Absolute rate constants for reactions of alkylperoxyl and substituted alkylperoxyl radicals with inorganic and organic compounds in aqueous and non-aqueous fluid solutions have been compiled. The radicals have been generated by radiolysis or photolysis and their rate constants were determined generally by kinetic spectrophotometry or esr. Rate constants are included also for formation of peroxyl radicals by reaction of alkyl radicals with oxygen and for decay of peroxyl radicals by radical-radical reactions.

Key words: alkyl radicals; alkylperoxyl radicals; aqueous solution; chemical kinetics; oxygen; oxygen radicals; peroxyl radicals; photolysis; radiolysis; rate constants.

1. Introduction

Peroxyl radicals, $ROO\cdot$, are important reactive intermediates formed in the oxidation of organic and biological materials. They propagate chain reactions and may cause detrimental effects in biological systems. Because of their importance in biological systems, in atmospheric reactions, and in industry, they have been the topic of numerous investigations. Earlier studies have been discussed in several reviews¹ and the kinetic results were summarized in a sizable compilation.² This compilation includes a vast number of relative rate constants determined from studies of the autoxidation of hydrocarbons, but only a limited number of absolute rate constants mea-

sured by direct time resolved techniques. Since the publication of the above reviews and compilation many direct measurements of absolute rate constants for reactions of peroxy radicals in solution have been reported. In addition, a number of indirect determinations have been carried out with fast kinetic techniques and with reference reactions where absolute rate constants have been accurately determined. The present compilation is intended to evaluate the available rate constants and to present them in a concise and readily accessible form. Rate constants derived from autoxidation studies are omitted since their values depend on the assumed mechanism and rate of termination; most of these are found in the previous compilation.² A brief description of the methods of production of peroxy radicals and of determination of their rate constants, as well as the general patterns of peroxy radical reactions, are given below.

1.1. Production of Peroxy Radicals

Peroxy radicals generally are produced by reaction of O₂ with alkyl radicals. Since alkyl radicals can be produced via many different reactions, we will discuss first procedures by which different types of alkyl radicals can be produced.

1.1.1. Production of Alkyl Radicals by Radiolysis

Substituted alkyl radicals are produced in irradiated solutions by reaction of primary radiolytic species with the solvent or with solutes. In aqueous solutions the radicals are generated by the reactions of e_{aq}⁻ or ·OH radicals with various organic compounds. If the ·OH radical is to be used, the solutions typically contain N₂O to convert the e_{aq}⁻ into ·OH, thus increasing the yield of the desired alkyl radical and reducing possible complications arising from other reactions of the electron.

If the e_{aq}⁻ is to be used to produce the desired alkyl radical, the ·OH radical cannot simply be converted to the hydrated electron, but often can be converted to a reducing radical capable of producing more of the desired alkyl radical. Otherwise, secondary products arising from the ·OH must be taken into account in the kinetic analysis.

(a) Many alkyl radicals have been formed by hydrogen abstraction from the solvent or a solute by primary or secondary radiolytic products. This can result in a

mixture of several alkyl radicals, depending upon the selectivity of the reactant radical. The ·OH radical is very non-selective and is used primarily to produce radicals from simple precursors, for example methanol, acetone, or acetonitrile, where essentially all of the alkyl radicals will be identical. For 2-propanol, which is slightly more complex, 86% of the alkyl radicals will be secondary while 13% will be primary. When ·OH is allowed to react with precursors containing aromatic moieties, the situation may be even more complex, with the formation of OH adduct radicals along with radicals formed by abstraction from side chains. Rate constants for a large number of hydroxyl radical reactions are summarized in a recent compilation.³

(b) Many simple alkyl radicals can be formed cleanly by the reaction of ·OH with alkyl sulfoxides via an addition/fragmentation mechanism.⁴

Since the rate constants for reaction of ·OH with the sulfoxides are >10⁹ L mol⁻¹ s⁻¹ and the lifetime of the OH-adducts are <200 ns, in 0.01 mol L⁻¹ sulfoxide solutions the radicals R· are produced in <1 μs after the pulse.

(c) Alkyl radicals are also produced by reaction of e_{aq}⁻ with halogenated organic compounds, leading to reductive elimination of a halide ion. The ·OH radicals can be removed by scavenging them with 2-PrOH, Eq. (6), or with formate ions, Eq. (7).

The radical from 2-PrOH will reduce some halogenated compounds (such as CCl₄ or CH₃I) to produce more of the desired radical.⁵

Many halogenated compounds, however, do not react rapidly with (CH₃)₂ĊOH, which will instead react with O₂ to produce a peroxy radical.^{6,7} This may need to be taken into account in the subsequent kinetic analysis.

The CO₂·⁻ radical formed by reaction (7) reacts rapidly with O₂ to yield O₂·⁻ and CO₂.⁸ The radical O₂·⁻ is a very weak oxidant⁹ and in most cases does not interfere with the oxidation of organic reductants by the peroxy radicals. Further details on the reactions involved in the preparation of the various substituted alkyl radicals have been given elsewhere.^{5,10,11,12}

(d) Alkyl radicals have also been produced by reaction of e_{aq}⁻ with alkylammonium derivatives, a reaction that proceeds by reductive elimination of ammonia.¹³

Elimination of ammonia occurs only when the amino group is protonated and the α -carbon bears an electron withdrawing group such as carbonyl or phenyl. However, the process is not always quantitative, benzylammonium undergoes deamination corresponding to 70% of the e_{aq}^- but diphenylmethylammonium deaminates to 95%, the rest of the hydrated electron reactions occur via ring addition and protonation to give an H-adduct.¹³ The H-adducts and OH-adducts may also react with O_2 to form peroxy radicals, whose contribution to the observed oxidation processes may have to be taken into account.

1.1.2. Photolytic Production of Alkyl Radicals

Photolytic methods for production of the alkyl radical precursors of peroxy radicals have been extensively employed, particularly in the studies of the self-reactions of peroxy radicals and in some of the slower reactions of peroxy radicals with other solutes. Techniques include the photolysis of azo compounds,¹⁴ ketones,¹⁵ and, less frequently, the photolysis of compounds containing metal-carbon bonds.¹⁶ Photodecomposition of azo compounds results in formation of two alkyl radicals and, if the azo compound is symmetric, the radicals are identical.

On the other hand, photolysis of ketones yields an alkyl and an acyl radical, both of which may react with O_2 to form peroxy radicals. As a result the kinetic measurements may be for concurrent reactions with different rate constants.

A common photolytic technique is to generate a reactive intermediate which can abstract a hydrogen atom from a solute or the solvent to produce the desired alkyl radical. The photolysis of H_2O_2 has been used to produce $\cdot OH$ radicals, but it is more common to employ photolysis to produce more selective reactants. For example, the photolysis of di-*tert*-butyl peroxide (DTBP) is employed to produce *tert*-butoxyl radicals, which are then used to react with the solvent.

Radicals such as *tert*-butoxyl are far more selective than the hydroxyl radical, allowing greater control over the specific alkyl radical produced and the subsequent peroxy radical. Generally, this greater selectivity means that, where possible, tertiary alkylperoxy will predominate over secondary which, in turn, will predominate over primary. Further, this radical does not add to the aromatic ring, reacting only by abstraction from the alkyl substituent.

1.1.3. Reaction of Alkyl Radicals with Oxygen

Alkyl radicals react with O_2 rapidly to form peroxy radicals.

The rate constants for these reactions are generally of the order of $10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ (Table 3). With rate constants k_{14} of $2 \times 10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ and $[O_2] 3 \times 10^{-4} \text{ mol L}^{-1}$ (corresponding to N_2/O_2 or Ar/O_2 4:1 mixtures), formation of $ROO\cdot$ by reaction (14) is complete within $<10 \mu\text{s}$, a period much shorter in most cases than that used for observation of subsequent reactions of $ROO\cdot$ (see below). Rate constants for the reactions of alkyl radicals with oxygen have also been measured in the gas phase.¹⁷ The rate constants range from 1.3×10^9 for methyl radicals to $9 \times 10^9 \text{ L mol}^{-1} \text{ s}^{-1}$ for isopropyl radicals.

1.2. Reactions of Peroxy Radicals

Peroxy radicals are detected by their optical absorption or esr spectra. Peroxy radicals exhibit weak absorptions in the UV, generally with a peak at or below 250 nm, which have been utilized to measure the rates of second-order decay of these radicals. These absorptions, however, do not permit accurate monitoring of the reactions of peroxy radicals with substrates, particularly when the substrates absorb in the UV. Therefore, rates of reaction of peroxy radicals with inorganic and organic compounds were determined in most cases by following the decay of the esr signal of peroxy radicals or the buildup of optical absorption of the product radical. When the product radical exhibits no intense absorption at $\lambda > 250 \text{ nm}$, as in the case of fatty acids, the rate constants were determined by competition kinetics using compounds such as ABTS or porphyrins as reference reactants.

1.2.1. Radical-Radical Reactions

The derivation of an absolute rate constant for the self-reaction of peroxy radicals requires the determination of the absolute concentration of the radicals corresponding to the signal being measured. Radical concentrations have been followed in one of three ways: by optical absorption, electron spin resonance (esr), or by the change in conductivity.

When optical absorption is used, the molar absorptivity of the radical at the wavelength used is needed. In most cases, this quantity was not determined, but taken from the literature, often from gas-phase work. Table 1 summarizes most of the reported values of the molar absorptivity of peroxy radicals. There is obviously not complete consistence in the values, but where the determinations were fairly direct, the absorptivity at the wavelength of maximum absorption for the smaller radicals appears to be about $1000 \pm 200 \text{ L mol}^{-1} \text{ cm}^{-1}$.

Where there is no other direct information on the absorptivity, we have used this value to derive the second-order rate constant.

The determination of radical concentration by esr is much more straightforward, since the magnitude of the signal is proportional to the number of free spins, but independent of the radical type. The radical concentration, therefore, can be obtained by comparison of the peak area (obtained by double-integrating the first-derivative signal) with the area obtained from a known concentration of a stable free radical.

Rate constants for self-reactions of peroxy radicals also have been obtained by following the change in conductivity of the solution after the generation of the radicals. In this case, information on the mechanism of the reaction must first be obtained, specifically the yields of products which influence the conductivity. Typically, the conductivity change arises from the generation or consumption of protons in the reaction, either directly or indirectly. For example, if O_2^- is eliminated from a product of the reaction, and the experiment is carried out at low pH, O_2^- will protonate to form HO_2 , decreasing the conductivity by a known amount.

Rate measurements on the self-reactions of peroxy radicals derived from secondary and tertiary alkyl radicals have been carried out over a range of experimental conditions, particularly over a wide range of temperature. The rate constants for self-reactions of primary alkylperoxy radicals have been carried out only at room temperature and, typically, only in aqueous solutions. This is due to the large difference in reactivity between these classes of radicals. Primary alkylperoxy radicals react by self-reaction very rapidly, near the collision rate; secondary radicals react much more slowly, and tertiary radicals react very slowly. Therefore, rapid kinetic techniques, such as pulse radiolysis or flash photolysis, are required for the study of primary radicals while slower kinetic techniques, such as interrupted photolysis, can be used for secondary and tertiary radicals.

At low temperatures (<200 K), secondary and tertiary peroxy radicals exist in equilibrium with their dimers, the tetroxides. This leads to a much greater apparent temperature dependence in the rate constant at these low temperatures. As the temperature is raised, disproportionation becomes more important. For example, for the 2-propylperoxy radical:

As the temperature is raised further, formation of alkoxy radicals can become important,

leading to a further increase in the measured temperature dependence.

Rate constants for the self-reactions of primary and secondary peroxy radicals have been measured in the

gas-phase.¹⁷ At room temperature their values are similar to those observed for primary and small secondary peroxy radicals in the liquid phase. The most interesting feature of the observations is the temperature dependence. For ethylperoxy radicals the temperature dependence is small, with $E_a = 910 \text{ J mol}^{-1}$; for methylperoxy radicals the temperature dependence is negative, with $E_a = -1830 \text{ J mol}^{-1}$. For 2-propylperoxy radicals, the temperature dependence is somewhat stronger than that reported for the liquid phase, with $E_a = 12 \text{ kJ mol}^{-1}$ for reaction (15) and 21.5 kJ mol^{-1} for reaction (16).

1.2.2. Reactions with Molecules

Rate constants for reaction of peroxy radicals with other molecules are determined by following the decay of the optical or esr signal of the peroxy radicals but more often by following the formation of the product absorption signal. Generally, reactions are monitored under conditions of excess substrate so that the decay follows a first-order rate law. The second-order rate constants are derived from linear plots of the observed first-order rates, k_{obs} , as a function of substrate concentration. When k_{obs} is very high, the rate of formation of the peroxy radical may limit the observed rate. Under these conditions the plot of k_{obs} vs. concentration will curve and approach a plateau, but the second order rate constant can be derived from the initial slope.

Due to the complexity of many of these chemical systems, it is very difficult to establish with confidence the accuracy of the reported rate constants. The precision of the numbers depends basically on the number of measurements taken and the range of concentrations employed. If at least four concentrations are used, varying by an overall factor of at least 4, and the measurement at each concentration repeated several times, and if the above linear plot has a relatively small intercept, the second-order rate constants probably have a precision of $\pm 10\%$. Not all measurements reported have been carried out with this level of precision but most are better than $\pm 25\%$. The level of precision is not given in the tables, but when the rate constants were only approximations the values are denoted as such.

Peroxy radicals react with inorganic and organic compounds predominantly by electron transfer, hydrogen abstraction, or addition. Only a few absolute rate constants have been reported for hydrogen abstraction and addition reactions, and these were generally measured by competition kinetics rather than by direct measurements. Peroxy radicals abstract H only from weak C-H bonds because the $ROO-H$ bond dissociation energy is 380 kJ mol^{-1} ,¹⁸ higher than that of allylic or benzylic C-H bonds but lower than that of primary and secondary C-H bonds. The abstraction is relatively slow and, therefore, measurement of rate constants is hampered by the faster radical-radical decay processes.

By far the most studied reactions of peroxy radicals are those involving electron transfer. Typical of the elec-

tron transfer reactions is the oxidation of ascorbate ions¹⁰⁻¹²

and of TMPD (*N,N,N',N'*-tetramethyl-*p*-phenylenediamine).^{19,20}

Ascorbate is known to be oxidized very rapidly (k near $10^9 \text{ L mol}^{-1} \text{ s}^{-1}$) by the polyhalogenated alkylperoxyl radicals but much more slowly ($k = 2 \times 10^6 \text{ L mol}^{-1} \text{ s}^{-1}$) by methylperoxyl.¹⁰⁻¹² However, both the fast and the slow reactions lead to the same product, the ascorbate radical. The very large increase in rate constants upon substitution with halogens suggests that electron withdrawing substituents have a significant effect on the reactivity of peroxyl radicals. Correlation of rate constants for reaction of ascorbate ions and TMPD with thirty different substituted methylperoxyl radicals²¹ with the polar substituent constants σ^* ²² shows that the reactivity of peroxyl radicals increases systematically with increasing electron-withdrawing power of their substituents, evidence for an electron-transfer mechanism.

Rate constants for the reactions of peroxyl radicals with ascorbate, Trolox (6-hydroxy-2,5,7,8-tetramethylchroman-2-carboxylate), and TMPD also have been determined in different solvents²³ and were found generally to increase with increasing water content in the solvent mixture and with increasing solvent polarity. The rate constants were found to correlate well with a two-parameter equation which includes the dielectric constant of the solvent and the coordinate covalency parameter, a measure of the proton-transfer basicity of the solvent. Kinetic isotope effects in $\text{H}_2\text{O}/\text{D}_2\text{O}$ of about 2 and activation entropies of about $-10 \text{ J K}^{-1} \text{ mol}^{-1}$ for reduction of $\text{ROO}\cdot$ by the organic reductants indicate that electron transfer to the peroxyl radical is concerted with transfer of proton from the solvent to the incipient hydroperoxide anion.

Oxidation of metalloporphyrins by peroxyl radicals also takes place by electron transfer. For these complexes it was concluded that the mechanism is not an outer sphere electron transfer but rather involves an intermediate binding of the peroxyl radical to the metal center of the metalloporphyrin.²⁴

Because of the strong solvent effect discussed above one should be extremely careful in extrapolating results from aqueous or alcoholic solutions to the biological system, since the exact nature of the microenvironment may change the rate constant by as much as two orders of magnitude. Also, when comparing the reactivities of several compounds or radicals it is necessary to take into account the solvent effect. Table 2 presents a comparison of the reactivities of four compounds with the various peroxyl radicals. The values of the rate constants in this Table are taken from Tables 6 and 7 and for each

case they are for the measurement in aqueous or as close to aqueous solution as was available. This Table can serve for comparing the reactivities of the various radicals in electron transfer reactions.

2. Arrangement of Tables 3-7

Table 3 contains rate constants of reactions for formation of peroxyl radicals by reaction of alkyl radicals with O_2 . Table 4 contains rate data for radicals which undergo first-order decomposition or hydrolysis in solution. Table 5 contains rate constants for second-order radical-radical reactions. Separate tables are provided for reactions of unsubstituted (Table 6) and substituted (Table 7) alkylperoxyl radicals with various substrates. The order of entries in Table 3 for the formation of peroxyl radicals, is the same as the arrangement in Tables 4-7 for the reactions of peroxyl radicals. Unsubstituted alkylperoxyl radicals $\text{ROO}\cdot$, are given first, arranged by increasing number of carbons in R. Each radical has a separate entry number in each table, e.g. 6.1 for Methylperoxyl in Table 6. For each radical the reactions of inorganic substrates are given first, in alphabetical order of the symbol for the main element, and numbered 6.1.1, etc. Organic substrates follow in alphabetical order by name. Systematic names are used in the table for the substrates, unless the reactant is better known by a common name and has a complex structure. Alternate names are given in the chemical name index.

Table 7 includes reactions of substituted alkylperoxyl radicals with various substrates. Oxygen-, nitrogen- and phosphorus-substituted alkylperoxyl radicals are listed first followed by haloalkyl radicals in the following order: F-containing (by increasing numbers of F), Cl-containing, and Cl + F, (by increasing numbers of Cl), Br-containing, and I-containing. Peroxyl radicals derived from compounds of biological importance, e.g. lipids and nucleoside bases, are grouped at the end. The arrangement for each radical's reactions with inorganic and organic substrates is the same as in Table 6.

Section 4 contains a list of radicals in the order of appearance in the tables. The molecular formula index (Sec. 8.1) and chemical name index (Sec. 8.2) include all of the reactant radicals and can be consulted for the entry numbers in Tables 3-7 where reactions of the radicals appear. The indexes also include all of the substrates and the entry numbers in the tables where reactions of the substrates with various radicals appear. The indexes have been generated from the registry file at the Radiation Chemistry Data Center. The chemical name index may contain alternate names to those listed in the tables (systematic names and synonyms); inverted names are also included in the index whenever they were present in the registry file. A molecular formula index is also provided as an aid to locating particular reactants.

The products of the reactions are included when they are known reasonably well or when they have been discussed in the paper reporting the data. In cases where rate constants are given for a series of pH values it

should be understood that a mixture of ionic forms of the substrate (and of the radical and the products) may be present.

For the values of k_{obs} the "temperature" column contains the value in Kelvins (K) or RT (room temperature). The temperatures 200 K or 298 K are given in brackets following values of k which have been calculated from $\log A$ and E_a in Tables 5 and 6; in those cases the temperature range of the measurements is given in the comments. When the temperature is not given in the table the measurement was stated or presumed to be carried out at room temperature. In the "solvent" column the main solvent is given first followed by other components amounting to 10% or more of the solvent mixture.

The "method" column contains symbols such as p.r. (pulse radiolysis), and f.p. (flash photolysis), which indicate the method of generation of the radical. The "comment" column briefly describes the means of following the reaction, e.g. p.b.k. indicates product buildup kinetics with optical detection. Other means of detection are given, along with concentrations of solutes, the source of the radical, and other details about the determination. The rate constants for the reference reactions are given for the few rate constants which have been derived by competition. Abbreviations and symbols are identified in Sec. 3.

References to the tables, in Sec. 7 which follows the tables, are listed by serial number assigned by the Radiation Chemistry Data Center and included in the RCDC Bibliographic Data Base.

5. Acknowledgments

This review was generated at the Chemical Kinetics Division, National Institute of Standards and Technology, with the partial support of the Office of Basic Energy Sciences of the Department of Energy and at the Radiation Laboratory at the University of Notre Dame, which is operated under Contract DE-AC02-76ER0038 with the Department of Energy. The Radiation Chemistry Data Center is supported jointly by the Office of Basic Energy Sciences, Department of Energy, and the Office of Standard Reference Data, National Institute of Standards and Technology. This is Radiation Laboratory Document No. NDRL-3216. We thank Drs. J. A. Howard, C. von Sonntag, and S. Steenken for their comments on the manuscript.

$C_{53}H_{41}N_5Zn$	5,10,15,20-Tetrakis(4-methylphenyl)porphinatozinc(II) pyridine complex 7.27.3, 7.35.3		
ClO_2^-	Chlorite ion 7.42.1		
Cl_3P	Phosphorus trichloride 6.5.4		
Cl_5Pt^{2-}	Pentachloroplatinate(III) ion 7.5.3		

8.2 Chemical Name Index

- Acetoxybutylperoxyl 5.50, 50.1
 1-Acetoxyethylperoxyl 5.47, 47.1
 Acetoxymethyl 3.30
 1-Acetoxy-1-methylethylperoxyl 5.49, 49.1
 Acetoxymethylperoxyl 5.46, 46.1
 Acetoxypentylperoxyl 5.51, 51.1
 Acetoxy(phenyl)methylperoxyl 5.52, 52.1
 1-Acetoxypropylperoxyl 5.48, 48.1
 Acetylperoxyl 7.15
 Allylperoxyl 7.1
 2-Amino-2-carboxy-1-hydroxyethyl, anion 3.35
 Amino(carboxy)methyl, anion 3.33
 Amino(carboxy)methylperoxyl 4.15
 2-Aminoethanethiol 7.59.1, 7.60.1, 7.61.2, 7.62.2
 2-Amino-4-(methylthio)butanoic acid 7.32.12, 7.42.53
 1-Aminonaphthalene-*N,N*-*d*₂ 6.5.43
 1-Aminonaphthalene 6.5.42
 2-Aminonaphthalene 6.5.44
 Aminopyrine 7.42.33
 Aniline 6.5.12, 7.27.4, 7.35.4
 Aniline, *N,N*-dimethyl- 7.35.9
 Aniline, *N,N*-dimethyl-4-nitroso- 7.6.3
 Aniline, *N*-methyl- 6.5.39
 1-Anilinonaphthalene 6.5.49, 6.9.11
 2-Anilinonaphthalene 6.9.12
 Antipyrine 7.42.35
 Arachidonate radicals 3.52
 Arachidonic acid 7.32.3, 7.42.16
 Ascorbate ion 6.1.3, 7.1.1, 7.2.1, 7.3.1, 7.4.1, 7.5.4, 7.7.4, 7.8.6, 7.15.1, 7.16.1, 7.18.2, 7.20.1, 7.21.1, 7.22.1, 7.24.2, 7.25.1, 7.26.1, 7.27.5, 7.28.1, 7.29.1, 7.30.1, 7.32.4, 7.34.1, 7.35.5, 7.36.1, 7.37.1, 7.38.1, 7.39.1, 7.41.1, 7.42.17, 7.44.1, 7.45.1, 7.47.2, 7.48.1, 7.56.2, 7.58.1
 Ascorbic acid 6.1.4, 7.42.18
 2,2'-Azinobis(3-ethylbenzothiazoline-6-sulfonate ion) 6.1.5, 7.11.1, 7.15.2, 7.25.2, 7.26.2, 7.27.6, 7.28.2, 7.32.5, 7.34.2, 7.35.6, 7.36.2, 7.37.2, 7.38.2, 7.41.2, 7.42.19, 7.44.2, 7.56.1, 7.58.2
 Benzaldehyde, 3,5-di-*tert*-butyl-4-hydroxy- 6.5.22
 Benzenamine, *N,N*-diethyl- 6.5.30
 Benzenamine, *N,N*-dimethyl- 7.35.9
 Benzenamine, *N,N*-dimethyl-4-nitroso- 7.6.3
 Benzenamine, *N*-methyl- 6.5.39
 Benzenamine, *N*-phenyl- 6.8.4, 6.9.10
 Benzene, 1,4-dihydroxy- 6.1.7, 7.24.4, 7.42.44, 7.47.5, 7.56.3, 7.58.3
 Benzene, hexamethyl- 7.42.42
 1,4-Benzenediamine, *N,N,N',N'*-tetramethyl- 6.1.12, 6.2.2, 6.3.1, 6.4.1, 6.5.57, 7.5.5, 7.8.8, 7.9.1, 7.10.1, 7.11.2, 7.12.1, 7.13.1, 7.14.1, 7.15.3, 7.16.3, 7.18.4, 7.20.4, 7.27.13, 7.35.14, 7.42.75, 7.52.1, 7.53.1, 7.54.1, 7.56.7, 7.57.1, 7.58.5
 Benzenethiol 6.5.58
 Benzoic acid, 3,5-bis(1,1-dimethylethyl)-4-hydroxy-, 1,1-dimethylethyl ester 6.5.17
 Benzoic acid, 3,5-di-*tert*-butyl-4-hydroxy- 6.5.23
 Benzotrile, 3,5-bis(1,1-dimethylethyl)-4-hydroxy- 6.5.20
 2*H*-1-Benzopyran-2-carboxylic acid, 3,4-dihydro-6-hydroxy-2,5,7,8-tetramethyl- 6.1.8, 7.20.3
 2*H*-1-Benzopyran-2-carboxylic acid, 3,4-dihydro-6-hydroxy-2,5,7,8-tetramethyl-, ion(1-) 7.24.5, 7.27.9, 7.35.10, 7.42.46, 7.47.6
 2*H*-1-Benzopyran-6-ol, 3,4-dihydro-2,8-dimethyl-2-(4,8,12-trimethyltridecyl)- 6.5.61, 7.17.10
 2*H*-1-Benzopyran-6-ol, 3,4-dihydro-2,5,7,8-tetramethyl-2-(4,8,12-trimethyltridecyl)-, 6.5.59, 6.8.7, 6.10.1, 6.11.1, 7.6.4, 7.17.8, 7.19.1, 7.32.17, 7.42.77, 7.51.2
 2*H*-1-Benzopyran-6-ol, 3,4-dihydro-2,7,8-trimethyl-2-(4,8,12-trimethyltridecyl)- 6.5.60, 7.17.9
 Benzopyran-6-ol, 2,2,5,7,8-pentamethyl- 7.17.5
 Benzopyran-6-ol, 2,2,5,7,8-pentamethyl- 6.5.35
 1-Benzopyran-4-one, 2-(3,4-dihydroxyphenyl)-3,5,7-trihydroxy- 7.50.2
 1-Benzopyran-4-one, 3,5,7-trihydroxy-2-(4-hydroxyphenyl)- 7.50.1
 Benzyl 3.9
 Benzylperoxyl 7.2
 Bicyclo[2.2.1]heptane-2-carboxylic acid, 6-(methylthio)- 7.42.64
 Bicyclo[2.2.1]heptane-2-carboxylic acid, 6-(methylthio)-, methyl ester 7.42.61
 Bicyclo[2.2.1]heptylperoxyl, 1-hydroxy-1,7,7-trimethyl- 5.36, 36.1
 Biline-8,12-dipropanoate ion, 2,17-diethenyl-1,10,19,22,23,24-hexahydro-3,7,13,17-tetramethyl-1,19-dioxo- 6.1.6, 6.2.1, 7.27.7, 7.29.2, 7.31.1, 7.33.1, 7.35.7, 7.36.3, 7.37.3, 7.42.20, 7.43.1, 7.45.2, 7.46.1, 7.47.3, 7.48.2
 Bilirubin dianion 6.1.6, 6.2.1, 7.27.7, 7.29.2, 7.31.1, 7.33.1, 7.35.7, 7.36.3, 7.37.3, 7.42.20, 7.43.1, 7.45.2, 7.46.1, 7.47.3, 7.48.2
 Bis(acetylacetonato)cobalt(II) 6.5.1
 Bis(acetylacetonato)oxovanadium(IV) 6.5.7
 1,4-Bis(*N,N*-dimethylamino)benzene 6.1.12, 6.2.2, 6.3.1, 6.4.1, 6.5.57, 7.5.5, 7.8.8, 7.9.1, 7.10.1, 7.11.2, 7.12.1, 7.13.1, 7.14.1, 7.15.3, 7.16.3, 7.18.4, 7.20.4, 7.27.13, 7.35.14, 7.42.75, 7.52.1, 7.53.1, 7.54.1, 7.56.7, 7.57.1, 7.58.5
 Bis(2,4-pentanedionato)cobalt(II) 6.5.1
 1,4-Bis(*N*-phenylamino)benzene 6.8.5

- Bromomethylperoxyl 7.45
 Butylated hydroxyanisole 6.8.1, 7.42.21
 Butylated hydroxytoluene 6.5.26, 6.8.2, 7.17.2, 7.42.31
 4-*tert*-Butyl-*N*-(4-*tert*-butylphenyl)-1-naphthylamine 6.9.1
 4-*tert*-Butyl-*N*-(4-*tert*-butylphenyl)-1-naphthylamine-*N*-oxyl 6.9.2
sec-Butyl hydroperoxide 6.5.13
 3-*tert*-Butyl-4-hydroxyanisole 6.8.1, 7.42.21
N-*tert*-Butyl-*N*-hydroxy-2-naphthylamine 6.9.4
N-*tert*-Butyl-2-naphthylamine 6.9.3
 Butylperoxyl 6.4
sec-Butylperoxyl 5.2, 2.1
tert-Butylperoxyl 5.3, 3.1, 6.5
 4-(*tert*-Butyl)phenol 6.5.14
N-(4-*tert*-Butylphenyl)-1-naphthylamine 6.9.5
N-(4-*tert*-Butylphenyl)-1-naphthylamine-*N*-oxyl 6.9.6
tert-Butyl 3.3
 Camphor ketyl peroxy radical 5.36, 36.1
 Carboxy(carboxymethylamino)methyl, dianion 3.34
 Carboxy(chloro)methylperoxyl, anion 7.30
 Carboxy(dichloro)methylperoxyl, anion 7.39
 Carboxy(difluoro)methylperoxyl, anion 7.23
 1-Carboxy-1-hydroxyethyl, anion 3.29
 Carboxy(hydroxy)methyl, anion 3.28
 Carboxymethyl, anion 3.27
 Carboxymethyldioxy ion(1-) 5.45, 45.1, 7.18
 Carboxymethylperoxyl, anion 5.45, 45.1, 7.18
 β -Carotene 7.42.22
 Chlorite ion 7.42.1
 1-Chloro-2,2-difluoro-2-methoxyethyl 3.41
 1-Chloro-2,2-difluoro-2-methoxyethylperoxyl 7.34
 Chlorodifluoromethylperoxyl 7.31
 2-Chloro-10-dimethylaminopropylphenothiazine, conjugate acid 7.16.2, 7.20.2, 7.24.3, 7.25.3, 7.26.3, 7.27.8, 7.28.3, 7.32.6, 7.34.3, 7.35.8, 7.36.4, 7.37.4, 7.38.3, 7.40.1, 7.41.3, 7.42.23, 7.44.3, 7.47.4
 Chlorodiphenylphosphine 6.5.15
 1-Chloroethyl 3.39
 1-Chloroethylperoxyl 7.28
 2-Chloroethylperoxyl 7.29
 Chloromethyl 3.38
 Chloromethylperoxyl 7.27
 2-Chloro-1,1,2,2-tetrafluoroethylperoxyl 7.33
 1-Chloro-2,2,2-trifluoroethyl 3.40
 1-Chloro-2,2,2-trifluoroethylperoxyl 7.32
 Chlorpromazine, conjugate acid 7.16.2, 7.20.2, 7.24.3, 7.25.3, 7.26.3, 7.27.8, 7.28.3, 7.32.6, 7.34.3, 7.35.8, 7.36.4, 7.37.4, 7.38.3, 7.40.1, 7.41.3, 7.42.23, 7.44.3, 7.47.4
 Cholestan-7-ylperoxyl, 3β -3-dodecanoyloxy- 5.72, 72.1
 Cholestan-7-ylperoxyl, 3β -3-hydroxy- 5.70, 70.1
 Cholest-5-en-7-ylperoxyl, 3β -3-dodecanoyloxy- 5.71, 71.1
 Cholest-5-en-7-ylperoxyl, 3β -3-hydroxy- 5.69, 69.1
 Cholesterol 7.32.7, 7.42.24
 6-Chromanol, 2-carboxy-2,5,7,8-tetramethyl- 6.1.8, 7.20.3
 6-Chromanol, 2,8-dimethyl-2-(4,8,12-trimethyltridecyl)- 6.5.61, 7.17.10
 6-Chromanol, 2,5,7,8-tetramethyl-2-(4,8,12-trimethyltridecyl)- 6.5.59, 6.8.7, 6.10.1, 6.11.1, 7.6.4, 7.17.8, 7.19.1, 7.32.17, 7.42.77, 7.51.2
 6-Chromanol, 2,7,8-trimethyl-2-(4,8,12-trimethyltridecyl)- 6.5.60, 7.17.9
 Cleland's Reagent, 7.59.2, 7.60.2, 7.61.1, 7.62.1
 Cobalt(II), 2,3,9,10-tetramethyl-1,4,8,11-tetraazacyclotetradeca-1,3,8,10-tetraene 6.1.1
 Copper(II) ion 7.6.2
 Copper(I) ion 7.6.1, 7.7.1
 Cu,Zn-Erythrocyuprein 7.8.7
 Cyanomethylperoxyl 7.20
 Cyclododecylperoxyl 5.21, 21.1
 Cycloheptylperoxyl 5.15, 15.1
 Cyclohexadienyl 3.6
 Cyclohexadienylperoxyl, hydroxy- 5.35, 35.1
 Cyclohexane 7.42.25
 Cyclohexene 7.42.26
 Cyclohexenylperoxyl 5.10, 10.1
 Cyclohexylperoxyl 5.11, 11.1, 6.8
 Cyclohexylperoxyl, methyl- 5.12, 12.1
 Cyclooctylperoxyl 5.17, 17.1
 Cyclopentenylperoxyl 5.6, 6.1
 Cyclopentyl 3.4
 Cyclopentylperoxyl 5.7, 7.1, 6.7
 Cysteamine 7.59.1, 7.60.1, 7.61.2, 7.62.2
 Cysteine 7.32.8
 Cytidine-OH adduct 3.69
 Cytidine 5'-monophosphate-OH adduct 3.72
 Cytidylic acid-OH adduct 3.72
 Cytosine-OH adduct 3.60
 DNA-OH adduct 3.74
 Decylperoxyl 5.20, 20.1
 Deoxyadenosine OH-adduct 3.63
 2'-Deoxyadenosine 5'-monophosphate 7.42.27
 Deoxyadenosine monophosphate 7.42.27
 Deoxyadenylic acid 7.42.27
 2'-Deoxy-5'-adenylic acid 7.42.27
 2'-Deoxycytidine 5'-monophosphate OH-adduct 3.73
 Deoxycytidylic acid-OH adduct 3.73
 Deoxyguanosine 5'-monophosphate 7.42.28
 Deoxyguanylic acid 7.42.28
 Deuterohemin 7.24.1
 1,3-Diacetoxy-2,2-dimethylpropylperoxyl 5.55, 55.1

- 1,2-Diacetoxyethylperoxyl 5.54, 54.1
1,4-Diazabicyclo[2.2.2]octane 6.5.16, 7.42.29
9-Diazofluorene 7.42.30
Dibromomethylperoxyl 7.46
3,8-Di-*tert*-butyl-*N*-(4-*tert*-butylphenyl)-1-naphthylamine 6.9.7
3,8-Di-*tert*-butyl-*N*-(4-*tert*-butylphenyl)-1-naphthylamine-*N*-oxyl 6.9.9
2,6-Di-*tert*-butyl-4-carbo-*tert*-butoxyphenol 6.5.17
2,6-Di-*tert*-butyl-4-carboxyphenol 6.5.23
O-*d*-2,6-Di-*tert*-butyl-4-chlorophenol 6.5.19
2,6-Di-*tert*-butyl-4-chlorophenol 6.5.18
2,6-Di-*tert*-butyl-*p*-cresol 6.5.26, 6.8.2, 7.17.2, 7.42.31
O-*d*-2,6-Di-*tert*-butyl-4-cyanophenol 6.5.21
2,6-Di-*tert*-butyl-4-cyanophenol 6.5.20
2,6-Di-*tert*-butyl-4-formylphenol 6.5.22
3,5-Di-*tert*-butyl-4-hydroxybenzaldehyde 6.5.22
3,5-Di-*tert*-butyl-4-hydroxybenzoic acid 6.5.23
2,6-Di-*tert*-butyl-1-hydroxy-4-methylcyclohexadienyl 3.8
3,5-Di-*tert*-butyl-4-hydroxytoluene 6.5.26, 6.8.2, 7.17.2, 7.42.31

- 2,4-Pyrimidinedione, 5-methyl-, radical ion (1-) 3.57
- 5-Pyrimidinyl, 1-(2-deoxy- β -D-erythropentofuranosyl)hexahydro-6-hydroxy-5-methyl-2,4-dioxo- 3.67
- Pyrimidinyl, 1,2,6,?-tetrahydro-5-methyl-2,6-dioxo- 3.58
- 6-Pyrimidinylperoxyl, 4-amino-5-hydroxy-2-oxo- 7.53
- 5-Pyrimidinylperoxyl, hexahydro-5-methyl-2,4-dioxo- 5.74, 74.1
- 6-Pyrimidinylperoxyl, hexahydro-5-hydroxy-2,4-dioxo- 7.52
- Pyrimidinylperoxyl, hexahydro(hydroxy)-2,4-dioxo- 5.76, 76.1
- Pyrimidinylperoxyl, hexahydro(hydroxy)-5-methyl-2,4-dioxo- 7.55
- Pyrimidinylperoxyl, hexahydro-2,4-dioxo- 4.18, 5.75, 75.1
- Pyrrolidine 6.5.53
- Quercetin 7.50.2
- Radical from alanine anhydride 3.55
- Radical from *d*-erythro-2-Deoxypentose 3.23
- Radical from glycine anhydride 3.54
- Radical from sarcosine anhydride 3.56
- Radicals from arachidonate 3.52
- Radicals from deoxyribose 3.23
- Radicals from glucose 3.24
- Radicals from linoleate 3.50
- Radicals from linolenate 3.51
- Radicals from oleate 3.49

- Radicals from polyethylene oxide 3.25
 Serine radical, conjugate base 3.35
 Skatole 7.42.60
 Stannane, hexaphenyl 6.5.6
 Sulfite ion 7.18.1, 7.42.7
 Superoxide dismutase 7.8.7
 Tetrahydro-2-furanylperoxyl 7.10
 Tetrahydropyrrole 6.5.53
 1,2,3,4-Tetrahydroxybutylperoxyl 4.7
 5,10,15,20-Tetrakis(2-hydroxyphenyl)porphinatozinc(II) 7.42.12
 5,10,15,20-Tetrakis(3-hydroxyphenyl)porphinatozinc(II) 7.42.13
 5,10,15,20-Tetrakis(4-hydroxyphenyl)porphinatozinc(II) 7.42.14
 5,10,15,20-Tetrakis(4-methylphenyl)porphinatozinc(II) 7.27.2, 7.35.2
 5,10,15,20-Tetrakis(4-methylphenyl)porphinatozinc(II) pyridine complex 7.27.3, 7.35.3
 5,10,15,20-Tetrakis(1-methylpyridinium-4-yl)porphinatozinc(II) ion 7.42.11
 5,10,15,20-Tetrakis(4-pyridyl)porphinatozinc(II) 7.42.10
 5,10,15,20-Tetrakis(4-sulfonatophenyl)porphinatozinc(II) ion 7.42.15
 α -Tetralin hydroperoxide, deuterated (OOD) 6.5.55
 α -Tetralin hydroperoxide 6.5.54, 6.6.3
