encountered during the development of these very long arrays, such as the strong coupling between very long power divider lines, the strong leakage radiation from the lengthy transmission lines, and the lack of computer analysis capability of these electrically large arrays.

This viewgraph presentation reviews the multiplier source technologies and the status/Performance of THz multiplier sources. An example of a THz application is imaging radar. The presentation reviews areas of requirements for THz sources: (1) Figures of merit, (i.e., Frequency Terahertz for high resolution Bandwidth of at least 15 GHz for high range resolution Efficiency (i.e., minimize power supply requirements) (2) Output power: (i.e., Milliwatts below 800 GHz, 10s of microwatts above 1 THz, 1-2 microwatts near 2 THz (3) Mechanical--stability, compact, low mass (4) Environmental -- radiation, vibration, thermal. Several sources for 0.3 - 2 THz are reviewed: FIR lasers, quantum cascade lasers (QCL), backward-wave oscillator (BWO), and Multiplier sources. The current state of the art (SoA) is shown as Substrateless Technology. It also shows where the SoA is for devices beyond 1 THz. The presentation concludes by reviewing the options for future development, and 2 technology roadmaps

Tropical cyclones can cause major loss of both life and property, so that improvements in forecasting motion, intensity, and rainfall are needed. Such forecasting requires accurate measurements of the current state of the cyclone. Ground-based Doppler radars have long been used as an effective means of monitoring severe precipitating storms. Because of the oceanic nature of tropical cyclones, remote monitoring from space is desirable. Recently, the Precipitation Radar (PR) [1] aboard the Tropical Rainfall Measuring Mission (TRMM) [2] satellite has demonstrated an unprecedented capacity for 3-D imaging of precipitating storms. Nonetheless, due to the relatively long TRMM return cycle (less than once per day) the value of PR data has primarily been limited to the understanding of climatological properties of tropical cyclones [3]. The return cycle can be substantially reduced by sensing from a geostationary platform.

The Alternator Test Unit (ATU) in the Lunar Power System Facility (LPSF) located at the NASA Glenn Research Center (GRC) in Cleveland, OH was modified to simulate high voltage transmission capability. The testbed simulated a 1 km transmission cable length from the ATU to the LPSF using resistors and inductors installed between the distribution transformers. Power factor correction circuitry was used to compensate for the reactance of the distribution system to improve the overall power factor. This test demonstrated that a permanent magnet alternator can successfully provide high frequency AC power to a lunar facility located at a distance.

Report No.(s): NASA/TM-2007-215044; AIAA Paper-2007-4789; E-16243; Copyright; Avail.: CASI: [A03](#), Hardcopy

Batteries are critical components for spacecraft, supplying power to all electrical systems during solar eclipse. These components must be lightweight due to launch vehicle limitations and the desire to fly heavier, more capable payloads, and must show excellent capacity retention with age to support the ever growing durations of space missions. ABSL's heritage Lithium Ion cell, the ABSL 18650HC, is an excellent low mass solution to this problem that has been proven capable of supporting long mission durations. The NASA Glenn Research Center recently proposed and initiated a test to study the effects of reduced end of charge voltage on aging of the ABSL 18650HC and other Lithium Ion cells. This paper presents the testing details, a method to analyze and compare capacity fade between the different cases, and a preliminary analysis of the to-date performance of ABSL s cells. This initial analysis indicates that employing reduced end of charge techniques could double the life capabilities of the ABSL 18650HC cell. Accordingly, continued investigation is recommended, particularly at higher depths of discharge to better assess the method s potential mass savings for short duration missions.

ONLINE: <http://hdl.handle.net/2014/40578>

Terahertz (frequencies ranged from 300GHz to 3THz) imaging and spectroscopic systems have drawn increasing attention recently due to their unique capabilities in detecting and possibly analyzing concealed objects. The generation of terahertz signals is nonetheless nontrivial and traditionally accomplished by using either free-electron radiation, optical lasers, Gunn diodes or fundamental oscillation by using III-V based HBT/HEMT technology[1-3]... We have substantially extended the operation range of deep-scaled CMOS by using a linear superimposition method, in which we have realized a 324GHz VCO in 90nm digital CMOS with 4GHz tuning range under 1V supply voltage. This may also pave the way for ultra-high data rate

wireless communications beyond that of IEEE 802.15.3c and reach data rates comparable to that of fiber optical communications, such as OC768 (40Gbps) and beyond.

This report describes approaches to system-level design tools and methodologies. It incorporates significant advances in a behavioral modeling and simulation methodology for Lab-on-a-chip (LoC) design. This modeling and simulation methodology was developed with optimization for design synthesis in mind, enabling rapid automated design of highly complex biofluidic microsystems. This behavioral modeling methodology involves decomposing a complex LoC system into a small set of elements. Each of the elements is associated with a parameterized behavioral model that describes its electric and biofluidic behavior.

**The use of Electrolyte Additives to Improve the High Temperature Resilience of Li-Ion Cells**

Smart, Marshall C.; Lucht, B. L.; Ratnakumar, Bugga V.; October 11, 2007; 24 pp.; In English; 212th Meeting of the Electrochemical Society, 7-12 Oct. 2007, Washington, DC, USA; Original contains color and black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40567>

This viewgraph presentation reviews the use of electrolyte additives to improve the resilience of Lithium ion cells. The objective of this work is to identify lithium-ion electrolytes, which will lead to Li-ion cells with a wide operational temperature range (+60 to -60 C), and to develop Li-ion electrolytes which result in cells that display improved high temperature resilience. Significant improvement in the high temperature resilience of Li-ion cells containing these additives was observed, with the most dramatic benefit being displayed by addition of DMAc. When the electrochemical properties of the individual electrodes were analyzed, the degradation of the anode kinetics was slowed most dramatically by the incorporation of DMAc into the electrolytes. Whereas, the greatest retention in the cathode kinetics was observed in the cell containing the electrolyte with VC added.

**Characterization of Transparent Organic Light-Emitting Device (TOLED)**

Chin, David Y; Blomquist, Steven M; Forsythe, Eric; Shi, Jianmin; Morton, David; Nov 2007; 34 pp.; In English; Original contains color illustrations

Report No.(s): AD-A474589; ARL-TR-4322; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Typical OLEDs are constructed in a bottom-emitting configuration where active organic layers are deposited on top of a transparent electrode, such as indium-tin-oxide (ITO), and then a non-transparent low function metal cathode, such as Mg, Ca, Li, is deposited as the top electrode. When appropriate current and voltage are applied to the electrodes, the organic layers are activated, and light is produced which can be seen at the transparent ITO side. Recently there has been increasing interest in the fabrication of OLEDs that are capable of emitting light from the top surface or from both the top and bottom surfaces by using transparent electrodes on both sides. These transparent OLEDs (TOLEDs) offer some unique features that are applicable to both the military and the commercial world. Examples of which include helmet mounted see-through head-up displays, windshield or window displays, stacked organic light-emitting devices (SOLED) for improved resolution and enhanced full-color capability, etc. This report describes a study performed on TOLEDs by using Mg:Ag and ZnS/Ag/ZnS as the transparent cathodes, a standard OLED device structure, and transparent ITO anode on a glass substrate to investigate and

characterize the device performance as function of the transparent layer thickness; specifically at Mg:Ag layer thickness of 75 Angstroms, 150 Angstroms, 100 Angstroms, and 200 Angstroms.

ONLINE: <http://hdl.handle.net/2060/20080006598>

A research plan is being implemented at NASA to investigate inlet mode transition for turbine-based combined-cycle (TBCC) propulsion for the hypersonic community. Unresolved issues have remained on how to design an inlet system to supply both a turbine engine and a ram/scramjet flowpath that operate with both high performance and stability. The current plan is aimed at characterizing the design, performance and operability of TBCC inlets through a series of experiments and analyses. A TBCC inlet has been designed that is capable of high performance (near MIL-E-5008B recovery) with smooth transitioning characteristics. Traditional design techniques were used in an innovative approach to balance the aerodynamic and mechanical constraints to create a new TBCC inlet concept. The inlet was designed for top-end Mach 7 scramjet speeds with an over/under turbine that becomes cocooned beyond its Mach 4 peak design point. Conceptually, this propulsion system was picked to meet the needs of the first stage of a two-stage to orbit vehicle. A series of increasing fidelity CFD-based tools are being used throughout this effort. A small-scale inlet experiment is on-going in the GRC 1'x1' Supersonic Wind Tunnel (SWT). Initial results from both the CFD analyses and test are discussed showing that high performance and smooth mode transitions are possible. The effort validates the design and is contributing to a large-scale inlet/propulsion test being planned for the GRC 10' x10' SWT. This large-scale effort provide the basis for a Combined Cycle Engine Testbed, (CCET), that will be able to address integrated propulsion system and controls objectives.

#### **Heat Transfer and Pressure Drop in Concentric Annular Flows of Binary Inert Gas Mixtures**

Reid, R. S.; Martin, J. J.; Yocum, D. J.; Stewart, E. T.; November 2007; 84 pp.; In English; Original contains color and black and white illustrations

Report No.(s): NASA/TM-2007-215135; M-1210; Copyright; Avail.: CASI: [A05](#), Hardcopy

Studies of heat transfer and pressure drop of binary inert gas mixtures flowing through smooth concentric circular annuli, tubes with fully developed velocity profiles, and constant heating rate are described. There is a general lack of agreement among the constant property heat transfer correlations for such mixtures. No inert gas mixture data exist for annular channels. The intent of this study was to develop highly accurate and benchmarked pressure drop and heat transfer correlations that can be used to size heat exchangers and cores for direct gas Brayton nuclear power plants. The inside surface of the annular channel is heated while the outer surface of the channel is insulated. Annulus ratios range  $0.5 < r^* < 0.83$ . These smooth tube data may serve as a reference to the heat transfer and pressure drop performance in annuli, tubes, and channels having helixes or spacer ribs, or other surfaces.

**Single-Shot Scalar-Triplet Measurements in High-Pressure Swirl-Stabilized Flames for Combustion Code Validation**

Kojima, Jun; Nguyen, Quang-Viet; October 30, 2007; 16 pp.; In English; NASA Fundamental Aeronautics 1st Annual Meeting, 30 Oct. - 1 Nov. 2007, New Orleans, LA, USA; Original contains color illustrations

Contract(s)/Grant(s): WBS 984754.02.07.03.19.03; Copyright; Avail.: CASI: [A03](#), Hardcopy

In support of NASA ARMD's code validation project, we have made significant progress by providing the first quantitative single-shot multi-scalar data from a turbulent elevated-pressure (5 atm), swirl-stabilized, lean direct injection (LDI) type research burner operating on CH<sub>4</sub>-air using a spatially-resolved pulsed-laser spontaneous Raman diagnostic technique. The Raman diagnostics apparatus and data analysis that we present here were developed over the past 6 years at Glenn Research Center. From the Raman scattering data, we produce spatially-mapped probability density functions (PDFs) of the instantaneous temperature, determined using a newly developed low-resolution effective rotational bandwidth (ERB) technique. The measured 3-scalar (triplet) correlations, between temperature, CH<sub>4</sub>, and O<sub>2</sub> concentrations, as well as their PDFs, also provide a high-level of detail into the nature and extent of the turbulent mixing process and its impact on chemical reactions in a realistic gas turbine injector flame at elevated pressures. The multi-scalar triplet data set presented here provides a good validation case for CFD combustion codes to simulate by providing both average and statistical values for the 3 measured scalars.

**A Microfabricated Segmented-Involute-Foil Regenerator for Enhancing Reliability and Performance of Stirling Engines**

Ibrahim, Mounir; Danila, Daniel; Simon, Terrence; Mantell, Susan; Sun, Liyong; Gadeon, David; Qiu, Songgang; Wood, Gary; Kelly, Kevin; McLean, Jeffrey; December 2007; 181 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NAS3-03124; WBS 138494.04.01.01

Report No.(s): NASA/CR-2007-215006; E-16191; Copyright; Avail.: CASI: [A09](#), Hardcopy

An actual-size microfabricated regenerator comprised of a stack of 42 disks, 19 mm diameter and 0.25 mm thick, with layers of microscopic, segmented, involute-shaped flow channels was fabricated and tested. The geometry resembles layers of uniformly-spaced segmented-parallel-plates, except the plates are curved. Each disk was made from electro-plated nickel using the LiGA process. This regenerator had feature sizes close to those required for an actual Stirling engine but the overall regenerator dimensions were sized for the NASA/Sunpower oscillating-flow regenerator test rig. Testing in the oscillating-flow test rig showed the regenerator performed extremely well, significantly better than currently used random-fiber material, producing the highest figures of merit ever recorded for any regenerator tested in that rig over its approximately 20 years of use.

**Hydrodynamic Force on a Cylinder Oscillating at Low Frequency**

Berg, Robert F.; Yao, Minwu; Panzarella, Charles H.; December 2007; 47 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NASA Order C-32067-J; WBS 253225.04.01.02.05.03.03

Report No.(s): NASA/CR-2007-215050; E-16266; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080006726>

The hydrodynamic force on a cylinder oscillating transversely to its axis is a nonlinear function of the displacement amplitude  $x_0$ . We report measurements and numerical calculations of the force at frequencies low enough that  $\delta > R$ , where  $\delta$  is the viscous penetration length and  $R$  is the cylinder radius. For small amplitudes, the numerically calculated Fourier transform of the force per unit length,  $F(\text{sub small})$ , agrees with Stokes' analytical calculation. For larger amplitudes, the force per unit length found by both calculation and measurement is  $F = F(\text{sub small})C(x_0/\delta, R/\delta)$ . The complex function  $C$  depends only weakly on  $R/\delta$ , indicating that  $x_0/\delta$  is more appropriate as a scaling variable than the Keulegan-Carpenter number  $KC = \pi x_0/R$ . The measurements used a torsion oscillator driven at frequencies from 1 to

12 Hz while immersed in dense xenon. The oscillator comprised cylinders with an effective radius of  $R = 13.4$  micron and oscillation amplitudes as large as  $x(\text{sub } 0)/\delta = 4$  (corresponding to  $KC$  as large as 71). The calculations used similar conditions except that the amplitudes were as large as  $x_0/\delta = 28$ .

**Analyzing the Influence of Compressibility on the Rapid Pressure-Strain Rate Correlation in Turbulent Shear Flows**

Thacker, W. D.; Sarkar, S.; Gatski, T. B.; [2007]; 30 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 23-065-30-35; Copyright; Avail.: Other Sources

The influence of compressibility on the rapid pressure-strain rate tensor is investigated using the Green's function for the wave equation governing pressure fluctuations in compressible homogeneous shear flow. The solution for the Green's function is obtained as a combination of parabolic cylinder functions; it is oscillatory with monotonically increasing frequency and decreasing amplitude at large times, and anisotropic in wave-vector space. The Green's function depends explicitly on the turbulent Mach number  $M(\text{sub } t)$ , given by the root mean square turbulent velocity fluctuations divided by the speed of sound, and the gradient Mach number  $M(\text{sub } g)$ , which is the mean shear rate times an integral scale of the turbulence divided by the speed of sound. Assuming a form for the temporal decorrelation of velocity fluctuations brought about by the turbulence, the rapid pressure-strain rate tensor is expressed exactly in terms of the energy spectrum tensor and the time integral of the Green's function times a decaying exponential. A model for the energy spectrum tensor linear in Reynolds stress anisotropies and in mean shear is assumed for closure. The expression for the rapid pressure-strain correlation is evaluated using parameters applicable to a mixing layer and a boundary layer. It is found that, for the same range of  $M(\text{sub } t)$ , there is a large reduction of the pressure-strain correlation in the mixing layer but not in the boundary layer. Implications for compressible turbulence modeling are also explored.

**Role of Turbulent Prandtl Number on Heat Flux at Hypersonic Mach Numbers**

Xiao, X.; Edwards, J. R.; Hassan, H. A.; Gaffney, R. L., Jr.; [2007]; 21 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): FA9101-04-C-0015; NAG1-03030; 23R-065-50-9177-01

Report No.(s): AIAA Paper 2005-1098; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080006846>

A new turbulence model suited for calculating the turbulent Prandtl number as part of the solution is presented. The model is based on a set of two equations: one governing the variance of the enthalpy and the other governing its dissipation rate. These equations were derived from the exact energy equation and thus take into consideration compressibility and dissipation terms. The model is used to study two cases involving shock wave/boundary layer interaction at Mach 9.22 and Mach 5.0. In general, heat transfer prediction showed great improvement over traditional turbulence models where the turbulent Prandtl number is assumed constant. It is concluded that using a model that calculates the turbulent Prandtl number as part of the solution is the key to bridging the gap between theory and experiment for flows dominated by shock wave/boundary layer interactions.

**Dual-Pump CARS Temperature and Species Concentration Measurements in a Supersonic Combustor**

O'Byrne, S.; Danehy, P. M.; Tedder, S. A.; Cutler, A. D.; [2007]; 31 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 599489.02.07.07; Copyright; Avail.: CASI: [A03](#), Hardcopy

The dual-pump coherent anti-Stokes Raman scattering (CARS) method was used to measure temperature and the mole fractions of  $N_2$  and  $O_2$  in a supersonic combustor. Experiments were conducted in NASA Langley Research Center's Direct

Connect Supersonic Combustion Test Facility. In this facility, H<sub>2</sub> and oxygen-enriched air burn to increase the enthalpy of the simulated air test gas. This gas is expanded through a Mach 2 nozzle and into a combustor model consisting of a short constant-area section followed by a small rearward-facing step and another constant-area section. At the end of this straight section, H<sub>2</sub> fuel is injected at Mach 2 and at a 30 angle with respect to the freestream. One wall of the duct then expands at a 3 angle for over 1 meter. The ensuing combustion is probed optically through ports in the side of the combustor. Dual-pump CARS measurements were performed at the facility nozzle exit and at four planes downstream of fuel injection. Maps are presented of the mean temperature, as well as N<sub>2</sub> and O<sub>2</sub> mean mole fraction fields. Correlations between fluctuations of the different measured parameters are also presented.

**Small Scale Response and Modeling of Periodically Forced Turbulence**

Bos, Wouter; Clark, Timothy T.; Rubinstein, Robert; [2007]; 23 pp.; In English; Original contains black and white illustrations  
Contract(s)/Grant(s): WBS 561581.02.08; Copyright; Avail.: CASI: [A03](#), Hardcopy

The response of the small scales of isotropic turbulence to periodic large scale forcing is studied using two-point closures. The frequency response of the turbulent kinetic energy and dissipation rate, and the phase shifts between production, energy and dissipation are determined as functions of Reynolds number. It is observed that the amplitude and phase of the dissipation exhibit nontrivial frequency and Reynolds number dependence that reveals a filtering effect of the energy cascade. Perturbation analysis is applied to understand this behavior which is shown to depend on distant interactions between widely separated scales of motion. Finally, the extent to which finite dimensional models (standard two-equation models and various generalizations) can reproduce the observed behavior is discussed.

**The alpha(3) Scheme - A Fourth-Order Neutrally Stable CESE Solver**

Chang, Sin-Chung; June 27, 2007; 36 pp.; In English; 18th AIAA Computational Fluid Dynamics Conference, 25-28 Ju. 2007, Miami, FL, USA; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 599489.02.07.03.04.03.01

Report No.(s): AIAA 2007-4321; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080007495>

The conservation element and solution element (CESE) development is driven by a belief that a solver should (i) enforce conservation laws in both space and time, and (ii) be built from a non-dissipative (i.e., neutrally stable) core scheme so that the numerical dissipation can be controlled effectively. To provide a solid foundation for a systematic CESE development of high order schemes, in this paper we describe a new 4th-order neutrally stable CESE solver of the advection equation  $\frac{\partial u}{\partial t} + \alpha \frac{\partial u}{\partial x} = 0$ . The space-time stencil of this two-level explicit scheme is formed by one point at the upper time level and three points at the lower time level. Because it is associated with three independent mesh variables  $u^{(n)}(j)$ ,  $u^{(n)}(x)$ , and  $u^{(n)}(xz)$  (the numerical analogues of  $u$ ,  $\frac{\partial u}{\partial t}$ , and  $\frac{\partial^2 u}{\partial t^2}$ ), respectively) and four equations per mesh point, the new scheme is referred to as the alpha(3) scheme. As in the case of other similar CESE neutrally stable solvers, the alpha(3) scheme enforces conservation laws in space-time locally and globally, and it has the basic, forward marching, and backward marching forms. These forms are equivalent and satisfy a space-time inversion (STI) invariant property which is shared by the advection equation. Based on the concept of STI invariance, a set of algebraic relations is developed and used to prove that the alpha(3) scheme must be neutrally stable when it is stable. Moreover it is proved rigorously that all three amplification factors of the alpha(3) scheme are of unit magnitude for all phase angles if  $|v| \leq 1/2$  ( $v = \alpha \Delta t / \Delta x$ ). This theoretical result is consistent with the numerical stability condition  $|v| \leq 1/2$ . Through numerical experiments, it is established that the alpha(3) scheme generally is (i) 4th-order accurate for the mesh variables  $u^{(n)}(j)$  and  $u^{(n)}(x)$ ; and 2nd-order accurate for  $u^{(n)}(xz)$ . However, in some exceptional cases, the scheme can achieve perfect accuracy aside from round-off errors.

In Spring of 2005, the NASA Engineering Safety Center (NESC) was engaged by the Space Shuttle Program (SSP) to peer review the suite of analytical tools being developed to support the determination of impact and damage tolerance of the Orbiter Thermal Protection Systems (TPS). The NESC formed an independent review team with the core disciplines of materials, flight sciences, structures, mechanical analysis and thermal analysis. The Math Model Tools reviewed included damage prediction and stress analysis, aeroheating analysis, and thermal analysis tools. Some tools are physics-based and other tools are empirically-derived. Each tool was created for a specific use and timeframe, including certification, real-time pre-launch assessments. In addition, the tools are used together in an integrated strategy for assessing the ramifications of impact damage to tile and RCC. The NESC teams conducted a peer review of the engineering data package for each Math Model Tool. This report contains the summary of the team observations and recommendations from these reviews.

**Evaluation of Modified Two-Equation Turbulence Models for Jet Flow Predictions**

Georgiadis, Nicholas J.; Yoder, Dennis A.; Engblom, William A.; AIAA Journal; December 2006; Volume 44, No. 12, pp. 3107-3114; In English; AIAA Aerospace Sciences Meeting and Exhibit, 9-12 Jan 2006, Reno, NV, USA; Original contains black and white illustrations

Report No.(s): AIAA Paper-2006-0490; Copyright; Avail.: CASI: [A02](#), Hardcopy

ONLINE: <http://dx.doi.org/10.2514/1.22650>

Three two-equation turbulence models developed specifically to improve prediction of jet flowfields are investigated. These models are the Tam-Ganesan k-epsilon formulation, a standard k-epsilon model with modification for heated jets referred to as the PAB temperature correction, and a standard k-epsilon model employing variable diffusion for the k and epsilon equations. Two standard two-equation models are also investigated for comparison with the modified formulations. The standard models are the Chien k-epsilon and Menter shear stress transport formulations. All of the models were investigated for a reference nozzle producing heated and unheated jets at a low acoustic Mach number of 0.5 to avoid complications of large compressibility effects. The primary deficiency of the standard models was the delayed initial jet mixing rate. All of the modified turbulence model formulations provided improved mean flow predictions relative to the standard models. The improved mixing rate enabled by the Tam-Ganesan model and the variable diffusion correction resulted from increased turbulent diffusion enabled by both models. The Tam-Ganesan model and PAB temperature correction improved predictions of mean axial velocities for the heated jet, but did not improve prediction of the calculated turbulent kinetic energy fields.

**Constraint Force Equation Methodology for Modeling Multi-Body Stage Separation Dynamics**

Toniolo, Matthew D.; Tartabini, Paul V.; Pamadi, Bandu N.; Hotchko, Nathaniel; January 07, 2008; 22 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

This paper discusses a generalized approach to the multi-body separation problems in a launch vehicle staging environment based on constraint force methodology and its implementation into the Program to Optimize Simulated Trajectories II (POST2), a widely used trajectory design and optimization tool. This development facilitates the inclusion of stage separation analysis into POST2 for seamless end-to-end simulations of launch vehicle trajectories, thus simplifying the overall implementation and providing a range of modeling and optimization capabilities that are standard features in POST2.

Analysis and results are presented for two test cases that validate the constraint force equation methodology in a stand-alone mode and its implementation in POST2.

**Apparent Transition Behavior of Widely-Used Turbulence Models**

Rumsey, Christopher L.; December 2007; 34 pp.; In English

Contract(s)/Grant(s): WBS 561581.02.08; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080008439>

The Spalart-Allmaras and the Menter SST k-omega turbulence models are shown to have the undesirable characteristic that, for fully turbulent computations, a transition region can occur whose extent varies with grid density. Extremely fine two-dimensional grids over the front portion of an airfoil are used to demonstrate the effect. As the grid density is increased, the laminar region near the nose becomes larger. In the Spalart-Allmaras model this behavior is due to convergence to a laminar-behavior fixed point that occurs in practice when freestream turbulence is below some threshold. It is the result of a feature purposefully added to the original model in conjunction with a special trip function. This degenerate fixed point can also cause non-uniqueness regarding where transition initiates on a given grid. Consistent fully turbulent results can easily be achieved by either using a higher freestream turbulence level or by making a simple change to one of the model constants. Two-equation k-omega models, including the SST model, exhibit strong sensitivity to numerical resolution near the area where turbulence initiates. Thus, inconsistent apparent transition behavior with grid refinement in this case does not appear to stem from the presence of a degenerate fixed point. Rather, it is a fundamental property of the k-omega model itself, and is not easily remedied.

Preliminary steps toward modeling a coupled ablation problem using a finite-volume Navier-Stokes code (LAURA) are presented in this paper. Implementation of a surface boundary condition with mass transfer (blowing) is described followed by verification and validation through comparisons with analytic results and experimental data. Application of the code to a carbon-nosetip ablation problem is demonstrated and the results are compared with previously published data. It is concluded that the code and coupled procedure are suitable to support further ablation analyses and studies.

**Turbulence Modeling Effects on Calculation of Lobed Nozzle Flowfields**

Georgiadis, Nicholas J.; Rumsey, Christopher L.; Yoder, Dennis A.; Zaman, Khairul B. M. Q.; Journal of Propulsion and Power; May-June 2006; Volume 22, No. 3, pp. 567-575; In English; AIAA 41st Aerospace Sciences Meeting and Exhibit, 6-9 Jan. 2003, Reno, NV, USA; Original contains black and white illustrations; Copyright; Avail.: CASI: [A02](#), Hardcopy

Two Reynolds-averaged Navier-Stokes solvers, CFL3D and WIND, are applied to the subsonic turbulent jet flowfield originating from a six-lobed nozzle, with emphasis placed on turbulence modeling effects. The turbulence models investigated include linear one-equation and two-equation models and nonlinear two-equation explicit algebraic stress model (EASM) formulations. Two nozzle operating points are investigated, corresponding to exit Mach numbers of 0.30 and 0.94. Comparisons of calculated mean axial velocities and turbulence intensities are made with experimental data. All of the turbulence models were deficient in predicting the initial mixing rate exhibited by the experimental data. The one-equation model provided the best agreement with experimental data in the near field of the jet. The linear two-equation models and a modified EASM provided better agreement with data in the farfield. The Mach 0.30 k-w EASM calculation required a

time-accurate calculation because of significant unsteadiness in the initial jet region, which is believed to be characteristic of the nozzle flow under consideration.

#### **Advanced Integrated Multi-Sensor Surveillance (AIMS. Operator Machine Interface (OMI) Definition Study**

Baker, Kevin; Youngson, Gord; Feb 2007; 142 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DRDC; ATLANTIC CR 2006-242

Report No.(s): AD-A475282; No Copyright; Avail.: Defense Technical Information Center (DTIC)

To enhance the capability of airborne search and rescue (SAR) and surveillance, particularly at night and in poor weather, a multi sensor electro optical imaging system, the Advanced Integrated Multi sensor Surveillance (AIMS) system, is being developed by Defence Research & Development Canada. The AIMS system is advanced through active gated capability and the integration of five sensors into a single gimbal. As such, the system will support a myriad of missions for both the CP 140 and FWSAR communities including timely SAR response and ground surveillance in aid of the Land Forces (LF). To ensure optimal performance the AIMS system requires an appropriate interface and controls, the design of which must realize the interaction between technological capability and operator performance. This document, prepared by CAE Professional Services on behalf of Defence Research and Establishment Canada, presents preliminary design concepts and associated rationale for the AIMS Operator Machine Interface (OMI). The intent is to provide a framework for the future evolution of the AIMS OMI as well as identify areas for investigation.

#### **AIMSsim Version 2.2.1, System Manual**

Schoenborn, Oliver; Mar 2007; 50 pp.; In English; Original contains color illustrations

Report No.(s): AD-A475272; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This system manual provides an overview of software developed to support the empirical investigation of a simulated user interface for an Advanced Integrated Multi-sensor Surveillance (AIMS) system (formerly known as the Enhanced Low Light Level Visible and Infrared Surveillance System ELVISS). The AIMS system is an electro-optical imaging system being developed by the Defence Research and Development Canada (DRDC)-Valcartier to enhance the capability of search and rescue (SAR) crews to operate effectively at night and in degraded weather conditions. In order to ensure that a SAR operator would be able to use the system effectively and with a minimal amount of training, a prototype human machine interface (HMI) was developed to evaluate design concepts. The latest development phase added important tracking and motion related functionality (amongst other things) to the system and gave it a new name AIMSsim.

#### **Sensor Feasibility Report: Survey of the Capabilities and Limitations of Chemical, Biological, Radiological, Nuclear and Explosive (CBRNE) Sensor Technologies Relevant to Vehicle Inspection Systems**

Riley, Larry E; Oct 2007; 20 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA4819-06-C-0012; Proj-GOVT

Report No.(s): AD-A475258; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report provides a summary of KRD's research on existing Chemical, Biological, Radiological, Nuclear, and Explosive (CBRNE) sensor technologies and possible incorporation into Under Vehicle Inspection Systems (UVIS) platforms,

as provided in the sensor integration plan. Sections two through five discuss how KRD could potentially integrate these technologies into its Under-Vehicle Inspection System (UVIS) platforms, thereby enhancing their threat detection capabilities. These sections also focus on the practical implications of each sensor technology, including capabilities, limitation, operational considerations, and integration with UVIS platforms. Detailed information on the theory and principal of operation for each sensor technology can be found in the references. Section six presents a sensor integration plan for incorporating sensor capabilities into KRD's UVIS platforms for large vehicles. This plan summarizes the practical considerations in selecting a CBRNE sensor. Additionally, it discusses the advantage of selecting a 'weigh-in-motion' capability as the first sensor technology that KRD will use in conjunction with its UVIS platforms.

**In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage**

Nguyen, Quang-Viet; October 29, 2007; 23 pp.; In English; International Fire and Cabin Saety Research Conference, 29 Oct. - 1 Nov. 2007, Atlantic City, NJ, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 561581.02.08.03.05.01; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080007196>

A rugged and compact fiber optic sensor system for in situ real-time measurement of nitrogen (N<sub>2</sub>), oxygen (O<sub>2</sub>), hydrocarbon (HC) fuel vapors, and other gases has been developed over the past several years at Glenn Research Center. The intrinsically-safe, solid-state fiber optic sensor system provides a 1% precision measurement (by volume) of multiple gases in a 5-sec time window. The sensor has no consumable parts to wear out and requires less than 25 W of electrical power to operate. The sensor head is rugged and compact and is ideal for use in harsh environments such as inside an aircraft fuel tank, or as a feedback sensor in the vent-box of an on-board inert gas generation system (OBIGGS). Multiple sensor heads can be

monitored with a single optical detection unit for a cost-effective multi-point sensor system. The present sensor technology is unique in its ability to measure N<sub>2</sub> concentration directly, and in its ability to differentiate different types of HC fuels. The present sensor system provides value-added aircraft safety information by simultaneously and directly measuring the nitrogen-oxygen-fuel triplet, which provides the following advantages: (1) information regarding the extent of inerting by N<sub>2</sub>, (2) information regarding the chemical equivalence ratio, (3) information regarding the composition of the aircraft fuel, and (4) by providing a self-consistent calibration by utilizing a singular sensor for all species. Using the extra information made available by this sensor permits the ignitability of a fuel-oxidizer mixture to be more accurately characterized, which may permit a reduction in the amount of inerting required on a real-time basis, and yet still maintain a fire-safe fuel tank. This translates to an increase in fuel tank fire-safety through a better understanding of the physics of fuel ignition, and at the same time, a reduction in compressed bleed air usage and concomitant aircraft operational costs over the long-run. The present fiber optic sensor can also be used as a false-alarm-free engine/hidden/cargo space fire detector (by measuring increased CO<sub>2</sub> and CO, and decreased O<sub>2</sub>), a multi-point in situ measurement and certification system for halogenated-compound fire protection systems, and for the testing and certification of other aircraft safety sensor systems. The technology (LEW-17826-1) developed in the present sensor system is patent pending.

ONLINE: <http://hdl.handle.net/2014/40597>

Mid-wavelength infrared (MWIR) and long-wavelength infrared (LWIR) 1024x1024 pixel quantum well infrared photodetector (QWIP) focal planes have been demonstrated with excellent imaging performance. The MWIR QWIP detector array has demonstrated a noise equivalent differential temperature (NE( $\Delta$ )T) of 17 mK at a 95K operating temperature with f/2.5 optics at 300K background and the LWIR detector array has demonstrated a NE( $\Delta$ )T of 13 mK at a 70K operating temperature with the same optical and background conditions as the MWIR detector array after the subtraction of system noise. Both MWIR and LWIR focal planes have shown background limited performance (BLIP) at 90K and 70K operating-temperatures respectively, with similar optical and background conditions. In addition, we are in the process of developing MWIR and LWIR pixel colocated simultaneously readable dualband QWIP focal plane arrays.

This paper describes an instantaneous velocity measurement system based on the Doppler shift of elastically scattered laser light from gas molecules (Rayleigh scattering) relative to an incident laser. The system uses a pulsed laser as the light source, direct-viewing optics to collect the scattered light, an interferometer to analyze spectrally the scattered light mixed with the incident laser light, and a CCD camera to capture the resulting interferogram. The system is capable of simultaneous, spatially (approximately 0.2 mm(exp 3)) and temporally (approximately 40 ns) resolved, multiple point measurements of two orthogonal components of flow velocity in the presence of background scattered light, acoustic noise and vibrations, and flow particulates. Measurements in a large-scale axi-symmetric Mach 1.6 H<sub>2</sub>-air combustion-heated jet running at a flow sensible enthalpy specific to Mach 5.5 hypersonic flight are performed to demonstrate the technique. The measurements are compared with CFD calculations using a finite-volume discretization of the Favre-averaged Navier-Stokes equations (VULCAN code).

A Tm:germanate fiber laser produced >0.25 mJ/pulse in a 45 ns pulse. It is capable of producing multiple Q-switched pulses from a single pump pulse. With the addition of a diffraction grating, Tm:germanate fiber lasers produced a wide, but length dependent, tuning range. By selecting the fiber length, the tuning range extends from 1.88 to 2.04  $\mu$ m. These traits make Tm:germanate lasers suitable for remote sensing of water vapor.

#### **DSP-Based Adaptive Fuzzy Velocity/Pressure Control of Injection Molding Machines**

Wang, Ming-Shyan; Chang, Chia-Ming; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 819-827; In English; See also [20080008363](#)

Contract(s)/Grant(s): NSC 92-2622-E-218-015-CC3; Copyright; Avail.: Other Sources

The design and implementation of a low-cost DSP-based fully digital velocity/pressure (V/P) controller for hydraulic injection molding machines is proposed. This system includes an analog potentiometer to sense position signal and a fixed-point 16-bit DSP with built-in 10-bit ADCs. An in-parallel interlaced sample-and-hold structure is proposed to improve the accuracy of computing low velocities due to noise contamination and using low-resolution ADCs. PI control is employed in V/P control loops to provide compatibility with commercial cards. An adaptive fuzzy control is adopted to overcome the pressure drop at the V/P transfer point. Finally, simulated and experimental results validate the proposed algorithms.

### **Stress Analysis of Composite Cylindrical Shells with an Elliptical Cutout**

Oterkus, E.; Madenci, E.; Nemeth, M. P.; [2007]; 63 pp.; In English; Original contains color and black and white illustrations  
Contract(s)/Grant(s): 732759.07.11; Copyright; Avail.: CASI: [A04](#), Hardcopy

A special-purpose, semi-analytical solution method for determining the stress and deformation fields in a thin laminated-composite cylindrical shell with an elliptical cutout is presented. The analysis includes the effects of cutout size, shape, and orientation; non-uniform wall thickness; oval-cross-section eccentricity; and loading conditions. The loading conditions include uniform tension, uniform torsion, and pure bending. The analysis approach is based on the principle of stationary potential energy and uses Lagrange multipliers to relax the kinematic admissibility requirements on the displacement representations through the use of idealized elastic edge restraints. Specifying appropriate stiffness values for the elastic extensional and rotational edge restraints (springs) allows the imposition of the kinematic boundary conditions in an indirect manner, which enables the use of a broader set of functions for representing the displacement fields. Selected results of parametric studies are presented for several geometric parameters that demonstrate that analysis approach is a powerful means for developing design criteria for laminated-composite shells.

### **Bulk Scattering Properties for the Remote Sensing of Ice Clouds. 3. High Resolution Spectral Models from 100 to 3250 cm(exp -1)**

Baum, Bryan A.; Yang, Ping; Nasiri, Shaima; Heidinger, Andrew K.; Heymsfield, Andrew; Li, Jun; [2007]; 27 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NNG04GL24G; NSF ATM-0239605; WBS 921266.04.07.06; Copyright; Avail.: Other Sources

This study reports on the development of bulk single-scattering models for ice clouds that are appropriate for use in hyperspectral radiative transfer cloud modeling over the spectral range from 100 to 3250 / cm. The models are developed in a manner similar to that recently reported for the Moderate Resolution Imaging Spectroradiometer (MODIS), so these models result in a consistent set of scattering properties from visible to far-infrared wavelengths. The models incorporate a new

database of individual ice particle scattering properties that includes droxtals, 3D bullet rosettes, hexagonal solid and hollow columns, aggregates, and plates. The database provides scattering properties for each habit in 45 size bins ranging from 2 to 9500 m, at a spectral resolution of 1 / cm obtained from a spline interpolation based on data sets at 49 wavenumbers. Bulk models are developed by integrating various properties over both particle habit and size distributions. A total of 1117 particle size distributions are used in the analyses, and are taken from analysis of FIRE-I, FIRE-II, ARM-IOP, TRMM-KWAJEX, and CRYSTAL-FACE data. The models include microphysical and scattering properties such as median mass diameter, effective diameter, single-scatter albedo, asymmetry factor, and scattering phase function. The spectral models are appropriate for use by infrared spectrometers such as the Atmospheric InfraRed Sounder (AIRS) on the NASA Aqua satellite and the Cross-track Infrared Sounder (CrIS) on the upcoming National Polar Orbiting Environmental Satellite System (NPOESS) platforms.

#### **Investigating Sonoluminescence as a Means of Energy Harvesting**

Wrbanek, John D.; Gralic, Gustave C.; Wrbanek, Susan Y.; Hall, Nancy R.; [2008]; 29 pp.; In English; *Frontiers of Propulsion Science*; Original contains black and white illustrations; No Copyright; Avail.: Other Sources

SONOLUMINESCENCE has risen to be a source of interest to those outside of the ultrasonic community over the last decade. The processes of understanding the effect lead to the challenge of utilizing some of its more interesting properties in practical applications. The sonoluminescence phenomena is defined as the generation of light from sound waves, first discovered in the 1930s as a by-product of early work on sonar. The report in 1992 of the ultrasonic trapping of a single glowing bubble in a flask of water generated a cascade of research. The glow from the bubble was found to be generated in bubbles compressed to at least 150 kPa in an extremely short duration flash (<12 picoseconds), and had temperatures of at least 25,000 K for the single bubble. Bubbles of noble gases were seen to flash brighter, but the nature of the liquid was also seen as playing a large role in the flashes as well. Shortly after experimental results on trapped single bubbles were published, models were developed to explain these measurements. Simple shock calculations showed that peak temperatures inside the sonoluminescent bubbles could reach  $3 \times 10^{(exp 8)}$  K based on the collapse of an ideal spherical gas bubble. Assuming a non-spherical collapse, the high-speed jet striking the opposite side of the bubble gave rise to the possibility of the water being fractured on the molecular scale and generating light as fracto-luminescence. The extremely rapid collapse of the bubble led to the theoretical examination of sonoluminescence as an effect of quantum vacuum radiation. The lack of an after-glow suggested a cooperative optical emission, like that of an optical laser or superradiance. A model of the flash resulting from a two-component plasma in the bubble (containing a low density halo and high density core) was developed to explain the measured properties. The actual process may be a combination of any of the above. A simplified schematic of the current model of the process is shown in accompanying figure. Even as these theories are being explored, applications for the effect are taking shape, from fusion containment to thin film deposition systems and other useful applications. Recently, claims put forward for the generation of fusion reactions has caused controversy in the scholarly and popular media. However, if realized, harnessing the high energy release in safe, emission-free ultrasonic processes would lead to the development of revolutionary power systems for in-flight use for both aircraft and spacecraft. The benefits of an on-board fusion power system will be in reduced fuel consumption, lower emissions and reduced noise for many types of aircraft. A practical fusion power source would replace the conventional gas turbine auxiliary power units and electrical generators in aircraft, and fuel cells and batteries in spacecraft, improving flight and mission capability. Longer-term use of the power source will have both an environmental benefit and act as a positive contributor to the country's energy diversification, as well as enable new missions for both air and space.

#### **Fluorinated Ester Co-Solvents for Low-Temperature Li-Ion Cells**

Smith, Kiah A.; Smart, Marshall C.; Prakash, G. K. Surya; Ratnakumar, B. V.; FROM; October 7, 2007; 32 pp.; In English;

212th Meeting of the Electrochemical Society, 7-12 Oct. 2007, Washington, DC, USA; Original contains color illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40568>

This viewgraph presentation reviews the development of co-solvents for Li-ion cells. The future planned NASA Missions to explore Mars, the Moon, and the outer planets require rechargeable batteries that can operate at low temperatures. The applications for these batteries include landers, rovers and penetrators. This presentation reviews the work on optimizing the ester-based electrolyte formulations, with the intent of providing the best performance at temperatures ranging from -60 to +60 C.

#### **Chemical Data Assimilation Estimates of Continental US Ozone and Nitrogen Budgets during INTEX-A**

Pierce, Robert B.; Schaack, Todd K.; Al-Saadi, Jassim A.; Fairlie, T. Duncan; Kittaka, Chieko; Lingenfelter, Gretchen; Natarajan, Murali; Olson, Jennifer; Soja, Amber; Zapotocny, Tom; Lenzen, Allen; Stobie, James; Johnson, Donald; Avery, Melody A.; Sachse, Glen W.; Thompson, Anne; Cohen, Ron; Dibb, Jack E.; Crawford, James H.; Rault, Didier F.; Martin, Randall; Szykman, James J.; Fishman, Jack; [2007]; 66 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 281945.02.37.01.15; Copyright; Avail.: CASI: [A04](#), Hardcopy

Global ozone analyses, based on assimilation of stratospheric profile and ozone column measurements, and NO<sub>y</sub> predictions from the Real-time Air Quality Modeling System (RAQMS) are used to estimate the ozone and NO<sub>y</sub> budget over the Continental US during the July-August 2004 Intercontinental Chemical Transport Experiment-North America (INTEX-A). Comparison with aircraft, satellite, surface, and ozonesonde measurements collected during the INTEX-A show that RAQMS captures the main features of the global and Continental US distribution of tropospheric ozone, carbon monoxide, and NO<sub>y</sub> with reasonable fidelity. Assimilation of stratospheric profile and column ozone measurements is shown to have a positive impact on the RAQMS upper tropospheric/lower stratosphere ozone analyses, particularly during the period when SAGE III limb scattering measurements were available. Eulerian ozone and NO<sub>y</sub> budgets during INTEX-A show that the majority of the Continental US export occurs in the upper troposphere/lower stratosphere poleward of the tropopause break, a consequence of convergence of tropospheric and stratospheric air in this region. Continental US photochemically produced ozone was found to be a minor component of the total ozone export, which was dominated by stratospheric ozone during INTEX-A. The unusually low photochemical ozone export is attributed to anomalously cold surface temperatures during the latter half of the INTEX-A mission, which resulted in net ozone loss during the first 2 weeks of August. Eulerian NO<sub>y</sub> budgets are shown to be very consistent with previously published estimates. The NO<sub>y</sub> export efficiency was estimated to be 24 percent, with NO<sub>x</sub>+PAN accounting for 54 percent of the total NO<sub>y</sub> export during INTEX-A.

#### **Processes Influencing Ozone Levels in Alaskan Forest Fires Plumes during Long-Range Transport over the North Atlantic**

Real, E.; Law, K. S.; Wienzierl, B.; Fiebig, M.; Petzold, A.; Wild, O.; Methven, J.; Arnold, S.; Stohl, A.; Huntrieser, H.; Roiger, A.; Schlager, H.; Stewart, D.; Avery, M.; Sachse, G.; Browell, E.; Ferrare, R.; Blake, D.; [2006]; 56 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A04](#), Hardcopy

A case of long-range transport of a biomass burning plume from Alaska to Europe is analyzed using a Lagrangian approach. This plume was sampled several times in the free troposphere over North America, the North Atlantic and Europe by 3 different aircraft during the IGAC Lagrangian 2K4 experiment which was part of the ICARTT/ITOP measurement intensive in summer 2004. Measurements in the plume showed enhanced values of CO, VOCs and NO<sub>y</sub>, mainly in form of PAN. Observed O<sub>3</sub> levels increased by 17 ppbv over 5 days. A photochemical trajectory model, CiTTYCAT, is used to examine

processes responsible for the chemical evolution of the plume. The model was initialized with upwind data, and compared with downwind measurements. The influence of high aerosol loading on photolysis rates in the plume is investigated using in-situ aerosol measurements in the plume and lidar retrievals of optical depth as input into a photolysis code (Fast-J), run in the model. Significant impacts on photochemistry are found with a decrease of 18 percent in O<sub>3</sub> production and 24 percent in O<sub>3</sub> destruction over 5 days when including aerosols. The plume is found to be chemically active with large O<sub>3</sub> increases attributed primarily to PAN decomposition during descent of the plume towards Europe. The predicted O<sub>3</sub> changes are very dependent on temperature changes during transport, and also, on water vapor levels in the lower troposphere which can lead to O<sub>3</sub> destruction. Simulation of mixing/dilution was necessary to reproduce observed pollutants level in the plume. Mixing was simulated using background concentrations from measurements in air masses in close proximity to the plume, and mixing timescales (averaging 6.25 days) were derived from CO changes. Observed and simulated O<sub>3</sub>/CO correlations in the plume are also compared in order to evaluate the photochemistry in the model. Observed slopes changed from negative to positive over 5 days. This change, which can be attributed largely to photochemistry, is well reproduced by multiple model runs even if slope values are slightly underestimated suggesting small underestimation of photochemical processes. The possible impact of this biomass burning plume on O<sub>3</sub> levels in the Europe boundary layer is also examined by running the model for a further 5 days, and comparing with data collected at surface sites, such as Jungfraujoch, which showed small O<sub>3</sub> increases and elevated CO levels. The model predicts significant changes in O<sub>3</sub> over this 10 days due to photochemistry but the signal is largely lost due to the effects of dilution. However, measurement in several others BB plumes over Europe show that O<sub>3</sub> impact of Alaskan fires can be punctually significant over Europe.

Contract(s)/Grant(s): WBS 281945.02.39.01.04; Copyright; Avail.: CASI: [A03](#), Hardcopy

We evaluate the Meteo-France global chemistry transport 3D model MOCAGE (MOdele de Chimie Atmospherique a Grande Echelle) using the important set of aircraft measurements collected during the ICARTT/ITOP experiment. This experiment took place between US and Europe during summer 2004 (July 15-August 15). Four aircraft were involved in this experiment providing a wealth of chemical data in a large area including the North East of US and western Europe. The model outputs are compared to the following species of which concentration is measured by the aircraft: OH, H<sub>2</sub>O<sub>2</sub>, CO, NO, NO<sub>2</sub>, PAN, HNO<sub>3</sub>, isoprene, ethane, HCHO and O<sub>3</sub>. Moreover, to complete this evaluation at larger scale, we used also satellite data such as SCIAMACHY NO<sub>2</sub> and MOPITT CO. Interestingly, the comprehensive dataset allowed us to evaluate separately the model representation of emissions, transport and chemical processes. Using a daily emission source of biomass burning, we obtain a very good agreement for CO while the evaluation of NO<sub>2</sub> points out uncertainties resulting from inaccurate ratio of emission factors of NO<sub>x</sub>/CO. Moreover, the chemical behavior of O<sub>3</sub> is satisfactory as discussed in the paper.

#### **Study Pollution Impacts on Upper-Tropospheric Clouds with Aura, CloudSat, and CALIPSO Data**

Wu, Dong; June 11, 2007; 11 pp.; In English; CloudSat/CALIPSO Science Meeting, 11-14 Jun. 2007, San Francisco, CA, USA; Original contains color and black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40577>

This viewgraph presentation reviews the impact of pollution on clouds in the Upper Troposphere. Using the data from the Aura Microwave Limb Sounder (MLS), CloudSat, CALIPSO the presentation shows signatures of pollution impacts on clouds in the upper troposphere. The presentation demonstrates the complementary sensitivities of MLS, CloudSat and CALIPSO to upper tropospheric clouds. It also calls for careful analysis required to sort out microphysical changes from dynamical changes.

**Forest Fire Plumes over the North Atlantic: p-TOMCAT Model Simulations with Aircraft and Satellite Measurements from the ITOP/ICARTT Campaign**

Cook, Peter A.; Savage, Nicholas; Turquety, Solene; Carver, Glenn D.; OConnor, Fiona M.; Heckel, Andreas; Stewart, David; Whalley, Lisa K.; Parker, Alex E.; Schlager, Hans; Singh, Hanwant B.; Avery, Melody A.; Sachse, Glen W.; Brune, William; Richter, Andreas; Burrows, John P.; Purvis, Ruth; Lewis, Alastair C.; Reeves, Claire E.; Monks, Paul S.; Levine, James G.; Pyle, John A.; [2007]; 59 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: Other Sources

ITOP (Intercontinental Transport of Ozone and Precursors), part of ICARTT (International Consortium for Atmospheric Research on Transport and Transformation), was an intense research effort to measure the long range transport of pollution across the North Atlantic and its impact on O<sub>3</sub> production. During the aircraft campaign in July and August 2004, plumes were encountered containing large concentrations of CO plus other tracers and aerosols emitted from forest fires in Alaska and Canada. Here a chemical transport model, p-TOMCAT, and new inventories of the biomass-burning emissions during May to August 2004 have been used to study both the long-range transport of the fire emissions and their impact on the O<sub>3</sub> budget across large regions of the troposphere. The structure of the fire plume is modeled well by the transport model until it encounters convection over Europe. The CO values within the simulated plumes closely match the measurements from aircraft flying near North America and over the Atlantic and there is also good agreement with the CO data from MOPITT. Values of O<sub>3</sub> and NO(x) were initially too great in the model plumes. However, by including additional vertical mixing of O<sub>3</sub> into the troposphere above the fires, and using a lower NO<sub>2</sub>/CO emission ratio (0.008) for boreal fires, O<sub>3</sub> concentrations in the simulated plumes are reduced closer to aircraft measurements, with NO<sub>2</sub> closer to data from the SCIAMACHY satellite instrument. Too little PAN is produced within the simulated plumes and the simplicity of our VOC scheme may be another reason for model-data discrepancies for O<sub>3</sub> and NO(x). In the p-TOMCAT simulations the fire emissions lead to increased O<sub>3</sub> in the troposphere over much of North America, the north Atlantic, and western Europe from photochemical production and transport. The increased O<sub>3</sub> over the northern hemisphere in the model simulations reaches a peak in July 2004 in the range 2.0 to 6.2 Tg over a baseline of 150 Tg.

Contract(s)/Grant(s): WBS 281945.02.39.01.04; Copyright; Avail.: CASI: [A03](#), Hardcopy

We use observations from two aircraft during the International Consortium for Atmospheric Research on Transport and Transformation (ICARTT) campaign over the eastern USA and North Atlantic during summer 2004, interpreted with a global 3-D model of tropospheric chemistry (GEOS-Chem) to test current understanding of the regional sources, chemical evolution, and export of nitrogen oxides. The boundary layer NO(x) data provide top-down verification of a 50% decrease in power plant and industry NO(x) emissions over the eastern USA between 1999 and 2004. Observed 8-12 km NO(x) concentrations in ICARTT were 0.55 +/- 36 ppbv, much larger than in previous USA aircraft campaigns (ELCHEM, SUCCESS, SONEX). We show that regional lightning was the dominant source of this NO(x) and increased upper tropospheric ozone by 10 ppbv. Simulating the ICARTT upper tropospheric NO(x) observations with GEOS-Chem require a factor of 4 increase in the model NO(x) yield per flash (to 500 mol/flash). Observed OH concentrations were a factor of 2 lower than can be explained from current photochemical models, and if correct would imply a broader lightning influence in the upper troposphere than presently thought. An NO(y)-CO correlation analysis of the fraction *f* of North American NO(x) emissions vented to the free troposphere as NO(y) (sum of NO(x) and its oxidation products PAN and HNO<sub>3</sub>) shows observed *f*=16 +/- 10 percent and modeled *f*=14 +/- 8 percent, consistent with previous studies. Export to the lower free troposphere is mostly HNO<sub>3</sub> but at higher altitudes is mostly PAN. The model successfully simulates NO(y) export efficiency and speciation, supporting previous model estimates of a large U.S. contribution to tropospheric ozone through NO(x) and PAN export.

**Summertime Influence of Asian Pollution in the Free Troposphere over North America**

Liang, Q.; Jaegle, Lyatt; Hudman, Rynda C.; Turquety, Solene; Jacob, Daniel J.; Avery, Melody A.; Blake, Donald R.; Browell, Edward V.; Sachse, Glen W.; Brune, W. H.; Ren, Xinrong; Clarke, A.; Cohen, R.; Dibb, Jack; Fried, Alan; Fuelberg, Henry; Porter, M.; Heikes, Brian; Huey, Greg; Singh, H. B.; Wennberg, Paul; [2007]; 48 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NSF ATM 0238530; WBS 281945.02.39.01.04; Copyright; Avail.: CASI: [A03](#), Hardcopy

We analyze aircraft observations obtained during INTEX-A (1 July 14 - August 2004) to examine the summertime influence of Asian pollution in the free troposphere over North America. By applying correlation analysis and Principal Component Analysis (PCA) to the observations between 6-12 km, we find dominant influences from recent convection and lightning (13 percent of observations), Asia (7 percent), the lower stratosphere (7 percent), and boreal forest fires (2 percent), with the remaining 71 percent assigned to background. Asian air masses are marked by high levels of CO, O<sub>3</sub>, HCN, PAN, acetylene, benzene, methanol, and SO<sub>4</sub>(2-). The partitioning of reactive nitrogen species in the Asian plumes is dominated by peroxyacetyl nitrate (PAN) (approximately 600 pptv), with varying NO(x)/HNO<sub>3</sub> ratios in individual plumes consistent with different plume ages ranging from 3 to 9 days. Export of Asian pollution in warm conveyor belts of mid-latitude cyclones, deep convection, and lifting in typhoons all contributed to the five major Asian pollution plumes. Compared to past measurement campaigns of Asian outflow during spring, INTEX-A observations display unique characteristics: lower levels of anthropogenic pollutants (CO, propane, ethane, benzene) due to their shorter summer lifetimes; higher levels of biogenic tracers (methanol and acetone) because of a more active biosphere; as well as higher levels of PAN, NO(x), HNO<sub>3</sub>, and O<sub>3</sub> (more active photochemistry possibly enhanced by injection of lightning NO(x)). The high delta O<sub>3</sub>/delta CO ratio (0.76 mol mol(exp -1)) of Asian plumes during INTEX-A is due to a combination of strong photochemical production and mixing with stratospheric air along isentropic surfaces. The GEOS-Chem global chemical transport model captures the timing and location of the Asian plumes remarkably well. However, it significantly underestimates the magnitude of the enhancements.

Contract(s)/Grant(s): WBS 389018.02.13.01.46

Report No.(s): J5.4; Copyright; Avail.: CASI: [A03](#), Hardcopy

The Clean Air Interstate Rule (CAIR) is expected to reduce transport of air pollutants (e.g. fine sulfate particles) in nonattainment areas in the Eastern USA. CAIR highlights the need for an integrated air quality observational and modeling system to understand sulfate as it moves in multiple dimensions, both spatially and temporally. Here, we demonstrate how results from an air quality model can be combined with a 3d monitoring network to provide decision makers with a tool to help quantify the impact of CAIR reductions in SO<sub>2</sub> emissions on regional transport contributions to sulfate concentrations at surface monitors in the Baltimore, MD area, and help improve decision making for strategic implementation plans (SIPs). We sample results from the Community Multiscale Air Quality (CMAQ) model using ensemble back trajectories computed with the NASA Langley Research Center trajectory model to provide Lagrangian time series and vertical profile information, that can be compared with NASA satellite (MODIS), EPA surface, and lidar measurements. Results are used to assess the regional transport contribution to surface SO<sub>4</sub> measurements in the Baltimore MSA, and to characterize the dominant source regions for low, medium, and high SO<sub>4</sub> episodes.

**Seismic Energy Generation and Partitioning into Various Regional Phases from Different Seismic Sources in the Middle East Region**

Gitterman, Yefim; Pinsky, Vladimir; Hofstetter, Rami; Sep 20, 2007; 85 pp.; In English; Original contains color illustrations  
Contract(s)/Grant(s): F19628-03-C-0124; Proj-1010

Report No.(s): AD-A475170; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The project was focused on studying, experimentally, features of seismic energy generation and partitioning of P and S waves from different explosive seismic sources, at near-source and regional distances, in the time and spectral domain. An extensive database of Ground Truth single-fired explosions was created. The explosions selected contain a broad variety of design features (buried and surface sources, tamped and decoupled shots, large diameter 0.5-0.8m borehole and near-spherical cavity charges), charge weight (100-32500kg), depth (14-62m), scaled burial depth (1.0-3.9m/kg<sup>1/3</sup>), emplacement rocks (alluvium, basalts, marls) and geological settings. The highlight of this project was the source phenomenology experiments: Decoupling and Depth-of-Burial (DOB) explosion series at the phosphate quarry Oron, Negev. A special technology was used for creation of large cavities (up to 3.5 m) at different depths, to accommodate large near-spherical ANFO charges. Extensive observations in the near-source zone (100-800 m) and remotely (up to 350 km) demonstrated signal characteristics and energy generation features; decoupling factors were estimated. The design and configuration of the Oron DOB experiment were preferable in design to the previous Balapan DOB experiment (1997): media homogeneity, small aspect ratio (~1), full containment and small separation (~200 m) of the shots. The crossover point of spectral dominance at ~10 Hz for different depth shots, observed at ranges 0.2-230 km, was remarkably consistent with the Mueller/Murphy source model predictions.

Contract(s)/Grant(s): WBS 281945.02.39.01.04; Copyright; Avail.: CASI: [A03](#), Hardcopy

We present a statistical representation of the aggregate effects of deep convection on the chemistry and dynamics of the Upper Troposphere (UT) based on direct aircraft observations of the chemical composition of the UT over the Eastern USA and Canada during summer. These measurements provide new and unique observational constraints on the chemistry occurring downwind of convection and the rate at which air in the UT is recycled, previously only the province of model analyses. These results provide quantitative measures that can be used to evaluate global climate and chemistry models.

**A Link between Variability of the Semidiurnal Tide and Planetary Waves in the Opposite Hemisphere**

Smith, Anne K.; Pancheva, Dora V.; Mitchell, Nicholas J.; Marsh, Daniel R.; Russell, James M., III; Mlynczak, Martin G.; [2007]; 19 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 370544.04.12; Copyright; Avail.: CASI: [A03](#), Hardcopy

Horizontal wind observations over four years from the meteor radar at Esrange (68 deg N) are analyzed to determine the variability of the semidiurnal tide. Simultaneous global observations of temperature and geopotential from the SABER satellite instrument are used to construct time series of planetary wave amplitudes and geostrophic mean zonal wind. During NH summer and fall, the temporal variability of the semidiurnal tide at Esrange is found to be well correlated with the amplitude of planetary wavenumber 1 in the stratosphere in high southern latitudes (i.e., in the opposite hemisphere). The correlations indicate that a significant part of the tidal variations at Esrange is due to dynamical interactions in the Southern

Hemisphere. Other times of the year do not indicate a corresponding robust correlation pattern for the Esrange tides over multiple years.

ONLINE: <http://dx.doi.org/10.1029/2006GL026065>

We built a device for translating a GPS antenna on a positioning table to simulate the ground motions caused by an earthquake. The earthquake simulator is accurate to better than 0.1 mm in position, and provides the 'ground truth' displacements for assessing the technique of high-rate GPS. We found that the root-mean-square error of the 1-Hz GPS position estimates over the 15-min duration of the simulated seismic event was 2.5 mm, with approximately 96% of the observations in error by less than 5 mm, and is independent of GPS antenna motion. The error spectrum of the GPS estimates is approximately flicker noise, with a 50% decorrelation time for the position error of approx.1.6 s. We that, for the particular event simulated, the spectrum of dependent error in the GPS measurements. surface deformations exceeds the GPS error spectrum within a finite band. More studies are required to determine whether a generally optimal bandwidth exists for a target group of seismic events.

ONLINE: <http://dx.doi.org/10.1029/2006JB004675>

Recent studies of the GPS satellite phase center offsets (PCOs) suggest that these have been in error by approx.1 m. Previous studies had shown that PCO errors are absorbed mainly by parameters representing satellite clock and the radial components of site position. On the basis of the assumption that the radial errors are equal, PCO errors will therefore introduce an error in network scale. However, PCO errors also introduce distortions, or apparent deformations, within the network, primarily in the radial (vertical) component of site position that cannot be corrected via a Helmert transformation. Using numerical simulations to quantify the effects of PCO errors, we found that these PCO errors lead to a vertical network distortion of 6-12 mm per meter of PCO error. The network distortion depends on the minimum elevation angle used in the analysis of the GPS phase observables, becoming larger as the minimum elevation angle increases. The steady evolution of the GPS constellation as new satellites are launched, age, and are decommissioned, leads to the effects of PCO errors varying with time that introduce an apparent global-scale rate change. We demonstrate here that current estimates for PCO errors result in a geographically variable error in the vertical rate at the 1-2 mm/yr level, which will impact high-precision crustal deformation studies.

**Radiative Heating Methodology for the Huygens Probe**

Johnston, Christopher O.; Hollis, Brian R.; Sutton, Kenneth; October 2007; 36 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

The radiative heating environment for the Huygens probe near peak heating conditions for Titan entry is investigated in this paper. The task of calculating the radiation-coupled flowfield, accounting for non-Boltzmann and non-optically thin radiation, is simplified to a rapid yet accurate calculation. This is achieved by using the viscous-shock layer (VSL) technique for the stagnation-line flowfield calculation and a modified smeared rotational band (SRB) model for the radiation calculation. These two methods provide a computationally efficient alternative to a Navier-Stokes flowfield and line-by-line radiation

calculation. The results of the VSL technique are shown to provide an excellent comparison with the Navier-Stokes results of previous studies. It is shown that a conventional SRB approach is inadequate for the partially optically-thick conditions present in the Huygens shock-layer around the peak heating trajectory points. A simple modification is proposed to the SRB model that improves its accuracy in these partially optically-thick conditions. This modified approach, labeled herein as SRBC, is compared throughout this study with a detailed line-by-line (LBL) calculation and is shown to compare within 5% in all cases. The SRBC method requires many orders-of-magnitude less computational time than the LBL method, which makes it ideal for coupling to the flowfield. The application of a collisional-radiative (CR) model for determining the population of the CN electronic states, which govern the radiation for Huygens entry, is discussed and applied. The non-local absorption term in the CR model is formulated in terms of an escape factor, which is then curve-fit with temperature. Although the curve-fit is an approximation, it is shown to compare well with the exact escape factor calculation, which requires a computationally intensive iteration procedure.

A04, Hardcopy

A multi-layered cloud retrieval system (MCRS) is updated and used to estimate ice water path in maritime ice-over-water clouds using Visible and Infrared Scanner (VIRS) and TRMM Microwave Imager (TMI) measurements from the Tropical Rainfall Measuring Mission spacecraft between January and August 1998. Lookup tables of top-of-atmosphere 0.65- m reflectance are developed for ice-over-water cloud systems using radiative transfer calculations with various combinations of ice-over-water cloud layers. The liquid and ice water paths, LWP and IWP, respectively, are determined with the MCRS using these lookup tables with a combination of microwave (MW), visible (VIS), and infrared (IR) data. LWP, determined directly from the TMI MW data, is used to define the lower-level cloud properties to select the proper lookup table. The properties of the upper-level ice clouds, such as optical depth and effective size, are then derived using the Visible Infrared Solar-infrared Split-window Technique (VISST), which matches the VIRS IR, 3.9- m, and VIS data to the multilayer-cloud lookup table reflectances and a set of emittance parameterizations. Initial comparisons with surface-based radar retrievals suggest that this enhanced MCRS can significantly improve the accuracy and decrease the IWP in overlapped clouds by 42% and 13% compared to using the single-layer VISST and an earlier simplified MW-VIS-IR (MVI) differencing method, respectively, for ice-over-water cloud systems. The tropical distribution of ice-over-water clouds is the same as derived earlier from combined TMI and VIRS data, but the new values of IWP and optical depth are slightly larger than the older MVI values, and exceed those of single-layered layered clouds by 7% and 11%, respectively. The mean IWP from the MCRS is 8-14% greater than that retrieved from radar retrievals of overlapped clouds over two surface sites and the standard deviations of the differences are similar to those for single-layered clouds. Examples of a method for applying the MCRS over land without microwave data yield similar differences with the surface retrievals. By combining the MCRS with other techniques that focus primarily on optically thin cirrus over low water clouds, it will be possible to more fully assess the IWP in all conditions over ocean except for precipitating systems.

ONLINE: <http://dx.doi.org/10.1038/nature05508>

Atmospheric moisture cycling is an important aspect of the Earth's climate system, yet the processes determining atmospheric humidity are poorly understood. For example, direct evaporation of rain contributes significantly to the heat and moisture budgets of clouds, but few observations of these processes are available. Similarly, the relative contributions to atmospheric moisture over land from local evaporation and humidity from oceanic sources are uncertain. Lighter isotopes of water vapour preferentially evaporate whereas heavier isotopes preferentially condense and the isotopic composition of ocean water is known. Here we use this information combined with global measurements of the isotopic composition of tropospheric water vapour from the Tropospheric Emission Spectrometer (TES) aboard the Aura spacecraft, to investigate aspects of the atmospheric hydrological cycle that are not well constrained by observations of precipitation or atmospheric vapour content. Our measurements of the isotopic composition of water vapour near tropical clouds suggest that rainfall evaporation contributes significantly to lower troposphere humidity, with typically 20% and up to 50% of rainfall evaporating near convective clouds. Over the tropical continents the isotopic signature of tropospheric water vapour differs significantly from that of precipitation, suggesting that convection of vapour from both oceanic sources and evapotranspiration are the dominant moisture sources. Our measurements allow an assessment of the intensity of the present hydrological cycle and will help identify any future changes as they occur.

**Nitric Acid Particles in Cold Thick Ice Clouds Observed at Global Scale: Link with Lightning, Temperature, and Upper Tropospheric Water Vapor**

Chepfer, H.; Minnis, P.; Dubuisson, P.; Chiriaco, M.; Sun-Mack, S.; Riviere, E. D.; [2007]; 24 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): 23-621-35-96; Copyright; Avail.: CASI: [A03](#), Hardcopy

Signatures of nitric acid particles (NAP) in cold thick ice clouds have been derived from satellite observations. Most NAP are detected in the Tropics (9 to 20% of clouds with T less than 202.5 K). Higher occurrences were found in the rare mid-latitudes very cold clouds. NAP occurrence increases as cloud temperature decreases and NAP are more numerous in January than July. Comparisons of NAP and lightning distributions show that lightning is the main source of the NO<sub>x</sub>, which forms NAP in cold clouds. Qualitative comparisons of NAP with upper tropospheric humidity distributions suggest that NAP play a role in the dehydration of the upper troposphere when the tropopause is colder than 195K.

**A Reanalysis for the Seasonal and Longer-Period Cycles and the Trends in Middle Atmosphere Temperature from the HALOE**

Remsberg, Ellis E.; [207]; 55 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): 584635.04.02.01; No Copyright; Avail.: CASI: [A04](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080007106>

Previously published analyses for the seasonal and longer-period cycles in middle atmosphere temperature versus pressure (or T(p)) from the Halogen Occultation Experiment (HALOE) are extended to just over 14 years and updated to properly account for the effects of autocorrelation in its time series of zonally-averaged data. The updated seasonal terms and annual averages are provided, and they can be used to generate temperature distributions that are representative of the period 1991-2005. QBO-like terms have also been resolved and are provided, and they exhibit good consistency across the range of latitudes and pressure-altitudes. Further, exploratory analyses of the residuals from each of the 221 time series have yielded significant 11-yr solar cycle (or SC-like) and linear trend terms at a number of latitudes and levels. The amplitudes of the

SC-like terms for the upper mesosphere agree reasonably with calculations of the direct solar radiative effects for T(p). Those SC amplitudes increase by about a factor of 2 from the lower to the upper mesosphere and are also larger at the middle than at the low latitudes. The diagnosed cooling trends for the subtropical latitudes are in the range, -0.5 to -1.0 K/decade, which is in good agreement with the findings from models of the radiative effects on pressure surfaces due to known increases in atmospheric CO<sub>2</sub>. The diagnosed trends are somewhat larger than predicted with models for the upper mesosphere of the northern hemisphere middle latitudes.

#### **Climate-Induced Boreal Forest Change: Predictions versus Current Observations**

Soja, Amber J.; Tchepakova, Nadezda M.; French, Nancy H. F.; Flannigan, Michael D.; Shugart, Herman H.; Stocks, Brian J.; Sukhinin, Anatoly I.; Parfenova, E. I.; Chapin, F. Stuart, III; Stackhouse, Paul W., Jr.; [2007]; 58 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): RFBS-06-05-65127; WBS 920476.07.07; Copyright; Avail.: CASI: [A04](#), Hardcopy

For about three decades, there have been many predictions of the potential ecological response in boreal regions to the currently warmer conditions. In essence, a widespread, naturally occurring experiment has been conducted over time. In this paper, we describe previously modeled predictions of ecological change in boreal Alaska, Canada and Russia, and then we investigate potential evidence of current climate-induced change. For instance, ecological models have suggested that warming will induce the northern and upslope migration of the treeline and an alteration in the current mosaic structure of boreal forests. We present evidence of the migration of keystone ecosystems in the upland and lowland treeline of mountainous regions across southern Siberia. Ecological models have also predicted a moisture-stress-related dieback in white spruce trees in Alaska, and current investigations show that as temperatures increase, white spruce tree growth is declining. Additionally, it was suggested that increases in infestation and wildfire disturbance would be catalysts that precipitate the alteration of the current mosaic forest composition. In Siberia, five of the last seven years have resulted in extreme fire seasons, and extreme fire years have also been more frequent in both Alaska and Canada. In addition, Alaska has experienced extreme and geographically expansive multi-year outbreaks of the spruce beetle, which had been previously limited by the cold, moist environment. We suggest that there is substantial evidence throughout the circumboreal region to conclude that the biosphere within the boreal terrestrial environment has already responded to the transient effects of climate change. Additionally, temperature increases and warming-induced change are progressing faster than had been predicted in some regions, suggesting a potential non-linear rapid response to changes in climate, as opposed to the predicted slow linear response to climate change.

#### **An EOF Iteration Approach for Obtaining Homogeneous Radiative Fluxes from Satellites Observations**

Zhang, Banglin; Pinker, Rachel T.; Stackhouse, Paul W., Jr.; [2007]; 30 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NAGW-4740; NAG5-6667; WBS 509496.02.01.01.13; Copyright; Avail.: CASI: [A03](#), Hardcopy

Conventional observations of climate parameters are sparse in space and/or in time and the representativeness of such information needs to be optimized. Observations from satellites provide improved spatial coverage than point observations however they pose new challenges for obtaining homogeneous coverage. Surface radiative fluxes, the forcing functions of the hydrologic cycle and biogeophysical processes, are now becoming available from global scale satellite observations. They are derived from independent satellite platforms and sensors that differ in temporal and spatial resolution and in the size of the footprint from which information is derived. Data gaps, degraded spatial resolution near boundaries of geostationary satellites, and different viewing geometries in areas of satellite overlap, could result in biased estimates of radiative fluxes. In this study, discussed will be issues related to the sources of inhomogeneity in surface radiative fluxes as derived from satellites; development of an approach to obtain homogeneous data sets; and application of the methodology to the widely used International Satellite Cloud Climatology Project (ISCCP) data that currently serve as a source of information for deriving estimates of surface and top of the atmosphere radiative fluxes. Introduced is an Empirical Orthogonal Function (EOF) iteration scheme for homogenizing the fluxes. The scheme is evaluated in several ways including comparison of the inferred

radiative fluxes against ground observations, both before and after the EOF approach is applied. On the average, the latter reduces the rms error by about 2-3 W/m<sup>2</sup>.

**Reactive Nitrogen Distribution and Partitioning in the North American Troposphere and Lowermost Stratosphere**

Singh, H. B.; Salas, L.; Herlth, D.; Kolyer, R.; Czech, E.; Avery, M.; Crawford, J. H.; Pierce, B.; Sachse, G. W.; Blake, D. R.; Cohen, R. C.; Dibb, J.; Huey, G.; Hudman, R. C.; Turquety, S.; Emmons, L. K.; Flocke, F.; Tang, Y.; Carmichael, G. R.; Horowitz, L. W.; [2007]; 35 pp.; In English; Submitted to the Journal of Geophysical Research to be published in volume 112, pp. 1-15, April 2007; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 281945.02.39.01.04; Copyright; Avail.: CASI: [A03](#), Hardcopy

A comprehensive group of reactive nitrogen species (NO, NO<sub>2</sub>, HNO<sub>3</sub>, HO<sub>2</sub>NO<sub>2</sub>, PANs, alkyl nitrates, and aerosol-NO<sub>3</sub>) were measured in the troposphere and lowermost stratosphere over North America and the Atlantic during July/August 2004 (INTEX-A) from the NASA DC-8 platform (0.1-12 km). Less reactive nitrogen species (HCN and CH<sub>3</sub>CN), that are also unique tracers of biomass combustion, were also measured along with a host of other gaseous (CO, VOC, OVOC, halocarbon) and aerosol tracers. Clean background air as well as air with influences from biogenic emissions, anthropogenic pollution, biomass combustion, and stratosphere was sampled both over continental U. S., Atlantic and Pacific. The North American upper troposphere was found to be greatly influenced by both lightning NO(x) and surface pollution lofted via convection and contained elevated concentrations of PAN, ozone, hydrocarbons, and NO(x). Under polluted conditions PAN was a dominant carrier of reactive nitrogen in the upper troposphere while nitric acid dominated in the lower troposphere. Peroxynitric acid (HO<sub>2</sub>NO<sub>2</sub>) was present in sizable concentrations always peaking at around 8 km. Aerosol nitrate appeared to be mostly contained in large soil based particles in the lower troposphere. Plumes from Alaskan fires contained large amounts of PAN and very little enhancement in ozone. Observational data suggest that lightning was a far greater contributor to NO(x) in the upper troposphere than previously believed. NO(x) and NO(y) reservoir appeared to be in steady state only in the middle troposphere where NO(x)/NO(y) was independent of air mass age. A first comparison of observed data with simulations from four 3-D models shows significant differences between observations and models as well as among models. These uncertainties likely propagate themselves in satellites derived NO<sub>x</sub> data. Observed data are interpreted to suggest that soil sinks of HCN/CH<sub>3</sub>CN are at best very small. We investigate the partitioning and interplay of the reactive nitrogen species within characteristic air masses and further examine their role in ozone formation.

**Cloudy Sounding and Cloud-Top Height Retrieval From AIRS Alone Single Field-of-View Radiance Measurements**

Weisz, Elisabeth; Li, Jun; Li, Jinlong; Zhou, Daniel K.; Huang, Hung-Lung; Goldberg, Mitchell D.; Yang, Ping; [2007]; 19 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): WBS 5341730207943802; Copyright; Avail.: CASI: [A03](#), Hardcopy

High-spectral resolution measurements from the Atmospheric Infrared Sounder (AIRS) onboard the EOS (Earth Observing System) Aqua satellite provide unique information about atmospheric state, surface and cloud properties. This paper presents an AIRS alone single field-of-view (SFOV) retrieval algorithm to simultaneously retrieve temperature, humidity and ozone profiles under all weather conditions, as well as cloud top pressure (CTP) and cloud optical thickness (COT) under cloudy skies. For optically thick cloud conditions the above-cloud soundings are derived, whereas for clear skies and optically thin cloud conditions the profiles are retrieved from 0.005 hPa down to the earth's surface. Initial validation has been conducted by using the operational MODIS (Moderate Resolution Imaging Spectroradiometer) product, ECMWF (European Center of Medium range Weather Forecasts) analysis fields and radiosonde observations (RAOBs). These inter-comparisons clearly demonstrate the potential of this algorithm to process data from 38 high-spectral infrared (IR) sounder instruments.

**Ionospheric E-Region Response to Solar-Geomagnetic Storms Observed by TIMED/SABER and Application to IRI Storm-Model Development**

Mertens, Christopher J.; Mast, Jeffrey C.; Winick, Jeremy R.; Russell, James M., III; Mlynczak, Martin G.; Evans, David S.; [2007]; 23 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): WBS 23-370-16-02; Copyright; Avail.: CASI: [A03](#), Hardcopy

The large thermospheric infrared radiance enhancements observed from the TIMED/SABER experiment during recent solar storms provide an exciting opportunity to study the influence of solar-geomagnetic disturbances on the upper atmosphere and ionosphere. In particular, nighttime enhancements of 4.3  $\mu\text{m}$  emission, due to vibrational excitation and radiative emission by  $\text{NO}^+$ , provide an excellent proxy to study and analyze the response of the ionospheric E-region to auroral electron dosing and storm-time enhancements to the E-region electron density. In this paper we give a status report of on-going work on model and data analysis methodologies of deriving  $\text{NO}^+$  4.3  $\mu\text{m}$  volume emission rates, a proxy for the storm-time E-region response, and the approach for deriving an empirical storm-time correction to International Reference Ionosphere (IRI) E-region  $\text{NO}^+$  and electron densities.

**A Space-Based Proxy for the Dst Index**

Rich, F J; Bono, J M; Burke, W J; Gentile, L C; May 18, 2007; 8 pp.; In English

Contract(s)/Grant(s): F19628-02-C-0012; Proj-2311

Report No.(s): AD-A474975; AFRL-RV-HA-TR-2007-1114; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA474975>

The Dst index was created to monitor and quantify disturbances in the inner magnetosphere using ground-based, magnetic field measurements. The phases and strengths of geomagnetic storms are usually defined by the evolution of Dst. The standard Dst database is computed and maintained at the World Data Center for Geomagnetism, Kyoto. We demonstrate that the Dst index can also be approximated using magnetometers on spacecraft in near-Earth orbit. Measurements used in the demonstration were obtained from boom-mounted sensors on two spacecraft of the Defense Meteorological Satellite Program. The extraction technique can be applied to magnetic field data retrieved by magnetometers on any spacecraft in low Earth orbit. This alternate method for computing a Dst-like index can be used to (1) supplement the standard Dst index in near-real-time space weather applications and (2) replace the 'prompt' Dst index during periods of unavailability.

**The Seasonal Heat Budgets of the Red and Black Seas**

Matsoukas, C.; Banks, A. C.; Pavlakis, K. G.; Hatzianastassiou, N.; Hatzidimitriou, D.; Drakakis, E.; Stackhouse, Paul W.; Vardavas, I.; October 2007; 44 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 509496.02.01.01.13; Copyright; Avail.: Other Sources

In this study we calculate the monthly heat budget of the Red and Black Seas and its components: the net solar and net terrestrial fluxes, the sensible and latent heat fluxes, and the monthly heat content change. A radiation transfer model is employed for the estimation of the net solar and terrestrial energy fluxes, instead of commonly used parameterizations. The agreement with radiation fluxes measured at surface stations is within 10  $\text{W}/\text{sq m}$ . The Red Sea net solar flux estimate is lower than past studies. The monthly heat content of both Seas is estimated from water temperature and salinity profiles and is found to dominate the seasonal energy exchange between the water and the atmosphere, as for the Mediterranean Sea. The latent heat flux is calculated using two methodologies: the bulk aerodynamic and the energy balance method. Our annual results for the Red and Black Seas show solar heating of 238 and 139  $\text{W}/\text{sq m}$ , respectively. The evaporation rates are 2120 and 960  $\text{mm}/\text{yr}$ , respectively. The annual aerosol direct forcing on the net solar flux is -10  $\text{W}/\text{sq m}$  and -3  $\text{W}/\text{sq m}$ .

**Creating User-Friendly Tools for Data Analysis and Visualization in K-12 Classrooms: A Fortran Dinosaur Meets Generation Y**

Chambers, L. H.; Chaudhury, S.; Page, M. T.; Lankey, A. J.; Doughty, J.; Kern, Steven; Rogerson, Tina M.; January 20, 2008; 6 pp.; In English; 88th AMS Annual Meeting, 20-24 Jan. 2008, New Orleans, LA, USA; Original contains color illustrations  
Contract(s)/Grant(s): NNG06GH31G; WBS 333217.02.01.01.06; Copyright; Avail.: CASI: [A02](#), Hardcopy

During the summer of 2007, as part of the second year of a NASA-funded project in partnership with Christopher Newport University called SPHERE (Students as Professionals Helping Educators Research the Earth), a group of undergraduate students spent 8 weeks in a research internship at or near NASA Langley Research Center. Three students from this group formed the Clouds group along with a NASA mentor (Chambers), and the brief addition of a local high school student fulfilling a mentorship requirement. The Clouds group was given the task of exploring and analyzing ground-based cloud observations obtained by K-12 students as part of the Students' Cloud Observations On-Line (S'COOL) Project, and the corresponding satellite data. This project began in 1997. The primary analysis tools developed for it were in FORTRAN, a computer language none of the students were familiar with. While they persevered through computer challenges and picky syntax, it eventually became obvious that this was not the most fruitful approach for a project aimed at motivating K-12 students to do their own data analysis. Thus, about halfway through the summer the group shifted its focus to more modern data analysis and visualization tools, namely spreadsheets and Google(tm) Earth. The result of their efforts, so far, is two different Excel spreadsheets and a Google(tm) Earth file. The spreadsheets are set up to allow participating classrooms to paste in a particular dataset of interest, using the standard S'COOL format, and easily perform a variety of analyses and comparisons of the ground cloud observation reports and their correspondence with the satellite data. This includes summarizing cloud occurrence and cloud cover statistics, and comparing cloud cover measurements from the two points of view. A visual classification tool is also provided to compare the cloud levels reported from the two viewpoints. This provides a statistical counterpart to the existing S'COOL data visualization tool, which is used for individual ground-to-satellite correspondences. The Google(tm) Earth file contains a set of placemarks and ground overlays to show participating students the area around their school that the satellite is measuring. This approach will be automated and made interactive by the S'COOL database expert and will also be used to help refine the latitude/longitude location of the participating schools. Once complete, these new data analysis tools will be posted on the S'COOL website for use by the project participants in schools around the US and the world.

**Integration of Satellite-Derived Cloud Phase, Cloud Top Height, and Liquid Water Path into an Operational Aircraft Icing Nowcasting System**

Haggerty, Julie; McDonough, Frank; Black, Jennifer; Landott, Scott; Wolff, Cory; Mueller, Steven; Minnis, Patrick; Smith, William, Jr.; January 20, 2008; 8 pp.; In English; AMS 13th Conf Aviation, Range, and Aerospace Meteorology, 20-24 Jan. 2008, New Orleans, LA, USA; Original contains color and black and white illustrations  
Contract(s)/Grant(s): WBS 389018.02.13.01.60; Copyright; Avail.: CASI: [A02](#), Hardcopy

Operational products used by the U.S. Federal Aviation Administration to alert pilots of hazardous icing provide nowcast and short-term forecast estimates of the potential for the presence of supercooled liquid water and supercooled large droplets. The Current Icing Product (CIP) system employs basic satellite-derived information, including a cloud mask and cloud top temperature estimates, together with multiple other data sources to produce a gridded, three-dimensional, hourly depiction of icing probability and severity. Advanced satellite-derived cloud products developed at the NASA Langley Research Center (LaRC) provide a more detailed description of cloud properties (primarily at cloud top) compared to the basic satellite-derived information used currently in CIP. Cloud hydrometeor phase, liquid water path, cloud effective temperature, and cloud top height as estimated by the LaRC algorithms are into the CIP fuzzy logic scheme and a confidence value is determined. Examples of CIP products before and after the integration of the LaRC satellite-derived products will be presented at the conference.

**Seasonal Trends in Stratospheric Water Vapor as Derived from SAGE II Data**

Roell, Marilee M.; Fu, Rong; January 20, 2008; 1 pp.; In English; 88th AMS Annual Meeting, 20-24 Jan. 2008, New Orleans, LA, USA

Contract(s)/Grant(s): WBS 526282.01.07.02

Report No.(s): P1.76; Copyright; Avail.: Other Sources; Abstract Only

Published analysis of HALOE and Boulder balloon measurements of water vapor have shown conflicting trends in stratospheric water vapor for the periods of 1981 through 2005. Analysis of the SAGE II monthly mean water vapor data filtered for large aerosol events for time periods from 1985-1991, 1995-1999, and 2000-2005 have shown a globally decreasing water vapor trend at 17.5km. Seasonal analysis for these three time periods show a decreasing trend in water vapor at 17.5km for the winter and spring seasons. The summer and autumn seasonal analysis show a decreasing trend from 1985-2005, however, there is a increasing trend in water vapor at 17.5km for these seasons during 1995-2005. Latitude vs height seasonal analysis show a decreasing trend in the lower stratosphere between 20S - 20N for the autumn season, while at the latitudes of 30-50S and 30-50N there is an increasing trend in water vapor at heights up to 15km for that season. Comparison with regions of monsoon activity (Asian and North American) show that the Asian monsoon region had some effect on the lower stratospheric moistening in 1995-1999, however, for the time period of 2000-2005, there was no change in the global trend analysis due to either monsoon region. This may be due to the limitations of the SAGE II data from 2000-2005.

**Characterization of the Effects of Fatigue on the Central Nervous System (CNS) and Drug Therapies**

Mery, Laura; Nov 2007; 20 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-2313

Report No.(s): AD-A475248; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study aimed to establish a rat fatigue model to test fatigue countermeasures. The model focused on central fatigue. Central fatigue associated with sleep disruption may precede peripheral fatigue, and therefore may predict impaired performance earlier than peripheral fatigue. The modified flower pot method of sleep disruption was used to induce fatigue. This study utilized hippocampal dependant tasks, the radial arm maze and the Barnes maze, to characterize the effects of sleep disruption fatigue. In addition, EEG recordings were taken to detect different sleep state changes associated with 12 hours of light phase sleep disruption. Modafinil given before sleep disruption, and at least 6 hours after the beginning of the light phase during the sleep disruption tended to improve performance in the radial arm maze. Orexin receptor antagonist SB 344867 was administered at the same time points as modafinil for a total dose of 30 mg/kg in a 12 hour sleep disruption time period. SB 344867 had an effect on Barnes maze performance. In this modified flower pot method for sleep disruption, corticosterone increased significantly during the 12 hours of sleep disruption and returned to basal levels at the end of the light phase. Elevated corticosterone leads to dendritic changes in the hippocampus, which is associated with radial arm maze and Barnes maze performance.

**Prion Transport to Secondary Lymphoreticular System Tissues**

Bartz, Jason C; Jun 2007; 9 pp.; In English

Contract(s)/Grant(s): DAMD17-03-1-0319

Report No.(s): AD-A474582; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The long-term objective of this proposal is to identify mechanisms of prion transport to secondary lymphoreticular system

(LRS) tissues. The hypothesis to be tested is that following peripheral exposure to prions; host proteins (e.g. complement) bind prions allowing for trapping by cells in the spleen and enhancing uptake by macrophages, which are cells that are responsible for destruction of foreign proteins. To investigate this hypothesis we will examine the disease development of a prion strain (DY TME) that does not replicate in the spleen of hamsters. This system will provide details into the host factor(s) involved in transport of prions to cells in the LRS. We have shown the susceptibility of HY and DY TME to phagocytosis and degradation by a murine macrophage cell line. We are currently studying the effects of prion infection on phagocytic ability and cell viability. We have shown differences in the spatial and temporal spread of the HY and DY TME agents in LRS tissues following intraperitoneal inoculation. We have shown gender specific responses to intraperitoneal DY TME inoculation.

#### **Zero-Gravity Locomotion Simulators: New Ground-Based Analogs for Microgravity Exercise Simulation**

Perusek, Gail P.; DeWitt, John K.; Cavanagh, Peter R.; Grodzinsky, Carlos M.; Gilkey, Kelly M.; December 10, 2007; 27 pp.; In English; ESA Symposium: Technology for Artificial Gravity and Microgravity Simulation, 10-12 Dec. 2007, Noordwijk, Netherlands; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 516724.02.02.03; Copyright; Avail.: CASI: [A03](#), Hardcopy

Maintaining health and fitness in crewmembers during space missions is essential for preserving performance for mission-critical tasks. NASA's Exercise Countermeasures Project (ECP) provides space exploration exercise hardware and monitoring requirements that lead to devices that are reliable, meet medical, vehicle, and habitat constraints, and use minimal vehicle and crew resources. ECP will also develop and validate efficient exercise prescriptions that minimize daily time needed for completion of exercise yet maximize performance for mission activities. In meeting these mission goals, NASA Glenn Research Center (Cleveland, OH, USA), in collaboration with the Cleveland Clinic (Cleveland, Ohio, USA), has developed a suite of zero-gravity locomotion simulators and associated technologies to address the need for ground-based test analog capability for simulating in-flight (microgravity) and surface (partial-gravity) exercise to advance the health and safety of astronaut crews and the next generation of space explorers. Various research areas can be explored. These include improving crew comfort during exercise, and understanding joint kinematics and muscle activation pattern differences relative to external loading mechanisms. In addition, exercise protocol and hardware optimization can be investigated, along with characterizing system dynamic response and the physiological demand associated with advanced exercise device concepts and performance of critical mission tasks for Exploration class missions. Three zero-gravity locomotion simulators are currently in use and the research focus for each will be presented. All of the devices are based on a supine subject suspension system, which simulates a reduced gravity environment by completely or partially offloading the weight of the exercising test subject's body. A platform for mounting treadmill is positioned perpendicularly to the test subject. The Cleveland Clinic Zero-g Locomotion Simulator (ZLS) utilizes a pneumatic subject load device to apply a near constant gravity-replacement load to the test subject during exercise, and is currently used in conjunction with the General Clinical Research Center for evaluating exercise protocols using a bedrest analog. The enhanced ZLS (eZLS) at NASA Glenn Research Center features an offloaded treadmill that floats on a thin film of air and interfaces to a force reaction frame via variably-compliant isolators, or vibration isolation system. The isolators can be configured to simulate compliant interfaces to the vehicle, which affects mechanical loading to crewmembers during exercise, and has been used to validate system dynamic models for new countermeasures equipment designs, such as the second International Space Station treadmill slated for use in 2010. In the eZLS, the test subject and exercise device can be pitched at the appropriate angle for partial gravity simulations, such as lunar gravity (1/6th earth gravity). On both the eZLS and the NASA-Johnson Space Center standalone ZLS installed at the University of Texas Medical Branch in Galveston, Texas, USA, the subject's body weight relative to the treadmill is controlled via a linear motor subject load device (LM-SLD). The LM-SLD employs a force-feedback closed-loop control system to provide a relatively constant force to the test subject during locomotion, and is set and verified for subject safety prior to each session. Locomotion data were collected during parabolic flight and on the eZLS. The purpose was to determine the similarities and differences between locomotion in actual and simulated microgravity. Subjects attained greater amounts of hip flexion during walking and running during parabolic flight.

During running, subjects had greater hip range of motion. Trunk motion was significantly less on the eZLS than during parabolic flight. Peak impact forces, loading rate, and impulse were greater on the eZLS than during parabolic while walking with a low external load (EL) and rning with a high EL. Activation timing differences existed between locations in all muscles except for the rectus femoris. The tibialis anterior and gluteus maximus were active for longer durations on the eZLS than in parabolic flight during walking. Ground reaction forces were greater with the LM-SLD than with bungees during eZLS locomotion. While the eZLS serves as a ground-based analog, researchers should be aware that subtle, but measurable, differences in kinematics and leg musculature activities exist between the environments. Aside from space applications, zero-gravity locomotion simulators may help medical researchers in the future with development of rehabilitative or therapeutic protocols for injured or ill patients. Zero-gravity locomotion simulators may be used as a ground-based test bed to support future missions for space exploration, and eventually may be used to simulate planetary locomotion in partial gravity environments, including the Moon and Mars. Figure: Zero-gravity Locomotion Simulator at the Cleveland Clinic, Cleveland, Ohio, USA

Objective: To solve the eddy current problem or the forward problem in magnetic induction tomography(MIT). Methods: Differential equation and its boundary condition of eddy current problem in MIT were presented; finite element method was used to calculate the magnetic vector potential of perturbations with different conductivities or positions. Results: The simulation results agreed well with the measured ones from a single receiving coil MIT system. Conclusion: The good agreement of the simulated data with the measured ones demonstrates the applicability of the finite element method for biomedical applications and a solution of the forward problem in MIT, a more sophisticated simulation model may further improve the calculation accuracy. Key words: magnetic induction tomography; forward problem ; finite element method ; eddy currents

**Image Distance Transform as Used for Studying Distribution of Ca<sup>2+</sup> Concentration in Cardiac Myocyte**

Li, Xian-wei; Luo, Dai-sheng; Xie, Ming; Gan, Ke; Hu, Huo-zhen; Zhang, Yong-gang; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 213-218; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

To study the spatial distribution and the time distribution of Ca<sup>2+</sup> concentrations in a cardiac myocyte in order to get the parameters for mathematically modeling the excitation-contraction of the cardiac myocyte and to assist pathological and pharmacological researches of cardiac diseases in cell level. The images of a cardiac myocyte were first segmented by image segmentation. Then a distance transform was used to divide the cardiac myocyte into layers of shells from the membrane towards inside. Ca<sup>2+</sup> concentrations were detected for each layer. According to the Ca<sup>2+</sup> concentrations of each shell in serial time, spatial distribution and time distribution of the Ca<sup>2+</sup> concentrations in the cardiac myocyte was calculated. Conclusion The distribution of Ca<sup>2+</sup> (and the other ions) concentrations in an elastically beating cardiac myocyte can be analyzed fast and correctly by applying the distance transform method to the cardiac myocyte images. This method can also be applied to analyze the measurements of other elastically moving objects.

Most of the experimental technologies for imposing force on cells mimic only one in vivo or in vitro mechanical environment. According to the different source of forces, the loading methods can be divided into two types: modeling the force in vivo mainly to simulate fluid shear stress, liquid hydrostatic pressure, circumferential strain and substrate stretch stress; and modeling mechanics in vitro mainly including microgravity culture system, centrifugal field culture system, air hydrostatic pressurization, ultrasound stimulus and microbeam irradiation. In addition, the main experimental technologies for single cell exposed to force are listed as Micropipette aspiration technique, atomic force microscope cantilevers deflection stimulus, magnetic twisting method, and force generated by a laser tweezers trap. These main experimental technologies are discussed in this paper. Key words: cellular mechanics ; mechanobiology ; experimental technology; loading methods ; instruments and equipments

**A Contact Mechanics Characteristic Analysis of Artificial Acetabulum by Finite Element Method**

Ge, Shi-rong; Jiang, Hai-bo; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 223-226; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To investigate the contact mechanical characteristics of artificial acetabulum made of ultra-high molecule polyethylene (UHMWPE). Methods: An acetabulum model was developed and meshed with free pattern. The contact pairs between acetabulum and femur head were built and the mechanical characteristics were analyzed under different conditions by finite element method (FEM). Results: The magnitude of compress deformation decreased with the increase of friction coefficient and acetabulum diameter. Long-term stability of the hip joint was affected by contact layer thickness and contact area that have different characteristics under various thicknesses of the acetabulum. Conclusion The calculations show that acetabula with 7-9 mm thicknesses have better contact mechanical characteristics.

Objective: To investigate the effect of circadian gene Period2(Per2) on NIH3T3 cell damaged by ultraviolet. Methods: The Per2 expressing vector (pcDNA 3.1-Per2) was transfected into NIH3T3 cells(pcDNA 3.1-Per2 transfected with pcDNA 3.1-Per2, and pcDNA 3.1-vector transfected with pcDNA 3.1-vector) by liposome. They were irradiated with ultraviolet light. Expression of Per2 in the NIH3T3 cells was tested by immunohistochemistry and flow cytometry, while proliferation and apoptosis were examined by colony formation assay and flow cytometry. Single cell gel electrophoresis (SCGE) was used to test the damage and repair pattern of DNA. Results: As compared with the control cells, NIH3T3 cells transfected with pcDNA 3.1-Per2 showed high proliferation and low apoptosis after ultraviolet irradiation. SCGE test also showed that the rate of comet cell and the length of DNA migration was lower in pcDNA 3.1-Per2 transfected cells than that in control cells, though all groups exhibited apparent damage of DNA. Conclusion: Per2 may have protective effect against ultraviolet damage to DNA. The mechanism may be related to the enhancement of DNA repair by Per2. Key words: circadian gene ; Per2 ; DNA damage ; single cell gel electrophoresis ; ultraviolet radiation

#### **Atrial Arrhythmia Recognition Based on Grey Correlation and K-nearest Neighbor**

Sun, Rong-rong; Wang, Yuan-yuan; Fang, Zu-xiang; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 193-197; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To study the method combining the grey correlation of the grey theory and the k-nearest neighbor to recognize sinus rhythm (SR), atrial flutter (AFL) and atrial fibrillation (AF). Methods: The electrocardiograms were divided into training data and testing data. Firstly, signals were transformed into time-frequency domain using multi-scale wavelet. Then singular values were extracted from the wavelet coefficient matrix as feature vectors of the signals. With feature vectors of all the training data as normal template, grey correlation coefficients between feature vectors of the testing data and the normal template were calculated. Finally recognition was made using the k-nearest neighbor. Sensitivity (SE), specificity (SP) and accuracy (AC) of the method were evaluated for atrial arrhythmia recognition with two databases, the MIT-BIH arrhythmia database and the canine endocardial database. Results: Experimental results demonstrated that the proposed method achieved higher recognition performance for SR, AFL or AF with a higher computation speed compared with the traditional grey correlation, the traditional k-nearest neighbor or the back propagation (BP) neural network. Conclusion: The proposed method can recognize SR, AFL and AF accurately with a simple computation and small training samples. It is expected to be used in implantable devices for therapy of atrial arrhythmias. Key words: atrial arrhythmia; wavelet transform; singular value decomposition; grey correlation; k-nearest neighbor

#### **Edge Detection of Ultrasound Medical Image Using Mean Curvature Vector Flow Deformable Models**

Yang, Liu; Wang, Tian-fu; Lin, Jiang-li; Li, De-yu; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 205-208; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To promote stability and accuracy of gradient vector flow (GVF) deformable models by improving external potential force field of ultrasound images under speckle noisy environments. Methods: A new external force field was generated by using corner and gradient weight function to control the mean curvature vector flow (MCVF) and anisotropic diffusion, then the deformable model was guided to achieve edge detection. Results: According to the test on noise binary images and ultrasound images, it was proved that in this case the capture range was larger than that of GVF, and it was more insensitive to noise. Conclusion: The results showed that the new method has the advantages of robustness, and large capture range. It reduces noise and at the same time preserves edges and sharp corner points in ultrasound images. It proves to be an effective method for edge detection of ultrasound images. Key words: ultrasound images ; edge detection ; deformable model ; anisotropic diffusion ; mean curvature vector flow

**Changes of Cardiac Pump Function in Push-pull Effect Simulated by Tilt Table**

Geng, Jie; Sun, Xi-qing; Yang, Chang-bin; Wang, Yong-chun; Wu, Yan-hong; Wang, Hai-song; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 157-160; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To assess push-pull effect (PPE) on detailed cardiac pump function responses with a tilt table. Methods: Eight healthy male volunteers were exposed to 3 times transition of body position of +90deg head-up tilt (HUT) for 30s approaches head-down tilt (HDT) for 15s in randomized sequences, the angle of HDT are 0deg, -30deg and -90deg. Results: 1) Z(sub 0) decreased with HDT(-Gz) level in the 'push' and 'pull' phases; 2) SV and CO increased with HDT (-Gz) in the 'push' and 'pull' phases; 3) HR decreased in the 'push' phase, but it recovered in the 'pull' phase with HDT (-Gz). Conclusions: In the 'pull' phase of PPE, SV and CO increases while HR decreases with the amplitude of the negative acceleration. This suggests that the vasoconstriction or vasodilatation of peripheral arterial vessels plays an important role in the mechanism of PPE.

**Effects of Dorsal Periaqueductal Gray Stimulation and Reperfusion on Cerebral Ischemic Injury in Rats**

Lei, ting; Huang, Hui-ming; Jin, Ying-xiong; Yang, Zhuo; Zhang, Tao.; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 174-179; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To investigate the effects of dorsal periaqueductal gray (dPAG) stimulation or reperfusion on neural injury and autonomic dysfunction after cerebral ischemia in rats. Methods: Twenty-four male Spague-Dawley rats were randomly divided into three groups: ischemia for 5 h group, ischemia for 2 h plus reperfusion for 3 h group, ischemia for 2 h plus stimulation of dPAG for 1 h group. Cerebral ischemia was induced by intraluminal occlusion of middle cerebral artery. Blood pressure, electrocardiograph and renal sympathetic nerve activity were collected during experiments. Heart rate variability and renal sympathetic nerve activity signals were estimated by power spectral analysis. And infarction volume was measured as well. Results: Stimulation of dPAG reduced infarction volume after cerebral ischemia and increased total power of autonomic system and parasympathetic nerve activity. Reperfusion increased infarction volume after cerebral ischemia and increased sympathetic and parasympathetic nerve activities. Conclusion: Reperfusion has ascendancy in long-dated effects. Electrical stimulation could be beneficial for early injury after cerebral ischemia and may be an accessorial therapy of reperfusion. Key words: electrical stimulation ; reperfusion ; cerebral ischemia ; autonomic dysfunction

**Oxygenated Hemoglobin Responses in Prefrontal Area during Visual Search Tasks Measured with Near-infrared Spectroscopy**

Yang, Hong-yu; Zhou, Zhen-yu; Ruan, Zong-cai; Gong, Hui; Luo, Qing-ming; Lu, Zu-hong; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 209-212; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To observe concentration changes of oxygenated hemoglobin (HbO<sub>2</sub>) in prefrontal area during visual search tasks. Methods: Twenty-five healthy college students were asked to do two levels of visual search tasks during which changes of concentration of HbO<sub>2</sub> were measured. Results: 1) HbO<sub>2</sub> increased during the task of detecting a target letter from eight non-target letters as compared with that during the task of detecting a target letter from 2 non-target letters. 2) The enhancement of HbO<sub>2</sub> measured by NIRS on prefrontal cortex was negatively correlated with performance of the tasks. Conclusion: The HbO<sub>2</sub> response of prefrontal area is consistent with the behavioral result of visual search tasks, suggesting that higher hemodynamic response may reduce the response time of visual search task. Key works : prefrontal cortex ; near-infrared spectroscopy ; visual search

**Screening the Interacting Proteins of hPerl**

Ji, Zhi-hong; Jiang, Zhou; Wang, Yu-hui; Lu, Fang; Liu, Yan-you; Gao, Mei; Wang, Zheng-rong; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 184-187; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

To find a new method for identifying interacting proteins of human Per1 in the blood. Using bHLH-PAS domain of hPerl as bait, a human blood cDNA library was screened and the proteins interacting with hPerl were searched. The positive clones were sequenced and analyzed by bioinformatics methods. Forty-six colonies were selected by the yeast two-hybrid system. LSMD1 protein was obtained after verification. It is proved that Perl can interact with LSMD1 by yeast two-hybrid system.

**Design of a Novel Quartz Temperature Sensor Used for Temperature Monitoring in Manned Space Flight**

Chen, Zhao-yang; Hao, Hong-wei; Li, Lu-ming; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 170-173; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To design a new digital temperature sensor with quartz crystal for manned space flight. Methods: Based on the piezoelectric resonance principles, the mechanics of quartz tuning-fork flexural vibration frequency was analyzed to determine the first order frequency-temperature characteristics. ZYtw cut mode was designed for the novel tuning-fork temperature sensor. Results: Static and dynamic experiments showed that the nominal frequency of the quartz temperature sensor was 31.530 kHz; the resolution reached 0.03deg C/Hz; and the respond time was less than 4.5 s. Conclusion: The accuracy and effectiveness of the method for designing the new quartz temperature sensor is confirmed to be suitable for manned space flight. **Experimental Study of Expression of PAL Gene and HSP60 Gene of Legionella Pneumophila in NIH3T3 Cell**

Tian, Yu; Chen, Jian-ping; Zhang, Jian-guo; Yang, Chun-lei; Liu, Ming-jie; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 188-192; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

To study the expression of PAL,HSP60 gene of Legionella pneumophila in NIH3T3 cell ,in order to provide experimental data for development of DNA vaccine against legionnaires' disease. Recombinant plasmid pcDNA3.1-PAL and pcDNA3.1-HSP60 were transfected into the eukaryotic cell NIH3T3 respectively with lipofection strategy. Furthermore, mixed pcDNA3.1- PAL and pcDNA3. 1-HSP60 were also transfected into NIH3T3. Their expression were detected by immunofluorescent staining and RT-PCR. Immunofluorescent staining and RT-PCR detection showed that the recombinant plasmid pcDNA3.1-PAL and pcDNA3.1-HSP60 could express PAL protein and HSP60 protein in the eukaryotic cell NIH3T3 respectively, and mixed pcDNA3. 1-PAL and pcDNA3.1-HSP60 could express PAL protein and HSP60 protein respectively in the eukaryotic cell NIH3T3. These evidences could be the basis for developing new genetic vaccine against Legionnaires ' disease.

**Effects of Beer and Ethanol on Gamma-Ray-induced Chromosome Aberration in Mouse Bone Marrow Cells**

Lv, Dui-cai; Zhao, Ya-li; Wang, Gen-liang; Liang, Hong; Guo, Yao-yu; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 161-164; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To observe effects of beer and ethanol on chromosome aberrations of mouse bone marrow cells induced by various doses of gamma-ray irradiation. Methods: Healthy male BALB/c mice were arranged into control group, beer group and diluted ethanol group. One ml of saline, beer(ethano1 content, 4.5 v/v) or diluted ethanol (4.5 v/v) were administered orally to the three groups respectively. Thirty minutes later, the animals were given whole-body irradiation with various doses of gamma-ray. The animals were sacrificed by cervical dislocation 24 h after irradiation. (4 micro-g/g colchicine was administered to the experimental animals intraperitoneally 4 h before killing). According to routine methods,chromosome

slides were made with bone marrow from both femurs. Five mice were used for each dose and 100 metaphases for each animal were observed under microscope. Results: When irradiation dose was up to 0.5 Gy, chromosome aberrations induced by irradiation in both beer and ethanol groups decreased obviously ( $P < 0.05$  or  $P < 0.01$ ), and more significant effect was found in beer group. Conclusion Beside ethanol, other antioxidant substances, such as phenolic compounds, may account for beer's activity of reducing chromosome aberrations induced by irradiation.

**Development of a Ground-based Micro-algae Photo-bioreactor Experimental Facility for Using in Space**

Al, Wei-dang; Guo, Shuang-sheng; Qin, Li-feng; Tang, Yong-kang; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 165-169; In Chinese; See also [20080008161](#); Copyright; Avail.: Other Sources

Objective: To develop a ground-based micro-algae photo-bioreactor experimental facility for using in space. Methods: Project planning, design drafting, manufacture and debugs were conducted basing on demand of using in space. Finally, a demonstration test for producing algae was done. Results: The facility comprises nine subsystems, including a reactor, a light unit, a CO<sub>2</sub> supplying unit and an O<sub>2</sub> removing unit. A new type of reactor was adopted, where the micro-algae grew. A membrane module was introduced to develop a CO<sub>2</sub> supplying unit. By this way, capacity of algae absorbing and utilizing CO<sub>2</sub> was improved. An O<sub>2</sub> removing unit was manufactured by applying the membrane technique, it not only removed the dissolved oxygen immediately and gave it to the human, but also alleviated the load of separating gas from liquid in weightlessness condition. The experimental test results demonstrated that the density of algae in the photo-bioreactor increased from 0.174 g (DW)/L to 4.064 g (DW)/L after 7 d growing. Its productivity for the microalgae was up to 11.1 g (DW)/d. Conclusion The facility has reasonable technical indexes, and smooth and reliable performances. The micro-algae can grow normally in the bioreactor. The principle of the bioreactor of providing CO<sub>2</sub> for algae and taking O<sub>2</sub> from the culture medium is suitable for the demand under space conditions.

**The Validation of Vapor Phase Hydrogen Peroxide Microbial Reduction for Planetary Protection and a Proposed Vacuum Process Specification**

Chung, Shirley; Barengoltz, Jack; Kern, Roger; Koukol, Robert; Cash, Howard; October 2006; 47 pp.; In English; Original contains color and black and white illustrations

Report No.(s): JPL Publication 06-6; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40601>

The Jet Propulsion Laboratory, in conjunction with the NASA Planetary Protection Officer, has selected the vapor phase hydrogen peroxide sterilization process for continued development as a NASA approved sterilization technique for spacecraft subsystems and systems. The goal is to include this technique, with an appropriate specification, in NPR 8020.12C as a low temperature complementary technique to the dry heat sterilization process. To meet microbial reduction requirements for all Mars in-situ life detection and sample return missions, various planetary spacecraft subsystems will have to be exposed to a qualified sterilization process. This process could be the elevated temperature dry heat sterilization process (~115 C for 40 hours) which was used to sterilize the Viking lander spacecraft. However, with utilization of such elements as highly sophisticated electronics and sensors in modern spacecraft, this process presents significant materials challenges and is thus an undesirable bioburden reduction method to design engineers. The objective of this work is to introduce vapor hydrogen peroxide (VHP) as an alternative to dry heat microbial reduction to meet planetary protection requirements. The VHP process is widely used by the medical industry to sterilize surgical instruments and biomedical devices, but high doses of VHP may degrade the performance of flight hardware, or compromise material properties. Our goal for this study was to determine the minimum VHP process conditions to achieve microbial reduction levels acceptable for planetary protection.

**Spatial Awareness in Synthetic Vision Systems: Using Spatial and Temporal Judgments to Evaluate Texture and Field of View**

Bolton, Matthew L.; Bass, Ellen J.; Comstock, James Raymond, Jr.; [2007]; 35 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 609866.02.07.07.03; Copyright; Avail.: Other Sources

This work introduced judgment-based measures of spatial awareness and used them to evaluate terrain textures and fields of view (FOVs) in Synthetic Vision Systems (SVS) displays. SVS are cockpit technologies which depict computer generated views of terrain surrounding an aircraft. In the assessment of textures and FOVs for SVS, no studies have directly measured the 3 levels of spatial awareness with respect to terrain: 1) identification of terrain, 2) its relative spatial location, and 3) its relative temporal location. Eighteen pilots made 4 judgments (relative azimuth angle, distance, height, and abeam time) regarding the location of terrain points displayed in 112 5-second, non-interactive simulations of a SVS head down display. There were 2 between subject variables (texture order and FOV order) and 5 within subject variables (the relative azimuth angle, distance, and height of the terrain point, texture, and FOV). Texture produced significant main and interaction effects for the magnitude of error in the relative angle, distance, height, and abeam time judgments. FOV interaction effects were significant for the directional magnitude of error in the relative distance, height, and abeam time judgments. Spatial awareness was best facilitated by the Elevation Fishnet (EF), Photo Fishnet (PF), and Photo Elevation Fishnet (PEF) textures. This study recommends that the EF, PF, and PEF textures be further evaluated in future SVS experiments. Additionally, the judgment-based spatial awareness measures used in this experiment could be used to evaluate other display parameters and depth cues in SVS.

**Parallel Anisotropic Tetrahedral Adaptation**

Park, Michael A.; Darmofal, David L.; January 07, 2008; 17 pp.; In English; 46th AIAA Aerospace Sciences Meeting and Exhibit, 7-10 Jan. 2008, Reno, NV, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 561581; Copyright; Avail.: CASI: A03, Hardcopy

An adaptive method that robustly produces high aspect ratio tetrahedra to a general 3D metric specification without introducing hybrid semi-structured regions is presented. The elemental operators and higher-level logic is described with their respective domain-decomposed parallelizations. An anisotropic tetrahedral grid adaptation scheme is demonstrated for 1000-1

stretching for a simple cube geometry. This form of adaptation is applicable to more complex domain boundaries via a cut-cell approach as demonstrated by a parallel 3D supersonic simulation of a complex fighter aircraft. To avoid the assumptions and approximations required to form a metric to specify adaptation, an approach is introduced that directly evaluates interpolation error. The grid is adapted to reduce and equidistribute this interpolation error calculation without the use of an intervening anisotropic metric. Direct interpolation error adaptation is illustrated for 1D and 3D domains.

ONLINE: <http://hdl.handle.net/2060/20080008295>

New methodology for verification of computational methods using unstructured grids is presented. The discretization order properties are studied in computational windows, easily constructed within a collection of grids or a single grid. The windows can be adjusted to isolate the interior discretization, the boundary discretization, or singularities. A major component of the methodology is the downscaling test, introduced previously for studying the convergence rates of truncation and discretization errors of finite-volume discretization schemes on general unstructured grids. Demonstrations of the method are shown, including a comparative accuracy assessment of commonly-used schemes on general mixed grids and the identification of local accuracy deterioration at intersections of tangency and inflow/outflow boundaries. Recommendations for the use of the methodology in large-scale computational simulations are given.

ONLINE: <http://hdl.handle.net/2060/20080008435>

Mesh deformation in response to redefined boundary geometry is a frequently encountered task in shape optimization and analysis of fluid-structure interaction. We propose a simple and concise method for deforming meshes defined with three-node triangular or four-node tetrahedral elements. The mesh deformation method is suitable for large boundary movement. The approach requires two consecutive linear elastic finite-element analyses of an isotropic continuum using a prescribed displacement at the mesh boundaries. The first analysis is performed with homogeneous elastic property and the second with inhomogeneous elastic property. The fully stressed design is employed with a vanishing Poisson's ratio and a proposed form of equivalent strain (modified Tresca equivalent strain) to calculate, from the strain result of the first analysis, the element-specific Young's modulus for the second analysis. The theoretical aspect of the proposed method, its convenient numerical implementation using a typical linear elastic finite-element code in conjunction with very minor extra coding for data processing, and results for examples of large deformation of two-dimensional meshes are presented in this paper. KEY WORDS: Mesh deformation, shape optimization, fluid-structure interaction, fully stressed design, finite-element analysis, linear elasticity, strain failure, equivalent strain, Tresca failure criterion

This technical note provides a mathematical proof of Corollary 1 from the paper 'A Nonlinear Model Predictive Control Algorithm with Proven Robustness and Resolvability' that appeared in the 2006 Proceedings of the American Control

Conference. The proof was omitted for brevity in the publication. The paper was based on algorithms developed for the FY2005 R&TD (Research and Technology Development) project for Small-body Guidance, Navigation, and Control [2]. The framework established by the Corollary is for a robustly stabilizing MPC (model predictive control) algorithm for uncertain nonlinear systems that guarantees the resolvability of the associated finite-horizon optimal control problem in a receding-horizon implementation. Additional details of the framework are available in the publication.

#### **Effects of Spatial and Non-Spatial Multi-Modal Cues on Orienting of Visual-Spatial Attention in an Augmented Environment**

Jerome, Christian J; Nov 2007; 67 pp.; In English

Contract(s)/Grant(s): Proj-A790

Report No.(s): AD-A475115; ARI-TR-1215; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Visual search tasks are known to be cognitive capacity demanding and therefore may be improved by training in an augmented reality (AR) environment. During the experimental task, 64 participants searched for enemies (while cued from visual, auditory, tactile, combinations of two, or all three modality cues) and tried to shoot them while avoiding shooting the civilians (fratricide) for two 2-minute low-workload scenarios, and two 2-minute high-workload scenarios. The results showed significant benefits of attentional cueing on visual search task performance. These benefits were revealed by improved performance in reaction time and accuracy from the haptic cues alone, auditory cues alone, and the combination of the visual and haptic cues together. Fratricide occurrence was shown to be amplified by the presence of the audio cues. The two levels of workload produced differences within individual's task performance for accuracy and reaction time. Accuracy and reaction time were significantly better with the medium cues than all the other cue \* specificities and the control condition during low workload and marginally better during high workload. Cue specificity generally resulted in better accuracy and reaction time with the medium cues.

ONLINE: <http://hdl.handle.net/2014/40582>

Statecharts have been used as a means to communicate behaviors in a precise manner between system engineers and software engineers. Hand-translating a statechart to code, as done on some previous space missions, introduces the possibility of errors in the transformation from chart to code. To improve auto-coding, we have developed a process that generates flight code from UML statecharts. Our process is being used for the flight software on the Space Interferometer Mission (ESA).

Contract(s)/Grant(s): DAAD16-02-C-0057

Report No.(s): AD-A474493; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes the design and simulation of a bandwidth-efficient waveform suitable for the SLICE radio developed

by ITT Aerospace/Communications; this waveform uses quadrature amplitude modulation (QAM) and low-complexity turbo codes developed at Notre Dame. The result is compared with another using continuous phase modulation (CPM). It is shown that the amplifier backoff required for QAM puts it at a disadvantage to CPM at spectral efficiencies where both are feasible - below 2.0 bits/sec/Hz. However, signal processing techniques (e.g. pre-distortion filtering) for QAM can reduce that disadvantage; moreover, at higher spectral efficiencies, QAM may be the only feasible solution. Other topics include low-density parity check (LDPC) convolutional codes, new techniques to reduce the peak to average power ratio (PAPR) for QPSK signals, and analysis of systems employing adaptive modulation and orthogonal frequency division multiplexing (OFDM).

Classical operating system architecture provides support for only a limited class of coarse-grained security policies. Furthermore, system software has grown too large and complicated to be considered trustworthy. To address these shortcomings, we have explored the application of programming language technology, including advanced type-systems, proof systems, analyses, and compilers for realizing new classes of security policies and for reducing or relocating the trusted computing base.

**Comparison of Two Hierarchical Routing Protocols for Heterogeneous MANET**

Yang, Maoyu; Ge, Ying; Lamont, Louise; Oct 2007; 78 pp.; In English; Original contains color illustrations

Report No.(s): AD-A475287; DRDC OTTAWA TM 2007-201; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this report, a study on hierarchical routing protocols for heterogeneous mobile Ad Hoc wireless networks is presented. The main thrust of the investigation is to identify a potential hierarchical routing scheme that is best suited for a heterogeneous tactical Mobile Ad Hoc Network (MANET). Such networks consist of mobile nodes that are characterized by different communications capabilities, such as multiple radio interfaces. The report highlights the benefits and issues of the different routing protocols, namely the H-OLSR and H-LANMAR, as they pertain to a military tactical scenario. We first discuss the context for the use of a hierarchical routing strategy by describing a typical military scenario where a number of platforms are used each supporting link types of varying capabilities. We then discuss the rationale for selecting a proactive hierarchical routing scheme for typical tactical MANETs. We discuss in detail the routing algorithms of the two protocols under investigation. Finally we conduct an experimental comparison study between the two routing protocols. Our experiments reveal that H-OLSR outperforms H-LANMAR for most of the group mobility scenarios that can potentially be used in the operation of a tactical MANET.

Report No.(s): AD-A475135; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Social network analysis (SNA) has become an important analytic tool for analyzing terrorist networks, friendly command and control structures, and a wide variety of other applications. In this project we collect social network data from a group of 24 Army officers in a one-year graduate program at Columbia University. In this report we discuss methodological issues associated with collecting e-mail social networks and include source code for an add-in to Microsoft Outlook to aid in this process. These data were investigated for patterns and trends in mutual, asymmetric, and null dyads. Behavioral changes in the group resulting from awareness of one's position in social network were also studied. Additionally, comparisons were made between SNA data derived from e-mail traffic and from questionnaires. The differences between these two types of networks are important concerns when considering the implementation of SNA as a command and control tool for friendly forces.

The Domain Name System (DNS) converts names such as www.afrl.mil into IP addresses that can be used for communication. It is an essential part of almost every Internet application, but lacks authentication mechanisms. The DNS Security Extensions address this problem and add origin authentication into the system. Deployment of the security extensions is now beginning and this project monitors that early deployment. The project provides real-time deployment tracking and identifies several operational challenges and barriers that must be overcome for this system to succeed.

**Using Planning, Scheduling and Execution for Autonomous Mars Rover Operations**

Estlin, Tara A.; Gaines, Daniel M.; Chouinard, Caroline M.; Fisher, Forest W.; Castano, Rebecca; Judd, Michele J.; Nesnas, Issa A.; June 6, 2006; 10 pp.; In English; International Conference on Automated Planning and Scheduling, 6-7 Jun. 2006, Windermere, UK; Original contains black and white illustrations; Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/2014/40588>

With each new rover mission to Mars, rovers are traveling significantly longer distances. This distance increase raises not only the opportunities for science data collection, but also amplifies the amount of environment and rover state uncertainty that must be handled in rover operations. This paper describes how planning, scheduling and execution techniques can be used onboard a rover to autonomously generate and execute rover activities and in particular to handle new science opportunities that have been identified dynamically. We also discuss some of the particular challenges we face in supporting autonomous rover decision-making. These include interaction with rover navigation and path-planning software and handling large amounts of uncertainty in state and resource estimations. Finally, we describe our experiences in testing this work using several Mars rover prototypes in a realistic environment.

ONLINE: <http://hdl.handle.net/2014/40571>

This paper describes how dynamic planning and scheduling techniques can be used onboard a rover to autonomously adjust rover activities in support of science goals. These goals could be identified by scientists on the ground or could be identified by onboard data-analysis software. Several different types of dynamic decisions are described, including the handling of opportunistic science goals identified during rover traverses, preserving high priority science targets when resources, such as power, are unexpectedly over-subscribed, and dynamically adding additional, ground-specified science targets when rover actions are executed more quickly than expected. After describing our specific system approach, we discuss some of the particular challenges we have examined to support autonomous rover decision-making. These include interaction with rover navigation and path-planning software and handling large amounts of uncertainty in state and resource estimations.

**A Genetic Algorithm Based Recurrent Fuzzy Neural Network for Linear Induction Motor Servo Drive**

Lin, Faa-Jen; Huang, Po-Kai; Lin, F. J.; Chou, Wen-Der; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 801-817; In English; See also [20080008363](#); Copyright; Avail.: Other Sources

A genetic algorithm (GA) based recurrent fuzzy neural network (RFNN) is proposed to control the mover of a linear induction motor (LIM) servo drive for periodic motion in this paper. The GA is developed to search the optimal weights between the membership layer and the rule layer of RFNN. First, the dynamic model of an indirect field-oriented LIM servo drive is derived. Then, an on-line training RFNN with backpropagation algorithm is introduced as the tracking controller. Moreover, to guarantee the global convergence of tracking error, analytical methods based on a discrete-type Lyapunov function are proposed to determine the varied learning rates of the RFNN. In addition, a real-time GA is developed to search the optimal weights between the membership layer and the rule layer of RFNN on-line. The theoretical analyses for the proposed GA-based RFNN controller are described in detail. Finally, simulated and experimental results show that the proposed controller provides good control performance dynamic characteristics and is robust with regard to plant parameter variations and external load disturbance.

**20080006702** Air Force Research Lab., Rome, NY USA

**Development and Evaluation of Fusion Techniques**

Alford, Mark G; Scalzo, Maria L; Bubalo, Adnan; Jones, Eric C; Oct 2007; 94 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-459E

Report No.(s): AD-A474630; AFRL-RI-RS-TR-2007-215; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this effort was to investigate and develop promising innovative technologies that hold promise for improvements in the Air Force target tracking and fusion capabilities. The problem statement is that Nonlinear Non-Gaussian Processes (NNGP) present a major challenge in all types of military problems. This is because the real-world is nonlinear and non-Gaussian, despite assumptions made in most conventional fusion algorithms. This in-house program addressed this problem by researching and developing tracking filters that do not presume a linear Gaussian world. The most famous of these is the Particle Filter (PF). Progress made includes development of a MATLAB PF simulation capability for in-house analysis/testing and preliminary investigation of PF capabilities. Prior to this effort AFRL/IF had no capability in this area and

PF were not being investigated. DEFT developed a two-dimensional PF and performed Monte Carlo simulation runs to test the performance of the PF as compared to the Extended Kalman Filter (EKF) for multiple bearings only sensors (ESM sensors). Results showed that in certain cases, the Monte Carlo averaged tracking error variance of the PF was much better than that of the EKF, but with ten times the computational cost. Under these same conditions (50 particles, 100 Monte Carlo runs, two bearings only sensors), the EKF lost track 28% of the time whereas the PF did not lose track at all. This effort established future directions for research. There is a need to do more nonlinear filtering analysis, development and enhancements under realistic scenarios with varying degrees of nonlinearity. Considerable study is needed to fully determine the conditions under which these techniques will lead to improved performance. It is possible that a system could be developed employing multiple nonlinear filters.

**Magnetic Field Response Measurement Acquisition System**

Woodard, Stanley E.; Taylor, Bryant D.; Shams, Qamar A.; Fox, Robert L.; [2007]; 35 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 23-762-65-AT; Copyright; Avail.: CASI: A03, Hardcopy

This paper presents a measurement acquisition method that alleviates many shortcomings of traditional measurement systems. The shortcomings are a finite number of measurement channels, weight penalty associated with measurements, electrical arcing, wire degradations due to wear or chemical decay and the logistics needed to add new sensors. Wire degradation has resulted in aircraft fatalities and critical space launches being delayed. The key to this method is the use of sensors designed as passive inductor-capacitor circuits that produce magnetic field responses. The response attributes correspond to states of physical properties for which the sensors measure. Power is wirelessly provided to the sensing element by using Faraday induction. A radio frequency antenna produces a time-varying magnetic field used to power the sensor and receive the magnetic field response of the sensor. An interrogation system for discerning changes in the sensor response frequency, resistance and amplitude has been developed and is presented herein. Multiple sensors can be interrogated using this method. The method eliminates the need for a data acquisition channel dedicated to each sensor. The method does not require the sensors to be near the acquisition hardware. Methods of developing magnetic field response sensors and the influence of key parameters on measurement acquisition are discussed. Examples of magnetic field response sensors and the respective measurement characterizations are presented. Implementation of this method on an aerospace system is discussed.

Our starting point, of course, has to be wargaming itself. What is it? Too often, people in this business use the term loosely, to describe everything from the activity of thousands of real troops and vehicles maneuvering across hundreds of square miles, to the largely intellectual activity of a couple of guys crouched over a paper map and pushing around tiny cardboard squares. What I am going to be talking about here are REAL wargames, not field exercises, analytical models, or computer simulations without players (what I call cazwhips). Real wargames involve human beings making decisions and dealing with the consequences of those decisions, but not the action of actual forces.

Report No.(s): AD-A475216; DEBL-2005-03; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Recently, a millimeter wave (MMW) hardware system, called Active Denial System (ADS) has been developed for use as a non-lethal weapon system. The ADS system is capable of generating high power MMWs and is to be used for, but not limited to, crowd management and denying access to restricted areas. ADS achieves this end by using a 94 GHz MMW beam to produce rapid skin heating to a temperature that causes intense discomfort in a very short period of time, normally in just a matter of seconds. The intensity of the discomforting sensation rapidly decreases when the power to the transmitter is turned off or the individual moves out of the MMW beam. The primary effect of the ADS is heating of skin and absorption of the 94GHz millimeter waves in the eye. Recently the effects that eyewear may have on the absorption of 94 GHz MMWs on the face have been questioned. To fully understand the effects of ADS through eyewear, exposure data must be collected while the targeted subject is wearing various types of eyewear, such as, eyeglasses, night vision goggles (NVG) and binoculars, that may be encountered when subjects are be exposed to the system. This investigation was conducted to evaluate the effects that

various types of eyewear may have on absorption of the 94 GHz beam and especially the production of hotspots generated by reflections or focusing of the beam on the surface of the face.

### **Evaluation of a Low-Noise Formate Spiral-Bevel Gear Set**

Lewicki, David g.; Woods, Ron L.; Litvin, Faydor L.; Fuentes, Alfonso; December 2007; 23 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NCC2-9019

Report No.(s): NASA/TM-2007-215032; ARL-TR-4135; E-16204; ARL-TR-4125; Copyright; Avail.: CASI: [A03](#),

Hardcopy

Studies to evaluate low-noise Formate spiral-bevel gears were performed. Experimental tests were performed on the OH-58D helicopter main-rotor transmission in the NASA Glenn 500-hp Helicopter Transmission Test Stand. Low-noise Formate spiral-bevel gears were compared to the baseline OH-58D spiral-bevel gear design, a high-strength design, and previously tested low-noise designs (including an original low-noise design and an improved-bearing-contact low-noise design). Noise, vibration, and tooth strain tests were performed. The Formate design showed a decrease in noise and vibration compared to the baseline OH-58D design, and was similar to that of the previously tested improved-bearing contact low-noise design. The pinion tooth stresses for the Formate design significantly decreased in comparison to the baseline OH-58D design. Also similar to that of the improved bearing-contact low-noise design, the maximum stresses of the Formate design shifted toward the heel, compared to the center of the face width for the baseline, high-strength, and previously tested low-noise designs.

ONLINE: <http://hdl.handle.net/2060/2008008146>

The acoustic assessment task for both the Subsonic Fixed Wing and the Supersonic projects under NASA's Fundamental Aeronautics Program was designed to assess the current state-of-the-art in noise prediction capability and to establish baselines for gauging future progress. The documentation of our current capabilities included quantifying the differences between predictions of noise from computer codes and measurements of noise from experimental tests. Quantifying the accuracy of both the computed and experimental results further enhanced the credibility of the assessment. This presentation gives sample results from codes representative of NASA's capabilities in aircraft noise prediction at the system level and at the component level. These include semi-empirical, statistical, analytical, and numerical codes. An example of system level results is shown for an aircraft. Component level results are shown for airframe flaps and landing gear, for jet noise from a variety of nozzles, and for broadband fan noise. Additional results are shown for modeling of the acoustic behavior of duct acoustic lining and the attenuation of sound in lined ducts with flow.

### **Speckle Reduction for Ultrasound Images with Anisotropic Diffusion Based on EM Parameter Estimation Algorithm**

Yu, Jin-hua; Wang, Yuan-yuan; Shi, Xin-ling; Space Medicine and Medical Engineering, Volume 20, No. 3; June 2007, pp. 198-204; In Chinese; See also [2008008161](#); Copyright; Avail.: Other Sources

To improve the flexibility and stability of the filter in speckle reduction of ultrasound images. The gray distribution of an

ultrasound image was modeled by a mixture of one Rayleigh and one Gaussian distribution. The mixture distribution was decomposed using the expectation maximization(EM) algorithm. The homogeneous region of the image was then estimated according to the decomposition results of the mixture distribution. Finally, the diffusion threshold was obtained by analyzing the statistical features of the homogeneous region. By comparing the results with other two improved parameter estimation methods for the anisotropic diffusion, the method based on the EM algorithm could estimate the diffusion threshold more accurately. The balance between speckle removal and edge preservation could also be obtained in the diffusion result. The anisotropic diffusion based on EM parameter estimation is an effective method for suppressing speckle in ultrasound images.

#### **Jet Screech Noise Computation**

Loh, Ching Y.; Hultgren, Lennart S.; AIAA Journal; May 2006; Volume 44, No. 5, pp. 992-998; In English; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A02](#), Hardcopy

The near-field screech-tone noise of a typical underexpanded circular jet issuing from a sonic nozzle is simulated numerically. The self-sustained feedback loop is automatically established in the simulation. The computed shock-cell structure, acoustic wave length, screech-tone frequencies, and sound pressure levels in the near field are in good agreement with existing experimental results.

#### **Focal-Plane Imaging of Crossed Beams in Nonlinear Optics Experiments**

Bivolaru, Daniel; Herring, G. C.; [2007]; 3 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): WBS 984754.02.07.07.14.02; Copyright; Avail.: CASI: [A01](#), Hardcopy

An application of focal-plane imaging that can be used as a real time diagnostic of beam crossing in various optical techniques is reported. We discuss two specific versions and demonstrate the capability of maximizing system performance with an example in a combined dual-pump coherent anti-Stokes Raman scattering interferometric Rayleigh scattering experiment (CARS-IRS). We find that this imaging diagnostic significantly reduces beam alignment time and loss of CARS-IRS signals due to inadvertent misalignments.

This AGARDograph presents a general summary of suggested Night Vision Goggle (NVG) testing methods and should be used as a framework for developing airborne and laboratory based experiments to evaluate equipment. The objective of this document is to provide an inventory of rules, standards, procedures, methods and means needed to test and evaluate night vision systems. In order to meet its objective, the scope of this AGARDograph is limited to the testing of night vision devices based on image intensification technology for use in rotorcraft. This AGARDograph includes sections covering the basic theory of the systems in use today, human vision and its relationship to the technology, general flight test methodology and an inventory of flight test techniques from NATO countries.

**TRL-6 for JWST Wavefront Sensing and Control**

Feinberg, Lee; Dean, Bruce; Smith, Scott; Aronstein, David; Shiri, Ron; Lyon, Rick; Hayden, Bill; Bowers, Chuck; Acton, D. Scott; Shields, Duncan; Sabatke, Erin; Schwenker, John; Towell, Tim; Carey, Larkin; Contos, Adam; Shi, Fang; Mesa, Luis; August 26, 2007; 1 pp.; In English; SPIE Optics and Photonics, 26-30 Aug. 2007, San Diego, CA, USA; Copyright; Avail.: Other Sources; Abstract Only

NASA's Technology Readiness Level (TRL)-6 is documented for the James Webb Space Telescope (JWST) Wavefront Sensing and Control (WFSC) subsystem. The WFSC subsystem is needed to align the Optical Telescope Element (OTE) after all deployments have occurred, and achieves that requirement through a robust commissioning sequence consisting of unique commissioning algorithms, all of which are part of the WFSC algorithm suite. This paper identifies the technology need, algorithm heritage, describes the finished TRL-6 design platform, and summarizes the TRL-6 test results and compliance.

**Estimation of Cyclic Error Due to Scattering in the Internal OPD Metrology of the Space Interferometry Mission**

Tang, Hong; Zhao, Feng; February 14, 2005; 9 pp.; In English; 8th International Symposium on Laser Metrology, 14-18 Feb. 2005, Merida, Yucatan, Mexico; Original contains black and white illustrations; Copyright; Avail.: Other Sources  
ONLINE: <http://hdl.handle.net/2014/40602>

A common-path laser heterodyne interferometer capable of measuring the internal optical path difference (OPD) with accuracy of the order of 10 pm was demonstrated at JPL. To achieve this accuracy, the relative power received by the detector that is contributed by the scattering of light at the optical surfaces should be less than -97 dB. A method has been developed to estimate the cyclic error caused by the scattering of the optical surfaces. The result of the analysis is presented.

**Photon Counting Techniques for the Bandlimited Optical Channel**

Lee, Clement G.; Gray, Andrew A.; March 5, 2005; 7 pp.; In English; IEEE Aerospace Conference, Big Sky, Montana, March 5-12, 2005, 5-12 Mar. 2005, Big Sky, MT, USA; Original contains black and white illustrations  
Report No.(s): IEEEAC Paper #1403; Copyright; Avail.: Other Sources  
ONLINE: <http://hdl.handle.net/2014/40594>

Two methods of estimating received photon counts given a realistic noisy and bandlimited optical channel are presented. The function of estimating photon counts is critical in any optical communications receiver. The purpose of this work is to compare two methods, neither of which is generically optimal, with realistic channels-for the purpose of assessing which is more appropriate for application in a hardware receiver given the current state-of-the art.

**Model of the Plasma Potential Distribution in the Plume of a Hollow Cathode**

Katz, Ira; Mikellides, Ioannis G.; Goebel, Dan M.; July 12, 2004; 10 pp.; In English; Joint Propulsion Conference, 12-14 Jul. 2006, Fort Lauderdale, FL, USA; Original contains black and white illustrations; Copyright; Avail.: Other Sources  
ONLINE: <http://hdl.handle.net/2014/40572>

In this paper we present results from a new model of the plasma potentials in the plume just downstream of the hollow cathode keeper. We examine the electron drift velocity as the hollow cathode plasma and neutral gas expand downstream of the keeper. If the drift velocity exceeds the thermal velocity a double layer potential structure develops that is the source of hot electrons. Ions are accelerated upstream through the double layer. The locations of the double layers are calculated using

a simple model. It is shown that as the cathode gas flow increases, the location of the double layer moves farther downstream.

Solid state lasers have remained a vibrant area of research because several major innovations expanded their capability. Major innovations are presented with emphasis focused on the laser efficiency. A product of efficiencies approach is developed and applied to describe laser performance. Efficiency factors are presented in closed form where practical and energy transfer effects are included where needed. In turn, efficiency factors are used to estimate threshold and slope efficiency, allowing a facile estimate of performance. Spectroscopic, thermal, and mechanical data are provided for common solid state laser materials.

#### **Log-Scale Method with Equivalent Circuit Model in Semiconductor Device Simulations**

Li, Szu-Jun; Ho, Chi-Hon; Liao, Chien Nan; Tsai, Yao-Tsung; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 843-846; In English; See also [20080008363](#); Copyright; Avail.: Other Sources

Semiconductor device simulations sometimes have to solve for large-scale and small-scale variables at the same time, especially with density-gradient models and hydrodynamic models. The usual way is to use the scaling factors, but scaled variables are still not of the same order of magnitude. We propose a log-scale method to make all variables of similar orders without scaling factors. All variables in similar orders of magnitude will help Newton-Raphson iterations to easily converge in device simulations. We use the divergence theorem of Gauss to discretize Poisson's and continuity equations, using the element-by-element method and develop an equivalent circuit model. The electron and hole concentrations are presented for a diode and an MOS capacitor by using the log-scale method and the equivalent circuit model. The numerical results show the great capability of the equivalent circuit model with log-scale method

**On the Reverse Short-Channel Effect and Threshold Voltage Roll-Off Controls for 90 nm Node MOSFETs**

Chen, Shuang-Yuan; Tu, Chia-Hao; Lin, Jung-Chun; Chen, Ying-Tsung; Zhuang, Sheng-Jun; Huang, Heng-Sheng; Liu, Chuan-Hsi; Chou, Sam; Ko, Joe; Journal of the Chinese Institute of Engineers: Vol. 30, No. 5; July 2007, pp. 847-853; In English; See also [20080008363](#); Original contains black and white illustrations; Copyright; Avail.: Other Sources

In order to let device designers tune the short channel behavior of MOSFETs, a method is proposed in this work to demonstrate how to use LDD (lightly doped drain) and pocket implants to control RSCE (reverse short channel effect) and threshold voltage ( $V_{(sub\ t)}$ ) roll-off. The method is based on the process parameters and silicon data of the 90 nm node technology of UMC (United Microelectronics Corporation). With the help of computers, 17 different process conditions of 8 different gate lengths were simulated using ISE TCAD to collect  $V_{(sub\ t)}$  variation data. Four characteristics representing the short channel behaviors of the MOSFETs were designed and extracted from the simulated data. Their empirical equations were also established subsequently. After verification, those mathematical models were demonstrated to help device designers in choosing the most suitable LDD and pocket implant parameters to generate required  $V_{(sub\ t)}$  characteristics.

**Conduction and Convection of Heat Produced by the Attenuation of Laser Beams in Liquids**

Goldberg, Irwin S; Garcia, Misty; Maswadi, Saher; Thomas, Robert J; Clark, Clifton D; Sep 2007; 44 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8650-06-1-6747; Proj-7757

Report No.(s): AD-A474628; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Mathematical models are used to simulate temperature changes that are induced by the absorption of energy from propagating laser beams in water. Both convective and conductive heat transfer are considered. Thermally insulated surfaces as well as surfaces involving heat transfer with the surroundings are considered. The simulated results demonstrate the importance of thermal convection. In the first part of this report containers with closed surfaces are considered. In the second part of the report free-surface effects are considered: These effects include evaporative heat loss and the occurrence of surface tension produced by temperature gradients at the surface (the Marangoni effect). Evaporative heat loss is simulated and the Marangoni effect is discussed. The quantitative determination of the temperature changes in the water due to the heat transferred by an absorbed laser beam could facilitate the improvement of models involving the optics of laser beam penetration in liquids.

Report No.(s): NASA/SP-2007-4801; Copyright; Avail.: CASI: [EA5](#), Hardcopy

Since the dawn of spaceflight advocates of a robust space effort have argued that human activity beyond Earth makes a significant difference in everyday life. Assertions abound about the 'impact' of spaceflight on society and its relationship to the larger contours of human existence. Fifty years after the Space age began, it is time to examine the effects of spaceflight on

society in a historically rigorous way. Has the Space age indeed had a significant effect on society? If so what are those influences? What do we mean by an 'impact' on society? And what parts of society? Conversely, has society had any effect on spaceflight? What would be different had there been no Space Age? The purpose of this volume is to examine these and related questions through scholarly research, making use especially of the tools of the historian and the broader social sciences and humanities. Herein a stellar array of scholars does just that and arrives at sometimes surprising conclusions. Once contemplated, the subject is broad, rich and stimulating. Spaceflight has commercial, and economic dimensions as well as social, cultural and ideological ramifications. It touches on enduring American values of pioneering, progress, enterprise and rugged individualism. Worldwide it encompasses international cooperation and competition, and affects foreign policies, national security, and questions of global environment. Viewing Earth from space, and space from the vicinity of Earth, alters world views, conceptions of self and others, and our understanding of our place and purpose in the universe.

**Mapping Experiment Results to Operational Capabilities**

Schacher, Gordon; Nov 1, 2007; 50 pp.; In English; Original contains color illustrations

Report No.(s): AD-A475185; NPS-97-08-001; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This work addresses the reporting of results from military operational experiments. These experiments are designed to examine a defined set of specific objectives, goals, and metrics, and results are developed for those objectives and goals. The results often apply to a fairly broad range of interests in addition to the experiment and its direct objectives. The authors refer to these as 'Areas of Interest' (AoI). The purpose of the work is to develop a structure and methodology, a schema, for mapping experiment results to these AoI. Figure 1 illustrates the basic mapping structure, which shows that results mapping is done at the objective level. The structure developed can be used for mapping experiment results to any military AoI. Initial work in this project has been mapped from Trident Warrior experiments to the following: Joint Capabilities Integration and Development System (JCIDS) Joint Capability Areas (JCAs), FORCENet Capabilities, Naval Netwar FORCENet Enterprise (NNFE) Capabilities List (NCL), and Operational Capability Gaps. The mapping described here focuses mainly on net-centric warfare: on information development, information flow, and decision-making. Force application activities are included, but less extensively. The structure does accommodate supported JCAs, but using it to do a good mapping of operational effectiveness results to them would require some expansion of the structure.

Corkill, Daniel; Dec 7, 2007; 50 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W15P7T-05-P621

Report No.(s): AD-A474815; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes research associated with the development of a highly responsive decision-support technology that can improve the effectiveness of analysts and decision makers - within the Army's Brigade Combat Teams (BCTs). These analysts and decision makers must work with large data volumes- in time-constrained and uncertain operating environments. This joint research and proof-of-concept effort involved the University of Massachusetts Amherst (UMass), BBTech Corporation, and the U.S. Army RDECOM CERDEC Intelligence and Information Warfare Directorate, Fort Monmouth, NJ.- This final report focuses on the UMass portion of the effort. This research was performed in the context of the CIFA (Collaborative Information-Fusion Assistant) decision-support environment, a prototype suite of tools and technologies developed jointly in this effort. CIFA can augment and support Army personnel in answering Priority Intelligence Requirements (PIRs) associated with monitoring, assessing, and responding to enemy courses of action and other battlespace-environment - characteristics. At present, time constraints and information overload often result in hasty, partial analysis of the information available to intelligence personnel. CIFA helps Army analysts and decision makers focus their attention on appropriate data by providing spatially - and temporally aggregated views of the environment and by ensuring that important information has not been overlooked. Research activities were performed in three main areas: 1) blackboard-based temporal and spatial aggregation and abstraction; 2) presentation of real-time battlespace assessments and user alerts; and 3) principled integration of sensor data, human-generated reports, and automated processing results. This report discusses the issues we addressed, the techniques we developed and our evaluations of them, and lessons learned.

This paper presents a methodology for observing GPS carrier phase data with the least-squares algorithm and the extended Kalman filter to improve positioning accuracy of the real-time kinematic GPS (KGPS). The integer least-squares method is first employed to solve the GPS integer ambiguities, and the extended Kalman filter scheme is then used to find real-time kinematic position estimates by incorporating with the vehicle kinematics of the user station. Experimental results show that the proposed KGPS algorithm is not only effective in providing more precise position estimates and reducing the detrimental effect of the cycle slip, but also useful for realtime vehicle navigation and high-accuracy surveying.

ONLINE: <http://hdl.handle.net/2014/40600>

Independent Earth orientation measurements taken by the space-geodetic techniques of lunar and satellite laser ranging, by very long baseline interferometry, and by the Global Positioning System have been combined using a Kalman filter. The resulting combined Earth orientation series, SPACE2005, consists of values and uncertainties for Universal Time, polar motion, and their rates that span from September 28, 1976, to January 7, 2006, at daily intervals and is available in versions whose epochs are given at either midnight or noon. The space-geodetic measurements used to generate SPACE2005 have then been combined with optical astrometric measurements to form two additional combined Earth orientation series: (1) COMB2005, consisting of values and uncertainties for Universal Time, polar motion, and their rates that span from January 20, 1962, to January 7, 2006, at daily intervals and which is also available in versions whose epochs are given at either

midnight or noon; and (2) POLE2005, consisting of values and uncertainties for polar motion and its rate that span from January 20, 1900, to December 21, 2005, at 30.4375-day intervals.

#### **Sloan Digital Sky Survey Standard Star Catalog for Stripe 82: The Dawn of Industrial 1% Optical Photometry**

Ivezic, Zeljko; Smith, J A; Miknaitis, Gajus; Lin, Huan; Tucker, Douglas; Lupton, Robert H; Gunn, James E; Knapp, Gillian R; Strauss, Michael A; Sesar, Branimir; Sep 2007; 27 pp.; In English

Report No.(s): AD-A475266; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We describe a standard star catalog constructed using multiple SDSS photometric observations (at least four per band, with a median of 10) in the ugriz system. The catalog includes 1.01 million nonvariable unresolved objects from the equatorial stripe 82 in the right ascension range and with the corresponding r-band (approximately Johnson V-band) magnitudes in the range 14-22. The distributions of measurements for individual sources demonstrate that the photometric pipeline correctly estimates random photometric errors, which are below 0.01 mag for stars brighter than 19.5, 20.5, 20.5, 20, and 18.5 in ugriz, respectively (about twice as good as for individual SDSS runs). Several independent tests of the internal consistency suggest that the spatial variation of photometric zero points is not larger than 0.01 mag (rms). In addition to being the largest available data set with optical photometry internally consistent at the ~1% level, this catalog provides a practical definition of the SDSS photometric system. Using this catalog, we show that photometric zero points for SDSS observing runs can be calibrated within a nominal uncertainty of 2% even for data obtained through 1 mag thick clouds, and we demonstrate the existence of He and H white dwarf sequences using photometric data alone. Based on the properties of this catalog, we conclude that upcoming large-scale optical surveys such as the Large Synoptic Survey Telescope will be capable of delivering robust 1% photometry for billions of sources.

ONLINE: <http://dx.doi.org/10.1017/S1743921307004085>

The Kepler Mission is a space-based photometric mission with a differential photometric precision of 14 ppm (at  $V = 12$  for a 6.5 hour transit). It is designed to continuously observe a single field of view (FOV) of greater than 100 square degrees in the Cygnus-Lyra region for four or more years. The primary goal of the mission is to monitor more than one-hundred thousand stars for transits of Earth-size and smaller planets in the habitable zone of solar-like stars. In the process, many eclipsing binaries (EB) will also be detected and light curves produced. To enhance and optimize the mission results, the stellar characteristics for all the stars in the Kepler FOV with  $V < 16$  will have been determined prior to launch. As part of the verification process, stars with transit candidates will have radial-velocity follow-up observations performed to determine the component masses and thereby separate eclipses caused by stellar companions from transits caused by planets. The result will be a rich database on EBs. The community will have access to the archive for further analysis, such as, for EB modeling of the high-precision light curves. A guest observer program is also planned to allow for photometric observations of objects not on the target list but within the FOV.

**Optical and X-Ray Observations of GRB 060526: A Complex Afterglow Consistent with an Achromatic Jet Break**

Dai, X.; Halpern, J. P.; Morgan, N. D.; Armstrong, E.; Mirabal, N.; Haislip, J. B.; Reichart, D. E.; Stanek, K. Z.; *The Astrophysical Journal*; March 20, 2007; Volume 513, pp. 509-513; In English; Original contains black and white illustrations  
Contract(s)/Grant(s): NNG06GJ25G; Copyright; Avail.: Other Sources

We obtained 98 R-band and 18 B, r', i' images of the optical afterglow of GRB 060526 ( $z = 3.21$ ) with the MDM 1.3 m, 2.4 m, and the PROMPT telescopes at CTIO over the five nights following the burst trigger. Combining these data with other optical observations reported in GCN and the Swift XRT observations, we compare the optical and X-ray afterglow light curves of GRB 060526. Both the optical and X-ray afterglow light curves show rich features, such as flares and breaks. The densely sampled optical observations provide very good coverage at  $T > 10(\text{exp } 4)$  s. We observed a break at  $2.4 \times 10(\text{exp } 5)$  s in the optical afterglow light curve. Compared with the X-ray afterglow light curve, the break is consistent with an achromatic break supporting the beaming models of GRBs. However, the prebreak and postbreak temporal decay slopes are difficult to explain in simple afterglow models. We estimated a jet angle of  $\theta(\text{sub } j)$  approx.  $7\text{deg}$  and a prompt emission size of  $R(\text{sub } \text{prompt})$  approx.  $2 \times 10(\text{exp } 14)$  cm. In addition, we detected several optical flares with amplitudes of  $(\Delta)m$  approx. 0.2, 0.6, and 0.2 mag. The X-ray afterglows detected by Swift have shown complicated decay patterns. Recently, many well-sampled optical afterglows also show decays with flares and multiple breaks. GRB 060526 provides an additional case of such a complex, well-observed optical afterglow. The accumulated well-sampled afterglows indicate that most of the optical afterglows are complex.

**GRB 050826: A Subluminous Event at  $z=0.296$  Finds Its Place in the Luminosity Distribution of Gamma-Ray Burst Afterglows**

Mirabal, N.; Halpern, J. P.; O'Brien, P. T.; *The Astrophysical Journal*; June 2007; Volume 661, pp. L127-L130; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NNG06GJ25G; NNH05ZDA001N; Copyright; Avail.: Other Sources

We present the optical identification and spectroscopy of the host galaxy of GRB 050826 at redshift  $z = 0.296 \pm 0.001$ . Image subtraction among observations obtained on three consecutive nights reveals a fading object 5 hr after the burst, confirming its identification as the optical afterglow of this event. Deep imaging shows that the optical afterglow is offset by  $0.4'$  (1.76 kpc) from the center of its irregular host galaxy, which is typical for long-duration gamma-ray bursts. Combining these results with X-ray measurements acquired by the Swift XRT instrument, we find that GRB 050826 falls entirely within the subluminous, subenergetic group of long gamma-ray bursts at low redshift ( $z$  less than or equal to 0.3). The results are discussed in the context of models that possibly account for this trend, including the nature of the central engine, the evolution of progenitor properties as a function of redshift, and incompleteness in current gamma-ray burst samples.

Polaris, the nearest and brightest classical Cepheid, is a member of at least a triple system. It has a wide ( $18'$ ) physical companion, the F-type dwarf Polaris B. Polaris itself is a single-lined spectroscopic binary with an orbital period of approximately 30 years. By combining Hipparcos measurements of the instantaneous proper motion with long-term measurements and the Kamper radial-velocity orbit, have predicted the astrometric orbit of the close companion. Using the Hubble Space Telescope and the Advanced Camera for Surveys' High-Resolution Channel with an ultraviolet (F220W) filter, we have now directly detected the close companion. Based on the Wielen et al. orbit, the Hipparcos parallax, and our measurement of the separation ( $0'.176 \pm 0'.002$ ), we find a preliminary mass of  $5.0 \pm 1.5 M(\text{circle dot solar})$  for the

Cepheid and  $1.38 \pm 0.61 M_{\odot}$  for the close companion. These values will be refined by additional HST observations scheduled for the next 3 years. We have also obtained a Chandra ACIS-I image of the Polaris field. Two distant companions C and D are not X-ray sources and hence are not young enough to be physical companions of the Cepheid. There is one additional stellar X-ray source in the field, located  $253'$  from Polaris A, which is a possible companion. Further investigation of such a distant companion is valuable to confirm the full extent of the system.

This viewgraph presentation is composed of two sections. The first reviews the features and the science goals of the Space Interferometry Mission (ESA). The goals are: (1) Perform a search for other planetary systems by surveying 2000 nearby stars for astrometric signatures of planetary companion, (2) Survey a sample of 200 nearby stars for orbiting planets down to terrestrial-type masses (3) Improve best current catalog of star positions by  $>100\times$  and extend to fainter stars to allow extension of stellar knowledge to include our entire galaxy (4) Study dynamics and evolution of stars and star clusters in our galaxy to understand how our galaxy was formed and how it will evolve. (5) Calibrate luminosities of important stars and cosmological distance indicators to improve our understanding of stellar processes and to measure precise distance in the distant universe. The presentation also reviews the accomplishments since 2002, the plans for the subsequent 6 months. The second entitled 'The Breadth of ESA Science,' reviews ESA science goals in a larger context. ESA will serve to complement and pave the way for the Terrestrial Planet Finder (TPF). ESA observations of the motions of stars will tell us about the distribution of all gravitating mass (light plus dark matter) in the Galaxy. ESA observations of the motions of dwarf galaxies around our own will determine the mass distribution (light plus dark matter) in the Halo. ESA will greatly extend these observations to test the theories of accretion disks around super massive black holes. ESA has advantages for studying AGN and other very compact objects.

This viewgraph presentation reviews the history, and current work on HI and its importance in star formation. Through many observations of HI Narrow Self Absorption (HINSA) the conclusions are drawn and presented. Local molecular clouds have HI well-mixed with molecular constituents. This HI is cold, quiescent, and must be well-shielded from the UV radiation field. The density and fractional abundance (wrt  $H_2$ ) of the cold HI are close to steady state values. The time required to convert

these starless clouds from purely HI initial state to observed present composition is a few to ten million years This timescale is a lower limit - if dense clouds being swept up from lower density regions by shocks, the time to accumulate material to get A(sub v) is approximately 1 and provide required shielding may be comparable or longer

ONLINE: <http://hdl.handle.net/2014/40599>

Over the past two years, the focus of the project for the interferometric version of the Terrestrial Planet Finder(TPF-I) has been on the development of the scientific rationale for the mission, the assessment of TPF-I architectures, the laboratory demonstration of key technologies, and the development of a detailed technology roadmap. The Science Working Group (SWG), in conjunction with European colleagues working on the European Space Agency's (ESA's) Darwin project, has reaffirmed the goals of TPF-I as part of a broad vision for the detection and characterization of Earth-like planets orbiting nearby stars and for the search for life on those planets. The SWG also helped to assess the performance of different interferometric configurations for TPF-I/Darwin. Building on earlier SWG reports, this document restates the scientific case for TPF-I, assesses suitable target stars and relevant wavelengths for observation, discusses dramatic new capabilities for general astrophysical observations, and summarizes how Spitzer has improved our knowledge of the incidence of zodiacal emission on the search for planets. This document discusses in some detail on laboratory advances in interferometric nulling and formation flying. Laboratory experiments have now achieved stable narrow- and broad-band nulling the levels of  $10^{-6}$  and  $2.0 \times 10^{-5}$ , respectively. A testbed has demonstrated formation flying using two realistic spacecraft mockups. With a suitably funded program of technology development, as summarized herein and described in more detail in the Technology Plan for the Terrestrial Planet Finder Interferometer (2005), the National Aeronautics and Space Administration (NASA) and ESA would be able to start within the coming decade a full-scale TPF-I/Darwin mission capable of finding Earths orbiting more than 150 nearby stars, or a scaled back interferometer capable of studying more than 30 stars. Finding evidence for life on just one of those planets would revolutionize our understanding of our place in the cosmos.

ONLINE: <http://hdl.handle.net/2060/20080006604>

The successes of the Cassini/Huygens mission have heightened interest to return to the Saturn system with focused robotic missions. The desire for a sustained presence at Titan, through a dedicated orbiter and in-situ vehicle, either a lander or aerobot, has resulted in definition of a Titan Explorer flagship mission as a high priority in the Solar System Exploration Roadmap. The discovery of active water vapor plumes erupting from the tiger stripes on the moon Enceladus has drawn the attention of the space science community. The NASA's Evolutionary Xenon Thruster (NEXT) ion propulsion system is well suited to future missions to the Saturn system. NEXT is used within the inner solar system, in combination with a Venus or Earth gravity assist, to establish a fast transfer to the Saturn system. The NEXT system elements are accommodated in a separable Solar Electric Propulsion (SEP) module, or are integrated into the main spacecraft bus, depending on the mission architecture and performance requirements. This paper defines a range of NEXT system configurations, from two to four thrusters, and the Saturn system performance capability provided. Delivered mass is assessed parametrically over total trip

time to Saturn. Launch vehicle options, gravity assist options, and input power level are addressed to determine performance sensitivities. A simple two-thruster NEXT system, launched on an Atlas 551, can deliver a spacecraft mass of over 2400 kg on a transfer to Saturn. Similarly, a four-thruster system, launched on a Delta 4050 Heavy, delivers more than 4000 kg spacecraft mass. A SEP module conceptual design, for a two thruster string, 17 kW solar array, configuration is characterized.

Arriving in orbit around the planet Jupiter in 2016 after a five-year journey, the Juno spacecraft will begin a one-year investigation of the gas giant in order to understand its origin and evolution by determining its water abundance and constraining its core mass. In addition, Juno will map the planet's magnetic and gravitational fields, map its atmosphere, and explore the three-dimensional structure of Jupiter's polar magnetosphere and auroras. Juno will discriminate among different models for giant planet formation. These investigations will be conducted over the course of thirty-two 11-day elliptical polar orbits of the planet. The orbits are designed to avoid Jupiter's highest radiation regions. The spacecraft is a spinning, solar-powered system carrying a complement of eight science instruments for conducting the investigations. The spacecraft systems and instruments take advantage of significant design and operational heritage from previous space missions.

ONLINE: <http://hdl.handle.net/2060/20080008384>

The thesis of the present discussion is that the simultaneous cost and inherent safety issues of human on-site exploration of Mars will require advanced-to-revolutionary technologies. The major crew safety issues as currently identified include reduced gravity, radiation, potentially extremely toxic dust and the requisite reliability for years-long missions. Additionally, this discussion examines various technological areas which could significantly impact Human-Mars cost and safety. Cost reductions for space access is a major metric, including approaches to significantly reduce the overall up-mass. Besides fuel, propulsion and power systems, the up-mass consists of the infrastructure and supplies required to keep humans healthy and the equipment for executing exploration mission tasks. Hence, the major technological areas of interest for potential cost reductions include propulsion, in-space and on-planet power, life support systems, materials and overall architecture, systems, and systems-of-systems approaches. This discussion is specifically offered in response to and as a contribution to goal 3 of the Presidential Exploration Vision: 'Develop the Innovative Technologies Knowledge and Infrastructures both to explore and to support decisions about the destinations for human exploration'

The National Aeronautics and Space Administration (NASA) Exploration Systems Enterprise is planning a series of human and robotic missions to the Earth's moon and to Mars. These missions will require communication and navigation services. This paper sets forth presumed requirements for such services and concepts for lunar and Mars telecommunications network architectures to satisfy the presumed requirements. The paper suggests that an inexpensive ground network would suffice for missions to the near-side of the moon. A constellation of three Lunar Telecommunications Orbiters connected to an inexpensive ground network could provide continuous redundant links to a polar lunar base and its vicinity. For human and robotic missions to Mars, a pair of areostationary satellites could provide continuous redundant links between Earth and a mid-latitude Mars base in conjunction with the Deep Space Network augmented by large arrays of 12-m antennas on Earth.

**Anticipating Cycle 24 Minimum and Its Consequences**

Wilson, Robert M.; Hathaway, David H.; November 2007; 52 pp.; In English; Original contains black and white illustrations

Report No.(s): NASA/TP-2007-215134; M-1209; No Copyright; Avail.: CASI: [A04](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20080006637>

On the basis of the 12-mo moving average of monthly mean sunspot number (R) through November 2006, cycle 23 has persisted for 126 mo, having had a minimum of 8.0 in May 1996, a peak of 120.8 in April 2000, and an ascent duration of 47 mo. In November 2006, the 12-mo moving average of monthly mean sunspot number was 12.7, a value just outside the upper observed envelope of sunspot minimum values for the most recent cycles 16-23 (range 3.4-12.3), but within the 90-percent prediction interval (7.8 +/- 6.7). The first spotless day during the decline of cycle 23 occurred in January 2004, and the first occurrence of 10 or more and 20 or more spotless days was February 2006 and April 2007, respectively, inferring that sunspot minimum for cycle 24 is imminent. Through May 2007, 121 spotless days have accumulated. In terms of the weighted mean latitude (weighed by spot area) (LAT) and the highest observed latitude spot (HLS) in November 2006, 12-mo moving averages of these parameters measured 7.9 and 14.6 deg, respectively, these values being the lowest values yet observed during the decline of cycle 23 and being below corresponding mean values found for cycles 16-23. As yet, no high-latitude new-cycle spots have been seen nor has there been an upturn in LAT and HLS, these conditions having always preceded new cycle minimum by several months for past cycles. Together, these findings suggest that cycle 24 s minimum amplitude still lies well beyond November 2006. This implies that cycle 23 s period either will lie in the period 'gap' (127-134 mo), a first for a sunspot cycle, or it will be longer than 134 mo, thus making cycle 23 a long-period cycle (like cycle 20) and indicating that cycle 24 s minimum will occur after July 2007. Should cycle 23 prove to be a cycle of longer period, a consequence might be that the maximum amplitude for cycle 24 may be smaller than previously predicted.

We report the results of a search for waves/turbulence in the Heliospheric Plasma Sheet (HPS) surrounding the Heliospheric Current Sheet (HCS). The HPS is treated as a distinctive heliospheric structure distinguished by relatively high Beta, slow speed plasma. The data used in the investigation are from a previously published study of the thicknesses of the HPS and HCS that were obtained in January to May 2004 when Ulysses was near aphelion at 5 AU. The advantage of using

these data is that the HPS is thicker at large radial distances and the spacecraft spends longer intervals inside the plasma sheet. From the study of the magnetic field and solar wind velocity components, we conclude that, if Alfvén waves are present, they are weak and are dominated by variations in the field magnitude, B, and solar wind density, NP, that are anti-correlated.

A prediction of 75, a relatively low number, has been made for peak sunspot number for solar cycle 24. Direct measurements of the solar wind magnetic field strength and speed became routinely available in the 1960s. The Interdiurnal Variability Index has been used to reconstruct the magnetic field strength of the solar wind, thereby extending the data back for a total of about 125 years. With these results and the Interhourly Variability Index, the speed of the solar wind has been determined for the same period of time. Other results include the establishment of bench marks for the extreme limits of solar-terrestrial activity and validation of the Proton Prediction Study tool for short term alerts of solar particle events.

- CURVATURE**  
Edge Detection of Ultrasound Medical Image Using Mean Curvature Vector Flow Deformable Models – 71

## **CURVED BEAMS**

Reduced-Order Modeling of the Random Response of Curved Beams Using Implicit Condensation (Preprint) – 8

## **CYCLONES**

A Range Compensating Feed Motion Concept for Spaceborne Radar – 40

## **CYLINDRICAL BODIES**

Very Long Microstrip Array Feeds of a Membrane Reflector for the Advanced Precipitation Radar – 40

## **CYLINDRICAL SHELLS**

Stress Analysis of Composite Cylindrical Shells with an Elliptical Cutout – 53

## **DAMAGE ASSESSMENT**

Inspection of the Math Model Tools for On-Orbit Assessment of Impact Damage Report – 47

## **DAMAGE**

The Influence of Circadian Gene Period2 on NIH3T3 Cell Damaged by Ultraviolet – 71

## **DATA ACQUISITION**

Magnetic Field Response Measurement Acquisition System – 81

## **DATA MANAGEMENT**

F.I.R.E. Experiment Planning and Reporting Structure – 88

## **DATA PROCESSING**

Mapping Experiment Results to Operational Capabilities – 89

## **DEBRIS**

Ares-I-X Vehicle Preliminary Range Safety Malfunction Turn Analysis – 15

External Tank (ET) Bipod Fitting Bolted Attachment Locking Insert Performance – 18

## **DECISION MAKING**

An Enhanced Collaborative-Software Environment for Information Fusion at the Unit of Action – 89

Enabling Autonomous Rover Science through Dynamic Planning and Scheduling – 80

Using Planning, Scheduling and Execution for Autonomous Mars Rover Operations – 79

Wargaming and Analysis. Presentation for MORS Special Meeting – 82

## **DECISION SUPPORT SYSTEMS**

An Enhanced Collaborative-Software Environment for Information Fusion at the Unit of Action – 89

## **DECOMPOSITION**

Atrial Arrhythmia Recognition Based on Grey Correlation and K-nearest Neighbor – 71

## **DECOUPLING**

Seismic Energy Generation and Partitioning into Various Regional Phases from Different Seismic Sources in the Middle East Region – 59

## **DEEP SPACE NETWORK**

Changes in the Deep Space Network to Support the Mars Reconnaissance Orbiter – 16

Integrated Network Architecture for Sustained Human and Robotic Exploration – 96

## **DEFORMATION**

A Contact Mechanics Characteristic Analysis of Artificial Acetabulum by Finite Element Method – 70

Dynamic Finite Element Modeling for the Conventional Spinning Process – 36

Edge Detection of Ultrasound Medical Image Using Mean Curvature Vector Flow Deformable Models – 71

Global Distortion of GPS Networks Associated with Satellite Antenna Model Errors – 60

Mesh Deformation Based on Fully Stressed Design: The Method and Two-Dimensional Examples – 76

Stress Analysis of Composite Cylindrical Shells with an Elliptical Cutout – 53

## **DEGRADATION**

Magnetic Field Response Measurement Acquisition System – 81

## **DEGREES OF FREEDOM**

Singularity Analysis and Path Planning for a MDOF Manipulator – 36

The X-43A Six Degree of Freedom Monte Carlo Analysis – 9

## **DEICING**

Flight Testing an Iced Business Jet for Flight Simulation Model Validation – 10

## **DELTA WINGS**

What Was Learned from the New VFE-2 Experiments? – 4

## **DEOXYRIBONUCLEIC ACID**

Experimental Study of Expression of PAL Gene and HSP60 Gene of Legionella Pneumophila in NIH3T3 Cell – 73

The Influence of Circadian Gene Period2 on NIH3T3 Cell Damaged by Ultraviolet – 70

## **DEPLOYMENT**

Monitoring Tools for Domain Name System (DNS) Security Deployment – 79

## **DEPOSITION**

Use of Measured Species Class Concentrations with Chemical Kinetic Modeling for the Prediction of Autoxidation and Deposition of Jet Fuels (Postprint) – 28

## **DEPOSITS**

Use of Measured Species Class Concentrations with Chemical Kinetic Modeling for the Prediction of Autoxidation and Deposition of Jet Fuels (Postprint) – 28

## **DEPTH**

Characterization of Mode I Properties of Full-Depth Z-Fiber Stubble in Co-Bonded Composites (Preprint) – 25

## **DESCENT**

Hyper-X (X-43A) Flight Test Range Operations Overview – 39

Mars Exploration Rover: Launch, Cruise, Entry, Descent, and Landing – 97

## **DESIGN ANALYSIS**

Aerodynamic Analysis of Simulated Heat Shield Recession for the Orion Command Module – 3

Stardust Entry Reconstruction – 14

Stress Analysis of Composite Cylindrical Shells with an Elliptical Cutout – 53

Unbalanced and Minimal Point Equivalent Estimation Second-Order Split-Plot Designs – 33

## **DESIGN OPTIMIZATION**

Interactive Inverse Design Optimization of Fuselage Shape for Low-Boom Supersonic Concepts – 11

## **DETECTION**

Magnetic Field Response Measurement Acquisition System – 81

TRL-6 for JWST Wavefront Sensing and Control – 85

## **DEUTERIUM**

Experimental Air-Broadened Line Parameters in the nu2 Band of CH3D – 28

## **DIELECTRICS**

Spacecraft Sterilization Using Non-Equilibrium Atmospheric Pressure Plasma – 15

## **DIFFUSION**

Speckle Reduction for Ultrasound Images with Anisotropic Diffusion Based on EM Parameter Estimation Algorithm – 84

## **DIGITAL SYSTEMS**

Formats for Digital Preservation: A Review of Alternatives and Issues – 90

## **DIPOLE ANTENNAS**

Evaluation of the Interference Rejection Capability of a Uniform Circular Array – 38

## **DIRECT CURRENT**

DAWN Mission Bus and Waveguide Venting Analysis Review – 17

## **DIRECT NUMERICAL SIMULATION**

Monitoring Tools for Domain Name System (DNS) Security Deployment – 79

## **DISPLACEMENT**

Accuracy of High-Rate GPS for Seismology – 60

## **DISPLAY DEVICES**

Spatial Awareness in Synthetic Vision Systems: Using Spatial and Temporal Judgments to Evaluate Texture and Field of View – 75

Small Scale Response and Modeling of Periodically Forced Turbulence – 46

## FLUID JETS

Evaluation of Modified Two-Equation Turbulence Models for Jet Flow Predictions – 47

## FLUID MANAGEMENT

Cryogenic Fluid Management Technologies for Advanced Green Propulsion Systems – 23

## FLUORESCENCE

Fluorescence Imaging Study of Impinging Underexpanded Jets – 4

## FLUORINATION

Fluorinated Ester Co-Solvents for Low-Temperature Li-Ion Cells – 55

## FLUX DENSITY

Mechanism and Risk Factors of Adjacent Vertebral Failure Post Percutaneous Vertebroplasty: A Strain Energy Density Approach – 37

## FOAMS

External Tank (ET) Bipod Fitting Bolted Attachment Locking Insert Performance – 18

## FOCAL PLANE DEVICES

1024x1024 Pixel MWIR and LWIR QWIP Focal Plane Arrays and 320x256 MWIR:LWIR Pixel Colocated Simultaneous Dualband QWIP Focal Plane Arrays – 51

## FOREST FIRES

Processes Influencing Ozone Levels in Alaskan Forest Fires Plumes during Long-Range Transport over the North Atlantic – 56

## FORESTS

Climate-Induced Boreal Forest Change: Predictions versus Current Observations – 63

## FORMAT

Formats for Digital Preservation: A Review of Alternatives and Issues – 90

## FRACTURING

Mechanism and Risk Factors of Adjacent Vertebral Failure Post Percutaneous Vertebroplasty: A Strain Energy Density Approach – 37

## FREE FLOW

Dual-Pump CARS Temperature and Species Concentration Measurements in a Supersonic Combustor – 46

## FREQUENCIES

Efficient Single-Frequency Thulium Doped Fiber Laser Near 2-micrometers – 86

## FREQUENCY DISTRIBUTION

Design of a Novel Quartz Temperature Sensor Used for Temperature Monitoring in Manned Space Flight – 73

## FUEL INJECTION

Dual-Pump CARS Temperature and Species Concentration Measurements in a Supersonic Combustor – 46

Exploratory Work With Pre-Mixing Injectors for Nitric Acid-Kerosene Rocket Motors – 32

## FUEL TANKS

In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage – 51

## FUSELAGES

Application of Probability Methods to Assess Crash Modeling Uncertainty – 7

Interactive Inverse Design Optimization of Fuselage Shape for Low-Boom Supersonic Concepts – 11

Multi-Terrain Impact Testing and Simulation of a Composite Energy Absorbing Fuselage Section – 5

## FUZZY SYSTEMS

Constructing a New Fuzzy Classifier Based on Hierarchical Fuzzy Entropy – 37

## GALAXIES

GRB 050826: A Subluminous Event at z=0.296 Finds Its Place in the Luminosity Distribution of Gamma-Ray Burst Afterglows – 92

## GAME THEORY

Inverse Problems, Control and Modeling in the Presence of Uncertainty – 81

## GAMMA RAY BURSTS

GRB 050826: A Subluminous Event at z=0.296 Finds Its Place in the Luminosity Distribution of Gamma-Ray Burst Afterglows – 92

Optical and X-Ray Observations of GRB 060526: A Complex Afterglow Consistent with an Achromatic Jet Break – 92

## GAMMA RAYS

Effects of Beer and Ethanol on Gamma-Ray-induced Chromosome Aberration in Mouse Bone Marrow Cells – 74

## GAS COMPOSITION

In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage – 51

## GAS DETECTORS

In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage – 51

## GAS FLOW

Model of the Plasma Potential Distribution in the Plume of a Hollow Cathode – 86

## GAS MIXTURES

Heat Transfer and Pressure Drop in Concentric Annular Flows of Binary Inert Gas Mixtures – 43

## GAS TURBINE ENGINES

Feasibility Study of Vapor-Mist Phase Reaction Lubrication Using a Thioether Liquid – 29

## GAS TURBINES

Initial Test Results of a Dual Closed-Brayton-Cycle Power Conversion System – 23

## GAUSSIAN ELIMINATION

An Extended Surface Fitting Algorithm for Random Data – 34

## GENETIC ALGORITHMS

A Genetic Algorithm Based Recurrent Fuzzy Neural Network for Linear Induction Motor Servo Drive – 80

Journal of the Chinese Institute of Engineers: Vol. 30, No. 5 – 34

Singularity Analysis and Path Planning for a MDOF Manipulator – 36

## GENETICS

Experimental Study of Expression of PAL Gene and HSP60 Gene of Legionella Pneumophila in NIH3T3 Cell – 73

## GEODETTIC SURVEYS

Combinations of Earth Orientation Measurements: SPACE2005, COMB2005, and POLE2005 – 91

## GEOMAGNETISM

A Space-Based Proxy for the Dst Index – 65

Ionospheric E-Region Response to Solar-Geomagnetic Storms Observed by TIMED/SABER and Application to IRI Storm-Model Development – 65

## GEOSYNCHRONOUS ORBITS

A Range Compensating Feed Motion Concept for Spaceborne Radar – 40

## GLASS FIBERS

Efficient Single-Frequency Thulium Doped Fiber Laser Near 2-micrometers – 86

## GLASS

Global Roadmap for Ceramics and Glass Technology – 31

## GLIDING

Autonomous Soaring – 11

## GLOBAL POSITIONING SYSTEM

Accuracy of High-Rate GPS for Seismology – 60

Combinations of Earth Orientation Measurements: SPACE2005, COMB2005, and POLE2005 – 90

Experimental Evaluation of a Real-Time Kinematic GPS Positioning Technique – 90

Global Distortion of GPS Networks Associated with Satellite Antenna Model Errors – 60

Journal of the Chinese Institute of Engineers: Vol. 30, No. 5 – 34

## GOGGLES

Flight Testing of Night Vision Systems in Rotorcraft – 84

## GRADIENTS

Edge Detection of Ultrasound Medical Image Using Mean Curvature Vector Flow Deformable Models – 71

## GRAIN SIZE

The Grain Size-Temperature Response of Advanced Nickel-Base Disk Superalloys During Solution Heat Treatments – 30

## GRAPHITE-EPOXY COMPOSITES

Effect of Surface Engineering Processes on the Surface Properties and Adhesive Bonding of Graphite/Epoxy Composites (Preprint) – 25

## GRAVITATIONAL EFFECTS

Space Medicine and Medical Engineering, Volume 20, No. 3 – 69

## GRAVITATIONAL PHYSIOLOGY

Space Medicine and Medical Engineering, Volume 20, No. 3 – 69

## GRAVITATION

Zero-Gravity Locomotion Simulators: New Ground-Based Analogs for Microgravity Exercise Simulation – 69

## GREEN'S FUNCTIONS

Analyzing the Influence of Compressibility on the Rapid Pressure-Strain Rate Correlation in Turbulent Shear Flows – 45

## GRID GENERATION (MATHEMATICS)

Grid Quality and Resolution Issues from the Drag Prediction Workshop Series – 5

## GRID REFINEMENT (MATHEMATICS)

Grid Quality and Resolution Issues from the Drag Prediction Workshop Series – 5

## GRIT

Effect of Surface Engineering Processes on the Surface Properties and Adhesive Bonding of Graphite/Epoxy Composites (Preprint) – 25

## GROUND STATIONS

Hyper-X (X-43A) Flight Test Range Operations Overview – 39

## GROUND TRUTH

Accuracy of High-Rate GPS for Seismology – 60

## GROUP DYNAMICS

IkeNet: Social Network Analysis of E-mail Traffic in the Eisenhower Leadership Development Program – 79

## GUIDANCE (MOTION)

GN&C Engineering Best Practices for Human-Rated Spacecraft Systems – 18

GN&C Engineering Best Practices for Human-Rated Spacecraft System – 20

LMI-Based Generation of Feedback Laws for a Robust Model Predictive Control Algorithm – 76

## H ALPHA LINE

Cosmic Star Formation from  $0.5 < z < 20$  with Spitzer – 93

## HALOGEN OCCULTATION EXPERIMENT

A Reanalysis for the Seasonal and Longer-Period Cycles and the Trends in Middle Atmosphere Temperature from the HALOE – 63

Seasonal Trends in Stratospheric Water Vapor as Derived from SAGE II Data – 67

## HANDBOOKS

NASA Systems Engineering Handbook – 34

## HAZARDS

Managing Space Station Solar-Array Electrical Hazards for Sequential Shunt Unit Replacement – 25

## HEAD-UP DISPLAYS

Towards Determination of Visual Requirements for Augmented Reality Displays and Virtual Environments for the Airport Tower – 13

## HEART FUNCTION

Changes of Cardiac Pump Function in Push-pull Effect Simulated by Tilt Table – 72

## HEART RATE

Changes of Cardiac Pump Function in Push-pull Effect Simulated by Tilt Table – 72

## HEART

Image Distance Transform as Used for Studying Distribution of Ca<sup>2+</sup> Concentration in Cardiac Myocyte – 70

## HEAT BUDGET

The Seasonal Heat Budgets of the Red and Black Seas – 65

## HEAT EXCHANGERS

Heat Transfer and Pressure Drop in Concentric Annular Flows of Binary Inert Gas Mixtures – 43

High Specific Power Motors in LN<sub>2</sub> and LH<sub>2</sub> – 33

## HEAT FLUX

Experimental Measurement of RCS Jet Interaction Effects on a Capsule Entry Vehicle – 21

The Seasonal Heat Budgets of the Red and Black Seas – 65

## HEAT RESISTANT ALLOYS

Effects of Stoichiometry on Transformation Temperatures and Actuator-Type Performance of NiTiPd and NiTiPdX High-Temperature Shape Memory Alloys – 30

Fabrication and Characterization of Diffusion Bonds for Silicon Carbide – 26

The Grain Size-Temperature Response of Advanced Nickel-Base Disk Superalloys During Solution Heat Treatments – 30

## HEAT SHIELDING

Aerodynamic Analysis of Simulated Heat Shield Recession for the Orion Command Module – 3

Aeroheating Test of CEV Entry Vehicle at Turbulent Conditions – 19

Aerothermodynamic Testing of Protuberances and Penetrations on the NASA Crew Exploration Vehicle Heat Shield in the NASA Langley 20-Inch Mach 6 Air Tunnel – 18

## HEAT SOURCES

Initial Test Results of a Dual Closed-Brayton-Cycle Power Conversion System – 23

## HEAT TRANSFER

Aerothermodynamic Testing and Boundary Layer Trip Sizing of the HIFIRE Flight 1 Vehicle – 12

Aerothermodynamic Testing of Protuberances and Penetrations on the NASA Crew Exploration Vehicle Heat Shield in the NASA Langley 20-Inch Mach 6 Air Tunnel – 18

Aerothermodynamic Testing of the Crew Exploration Vehicle in the LaRC 20-Inch Mach 6 and 31-Inch Mach 10 Tunnels – 3

Heat Transfer and Pressure Drop in Concentric Annular Flows of Binary Inert Gas Mixtures – 43

Role of Turbulent Prandtl Number on Heat Flux at Hypersonic Mach Numbers – 45

## HELIOSPHERE

Slow Mode Waves in the Heliospheric Plasma Sheet – 98

## HELIUM

International Space Station (ISS) S-Band Corona Discharge Anomaly Consultation – 39

## HEMODYNAMIC RESPONSES

Oxygenated Hemoglobin Responses in Prefrontal Area during Visual Search Tasks Measured with Near-infrared Spectroscopy – 72

## HEMOGLOBIN

Oxygenated Hemoglobin Responses in Prefrontal Area during Visual Search Tasks Measured with Near-infrared Spectroscopy – 72

## HETERODYNING

Estimation of Cyclic Error Due to Scattering in the Internal OPD Metrology of the Space Interferometry Mission – 85

## HETEROGENEITY

Comparison of Two Hierarchical Routing Protocols for Heterogeneous MANET – 78

## HETEROJUNCTION DEVICES

324GHz CMOS VCO Using Linear Superimposition Technique – 42

## HIGH ASPECT RATIO

Parallel Anisotropic Tetrahedral Adaptation – 76

## HIGH CURRENT

Performance of the NEXT Engineering Model Power Processing Unit – 24

## HIGH ELECTRON MOBILITY TRANSISTORS

324GHz CMOS VCO Using Linear Superimposition Technique – 42

## HIGH FREQUENCIES

Test Results from a Simulated High Voltage Lunar Power Transmission Line – 41

## HIGH PRESSURE

Single-Shot Scalar-Triplet Measurements in High-Pressure Swirl-Stabilized Flames for Combustion Code Validation – 44

## HIGH RESOLUTION

Bulk Scattering Properties for the Remote Sensing of Ice Clouds. 3. High Resolution Spectral Models from 100 to 3250 cm(exp -1) – 54

## HIGH TEMPERATURE

Ceramic Integration Technologies for Aerospace and Energy Systems: Technical Challenges and Opportunities – 26

Effects of Stoichiometry on Transformation Temperatures and Actuator-Type Performance of NiTiPd and NiTiPdX High-Temperature Shape Memory Alloys – 30

The use of Electrolyte Additives to Improve the High Temperature Resilience of Li-Ion Cells – 42

## HIGH VOLTAGES

High Voltage Breakdown Levels in Various EPC Potting Materials – 27

International Space Station (ISS) S-Band Corona Discharge Anomaly Consultation – 39

NEXT Thruster Component Verification Testing – 23

Test Results from a Simulated High Voltage Lunar Power Transmission Line – 41

## HISTORIES

Societal Impact of Spaceflight – 88

X-15: Extending the Frontiers of Flight – 12

## HOLLOW CATHODES

Model of the Plasma Potential Distribution in the Plume of a Hollow Cathode – 86

## HOT ELECTRONS

Model of the Plasma Potential Distribution in the Plume of a Hollow Cathode – 86

## HUMAN FACTORS ENGINEERING

Advanced Integrated Multi-Sensor Surveillance (AIMS: Operator Machine Interface (OMI) Definition Study – 49

Use of Traffic Displays for General Aviation Approach Spacing: A Human Factors Study – 13

## HUMAN PERFORMANCE

Towards Determination of Visual Requirements for Augmented Reality Displays and Virtual Environments for the Airport Tower – 13

Use of Traffic Displays for General Aviation Approach Spacing: A Human Factors Study – 13

## HUYGENS PROBE

Radiative Heating Methodology for the Huygens Probe – 61

## HYDROCARBON FUELS

In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage – 51

## HYDROCARBONS

Evaluation of the MOCAGE Chemistry Transport Model during the ICARTT/ITOP Experiment – 56

Reactive Nitrogen Distribution and Partitioning in the North American Troposphere and Lowermost Stratosphere – 64

## HYDRODYNAMICS

Hydrodynamic Force on a Cylinder Oscillating at Low Frequency – 45

## HYDROGEN ATOMS

Cold Atomic Hydrogen, Narrow Self-Absorption, and the Age of Molecular Clouds – 94

## HYDROGEN CLOUDS

Cold Atomic Hydrogen, Narrow Self-Absorption, and the Age of Molecular Clouds – 94

## HYDROGEN PEROXIDE

Evaluation of the MOCAGE Chemistry Transport Model during the ICARTT/ITOP Experiment – 56

The Validation of Vapor Phase Hydrogen Peroxide Microbial Reduction for Planetary Protection and a Proposed Vacuum Process Specification – 74

## HYDROGEN

Cold Atomic Hydrogen, Narrow Self-Absorption, and the Age of Molecular Clouds – 94

## HYDROLOGICAL CYCLE

Importance of Rain Evaporation and Continental Convection in the Tropical Water Cycle – 62

## HYDROSTATIC PRESSURE

Experimental Technologies for Imposing Mechanical Force on Cells – 70

## HYDROXYL RADICALS

Evaluation of the MOCAGE Chemistry Transport Model during the ICARTT/ITOP Experiment – 56

## HYPERSONIC AIRCRAFT

Breathing New Hope into Hypersonics – 3

## HYPERSONIC FLIGHT

Aerothermodynamic Testing and Boundary Layer Trip Sizing of the HIFiRE Flight 1 Vehicle – 12

Breathing New Hope into Hypersonics – 3

## HYPERSONIC SPEED

Aeroheating Test of CEV Entry Vehicle at Turbulent Conditions – 19

Direct-View Multi-Point Two-Component Interferometric Rayleigh Scattering Velocimeter – 51

Hyper-X (X-43A) Flight Test Range Operations Overview – 39

Role of Turbulent Prandtl Number on Heat Flux at Hypersonic Mach Numbers – 45

## HYPERSONICS

Breathing New Hope into Hypersonics – 3

X-15: Extending the Frontiers of Flight – 12

## HYPOKINESIA

Changes of Cardiac Pump Function in Push-pull Effect Simulated by Tilt Table – 72

## ICE CLOUDS

Bulk Scattering Properties for the Remote Sensing of Ice Clouds. 3. High Resolution Spectral Models from 100 to 3250 cm(exp -1) – 54

Ice Cloud Properties in Ice-Over-Water Cloud Systems Using TRMM VIRS and TMI Data – 61

Nitric Acid Particles in Cold Thick Ice Clouds Observed at Global Scale: Link with Lightning, Temperature, and Upper Tropospheric Water Vapor – 62

## ICE FORMATION

Observations on the Growth of Roughness Elements Into Icing Feathers – 6

## ICE PREVENTION

Flight Testing an Iced Business Jet for Flight Simulation Model Validation – 10

## IMAGE ANALYSIS

Target Tracking, Approach, and Camera Handoff for Automated Instrument Placement – 14

## IMAGE ENHANCEMENT

Speckle Reduction for Ultrasound Images with Anisotropic Diffusion Based on EM Parameter Estimation Algorithm – 84

## IMAGE INTENSIFIERS

Flight Testing of Night Vision Systems in Rotorcraft – 84

## IMAGE PROCESSING

GRB 050826: A Subluminous Event at z=0.296 Finds Its Place in the Luminosity Distribution of Gamma-Ray Burst Afterglows – 92

## IMAGING TECHNIQUES

1024x1024 Pixel MWIR and LWIR QWIP Focal Plane Arrays and 320x256 MWIR:LWIR Pixel Colocated Simultaneous Dualband QWIP Focal Plane Arrays – 51

Nanoscale Subsurface Imaging via Resonant Difference-Frequency Atomic Force Ultrasonic Microscopy – 27

## IMPACT DAMAGE

Inspection of the Math Model Tools for On-Orbit Assessment of Impact Damage Report – 47

Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities – 16

## IMPACT RESISTANCE

Multi-Terrain Impact Testing and Simulation of a Composite Energy Absorbing Fuselage Section – 6

## IMPACT TESTS

Multi-Terrain Impact Testing and Simulation of a Composite Energy Absorbing Fuselage Section – 6

## IMPLANTATION

Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability – 38

## IN SITU MEASUREMENT

Processes Influencing Ozone Levels in Alaskan Forest Fires Plumes during Long-Range Transport over the North Atlantic – 56

## IN VITRO METHODS AND TESTS

Experimental Technologies for Imposing Mechanical Force on Cells – 70

## IN VIVO METHODS AND TESTS

Experimental Technologies for Imposing Mechanical Force on Cells – 70

Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability – 38

## INDUCTANCE

The Effect of Transformer Magnetizing Inductance on a Forward Converter with Current Mode Control – 36

## INDUCTION MOTORS

A Genetic Algorithm Based Recurrent Fuzzy Neural Network for Linear Induction Motor Servo Drive – 80

## INDUSTRIES

Global Roadmap for Ceramics and Glass Technology – 31

## INFECTIOUS DISEASES

Experimental Study of Expression of PAL Gene and HSP60 Gene of Legionella Pneumophila in NIH3T3 Cell – 73

Prion Transport to Secondary Lymphoreticular System Tissues – 67

## INFORMATION MANAGEMENT

F.I.R.E. Experiment Planning and Reporting Structure – 88

Formats for Digital Preservation: A Review of Alternatives and Issues – 90

Mapping Experiment Results to Operational Capabilities – 89

## INFORMATION SYSTEMS

NASA Systems Engineering Handbook – 34

## INFRARED ASTRONOMY

Cosmic Star Formation from  $0.5 < z < 20$  with Spitzer – 93

## INFRARED IMAGERY

1024x1024 Pixel MWIR and LWIR QWIP Focal Plane Arrays and 320x256 MWIR:LWIR Pixel Colocated Simultaneous Dualband QWIP Focal Plane Arrays – 51

## INFRARED INSTRUMENTS

Cloudy Sounding and Cloud-Top Height Retrieval From AIRS Alone Single Field-of-View Radiance Measurements – 64

## INFRARED RADIATION

1024x1024 Pixel MWIR and LWIR QWIP Focal Plane Arrays and 320x256 MWIR:LWIR Pixel Colocated Simultaneous Dualband QWIP Focal Plane Arrays – 51

AIMSsim Version 2.2.1, System Manual – 49

## INJECTION MOLDING

DSP-Based Adaptive Fuzzy Velocity/Pressure Control of Injection Molding Machines – 52

## INJECTION

The Potential Benefits of Advanced Casing Treatment for Noise Attenuation in Ultra-High Bypass Ratio Turbofan Engines – 2

## INJECTORS

Exploratory Work With Pre-Mixing Injectors for Nitric Acid-Kerosene Rocket Motors – 32

Single-Shot Scalar-Triplet Measurements in High-Pressure Swirl-Stabilized Flames for Combustion Code Validation – 44

## INORGANIC MATERIALS

Hybrid Organic-Inorganic Photorefractives (Preprint) – 31

## INSPECTION

Sensor Feasibility Report: Survey of the Capabilities and Limitations of Chemical, Biological, Radiological, Nuclear and Explosive (CBRNE) Sensor Technologies Relevant to Vehicle Inspection Systems – 50

## INTERACTIONS

Screening the Interacting Proteins of hPerl – 73

## INTERFEROMETRY

Direct-View Multi-Point Two-Component Interferometric Rayleigh Scattering Velocimeter – 51

Estimation of Cyclic Error Due to Scattering in the Internal OPD Metrology of the Space Interferometry Mission – 85

Focal-Plane Imaging of Crossed Beams in Nonlinear Optics Experiments – 84

Terrestrial Planet Finder Interferometer Science Working Group Report – 94

## INTERNATIONAL COOPERATION

Challenges of Space Mission Interoperability – 17

## INTERNATIONAL SPACE STATION

International Space Station (ISS) S-Band Corona Discharge Anomaly Consultation – 39

## INTERNET RESOURCES

The ComplexityHub Web Site: Needs, Requirements, and Development – 89

## INTERNETS

Monitoring Tools for Domain Name System (DNS) Security Deployment – 79

The ComplexityHub Web Site: Needs, Requirements, and Development – 89

## INTEROPERABILITY

Challenges of Space Mission Interoperability – 17

## INTERPOLATION

Parallel Anisotropic Tetrahedral Adaptation – 76

## ION ENGINES

NEXT Thruster Component Verification Testing – 23

## ION PROPULSION

NEXT Ion Propulsion System Configurations and Performance for Saturn System Exploration – 95

Performance of the NEXT Engineering Model Power Processing Unit – 24

## IONS

Image Distance Transform as Used for Studying Distribution of Ca<sup>2+</sup> Concentration in Cardiac Myocyte – 70

## ISCHEMIA

Effects of Dorsal Periaqueductal Gray Stimulation and Reperfusion on Cerebral Ischemic Injury in Rats – 72

## ISOCYANATES

Carbon Nanofiber Incorporated Silica Based Aerogels with Di-Isocyanate Cross-Linking – 27

## ISOTROPIC TURBULENCE

Small Scale Response and Modeling of Periodically Forced Turbulence – 46

## JAMES WEBB SPACE TELESCOPE

TRL-6 for JWST Wavefront Sensing and Control – 85

## JET AIRCRAFT NOISE

Jet Screech Noise Computation – 84

Overview of Aircraft Noise Prediction Tools Assessment – 83

## JET ENGINE FUELS

Use of Measured Species Class Concentrations with Chemical Kinetic Modeling for the Prediction of Autoxidation and Deposition of Jet Fuels (Postprint) – 28

## JET FLOW

Evaluation of Modified Two-Equation Turbulence Models for Jet Flow Predictions – 47

Experimental Measurement of RCS Jet Interaction Effects on a Capsule Entry Vehicle – 21

## JIGS

Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability – 38

## JOINTS (ANATOMY)

A Contact Mechanics Characteristic Analysis of Artificial Acetabulum by Finite Element Method – 70

## JUPITER ATMOSPHERE

An Overview of the Juno Mission to Jupiter – 95

## JUPITER (PLANET)

An Overview of the Juno Mission to Jupiter – 95

## JUPITER PROBES

An Overview of the Juno Mission to Jupiter – 95

Key and Driving Requirements for the Juno Payload of Instruments – 22

## KALMAN FILTERS

Combinations of Earth Orientation Measurements: SPACE2005, COMB2005, and POLE2005 – 91

Experimental Evaluation of a Real-Time Kinematic GPS Positioning Technique – 90

## K-EPSILON TURBULENCE MODEL

Evaluation of Modified Two-Equation Turbulence Models for Jet Flow Predictions – 47

## KEROSENE

Exploratory Work With Pre-Mixing Injectors for Nitric Acid-Kerosene Rocket Motors – 32

## KINEMATICS

Experimental Evaluation of a Real-Time Kinematic GPS Positioning Technique – 90

Singularity Analysis and Path Planning for a MDOF Manipulator – 36

## KINETIC ENERGY

Evaluation of Modified Two-Equation Turbulence Models for Jet Flow Predictions – 47

## KNOWLEDGE BASED SYSTEMS

F.I.R.E. Experiment Planning and Reporting Structure – 88

Mapping Experiment Results to Operational Capabilities – 89

## K-OMEGA TURBULENCE MODEL

Apparent Transition Behavior of Widely-Used Turbulence Models – 48

## LAGRANGIAN FUNCTION

3D Air Quality and the Clean Air Interstate Rule: Lagrangian Sampling of CMAQ Model Results to Aid Regional Accountability Metrics – 58

Dynamic Finite Element Modeling for the Conventional Spinning Process – 36

## LAMINAR FLOW

Aeroheating Test of CEV Entry Vehicle at Turbulent Conditions – 19

Experimental Measurement of RCS Jet Interaction Effects on a Capsule Entry Vehicle – 21

Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities – 16

## LANDING SITES

Mars Exploration Rover: Launch, Cruise, Entry, Descent, and Landing – 97

## LASER APPLICATIONS

Estimation of Cyclic Error Due to Scattering in the Internal OPD Metrology of the Space Interferometry Mission – 85

## LASER BEAMS

Conduction and Convection of Heat Produced by the Attenuation of Laser Beams in Liquids – 87

## LASER INDUCED FLUORESCENCE

Fluorescence Imaging Study of Impinging Underexpanded Jets – 4

Visualization of Flowfield Modification by RCS Jets on a Capsule Entry Vehicle – 19

## LASER MATERIALS

Efficient Single-Frequency Thulium Doped Fiber Laser Near 2-micrometers – 86

## LASER OUTPUTS

Solid State Lasers from an Efficiency Perspective – 86

## LATENT HEAT

The Seasonal Heat Budgets of the Red and Black Seas – 65

## LATITUDE

Anticipating Cycle 24 Minimum and Its Consequences – 97

## LAUNCHING

Hyper-X (X-43A) Flight Test Range Operations Overview – 39

Mars Exploration Rover: Launch, Cruise, Entry, Descent, and Landing – 97

## LAWS

LMI-Based Generation of Feedback Laws for a Robust Model Predictive Control Algorithm – 77

## LEADERSHIP

IkeNet: Social Network Analysis of E-mail Traffic in the Eisenhower Leadership Development Program – 79

## LEADING EDGES

What Was Learned from the New VFE-2 Experiments? – 4

## LEAST SQUARES METHOD

Experimental Evaluation of a Real-Time Kinematic GPS Positioning Technique – 90

On the Development of a Hole Filling Algorithm for Triangular Meshes – 35

## LIFE (DURABILITY)

NASA Systems Engineering Handbook – 34

## LIGHT CURVE

Optical and X-Ray Observations of GRB 060526: A Complex Afterglow Consistent with an Achromatic Jet Break – 92

## LIGHT EMISSION

Investigating Sonoluminescence as a Means of Energy Harvesting – 54

## LIGHT EMITTING DIODES

Characterization of Transparent Organic Light-Emitting Device (TOLED) – 43

## LIGHTNING

Nitric Acid Particles in Cold Thick Ice Clouds Observed at Global Scale: Link with Lightning, Temperature, and Upper Tropospheric Water Vapor – 62

Surface and Lightning Sources of Nitrogen Oxides over the USA: Magnitudes, Chemical Evolution, and Outflow – 57

## LINE SPECTRA

Experimental Air-Broadened Line Parameters in the nu2 Band of CH3D – 28

## LIQUID HYDROGEN

High Specific Power Motors in LN2 and LH2 – 33

## LIQUID NITROGEN

High Specific Power Motors in LN2 and LH2 – 33

## LIQUIDS

Conduction and Convection of Heat Produced by the Attenuation of Laser Beams in Liquids – 87

## LITHIUM BATTERIES

Fluorinated Ester Co-Solvents for Low-Temperature Li-Ion Cells – 55

The use of Electrolyte Additives to Improve the High Temperature Resilience of Li-Ion Cells – 42

## LITHIUM

Fluorinated Ester Co-Solvents for Low-Temperature Li-Ion Cells – 55

The use of Electrolyte Additives to Improve the High Temperature Resilience of Li-Ion Cells – 42

## LOADS (FORCES)

Dynamic Finite Element Modeling for the Conventional Spinning Process – 37

External Tank (ET) Bipod Fitting Bolted Attachment Locking Insert Performance – 18

Structural Analysis of the Right Rear Lug of American Airlines Flight 587 – 6

Zero-Gravity Locomotion Simulators: New Ground-Based Analogs for Microgravity Exercise Simulation – 68

## LOCOMOTION

Zero-Gravity Locomotion Simulators: New Ground-Based Analogs for Microgravity Exercise Simulation – 69

## LOW FREQUENCIES

Hydrodynamic Force on a Cylinder Oscillating at Low Frequency – 45

## LOW NOISE

Evaluation of a Low-Noise Formate Spiral-Bevel Gear Set – 83

## LOW TEMPERATURE

Fluorinated Ester Co-Solvents for Low-Temperature Li-Ion Cells – 55

## LUGS

Structural Analysis of the Right Rear Lug of American Airlines Flight 587 – 7

## LUMBAR REGION

Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability – 38

## LUMINOSITY

GRB 050826: A Subluminous Event at  $z=0.296$  Finds Its Place in the Luminosity Distribution of Gamma-Ray Burst Afterglows – 92

## LUNAR BASED EQUIPMENT

Test Results from a Simulated High Voltage Lunar Power Transmission Line – 41

## LUNAR ORBITER

Integrated Network Architecture for Sustained Human and Robotic Exploration – 96

## LYMPHATIC SYSTEM

Prion Transport to Secondary Lymphoreticular System Tissues – 68

## MACH NUMBER

Analyzing the Influence of Compressibility on the Rapid Pressure-Strain Rate Correlation in Turbulent Shear Flows – 45

Initial Experiments and Analysis of Blunt-Edge Vortex Flows – 4

Role of Turbulent Prandtl Number on Heat Flux at Hypersonic Mach Numbers – 45

Stability and Controls Analysis and Flight Test Results of a 24-Foot Telescoping Nose Boom on an F-15B Airplane – 9

## MAGNETIC FIELDS

Magnetic Field Response Measurement Acquisition System – 81

## MAGNETIC INDUCTION

Simulation Study of Eddy Current Problem in Magnetic Induction Tomography by Using Finite Element Method – 69

## MAGNETIC STORMS

A Space-Based Proxy for the Dst Index – 65

Ionospheric E-Region Response to Solar-Geomagnetic Storms Observed by TIMED/SABER and Application to IRI Storm-Model Development – 65

## MAGNETIZATION

The Effect of Transformer Magnetizing Inductance on a Forward Converter with Current Mode Control – 36

## MAGNETOHYDRODYNAMIC WAVES

Slow Mode Waves in the Heliospheric Plasma Sheet – 98

## MAGNETOMETERS

A Space-Based Proxy for the Dst Index – 65

## MALFUNCTIONS

Ares-I-X Vehicle Preliminary Range Safety Malfunction Turn Analysis – 15

## MANAGEMENT INFORMATION SYSTEMS

An Enhanced Collaborative-Software Environment for Information Fusion at the Unit of Action – 89

## MANAGEMENT PLANNING

Threads of Mission Success – 52

## MANIPULATORS

Adaptive Control of Electrically-Driven Robot without Computation of Regressor Matrix – 36

## MANNED MARS MISSIONS

Imaginable Technologies for Human Missions to Mars – 96

## MANUFACTURING

Global Roadmap for Ceramics and Glass Technology – 31

## MAPPING

Mapping Experiment Results to Operational Capabilities – 89

## MARS ATMOSPHERE

Mars Aeronomy Explorer (MAX): Study Employing Distributed Micro-Spacecraft – 21

Mars Science and Telecommunications Orbiter: Report of the Science Analysis Group, March 2006 – 95

## MARS EXPLORATION

Imaginable Technologies for Human Missions to Mars – 96

Multijunction Solar Cells Optimized for the Mars Surface Solar Spectrum – 95

## MARS LANDING

Mars Exploration Rover: Launch, Cruise, Entry, Descent, and Landing – 97

## MARS MISSIONS

Integrated Network Architecture for Sustained Human and Robotic Exploration – 96

Mars Aeronomy Explorer (MAX): Study Employing Distributed Micro-Spacecraft – 21

Using Planning, Scheduling and Execution for Autonomous Mars Rover Operations – 79

## MARS RECONNAISSANCE ORBITER

Changes in the Deep Space Network to Support the Mars Reconnaissance Orbiter – 16

## MARS ROVING VEHICLES

Using Planning, Scheduling and Execution for Autonomous Mars Rover Operations – 79

## MASS TRANSFER

Cryogenic Fluid Management Technologies for Advanced Green Propulsion Systems – 23

Implementation of a Blowing Boundary Condition in the LAURA Code – 48

## MATHEMATICAL MODELS

Constraint Force Equation Methodology for Modeling Multi-Body Stage Separation Dynamics – 48

Direct Measurements of the Convective Recycling of the Upper Troposphere – 59

Inspection of the Math Model Tools for On-Orbit Assessment of Impact Damage Report – 47

Journal of the Chinese Institute of Engineers: Vol. 30, No. 5 – 34

Sensor Selection and Optimization for Health Assessment of Aerospace Systems – 8

Turbulence Modeling Effects on Calculation of Lobed Nozzle Flowfields – 48

## MEAN

Anticipating Cycle 24 Minimum and Its Consequences – 97

## MEASUREMENT

Polaris: Mass and Multiplicity – 93

## MECHANICAL DRIVES

A Genetic Algorithm Based Recurrent Fuzzy Neural Network for Linear Induction Motor Servo Drive – 80

## MECHANICAL PROPERTIES

A Contact Mechanics Characteristic Analysis of Artificial Acetabulum by Finite Element Method – 70

## MEMBRANES

Development of a Ground-based Microalgae Photo-bioreactor Experimental Facility for Using in Space – 74

## METAL BONDING

Fabrication and Characterization of Diffusion Bonds for Silicon Carbide – 26

## METAL IONS

The use of Electrolyte Additives to Improve the High Temperature Resilience of Li-Ion Cells – 42

## METAL OXIDE SEMICONDUCTORS

Journal of the Chinese Institute of Engineers: Vol. 30, No. 5 – 34

Log-Scale Method with Equivalent Circuit Model in Semiconductor Device Simulations – 86

On the Reverse Short-Channel Effect and Threshold Voltage Roll-Off Controls for 90 nm Node MOSFETs – 87

## METEOROLOGICAL PARAMETERS

Cloudy Sounding and Cloud-Top Height Retrieval From AIRS Alone Single Field-of-View Radiance Measurements – 64

Weather and Flight Testing – 6

## METEOROLOGICAL RADAR

A Range Compensating Feed Motion Concept for Spaceborne Radar – 40

Very Long Microstrip Array Feeds of a Membrane Reflector for the Advanced Precipitation Radar – 39

## METEOROLOGY

Mars Science and Telecommunications Orbiter: Report of the Science Analysis Group, March 2006 – 95

## METHANE

Experimental Air-Broadened Line Parameters in the nu2 Band of CH3D – 28

## MICROBEAMS

Experimental Technologies for Imposing Mechanical Force on Cells – 70

## MICROELECTRONICS

Synthesis of Biofluidic Microsystems (SYNBIOSYS) – 42

## MICROGRAVITY

Experimental Technologies for Imposing Mechanical Force on Cells – 70

## MICROORGANISMS

Development of a Ground-based Microalgae Photo-bioreactor Experimental Facility for Using in Space – 74

## MICROWAVE IMAGERY

Ice Cloud Properties in Ice-Over-Water Cloud Systems Using TRMM VIRS and TMI Data – 61

## MICROWAVE SOUNDING

Study Pollution Impacts on Upper-Tropospheric Clouds with Aura, Cloud-Sat, and CALIPSO Data – 56

## MICROWAVE TUBES

DAWN Mission Bus and Waveguide Venting Analysis Review – 17

## MIDDLE ATMOSPHERE

A Reanalysis for the Seasonal and Longer-Period Cycles and the Trends in Middle Atmosphere Temperature from the HALOE – 63

## MIDDLE EAST

Seismic Energy Generation and Partitioning into Various Regional Phases from Different Seismic Sources in the Middle East Region – 59

## MILITARY OPERATIONS

F.I.R.E. Experiment Planning and Reporting Structure – 88

Foundations of Military Pilot Selection Systems: World War I – 5

Mapping Experiment Results to Operational Capabilities – 89

Wargaming and Analysis. Presentation for MORS Special Meeting – 82

## MILITARY TECHNOLOGY

Air Force Research Laboratory Fire Research (Postprint) – 75

## MILLIMETER WAVES

DAWN Mission Bus and Waveguide Venting Analysis Review – 17

Effects of Facial Topography and Eyewear on the 94 GHz Beam – 82

Effects of Multiple Scattering for Millimeter-Wavelength Weather Radars – 39

## MISSION PLANNING

Mars Aeronomy Explorer (MAX): Study Employing Distributed Micro-Spacecraft – 21

Threads of Mission Success – 52

## MIST

Feasibility Study of Vapor-Mist Phase Reaction Lubrication Using a Thioether Liquid – 29

## MODELS

Inverse Problems, Control and Modeling in the Presence of Uncertainty – 81

Reduced-Order Modeling of the Random Response of Curved Beams Using Implicit Condensation (Preprint) – 8

## MODULUS OF ELASTICITY

Mesh Deformation Based on Fully Stressed Design: The Method and Two-Dimensional Examples – 76

## MOLECULAR CLOUDS

Cold Atomic Hydrogen, Narrow Self-Absorption, and the Age of Molecular Clouds – 94

## MONTE CARLO METHOD

The X-43A Six Degree of Freedom Monte Carlo Analysis – 9

## MOON

Integrated Network Architecture for Sustained Human and Robotic Exploration – 96

## MULTIPLIERS

Terahertz Schottky Multiplier Sources – 40

## MULTISENSOR APPLICATIONS

Advanced Integrated Multi-Sensor Surveillance (AIMS. Operator Machine Interface (OMI) Definition Study – 49

AIMSsim Version 2.2.1, System Manual – 49

## MULTISENSOR FUSION

Advanced Integrated Multi-Sensor Surveillance (AIMS. Operator Machine Interface (OMI) Definition Study – 49

An Enhanced Collaborative-Software Environment for Information Fusion at the Unit of Action – 89

Development and Evaluation of Fusion Techniques – 80

Study Pollution Impacts on Upper-Tropospheric Clouds with Aura, Cloud-Sat, and CALIPSO Data – 56

## MUSCLE CELLS

Image Distance Transform as Used for Studying Distribution of Ca2+ Concentration in Cardiac Myocyte – 70

## NANOCOMPOSITES

Carbon Nanofiber Incorporated Silica Based Aerogels with Di-Isocyanate Cross-Linking – 27

## NANOSTRUCTURE (CHARACTERISTICS)

Carbon Nanofiber Incorporated Silica Based Aerogels with Di-Isocyanate Cross-Linking – 27

## NASA PROGRAMS

Earth-Like Exoplanets: The Science of NASA's Navigator Program – 96

Integrated Network Architecture for Sustained Human and Robotic Exploration – 96

NASA Dryden's UAS Service Capabilities – 10

NASA Systems Engineering Handbook – 33

Terrestrial Planet Finder Interferometer Science Working Group Report – 94

## NASA SPACE PROGRAMS

Crew Exploration Vehicle Ascent Abort Trajectory Analysis and Optimization – 15

Project Status Update and ESA Science Breadth Discussion for the Origins Subcommittee (OS) – 93

## NAVIER-STOKES EQUATION

Implementation of a Blowing Boundary Condition in the LAURA Code – 48

Radiative Heating Methodology for the Huygens Probe – 60

Turbulence Modeling Effects on Calculation of Lobed Nozzle Flowfields – 48

## NAVIGATION SATELLITES

Global Distortion of GPS Networks Associated with Satellite Antenna Model Errors – 60

## NAVIGATION

GN&C Engineering Best Practices for Human-Rated Spacecraft Systems – 18

GN&C Engineering Best Practices for Human-Rated Spacecraft System – 20

## NAVIGATORS

Earth-Like Exoplanets: The Science of NASA's Navigator Program – 96

## NETWORK ANALYSIS

IkeNet: Social Network Analysis of E-mail Traffic in the Eisenhower Leadership Development Program – 79

ON-Line ATC Estimator Using Hybrid Principal Component Analysis Network – 35

## NEURAL NETS

A Genetic Algorithm Based Recurrent Fuzzy Neural Network for Linear Induction Motor Servo Drive – 80

Atrial Arrhythmia Recognition Based on Grey Correlation and K-nearest Neighbor – 71

ON-Line ATC Estimator Using Hybrid Principal Component Analysis Network – 35

## NICKEL ALLOYS

Effects of Stoichiometry on Transformation Temperatures and Actuator-Type Performance of NiTiPd and NiTiPdX High-Temperature Shape Memory Alloys – 30

The Grain Size-Temperature Response of Advanced Nickel-Base Disk Superalloys During Solution Heat Treatments – 30

## NIGHT VISION

Flight Testing of Night Vision Systems in Rotorcraft – 84

## NITRIC ACID

Exploratory Work With Pre-Mixing Injectors for Nitric Acid-Kerosene Rocket Motors – 32

Nitric Acid Particles in Cold Thick Ice Clouds Observed at Global Scale: Link with Lightning, Temperature, and Upper Tropospheric Water Vapor – 62

## NITRIC OXIDE

Visualization of Flowfield Modification by RCS Jets on a Capsule Entry Vehicle – 20

## NITROGEN COMPOUNDS

Evaluation of the MOCAGE Chemistry Transport Model during the ICARTT/ITOP Experiment – 56

## NITROGEN OXIDES

Reactive Nitrogen Distribution and Partitioning in the North American Troposphere and Lowermost Stratosphere – 64

Surface and Lightning Sources of Nitrogen Oxides over the USA: Magnitudes, Chemical Evolution, and Outflow – 57

## NITROGEN

Chemical Data Assimilation Estimates of Continental US Ozone and Nitrogen Budgets during INTEX-A – 55

Dual-Pump CARS Temperature and Species Concentration Measurements in a Supersonic Combustor – 45

In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage – 50

International Space Station (ISS) S-Band Corona Discharge Anomaly Consultation – 39

Reactive Nitrogen Distribution and Partitioning in the North American Troposphere and Lowermost Stratosphere – 64

## NOISE MEASUREMENT

Overview of Aircraft Noise Prediction Tools Assessment – 83

## NOISE PREDICTION

Overview of Aircraft Noise Prediction Tools Assessment – 83

## NOISE REDUCTION

Recent Progress in Aircraft Noise Research – 2

The Potential Benefits of Advanced Casings Treatment for Noise Attenuation in Ultra-High Bypass Ratio Turbofan Engines – 2

## NONFLAMMABLE MATERIALS

Air Force Research Laboratory Fire Research (Postprint) – 75

## NONLINEAR OPTICS

Focal-Plane Imaging of Crossed Beams in Nonlinear Optics Experiments – 84

## NONLINEAR SYSTEMS

LMI-Based Generation of Feedback Laws for a Robust Model Predictive Control Algorithm – 77

## NORTH AMERICA

Processes Influencing Ozone Levels in Alaskan Forest Fires Plumes during Long-Range Transport over the North Atlantic – 56

## NORTHERN HEMISPHERE

Forest Fire Plumes over the North Atlantic: p-TOMCAT Model Simulations with Aircraft and Satellite Measurements from the ITOP/ICARTT Campaign – 57

## NOZZLE DESIGN

Visualization of Flowfield Modification by RCS Jets on a Capsule Entry Vehicle – 20

## NOZZLE FLOW

Turbulence Modeling Effects on Calculation of Lobed Nozzle Flowfields – 49

## OBSTACLE AVOIDANCE

Target Tracking, Approach, and Camera Handoff for Automated Instrument Placement – 14

## OCEANS

Charting the Course for Ocean Science in the USA for the Next Decade: An Ocean Research Priorities Plan and Implementation Strategy – 33

## OH-58 HELICOPTER

Evaluation of a Low-Noise Formate Spiral-Bevel Gear Set – 83

## ONBOARD DATA PROCESSING

Limits on Interconnection Bandwidth for On-Board Processing – 16

## ON-LINE SYSTEMS

ON-Line ATC Estimator Using Hybrid Principal Component Analysis Network – 35

## OPENINGS

Stress Analysis of Composite Cylindrical Shells with an Elliptical Cutout – 53

## OPTICAL COMMUNICATION

324GHz CMOS VCO Using Linear Superimposition Technique – 42

Photon Counting Techniques for the Bandlimited Optical Channel – 85

## OPTICAL MEASUREMENT

Combinations of Earth Orientation Measurements: SPACE2005, COMB2005, and POLE2005 – 91

In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage – 50

Sloan Digital Sky Survey Standard Star Catalog for Stripe 82: The Dawn of Industrial 1 Optical Photometry – 91

## OPTICAL MEASURING INSTRUMENTS

Focal-Plane Imaging of Crossed Beams in Nonlinear Optics Experiments – 84

## OPTICAL PATHS

Estimation of Cyclic Error Due to Scattering in the Internal OPD Metrology of the Space Interferometry Mission – 85

## OPTICAL RADAR

The Design of an Intelligent Real-Time Autonomous Vehicle, Taiwan ITS-1 – 35

## OPTIMAL CONTROL

LMI-Based Generation of Feedback Laws for a Robust Model Predictive Control Algorithm – 77

## OPTIMIZATION

Sensor Selection and Optimization for Health Assessment of Aerospace Systems – 8

## ORDNANCE

Standardized UXO Technology Demonstration Site Blind Grid Scoring Record No. 830 – 50

Standardized UXO Technology Demonstration Site Blind Grid Scoring Record No. 831 – 50

## ORGANIC LIQUIDS

Feasibility Study of Vapor-Mist Phase Reaction Lubrication Using a Thioether Liquid – 29

## ORGANIC MATERIALS

Hybrid Organic-Inorganic Photorefractives (Preprint) – 31

## OSCILLATING CYLINDERS

Hydrodynamic Force on a Cylinder Oscillating at Low Frequency – 45

## OSCILLATIONS

Hydrodynamic Force on a Cylinder Oscillating at Low Frequency – 45

## OXIDATION

Use of Measured Species Class Concentrations with Chemical Kinetic Modeling for the Prediction of Autoxidation and Deposition of Jet Fuels (Postprint) – 28

## OXYGENATION

Oxygenated Hemoglobin Responses in Prefrontal Area during Visual Search Tasks Measured with Near-infrared Spectroscopy – 72

## OXYGEN

Development of a Ground-based Microalgae Photo-bioreactor Experimental Facility for Using in Space – 74

Dual-Pump CARS Temperature and Species Concentration Measurements in a Supersonic Combustor – 45

In Situ Multi-Species (O<sub>2</sub>, N<sub>2</sub>, Fuel, Other) Fiber Optic Sensor for Fuel Tank Ullage – 50

## OZONE

Chemical Data Assimilation Estimates of Continental US Ozone and Nitrogen Budgets during INTEX-A – 55

Evaluation of the MOCAGE Chemistry Transport Model during the ICARTT/ITOP Experiment – 56

## **SILICON CARBIDES**

Fabrication and Characterization of Diffusion Bonds for Silicon Carbide – 26

Tensile Creep and Fatigue of Sylramic-iBN Melt-Infiltrated SiC Matrix Composites: Retained Properties, Damage Development, and Failure Mechanisms – 31

## **SILICONES**

High Voltage Breakdown Levels in Various EPC Potting Materials – 27

## **SIMULATION**

Constraint Force Equation Methodology for Modeling Multi-Body Stage Separation Dynamics – 48

Log-Scale Method with Equivalent Circuit Model in Semiconductor Device Simulations – 86

Parallel Anisotropic Tetrahedral Adaptation – 75

Simulation Study of Eddy Current Problem in Magnetic Induction Tomography by Using Finite Element Method – 69

## **SIMULATORS**

Zero-Gravity Locomotion Simulators: New Ground-Based Analogs for Microgravity Exercise Simulation – 69

## **SINGULARITY (MATHEMATICS)**

Singularity Analysis and Path Planning for a MDOF Manipulator – 36

Towards Verification of Unstructured-Grid Solvers – 76

## **SINKS**

The Orbiting Carbon Observatory: Sampling Approach and Anticipated Data Products – 53

## **SITUATIONAL AWARENESS**

Spatial Awareness in Synthetic Vision Systems: Using Spatial and Temporal Judgments to Evaluate Texture and Field of View – 75

## **SKY SURVEYS (ASTRONOMY)**

Sloan Digital Sky Survey Standard Star Catalog for Stripe 82: The Dawn of Industrial 1 Optical Photometry – 91

## **SLEEP DEPRIVATION**

Characterization of the Effects of Fatigue on the Central Nervous System (CNS) and Drug Therapies – 67

## **SLENDER WINGS**

Initial Experiments and Analysis of Blunt-Edge Vortex Flows – 4

## **SOARING**

Autonomous Soaring – 11

## **SOCIAL FACTORS**

Societal Impact of Spaceflight – 88

## **SOFTWARE DEVELOPMENT TOOLS**

AIMSsim Version 2.2.1, System Manual – 49

Auto-Coding UML Statecharts for Flight Software – 77

CMMI (Trademark) for Acquisition, Version 1.2 – 82

## **SOFTWARE ENGINEERING**

An Enhanced Collaborative-Software Environment for Information Fusion at the Unit of Action – 89

Auto-Coding UML Statecharts for Flight Software – 77

Language-Based Security for Malicious Mobile Code – 78

## **SOLAR ARRAYS**

Managing Space Station Solar-Array Electrical Hazards for Sequential Shunt Unit Replacement – 25

## **SOLAR CELLS**

Multijunction Solar Cells Optimized for the Mars Surface Solar Spectrum – 95

Ultra-Lightweight Hybrid Thin-Film Solar Cells: A Survey of Enabling Technologies for Space Power Applications – 29

## **SOLAR CORPUSCULAR RADIATION**

Solar and Solar Wind Disturbance Predictions – 98

## **SOLAR CYCLES**

A Reanalysis for the Seasonal and Longer-Period Cycles and the Trends in Middle Atmosphere Temperature from the HALOE – 63

## **SOLAR ECLIPSES**

The Effect of Variable End of Charge Battery Management on Small-Cell Batteries – 41

## **SOLAR ELECTRIC PROPULSION**

NEXT Ion Propulsion System Configurations and Performance for Saturn System Exploration – 95

Performance of the NEXT Engineering Model Power Processing Unit – 24

## **SOLAR ENERGY**

The Seasonal Heat Budgets of the Red and Black Seas – 65

## **SOLAR FLUX**

The Seasonal Heat Budgets of the Red and Black Seas – 65

## **SOLAR STORMS**

Ionospheric E-Region Response to Solar-Geomagnetic Storms Observed by TIMED/SABER and Application to IRI Storm-Model Development – 65

Solar and Solar Wind Disturbance Predictions – 98

## **SOLAR TERRESTRIAL INTERACTIONS**

Ionospheric E-Region Response to Solar-Geomagnetic Storms Observed by TIMED/SABER and Application to IRI Storm-Model Development – 65

Solar and Solar Wind Disturbance Predictions – 98

## **SOLAR WIND VELOCITY**

Slow Mode Waves in the Heliospheric Plasma Sheet – 98

## **SOLAR WIND**

Solar and Solar Wind Disturbance Predictions – 98

## **SOLID PROPELLANT ROCKET ENGINES**

Ares-I-X Vehicle Preliminary Range Safety Malfunction Turn Analysis – 15

## **SOLID STATE LASERS**

Solid State Lasers from an Efficiency Perspective – 86

## **SOLVENTS**

Fluorinated Ester Co-Solvents for Low-Temperature Li-Ion Cells – 55

## **SONIC BOOMS**

Interactive Inverse Design Optimization of Fuselage Shape for Low-Boom Supersonic Concepts – 11

## **SONIC NOZZLES**

Jet Screech Noise Computation – 84

## **SONOLUMINESCENCE**

Investigating Sonoluminescence as a Means of Energy Harvesting – 54

## **SOUND PRESSURE**

Jet Screech Noise Computation – 84

## **SOUND WAVES**

Jet Screech Noise Computation – 84

## **SOURCES**

Terahertz Schottky Multiplier Sources – 40

## **SPACE DEBRIS**

Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities – 16

## **SPACE EXPLORATION**

Cryogenic Fluid Management Technologies for Advanced Green Propulsion Systems – 23

Integrated Network Architecture for Sustained Human and Robotic Exploration – 96

Societal Impact of Spaceflight – 87

## **SPACE FLIGHT**

Societal Impact of Spaceflight – 88

## **SPACE MAINTENANCE**

Managing Space Station Solar-Array Electrical Hazards for Sequential Shunt Unit Replacement – 25

## **SPACE MISSIONS**

An Overview of the Juno Mission to Jupiter – 95

Challenges of Space Mission Interoperability – 17

Estimation of Cyclic Error Due to Scattering in the Internal OPD Metrology of the Space Interferometry Mission – 85

The Effect of Variable End of Charge Battery Management on Small-Cell Batteries – 41

## **SPACE PLATFORMS**

A Space-Based Proxy for the Dst Index – 65

## SPACE SHUTTLE ORBITERS

Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities – 16

## SPACE TRANSPORTATION SYSTEM

External Tank (ET) Bipod Fitting Bolted Attachment Locking Insert Performance – 18

## SPACE WEATHER

A Space-Based Proxy for the Dst Index – 65

## SPACEBORNE ASTRONOMY

Cosmic Star Formation from  $0.5 < z < 20$  with Spitzer – 93

Project Status Update and ESA Science Breadth Discussion for the Origins Subcommittee (OS) – 93

## SPACECRAFT COMMUNICATION

Challenges of Space Mission Interoperability – 17

Changes in the Deep Space Network to Support the Mars Reconnaissance Orbiter – 16

Limits on Interconnection Bandwidth for On-Board Processing – 16

## SPACECRAFT INSTRUMENTS

An Overview of the Juno Mission to Jupiter – 95

Limits on Interconnection Bandwidth for On-Board Processing – 16

The Orbiting Carbon Observatory: Sampling Approach and Anticipated Data Products – 53

## SPACECRAFT POWER SUPPLIES

The Effect of Variable End of Charge Battery Management on Small-Cell Batteries – 41

## SPACECRAFT PROPULSION

Imaginable Technologies for Human Missions to Mars – 96

## SPACECRAFT REENTRY

Stardust Entry Reconstruction – 14

Visualization of Flowfield Modification by RCS Jets on a Capsule Entry Vehicle – 19

## SPACECRAFT STERILIZATION

Spacecraft Sterilization Using Non-Equilibrium Atmospheric Pressure Plasma – 15

## SPACECRAFT TRAJECTORIES

Stardust Entry Reconstruction – 14

## SPACE-TIME CE/SE METHOD

The alpha(3) Scheme - A Fourth-Order Neutrally Stable CESE Solver – 46

## SPATIAL DEPENDENCIES

Spatial Awareness in Synthetic Vision Systems: Using Spatial and Temporal Judgments to Evaluate Texture and Field of View – 75

## SPATIAL DISTRIBUTION

Mars Aeronomy Explorer (MAX): Study Employing Distributed Micro-Spacecraft – 21

## SPECTRAL RESOLUTION

Bulk Scattering Properties for the Remote Sensing of Ice Clouds. 3. High Resolution Spectral Models from 100 to 3250 cm(exp -1) – 54

## SPECTROSCOPY

Experimental Air-Broadened Line Parameters in the nu2 Band of CH3D – 28

## SPINE

Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability – 38

## SPIRAL BEVEL GEARS

Evaluation of a Low-Noise Formate Spiral-Bevel Gear Set – 83

## STABILITY TESTS

Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability – 38

Stability and Controls Analysis and Flight Test Results of a 24-Foot Telescoping Nose Boom on an F-15B Airplane – 9

## STABILITY

Spatially Developing Secondary Instabilities and Attachment Line Instability in Supersonic Boundary Layers – 1

## STAGE SEPARATION

Constraint Force Equation Methodology for Modeling Multi-Body Stage Separation Dynamics – 48

## STANDARDIZATION

Challenges of Space Mission Interoperability – 17

Standardized UXO Technology Demonstration Site Blind Grid Scoring Record No. 830 – 50

Standardized UXO Technology Demonstration Site Blind Grid Scoring Record No. 831 – 50

## STAR FORMATION

Cold Atomic Hydrogen, Narrow Self-Absorption, and the Age of Molecular Clouds – 94

Cosmic Star Formation from  $0.5 < z < 20$  with Spitzer – 93

## STARDUST MISSION

Stardust Entry Reconstruction – 14

## STELLAR MASS

Polaris: Mass and Multiplicity – 93

## STELLAR PARALLAX

Polaris: Mass and Multiplicity – 93

## STERILIZATION

The Validation of Vapor Phase Hydrogen Peroxide Microbial Reduction for Planetary Protection and a Proposed Vacuum Process Specification – 74

## STIRLING CYCLE

Conceptual Trade Study of General Purpose Heat Source Powered Stirling Converter Configurations – 22

## STIRLING ENGINES

A Microfabricated Segmented-Involute-Foil Regenerator for Enhancing Reliability and Performance of Stirling Engines – 44

Conceptual Trade Study of General Purpose Heat Source Powered Stirling Converter Configurations – 22

## STOICHIOMETRY

Effects of Stoichiometry on Transformation Temperatures and Actuator-Type Performance of NiTiPd and NiTiPdX High-Temperature Shape Memory Alloys – 30

## STORMS (METEOROLOGY)

A Range Compensating Feed Motion Concept for Spaceborne Radar – 40

## STRAIN DISTRIBUTION

Dynamic Finite Element Modeling for the Conventional Spinning Process – 37

## STRATOSPHERE

Chemical Data Assimilation Estimates of Continental US Ozone and Nitrogen Budgets during INTEX-A – 55

Reactive Nitrogen Distribution and Partitioning in the North American Troposphere and Lowermost Stratosphere – 64

Seasonal Trends in Stratospheric Water Vapor as Derived from SAGE II Data – 67

## STRESS ANALYSIS

Inspection of the Math Model Tools for On-Orbit Assessment of Impact Damage Report – 47

Stress Analysis of Composite Cylindrical Shells with an Elliptical Cutout – 53

## STRESS DISTRIBUTION

Stress Analysis of Composite Cylindrical Shells with an Elliptical Cutout – 53

## STRESS-STRAIN RELATIONSHIPS

Application of Probability Methods to Assess Crash Modeling Uncertainty – 7

## STROKE VOLUME

Changes of Cardiac Pump Function in Push-pull Effect Simulated by Tilt Table – 72

## STRUCTURAL ANALYSIS

Structural Analysis of the Right Rear Lug of American Airlines Flight 587 – 7

## STRUCTURAL DESIGN

Unbalanced and Minimal Point Equivalent Estimation Second-Order Split-Plot Designs – 33

## STUDENTS

Creating User-Friendly Tools for Data Analysis and Visualization in K-12 Classrooms: A Fortran Dinosaur Meets Generation Y – 66

## SUBREFLECTORS

A Cassegrain Offset-Fed Dual-Band Reflectarray – 38

## **SUBSTRATES**

Fabrication and Characterization of Diffusion Bonds for Silicon Carbide – 26

## **SULFUR DIOXIDES**

3D Air Quality and the Clean Air Interstate Rule: Lagrangian Sampling of CMAQ Model Results to Aid Regional Accountability Metrics – 58

## **SUMMER**

A Link between Variability of the Semidiurnal Tide and Planetary Waves in the Opposite Hemisphere – 60

Summertime Influence of Asian Pollution in the Free Troposphere over North America – 58

## **SUNSPOT CYCLE**

Anticipating Cycle 24 Minimum and Its Consequences – 97

Solar and Solar Wind Disturbance Predictions – 98

## **SUNSPOTS**

Anticipating Cycle 24 Minimum and Its Consequences – 97

Solar and Solar Wind Disturbance Predictions – 98

## **SUN**

Solar and Solar Wind Disturbance Predictions – 98

## **SUPERHIGH FREQUENCIES**

An LO Phase Link Using a Commercial Geo-Stationary Satellite – 17

DAWN Mission Bus and Waveguide Venting Analysis Review – 17

Terahertz Schottky Multiplier Sources – 40

## **SUPERSONIC BOUNDARY LAYERS**

Spatially Developing Secondary Instabilities and Attachment Line Instability in Supersonic Boundary Layers – 1

## **SUPERSONIC COMBUSTION RAMJET ENGINES**

Breathing New Hope into Hypersonics – 3

TBCC Inlet Experiments and Analysis – 43

## **SUPERSONIC COMBUSTION**

Dual-Pump CARS Temperature and Species Concentration Measurements in a Supersonic Combustor – 46

## **SUPERSONIC WIND TUNNELS**

TBCC Inlet Experiments and Analysis – 43

## **SURFACE FINISHING**

Effect of Surface Engineering Processes on the Surface Properties and Adhesive Bonding of Graphite/Epoxy Composites (Preprint) – 25

## **SURFACE PROPERTIES**

Effect of Surface Engineering Processes on the Surface Properties and Adhesive Bonding of Graphite/Epoxy Composites (Preprint) – 25

Nanoscale Subsurface Imaging via Resonant Difference-Frequency Atomic Force Ultrasonic Microscopy – 27

Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities – 16

## **SURFACE REACTIONS**

Using Pressure- and Temperature-Sensitive Paint for Global Surface Pressure and Temperature Measurements on the Aft-Body of a Capsule Reentry Vehicle – 20

## **SURFACE ROUGHNESS**

Flight Testing an Iced Business Jet for Flight Simulation Model Validation – 10

## **SURFACE VEHICLES**

Fluorescence Imaging Study of Impinging Underexpanded Jets – 4

## **SURGICAL INSTRUMENTS**

The Validation of Vapor Phase Hydrogen Peroxide Microbial Reduction for Planetary Protection and a Proposed Vacuum Process Specification – 74

## **SURVEILLANCE**

Advanced Integrated Multi-Sensor Surveillance (AIMS. Operator Machine Interface (OMI) Definition Study – 49

AIMSsim Version 2.2.1, System Manual – 49

## **SURVEYS**

Sensor Feasibility Report: Survey of the Capabilities and Limitations of Chemical, Biological, Radiological, Nuclear and Explosive (CBRNE) Sensor Technologies Relevant to Vehicle Inspection Systems – 50

## **SWEEP WINGS**

Observations on the Growth of Roughness Elements Into Icing Feathers – 6

Spatially Developing Secondary Instabilities and Attachment Line Instability in Supersonic Boundary Layers – 1

## **SYMPATHETIC NERVOUS SYSTEM**

Effects of Dorsal Periaqueductal Gray Stimulation and Reperfusion on Cerebral Ischemic Injury in Rats – 72

## **SYSTEM EFFECTIVENESS**

GN&C Engineering Best Practices for Human-Rated Spacecraft Systems – 18

Standardized UXO Technology Demonstration Site Blind Grid Scoring Record No. 830 – 50

Standardized UXO Technology Demonstration Site Blind Grid Scoring Record No. 831 – 50

## **SYSTEMS ENGINEERING**

Conceptual Trade Study of General Purpose Heat Source Powered Stirling Converter Configurations – 22

GN&C Engineering Best Practices for Human-Rated Spacecraft Systems – 18

GN&C Engineering Best Practices for Human-Rated Spacecraft System – 20

NASA Systems Engineering Handbook – 33

Threads of Mission Success – 52

## **SYSTEMS HEALTH MONITORING**

Sensor Selection and Optimization for Health Assessment of Aerospace Systems – 8

## **SYSTEMS INTEGRATION**

Key and Driving Requirements for the Juno Payload of Instruments – 22

Sensor Selection and Optimization for Health Assessment of Aerospace Systems – 8

## **TAIL ASSEMBLIES**

Structural Analysis of the Right Rear Lug of American Airlines Flight 587 – 7

## **TARGET ACQUISITION**

Results of NASA/DARPA Automatic Probe and Drogue Refueling Flight Test – 13

## **TARGETS**

Development and Evaluation of Fusion Techniques – 81

## **TASK PLANNING (ROBOTICS)**

Using Planning, Scheduling and Execution for Autonomous Mars Rover Operations – 79

## **TECHNOLOGIES**

Global Roadmap for Ceramics and Glass Technology – 31

## **TECHNOLOGY ASSESSMENT**

Global Roadmap for Ceramics and Glass Technology – 31

## **TECHNOLOGY UTILIZATION**

Ceramic Integration Technologies for Aerospace and Energy Systems: Technical Challenges and Opportunities – 26

Global Roadmap for Ceramics and Glass Technology – 30

## **TELECOMMUNICATION**

Integrated Network Architecture for Sustained Human and Robotic Exploration – 96

Mars Science and Telecommunications Orbiter: Report of the Science Analysis Group, March 2006 – 95

Resource-Efficient Digital Communications: Research and Testbed Development in Support of Future Force Warrior and Joint Tactical Radio Systems – 77

## **TELEMETRY**

Hyper-X (X-43A) Flight Test Range Operations Overview – 39

## **TEMPERATURE MEASUREMENT**

Using Pressure- and Temperature-Sensitive Paint for Global Surface Pressure and Temperature Measurements on the Aft-Body of a Capsule Reentry Vehicle – 20

## **TEMPERATURE PROFILES**

Conceptual Trade Study of General Purpose Heat Source Powered Stirling Converter Configurations – 22

The Seasonal Heat Budgets of the Red and Black Seas – 65

#### TEMPERATURE SENSITIVE PAINTS

Using Pressure- and Temperature-Sensitive Paint for Global Surface Pressure and Temperature Measurements on the Aft-Body of a Capsule Reentry Vehicle – 20

#### TEMPERATURE SENSORS

Design of a Novel Quartz Temperature Sensor Used for Temperature Monitoring in Manned Space Flight – 73

#### TENSILE CREEP

Tensile Creep and Fatigue of Sylramic-iBN Melt-Infiltrated SiC Matrix Composites: Retained Properties, Damage Development, and Failure Mechanisms – 31

#### TERRAIN

Multi-Terrain Impact Testing and Simulation of a Composite Energy Absorbing Fuselage Section – 6

#### TERRESTRIAL PLANETS

Project Status Update and ESA Science Breadth Discussion for the Origins Subcommittee (OS) – 93

Terrestrial Planet Finder Interferometer Science Working Group Report – 94

#### TEST STANDS

An Agent Populated Testbed for C2 Experimentation – 32

Evaluation of a Low-Noise Formate Spiral-Bevel Gear Set – 83

#### TEST VEHICLES

Ares-I-X Vehicle Preliminary Range Safety Malfunction Turn Analysis – 15

#### TETRAHEDRONS

Parallel Anisotropic Tetrahedral Adaptation – 76

#### THERMAL CONDUCTIVITY

Conduction and Convection of Heat Produced by the Attenuation of Laser Beams in Liquids – 87

#### THERMAL PROTECTION

Aerodynamic Analysis of Simulated Heat Shield Recession for the Orion Command Module – 3

Flight Testing an Iced Business Jet for Flight Simulation Model Validation – 10

Inspection of the Math Model Tools for On-Orbit Assessment of Impact Damage Report – 47

Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities – 16

#### THERMOCOUPLES

Aeroheating Test of CEV Entry Vehicle at Turbulent Conditions – 19

#### THERMOGRAPHY

Aerothermodynamic Testing and Boundary Layer Trip Sizing of the HIFiRE Flight 1 Vehicle – 12

Aerothermodynamic Testing of Protuberances and Penetrations on the NASA Crew Exploration Vehicle Heat Shield in the NASA Langley 20-Inch Mach 6 Air Tunnel – 18

Aerothermodynamic Testing of the Crew Exploration Vehicle in the LaRC 20-Inch Mach 6 and 31-Inch Mach 10 Tunnels – 3

#### THERMOSPHERE

Ionospheric E-Region Response to Solar-Geomagnetic Storms Observed by TIMED/SABER and Application to IRI Storm-Model Development – 65

#### THIOLS

Feasibility Study of Vapor-Mist Phase Reaction Lubrication Using a Thioether Liquid – 29

#### THREE DIMENSIONAL FLOW

Experimental Measurement of RCS Jet Interaction Effects on a Capsule Entry Vehicle – 21

#### THREE DIMENSIONAL MODELS

3D Air Quality and the Clean Air Interstate Rule: Lagrangian Sampling of CMAQ Model Results to Aid Regional Accountability Metrics – 58

CFD to Flight: Some Recent Success Stories of X-Plane Design to Flight Test at the NASA Dryden Flight Research Center – 10

Documentation for Three Wake Vortex Model Data Sets from Simulation of Flight 587 Wake Vortex Encounter Accident Case – 7

Evaluation of the MOCAGE Chemistry Transport Model during the ICARTT/ITOP Experiment – 56

#### THRESHOLD VOLTAGE

On the Reverse Short-Channel Effect and Threshold Voltage Roll-Off Controls for 90 nm Node MOSFETs – 87

#### THRUST VECTOR CONTROL

Ares-I-X Vehicle Preliminary Range Safety Malfunction Turn Analysis – 15

#### THULIUM

Efficient Single-Frequency Thulium Doped Fiber Laser Near 2-micrometers – 86

Tm:germanate Fiber Laser: Tuning And Q-switching – 52

#### TIDES

A Link between Variability of the Semidiurnal Tide and Planetary Waves in the Opposite Hemisphere – 60

#### TILES

Inspection of the Math Model Tools for On-Orbit Assessment of Impact Damage Report – 47

Supersonic/Hypersonic Laminar Heating Correlations for Rectangular and Impact-Induced Open and Closed Cavities – 16

#### TIMBER VIGOR

Climate-Induced Boreal Forest Change: Predictions versus Current Observations – 63

#### TIMBERLINE

Climate-Induced Boreal Forest Change: Predictions versus Current Observations – 63

#### TIME SERIES ANALYSIS

A Link between Variability of the Semidiurnal Tide and Planetary Waves in the Opposite Hemisphere – 60

#### TISSUES (BIOLOGY)

Prion Transport to Secondary Lymphoreticular System Tissues – 68

#### TITANIUM ALLOYS

Effects of Stoichiometry on Transformation Temperatures and Actuator-Type Performance of NiTiPd and NiTiPdX High-Temperature Shape Memory Alloys – 30

Fabrication and Characterization of Diffusion Bonds for Silicon Carbide – 26

#### TITANIUM

Fabrication and Characterization of Diffusion Bonds for Silicon Carbide – 26

#### TOMOGRAPHY

Simulation Study of Eddy Current Problem in Magnetic Induction Tomography by Using Finite Element Method – 69

#### TOPOGRAPHY

Effects of Facial Topography and Eyewear on the 94 GHz Beam – 83

#### TOPOLOGY

Comparison of Two Hierarchical Routing Protocols for Heterogeneous MANET – 78

On the Development of a Hole Filling Algorithm for Triangular Meshes – 35

#### TORQUE

External Tank (ET) Bipod Fitting Bolted Attachment Locking Insert Performance – 18

Implementation of Power-Aided Control for a Virtual Reality Exercise Bike – 36

#### TOWED BODIES

Results of NASA/DARPA Automatic Probe and Drogue Refueling Flight Test – 12

#### TRACKING FILTERS

Development and Evaluation of Fusion Techniques – 81

#### TRACKING (POSITION)

Target Tracking, Approach, and Camera Handoff for Automated Instrument Placement – 14

#### TRAFFIC

IkeNet: Social Network Analysis of E-mail Traffic in the Eisenhower Leadership Development Program – 79

## TRAJECTORIES

Processes Influencing Ozone Levels in Alaskan Forest Fires Plumes during Long-Range Transport over the North Atlantic – 56

## TRAJECTORY ANALYSIS

Ares-I-X Vehicle Preliminary Range Safety Malfunction Turn Analysis – 15

Crew Exploration Vehicle Ascent Abort Trajectory Analysis and Optimization – 14

## TRAJECTORY OPTIMIZATION

Constraint Force Equation Methodology for Modeling Multi-Body Stage Separation Dynamics – 48

Crew Exploration Vehicle Ascent Abort Trajectory Analysis and Optimization – 14

NEXT Ion Propulsion System Configurations and Performance for Saturn System Exploration – 94

Enabling Autonomous Rover Science through Dynamic Planning and Scheduling – 80

Singularity Analysis and Path Planning for a MDOF Manipulator – 36

## TRANSFORMERS

The Effect of Transformer Magnetizing Inductance on a Forward Converter with Current Mode Control – 36

## TRANSITION FLOW

Aeroheating Test of CEV Entry Vehicle at Turbulent Conditions – 19

## TRANSMISSION LINES

Test Results from a Simulated High Voltage Lunar Power Transmission Line – 41

## TRANSMISSIONS (MACHINE ELEMENTS)

Evaluation of a Low-Noise Formate Spiral-Bevel Gear Set – 83

## TRANSMISSION

An LO Phase Link Using a Commercial Geo-Stationary Satellite – 17

## TRANSPARENCE

Characterization of Transparent Organic Light-Emitting Device (TOLED) – 43

## TRAVELING WAVE AMPLIFIERS

DAWN Mission Bus and Waveguide Venting Analysis Review – 17

## TREADMILLS

Zero-Gravity Locomotion Simulators: New Ground-Based Analogs for Microgravity Exercise Simulation – 69

## TREND ANALYSIS

Seasonal Trends in Stratospheric Water Vapor as Derived from SAGE II Data – 67

## TRMM SATELLITE

Ice Cloud Properties in Ice-Over-Water Cloud Systems Using TRMM VIRS and TMI Data – 61

## TROPICAL REGIONS

Importance of Rain Evaporation and Continental Convection in the Tropical Water Cycle – 62

Nitric Acid Particles in Cold Thick Ice Clouds Observed at Global Scale: Link with Lightning, Temperature, and Upper Tropospheric Water Vapor – 62

## TROPICAL STORMS

A Range Compensating Feed Motion Concept for Spaceborne Radar – 40

## TROPOSPHERE

Chemical Data Assimilation Estimates of Continental US Ozone and Nitrogen Budgets during INTEX-A – 55

Direct Measurements of the Convective Recycling of the Upper Troposphere – 59

Nitric Acid Particles in Cold Thick Ice Clouds Observed at Global Scale: Link with Lightning, Temperature, and Upper Tropospheric Water Vapor – 62

Reactive Nitrogen Distribution and Partitioning in the North American Troposphere and Lowermost Stratosphere – 64

Study Pollution Impacts on Upper-Tropospheric Clouds with Aura, CloudSat, and CALIPSO Data – 56

## TRUNCATION ERRORS

Towards Verification of Unstructured-Grid Solvers – 76

## TUNABLE LASERS

Tm:germanate Fiber Laser: Tuning And Q-switching – 52

## TUNING

Tm:germanate Fiber Laser: Tuning And Q-switching – 52

## TURBINE ENGINES

TBCC Inlet Experiments and Analysis – 43

## TURBOFAN ENGINES

The Potential Benefits of Advanced Casings Treatment for Noise Attenuation in Ultra-High Bypass Ratio Turbofan Engines – 2

## TURBULENCE MODELS

Apparent Transition Behavior of Widely-Used Turbulence Models – 48

Role of Turbulent Prandtl Number on Heat Flux at Hypersonic Mach Numbers – 45

Small Scale Response and Modeling of Periodically Forced Turbulence – 46

Turbulence Modeling Effects on Calculation of Lobed Nozzle Flowfields – 48

## TURBULENCE

Analyzing the Influence of Compressibility on the Rapid Pressure-Strain Rate Correlation in Turbulent Shear Flows – 45

Apparent Transition Behavior of Widely-Used Turbulence Models – 48

Documentation for Three Wake Vortex Model Data Sets from Simulation of Flight 587 Wake Vortex Encounter Accident Case – 7

Slow Mode Waves in the Heliospheric Plasma Sheet – 97

## TURBULENT BOUNDARY LAYER

Apparent Transition Behavior of Widely-Used Turbulence Models – 48

## TURBULENT DIFFUSION

Evaluation of Modified Two-Equation Turbulence Models for Jet Flow Predictions – 47

## TURBULENT FLOW

Aeroheating Test of CEV Entry Vehicle at Turbulent Conditions – 19

Analyzing the Influence of Compressibility on the Rapid Pressure-Strain Rate Correlation in Turbulent Shear Flows – 45

Apparent Transition Behavior of Widely-Used Turbulence Models – 48

Role of Turbulent Prandtl Number on Heat Flux at Hypersonic Mach Numbers – 45

Small Scale Response and Modeling of Periodically Forced Turbulence – 46

## TURBULENT MIXING

Single-Shot Scalar-Triplet Measurements in High-Pressure Swirl-Stabilized Flames for Combustion Code Validation – 44

## TWISTING

Influence of Jig Design on Biomechanical Evaluation of Spinal Construct Stability – 38

## ULTRASONIC RADIATION

Nanoscale Subsurface Imaging via Resonant Difference-Frequency Atomic Force Ultrasonic Microscopy – 27

## ULTRASONICS

Edge Detection of Ultrasound Medical Image Using Mean Curvature Vector Flow Deformable Models – 71

Experimental Technologies for Imposing Mechanical Force on Cells – 70

Speckle Reduction for Ultrasound Images with Anisotropic Diffusion Based on EM Parameter Estimation Algorithm – 83

## ULTRAVIOLET RADIATION

The Influence of Circadian Gene Period2 on NIH3T3 Cell Damaged by Ultraviolet – 71

## ULYSSES MISSION

Slow Mode Waves in the Heliospheric Plasma Sheet – 98

## UNCERTAIN SYSTEMS

LMI-Based Generation of Feedback Laws for a Robust Model Predictive Control Algorithm – 77

## UNITED STATES

Charting the Course for Ocean Science in the USA for the Next Decade: An Ocean Research Priorities Plan and Implementation Strategy – 33

Autonomous Soaring – 11

NASA Dryden's UAS Service Capabilities – 10

## UNSTRUCTURED GRIDS (MATHEMATICS)

Towards Verification of Unstructured-Grid Solvers – 76

## VACUUM

The Validation of Vapor Phase Hydrogen Peroxide Microbial Reduction for Planetary Protection and a Proposed Vacuum Process Specification – 74

## VAPOR PHASE LUBRICATION

Feasibility Study of Vapor-Mist Phase Reaction Lubrication Using a Thioether Liquid – 29

## VAPOR PHASES

The Validation of Vapor Phase Hydrogen Peroxide Microbial Reduction for Planetary Protection and a Proposed Vacuum Process Specification – 74

## VAPORS

Feasibility Study of Vapor-Mist Phase Reaction Lubrication Using a Thioether Liquid – 29

## VELOCITY DISTRIBUTION

Heat Transfer and Pressure Drop in Concentric Annular Flows of Binary Inert Gas Mixtures – 43

## VELOCITY MEASUREMENT

Direct-View Multi-Point Two-Component Interferometric Rayleigh Scattering Velocimeter – 51

## VELOCITY

DSP-Based Adaptive Fuzzy Velocity/Pressure Control of Injection Molding Machines – 52

## VERTEBRAE

Mechanism and Risk Factors of Adjacent Vertebral Failure Post Percutaneous Vertebroplasty: A Strain Energy Density Approach – 37

## VERY LONG BASE INTERFEROMETRY

Combinations of Earth Orientation Measurements: SPACE2005, COMB2005, and POLE2005 – 91

## VIRTUAL REALITY

Effects of Spatial and Non-Spatial Multimodal Cues on Orienting of Visual-Spatial Attention in an Augmented Environment – 77

Implementation of Power-Aided Control for a Virtual Reality Exercise Bike – 36

Towards Determination of Visual Requirements for Augmented Reality Displays and Virtual Environments for the Airport Tower – 13

## VIRUSES

Experimental Study of Expression of PAL Gene and HSP60 Gene of Legionella Pneumophila in NIH3T3 Cell – 73

## VISUAL OBSERVATION

Optical and X-Ray Observations of GRB 060526: A Complex Afterglow Consistent with an Achromatic Jet Break – 92

## VISUAL TASKS

Oxygenated Hemoglobin Responses in Prefrontal Area during Visual Search Tasks Measured with Near-infrared Spectroscopy – 72

## VOLTAGE CONTROLLED OSCILLATORS

324GHz CMOS VCO Using Linear Superposition Technique – 42

## VORTICES

Documentation for Three Wake Vortex Model Data Sets from Simulation of Flight 587 Wake Vortex Encounter Accident Case – 8

Initial Experiments and Analysis of Blunt-Edge Vortex Flows – 4

What Was Learned from the New VFE-2 Experiments? – 4

## WAR GAMES

Wargaming and Analysis. Presentation for MORS Special Meeting – 82

## WATER VAPOR

Nitric Acid Particles in Cold Thick Ice Clouds Observed at Global Scale: Link with Lightning, Temperature, and Upper Tropospheric Water Vapor – 62

Seasonal Trends in Stratospheric Water Vapor as Derived from SAGE II Data – 67

## WAVE FRONTS

TRL-6 for JWST Wavefront Sensing and Control – 85

## WAVELENGTHS

1024x1024 Pixel MWIR and LWIR QWIP Focal Plane Arrays and 320x256 MWIR:LWIR Pixel Colocated Simultaneous Dualband QWIP Focal Plane Arrays – 51

## WAVELET ANALYSIS

Atrial Arrhythmia Recognition Based on Grey Correlation and K-nearest Neighbor – 71

## WEATHER FORECASTING

Cloudy Sounding and Cloud-Top Height Retrieval From AIRS Alone Single Field-of-View Radiance Measurements – 64

## WEBSITES

The ComplexityHub Web Site: Needs, Requirements, and Development – 89

## WEIGHT REDUCTION

Imaginable Technologies for Human Missions to Mars – 96

## WEIGHTLESSNESS

Development of a Ground-based Microalgae Photo-bioreactor Experimental Facility for Using in Space – 74

Zero-Gravity Locomotion Simulators: New Ground-Based Analogs for Microgravity Exercise Simulation – 68

## WIND DIRECTION

Processes Influencing Ozone Levels in Alaskan Forest Fires Plumes during Long-Range Transport over the North Atlantic – 56

## WIND (METEOROLOGY)

A Link between Variability of the Semidiurnal Tide and Planetary Waves in the Opposite Hemisphere – 60

## WIND TUNNEL TESTS

Aerothermodynamic Testing and Boundary Layer Trip Sizing of the HIFIRE Flight 1 Vehicle – 12

Aerothermodynamic Testing of Protuberances and Penetrations on the NASA Crew Exploration Vehicle Heat Shield in the NASA Langley 20-Inch Mach 6 Air Tunnel – 18

Bayesian Inference in the Modern Design of Experiments – 1

Experimental Measurement of RCS Jet Interaction Effects on a Capsule Entry Vehicle – 21

Initial Experiments and Analysis of Blunt-Edge Vortex Flows – 4

TBCC Inlet Experiments and Analysis – 43

What Was Learned from the New VFE-2 Experiments? – 4

## WIRELESS COMMUNICATION

Comparison of Two Hierarchical Routing Protocols for Heterogeneous MANET – 78

Evaluation of the Interference Rejection Capability of a Uniform Circular Array – 37

Limits on Interconnection Bandwidth for On-Board Processing – 16
